Economic research has demonstrated that the richest 1 percent in terms of income and wealth are increasing their relative advantage (Atkinson et al., 2011; Piketty, 2014). However, there is little empirical research on the role of cultural processes including evaluation in (re)producing economic inequality at the top of the income distribution (Lamont et al., 2014; McCall, 2013). My study highlights the importance of the evaluative processes which are narrated as constituting top incomes for top income earners' perceptions of economic inequality. To understand how top income earners understand economic inequality, I interviewed and surveyed 30 UK-based participants. My main finding is that participants' perceptions of top income shares closely relate to their views on the production of top incomes for which evaluative processes based on economic ideas of the market are key. A majority of participants termed 'economic evaluators', explain that top incomes are the result of rational, economic evaluation processes based on the idea that 'the market' is the best instrument to determine the economic value of individuals' contribution. Economic reward is viewed as reflecting social contribution, as in the neoclassical marginal productivity theory of income distribution (McGoey, 2017). Hence economic, quantifiable 'value' is seen as enmeshed with moral, cultural 'values' (Skeggs, 2003). The most notable evaluative practice which participants refer to is the assessment of performance pay, which includes formulas for traders' bonuses and hedge fund returns. It is precisely these practices of performance-based remuneration which have been shown to be associated with increased wage inequality in the US and the UK (Atkinson, 2015; Angeles et al., 2016). I argue that inequality is made sense of as well as 'rationalized' through the economically 'rational' evaluative practice of performance pay (Bourdieu, 1986).

The Market Will Find a Level: Perceptions of Economic Inequality at the Top End of the Income and Wealth Distributions in the UK

Following in the tradition of research on 'elite' perceptions of inequality (Reis and Moore, 2005), my research investigates how economic inequality, measured by top income and wealth shares, is perceived by the top 1 percent of income earners in the UK. In the UK, a liberal market economy in which 'firms coordinate their activities primarily via hierarchies and competitive market arrangements' (Hall and Soskice, 2001 p.8), the distribution of income and wealth has become more unequal since the 1970s. Specifically, top income shares, the share of the top 1 percent in total national income have increased. Top wealth shares, the share of the top 1 percent in total wealth have also increased though less dramatically.

How are these recent increases in economic inequality understood and experienced by those with top incomes and wealth? I will answer this question by presenting findings from a mixed-methods doctoral study with 30 UK-based participants, whose income places them within the top 1 percent of the distribution. Even though research by economists has demonstrated that the richest 1 percent are increasing their advantage over others, there is little empirical research regarding how they perceive increasing economic inequality (Chin, 2014). Findings include that a majority of participants explain that they cannot answer the question how high top income (and wealth) shares ought to be; either because they prefer not to provide a judgement or because 'the market' should determine levels of inequality. I will unpack the idea of competitive markets and the process of

economic evaluation, to explain why many participants state that we should not concern ourselves with issues of distribution, but focus on maximizing 'wealth for all' through wealth and job creation.

Being Male and Stuck in Vulnerability. the Situation of Young Male Refugees in Turkey.

Being male and stuck in vulnerability. The situation of young male refugees in Turkey.

In the past decades there has been growing attention on the concept of gender and vulnerability in migration and border studies. For many years, scholars and especially feminist activists have demanded that international humanitarian agencies and nation states particularly ensure the protection of women, children and other vulnerable migrant groups. Recently a critical debate on the dangers of the discursive logic of vulnerability in the field of migration politics has emerged. Authors like Didier Fassin (2007, 2016) and Miriam Ticktin (2011) show that migration and refugee policies prioritize biological or health differences to delineate the deserving from the undeserving migrant.

In my paper, I will discuss the question of gender and vulnerability in the context of the current international refugee regime in Turkey. Based on ethnographic research we conducted in spring and summer of 2016 within the scope of the research project "De-and Re-stabilizations of the European Border Regime" (<http://transmigration-2.org>), I will elaborate how the introduction of the categories "gender and vulnerability" in the international humanitarian migration context, and particular in UNHCR politics in Turkey has restricted access to asylum and resettlement only to vulnerable cases, that by definition exclude certain profiles, like young male refugees.

Understanding the Evolution of GI Schemes and GI Products As Cultural Adaptation Work

The regulation and labelling scheme for PDO, PGI and TSG was set up in Norway in 2002, modelled on corresponding systems for GIs in the European Union. The implementation of GI in Norway was demanding, causing administrators, producers, consultants and others to make a significant and all-round effort to adapt the scheme to Norwegian food culture, and Norwegian food culture to the scheme. This paper probes the theme of this mutual adaptation work, and its consequences.

Norway makes up the food cultural context in this study, whereas *Tørrfisk fra Lofoten* and *Fenälär fra Norge* are used as examples of GI products. The two products are selected as objects for analysis because they are the only Norwegian products also registered as third country GI-products in EU - making the adaptation work and its consequences even more complex and intriguing.

The analysis is based on diverse forms of empirical material, such as document studies of laws, policy documents, etc. and interviews with persons responsible for working out product regulations in producer organizations. Interviews have also been conducted with key informants representing public administrative bodies administering the regulation.

The analysis is not dedicated to any specific methodological or theoretical tools but takes inspiration from an adapted set of perspectives to describe and understand the cultural adaptation work of GI schemes and products.

The conclusion is that the evolution of GI in Norway can be understood as a chain of adaptations and adaptive practises necessary to unite the dynamic ordering of modern global regulations with the food cultural status of traditional local products. The consequences of this food cultural adaptation work both give voices and empowers local actors and subordinate groups, but can also be seen as an instrument that hampers democratic forms of development.

Humanitarian Contradictions: The Formation and Demise of the Humanitarian Corridor in Croatia

For almost six months in 2015-2016, Croatia formed a strong centralized response to the refugee flows through the Western Balkans, with the government providing border-to-border transportation to refugees, as well as coordinating humanitarian aid within its transit camps. While the period of the humanitarian corridor was notable for the relatively high level of humanitarian care provided, particularly in contrast with its neighbors, Croatia's humanitarian record with asylum seekers since this period has been marked by abuses. Under what circumstances do states respond in humanitarian ways? What are the limitations of state-based humanitarian responses?

This paper studies the formation and demise of the humanitarian corridor using interviews and documents from actors involved in the humanitarian response, including government officials, officials from international organizations, and humanitarian aid workers from both Croatian and international NGOs.

Croatia's response to the Syrian refugee crisis was unusual because of the degree government centralization. Because the government directed the flow of refugees through its transportation and camp system, Croatia was able to bypass human traffickers and profiteers attempting to take advantage of refugees. Croatia was able to avoid many pitfalls common to humanitarian responses by facilitating communication and cooperation among humanitarian responders.

However, my research shows the contradictions of a government-led humanitarian response. Such a centralized response allowed the government to act as an arbiter of humanitarian aid, determining which groups were allowed to give aid, what groups were allowed to provide aid, where they were allowed to give it, and when groups had access to refugees. This lack of independence became problematic once the government and humanitarian organizations began to diverge in their principles of refugee care. The centralization of the humanitarian response was the driver of both the success and the demise of the humanitarian corridor.

Cumulative Histories of Co-Occurring Childhood Adversities and Trajectories of Psychological Distress in Adulthood

Childhood stressors often do not occur as isolated circumstances; instead, adverse childhood experiences tend to co-occur, resulting in an accumulation of risk with detrimental consequences for mental health. The enduring impact of cumulative childhood adversity on mental health is well documented in the literature; however, data constraints dictating the number and types of adversities included in studies have contributed to the exclusion of important contextual stressors, such as neighbourhood and school environment adversities, that have been linked to adult mental health. In addition, recent evidence reveals heterogeneity among adverse childhood experiences that cannot be captured using a simple sum score, the most commonly used measure of cumulative childhood adversity.

The present study utilizes 14 years of data from the Panel Study of Income Dynamics Childhood Retrospective Circumstances Study to examine the impact of heterogeneous histories of co-occurring childhood adversities on long-term trajectories of adult psychological distress. First, seven latent classes of distinct patterns of cumulative childhood adversity were identified using 25 indicators of adversity across multiple childhood domains. Next, latent growth curve modeling was used to examine the effects of the latent classes of cumulative childhood adversity on trajectories of psychological distress from early to late adulthood. The results indicate that respondents with a high probability of experiencing any adversity during childhood, regardless of latent class membership, reported higher levels of distress in adulthood. However, only membership in the class with a high probability of experiencing multiple adversities across different childhood domains significantly increased psychological distress over time. The findings suggest that there are variations in the experience of the accumulation of adverse childhood experiences that have important implications for long-term levels of psychological distress. Latent class analysis captures the heterogeneity in patterns of multiple, co-occurring adverse childhood experiences that sum scores cannot, and which may lead to model misspecification.

Leisure Engagement and Disengagement in Contemporary Finland

What does cultural disengagement – the non-consumption of cultural activities – mean in an egalitarian Nordic country such as Finland? How is the leisure time of allegedly passive Finns constructed, and how do they motivate their choices? While the benefits of culturally active life are well known, little is done to understand better the reasons behind cultural disengagement. Research on leisure has recently highlighted the rise of different cultural consumption patterns that challenge the classic theories on class-based hierarchies on taste. However, most of the attention has been focused on active rather than passive cultural consumers. This paper aims to fill that void and explore the reasons behind cultural disengagement and low cultural participation in contemporary Finland. Furthermore, it asks how cultural policy could function better and more equally. Existing research proves that culturally disengaged groups are difficult to reach through quantitative methods. Therefore, this project will draw on rich qualitative data: 20 focus groups interviews will be collected among groups and individuals already recognized as culturally disengaged by previous research. The interviews will focus on leisure in general and then more specifically on cultural domains (e.g. music, literature and sports) – both from the perspectives of traditional spectatorship and home-based participation. It might be expected that cultural disengagement is linked to lack of time or economical resources, or suitable possibilities of cultural participation close to home. On a deeper level, cultural disengagement could be a symbolic struggle against established lifestyles. In this way, this project will problematize the concept of "cultural

participation" altogether. This investigation will provide empirical data and a deeper understanding of the leisure time of the culturally disengaged, offering key information for policy-makers and cultural institutions to deploy new strategies and actions in a context of economic crisis and cuts in several fields of public services.

Social Dancing in Later Life: The Life Course, Historical Time and Serious Leisure

Research on dancing in later life has mainly focused on the health promoting effects of dance and in a lesser extent on its social meanings. A life course perspective has seldom been applied. Especially the influence of historical time has been neglected and dancing through life is usually described by a pre-given pattern. In this article we focus on social dancing in later life in a life course perspective in order to include historical time in the analysis. 44 qualitative interviews were conducted with older dancing adults in Sweden. The study illustrates how the older adults, regardless of age, have been influenced by the high popularity of folk dance in Sweden in the 1970s and 1980s. This dance wave was part of the green movement and spread in several countries. However, depending on age there are some variations in the influence as some were teenagers and others in their forties when they were enrolled by the wave. The study also illustrates how several interviewees simultaneously have several dances as leisure, or have shifted between different dances during life as a response to new life events such as getting children or a new spouse. The study challenges homogenous views of older people as well as of dancing through life.

From Military Profession, to NO Profession: The Plight of Former White Military Veterans

In South Africa a special Department of Military Veterans linked to the Department of Defence was established in 2009 to oversee the welfare of military veterans. This came about after many former veterans from the revolutionary forces, who fought against the Apartheid state started to protest and demand compensation for the sacrifices they made during the liberation struggle. There has been considerable focus on this group of military veterans, significantly less so on military veterans who fought for the former Apartheid state. Although many former military personnel have found alternative employment, especially in the growing security sector, many who took early retirement severance packages are destitute. They have joined the growing number of poor whites in the country who are homeless and live in abject poverty. The aim of this research is to uncover what contributed to their inability to reintegrate back into civilian society by looking at the effect that the military institution had on their military habitus and identity. Beyond this, we hope to uncover what has contributed to their economic, social and political isolation in the new democratic South Africa in order to gain a better understanding of the degree of marginalization they experience. While much has been written on military veterans internationally, this has only recently been highlighted as a matter of national concern in the country.

Governmental Sustainability Strategies and Policies: More Than a Toothless Tiger?

Since its beginnings in 1992 the (mainstream) discourse on sustainable development and sustainability transition has strongly focused on the paradigm of multi-stakeholder governance. This guiding vision of sustainability governance has its roots in the age of neoliberalization, deregulation and globalization at the end of the 1980ties and the beginning of the 1990ties after the breakdown of the Soviet Union. Apparent limits of state-led political steering where diagnosed and the power of societal (self-)governance beyond and even without the state were propagated. However, this approach itself has obviously limits in driving the sustainability transition: planetary boundaries keep on being transgressed and social sustainability, especially concerning social inequality, has increased in many regions around the world. In recent years the importance of state institutions for coping with societal crisis and driving societal transformation has been proven, for example in the aftermath of the global financial crises, in energy and electric mobility transition policies up to the transformative power of environmental policies in China - even though critically discussed. And the global adoption of the Transformation Agenda 2030 of the United Nations including the call for national sustainability strategies point to the key role of state institutions for leading and guiding sustainability transitions. Against this re-newed focus

on the role of state institutions for sustainable development this paper takes a critical look at the practice and potential of governmental sustainability strategies. Based on conceptual approaches of institutional theory and practice theory as well as on empirical findings from German case studies at the local, regional and national level it will be discussed, to what extent governmental sustainability strategies and policies are more than a toothless tiger and what it needs to become practically relevant and effective.

For a Holistic Social Science

Sociologists, political scientists and economists do not read each other's work, and very few of them want to know anything about such synthetic research programmes as political economy or historical materialism not to mention the results of natural sciences such as biology. The paper deals with the questions, how did we end up to this situation and, more importantly, how can we create a holistic research programme, which shows the path away from that balkanized state toward a social science, which understands that society is one totality, treats it as such and is thus capable to face the fatal problems of our time and future? Its strategy is to make a journey from political economists and Marx through Weber to Michael Mann's historical sociology with the so-called IEMP model for the study of ideological, economic, military and political power sources in its core. For creating capacity to properly treat the material side of society and tackle such fatal problems of our time and future as environmental crisis, violence reduction and inequality an even more extensive model is developed. In the spirit of the short-lived attempts for reconstruction of historical materialism by Habermas, Eder, Giddens and others in the turn of the 1970s and 1980s that approach unifies to one conception natural, artefactual, cultural, economic, violence-related and political sources of power and thus establishes what can be called the NACEVP model of social research.

Do Health Problems Have an Effect on Students' Plans for International Mobility?

Little is known about the international mobility of students with a disability or chronic disease. According to Dessof (2006), students with a disability are underrepresented concerning studies abroad. Matthews et al. (1998) and Kutsche (2012) report that a (supposed) lack of adjustments to the situation of students with a disability (e. g., disability access or special medical care) are obstacles for them concerning a study abroad. Our analyses are based on Rational Choice Theory and psychological approaches. Concerning the former theory, we assume that the preference for a study abroad on average does not vary between students with and without a disability. We suppose that differences concerning the restrictions are responsible for the fact that disabled students are less inclined to study abroad. According to Breen and Goldthorpe (1997), differences concerning resources induce different educational decisions. As disabled students are faced with restrictions concerning the resource "health", they are supposed to be less inclined to study abroad. In addition, we investigate whether or not students with and without a disability differ concerning personality traits. For disabled people, to begin a study is a much higher hurdle than for other people. Therefore, probably students with a disability have special personality traits due to selection processes (selective enrolment) which enables them to partly compensate for disadvantages, e. g. a higher degree of openness or a higher degree of extraversion. We use data of the 21st social survey (Middendorff et al. 2017). In 2016, 55,219 students in Germany have completed the social survey online survey. The proportion of students with disabilities/chronic diseases aggravating their studies is eleven per cent. Preliminary analyses show that disabled students are less inclined to plan a study abroad. The next analyses will concentrate on the analysis of the question which factors are responsible for these differences.

Primary and Secondary Effects on Choice of Field in Higher Education

This paper explores the choice of field in higher education, and the importance of grades from upper secondary school and parents' educational field for this choice. In times of inflation in educational credentials, differences between educational fields are increasingly important for individual life chances (Di Stasio, Bol, & Van de Werfhorst, 2016; Van de Werfhorst, 2009; Werfhorst & Andersen, 2005).

To address these issues, we study educational choices in the transition to tertiary education in Norway. The Norwegian case is particularly well suited for a study of choice of educational field. On average, the returns to higher education is quite low in Norway, but the returns vary considerable between educational fields. Grades are the only sorting criteria, and the only way upper and middle class students may use their family resources to increase their educational options is by retaking exams from upper secondary. By modeling effects of both social origin variables (like parents' educational fields and income), grade point average from upper secondary education and the propensity to retake exams, we may draw clearer distinctions between the role of preferences and school grades, i.e. secondary and primary effects (Boudon 1974).

The analyses examine the transition to higher education among young adults, and we rely on Norwegian administrative data covering the complete population. These data are well suited to examine fine-grained educational categories at the tertiary level, for both parents and their children. We control for grades from upper-secondary school. Our findings suggest that (1) significant intergenerational bindings in educational choices vary between fields: associations are stronger in fields with higher prestige and status. Even when (2) controlling for school grades such patterns remain quite substantial. Such findings could imply that secondary effects not only play a role in transitions between educational levels, but also between fields.

Invisibilized Temporary Foreign Workers: International Experience Canada and Irish Employment-Related Mobilities to Canada

Youth-oriented "Working Holiday" programs have recently been identified as significant conduits for flows of transnational labour mobility in and out of wealthy countries. Most of the research on this kind of labour mobility has come from Australia where Working Holiday programs funnel incoming temporary foreign labour to particular regions and sectors said to experience ongoing labour shortages. In the case of Canada, "Working Holiday" mobilities are organized through International Experience Canada (IEC). International Experience Canada is the largest sub-category of the International Mobility Program (IMP) that is responsible for more temporary foreign workers in Canada than the officially named Temporary Foreign Worker Program. Unlike Australian Working Holiday arrivals however, most IEC Working Holiday visa holders arrive in Canada with "open" work permits free of spatial or occupational constraint and most end up finding employment in Canada's largest cities. While serving as an important conduit for transnational labour mobility to Canada, International Experience Canada remains relatively invisible as a source of temporary foreign workers and has received limited scholarly attention. Drawing on initial and follow up interviews with white Irish holders of IEC Working Holiday visas working in Toronto, this paper examines how International Experience Canada shaped their employment-related mobilities to Canada and how their two-year visa and open work permit combined with a racialized Toronto labour market to produce both precarity and privilege in job searches and in the workplace.

Activation As a Field of Contention: Visions and Courter Visions of Activation in Israel

This article analyses the power struggles between different actors engaged in the politics of activation in Israel and the heterogeneity of goals and policy instruments they promoted to enhance the labour market integration of the long-term unemployed. These power struggles turned activation into a field of contention. The field of contention was composed of bureaucratic actors representing the Ministry of Finance and the Israel Employment Service and Ministry of Labour and Welfare. Within this field, actors promoted two main programs to enhance the reintegration of the long-term unemployed into the labour market. One program promoted policy instruments was underpinned

by "social investment" principles, while the other was premised on "workfarist" logic. The Ministry of Finance capitalized on its power to mobilize resources, strategies, and tactics to assemble a coalition around the workfarist program. The compromise reached by the coalition was a fragile one, and did not mitigate conflicts over activation. The conceptualization of activation as a field of contention reveals the messy actualities of the politics that surround neo-liberalist projects and the fact that the compromises on which they are based open them anew to resistance and contestation.

Shortages of Qualifications in Germany Despite Increased Migration– What Is Good for One, Is Harm for the Other

This paper intends to analyse the current effects of migration in the German labour market and their potential social impacts. The immigration to Germany is a result of the European economic crisis and the current Syrian crisis. However without these specific factors approximately 700,000 to 1,000,000 people migrate to Germany and approximately 600,000 to 900,000 people leave Germany each year.

Increased net migration has an effect on labour demand as well as on labour supply. It also increases domestic demand for goods and services and has an effect on the foreign trade.

Despite increased immigration, it will not be possible for Germany to satisfy the relatively constant requirement for skilled workers at the medium qualification level in the long run. On the other hand, highly qualified young workers with vocational training or with an academic degree leave Germany every year. Regarding these circumstances and the division of labour companies need to reorganize their production processes using the remaining qualifications or they have to relocate their production abroad.

The presentation uses the basic projection of the qualifications and occupational field projections (www.qube-projekt.de). This projection pursues an empirically based concept, which shows how the supply of and demand for skills and occupations may develop on a long-term basis until 2030. Therefore, occupational flexibility, qualification and branch developments, and their social impacts are presented.

This analysis will present different migration scenarios, because the reasons for migration are likely to increase worldwide in the coming years. Migration will influence the labour market, the economic and social development in the countries of origin as well as in the countries of destination. And it has an indirect impact on globalisation and transnational trade. The scenarios show to what extent different policies (like the policy on immigration to Germany during the Syrian crisis) influence the economy.

ZIKA, GERD (*Institute for Employment Research (IAB)*)

The Impact of Digitization on the German Labor Market – a Scenario Based on the Bibb-IAB Qualification and Occupational Field Projections (QuBe)

Political consulting requires scientifically sound forecasts for future planning and design. This means that forecasts must be theoretically and empirically well-founded and comprehensible. These predictions can be based on a wide variety of forecasting methods. Which method should be used depends on the respective question, or what knowledge is to be gained about the future.

The scenario method is particularly suitable for predicting different futures or different possible future outcomes. It is usually based on quantitative multi-equation models. The starting point here is the assumption of different frame conditions and action alternatives. In the scenarios, possible and probable "futures" are summarized.

On the basis of the BIBB-IAB qualification and occupational field projections (QuBe-Projekt.de), which illustrate the long-term development of labor supply and demand, we will present a practical application of the scenario method. Our topic for the scenario is a digital revolution in the next decade.

In a 5-step analysis of this scenario (cf. Wolter et al. 2015) we examine the impacts of

- (1) increased investments of enterprises in equipment
- (2) the state in the network infrastructure
- (3) decreased personnel and material costs of the enterprises
- (4) changed pattern of demand for occupations and skills
- (5) a potentially increasing demand for goods.

The cumulative effects of these five partial scenarios are compared with a baseline scenario which contains no advanced development path to a digitized economy.

The results show that economy 4.0 will accelerate the structural change towards more services. In this process labour force movements between branches, occupations and job requirements are much larger than changes in the number of employees in total. The turnover on the labour market is accompanied by an increasing value added which is leading not only to more economic assets but also – due to higher requirements for the labour force – to higher aggregate wages.

The Order of Human Interdependencies: Simulating Elias' One-Level Multi-Person Models

Sociologist Norbert Elias made it his lifework to describe and explain long-term processes. According to Elias, these processes cannot be studied voluntarily by only focusing on human intentions or motivations. This is because they are the unplanned result of a whole spectrum of interactions of different people over time. According to Elias, these interactions between individuals interweave to produce a development that is relatively autonomous from the actions of individuals. To illustrate how the actions of individuals interweave and produce emergent dynamics, Elias constructed several theoretical models that are simplified versions of social processes. Importantly, the different models state precise propositions and consequences of specific types of interweaving that can be formally tested. This article simulates the Elasian approach to social life. We reproduce the theoretical models of Elias with a method that is highly suited to investigate their emergent dynamics: agent-based modelling. Agent-based models are computer models that simulate agents (i.e., individuals or groups of individuals) and their interaction with other agents. More specifically, we test whether the theorized consequences of the Elasian models exist when we implement their propositions in a computational framework.

Enlarging the Analytical Scope of Professionalization Towards Critique

Classic analytical dimensions in professional theories, like e.g. professional knowledge, professional ethics, professional routines, or professional power barely fit when it comes to the analytical scope of *hybrid professional identities*. A current empirical study on clinician scientists, a professional group anchored in the field of biomedicine and historically based on two strong and powerful professions—physicians and scientists—reveals analytical limitations in the context of studying professional developments and conditions. Analyzing hybrid professional identities, like clinician scientists, with classic theoretical reference points (power, routines, ethics, etc.) means to risk, in an analytically sense, a permanent 'loop of re-characterization'—or a problem of 'recursivity'—regarding the underlying professions the hybrid role consists of. Thus, the description of professional characteristics will be per se reduced to the underlying professions of physicians and scientists.

Hence, in order to overcome this analytical shortcoming, this paper proposes to analyze the professional development via different modes of critique based on the pragmatic sociology of critique by Luc Boltanski and Laurent Thévenot. This proposed analytical scope is developed on three different empirical studies (discourse analysis, interviews and blog analysis) according to the professional development of clinician scientists in the field of biomedicine. Each of these studies concerns in particular different modes of critical actions, which are called 'tests': (1) truth test, (2) reality test and (3) existential test. The idea behind this analytical scope of 'testing' in the context of professionalization is to dedicate professional conditions to the persons concerned. That means to characterize the subjective professional scope by analyzing the critical negotiation of context conditions from the individuals involved. This perspective allows to define the professional constitution via their sources of (a) common sense, (b) public critique and (c) indig-

nation. Taken together, these three theoretical-analytical dimensions represent indicators for (future) professional developments.

HENDRIKS, BARBARA* (*Humboldt University Berlin*)

The Clinician Scientist in the Field of Translational Research: A Future Profession in Medicine?

Clinician scientists are nowadays discussed as the key medical profession in the field of translational research in biomedicine as they were understood as the *future role* able to closing the widening gap between biomedical research and medical practice. Thus, clinician scientist training and funding programs can nowadays be found in numerous universities and university hospitals around the world – such as Harvard Medical School, the University of Toronto, or the university hospital Charité Berlin—to name a few. The idea behind these programs is to promote a *hybrid profession* that translates research findings into clinical practice, and the other way round, *qua persona*. However, we can find empirically that clinician scientists do somehow fail on this request as the clinician scientist is lacking a form of institutionalization.

In this context, we find that previous studies addresses hurdles and barriers according to training and education of clinician scientists, but until now it is unclear what meaning translational research plays in this context? Translational research is mainly perceived as a driver for the clinician scientist position, but it seems rather unquestioned what kind of negative side effects translational research triggers towards the development of clinician scientists as a future medical profession. This paper addresses this shortcoming via a dualistic perspective by asking two questions simultaneously: How is translational research criticized by various stakeholders in the field of biomedicine, and what role does the clinician scientist play in this context? And b) how do clinician scientists criticize translational research and what role does this critique play for the perception of translational research? In order to answer these two questions the article is based on three sources of empirical data: (1) interviews with clinician scientists, (2) a discourse analysis of research articles and (3) a blog analysis from clinician scientists.

Brain Trauma As Constitutive Condition: Beyond the Event of Traumatic Brain Injury

In light of high-profile lawsuits involving professional sport leagues in North America, the effects of traumatic brain injury (TBI) have attracted significant public attention. News media regularly features reports of concussed athletes, speculation about the health risks of contact sport participation, scientific findings of degenerative brain disease, and the development of injury prevention methods. While these developments mark a shift in public consciousness, public discourse often overstates scientific findings about the effects of concussions and presents simplistic depictions of brain trauma. This paper steps back from popularized depictions of TBI to consider how participants navigate brain trauma, thus offering alternative narratives about experiences of—and with—brain injury. Rather than focusing on specific events resulting in TBI and their effects, this analysis looks at affected participants' descriptions of how they navigate and manage everyday life. Drawing on autoethnographic, interview and (inter)active observational data, it illuminates key features of brain trauma as a lived condition in which multiple layers of violence and trauma may be relevant. Further, many participants come to occupy an interstitial space between risk, injury and disability in ways that depart from popular discourses and their renderings of the TBI. The paper concludes by reflecting on how our understandings of brain injury and its effects might shift if we focus the constitutive elements that inform its materialization and lived experience.

Strategies of Survivance: Indigenous Street Gangs and Settler Colonialism

Indigenous peoples globally experience heightened levels of violence and its subsequent trauma resulting, not just from historical impacts of colonization, but continued policies of erasure brought on through settler colonialism. Despite such attacks, Indigenous peoples survive and resist the continued violence and violent erasure on their bodies, knowledges, and territories through strategies of *survivance* (Vizenor, 2008). This paper examines how Indigenous peoples in Western Canada, specifically those involved in street gang, have created survivance strategies to survive and resist settler colonialism. Focusing on three separate research projects involving Indigenous peoples, who at one time were engaged in street gangs, I show how the participants actively engaged in survivance strategies to survive and build their social capital. Although research is slowly beginning to emerge on the uniqueness of Indigenous street gang experience

formation there is still a strong tendency to adopt and adapt to American street gang perceptions. The aim of the three research projects was to engage with those individuals who are/were engaged with an Indigenous-based street gang and those who work with Indigenous street gang members and frame these experiences into the broader literature of colonialism and gang studies to better understand why Indigenous youth are drawn into a street gang lifestyle and the role(s) that the street gang has in creating spaces of survival across western Canada. The paper is designed to bring to the fore the importance of decolonial approaches to address Indigenous street gangs and challenge the continued criminal justice and public safety rhetoric of street gangs as violent predators who have little connection to their community. To accomplish this, space must be provided to create a counter-narrative to the continued suppressive criminal justice approaches and shift to localized decolonial approaches that view street gangs as sites of survival within contested colonial spaces.

Street Children's Narrative Accounts: Availability, Access and Transposing across Semiotic Systems.

In this paper we analyze pedagogical experiences carried out between 2013-2015 in Buenos Aires City by our team, a group of volunteers and other teachers that support street children. Our goal was to identify what kind of learning opportunities for narrative accounts, and what kinds of narratives, become visible when analyzing multi-mediated interactions (i.e., mediated through oral exchange, visual arts, photography, video and written text). Methodologically, we looked into the availability, access and transposition of different semiotic systems. Our outcomes show that facilitating access to a variety of resources, in different interactional configurations and with diverse media, enables participants to find a voice of their own and express themselves as individuals, and, simultaneously, enable children as a group to express as a collective. We conclude that these kinds of pedagogical experiences set out an educational potential for narration and self-expression while supporting a way by which children may be able to state their position vis a vis devastating living conditions that affect them.

HERBERT, DAVID* (Kingston University London)

Social Media and Social Order: A Comparative North European Study

This paper reflects on the findings of a 3 year Norwegian Research Council project which has investigated how social media is reshaping social relations in multi-ethnic neighbourhoods of cities in Norway, Denmark and the Netherlands, looking especially at how cultural conflict and social order are generated, reinforced and challenged both on social media platforms and at their intersection with life in the physical city. We have focused on the platforms Facebook (most widely used) and Instagram (most visually curated), examining their use in urban environments using mixed methods, including social media analytics (heat maps and network analysis), content analysis (of posts, photos and text) and interviews. Using these methods, we have investigated the online/offline lives of a variety of groups, including ethnic Danish converts to Islam and lifestyle clusters in Amsterdam and Kristiansand. Our evidence suggests that whereas many accounts emphasise the egalitarian and polarising potentials of social media, we find that social media platforms are more likely to reinforce existing power relations, distribution of resources and prevailing social consensus than to disrupt them.

The Access to the Brazilian Public Higher Education: Analysis about the Profile of the Entering Students in Courses of Prestige of Federal University of Rio De Janeiro

For a long time, Brazilian higher education was addressed to a small portion of the more socioeconomically favored population. In the last decades, this level of education has undergone transformations that involve the implementation of policies that aim to expand and democratize access. However, it is possible to perceive that the expansion of higher education and the arrival of a more heterogeneous public, especially in public universities, have been happening more broadly in courses of less social prestige, potentializing an uneven distribution between courses. In this way, it is necessary to analyze the profile of those who enter high social prestige courses and in what dimensions have the initiatives created by the federal government to democratize access to Brazilian public higher

education have contributed to diversify the profile of students in these courses. Therefore, the purpose of this text is to discuss the extent to which access policies such as affirmative action and the Brazilian National Examination of the High School / Brazilian Unified Selection System (ENEM/SISU) have collaborated so that students with a more diversified profile enter courses of high social prestige - Medicine, Law and Engineering - of the Federal University of Rio de Janeiro (UFRJ). Thus, supported by theoretical conceptions produced in the perspective of the Sociology of Education, we will develop a quantitative analysis, using descriptive statistics. We will use the microdata of the socioeconomic questionnaire, applied by UFRJ in the pre-enrollment of the selected students in the years 2013, 2014, 2015 and 2016 of mentioned courses. The variables selected for this research are: family income, student origin, mother's schooling, entrance modality and color/ race.

El Trabajo De Los Académicos En Tiempos De Globalización: La Situación En América Latina Con Foco En El Mercosur / Academic Workers in Globalization Times: Situation in Latin America Focusing Mercosur

La globalización ha traído una enorme cantidad de cambios en diferentes ámbitos y, como también se ha señalado, en la educación superior y en lo que habitualmente se denomina "mundo académico".

Suele hablarse de "internacionalización de la educación superior" para referirse a un proceso que siempre está vinculado a los efectos de la globalización en el mundo universitario. En otros trabajos, hemos señalado las consecuencias sobre este sector, pero aquí debemos detenernos en lo que esto implica para el trabajo en el mundo académico.

Esto implica comenzar por aceptar la naturaleza de "trabajadores" no solo de los docentes universitarios, sino también de los investigadores y becarios de diversos tipos que coexisten en el mundo de la educación superior, la ciencia y la tecnología. Si bien es obvio que se trata de trabajo remunerado y que, por lo tanto, quienes lo perciben deben ser considerados trabajadores, muchos estudios sobre la temática niegan explícita o implícitamente tal condición cuando sólo se centra el análisis en otros aspectos. No se pretende descalificar la importancia de los mismos (financiamiento, selección de temas, posibilidades comparadas, entre otros), pero sin señalar la importancia hora de analizar que condiciones particulares produce para los trabajadores del mundo académico, la globalización e internacionalización de la educación superior.

El presente trabajo se produce en el marco de la línea de investigación apoyada por el financiamiento de la Universidad de Buenos Aires con los proyectos UBACyT que viene dirigiendo el Profesor Hermo.

Confidentiality and Persuasive Messaging in Surveys of Businesses, Organizations, and Institutes

The production of official statistics about the economy relies on businesses' participation in sample surveys conducted by National Statistics Institutes (NSIs). While many of these surveys are mandatory, suggesting legal consequences for nonparticipation, NSIs prefer to persuade response rather than threaten prosecution. This requires effective communication with businesses and their community.

Research has shown that business survey respondents may be motivated by assurances that the confidentiality of their data is protected and by information about how their data is used. Pledges of confidentiality and security are often shrouded in legal phrasing, and survey data, which require application of technical statistical methodologies, are often used to make decisions that affect businesses indirectly. Neither of these are easily communicated by straightforward plain language.

In the United States, statistical agencies must meet the informed consent requirements of three laws associated with response burden, privacy, and cybersecurity. To facilitate compliance, the Department of Commerce suggested language to incorporate into survey 'Authority and Confidentiality' statements. However, cognitive research has identified issues with respondents' understanding and interpretation of various words and phrases that may be concerning and counter-productive to survey response goals. Considering concerns with nonresponse, the U.S. Census Bureau has undertaken cognitive testing to identify effective and reassuring ways to communicate the legitimacy of this information to business respondents. We also investigated possible persuasive messaging with business respondents, particularly to improve their knowledge of beneficial uses of survey data.

In this paper, we will describe our use of card sorting activities, along with traditional cognitive interviewing, to stimulate expression of respondents' viewpoints.

We will present findings about confidentiality language preferred by business respondents, along with the more motivating persuasive messages. The results of this research will enable the Census Bureau to foster a greater sense of trust and motivation among our business respondents.

Rethinking Paternities in the Chilean Migratory Context

The reflections and results presented for this congress are part of my doctoral research about fatherhood in Chile. It may be said that the focus on transnational paternity is recent in the migratory studies scenario. In this sense Privitsky (2012) argues that these appeared approximately after the first investigations on transnational maternity driven by the sociologists Hondagneu-Sotelo and Ávila (1997) and the consequent consolidation of this subspecialty within the migration studies with the contributions of Ávila 2008; Dreby 2006; Gamburd, 2000; Hondagneu-Sotelo 2001; Parreñas 2001, 2005; Schmalzbauer, 2004; among others. Why is it relevant to study transnational paternities in Chile? First, there has been little exploration of paternities in the migratory context, considering that migration to Chile has increased since the 1990s (Martínez, 2003; Schiappacasse, 2008), and especially since 1995 (Godoy, 2007; Santander, 2006; Stefoni, 2005). Latin American migration to Chile has quadrupled in absolute numbers since the end of the civil-military dictatorship until today (INE, 2015) (OBIMID, 2016) and a certain parity is visualized in the statistical figures of entry of migrant men and women to this country. In this context, it is then relevant to be able to investigate whether the migration context generates tensions in the traditional gender role of men, resulting in transitions to other models of paternity. In this sense, it can be said that the study stands as a contribution to the understanding of transnational migrations and the family and that all the components of a network are relieved where different actors interact in different ways, distinguish tensions, contradictions that make to rethink models of paternity in the Chilean contemporary migration context.

RC51-847.3

HERNANDEZ CASAS, DAVID* (*UNAM*)

Art Process As a Non-Trivial Machine. Looking at Art Practice As a Second Order System

Art practice as the process(es) in which an artist elaborates her artistic endeavors is seen for some scholars (Niedder, C., y Roworth-Strokes, S., 2005; Hannula, Surorante y Vadén, 2005; Graeme, S., 2010; Borgdorf, 2012; Leavy, P., 2015) as pre-reflexive, preconceptual activity and, almost solely, visually constructed (Arheim).

These scholars and their writings consider the artist and her thinking like a "naked eye" (O'Doherty), it is to say, a walking bodyless cartesian eye, through which "reality" enters directly the human system. Such thinking is unidimensional, leaving aside great part of other human domains, ignoring the artist's capabilities to model her practice through what Piaget calls "functional continuity", where biological, affective and logical domains are intertwined and interdefined.

This paper approaches art practice from the point of view of constructivism and its allies, sociocybernetics, genetic epistemology (Piaget), and the cognitive field (Amozurrutia); in order to propose a second order art practice. It is to say, to consider art practice and the artist thinking as a complex system whose aim is to construct sensual, symbolic, reflective and conceptual meaning, built through out empirical, affective and logical relationships.

In order to achieve this goal, I will quickly review current ideas around the subject and contrast these against the constructivist point of view. Then, I explain the selfreflective epistemological analysis I have elaborated of my own art- practice, following Piaget's genetique theory on knowledge, Amozurrutia's cognitive field and the heuristic methodology that constructivism offers to researching. The results are a series of diagrams and algorithms that describe epistemological routes within the practice. The main objective of this analysis is to show to the audience how an artistic practice is be informed no just through visual impulse, non-conceptual and pre-reflective thinking.

Citizen Strategies to Confront Mistreat and Negligence in Mexican Public Institutions of Health and Justice

At this time, Mexican public institutions of health and justice are more closely monitored than before by civil society, Human Rights associations and international organizations. However, cases of abuse, negligence and omission continue to be frequent among patients and victims when approaching public institutions to obtain medical care or to report a crime that affected them. Therefore, the purpose of this paper is to expose the different strategies of citizens when they try to respond to institutional mistreat. First, we will argue that abuses, negligence and omissions of public institutions constitute a particular kind of

violence that mixes complex bureaucratic processes, inadequate infrastructure, and insufficient and not well-trained staff. This kind of violence could often hide or diminish the responsibility of institutions, making people believe that health or justice are being denied because of a human error or because it is usual to wait a lot of time to obtain it. When people notice that it is not normal and if they do not fear of reprisals (which happens very often, unfortunately), they could deploy a repertoire of strategies (some of them very aggressive and some others very clever) to defy these institutional obstacles to obtain health and justice rights.

From Individual Indignation to Collective Action: Reopening the Question for Current Analysis of Social Movements

Even though questions about what allows or dissuades an individual to get into the streets and join a collective action have already been assessed by authors like Olson, Gramsci and others, in this paper we discuss what mobilizes an individual in our time. Since parameters of class, age, gender and other sociodemographic characteristics are no longer the unique features that define an individual's life, as Touraine or Martuccelli argue, and since Rational Choice theories have been strongly questioned by diverse approaches, we propose that is necessary a revision of what could current sociological theory say about individual motivations and practical capabilities that influence participation in collective action. We argue that sociology of social movements could be enriched if we look closer to the individual motivations and obstacles, and to the individual comprehension of what is fair and unfair, what kind of grievance makes people to feel outraged, and what are the possible actions to do after having been mistreated, according to him or her. The principal aim of this paper is to discuss what is in the middle of an individual indignation and the conformation of a collective action, emphasizing the fact that one thing does not drive automatically to the other one. We will explore some classic sociological responses that have tried to fill this gap and some more recent theories that could help us to refresh our approaches, considering that current social movements analysis may need to reconcile classic and recent theories, micro and macro sociological perspectives, and utilitarian and non-utilitarian visions of people's motivations.

The Political Economy of Securitization of Migration in Canada: A Critical Historical Account

Making use of political economy, securitization studies, and critical race theory under a transnational perspective, I analyze a number of historical immigration episodes in Canada—as case studies—to identify and explain how varied migration security formations pre-date the current theoretical emphasis on securitization, particularly after 9/11. These cases range from the constitution of the first Immigration Act in 1869 that identified 'undesirable' immigrants, such as poor or disabled people, to the establishment of a broader set of strategies to deter the immigration of Black people, seen as "unsuitable to the climate and requirements of Canada" and a threat to its eastern economy, to the double standard in Canada's immigration policy from the 1960s onward, when protecting asylum seekers escaping from communist regimes, but not those escaping from fascist, right-wing regimes due to their alleged threat of (left-wing) politicization. Thus, using a long-durée analytical perspective, I deploy and discuss the notions of social security and homeland security as part of Canada's historical securitization processes. In doing so, I also show how Canada's migration security formations have been constitutive elements in its nation-building process as an imagined white, dual settler/colony. These varied security formations have been produced by evolving politico-economic processes, the creation, implementation, and constant revision of legal regimes, and the Othering, racialization, and minoritization of non-white subjects. Thus, the resultant Other (vis-à-vis the Self or white, Anglo/French individual with Christian roots) is differentially constructed by the intersection of gender, ethnicity/race, class, ideology, sexuality, ability, and religion, and posited as a threat to Canada's (white) nation formation. Overall, a more comprehensive analysis of diverse security formations reveals that migration has been regulated and securitized along various scales, fields, and temporalities in Canada, even if using a language different than that of securitization/risk.

Penitentiary Treatment in Mexico: A Comparison between Men's and Women's Situation

Some researchers on human behavior declare that men and women have similar behavioral options, as they are living organisms which respond to the

stimuli in their environment and they have language as a conventional medium of contact (Ribes *et al.*, 2008). This work presents the results of a comparative study between penitentiary treatment for men and women in Mexico. On the one hand, a review of documents was made to estimate the differences in operation between men's and women's penitentiaries in Mexico; on the other hand, we expose the reactions of a focus group integrated by penitentiary personnel working in a women's correctional center. It was found that there exists a differentiated treatment between men and women in prison that does not seem naturally justified, nor juridically pertinent. Starting from the penitentiary administration, a distinct treatment was observed between male and female inmates. Even if men correctional facilities have been improving in last years, omissions, anti-constitutional practices and misstatements are still often seen in women correctional centers. Besides this, a comparative discourse is maintained among correctional officers, being more negative for those who work in women's penitentiaries, and transmitting a generalized feeling of abandon due to the lack of government support.

¿Resiliencia o Resignación?: La Tragedia Del Hogar Seguro "Virgen De La Asunción"

Hablar del conflicto social implica poner en juego los elementos que lo integran y le dan sentido a la acción colectiva. De esta manera, se busca ampliar la mirada sobre las diferentes estrategias que involucran la participación de los actores, sus posturas y los desencadenantes sociales que dan cabida a la indignación y participación ciudadana. Además, la resiliencia mide la capacidad de superar experiencias adversas y fortalecerse a partir de las mismas. Su desarrollo conceptual ha sido permeado por una serie de enfoques y teorías que la analizan desde cuatro ámbitos distintos: personal, familiar, comunitario y Estatal.

El 8 de marzo de 2017 se registró un incendio en el Hogar Seguro "Virgen de la Asunción", espacio de protección y abrigo, a cargo de la Secretaría de Bienestar Social de la Presidencia de la República de Guatemala. En el siniestro fallecieron 19 niñas por intoxicación y quemaduras. Otras 37 niñas fueron ingresadas a hospitales nacionales con heridas de gran magnitud, de las cuales fallecieron posteriormente 22 niñas, sumando 41 muertes. A partir de la tragedia, se registraron acciones, expresiones y demandas colectivas demandando justicia ante lo ocurrido, especialmente ante la sospecha ciudadana de un acto premeditado por parte de las instituciones encargadas de velar por la seguridad y el resguardo de la niñez, catalogándolo Estado feminicida.

Se presenta un análisis que permite articular los diversos ámbitos de la resiliencia comunitaria, identificar las bases del conflicto que alimentan el sentido de la acción colectiva, así como identificar las distintas expresiones y manifestaciones que surgen en el primer mes posterior al incendio. Se analiza un enfoque que intenta apropiarse el concepto de resiliencia comunitaria y acción colectiva desde la teoría de los cuerpos/emociones y aplicarlo al estudio de caso vinculado a la tragedia del Hogar Seguro "Virgen de la Asunción".

Identification with the Radical Right in Times of Increasing Social Inequality - Evidence from Germany

In September 2017, the radical right AfD (Alternative for Germany) party scored 12.6 percent of votes in the federal election entering for the first time Germany's parliament. Germany is only the latest country to experience the political resurgence of radical right movements. Their electoral success depends to some extent on the mobilization of the working classes. Past research suggests three competing explanations for the radical right's success among the working classes according to which the latter vote is the result of rising inequality (the modernization losers), heightened feelings of insecurity (the alienated) and growing labor market competition due to immigration (the protectionist). Most empirical inquiries, however, consider only one of the hypotheses and rarely employ dynamic designs that truly account the role of change in the explaining phenomena. Hence, we simultaneously model all three explanations to evaluate their relative importance and use an empirical design that allows us to identify effects of changing subjective and objective inequality. Employing longitudinal data from the SOEP (2000-2016), a large representative household panel study in Germany, we study respondents' party identification accounting for objective position, subjective worries and local labor market conditions. In the first step, we aim at describing the importance of different characteristics arguably related to right party identification. In multivariate models, we study four different sets of attributes: socio-demographic conditions; their subjective evaluations (e.g., satisfaction, sorrows); their personality as well as local opportunity structure and demographic composition (e.g., unemployment rate, migration rate). In the second step, we investigate to what extent social mobility, changing satisfaction and worries as well as changes in the local conditions motivate identification with extreme right parties. Our results indicate that the three alternative explanations

contribute to radical right party identification in Germany but differ to the extent to which they are related to changing identification.

Squeezing the Data? the Effect of Data Handling Practices in Stratification Research

Before being presented in a research paper or on a conference, data undergo a tedious generative process handling missing information. Secondary quantitative analyses are commonly based on a sub-sample of available observations. It is well-known that missing data points either due to item non-response (INR) or unit non-response (UNR) can bias inadvertently the outcome of empirical inquiry. We study the extent of such error induced for different outcomes with regard to a focal variable in stratification research: Social origins.

In case of longitudinal household panel data, the problem of missing data becomes even more complex. Longitudinal household data offers more information to address the problems accompanying INR and UNR because earlier data points can be used to extrapolate missing items and other household members' data can serve as proxy in case of UNR. This advantage, however, could easily become a pitfall if assumptions about the underlying process that generated the missing data are not only wrong but also bias estimators. The opposite strategy of simply ignoring partial observations (i.e. list-wise deletion) might also bias results by curbing the representativity of the results.

Based on the large body of literature on imputation techniques, we study the effect of various strategies of handling missing information in panel data. We compare results of stratification analyses using social origin as a predictor variable across several specifications obtained by applying the "persistence" approach (i.e. carrying forward or backward older information), the chained-regression imputation approach based on the same time point and, additionally, on prior information, using proxy information from other household members, and employing retrospective versus prospective information. Results are compared to those obtained by restricting the analysis sample to observed values. As litmus test for the effect of data handling practices, we employ three different applications from educational, social mobility and labor market research.

HERTZ, ROSANNA* (*Wellesley*)

Donor-Linked Families and a New Parenthood Practice: Intimate Surveillance

Donor anonymity has become a worldwide issue. In some countries the concept of donor anonymity has become obsolete due to mandates requiring children to have access to donor information at age 18 (such as in Sweden, Australia, The Australian state of Victoria, Switzerland, the Netherlands, Norway, the United Kingdom, New Zealand), and because of readily available genetic testing. Yet, most prominently in the United States, the issue of donor anonymity remains incredibly relevant, as laws surrounding donor anonymity have not fully caught up with the medical and technological sleuthing available to parents who conceived children via the booming global fertility industry. The sociological impact of the technologies used to search out donors has not been fully examined. Findings from a large qualitative study of families (interviews with parents and their children) who conceived with the use of a commercial donor are useful to discussing how: (1) The purchase of online gametes from the fertility industry creates an environment that normalizes personal information-sharing and encourages surveillance work; (2) despite guarantees by commercial banks to enforce donor anonymity, parents can easily use "detective work" online to figure out the donor's identity; (3) as a result, donors are 'followed' on various social media platforms without their knowledge; (4) this surveillance is linked to motherhood beliefs about keeping track of the child's intimates. In effect, this detective work is a resource parents provide their donor-conceived children. Moreover, the practice raises a set of ethical issues about the boundaries parents say they draw around official contact which belongs to their child when they turn 18.

Double Impact or Double Bind. the Conceptions of Educational Work and Children's Well-Being of Early Childhood Professionals in France

Double Impact or Double Bind. The Conceptions of Educational Work and Children's Well-Being of Early Childhood Professionals in France

In the aftermath of the Second World War, and up until the 1970s in France, hiring "unskilled but affectionate" nannies, rather than "soulless technicians" was the prevailing expectation of parents turning to family child care programs. This model was progressively replaced by an education-centered approach to young children's care, and young children have become objects of specific pedagogic action. The diffusion of paradigms promoting construction of identity and intellectual stimulation from a young age contributed to childhood professionals and parents expanding their respective educational roles well before children reach preschool age.

Day care centers and family child care providers are the two major types of child care institutions in France. This paper relies on a collective research in Paris and Normandy combining semi-structured interviews and direct observation, with professionals in day care centers and at family child care providers' homes during their working time.

The paper analyzes how early childhood professionals define the educative aspect of their activity, and correlatively how defining and acting upon children's well-being are a major part of their work practices. We specifically question whether injunctions to more 'pedagogization' are always compatible with how professionals conceive and perceive children's well-being. This is especially relevant for analyzing moments when young children's free play is abandoned in favor of supervised activities, regarded as useless, or replaced by a quick succession of activities. In this perspective, we address how conceptions of well-being and education vary according to the professional career, gender and social background of child care professionals.

Visual Punctum – Pedagogical Punctum

This proposal is based upon a case study of a pedagogical-visual process, which developed in the course: **Visual Literacy: Foundations of Visual Education**. The question I posed to myself as a lecturer was: **How to create dialogic instruction based on a personal connection**.

Due to the fact that I was a lecture in front of 65 student, I decided that the assignments I will give and the management of time outside of class hours will serve as the basis for dialogic instruction and personal connection, using a digital platform and sharing tools. The assignments were based on using the terms and, moving from the personal into the social, politic and cultural experience.

In first assignment the students learned certain terms from Roland Barthes' theory, like Punctum, Studium, and the Structure of a Myth. They were asked to analyze a photograph out of their private "photo album" which had Punctum for them. Next, they were required to use the picture as a search image on Google Search Pictures. From the image page they received they had to analyze visual patterns, e.g. personal as opposed to generalized, schematic, as opposed to unitary. In the third stage, they were required to associate the photograph with a visual myth. The students uploaded their assignments to a shared blog.

I term this process "Pedagogical Punctum" – a kind of initiation that stabs, that is relevant to the learner. Dialogic learning was established between us in which knowledge is built together, through sharing and with the utmost relevance, as suggested by Critical Pedagogy. Students were satisfied from the process which allowed them to return to their private photograph, encounter the "Visual Punctum", analyze it in a reflective manner: – from a personal experience to a generalized experience and knowledge – to form a "Pedagogical Punctum".

HERWIG, ANDREAS* (*Technische Universität Braunschweig*)

Immigrants' Socio-Economic Status in Europe and the Effect of the Education Systems

Immigrants' lower labor market chances vary considerably between European societies. It can be argued that these country-specific inequalities are linked to institutional characteristics of education systems. Due to the different extent of stratification and vocational specificity of national education systems, varying school-to-work linkages exist, having specific consequences for immigrants. Hence, as the main research question I ask in how far the labor market returns to education of different migration statuses – referring to the chances of entering skilled occupations – are shaped by the institutional arrangement of education systems.

I differentiate between natives, immigrants with host-country educational certificates and immigrants with (only) foreign certificates, assuming that natives have on average the highest returns – due to the larger extent of available host-country specific resources – whereas immigrants lacking host-country certificates have the lowest socio-economic status.

Regarding country-differences in the extent of such inequalities it can be expected that immigrants with host-country educational certificates enter skilled occupations more often the closer the relation between education and employment systems, that is the more stratified and / or vocationally specific the institutional setting. In contrast, immigrants lacking host-country certificates presumably have

difficulties in such contexts because of the highly regulated transition from school to work, resulting in the relevance of domestic educational certificates.

Multilevel analyses based on the European Union Labor Force Survey lead to two insights. First, the education's origin is more important than the person's origin. Second, as expected, the extent of penalties of immigrants with only foreign educational certificates is larger in countries with a high grade of stratification. Contrary to my hypothesis, vocational specific settings are not additionally detrimental to this group of immigrants. This could result from a generally beneficial labor market situation, rather flexible labor markets and favorable integration policies in these contexts.

Feminist Knowledge and the Politics of Numbers: Gender Indices As a Tool for Social Change

Foucault's concept of "Power/Knowledge" gave rise to many studies that revealed the power of statistics and the power of knowledge as tools in the hands of dominant groups.. This paper claims that the problem does not lie in the statistical science itself but in the sources of knowledge that constitute the science. The question that should be put on the agenda is not whether statistical data is needed but who defines what data is collected, for what purposes, and for whom.

Based on The Israeli Gender Inequality Index developed by WIPS, I would like to highlight the ways the index is part of women's collective effort to be partners in manufacturing alternative knowledge and social change.

The index is based on the calculation of gender inequality in various domains from 2004. Unlike most of the indices this Index is based on continuous expansion of the domains and the indicators that comprise them. This expansion is based upon knowledge that is developed from the bottom-up life experience of women. This knowledge grows out of a dialogue with women's organizations, research groups whose main focus is on qualitative research which strives to hear the voices and the needs of women. Inequality is measured not only based on a binary distinction between men and women but on intersectionality between gender and the various social locations like the periphery and Arab society in Israel. Workshops and meetings are conducted with government research departments and other data-generating bodies. The goal is to direct them to collect data that is gender sensitive and to mainstream gendered thinking. The Index makes it possible to demarcate transparent spaces of gender inequality. It serves as a policy compass for decision makers, government agencies and public bodies, as well as a vital tool for civil society

Extreme Comparisons: From Democracy in American to the Colonization of Algeria

Discussing Tocqueville's work and his lasting contributions, particularly in relation to comparisons, is impossible without some qualifications:

(1) It is necessary to widen the horizon and that means first and foremost not to see Tocqueville in total isolation and as a solitary figure. Due attention and respect needs to be paid to the work of Tocqueville's friend, travel companion and co-writer Gustave de Beaumont, particularly his analysis of Ireland;

(2) It is equally important to give credit to Francois Furet's remark that Tocqueville's thought (and by implication Beaumont's) had an existential dimension: how to maintain liberty in the light of new, and tententially universal, democratic and egalitarian aspirations and demands. This tension was the driving point in all their comparisons, including that between the US, France and Algeria and the UK and Ireland (and, to a lesser extent, Canada, Switzerland, Germany, the Caribbean and India).

(3) Finally, it is important to bear in mind what comparison could mean in terms of both hopes and realistic expectations and in relation to the spawning of democratic ideas and the birth pangs of modern democracy.

In my paper I will focus on one extreme comparison to illustrate my case - that between the US (and the hope it generated) and that of Algeria (including the initial hope and the disappointment which followed later). While the focus will clearly be on the US and Algeria I will also attempt to bring other dimensions to bear on Tocqueville and Beaumont's analysis (their abolitionism, their take on political economy, the social question, etc).

On Civil Disobedience: Judith N. Shklar on the Possibilities and Limitations of Dissent in Modern Democracies

For most of her life the Harvard political theorist Judith N. Shklar rejected being drawn into, or taking direct sides when it came to political debates. However, with her lectures on political obligation, which she gave just a few months before her death in the spring of 1992, a slightly different picture emerges. More specifically I will show how Shklar tackled the issue of obligation and its boundaries in the light of two American experiences: in the 19th slavery and the systematic exclusion of Black people (incl. the protest and radical abolitionist manifestations against it) and in the 20th century the Civil Rights movement and the war in Vietnam. In her lectures Shklar discussed various possible stands and different notions of 'voice', including some of its contradictions in the context of democratic aspirations, ranging from civil disobedience to advocating conscientious objection.

Visibility Cycles, (In)Visible Institutions and the Making of Scandals

The proposed contribution is concerned with phenomena of negative visibility, such as stigmatization, scandals, and public shaming. Looking not at the processes following and enhancing scandalization and shame penalties, but at the processes that precede it, we ask how this type of visibility relates to existing social or symbolic structures and the configurations of visibility they entail. Punishments and public notifications for scientific misconduct, which are highly symbolic in nature and rely almost exclusively on the negative effects of visibility to sanction scientists, shall serve as a case in point. By tracing the procedures and working conditions of the actors and institutions that form the (newly developing) system for social control in science, we aim to show how visibility features as a central concern and structuring element throughout this system. While these actors, e.g. offices of research integrity or ombudsman, struggle to make their work visible and transparent to the scientific community, they are threatened by a feedback loop of invisibility: By design, they solely rely on cases being reported to them and do not actively initiate investigations themselves; at the same time, cases are relatively rare and do not allow for continuous, day-to-day activities that could be made visible to an audience. The more the visibility of the institution subsides, the less cases will be reported, leading in turn to a further decrease of (potentially) visible activities. For such a system without stable representation or permanent visibility, convictions and the following upsurge of attention present the only way to gain visibility in the scientific community. Unable to produce visibility for themselves, these institutions feed off of the visibility of the scandals they incite. Visibility appears thus not as a situational feature, but as a complex cycle running through various situations, actors, and institutions.

Taxation Policy, Social Expenditure and Inequality – Global Trends and the Case of Sri Lanka

This paper uses the case of Sri Lanka to examine the inter-connections between taxation and social expenditure on one hand and patterns of social inequality on the other, based on secondary data derived from official sources. Persisting low direct taxes on personal and corporate incomes combined with an overwhelming reliance on indirect taxes continue to impact negatively on the life chances of low income groups and other vulnerable segments of society. On the other hand, continuing low social investments in such areas as health, education and public transport have lowered the quality of publicly funded services, compelling even low income groups to rely more and more on privately provided services. Poor social regulation of private services has resulted in higher charges levied by private providers, resulting in an increasing economic burden on low income groups. Meanwhile, more and more low income groups have tended to look for more lucrative employment outside the country as a way of coping with increasing cost of living. Exodus of labor in turn has led to wage escalation and labor shortages, making local production of industrial and agricultural goods less competitive in regional and global markets. Resulting stagnation of industrial and agricultural sectors has forced many workers to move into the informal sector, making their working and living conditions increasingly precarious. The emergent situation demands greater state regulation of income distribution, surplus extraction and private provision of social sector services and social sector investments.

After describing the case of Sri Lanka, the paper will discuss the findings in the context of the dominant global and regional market trends and policy environment that do not encourage greater and more proactive state interventions in the above regard.

Sociologising Maternity Care to Inform Workforce Capability Investment and Maximize Health Gains for Urban Indigenous Families

Clinical and cultural safety of health workforce is vital to accelerating health gains for Indigenous peoples. Maternal and infant health has been identified as a key area where preventative intervention can make lasting improvements to one's life trajectory. While there was some investment in Australia, there have been minimal gains in Indigenous maternal and infant health outcomes nationally. In Brisbane, Birthing in Our Community program was a local response to rising preterm birth rates for Indigenous babies was the partnering of a large tertiary based hospital with two local Indigenous community controlled health services to provide specialist wrap-around care for women having Indigenous babies and their families. Four years on this has proved a successful investment with families developing trusting relationships with their known midwife and Indigenous health worker, reducing preterm birth and increasing engagement with the broader health system. While 100% of women accessing the program felt their needs were met and they were understood and treated respectfully due to their cultural background, these same women reported feeling less cultural safe as they accessed mainstream maternal and infant health care within the hospital. This correlates with a lack of professional development opportunities for mainstream hospital staff to improve their cultural capabilities. Specialised services are important to having healthy and engaged Indigenous families but also requires cultural and clinical safety of mainstream tertiary services as clients navigate the broader health system. This involves reflection of the responsibilities of the health system, and its institutionalized power dynamics of professions, race, class, gender and intersectionality. This paper interrogates our responsibility as sociologists to understand ways of improving health systems within a social justice agenda, and explores our role in the newly emerging field of Indigenous midwifery research.

Institutional Logics and the Challenges of Assembling Agri-Food Technologies

In a recent article, Carolan (2017) calls for a re-shaping of the debate around how sociologists think and talk about agri-food based technologies. Specifically, Carolan argues that debate should shift from one in which technology is part of a pre-established pattern of structural change and power relations, to a more relational approach that looks at the effects particular socio-technical forms engender. We expand on this argument by suggesting that a relational approach to technology should also be attentive to the fragile and contingent ways in which socio-technical forms are assembled and held together. This issue has been given limited attention to date, and is one that we engage with in this paper through the application of an institutional logics framework. Institutional logics are the broad social and belief systems in which institutions operate that shape members' behaviours and cognitions. Central to the theory of institutional logics is the notion of the shared logic in which a common belief system guides and shapes the behaviour of all actors. Drawing upon qualitative data from a project focusing on the social factors influencing technology adoption in the Australian rice industry, we argue that efforts to implement new technology are complicated by tensions that arise within and across institutional logics that operate at different levels of policy practice. Specifically, we are interested in how different actors within the same industry interpret shared institutional logics and the ambiguities that arise in relation to the prioritising of different technologies and change initiatives. In doing so, we focus on three particular logics: a) the strategic-technical logic, which guide the overall strategy of the industry; b) the tactical-epistemic logic that guides the implementation of technology, and c) the operational-material logic, which guides the promotion of new technology at farm-level.

Rethinking Community Lives and Supports for the Persons with Mental Disorders Beyond the Difference in Social Positions: An Introduction of Practice of "Triologue" in France

Background: As deinstitutionalization has pervaded in most industrialized countries, persons with mental disorders have been greatly encouraged to live in the community. On the other hand, they still have difficulties, especially in choosing the mental health services or participating in social activities according to their will. These difficulties are often caused by a discrepancy between the

persons with the mental disorder, their families, and medical professionals in the attitudes toward "desirable" community lives and supports for these persons.

Aim: To resolve this discrepancy, this study introduces a new communicative activity, which is called "trialogue" in France. In this activity, the persons with the mental disorder, their family, and the medical professionals exchange their opinions about mental health services from their points of view to think better supports and lives. First, I introduce its outline. Second, I investigate how the gap between participants' attitudes toward desirable community lives and actual supports are filled (or not filled) through this program.

Methods: I conducted participant observations of triologue and semi-structured interviews with its organizer from 2016 to 2017 in urban areas in southern France. This field research is still ongoing and this study is an interim presentation. With these two kinds of qualitative data, I have analyzed the kinds of participant interactions that influence change in or maintenance of each participant's attitudes toward the theme they discussed about.

Results: In the process of triologue, diverse opinions were expressed and shared freely regardless of their differences in position. This atmosphere of triologue allowed the participants to examine their attitudes objectively, which sometimes enhanced their tolerance for different attitudes of other people.

Rethinking the Role of Religion in a Nordic Welfare State: Church Poverty Relief during the Time of Crisis in Finland

A key feature of the Nordic welfare states is their long history and tradition as Evangelic Lutheran state church countries, a fact which is very seldom recognized in the analysis of the development of the Nordic welfare state model. In the 1970s and 1980s the secularization theory was used to explain why churches in the protestant countries withdraw from providing welfare to make space for public actors, but with the rise of comparative welfare state research the role of religion was forgotten. For example, Esping-Andersen's (1990, 1999) regime theory suggests that the kind of traditional assistance the church lends to the poor would die out in the course of "socio-democratic" welfare state development, a statement analogous with the secularization hypothesis. With data on poverty relief in Finland this study aims to question this assumption.

In the early 1990s Finland was hit by a severe economic recession, which motivated the Evangelical Lutheran Church of Finland to combat poverty and social exclusion through new programs and initiatives. The global recession that started in 2008 gave new impetus. In the context of two recessions, this study provides a quantitative review of the volume and structure of Church poverty relief. The data on Church engagement in poverty relief is derived from annual Church statistics. The trends on Church poverty relief are contrasted with aggregate data on municipal social assistance, a source of statutory last resort financial aid.

The results show that the scope and volume of the Church's poverty relief programs during economic downturns gives reason to challenge the conventional clear cut conception of the universal Nordic welfare state model based solely on poverty relief. The Finnish case does not confirm the welfare state regime secularization theory. Instead it shows that churches can still be active agents in shaping welfare states.

Embodied Citizenship: Afghan Refugees' Sense of Belonging and Finnish Integration Policy

This paper explores how resistance and belonging are embodied by Afghan refugees in Finland. To analyse refugees' sense of belonging and agency, this research utilizes citizenship studies' notion of 'enacting citizenship'. However, this study not only concentrates on the often-analysed political activism or agency of people who already hold a certain level of rights, such as legal residency. The scope of this study also analyses struggles over gaining residency or asylum. In fact, these struggles reveal more about the boundaries of citizenship than other research material would. The paper revitalises discussions on how neoliberal citizenship produces a 'flow of categories' of destitute people who are excluded or disqualified from citizenship. It draws from scholarship on social class and classifications, feminist theories on intersectionality, and citizenship studies. Multi-sited ethnography is used to examine these questions. There are several factors that affect possibilities for embodied citizenship. These involve both refugees' and forced migrants' social positions and life experiences before fleeing, and their experiences of travel and waiting for residence permits. A further factor is locality – that is, the community in the final place of residence, and especially the ways in which 'integration work' is arranged in that area. All of these positions and experiences are intersectionally inscribed into the body as gendered, racialised, classed, and aged, etc. However, official integration policy does not fully recognize the issues which are essential for migrants' embodied citizenship. This paper suggests that the whole system of 'integration' is destined to fail if the mobile and vulnerable situations of people are overlooked.

Neoliberal Governmentality and Township Tourism in South Africa

South Africa's 1994 democratic transition and the global iconicity of Nelson Mandela inspired droves of international tourists to visit the now so-called "Rainbow Nation". Since then, the South African tourism industry has expanded rapidly. Luxury districts have burgeoned in emergent global cities, reflecting the country's rise as a leisure destination and economic epicenter. The growth of urban cores occurs alongside the growth of the peri-urban townships, attesting to the geographical entrenchment of the apartheid regime and the continuity of austere conditions for black South Africans. The state then promoted tourism as a vehicle for alleviating unemployment and poverty, particularly through the 1998 Growth, Employment, and Redistribution (GEAR) program's market-driven agenda. Township tourism has especially sparked the state's expectation that black entrepreneurs will drive township development by attaining foreign capital from overseas visitors. This illustrates Nikolas Rose's discussion of contemporary neoliberalism (1999), under which ideal citizens become "responsibilized and entrepreneurialized," absolving the state from more directly addressing the social ills that plague these disadvantaged communities.

This paper investigates this mode of "governmentality" through the daily lives of entrepreneurial black women who have established township guesthouses. Drawing from eleven months of ethnographic fieldwork in three townships outside of Cape Town, the nation's most popular tourist destination, I show how these women become entrepreneurial subjects who both comply with and resist neoliberal governance. On one hand, they utilize racialized, gendered, and classed strategies for targeting a white Western clientele in order to siphon global capital to their township communities. On the other, they avoid pure individualistic competition, choosing instead to work cooperatively as business owners to optimize communal resource distribution. In doing so, they not only refuse the neoliberal prescription of intraracial conflict (Spence 2013), but also use tourism as a mouthpiece to implicitly critique the state for neglecting poor black communities.

HILL, NICOLE* (*University of Alberta*)

Learning and Living Reproduction: Hollywood Representations of Pregnancy and Birth As Potential Learning Material for Real-Life Experience.

The representation of pregnancy and childbirth in Hollywood films is increasingly common as North American society gradually becomes more comfortable with (at least some of) the realities involved in producing new people. At the same time, practices in the care of pregnant and birthing individuals have themselves changed with shifts in medical, cultural, and social understandings of these processes. Research indicates that women may to some degree base their understandings of pregnancy and birth in their own lives on representations of these events in popular media. This presentation describes a qualitative analysis of Hollywood films released within the last two decades that depict a range of 'normal' experiences of pregnancy and birth to understand how these events are being depicted, including how individuals experiencing them are depicted, their behavior, and also that of their care providers. Results demonstrate the complex ways that popular film 'teaches' individuals about pregnancy and birth and maternity care, providing visual representations of what to expect (when you're expecting). These representations are laid against results from the nationwide *Listening to Mothers* and *What Mothers Say* surveys based in the United States and Canada (respectively) which elucidate the experiences of women in maternity care. In utilizing both film representations and large-scale survey results it is possible to discuss how the social knowledge viewers acquire when engaging with these films (il-)prepares them for actual experiences with maternity care and may maintain hegemonic ideologies and practices relating to pregnancy and birth.

HILL, NICOLE* (*University of Alberta*)

The Newsmedia, Emergent Frames Representing a 'new' Violence, and Audience Reactions: The Canadian Broadcasting Corporation Presents Obstetric Violence.

Obstetric violence, a 'new' form of gender violence which is enacted on birthing bodies through health care workers and systems, has been problematized globally in recent years through the inclusion of the term in bodies of law in several nations, as well as statements from groups including the World Health Organization, which identifies disrespect and abuse in facility-based childbirth as an issue of public health and human rights occurring around the globe. In Canada there has been little attention paid to obstetric violence until recently when the national public broadcaster, the Canadian Broadcasting Corporation (CBC), published a series of reports on the topic describing individuals' personal accounts of being subjected to violence, as well as comments and a prepared

statement from the Society of Obstetricians and Gynecologists of Canada which suggest that the issue "has not come up" and that it is a concern in places where women are "devalued."

This presentation uses multiple data sources including the series of CBC publications on obstetric violence, related social media posts, and online reader commentary to those posts in order to analyze the emergent representation of the issue of obstetric violence by the newsmedia, as well as reactions to this representation. Cultural studies has demonstrated that representations matter. Through qualitative analysis, this presentation discusses how obstetric violence is being represented and how these representations are being received, including the representation of victims and perpetrators, as well as the contexts in which it occurs. By also examining audience reactions, this presentation can reflect on the relationship between media representations and audience decoding of representations presented by media. Preliminary analysis reveals that though the publications problematize obstetric violence, the representations individualize events, which may render the challenge toothless in terms of critical analysis situated in an understanding of institutionalized systemic gender violence.

Using Creative Action Research to Investigate How Youth Understand and Build Community Resilience in Post-Flood Southern Alberta

Creative Action Research: Youth Building Resilient Communities

As the impacts of disasters and climate change intensify, the need to act collectively becomes more urgent. Grassroots leaders with flexible perspectives, creative approaches, and innovative and collaborative mindsets are needed to shift the status quo and re-imagine solutions to complex problems. Youth are a largely untapped resource and have immense leadership potential to address these global challenges. Although historically overlooked and perceived as vulnerable in the face of disasters and climate change, youth are both willing and able to contribute to establishing more resilient communities. Youth are also less habitual problem-solvers, more willing to take risks, early adopters of technology and innovation, and have a creative, vibrant energy that can be harnessed for social change. Building on the creative capacity, innovation, and agency of youth, the RbD Lab has developed a social innovation lab (SIL) process that offers young people tangible research skills and capacity-building opportunities while also engaging them as agents of change and innovation. The presenter will provide an overview of the social innovation process model, explain how it was developed and applied with youth in Southern Alberta, Canada, to generate community-relevant solutions related to climate change, disaster risk reduction, and resilience.

"I Mostly Took Pictures of Things That Were Special to Me": A Photo-Voice Project on Children's Home Reading Practices

As a part of a mixed methods project examining family engagement and literacy achievement in Ontario public schools, we conducted photo-interviews with 35 children (ages 5-8) in two schools located in socio-economically disadvantaged neighborhoods to find out more about their home-based literacy practices. Children were provided with a disposable camera to take home and respond to ten photo-prompts that related to their home literacy lives (e.g., take a picture of your favorite place to read). The photos were then used in face-to-face interviews with children as a catalyst for conversation. Thus far, analysis has primarily focused on the interviews with the children and what they had to tell us about reading at home. The purpose of the present study is to turn the analytical gaze on the photos themselves and ask: What can children show us about their home reading practices? Using economic, cultural, and social capital theories (Bourdieu, 1998), children's photos are analyzed for the tangible resources (e.g., books) and intangible resources (e.g., parents' helping their child with reading difficulties) that are provided in the home. Consideration of children's own agency – also referred to as 'child capital' (Chin and Phillips, 2004) – in home reading is also included in analysis. The children's photos gave us a window into their home literacy, the types of material resources available to children, and the people in their lives they can go to for help. Also, the photos reveal aspects of children's agency in the learning opportunities that they sometimes create for themselves and their choices in the pictures they choose to take. To strengthen home-school literacy connections, we conclude with recommendations to school policy and literacy programming to build on the capital that children have at their disposal.

HILLIER, CATHLENE* (*University of Waterloo*)

"They'Re My Investment": Lower-Class Parents' and Children's Aspirations and Home Learning Environments

Drawing on a photo-interview study of home reading practices with 27 children (ages 5-8) and interviews with 25 parents in Southwestern Ontario, this paper focuses on the perceptions that parents and children have about future education and how these understandings are translated into actions within the home learning environment. In particular, I examine the differences between lower-class parents with hopes that their child will graduate high school in contrast to those who encourage post-secondary education (PSE). Not surprisingly, interviews with children reveal that they are mostly unaware of future education or training requirements for the type of career they choose. However, child interviews, along with parents' interviews, uncover the types of conversations about future education that do (or do not) occur at home. Children whose parents have high school graduation aspirations for them talk less about future education than children whose parents have PSE aspirations. If parents have PSE goals for their children, they feel that PSE is a way for their children to experience social mobility, job security and satisfaction with their career and lives. Also, they are more likely to have conversations about future education with their children and these parents display a more interconnected approach with their child's education at school and at home. However, while more proactive, these families are heavily reliant on resources, information, and social connections provided by schools and the community. I conclude with policy recommendations on reaching students and parents earlier with career and post-secondary education experiences and information.

HILMAR, TILL* (*Yale University*)

Notions of Deservingness Among the Emerging Middle-Class in East Germany and the Czech Republic.

This paper approaches notions of moral-economic "deservingness" in two cases of emerging middle classes: East Germany and the Czech Republic after 1989. The concept of deservingness has been narrowly applied to the study of poverty, when instead, it should be regarded as a widespread, everyday articulation of issues of economic justice and economic dignity (Leslie McCall, Michele Lamont). Studying emerging post-socialist middle classes allows capturing the temporal grammars of legitimizing wealth, especially so in reference to the relational and moral distance to unemployment and the dangers of "falling from grace" (Katherine Newman) during the turbulent years of the post-socialist transformation. Individuals generate notions of deservingness from their own economic experiences, but also from comparisons with others (W.G. Runciman). This allows to study the specific moral-economic anchoring of strategies of coping with economic challenges, as well as with the fact that those close to oneself might fare better or worse. Beyond Bourdieusian "reproduction", perspectives of critical realism (Andrew Sayer) and cultural sociology allow to understand instances of "foundation" of notions of deservingness and economic self-worth in relation to others. This perspective also highlights the significance of concrete strong, trusted friendship ties (functioning as moral niches) for middle-class self-conceptions. The project is based on 67 interviews with respondents from two groups with varying likelihoods of status outcomes after 1989. The first group are engineers, with a high chance of social mobility, the second group are care workers (nursing and elderly care), with comparatively low levels of social mobility. The comparison of two national cases allows to consider the impact of different levels of exposure to unemployment on these groups during the 1990s.

RC09-182.4

HILMAR, TILL* (*Yale University*)

This Is Not Nostalgia: Economic Memory in Post-1989 East Germany and the Czech Republic.

How do varying economic trajectories shape individual and group memories of the past? This paper develops a theoretical notion of "economic memory" out of two cases of transforming societies after 1989: East Germany and the Czech Republic. Economic memory is concerned with the value of skills in transforming labor markets as well as with the evaluation of change in interpersonal relations and strong ties. Because economic memory is born out of a transformation context, it offers a crucial theoretical alternative to the image of "nostalgia". The paper brings scholarship on social memory (Jeffrey Alexander, Maurice Halbwachs, Avishai Margalit) together with economic sociology (E.P. Thompson, Viviana Zelizer) and the sociology of valuation and cultural inequality (Michele Lamont). It engages the comparison of two groups with a different likelihood of social mobility after 1989 (engineers and care-workers), embedded in the analysis in the historical comparison of social mobility trajectories post-1989 as well as in the specific cultural and temporal-economic dimensions of East-Central European varieties of capitalism. It seeks to go beyond a mere structural

comparison of economic processes, instead asking what we can learn from these rapid transformations about economic perceptions of inequality and notions of deservingness (McCall 2013). Such an approach conceptualizes the post-socialist space as a site to think about temporalities of the economic and to engage in cultural sociological theory-building.

HIMANEN, MARKUS* (*University of Helsinki*)

Criminalization of Immigration: Rationalizing Police Stops between Non-Discrimination Norms and Immigration Panic

The control oriented reaction to the rise of the number of people seeking asylum in European Union in 2015 and the rise of populist anti-immigration sentiment in Europe and USA has led to both increase in internal immigration controls and to an intensification of public discourse that conflates asylum policy, irregular migration, criminality and terrorism. These developments give rise to a concern that surveillance practices of police forces will increase ethnic profiling and that the principles of non-discrimination and ethnic equity are threatened.

The paper analyses the rationalizations that the Finnish police force uses in legitimizing the practices of internal immigration controls, and in selecting the persons that are targeted in the immigration checks. The research is made as a part of the three-year research project "Stopped – Spaces, Meanings and Practices of Ethnic Profiling" that examines the prevalence, the forms and practices of ethnic profiling by the police in Finland. The data used in this paper consists of semi-structured interviews (N=31) with the representatives of the police and other security authorities.

On the one hand, Finland and other European countries conceive immigration policing as a central means in solving perceived "migration crisis"; on the other hand, legal non-discrimination norms are seen as a guarantee that policing is conducted in an unbiased way. However, the paper argues that one crucial question concerning limiting and controlling police discretion in the context of immigration policing is the way the police as an institution, and the policemen as professionals, react to different moral, juridical and political pressures concerning discrimination and immigration policy goals set by the government.

HIMANEN, MARKUS* (*University of Helsinki*)

Securitizing Poverty in Urban Space: Bulgarian and Romanian Street Workers' Experiences of Intensive Urban Public and Private Policing in Helsinki

Many economically disadvantaged migrants from Romania and Bulgaria, of whom many belong to the Roma minority, work in the streets of European cities. The main reason for this form of migration is racial discrimination in the labour market and restricted access to basic services in South-East Europe. Instead of rights-based solutions, EU countries have reacted to these migrations with securitized policies that have resulted in intensive policing practices, recurrent police stops and searches, and forced evictions.

The presentation is based on an analysis of semi-structured group interviews with precarious street workers from Romania and Bulgaria living rough in Helsinki (N=25), interviews with NGO employees (N=8), and public authorities and private security actors (N=4). The research is made as a part of the project "Stopped – Spaces, Meanings and Practices of Ethnic Profiling" (2015–2018) that examines the prevalence, the forms and practices of ethnic profiling by the police in Finland.

The paper discusses the experiences of the street workers: frequent police stops and apprehensions, evictions from makeshift sleeping places, and harassment by the security guards in the train stations and shopping centres. The central questions are on the one hand, how the control of urban space by public authorities, private security and other commercial actors creates racialized and stratified impacts; and on the other hand, how visible, precarious forms of existence are increasingly perceived as problems for public safety in wealthy European cities. The paper argues that the intersection of street workers' precarious legal status, class position and ethnicity makes the targeting by the police and security guards possible.

Toward Developing an Integration Model for Migrant and Refugee Women in Athens

Toward Developing an Integration Model for Migrant and Refugee Women in Athens

This paper focuses on the resettlement needs and empowerment initiatives of migrant and refugee women. Through feminist action research at a migrant and refugee women's grassroots organization in Athens, Greece, I analyze the women's own understanding of their settlement and integration needs, and explore

their journeys to accessing better services for resettlement assistance, skill and confidence building, and cultural celebration.

The data for this work is collected through the use of qualitative research methods, such as participatory research, focus groups, and individual semi-structured interviews. Part of the methodological design for the action research includes participatory workshops in which the group of migrant and refugee women at the grassroots organization in Athens react to, and engage with a presentation of ongoing services and programs for migrant and refugee women's settlement and integration as they exist in 2017, in Halifax, Nova Scotia, Canada. This engagement consists in critically discussing the programs and services that are available in Halifax, and in selectively and creatively adapting them to their own circumstances in Athens.

Analysis of this data illustrates the powerful agency of women who manage to survive and thrive in the midst of precarious circumstances with minimal support, as well as the potential of action research for women's empowerment.

Pregnant Men and the (trans)Formation of Parenting Cultures

Changing social and cultural attitudes about gender and sexual diversity, and legal advances around sexuality and parenting, have enabled the recognition of same-sex and gender diverse partnerships, and allowed more equal access to fostering, adoption and assisted reproductive technology in many countries in the West. Moreover, over the last decade, same-sex parenting practices have received increasing social and cultural visibility, and lesbian and gay parenting has emerged as a central site of enquiry within sociological studies of gender, sexuality, intimacy, kinship and personal life. Transgender practices of parenting, however, have received much less attention. Trans male pregnancy shows how shifts in gendered and intimate practices occur within changing social institutions and cultural understandings. Vice versa, such social and cultural transformations impact on how individuals live their gendered, and intimate lives.

Drawing on initial data from an on-going qualitative research project funded by the UK Economic and Social Research Council (ESRC): 'Pregnant Men: An International Exploration of Trans Male Practices of Reproduction', this paper considers the ways in which trans male practices of pregnancy and birth bring new meanings to the gendered nature of parenting. Using case studies from in-depth interviews with trans men who have become pregnant and given birth after gender transition, the paper explores how issues surrounding parenting identity are experienced through pregnancy and birth, and how the gendering of parental roles are later negotiated. The paper will conclude that in problematizing traditional notions of motherhood and fatherhood, trans male practices of reproduction bring significant transformations to cultures of parenting, which demand renewed reflections on issues of power and justice as they pertain to intimate and family life.

HINRICHSSEN, HENDRIK* (*Georg-August University of Göttingen*)

How Is Jordan Dealing with All the Different Groupings of Refugees? Shifting Figurations of Migrants and Longtime Residents in Amman.

Since the 1940s, Jordan has coped with the immigration of vast numbers of refugees during different phases of regional history. As a result of the war in Syria, Jordan is currently again having to manage the entry of a large number of refugees. Jordan is often considered as an example of relatively successful 'integration' or management of large-scale immigration. Taking this notion as a starting point for my argumentation, I will ask – from the perspective of biographical research and figurational sociology – in what ways the relations between different groupings of refugees and longtime residents are changing due to recent dynamics of immigration in Jordan. Focusing on the urban setting of Amman, I will show how images of belonging, patterns of interpretation and experienced life histories of the city's residents are shaped by processes of migration and shifting power balances between different groupings of migrants and longtime residents. In my presentation, I analyse how biographical trajectories are embedded in family and collective histories, in order to be able to shed light on the intertwinement of people's we-images and senses of belonging and their figurational positioning. The preliminary findings discussed in the presentation are based on biographical-narrative interviews and participant observations conducted in Amman within the framework of an on-going DFG-funded research project at the University of Göttingen (Germany).

RC22-408.1HIRAFUJI, KIKUKO* (*Kokugakuin University*)*The Relationship in Japan between the Media and Young People's Perceptions of Religion*

The Kokugakuin University Institute for Japanese Culture and Classics and the Japanese Association for the Study of Religion and Society between 1995 to 2015 jointly carried out 12 surveys of university students' perceptions of religion. Questionnaires were sent every year to approximately 4,000 students asking them about the extent of their interest in religion; whether their parents adhere to one or another faith or not; whether they believe in the existence of *kami*, souls, and buddhas or not; whether they believe in fortune-telling or not; and furthermore about the extent of their interest in various social issues.

The year the surveys began was one in which Aum Shinrikyō launched its sarin gas attack in the Tokyo subway system. News media carried many negative items related to religion, and the idea of adhering to one or another faith carried an extremely poor image. The percentage of survey respondents who said they believed in one at the time stood at 6.7%. That figure has gradually rebounded in the twenty years since, with the results from the 2015 survey showing 10.2% professing one or another faith. However, more than half of the respondents indicated that they held an image of religion as being something dangerous.

In this presentation, I will use a bird's eye view of students' perceptions of religion built over this 20-year period to discuss the relationship between Japanese university students' perceptions of religion and that public space that the mass media represents.

RC40-699.4HIRAGA, MIDORI* (*Kyoto University*)*Latecomers' Food Regimes: A Study of Japanese Zaibatsu and Sogo-Shosha Building Agri-Food Complexes Since the First Food Regime in Asian Context*

Japanese sogo-shosha, like Mitsui, Mitsubishi, Itochu, and Marubeni, have dominant power in current food system, and their global strategy target growing Asian food market by sourcing grains and oilseeds from North and South America. Japanese government also encourages agri-food business to expand overseas with "Made WITH Japan" policy. The origin of this structure, however, dates back about a century. History reveals the continuous building of Japan-centered agri-food complexes since the era of the First Food Regime, with strong government support as a latecomer to the capitalist world economy. This paper studies accumulated Japanese research on zaibatsu, sogo-shosha, and corporate history of large food companies, to structure their historical trajectory of complex development for wheat, sugar, and soybean since the First Food Regime. When Japan began modernization in the 19th century, Japan first incorporated into the Atlantic agri-food complexes by importing wheat flour from the US. When Japan occupied Taiwan in 1895, Japanese capital invested in building modern sugar industry from Taiwan sugar cane. When Japan expanded to East Asia, they promoted Manchuria soybean industry and its international trade. Zaibatsu (financial and industrial conglomerates) and their trade sectors (the origins of today's sogo-shosha) were active actors as "government's trader". Japanese government actively promoted their expansion, to accumulate capital among Japanese hands to quickly progress industrial and capitalist development. This historical study of agri-food complexes focusing on corporate actors reveals the continuous development of their power and capital accumulation through the 1st, 2nd and the current food regimes. States involvement and support tend to be stronger as latecomer states try to catch up quickly by using existing large capital. I argue that Japan's historical example can suggest a clearer picture to analyse today's emerging large-scale agri-food business in other Asian and African countries.

RC12-243.2HIRAI, HIDEYUKI* (*Shitennoji University*)*Judicialization or De-Judicialization?: The Rise of Network-Based Governance of the Drug Problems in Contemporary Japan*

It has often been pointed out that national drug control policies vary markedly between countries. Internationally, Japan is a rare country that maintains a punitive drug control policy for more than a half century. The possession and use of drugs, even if the amount is low, are rigidly criminalized and those who are arrested as drug offenders possibly receive harsh penal sanctions. However, influenced by the new judicial trends such as harm reduction strategy, drug court movement, and therapeutic jurisprudence, the recent Japanese drug control policy has dramatically changed in the name of "from punishment to treatment." Is Japan heading for de-judicialization of drug problems as well as some other OECD countries? To examine this question, the author historically investigates the changing process of the Japanese drug control policy over the last few decades and conducts interviews with several policy makers and criminal justice

practitioners associated with the recent policy reform in Japan. According to the research findings, it increasingly becomes difficult to understand social control of the Japan's drug problems through the traditional theoretical conceptions such as "criminalization versus medicalization." Instead, they are governed through a broad and coordinated network consisting of the various social control agencies such as criminal justice, social welfare, mental health, and self-help groups. There is no conflict between those agencies in this network, therefore drug users can be treated not only as criminals but as sick people, welfare recipients, and members of self-help groups. The liberal critics used to criticize judicialization of drug problems and emphasized the importance of de-judicialization and the role of non-judicial agencies. Ironically, the goals of those critics are now partly fulfilled in that those non-judicial agencies, even though the drug problems themselves are still judicialized in Japan, have played the important part in the recent policy change.

RC52-869.3HIRANO, YUKO* (*Nagasaki University*)*Can Brain Circulation be Possible? the Second Career Quest of Indonesian Nurses Returned from Japan*

Japan opened its labor market for nurses and care workers under the Economic Partnership Agreements (EPAs), bilateral agreements with Asian countries, namely, Indonesia, Philippines, and Indonesia, since 2008. The agreements smoothed the trade barriers between Japan and signatory countries, reducing the labor shortage in Japan by importing professional human resources. However, receiving Asian nurses does not effectively satisfy the motivation of nurses migrating to Japan, a reason for which is "to develop my professional career."

In this presentation, the author scrutinizes how the nurse migration under the EPAs have influenced the choice of second careers of Indonesian returned nurses, by conducting quantitative and qualitative analyses. A quantitative analysis indicated that 86.2% of the respondents answered they returned to Indonesia because they wished to develop their careers in Indonesia. A qualitative analysis was conducted to clarify how they sought jobs in Indonesia after they returned from Japan. The results indicate that being a graduate nurse in Indonesia is advantageous in finding jobs after returning home, provided the nurse has basic medical knowledge and is fluent in the Japanese language. Returning nurses are likely to choose to work as interpreters for Japanese health insurance companies, where they earn much higher salaries than what they earn by working as nurses in Indonesia. The "medical oriented model" operation system in Indonesian medical institutions also hindered the returned nurses from working in such institutions, since they were used to working under the "patient oriented model" in Japan.

The study indicates that returned nurses are likely to use their professional skills in Japanese enterprises and clinics for Japanese patients in Indonesia, but less likely to contribute their nursing skills obtained abroad to their own country, Indonesia.

RC28-514.1HIRAO, ICHIRO* (*Osaka University*)*The Influence of the Family in the Withdrawal from Self-Employment in Japan: Using the 2015 SSM Survey Data*

1 Aim

As the rate of self-employment has declined rapidly in Japan, we need to understand the mechanism of the withdrawal from self-employment. Although Takenoshita (2015) has already examined the withdrawal from self-employment from the familial perspective, I aim to back up his research questions using the 2015 SSM survey data (the national survey of Social Stratification and social Mobility of 2015). This paper examines how self-employers' families, including the spouses and children, have influenced the withdrawal from self-employment.

2 Methods

For this purpose, I analyze Japanese self-employment with quantitative analysis, using the 2015 SSM survey data (the third delivered version). In the 2015 SSM data, there are variables regarding the respondents' children's gender and whether they live together, which are not in the 2005 SSM data. I focus on male and female persons who have the experience of self-employment in non-agricultural sectors. And I apply discrete logit models to the person-period data. The dependent variable is "withdrawal from self-employment." And I used the categories: "closing a business" and "family reasons" from the variables of the "withdrawal reason" as competed risks of the models. Independent variables are marital status, children's gender, children's age, children's co-habitation, and the variables related to respondents' social stratification.

3 Results

The results show that male self-employers are likely to close their businesses after divorce, but are not likely to withdraw from self-employment in the case of having children with whom they live together. In line with the patriarchal ideology, Japanese self-employers tend to prefer male children to female children as their successors. However, according to the data, elderly male self-employers are likely to close their businesses, even if they have male children. Female self-employers

are not likely to withdraw from self-employment after marriage, but are likely to withdraw from self-employment to concentrate on child rearing.

HIRAOKA, KOICHI* (*Ochanomizu University*)

Development and Reorganization of the Service Provision System in Long-Term Care: Comparison of Japan, Korea, and Taiwan

Japan, Korea, and Taiwan, which used to be regarded as typical cases of the "familialist" type of welfare regime, have seen the rapid expansion of long-term care (LTC) services since the 1990s as the "familialist" nature of their welfare regimes has weakened. During this period, these countries established an LTC service provision system and reorganized it in order to promote community care and marketize service provision; however, they differ both in the timing of the service expansion's commencement and the present quantity of services provided.

This study aims to conduct a comparative analysis of the changes in the LTC service provision systems of Japan, Korea, and Taiwan using a four-dimensional framework that the author developed based on the "analytic framework" of social welfare policy developed by Gilbert and Terrell (2010).

The major findings of the analysis include the following.

First, differences in the developmental stage of community care exist between Japan on one hand and Korea and Taiwan on the other. Japan has reached the developmental stage where housing for the aged is systematically developed and intensive home-based care, including around-the-clock home care service, is gradually expanded.

Second, while the three countries have conducted LTC marketizing reform in order to expand LTC services rapidly with moderate expenses, differences in the approach to service provision marketization exist between Japan and Korea on one hand and Taiwan on the other.

Third, these countries have faced serious challenges regarding the securing of an LTC labor force. Taiwan is unique in that it has relied heavily on foreign in-home-care workers.

This study concludes with a discussion of the implications of these three countries' policy developments regarding gender equity in care.

HIRAOKA, KOICHI* (*Ochanomizu University*)

Pronatalist Turn and Social Investment Perspectives in Family Policy in Japan

The purpose of this study is to examine the development of family policy in Japan by focusing on its pronatalist nature and the limitations of its social investment perspectives.

For this purpose, first, by outlining the policy development on low fertility since 2000, this study argues that its pronatalist turn occurred in 2003, and that the "Japanese-type family policy" was established in the mid-2000s. The study also states that, while, under Abe administration (2012-), the pronatalist nature of family policy was strengthened, the continuity of policy responses was noticeable.

Second, this study examines three major contradictions of family policy in Japan: pronatalism versus increased female labor force participation, quantity versus quality of childcare services, and the pursuit of work-family life balance versus a neoliberal labor policy.

Third, this study argues that, in Japan, while policy discourses on family policy are sometimes couched in terms of investment for the future, examination of the changes in the policy programs and the budget allocation reveals that an explicit social investment shift in the paradigm of family policy, as well as economic and social policy in general, has not occurred. It then analyzes its causes in terms of the public-finance crisis, financial structure of social security, lack of coherent strategies among political leaders, underutilization of research evidence in the policy-making, the electorate's loss-averse mind-sets, and high-level private social investment, among others. The study also highlights that, in Japan, the eligibility criteria for public assistance and unemployment benefits have always been strict, and that social investment perspectives have implicitly been applied to the standards of early childhood education and care, and to the management of the public education system.

Finally, the needs and possibilities for the future social investment turn in family policy in Japan are discussed.

Kyoto Speaks out: How the International Tourists Are Changing the Way of Communication Patterns and the Social Discourse of the People of Kyoto

Famous world heritage sites fascinate international tourists and they fully indulge themselves in exotic sceneries and extraordinary experiences. Kyoto,

the ancient capital of Japan, is not an exception. *Kyoto-jin*, as Kyoto natives call themselves, are often observed, as if they are staff in a theme park, if not props, by the tourists. They should be seen, not heard.

But now, *Kyoto-jin* are speaking out and insist to be heard. The excessive tourists increase the problems and the issues of sustainable tourism not only from the quantitative aspects but also from the qualitative aspects.

This presentation aims to prove that the growing number of international tourists and the consequences of the frequent usage of English are not only changing the diction of speech, but also the social discourse and the way of life of *Kyoto-jin*. Tourists have been innocently rambling around the city, not only at specific sight-seeing spots but to the habitats of *Kyoto-jin*. Now Kyoto faces a dilemma. Living in the city which heavily relies on the tourism industry; *Kyoto-jin* would like to entertain the tourists but at the same time, they want to protect their privacy and retain their traditional ways.

In *The Silent Language* (1959), Hall argued that Japanese communication style is high-context. Among Japanese, *Kyoto-jin* are known to have one of the most highly fabricated communication styles, which even other Japanese find hard to comprehend. The very beauty of the art of communication is not to express what they desire but let others detect their needs.

But this communication pattern has become difficult to function. As a result, in an unexpected way, by using, mainly English, *Kyoto-jin* have found voices to express themselves in which they have never expressed in Japanese language before. *Kyoto-jin* are now experiencing the transition from high-context to low-context culture communication patterns.

HIRATA, TOMOHISA* (*Gunma University*)

A Desire for Being Cosmopolitan: A Reconsideration of Hospitality As a Concept of Social Theory in Jacques Derrida and Marquis De Sade

The purpose of this presentation is to clarify the scope of Jacques Derrida's thoughts on cosmopolitanism and hospitality (Derrida 1997) by referring to Marquis de Sade's novel (Sade 1795) titled *La philosophie dans le boudoir*.

In *Cosmopolites de tout les pays, encore un effort!*, Derrida discussed an image of cosmopolitanism as universal hospitality through a criticism (or a deconstruction) of Immanuel Kant's thoughts on perpetual peace and its fundamental principle of not a right of residence but that of visitation (Derrida 1997). Amid calls for "refugee crisis" all over the world, his criticism continues to be worth our full attention.

However, there are very few studies which focus on the title of it, combined the last sentence of *The Communist Manifesto* with "François, encore un effort si vous voulez être républicains" which is the title of a booklet read out by a character in *La philosophie dans le boudoir*. Why did Derrida refer to (the title of) Sade's text in the context of cosmopolitanism and hospitality? And what kind of relationships are there between them? These are the questions I try to answer to accomplish the purpose of this presentation.

In my presentation, firstly I brief a summary of Derrida's discussions on cosmopolitanism and hospitality by introducing some previous studies on them. Secondly, I explain what Sade wrote in "François, encore un effort si vous voulez être républicains" and conceptualise his theory of acceptance. Finally, I analyse the implication of the combined title by referring to Kant's discussions on the relationship between perpetual peace and the republic, and discuss a way of application of Derrida's thoughts on cosmopolitanism to social theories as a conclusion.

HIRAYAMA, MAKI* (*Meiji University*)

Development of Information Technology and Sexual Depression of the Youth in Japan Since 2000

Among young people in Japan, since the early 2000s, the age of first sex has become older, less people have made couples, and more people have become indifferent to sex or had bad impression on sex,--thus sexual consciousness and behavior as a whole have been depressing. At the same time the information technology has developed and spread widely in various forms in Japan. It seems that some forms of the technology are deeply related to sexual depression. In this paper, we'll analyse the relation of two major forms of information technology and sexuality of the youth. (1) The development of electronic games and animation, and some young people have come to experience love and sex in the fictional world (2) The development of dating sites/applications and pornographic sites, and the information of commercial erotic service being flooded and young people have come to have bad impression on sex. In Japan, unlike many Western societies, people don't consider forming and maintaining a couple to be an important value, moreover commercial erotic services have been socially accepted. With these backgrounds, the development of information technology has bloated commercial sex service, and on the other hand the couples' sex have been about to be destroyed.

RC09-194.1HIRD-YOUNGER, MIRIAM* (*University of Toronto*)*Reimagining Participation: Situating Trust within Agricultural Development in Ghana*

This paper argues that a focus on trust and mistrust in relationships, partnerships and projects can provide insights into some of the failings and challenges of participatory engagement within international development. While trust may at times be assumed to be universally self-evident and commonly understood, this research illuminates an aspect of projects that is often overlooked – the dynamic and contested relational underpinnings of development projects. Based on qualitative in-depth interviews in Ghana with farmers, project implementers and donors, distinct experiences of trust are explored as well as the dynamic, quotidian practices that seek to produce and negotiate trust in the context of agricultural development. This research shows that an analysis of how trust is built and eroded is critical for understanding the micro-politics of development programs. The research found that the presence of trust and efforts to build trust are particularly important in project planning and the early stages of implementation. Mistrust is often the product of competition between the plethora of non-governmental organizations that are active in Ghana, decades of unfulfilled development expectations, inadequate participation, uneven transparency around funding and problems with communications. It was found that the framework of trust and mistrust provides a useful means to interpret the implications of development project failures, breakdowns in communications and challenges in farmer participation. In addition, as trust remains little theorized or empirically studied in development, this paper begins to exemplify how trust can be conceptualized as a generative line of inquiry into the relational politics of projects and programs. The paper concludes that situating trust as both a relational sentiment and an object that is produced and circulated may contribute to reimagining the politics of power and participation in development.

RC56-914.2HIREMATH, SUMANTH* (*Dept. of Sociology, Rani Channamma University, Belagavi. Karnataka State.*)*Married Women Pursuing Higher Education: A Sociological Study*

India being patriarchal society, men enjoy a superior status in all affairs in comparison to women. Most of the women feel, the only career for them is marriage and their predominant roles as wife and mother. After marriage, men manage to continue their study, but women cannot manage, as she has to look after the household affairs and their children. Consequently, women lack motivation and ambition towards higher education is easily destroyed. It is believed that, education provides knowledge and resources that hold potentials for social development, economic empowerment and for better livelihood in other streams of the society. Women's involvement in continuing education or their interest in pursuing further education is not without its challenges. Hence, the need of study on the topic- 'Married Women Pursuing Higher Education,' is assumed great significance. In this regard, the study also seeks to make its contribution by examining the challenges faced by the married women in continuing higher education.

Objectives and Methodology of the Study:

- To study the socio-economic, and educational background of the married women.
- To know the problems faced and solutions adopted by the respondents.
- To know the attitudes and aspirations of the respondents.

The study will be 'Case Study Method' and descriptive in nature with the help of primary and secondary data. In India, one of the largest university of Karnataka state is, Rani Channamma University, Belagavi (RCUB). The study will be limited to RCUB, its affiliated colleges (about 20) and 11 institutions which offer PG courses situated in Belagavi city only. The respondents to the study will be the married girls/women pursuing higher education in these institutions.

RC04-93.1HIRSCH ADLER, ANITA CECILIA* (*National Autonomous University of Mexico*)*Ethical Aspects of the Research That Is Being Done in Vulnerable Communities in Mexico and Bolivia*

We articulated the Human Research Ethics approach with the results obtained with a questionnaire of open questions, with a sample of 79 teacher educators from Mexico and Bolivia that, together with their students, perform research practices in vulnerable communities. The questions are: Which are the principal features of a teacher that works with vulnerable groups? Which ethical position do you consider that a researcher has to develop when the research participants belong to groups in vulnerable situations? What responsibility acquires the researcher when he or she works with persons, groups and vulnerable communities? What protective factors do you think that have to be taken into account when researchers work in vulnerable communities? The principal conclusion, in the first

three questions, is that the ethical aspects were the more important, specially values of respect, responsibility, honesty, solidarity and transparency and phrases about two of the principles that are central in professional ethics and research ethics: Beneficence and Non-maleficence. In the last question we found than even thought the substantive function of these educators is to prepare young teachers, when we asked them about the protective factors, they were able to express central issues in relation to research ethics.

RC52-868.2HIRSCH ADLER, ANITA CECILIA* (*National Autonomous University of Mexico*)*Opinions from Teacher Educators in Mexico about the Preparation They Receive in Professional Ethics*

In Mexico there are two parallel educational systems that train two types of teachers. One is in the universities and the other is in "Normal Schools". The principal purpose of the second one is to prepare young people to become teachers – that will instruct children in primary and secondary schools in Mexico-. The objective of the research was to understand the preparation that these teachers receive about professional ethics. To do that, we applied a questionnaire and an attitude scale to 43 teachers, to find out their opinion about professional ethics. As in other countries, in ours there is a tendency to evaluate teachers' practices following national and international guidelines. In international measurements, we have continuously obtained very low outcomes. The wide diffusion of these results has triggered several critiques from the social agents. This abundant and diversified criticism has contributed to deteriorate the social image of teachers from public schools. We will present some theoretical elements about the uncertainty of the professional practice of teachers in Mexico and the classification of the answers given by the sample of the teachers that studied the graduate program: "Specialization in Basic Tools for Educational Research" offered by the Autonomous University of the State of Morelos, to two open questions: Obstacles that Normal Schools educators confront to train future teachers in professional values and Action proposals in professional values training. We found that teachers are interested in a better cognitive knowledge and actualization; an approach to norms, rules and codes about values and ethical themes; the consequences of their professional decisions; the importance of team work and personal relations and communication. They consider themselves a behavioral model for their students and propose several ways to face the increasing uncertainty.

RC04-98.3HIRSH, PNINA* (*Ministry of Education*)*From Nursing to Pre-Med in the Design of Technological (vocational) High School Tracks: Neo-Liberalization and Heterogeneous Actor-Networks*

In recent years, the Israeli secondary-school system has undergone various reforms. This has resulted in a gradual narrowing of the gap between academic and technological (vocational) tracks. Today, technological-track graduates can obtain a quality matriculation certificate that allows them to pursue academic studies in prestigious university departments.

This paper focuses on the health studies curriculum, its development, and its transformation from a low-status Practical Nursing track within the vocational subsystem (in the 1970s) to the prestigious Pre-Med program of the 21st century.

At the macro level, the paper analyzes the social forces that affect this transformation. Following the ANT (Actor-Network Theory) methodology, it delves into the specific details of the process, unraveling the networks that enabled the establishment of the health studies curriculum and those that led to its 'fall from grace' and transformation.

In the design of the Practical Nursing track we see the influence of central actors who served as policymakers in various ministries. By contrast, the Pre-Med study programs were initiated by different and separate local heterogeneous actors and networks in various social and geographical locations and spaces in Israel.

This difference reflects a shift away from a centralized educational policy that is partly the result of globalization and a neo-liberal model that allows local actors to accumulate power and influence the design of official curricula. These forces fostered the development of inter-school competition and parental choice and thus promoted efforts to attract affluent populations and high-achieving students.

The change reflects the state's retreat from its involvement in the establishment of curricula and the increasing influence of secondary actors, a situation that might affect the equality of opportunities provided to all students.

RC21-391.4HISHIYAMA, KOSUKE* (*Kindai University*)*Gated and Mobilized Lifestyle of Japanese Migrants in Bali: With an Analysis of Mobility and Motility*

This presentation will clarify the characteristics of Japanese Lifestyle Migrants in Bali, Indonesia, who are dwelling in the Gated Communities. In order to analyze them, the theory of mobility and motility will be applied. Through the analysis, the relation between the flow of Lifestyle Migrants and enclosure of Gated Community will be explained.

Between 1980s' to 1990s', Lifestyle Migration was not so popular in Japan and limited in Super Rich. The destination was developed countries. In 2000s', the neoliberal policy by the government pushed Japanese to Southeast Asian countries. The booming of seminars of lifestyle migration by Japanese real estate consultants also accelerates the tendency. In Bali, traditional housing sector has been marketized and the gated communities have been developed. They provide Japanese Lifestyle Migrants with opportunity of motility and mobilization of their lifestyle. With this background, they establish various spatial mobilities and social activities.

In the first part, I will clarify their social status. Most of them are not super rich but high middle-class. They are divided two patterns of family structure. One is younger people who marry Balinese with downward marriage. Another is retired Japanese couple. Both of them frequently move between Japan and Bali. In the 2nd part, the way of gating (enclosure) and mobilization of lifestyle of Japanese Migrants will be described. Most of them chose the gated community as their living environment because of comfort, safety, quietness, etc. Such factors are easy to control, arrange and mobilize as their plural "Bali" images. In the 3rd part, I will analyze the cases from the theory of mobility and motility. The way of gating and mobilizing their lifestyle is materialized as their spatial mobility and motility.

Finally, I will clarify the achievement of my research and contribution to the gentrification studies and sociological discussions.

RC31-564.4

HITOMI, YASUHIRO* (*Nagoya Gakuin University*)

Refugee Families, Education and the Regime Transition of Homeland: The Case Study of Burmese Refugee Community in Japan

Burma was said to be sifted to the civilian rule since 2011. Burmese refugees who had fled their home country because of the fear of persecution returned to their homeland after this regime transition. How did this regime transition change their immigration strategies of Burmese refugees? This presentation focus on Burmese families and their education strategies and explore the factors which made their strategies between Burma and Japan.

This research is based on the field work data carried out in Tokyo, Japan since 2004 and Yangon, Burma since 2016. The data consists of interviews with Burmese refugees, refugee families, refugee advocacy NGOs, Government agency, and other related personnel.

I will discuss the following points. Firstly, their education strategies were diversified by the Legal statuses in Burma and Japan: Although Burmese refugees who received legal status in Japan and reacquired their Burmese passport could go back and forth between two nations, others could not. Burmese were limited the country where they raised their children depended on the legal statuses which they received. Secondly, life course factors. Some Burmese families returned to their homeland with their young children on the one hand, others raised their children in Japan. The life course factors including the child's age and education stages influenced their educational strategies. Thirdly, institutional factors. Since the education system between Burma and Japan disconnected each other, Burmese families hesitated to move between two nations with their children. On the other hand, Burmese refugee community and NGOs provide several resources for their children to get educational supports. Although they faced several barriers between Burma and Japan, Burmese refugees developed their new education strategies.

HO, KONG CHONG* (*National University of Singapore*)

The Changing Regulatory Field of Higher Education and the Transformation of Academic Work in Singapore

East Asia countries are late comers in the international education, league tables and "world class" university formation. This entry was marked by a fundamental restructuring of the university system, particularly among top national universities whose traditional task has been the training of the nation's elite.

Singapore's own experience at the restructuring process has been marked by distinctive features particular to the city state: (a) the Republic's search for international talent both in terms of international students who become skilled labour to augment its small and aging workforce as well as researchers to drive basic and applied research; and (b) Singapore's global city environment as well as its English system of education which are attractive to students and professors wishing a foothold in Asia but still able to operate in an international environment.

These features have shaped Singapore's efforts at rebuilding its national universities. The most visible impact is the institutionalization of a performance-based system in place of the civil service model. The restructuring has created a system where research is valued above all other academic responsibilities. Results from

a survey of academics from Singapore's two national universities will be used to reflect the new orientation in academic work.

The re-balancing of the academic system will require an appraisal system that is attentive to the needs of society, research funding which stipulates action and policy research, and a fuller career track of academic work based on practice. Such an institutional logic is ironically at odds with the ambitions of a city-state and a global city. Without strong academic unions, the growing employment of PhDs in civil society organizations, and perhaps a movement of academics into government and opposition political parties maybe the only hope for progressive change.

RC03-76.5

HO, KONG CHONG* (*National University of Singapore*)

The Sociable Amenity, the Community and the City

The Sociable Amenity, the Community and the City
Kong Chong HO (*Department of Sociology, National University of Singapore*)

Email: sochokc@nus.edu.sg

My interest in this paper is to conceptually situate the idea of a sociable amenity between the community which is primarily responsible for its production and segments of the city population which may be drawn into its orbit as regulators, resource providers, supporters, critics and visitors. This represents a way of locating the dynamics of local collective action within the larger context of urban politics, policy and metropolitan governance. Suggesting the notion of a sociable amenity is to move the attention away from natural amenities, from economic analysis of amenities, from a calculation of its value, and from amenity driven analysis of migration.

The production of the sociable amenity at the neighbourhood level represent a certain unity of purpose, espouse a common set of ideals and values, and because they require a certain goodwill and volunteerism among the local community for its continued functioning, the existence of such amenities link residents together in a number of formal and informal networks. Yet, we are also mindful that such sociable amenities are also the outcome of collaborative and sometimes conflict ridden relations involving the local government and also NGOs and other publics.

Drawing from my fieldwork in Tangpu (Taipei) Langham Place (Hong Kong) and Tampines Central (Singapore), I show how such sociable amenities are produced by a set of local actors and more significantly, how this composition of users, supporters, regulators, critics and visitors change in composition and purpose over time.

In this sense, the presence of sociable amenities shape in important ways, the everyday lives of the community and sustain diverse networks that contribute to the liveability of cities.

Studying Social Stratification Among Retirees. Value and Limits of French Administrative Data.

This presentation focuses on the interest, from a sociological point of view, of studying retirement inequalities using administrative data, and more precisely the « Echantillon Interregime des Retraités » (EIR). These data, gathered among the various French pension funds by a government statistical service, allow us to describe and analyse precisely the inequalities among retirees. Compared to social surveys, the EIR has exact values of the various pensions retirees receive. It is thus possible to distinguish between, for instance, one part of the pension received in return of the financial contributions made during the working-life, and another part received as a widower right – pensions who go at 80% to women, and represent 23% of their total pension, 1% for men. Therefore, the EIR is useful for measuring gender inequalities among retirees and decomposing these inequalities between different kinds of pensions.

We will argue that the administrative nature of the data also limits of their value for social stratification analysis. The main issue is the instability of administrative categories, who vary according to the French retirement policies. And whereas sex and age are two variables widely used to describe social stratification among retirees, the classic variables used to describe social status in France do not appear in the literature (profession, skill level, education level). Though assigning a profession to a retired person can seem arbitrary, the EIR, matched with another administrative data set (Insee's « Panel tous salariés »), can be used to achieve this goal, and thus allowing a study of the inequalities between retirees freed from the unstable categories of the administration.

Immigrant's Exclusionist Attitudes Towards Immigrants in Europe

The literature on exclusionist attitudes in Europe has advanced greatly in the last two decades. We have learned much about the underlying mechanisms

explaining the emergence of exclusionist attitudes both at the micro and the macro levels of inquiry. Interestingly though, efforts invested in understanding the consequences of the multicultural transformation of Europe, have by and large neglected to study the attitudes of minorities towards this transformation. Thus, most studies explaining the emergence of anti-foreigner sentiments focus attention on members of the majority group, explicitly deleting all migrants from their sample, or implicitly ignoring the fact that some individuals in the sample are of immigrant background.

This study seeks to narrow this gap looking at the attitudes of immigrants and immigrant offspring in Europe towards immigrants. Specifically, I ask whether the European case can provide support for the horizontal hostility hypothesis namely, that individuals of non-European immigrant background will be more exclusionist towards other, newer immigrants of European origin. I test the hypothesis using pooled ESS data for 9 countries over 6 rounds controlling for the usual predictors of exclusion like prejudice, well-being, political identification and socio-economic status. I also control for different immigration relevant predictors like immigrant generation, ethnic identification, citizenship status, and perceived discrimination. Findings indicate first that net of these predictors, the horizontal hostility hypothesis is corroborated. Further, the effect of non-European immigrant origin on the exclusion of (European) immigrants is moderated by prejudice. As prejudice increases, differences between European and non-European immigrants in exclusion probabilities decrease.

The Cybernetics of Corruption

Corruption is a major problem across the modern world, expressing and exacerbating relations of injustice, violence and unequal power. It is recognised even in popular discourse as a systemic problem, yet there have been remarkably few approaches using advanced forms of system theory, especially those with a socio-cybernetic basis. This paper will propose and test a number of models and scenarios for corruption, using a range of empirical data from one study area, corruption in Mexico. The paper will explore and evaluate two main alternative hypotheses. One hypothesis is that 'corruption' refers to an embedded system within a larger system, with feedback mechanisms whose function is to maintain or increase the scope of the corruption system within the larger system through homeostatic or auto-poietic devices. On this hypothesis, most attempts to reform or eradicate corruption will predictably fail. Strategies to affect corruption of this kind will need to use existing properties of the system against the system of corruption. The second hypothesis is that 'corruption' should refer to a class of pathologies of complex social systems. One that will be examined in this paper is the pathogenic effects of changes to higher-order components of hierarchically-ordered control systems, identified by Bateson (1972) as implicated in schizophrenia and schizogenesis. Another is the effect of leakage between interdependent but autonomous three-body systems of systems, as is common with corruption as usually defined, as illicit alignments between economic, political and semiotic systems (money, power and truth). The task of the paper is to translate these real-world descriptions into system terms, and produce models and scenarios that can be elaborated and tested.

La Seguridad Como Problema Altamente Significativo En La Ciudad De Santa Fe. Propuesta De Abordaje Empírico Para La Implementación De Políticas Públicas En El Ámbito Local.

En las últimas décadas, la problemática de la seguridad cobró gran relevancia tanto en la agenda de gobierno como en la sociedad civil. La seguridad pública se ha ido consolidando como un derecho esencial cuya garantía corresponde exclusivamente al Estado, y como condición sustancial para garantizar el normal desarrollo de las actividades de la comunidad. La ciudad de Santa Fe, no es la excepción a este panorama, y cabe destacar que sus niveles de violencia superan al promedio nacional.

La mayoría de las iniciativas estatales desarrolladas hasta la actualidad en torno a las cuestiones del delito están escasamente sustentadas en conocimiento académico de base empírica. Al mismo tiempo, sostenemos que dicho conocimiento posee dificultades para traducir su producción en propuestas prácticas para la gestión pública de la seguridad.

Al respecto, en la ciudad de Santa Fe se emprendieron programas de políticas públicas que buscan dar respuesta a las problemáticas específicas del territorio. Estos contemplan además, la posibilidad de extenderse a otras jurisdicciones.

El presente trabajo -que forma parte de un Proyecto de Investigación de la Universidad Nacional del Litoral- tiene como objetivo abordar la propuesta de construcción de un dispositivo de análisis sobre la seguridad en la ciudad de Santa Fe sustentado en datos confiables para la elaboración de acciones estratégicas. Es decir, la construcción de indicadores empíricos de fenómenos asociados a la

seguridad que permita la implementación de medidas efectivas por parte de las autoridades competentes.

Entre éstos, se destacan una serie de instrumentos de recolección de datos cuantitativos y cualitativos través de los cuales se espera aproximarse a la comprensión de factores implicados en el comportamiento delictivo del distrito suroeste de la ciudad. Este constituye uno de los más vulnerables en materia de cobertura de servicios y edificaciones. Presenta además, altos índices delictivos y de violencia.

Theoretical and Empirical Modeling of Identity and Sentiments in Collaborative Groups

Technological and social innovations are increasingly generated through informal, distributed processes of collaboration, rather than in formal, hierarchical organizations. We will present research that uses a data-driven approach to explore the social and psychological mechanisms motivating self-organized collaborations, in which people come together to work on a common problem, without prompting by a third party. We focus on the example of open, collaborative software development in online collaborative networks like GitHub (github.com). Our research is based in *affect control theory* (ACT) and a recent probabilistic generalization of the theory known as Bayesian affect control theory (BayesACT). The general assumption of BayesACT is that humans are motivated in their social interactions by *affective alignment*: They strive for their social experiences to be coherent at a deep, emotional level with their sense of identity and general worldviews as constructed through culturally shared symbols.

BayesACT models human interactions as a partially observable Markov decision process, which captures the complexities of dynamic (temporal) decision sequences, and finds optimal solutions to complex decision problems. It makes *explicit predictions* about online interactions in a collaborative group, based on the notion of each group member holds an identity that is *learnable*, *mathematically describable*, and *complementary* to those of other group members. BayesACT applies insights from Bayesian probability theory to explain how people learn and adjust meanings through social experience, and show how stable interaction dynamics can emerge from individuals' uncertain and noisy perceptions of their own and others' identities. We will present work that (1) shows that identity dynamics explain how and why actors pursue particular goals in their interactions, and (2) offers a mathematically precise model for predicting and testing collaborative dynamics.

Work in the Platform Economy – Policy Challenges in the Face of Gender Gap and Intergenerational Inequality

Digitalization has led to disruptive change, causing a rise of new forms of business and service provision. Organizations benefit from outsourcing services and use internet platforms to access a more flexible workforce. As platforms take over management duties such as task assignment, coordination and performance assessment, they reduce potential drawbacks for the outsourcing organization.

Furthermore, digitalization is said to create benefits for the workforce and to potentially increase labor market access. Platforms enable the diffusion of *gig work* and *cloud work*, thereby increasing job opportunities for those willing to or in need of "working anywhere, anytime". While existing literature accounts for new opportunities offered to the workforce in disadvantaged labor markets, a number of pitfalls are noted at the same time. Experts have alerted policy-makers to the dangers of the lack of regulation in the sector, reproducing gender gaps and causing intergenerational inequality. Literature has also pointed to the complex problematic of precarious employment, the decline in the quality of work, the increasing work intensification, the blurring boundaries between work and non-work, and the rising disproportion between paid and unpaid labor.

We argue that internet platforms are key agents in shaping opportunities and pitfalls of digital work. They determine the conditions of performance and delivery, the modes of and access to reputation, reshaping the parameters of work identity and social relations. Accounting for varieties of modes of organization, we will provide case studies of different European platforms.

Overall, we dispute technological determinism, arguing that digitalization is neither a one-way road nor imposed upon us by external forces of market society. A better understanding of the mechanisms that platforms use in order to manage labor and exert power upon digital workers is a necessary step towards developing regulations that can reduce inequalities and strengthen the social sustainability of platform economy.

From Cottage to Mill: Short-Term Rentals and Community Conflict

From Cottage to Mill: Short-term Rentals and Community Conflict

Discussion of the financialization of housing typically focuses on pre- and post-crash processes and *fails to include* the emergence of short-term rentals (STR), an increasingly popular global housing option that has become a source of conflict in communities of varying size and scale, from large cities to resort towns.

What is the impact of the proliferation of STR on housing accessibility and on communities? How do proponents and opponents of STR locate the issue in terms of a rights discourse? How do communities respond? What are the emergent policies and social consequences? How does the examination of STR amplify the discussion of housing financialization and "rights?"

Understanding the Democratic Workplace: The Socialization and Transformation of the Worker Co-Operative Member

Worker co-operatives, workplaces owned and managed by the workers themselves, offer an alternative to conventional labour-union focused and politically envisioned workplace democracy. However, because worker co-operatives are less common and unfamiliar to many, new members require a period of adjustments as they come to understand and embrace their dual roles as both co-workers and co-owners. Workers' new co-operative roles included both receiving more benefits and empowerment as co-owners, but also the demand of greater responsibility as well. While all jobs have some level of organizational socialization, this study found that much more deliberate and formal socialization occurred at the worker co-operatives. This more intensive organizational socialization contributed to higher levels of loyalty to the business: the members of the worker co-operative spoke of loyalty to their organizations much more than their counterparts in conventional businesses. When those employees in conventional businesses did speak of loyalty, it was to their industry as a whole or to co-workers, not to the organization. Drawing on longitudinal qualitative data collected over 20 years at four matched sets of cooperatives and conventional businesses, this paper expands current understandings of loyalty by considering how deliberate organizational socialization in worker co-operatives can impact members' loyalty.

The Global Financial Class: Global Financial Markets New Forms of Business Culture and Boundary Work

In our contribution we develop a theoretical perspective on class formation in the context of global markets and present empirical findings regarding the formation of a global financial class.

While previous approaches to global class formation concentrate either on a managerial elite or on the distribution of income and wealth in the global social structure, our research project focusses on the social interaction on markets as the basis for the formation of a global financial class.

Our research was conducted between 2014 and 2017 in Frankfurt (Germany) and Sydney (Australia). Through a comparative ethnography of the financial centers in both cities and a study of career paths through narrative interviews we show how the social embeddedness of global financial markets produces common forms of economic, social, and cultural capital, a shared world view and habitus.

Corporate cultures are of less importance for the members of the financial class than the connecting culture of the market. It is not the firms that primarily shape the actions of financial professionals, but rather the economic field of global financial markets.

This new social class distinguishes itself not only through specific status symbols, but also through gestures of cultural openness, diversity, and a cosmopolitan presentation of self. These cultural forms enable the financialization of other social spheres. Expansive economic practices of finance correspond with practices of cultural exploitation. A new, seemingly paradox mode of social boundary work emerges: exclusivity through inclusion, closure through demonstrative openness.

HOGSBRO, KJELD* (Aalborg University, Department of Sociology and Social Work)

Frontline Work in the Crossfire between Conflicting Ruling Relations

When working in residential homes in Denmark, frontline social workers are under the influence of different premises for accountability, assessment and authorisation. Regulating premises for the authorization of working environment are in conflict with the regulating premises for social services and the premises of professional discourses are in conflict with some of the 'evidence based' concepts promoted by the ministry of social affairs. In this crossfire between different discourses and regulating texts, staff members are left in what we have labelled a 'discursive vacuum'.

The paper will focus on this problematic and discuss the challenges it puts on our concepts of regulating text, our understanding of the neoliberal conduct of conduct and our concept of governmentality. The paper opens up to new dimensions in our IE investigation of modern institutions, our understanding of the life-world of staff members and our critique of and constructive directions for the conduct of modern institutions. The paper will be based on results from recent research and the author's involvement in the political processes defining the guidelines for the conduct of residential homes.

Interdisciplinary Approaches to the Understanding of Mental Disease and Disorder

In 2017 a Centre for Sociological research on Psychiatry (CSP) was formed by the presenters. The centre laid ground for an interdisciplinary network of Danish researchers from psychiatry, neuroscience, sociology, pedagogy, linguistics, anthropology and social work studies with the aim of developing an approach to psychiatric issues which were in accordance with the different disciplinary approaches to understanding human interaction and social conditions. The network involves 25 dedicated researchers from the different disciplines.

The presentation will focus on the epistemological challenges when trying to synthesise different perspectives, different relations to practice and different terminologies into a mutual understanding of the social factors which influence the pathogenesis and aetiology of mental illness. It will take its point of departure in the experiences from the initial discussions on the network seminars and present some of the possible solutions to the challenge. These solutions involve considering and rephrasing our approaches to mental vulnerability, stigma and social as well as biological heritage and it challenges the categorical diagnostic systems as well as our understanding of social and communicative interaction.

Artists, Alternative Creative Spaces and Urban Transformation: Three European Case Studies

Recent times have seen the growth of a range of cultural protests in Italy, including the creation of an imaginary 'People's Centre for Arts' in a thirty-one story skyscraper in Milan by a group called Macao, whose focus on guerrilla-branding tactics and self-organised cultural production has resulted in a broader radical experiment in creative democracy (Valli, 2015). In Berlin, a 26 year old 'art house' KuLe has recently documented its history and considered its future in the rapidly gentrifying neighbourhood of Mitte (Kule, 2016), while in the city of Amsterdam, the former squat OT301 has sought to maintain its radical roots in its transition from 'broedplaatsen' (breeding place) to independent ownership (EHBK/OT301, 2014). These varied, yet connected cases, are a small sample of a wide range of global examples of artistic and creative resistances, spaces, and movements, that exist in cities, despite counter urban tendencies to discourage them from forming and thriving. For despite a decade and a half of recognition about the importance of creativity in urban development and regeneration (Florida, 2002), corporate property-led urban development and neo-liberal austerity politics over the last couple of decades have paradoxically also led to new attacks on artistic livelihoods, as well as produced new conflicts and struggles over cultural spaces in cities (Mould, 2015; Sholette, 2011). The main aim of this paper is to assess the transformative potential of such alternative creative groups and spaces through a close examination of these three European case studies. The case studies chosen are analysed via five key themes including: 1. conditions of emergence 2. organisational form 3. artistic urban interventions 4. sustainability/ incorporation, and 5. the capacity to create collective cultural networks and link up with wider urban social movements.

 MUCKENHUBER, JOHANNA (*University of Graz*)

Religiousness, Existential Insecurity and Religious Culture

Cross-national comparative surveys show that the degree of religiosity varies strongly on the global level. According to previous research, two factors are particularly important to explain these differences: the level of existential insecurity and characteristics of the religious culture. In this paper we will review the importance of these two factors using data from the 6th wave of the World Value Survey (2010-14) which includes a set of questions on existential insecurity (having no money to buy food, becoming the victim of a criminal act, suffering from bad health, etc.). Our multi-level analysis that covers 45 countries from all major religious culture areas (Catholic and Protestant Western Europe, Orthodox Eastern Europe, USA, Muslim countries in North Africa and Asia, East and Southeast-Asia, Sub-Sahara Africa and Latin America) reveals two central findings: First, both the Human Development Index (as the best proxy of existential security) and our typology of religious culture-areas explain a considerable proportion of the variance of religiosity on the macro-level; the explanatory power of religious culture, however, is clearly higher than that of HDI and GINI-Index. Second, the effect of items measuring existential insecurity on religiousness on the individual level is rather low. These findings suggest, that in a global perspective the decline or persistence of religiosity is much more determined by the characteristics of the religious culture than by people's individual experience of existential insecurity.

The Cardinal Call for Soft Science Now Today: Interpretive / Qualitative Acumen UNDER Our Encountered Epistemological Maelstrom

This presentation is an extension of a presentation made at the 7th Critical Tourism Studies International Conference in Majorca in June 2017. It stands as one of a cousin pair of presentations which argues for the provision of annual or perhaps biennial short course somewhere in the world where those who are interested in critical issues in International Tourism Studies can gain state-of-the-art schooling in advanced interpretive cum qualitative inquiry. In this 'CARDINAL NOUS' delivery, it is proposed that RC50 of ISA should work closely with The Critical Tourism Studies International Network to find a host institution able to regularly stage an advanced short course of emergent understandings in soft science ... or otherwise to find a mix of institutions (in perhaps Europe, North America, Asia, Australasia ???) which could stage such an offering on a rolling basis.

In recent decades, social science research methodologies have changed considerably, perhaps in small but important ways in which received 'orthodox science' / 'conventional scientific approaches' are tickled or nuanced to bring favoured methods into alignment with the freshened outlooks of so called 'postmodern', 'postcolonial', or 'postdisciplinary' conceptual climates of today. These changes have principally occurred on account of the demand for researchers around the world to learn how to 'survive' amongst the epistemological uncertainties (and the ontological blindnesses!) of having to encounter not only new-to-them knowledges but fresh / confident / rebellious expressions of being and becoming. Sometimes, the changes of late decades (since the 1980s) have actually constituted tall and / or strident breaks with the old 'proper' and 'designated' laws of neutral / detached / universalised scientific inquiry, and some emergent tenets of social science research have witnessed substantive shifts in practice.

The New Interpretive Impetus --- the Reach Beyond: A Liquid Modern Critique of the Nomadic Conceptual Capacity of Tourism Studies Today

This presentation is the first of two cousin working papers on the fate of culture under globalisation / glocalisation and the found intermingling of populations. It focusses upon the changing role of culture and identity under liquid modernity, and it constitutes an applied extension (to Tourism Studies) of the ideas of the sociologist of surveillance, Bauman.

It will address the following four points about the new impermanence of heterogeneous space, under the globalising imperatives of liquid modernity, where seemingly:

1 = the world distribution of capital and information has become exterritorial, and governments have had to cede control over economic and cultural processes to politically-resistant 'market forces'. Consonantly 'culture' today tends to be **a matter of 'offers'** within the consumer-orientated market place – **a means of seduction**;

2 = the old / established right of nations to self-determination is slowly evaporating, and the identity-guaranteeing sovereignty of nation-states has corroded.

Accordingly, nations are turning from being territorially cohesive bodies into ever-more mobile and **spatially dispersed associations of spiritually allied units**;

3 = 'culture' is not so frequently found to be (nowadays) the messianic force by and through which (under high nationalism) it had been ... i.e., enlightening, converting, reflecting, perfecting local / national citizens ... but had becoming **a perpetually widening polylogue**; and,

4 = ways of life have tended to drift in varied and not necessarily coordinated directions, where cultural relations have become rather less 'vertical' and more commonly 'horizontal'. As old certainties and loyalties are consonantly swept away, people are prone to seeking **new belongings / new cultural identity storylines** which are decidedly different from the old narratives built on an assured naturalness of historical belonging.

Diagnostic Innovation and the Business of Regulation

This presentation is based on an exploration of the growing field of molecular diagnostics, heralded as the next frontier for medical innovation. In the last few decades the regulatory regime for medicines has shifted in numerous ways to accommodate the interests of the pharmaceutical industry (Davis and Abraham 2013). We investigate medical devices in this context, where manufacturers have learned from pharmaceutical companies in terms of how to produce, market and protect their commercial innovations, but also in the way that they interact with, respond to and shape the regulatory regime. Laboratories that produce diagnostic innovations at the molecular level can build on the promise of personalized or 'precision' medicine, where medical products are tailored to the individual patient. We explore how these molecular diagnostic manufacturers interface with the regulatory regime to most effectively deliver their products to patients. Our work is based on an evaluation of the regulation of in vitro diagnostics in the US, EU and Canada, ethnographic work at events for commercial laboratories and regulators, and interviews with manufacturers, scientists and regulators. Through this work we explore the relationship between the laboratories producing molecular diagnostic tests and the regulators approving the tests. Ultimately we present a complex picture of the intersection between markets and medical regulation.

Fanning in or out - How Does Schools Affect Inequality and Stratification

In this paper we use data from the Student/Teacher Achievement Ratio (STAR) project – a large longitudinal study of schools in Tennessee, USA to study how student stratification changes across school grades. We ask the question whether schools increase or decrease student ranking and student heterogeneity. If schools add to stratification at large we should expect first that schools exaggerate initial student heterogeneity. That is, variance in student achievement in kindergarten and first grade should be smaller than variance in student at later grades. Because student test scores are comparable across grades in STAR this data set allows at unique opportunity to test the hypothesis of student heterogeneity across grades. Secondly, we can test whether student ranking across grades are stable or change according to social background. We find that for achievement in English, variance in grades increase whereas for achievement in math, student heterogeneity decreases. For ranks, we find them to be stable across grades.

HOLMES, MARY* (*University of Edinburgh*)

Globalization and Emotional Lives at a Distance: Couples, Refugees and Internet Daters

Emotional Intimacy at a distance is becoming an increasingly likely experience for a wide range of people. In the context of globalization and rapid change, many face novel situations and uncertainty around how to feel. It is argued that emotional reflexivity thus plays an important role in the making, maintaining and unmaking of distance relationships. Yet how it does this is likely to vary depending on social and cultural context and on the type of relationship. Thus, I explore emotional reflexivity with reference to examples from research on academic couples in distance relationships, refugee youth and internet daters. The aim is to examine what emotional reflexivity can contribute to understanding racial and gender inequalities within the context of globalized intimacies.

RC35-635.1HOLMWOOD, JOHN* (*University of Nottingham*)*Decolonising Class Analysis*

Class – whether from a Marxian or Weberian perspective – is central to political economy within most critical theories of modernity. Class analysis inscribes the idea of the commodity status of labour power as integral to the economic logic of capitalism. In this context, colonialism appears as a contingent aspect of capitalism and ‘race’ as a ‘social’ intrusion on a logic that is defined as independent of it. This paper will argue that the idea of labour power as a commodity derives from a moral economy of race, rather than a political economy of market capitalism. The paper will develop a Polanyian argument, albeit one that is not found in Polanyi owing to his neglect of colonialism as integral to the relations of dispossession and possession he otherwise examines. The paper will suggest that labour is not a ‘fictitious’ commodity, and, indeed, enslavement is its reality. On this understanding, the commodification of labour power which is presented as the grounding of class analysis is already a de-commodification of the labourer. Class analysis betrays an underlying racial formation which undermines the capacity for understanding contemporary events and leads to a false distinction between class analysis and the politics of identity.

RC07-156.6HOLMWOOD, JOHN* (*University of Nottingham*)MARCUELLO-SERVOS, CHAIME (*Universidad de Zaragoza*)*Public University Pathogens: Digitalisation, Commodification and Precarity*

The excessive use of rankings, performance assessment and the commodification of teaching and research are three basic elements that drive a process of the global decoupling of knowledge and public values in Higher Education Institutions (HEIs). The cascade of budgetary cuts in the aftermath of the 2008 financial crisis accelerated a process of the neo-liberal reconstruction of HEIs, especially, in Public Universities, which in many places are undergoing processes of privatization and financialisation. Alongside processes of ‘flexibilization’, disinvestment and competition, new Information and Communication Technologies (ICTs) have also introduced a strong ideology of the re-organization of the teaching-learning nexus. The idea of a digital society aligns with digital higher education to produce a new paradise of low cost delivery. The utopia of the promise hides the dystopia of its consequences. Here, we propose an analysis of three enemies of higher education: Digitalisation, Commodification and Precariatization. We propose a critical approach to these issues, as an attempt to reinforce the democratic significance of Public Universities in local development and in global society.

RC01-44.1HOLOHAN, ANNE* (*Trinity College Dublin*)*Diversity Management in the Armed Forces: A Comparative Study of Attitudes Towards and Experiences of Minority Members (Women, LGBTQ) in Ireland, Finland, Poland and Bulgaria.*

EU Personnel in Conflict Prevention and Peace Building (CPPB) missions come from diverse organizations and nations, yet must coordinate together in the temporary network or umbrella organization that comprises each CPPB mission. Coordination is challenging strategically and operationally. Even if the structures to coordinate together are in place, diversity in organizations (militaries, police forces, civil organizations), gender and culture (national, ethnicity, religion) make understanding of diverse personnel, and communication and cooperation in contexts of diversity difficult yet vital in order to achieve CPPB missions' goals. Current training puts few resources into training personnel in these critical soft skills of gender awareness, cultural competency, communication and cooperation. Gaming for Peace (GAP), a H2020 project www.gap-project.eu, provides an efficient and effective means of developing and delivering a curriculum in those skills. Deriving a base curriculum from CPPB relevant soft skills and end user identified training gaps in this area, GAP designs a digital role playing game which simulates scenarios from CPPB missions.

As part of the project, in-depth interviews with over 100 peacekeeping personnel (military) from Ireland, Finland, Poland and Bulgaria were completed in the first part of 2017. One of the aims of the interviews was to discover the attitudes towards and experiences of women and LGBTQ persons in contemporary CPPB missions. This conference paper reports on the results of thematic analysis of this large data base on these issues, demonstrating the behaviours in the field in peacekeeping missions that encourage or mitigate against greater diversity and inclusivity.

RC22-411.6HOLTMANN, CATHERINE* (*Muriel McQueen Centre for Family Violence Research*)*The Complications of Care: Family Violence in the Lives of Muslim and Christian Immigrant Women*

There is little evidence to show that the prevalence of domestic violence amongst immigrant families differs from that in non-immigrant families in Canada. However, it is apparent that immigrant women experience unique challenges in situations of family violence due to the intersecting structural barriers that they face and the resultant ethnic, class, and gender inequalities. Religious beliefs and practices can further exacerbate these inequalities but they can also be a source of strength upon which immigrant women can and do draw when responding to situations of family violence. This paper highlights the value of care as it is exercised in the daily lives of immigrant women and their social support networks. Evidence is drawn from qualitative research with Christian and Muslim immigrant women living in the Canadian Maritimes. I argue that care can be the starting point for religious leaders, members of religious social networks, and secular service providers when initiating difficult but necessary conversations with immigrant women concerning domestic violence. A critical evaluation of the practices of care is required. Domestic violence contradicts the value of care whether it is understood in a religious or secular context. Thus disclosing family violence can be framed as an act of care. However, because the practice of care is impacted by gender, ethnic, and economic inequalities, disclosure is not straightforward. Women take more responsibility for unpaid care work in families than men, especially for young children. Racialized immigrant women are the most likely citizens to be unemployed or underemployed. Muslim women are subject to discrimination and Islamophobia. Caring social support that takes into account these structural inequalities is necessary as survivors seek safety.

RC07-158.3HOLUBEK, STEFAN* (*University Bremen*)*The Conduct of Life As Conceptual Framework for Middle Class Studies*

With view on the rapid growth of middle-income groups in countries such as China, India or Brazil a sociological discussion on a ‘coming middle-class century’ (Therborn 2012) emerged. However, the income related conceptions of the middle classes are confronted with a wide variety of living standards and consumerism across countries. In my presentation, I will suggest a conceptual framework that focuses instead on the ‘conduct of life’ (“Lebensführung”, in the sense of Max Weber) as a mode of living which systematically generates certain practices that could be used as an alternative base for comparisons between national dynamics.

In our project, we assume that the specific mode of ‘doing life’ in Germany has been and largely still is characterized by a continuous investment of economic and cultural capital to pursue the reproduction and, if possible, improvement of one's social status. Empirically, we conduct and analyse narrative biographical interviews with members of the German middle-class. In my presentation, I will rely on preliminary results to give an overview on a variety of elements of the conduct of life that are considered to be typical for middle class members, such as an orientation towards continuous individual status-improvement, a meritocratic ethos and a planning imperative. The empirical investigation and analytical conceptualization of such practices and underlying orientations appear as a promising attempt to compare national developments despite varying income levels and cultural settings.

RC35-636.3HOLZER, BORIS* (*University of Konstanz*)*Relationship Problems: A Systems Perspective*

Relational sociology seeks to offer an alternative to theories that presuppose individual or collective attributes as essential components of sociological explanations. Its basic claim therefore is “anti-essentialist” but also “structuralist” in the sense that social units are traced back to elementary structures, i.e. to the relationships among its constituent elements. Many contemporary social theories share those basic tenets, and systems theory is a particularly fitting candidate as it pursues a resolutely non-individualistic research program. However, the concept of “social relationship” has no obvious place in systems theory. That is because it seems to be not quite as anti-essentialist as it claims: The very notion of relationships presupposes the entities that are related to each other. It is thus replaced by the concept of social system which consists not of individuals, but of communication. A concept of “social relationship,” reformulated in terms of communication, then can no longer be located at the fundamental conceptual level.

What at first sight appears to be a depreciation of the very core of relational sociology may on closer inspection be useful to give social relationships a firm footing in social theory. The concept is then free to denote a specific form of social system formation, which is different from other forms. The paper will discuss

the implications of such a reconceptualization of relationships against the backdrop of systems theory's typology of social systems: If relationships do not simply "constitute" interactions, organizations or society as a whole how are they related to and distinguished from these social forms? The paper argues that conceiving social relationships as a particular social form enables us to give a more comprehensive and more complex account of social reality.

HOLZER, BORIS* (*University of Konstanz*)

HILGERT, CHRISTIAN (*University of Konstanz*)

Sources and Limits of Power

Sociological theories regard power as an attribute of social relationships, not of individual (or corporate) actors. Following Weber power is conceived as a capacity or "chance" to assert and carry out "one's will even against resistance." This kind of definition of power does not specify on what the "chance" is based. It may be physical dominance but also charisma, wealth or persuasiveness. The likelihood that power actually works does not hinge on objective criteria but on how the one subjected to the demands of power perceives and estimates the power relation. The exercise of power therefore is a matter of interpretation and communication: A threat can be a vehicle of power if and when it is considered credible and potentially harmful.

Based on relational and communicative concepts of power (e.g. Blau 1964; Luhmann 1979) this paper distinguishes several sources of power and analyses the dynamics of threat and evasion. Power may for instance flow from dependence relationships, information asymmetries or, of course, physical violence. The efficacy of threats based on those options is dependent on how the consequences of opposition are evaluated. For instance, alternative ways to either obtain withdrawn resources or to decrease the harm imposed by sanctions may diminish the perceived threat. By comparing different power settings (e.g. face-to-face situations and formal organizations) and the way in which power sources work or fail the paper will not only provide a more systematic account of forms of power but also explain the paramount importance of physical violence as a source of power.

Vulnerability of Female International Students in the U.S.

This paper explores the experiences of female international students studying in semi-rural U.S., where the population is highly homogeneous. Simultaneously, American students were interviewed through online focus groups regarding their perceptions of foreigners in the U.S. The focus is on the challenges they are confronted with, and the way their cultural identity and gender affects their study abroad experiences. Through qualitative methodology, the inquiry is made through interviews, surveys, and observations gathered from May 2015 to May 2017. This period covers pre and post Trump era, and tracks the changes in Americans' perceptions of foreigners. The preliminary results bring to light the severity of sexual harassment, discrimination and the vulnerability of this group. Furthermore, the complete inadequacy of universities to provide a safe learning environment for vulnerable female international students is brought to light by the testimonies of the students.

The Structure of Happiness across Age: A Method-Mix Approach with Focus on Japan's "Happy Youth"

Subjective wellbeing among 20-29-year-old Japanese has increased since the 1970s and by the turn of the century has outstripped that of those in their thirties, forties or fifties. While unimaginable by older generations, it seems that young Japanese – despite a bleak future outlook (e.g. in terms of employment or the financial burden of a super-ageing society) – feel satisfied with their lives. This result caused a stir in Japanese academic and public discourse alike. It indicates that what the young generation considers important for their wellbeing might differ from older generations.

In this paper, we test how and to what extent what we call the "structure of happiness", measured in terms of satisfaction with and importance of different life domains (such as health, finance, family, friends etc.), varies across age. We look at (1) which aspects of their lives young Japanese are satisfied or dissatisfied with (as compared to other generations), and (2) which of these aspects they think of as important when considering their happiness. We use data from the National Survey on Lifestyle Preferences from 2010, and from the SSP2015 survey for

analysis. Additionally, we analyse data from 55 qualitative interviews with young Japanese in their twenties, to add further substance to our quantitative results.

Our results imply that what is individually evaluated as "overall happiness" needs to be thought of as complex interplay of different topicalities that are weighted and judged against each other in course of the evaluation. In the specific case of the Japanese youth, their distinctively different idea of happiness points to an impact of their generational location – growing up in a period of economic stagnation – which distinguishes them from previous generations, who were used to continuous economic growth and social upgrading.

Multifamily (Danchi) Housing and Parenting in Japanese Urban Communities

In the mid-20th century, rapid growth in urban populations led to housing difficulties, with governments and public institutions leading push for the construction of housing complexes for working-class families, such as in the Soviet Union, Eastern European countries and Japan. The construction of such housing complexes, known as *danchi* in Japanese, not only guaranteed residential accommodation for nuclear families but also created new communities within urban areas in that the families shared the same facilities. In Japan, residents' association were developed to carry out programs such as the setting up of childcare facilities. The management of such childcare facilities by these residents' association is a subject of interest not only for Japan but also in terms of the relationship between family members and social organizations. Based on interviews to stakeholders, and documents issued by residents' association, I will detail the historical background that enabled these childcare facilities to operate, and the relationships between residents and their association as well as the childcare facilities. From my study, the following two points became clear. First, the operation of such childcare facilities was possible because the first residents were mainly younger workers and their families. Thus they shared a strong need for a place to leave their children which made it easy for them to cooperate. Second, as residents aged and their life courses became more diversified, it made it more difficult for communities in multifamily housing complexes to maintain childcare facilities, therefore, it is important for them to relate more to the community beyond their housing complexes. Based on the above findings, I will make suggestions for the formation of local communities in urban areas beyond the immediate family.

LEE, JIEUN (*University of York*)

The Uses of Social Investment in East Asia: How Work-Family Reconciliation Policies Make the Labour Market 'Flow' in Japan, Korea and Taiwan

Work-family reconciliation policies occupy an important part in the social investment discourse (Morel et al. 2012, Bonoli and Natali 2012), however they apply differently across different national contexts (Morgan 2012, Lee and Baek 2014, Garland 2016, Hemerijck 2017). Since from the 2000s, social investment policies have also been introduced in Japan, South Korea, Taiwan and China (Kim 2010, Chiu Wei 2011, Tsai 2012, Estevez-Abe and Kim 2014, Fleckenstein and Lee 2017), although they were originally following a traditional male breadwinner model (Lewis 2001), as often pointed out for the case of Japan (Seeleib-Kaiser and Toivonen 2011, Kleider 2015, Sjoeborg 2004).

Even acknowledging that more employment-friendly work-family reconciliation policies are taking place in Japan, Korea, and Taiwan, the correspondence to the original social investment goals of increasing 'stock' of human capital, easier 'flow' or labour market and life-course transitions, and stronger social protection measures as 'buffers' (Hemerijck 2013, 2015) finds a difficult terrain in these co-ordinated market economies (Soskice and Hall 2001, Amable 2003). By utilizing the comparative approach of the most similar case design (Ragin 2014), we question how the degree of economic individualization expected from an adult worker model (O'Connor 2005), typical of a social investment approach, applies within a still traditionalist East Asian context – in terms of labour market features and attitudes towards the gender role in the family –, resulting in a problematic reform implementation that does not correspond to the original policy intentions (Streeck and Thelen 2005).

Policy implications stemming from the analysis of these cases are yet another reminder of the several critical points of a social investment approach already identified in European welfare states (Hemerijck 2017): budgetary problems, problematic connection with economic performance (Noland 2013), "Matthew effects" (Cantillon 2011).

RC15-JS-86.4HONGO, MASATAKE* (*Wakayama Medical University*)YAMADA, TOMIAKI (*Matsuyama University*)*Becoming Victims of Drug-Induced Suffering (DIS): The Case of Japanese Hemophiliacs with HIV*

This study examines the process by which people become victims of "Drug-Induced Suffering" (DIS), especially individuals with both hemophilia and HIV by contaminated blood concentrates, through the examination of several life-story data and documents. I have participated in a research project since 2004 aimed at collecting and analyzing the life stories of doctors and patients with hemophilia since 2001.

HIV/AIDS as DIS has been the central point of understanding about HIV/AIDS in Japan, because much of the current medical system regarding HIV/AIDS was constructed after the lawsuit movements under the banner of DIS. The indigenous notion of DIS not only contributed to generate a robust dichotomy between "innocent" victims and "guilty" assaulters but also to form solidarity between different DISs—for example, the thalidomide-caused damage in the late 1950s, the Subacute Myelo-Optico-Neuropathy (SMON) caused by clioquinol in the 1960s, and so on. People whose lives were changed by drugs join in DIS solidarity for compensation and pursuing liability; other victims of DISs who share an idea of extermination of DISs known as the "Japanese National Liaison Council for Associations of Victims of DIS" were mobilized in 1999.

Most Japanese individuals with both hemophilia and HIV improve by becoming victims of DIS. However, this is evidence of the solidarity of the original hemophilia communities not having functioned enough. For example, Irish hemophilia patients regarded HIV infection by blood concentrate as an issue for the whole hemophilia community itself. Therefore, hemophilia patients without HIV (conscience adherents) who led compensation movements on behalf of hemophilia patients with HIV were not able to be open while Japanese hemophilia patients with HIV separated from other hemophilia patients on purpose to focus on drug victimization. That is, becoming victims of DIS offers the way of the different solidarity of hemophilia.

RC16-300.5HONJI, YUKICHI* (*University of Tokyo*)*Georg Simmel's Thought and the Sociology of Public Opinion*

What has Georg Simmel's contribution been to sociology in the twentieth and twenty-first centuries? Many sociologists have used his insights into various research subjects, for example, sociological theory, urban life, social relationships, and so on. **This presentation, however, focuses on an area not generally associated with his name, that is, the analysis of public opinion.** Simmel himself was little interested in public opinion. His work, however, inspired other sociologists to investigate it as a sociological subject in the interwar period. Moreover, Simmel's insight made it easy to focus on various small phenomena which lie under public opinion and mass-communication.

I will speak in particular three important works from the interwar-period. The first one that will be examined is, "Öffentliche Meinung und Presse" ("Public Opinion and Press," 1928) by Gerhard Münzner, a German sociologist. The second is "Gerüchte" ("Rumors," 1928) by Leonty A. Bysow, a Russian social psychologist. The third is "Ryu-Gen Hi-Go" ("Groundless Rumors," 1937) by Ikutaro Shimizu, a Japanese sociologist. Interestingly, Münzner, Bysow and Shimizu, obviously influenced by Simmel, put emphasis on face-to-face interactions among individuals and described how such interactions led to crises of the mass-media and public opinion in their own countries. For example, Shimizu referred to Simmel's famous analysis of the secret and the individual personality in *Soziologie*, and showed **how individual emotions are still alive in public opinion and endanger the system of mass-media and public opinion in Japanese society.**

In today's political debate about public opinion, interpersonal communication processes has become more and more important. Lies, groundless rumors, and "fake news" sometimes develop enormously through various personal interactions. Sociological analyses done by these three sociologists suggest that **we can use Simmel's point of view in order to describe how interpersonal communication processes influence, empower, and sometimes endanger public opinion of our society.**

RC52-872.5HONORE-MORRIS, DUNCAN* (*The University of Melbourne*)*The Professional Rubric: A Weberian based framework to assessing professional accounting practice and its educational needs*

Professionals and professional bodies are noting the rapidly evolving formats of service delivery from several pressures, including such things as rationalising and marketing of delivery, accountability to the public, ethical responsibilities, changing technology, increasing fragmentation of knowledge, globalisation,

increasing specialisation, neo-liberal policies of deregulation, and reduced monopolistic protection. These pressures on professionals involved in the delivery of professional services is forcing them, in Darwinism terminology, to adapt for survival or become irrelevant and extinct. Within the workforce, professions play a significant role and are a specialised form of labour and have, in sociological terms, several key criterion or characteristics that have been used to traditionally delineate them from occupations. Nine of these criteria have been framed into the The Professional Rubric, a Weberian conceptual framework, to assess any given profession. Applying this exemplar on the accounting profession, by way of a case study across several countries, to establish how accounting practitioners and academics envisage what their profession will look like in 10-15-years' time; and what changes will be required to meet the future educational needs for professional practice. This is phase two my PhD studies into the sociology of the professions and the professional practice of accounting and its educational needs.

RC21-392.3HORGAN, MERVYN* (*University of Guelph*)*Is Territorial Destigmatization Possible? Lessons from a Toronto Neighbourhood.*

Over the last quarter century, territorial stigmatization has emerged as one of the most powerful concepts for understanding how social, spatial, and symbolic processes of contemporary urban inequality are intertwined (Wacquant 1993). The concept has advanced our understanding of the very real material effects of symbolic denigration in wide range of neighbourhoods around the globe. Despite this power, existing research employing the concept has two main problems: (1) it tends to overlook decades of work in the broader field of stigma studies that has burgeoned since Goffman's pioneering work in the 1960s, and (2) it focuses primarily on delineation and critique of territorial stigmatization's genesis and course in various locales, largely leaving aside possibilities for amelioration. possibilities.

Drawing on archival research, participant observation, and interviews with a range of inhabitants of Parkdale—a Toronto neighbourhood that has been profoundly shaped and symbolically tainted by its long association with poverty, single room occupancy housing, and psychiatric survivors—this article demonstrates how territorial stigmatization, and a new allied concept, *territorial destigmatization*, operate simultaneously at the neighbourhood level. I show how territorial stigmatization and territorial destigmatization work across three dimensions: legal, material, and discursive. Foregrounding symbolic elements of these three dimensions, I delineate two strategies of territorial destigmatization: one that is mobilized in concert with gentrification-led displacement, and the other that works to symbolically reinscribe stigmatized persons and housing forms. To complement and sharpen territorial stigmatization research, I integrate recent findings from stigma studies to show how psychiatric survivors and housing advocates in Parkdale are using territorial destigmatization to offset gentrification-led displacement.

RC24-456.3HORIBE, MIYUKI* (*the Japanese Association for Environmental Sociology*)*The Potentiality of Food Bank As a Form of Aid for the Poor -a Case Study of Food Bank Kawasaki-*

One of the answers to social science engaged with the conceptualization of urban FEW-security, would be "gojo" or mutual support in Japanese. The purpose of this study is to examine the potentiality in aid for the poor through participant observation to food bank (hereinafter referred to as FB), as one of "gojo" activity. The report of people starving to death as a result of not being able to afford food sent a shockwave through the Japanese society. As DeFries (2016) has said "satiation is a crisis faced by mankind today just as starvation was in the past". There are a number of people who can not afford to use water and energy from poverty in urban city, Kawasaki. Why are there still people unable to feed themselves to the point of starvation and even death when there is such abundance of food? One of the initiatives organized to improve this situation through distributing surplus food to the poor is the local FB. By distributing water and unwanted food eaten without cooking (energy) to the poor for free, this initiative is considered effective in terms of environmental and social welfare. With regard to achieving the ethical equity in food distribution, ideally the criteria for start/end of aid to be clear and objective, however they are often obscure and subjective. The FB Kawasaki has seen an increase in the amount of users and food supply, signaling that such activity can be effective if continued. Hence, this study looked at the factors that may continue FB activities in spite of the sociopolitical and socioeconomic contradictions. The result shows that FB has high potential to contribute to support users to break away from not being able to have access to FEW.

HORIGUCHI, RYOICHI* (*Faculté des études internationales, Université de Kindai*)

Clivage Du Genre Et Sécurité Au Travail

Cette étude a pour but premier d'examiner si une présence équilibrée de femmes et d'hommes dans la société donne un point de repère pour savoir que la sécurité au travail est assurée. Il serait, en effet, important d'analyser, dans nos sociétés contemporaines, des rôles des femmes sur le lieu de travail, étant donné qu'elles n'y sont plus minoritaires aujourd'hui par rapport du passé, en même temps qu'elles ont un rôle important pour que l'on mesure les risques sur les lieux de travail. Cette étude traite des blessures mortelles sur le lieu de travail du point de vue social, économique et culturel pour comparer les uns avec les autres pour savoir quels sont les facteurs qui ont un impact sur ces décès sur la base d'une analyse approfondie des indicateurs statistiques sur les accidents des lieux de travail. La méthode de recherche dans cette étude consiste à faire une analyse des corrélations des données statistiques sur plus d'une centaine de pays du monde qui sont principalement fournies par l'OIT, l'OMS et la Banque mondiale. Grâce à ces analyses, il sera révélé que, comme l'une des conclusions les plus importantes de cette étude, un haut degré d'égalité entre les sexes pourrait avoir des effets positifs sur la sécurité au travail et qu'en d'autres termes, l'inégalité entre homme et femme au travail pourrait nous empêcher de créer un meilleur style de vie qui nous amènerait moins de malheur et plus de richesse sur le plan de moral et matériel. On constate que le lieu de travail à risque se produit, entre autres, dans un lieu de travail où se trouve un clivage du genre. Et, cette conclusion serait un point de référence principal pour mieux promouvoir la sécurité du travail ainsi qu'une installation correcte des dispositifs de sécurité sur le lieu de travail.

HORII, MITSUTOSHI* (*Shumei University*)

The Category 'Religion' Should be the Object, Not the Tool, of Analysis

The title of this paper is taken from Timothy Fitzgerald's *The Ideology of Religious Studies* (OUP, 2000). Fitzgerald has been a spearhead of the group of scholars who push forward the perspective called 'critical religion.' This paper introduces the 'critical religion' perspective, and explores the implications for sociology.

A 'critical religion' approach suggests the category 'religion' and related categories, such as 'secularity,' should be the object, not the tool, of analysis. It pays critical attention to the ways in which certain practices and value orientations are imagined as 'religious' while others are regarded as non-religious 'secular' ones. Like any other social categories, the utilisation of the terms 'religious,' and its binary opposite, 'secular,' serve the specific interests of groups and individuals, often in relation to constitutional and political rights. Some empirical studies are emerging in this area. Given the fact that 'religion' is a globalised concept, there has been a potential for cross-cultural research. This appears to be an area in which sociologists can be more involved.

Furthermore, it is important to stress that the religious-secular distinction is a modern classificatory practice, which historically represents western cultural norms from the colonial era onwards. Historically, this binary authorised the colonial rules, and in the present day, it naturalises the value orientations of modern liberal capitalist nation states. 'Religion' and 'secularity' have been the categories of governance. In other words, the religious-secular distinction constitutes the imperial epistemology. Sociology emerged from the modernist thought which separates the 'religious' from the 'secular.' Thus, critical reflections on the categories of religion and secularity urge sociologists to reflect upon the imperial ideological heritage embedded in sociological discourse.

HORNE, CHRISTINE* (*Washington State University*)

Common Ground in an Era of Political Polarization: Green Consumption and Social Status

American public opinion is divided along political lines, with polarized views on the economy, healthcare, foreign policy, and increasingly, the environment. Existing research shows clear divisions between liberals' and conservatives' opinions of government involvement in environmental protection. However, it is unclear what people's perceptions are of individual actions that can reduce environmental impact. We use mixed methods to understand liberal and conservative perceptions of proenvironmental household practices by focusing on the social status associated with green consumption and green behavior. Using a vignette experiment conducted with nationally representative samples of liberals and conservatives in the US, we find that both grant more status to green consumption than to green behavior. However, people expect Democrats (not Republicans) to grant status to both. Semi-structured interviews, conducted with liberals and conservatives, clarify people's perceptions of the status dynamics associated with green consumption. Results suggest there is more common ground on proenvironmental household practices than is generally recognized

– both liberals and conservatives react positively to green consumption. Our interviews show status attributions to green consumption reflect perceptions of wealth and success and moral commitments. In particular, liberal participants view those who engage in green consumption as more moral than those who engage in green behavior. People who do not purchase green products are aware of—and protest—these attributions of morality. Our findings challenge widespread assumptions regarding liberal support for and conservative opposition to proenvironmental household practices, and have implications for the development of policies aimed at encouraging households to reduce their environmental footprint.

HORNICK, BRAD* (*Simon Fraser University*)

Climate, Capitalism, Existentialism: Emergent Dimensions of Social Movements

Svante Arrhenius and earth scientists to follow, argued that the radiative effects of increasing carbon dioxide would push delicate ecosystems past historical boundaries and into zones that were dangerous to human life and delicate ecological equilibriums. At some point, cumulative anthropogenic contributions would force and trigger amplified positive feedbacks to activate independently within atmospheric and oceanic systems themselves, causing exponential transformations and consequent "runaway" and irreversible climate crisis.

Building on classical economic and social theory, Marx and Engels developed a theoretical foundation that also presaged crisis. The logic of capitalist accumulation creates material estrangement of human beings from each other, and the natural conditions of their existence. Society/nature "metabolic rift" extends into the connection between anthropogenic influences on the carbon cycle. Capital accumulation on never-ending and expanding scales within closed systems systematically undermines natural thermodynamic equilibrium, and will ultimately cause crisis of catastrophic proportions.

Little more than a century later, climate scientists monitor dangerous accelerations of climate crisis in real time. Climate modelling of gradual and linear changes to earth systems are being eclipsed by warnings of abrupt and irreversible climate change and the passing climate "tipping points." The world is witnessing multiple dire climate impacts. Scientists are identifying systemic breakdown of entire earth systems, and many are warning of entire civilizational collapse as a result of the corruption of Holocene era ecologies

Two converging and potentially intractable factors force planetary ecological crisis – the destructive trajectory of bio-physical processes, and the persistence of underlying and large causal socio-economic forces. The prescience of both earth and social scientists concerning existential threats have thus come to fruition, adding a new and emergent dimension confronting the incipient "climate movement" that has coalesced in response. Together, these two trajectories represent classic definitions of *existential crisis* and *nihilist* threat/opportunity for people, culture and movements.

RC36-644.3

HORNICK, BRAD* (*Simon Fraser University*)

Marxism and Existentialism in the Age of the Anthropocene

Marxist critiques of existentialist and absurdist philosophical positions pivot on the problem of the abstraction and mystification of historically specific conceptions of alienation. Humans are not alienated in general by a cosmic purposelessness and indifference of the universe, but are alienated in a particular and immediate form within a particular historical specificity. Existential angst and crisis is not a fundamental dimension of existence, and inherent in the nature of general consciousness, but arise within practical life when the exercise of fundamental freedoms are confounded, or foreclosed, as a result of reified social conditions.

Within the historical specificity of the Anthropocene, two converging and potentially intractable factors portend imminent planetary omnicide – the destructive trajectory of bio-physical processes, and the persistence of underlying and large causal socio-economic forces (ie. imperatives within the system of capitalism). This is why climate and capitalist crisis is "existential": as it is about the potential "no exit" from "terminal" collapse, and coming to terms in a universal sense, with our ambivalent personal and collective desires to retain or challenge foundations of meaning, purpose, and existence. What might Marxists learn from philosophies of nihilism in the age of the Anthropocene, that might lead to new forms of agency, and practical transcendence over growing forms of defeatism and immobilization?

HORNUNG, BERND* (*University Hospital Giessen and Marburg*)

Simulation of Social Systems: Paradigmatic Tool for Analyzing Social Processes behind Our Backs?

Society is man-made, but when we are born into it and start acting, it is a given. Social processes are going on in structures given at that moment, often behind our backs, moving society in unwanted directions. Attempts at controlling and steering such social forces turned out quite ineffective. Actors like governments, which are supposed to do so, are quite helpless in the face of such mechanisms and processes.

To be able to influence such processes, they need to be understood first. As multiple circular feedback loops are involved, which are interrelated, interacting and producing both positive amplifying and negative counteracting effects, conventional analysis does not help. Graphs and diagrams modelling such interrelated feedback loops are of limited help, as the processes behind our backs are dynamic and moreover involve structural change and innovation.

The paper proposes computer simulation, the paradigmatic method of systems and cybernetic research, in order to cope with these problems. This proposition is not new, but the promises, limits, and drawbacks of simulation models have barely been discussed with regard to the present issue.

Therefore the paper will focus on the limitations and drawbacks to be expected when using simulation models for such purposes. Among these are problems of validating a model, e.g. by use of historical data, of representing structural change, the functional equivalence of different structural set-ups along with the limits of such functional equivalence, the potential and limitations of step-functions to represent structural change etc.

The paper will not try to provide answers to all these difficult methodological questions, but is expected to lead into a substantial discussion among the experts present.

The conclusion is, however, that computer simulation is not a panacea, but the best methodology available at present, provided appropriate precautions are taken and its limitations are kept in mind.

How Discourse Theories Can Critically Engage Identity Formation in Patient-Centered Care.

How discourse theories can critically engage identity formation in patient-centered care.

Patient-centered care (PCC) is increasingly assumed to be synonymous with quality patient care, reflected in healthcare policies across the world. However, the performances of patient identity that must follow lack conceptual grounding in the research literature. The patient identity implied by PCC sees an identity shift from directive to performative ways of being that require patients to negotiate increasingly ambiguous scopes of responsibility and involvement in decision-making processes in the clinical encounter. They are positioned as active and informed consumers of healthcare. The PCC patient has significant parallels with the self-managing worker configured by neoliberal discourses of 'empowerment' that extend the reach of productivity deep into the self, putting identity and relational dynamics increasingly at risk. In this way, patient identity in the context of PCC may be considered as implicated in a wider 'identity crisis', that has resulted from rapid reconstitutions and associated conducts in interpersonal, social and organizational spheres. I suggest that the insights offered into identity from discourse scholarship have promising theoretical potential for engaging with the changing landscape of patient identity marked by PCC. Through a discursive lens we might explicate unmarked power relations that underpin patient identity performances in a PCC context, with the aim to develop work in this area both theoretically and on a practice-level. This engenders a conceptual effort to bring contributions from discourse scholarship to studies of identity in healthcare, with the purpose of critically engaging powerful neoliberal discourses that increasingly pervade healthcare systems across the world. As calls for bottom-up participation and empowerment become increasingly notable in the healthcare sphere, the social sciences must equip themselves with the theoretical tools necessary to permeate the re-articulations of power that follow.

What Makes Failed Research? "Conventionalist" Reflections on Epistemic Failure in an Interview Study on Educational Classifications

Starting from a neo-pragmatist perspective, this paper discusses the need for developing methodological frameworks that allow to actually *theorize* epistemic "failure" in social research. I argue that methodological self-reflexivity and a sensitivity for performativity are key ingredients of any such framework. I use concrete examples from a recent interview study with teachers which aimed at reconstructing educational orders of classification to illustrate this argument. This study did not (yet) end up in the drawer, but it raised epistemological issues that beg the question whether it has failed in a more fundamental way: regarding its capacity to answer the research question. Three aspects that are related to this problem are discussed. To begin with, I argue that the first and crucial challenge is to detect and diagnose epistemic failure. This requires ways of theorizing our

research activities that are coherent with how we conceptualize our phenomenon. The "sociology of conventions" is presented as one possible foundation for such an undertaking because it offers helpful heuristics for relating our "problem-solving" research activities to the concrete forms of agency involved in producing our data. Second, I believe we need to identify the mechanisms that have led to a particular "epistemic failure". In my case, this amounts to problematizing conventionalized forms of doing interviews – more generally, it may mean reconsidering taken-for-granted standards and procedures that might have become deeply ingrained in our everyday research activities and hence remain unconsidered. Third, a coherent framework should also enable us to get a grasp on the interplay between epistemic and other sorts of academic failure that are linked to the structures of disciplines and research fields. In their interplay, I believe that these points illustrate that thinking about failure in social research offers a promising point of departure for methodological debates that are long overdue.

Flexibility or Flexploitation: Shifting Power Relations in Organisation of Work

The capitalist economy is undergoing a series of changes under the hegemony of neoliberal policies, which have generated a profound transformation in societal relations since the late-1970s. Accordingly, numerous theories emerged to define the "new society" and to re-formulate work and labour. While some of these explanations acknowledged the ongoing capitalist nature of societal relations, most referred to a radical disengagement from the previous era, celebrating the coming of a post-capitalist society, the end of class struggle and the rise of an unalienated class of knowledge-workers. However, flexibility, whether in the labour market or labour process, has been a major force driving proletarianization over the last couple of decades, resulting in further exploitation – or flexploitation – of the labouring classes. This trend is affecting all segments of the working class including those who have been previously considered immune to insecurity. Therefore, despite the narrative of a brand-new society, a trend towards flexibilization of labour markets is evident across the globe, perhaps more so in the context of an emerging accumulation strategy based on knowledge, innovation and intellectual property rights.

The changes in Turkey's labour regime since the turn of the millennium have been in line with those global trends. The articulation of Turkish economy to the global economy based on export of technology-intensive capital goods has particularly paved the ground for such a transformation as accumulation required increased productivity levels, as well as a skilled and highly flexible workforce. In this paper, we explore the concepts of flexibility and knowledge-based economy as material mechanisms and discursive aspects of accumulation. Our aim is to elaborate their role in the exercise of micro and macro technologies of control of labour both theoretically and empirically, and their reflections in material experiences of labouring class in the context of a late developing economy.

HOSODA, MIWAKO* (Seisa University)

Japanese Community-Based Senior Groups and the Role of the University

Many developed countries have aging populations. A key issue is providing healthcare for these populations. However Japanese healthcare services for the elderly focus on medical aspects rather than long term well-being.

Moreover, preventive care and health maintenance approaches are now considered to be more essential. In Japan, we are turning into a super-aging society. By the year 2020, it is said that one out of three people will be over the age of 65. On the other end of this extreme, the falling birthrate is another problem we must face. You can see that the nation will not have enough taxpayers to support the elderly. Thus, it is clear that the current government mission is to provide a sustainable social system supporting elderly people's way of living while acknowledging that there will be limited access to financial support and human resource. In addition, the recent policy on healthcare in Japan encourages seniors to live in their community. Many elderly are discharged from medical care facilities and nursing care, and are living in their own houses, resulting in them being isolated and withdrawn from society.

In order for the elderly not to be isolated in their houses and maintain their health, it is important to create a place where they can participate in community activities. Since 2013, the university where I am affiliated has created a place where senior citizens and non-senior local people are able to participate in organized group activities. Now multiple generations are interacting in this place. In my research, I will investigate how these interactions impact the health condition of elderly. Also I will also investigate the role of the university in creating a place and supporting these community activities.

RC02-54.3HOSOGAYA, NOBUKO* (*Sophia University*)ARAI, NORIKO (*Sophia university*)TAKEUCHI, ASUKA (*Sophia university*)*Japanese Female Self-Initiated Expatriates As Labour Market Makers*

This paper clarifies the mechanism of Japanese female self-initiated expatriates (SIEs) participation in global labour market. SIEs are those who cross the borders with their volition and expense as they seek for the job opportunity in foreign lands without any assignment delegated by MNC corporations in home lands. Based on the analysis from in-depth interviews with Japanese female SIEs in Singapore, Hong Kong and New York, the mechanism is to be ascertained by comparing lineage between SIEs' roles and perceived rules which enable them to participate in the labour market and the influence from local government regulation towards market construction. Their job hunting is conditioned by their competency, their aspiration for the career and intermediary functions available in the host countries such as career agents and professional networks. Female SIEs leave Japanese labour market where male dominate assignments for the global positions in Japanese MNCs, and then they explore the new global market.

In this paper we argue that the results of these transactions help to understand the nexus between the development of SIEs' career and the diversified global labour markets. One prominent source of diversification is the country of origin of MNCs that have the major influence upon their subsequent expatriate transactions. Though Japanese MNCs are not seen by them as preferable counterparts in these transactions, working as local hired employees in subsidiaries of Japanese MNCs is an easier option for Japanese female SIEs because of the advantage they have regarding Japanese language and culture. However, such involvements seldom meet their career aspirations, as they are often under-valued for their actual competencies. In non-Japanese labour market, employment is strongly conditioned by the host country's visa policy requiring higher professional qualifications, and therefore Japanese SIEs who meet these condition, will be part of the construction of new global labour markets.

TG07-1004.5HOSSAIN, MASHRUR* (*Jahangirnagar University*)*To Nose Is to Know: The Politics of "Knowsinging"*

Apparently automatic and independent, our perception and the operation of each of the five senses are shaped and conditioned by culture. This is particularly true of odour, a distinctive, usually unpleasant, kind of smell. While the sense of disgust related to odour (e.g. of pus and putrid meat) has derived partly from human's behavioral immune system, a protection mechanism against contamination, it has often been a constructed affect, spatiotemporally contingent and ideologically loaded. History shows us how reductionist olfactory practices and metaphors have been deployed to construct, stigmatize, and delimit the inferiorized 'other' – woman smelling between her legs, stinking Negro, malodorous *adivasi*. Touching upon the *poetics* (biomedical, environmental and production mechanisms) and *politics* (conception, and circulation and reception mechanisms) of smell, the present paper investigates into the potential of the arts to re-configure the *experience* of odour. It develops through three sections. The first section, "Nosing: The Sensoriality of Odour," demonstrates how plastic art can activate audience's olfactory experiences and excites individuated responses; e.g. the (tabooed) smell of blood in Judy Chicago's installation, *Menstruation Bathroom* (1972). The second section, "Knowing: The Visuality of Odour," shows how even visual symbols or reports of odour that the audience is not smelling, e.g. the bouts of flatulence in the Japanese art scroll, *Ha-Gassen* (The Fart Battle), do reproduce 'known' responses. Taking thread from the previous sections, the third one, entitled "Knowsinging: The Scent of Odour," proposes "knowsinging" as a reception mechanism, which brings the olfactory to the fore along with the other senses in the *experience* and *use* of sensorial data. It explores whether and how creative-innovative intra-sensuous interactions between odour and fragrance and synaesthetic inter-animation of odour and other senses in the arts can transform our prejudiced responses to odour and the consequential otherizing hegemony.

RC48-800.5HOSSEINI FARADONBEH, SEYED A.* (*The University of Newcastle*)GILLS, BARRY* (*University of Helsinki*)*The Future of Capital and Its Alternatives in 21st Century: The Essentiality of Economic Democratization*

In 21st century, "Capital" requires a more comprehensive and applicable definition than merely a social process where money makes more money through production relations. *Capital*, in its material manifestation, is a socially organized 'process', through which surplus value is produced and controlled by 'unsustainable' and 'un-sovereign' ways of exploiting labour (both manual and intellectual), land (and other commons), nature (non-renewable sources of energy

and the earth's bio-capacity including the climate). It is, however, important to equally emphasize, and theorize how Capital can also immaterially but objectively colonize and depoliticize societal/communal solidarities (from the level of household, to the level of world community).

Thus, a critical analysis of Capitalist relations requires the theorization of not only the exploitation of labour, land and nature, but also the systemic colonization of communal solidarities as non-material Commons, through the de-democratization of collective production and reproduction relations. Austerity regimes, for instance, are not only about protecting the corporate interest, e.g. by dispossessing social welfare, but also about an antagonistic relation towards democratic self-management, collaborative determination, and self-sufficient uses of resources. The colonization of social solidarities by Capital creates a fertile breeding ground for the resurgence of ethno-populist responses. We will argue here that the profound democratization of economic relations can liberate the [transformative movements](#) from the immense gravity of Capital [by overcoming the dilemma of surviving while transforming ubiquitous capitalist relations](#).

RC42-721.3HOSSEINI FARADONBEH, SEYED A.* (*The University of Newcastle*)SAHA, LAWRENCE* (*Australian National University*)*Theorizing the Rise of Right Wing Populism in the Post-Globalist Era: Toward an Integrative Approach*

Populism, as a concept, generally implies a mobilized support for the political, cultural and economic preferences of the populace as opposed to those of the elite, foreigners, intellectuals, media, government, corporations, scientific bodies, ethnic minorities, immigrants/refugees, or any other social group or community whose identity or interest differs from the widely-idealized image of a typical countryperson. However, populism does not always appear in society as a well-articulated doctrine or a coherent group attitude with a number of detectable rigid principles. It normally emerges in the form of popular rhetoric that taps into the populations' emotions, and advocates quick solutions without a proper understanding of the root causes of the problems and the complexities of social institutions.

In this process, on the one hand, macro socioeconomic status appears to be a primary factor but only in association with other primary determinants (e.g. age, regional/rural residential status, ethnicity, gender, education, religion, and occupation), and this association occurs only in a relative sense (e.g. a relative decline in the middle-class status compared to lower/under class status). On the other hand, social psychological factors such as social anxiety, sense of insecurity, resentment, uncertainty, humility, and resentment (e.g. waning white privileges recently accelerated by economic liberalization and austerity regimes), mediate the macro factors. In addition, the social historical residues of centuries of colonialist-patriarchal culture, such as class-racial discrimination, patriotism, misogyny, and racism, plus personality factors like dogmatism, [closed-mindedness](#) and authoritarianism play a role in the translation of macro-structural changes and political discourses into personal and group actions and attitudes. In this paper, we develop a more [macro and micro integrative approach](#) to theoretically explain the emergence of right wing populist movements in the post-globalist era.

RC32-577.6HOTTON, TINA* (*University of Guelph*)*An Examination of Provincial/Territorial Variation in the Probability of Being Charged with Intimate Partner Assault By Gender of the Accused*

There have been a number of policy reforms over the past several decades, including a national level mandatory charging directive, that have had a tremendous impact on how the criminal justice system responds to intimate partner violence (IPV) in Canada. Intended to protect women and children exposed to violence in the home, one unintended consequence has been an increase in the number of women accused of IPV. This finding has been observed in other nations, including the United States, Australia and the United Kingdom (Canadian Observatory on the Justice System Response to IPV, 2009). While research on gender disparities in arrest for IPV has grown in recent years, very few studies have examined differences at the national level to better understand variations in charging practices across Canada. Using five years of data from the Uniform Crime Reporting Survey (2011-2015), this study examines provincial and territorial variation in police charging for incidents of intimate partner assault by gender of the accused. Preliminary results show that there is variation in the probability of being charged with intimate partner assault by gender of the accused and province/territory in which the incident occurred. In other words, while gender differences in police charging practices persist, they vary considerably across the country. These results will be discussed in the context of the possible impact of local policies at the provincial and police jurisdiction level on the police decision to proceed with formal charges for women and men accused of intimate partner assault.

RC05-JS-63.2HOTTON, TINA* (*University of Guelph*)*Justice in the Margins: Police Clearance of Homicide Involving Indigenous and Non-Indigenous Women and Girls in Canada*

Despite mounting evidence in the 1990s that indigenous women were seriously overrepresented as victims of sexual assault, physical assault and homicide, little attention has been directed to their experiences navigating the criminal justice system, particularly with respect to their encounters with police, or the outcomes of their cases. Notwithstanding earlier reports from inquiries and royal commissions, one could argue that the victimization of indigenous women did not receive adequate public and political attention in Canada until indigenous women's organizations started to shine a spotlight on serious gaps in the investigation and prosecution of homicides of indigenous women. Led by the Native Women's Association of Canada (NWAC), local grassroots organizations brought the issue of missing and murdered indigenous women and girls (hereafter referred to as MMIWG) into public consciousness. The MMIWG movement in Canada led to several important changes to government information collection and sharing. Canada's national police service, the Royal Canadian Mounted Police (RCMP) examined their data collection procedures and renewed attention to interprovincial information sharing on missing persons. The RCMP also revisited their original files to report "Aboriginal" identity information to Statistics Canada's Homicide Survey for female victims of homicide back to 1980. Available in the Homicide Survey, these new data allow for the analysis of trends in homicide victimization of indigenous and non-indigenous women across Canada over the past 35 years (1980-2015). Among the first multivariate analyses of its kind since the data enhancements, this study examines homicide victimization of indigenous and non-indigenous females in Canada. Specifically, we address the following research question: are homicides of indigenous women and girls less likely to be cleared or solved by police than those involving non-indigenous women and girls, controlling for other incident characteristics?

RC14-270.3HOU, RUI* (*QUEEN'S UNIVERSITY*)*Digital Surveillance with Knowledge Production: How the Chinese Government Manages Online Public Opinion in the Era of Big Data*

An increasing number of Chinese governmental agencies have begun to purchase the service of data-based technology to monitor and guide online opinion. Although this trend is criticized by Western medias as the rising digital totalitarianism, the industry of monitoring online opinion still enjoys a rapid expansion in China. Why does this so-called anti-democracy surveillance receive little resistance from the civil society? What strategy have Chinese authorities and surveillance-service providers adopted to embellish this form of surveillance? What theoretical implications could be developed to frame the state-market cooperation in Chinese Internet regulation?

By visiting 6 surveillance-service providers in Beijing and interviewing 43 practitioners in this industry, this work explores the mechanism through which the Chinese government utilizes commercialized data technology to regulate Internet dissent. Faced with the irreversible Internet popularization, Chinese authorities utilize the market mechanism to transfer ICT into their governance tool. Through purchasing the Internet opinion surveillance system which is based on technologies like data mining, sentiment analysis and cloud computing, Chinese governments conduct real-time surveillance on netizens' posts and make timely reaction to possible threats to social stability. Besides, with the rise of this industry, a special set of knowledge and discourse about Internet opinion is produced to emphasize the hazard of online rumors and the risk of uncontrolled free speech on the Internet. By issuing official policy documents, publishing textbooks and carrying out training programs on managing Internet public opinion, the Chinese government and surveillance-service providers legitimize their behavior of monitoring online opinion through highlighting its necessity. This work argues that online opinion surveillance in China and its accompanying knowledge-discourse production provides us with a typical case showing how a certain form of big-data technology becomes a non-democratic regime's governance tool, and it also displays what change the development of ICT brings to authoritarian regimes' Internet control.

RC47-798.1HOU, RUI* (*QUEEN'S UNIVERSITY*)*Outsourcing Repression to the Market: The Industry of Online Dissent Management in Authoritarian China*

Repression is both governmental and nongovernmental regulatory action exercised against collective actors challenging the existing relations of power (Peterson & Wahlström, 2014). While previous literature highlights state repression, the plurality of the repression forms unfolding and beyond the state receives little attention. Much literature displays that repression by the state is the linchpin for understanding the state-society relation in authoritarian regimes,

but little empirical study could answer the question about what role non-state actors play in authoritarian repression. Taking China as an typical authoritarian regime, this study is intended to display how Chinese governments use the market mechanism and cooperate with non-government actors to manage domestic dissent on the Internet. Through purchasing the Internet opinion surveillance system and other services which are based on technologies like data mining, sentiment analysis and cloud computing, Chinese governments conduct real-time surveillance on citizens' Internet posts and make timely reaction to possible threats to social stability. This paper argues that through purchasing various forms of governance service from for-profit agencies, the Chinese state outsources certain types of dissent repression to the market. During this process, for-profit agencies not only develop various forms of service to monitor, analyze and guide citizens' online posts, but also produce and spread the knowledge highlighting the necessity of monitoring online opinion by publishing textbooks and providing workshops for officials. The cooperation between the state and the market is transforming the repression of online dissent into a special form of commodity. This paper argues as that the commercialization of domestic governance is becoming increasingly popular in China and various form of commercialized repression still need more attention.

RC10-207.1HOWALDT, JÜRGEN* (*TU Dortmund*)*The Role of Participatory Action Research in Social Innovation – New Challenges for Social Sciences*

The importance of social innovation in successfully addressing social, economic, political and environmental challenges of the 21st century is recognised not only within the Europe 2020 strategy but also on a global scale. As a novel approach to address complex problems in global health, social care, education, energy, and environmental policies, social innovation has been embraced by stakeholders and communities on the local, regional and even national level.

But what are the conditions under which social innovations flourish? Who are the stakeholders and in what capacity do they understand and develop social innovation? In light of the increasing importance of social innovation, this paper explores the question of what (new) roles social sciences play in analyzing and shaping social innovation.

On the basis of the first results of the global research project SI-DRIVE the paper gives an overview of the current situation and the perspectives of social innovation research in social innovation processes (Howaldt et al. 2016). It argues that social sciences will be challenged to redefine their functions with regard to innovation. In the past, innovation research in the context of social sciences has contributed heavily to explain the social dimensions, the complexity and paradoxes of innovation processes. Henceforth, much will depend on realigning the range of competencies of social science as well as social scientists by contributing actively to the development and integration of innovations as well as by developing social innovation. Against that background participatory approaches that promote participation and empowerment of civil-society actors are indispensable.

RC23-435.1HOWALDT, JÜRGEN* (*TU Dortmund*)*Towards a New Innovation Paradigm – Mapping the World of Social Innovation*

The importance of social innovation in successfully addressing social, economic, political and environmental challenges of the 21st century is recognised not only within the Europe 2020 strategy but also on a global scale. However, despite this growing awareness of the significance of social innovation, there is still no sustained and systematic analysis of social innovation, its theories, characteristics and impacts. As a novel approach to address complex problems in global health, social care, education, energy, and environmental policies, social innovation has been embraced by stakeholders and communities on the local, regional and even national level.

But what are the conditions under which social innovations flourish? Who are the stakeholders and in what capacity do they understand and develop social innovation? How do social innovations diffuse and lead to social change? What are the success factors for assessing social innovations in communities, cities, regions, and states?

In light of the increasing importance of social innovation the paper presents the results of the global mapping of the research project SI-DRIVE and gives an overview of the current situation and observable trends in the field of social innovation. The mapping gives insights into the highly diverse world of social innovation, the variety of actors and their interaction, and the systemic character of the concept. It includes social innovations in education and lifelong learning,

employment, environment and climate change, energy supply, transport and mobility, health and social care, and poverty reduction and sustainable development. References

Howaldt, J.; Schröder, A.; Kaletka, C.; Rehfeld, D.; Terstriep, J. (2016). Mapping the World of Social Innovation: A Global Comparative Analysis across Sectors and World Regions. A deliverable of the project: "Social Innovation: Driving Force of Social Change" (SI-DRIVE).

HOWE, ADAM* (*The University of British Columbia*)

Representations of Indigenous and Settler-Canadian Political Identities in Canadian Speeches from the Throne, 1867-2015.

Agenda setting scholars use speeches from the throne as instances of official state discourse, to investigate the economic, political, and social interests that take priority in government agenda. Throne speeches outline governments' view of the 'state of things', their agenda, and the initiatives governments will pursue to achieve their agenda. Primarily, agenda setting scholars seek to explain changes in agenda by situation them within complex social, political, and historical contexts. While this literature offers valuable insights into the effects external conditions have on government agenda setting, the issue-topic focus neglects any analysis of how group political identities are constructed and negotiated within the discourse. This is important given Canada's history of denying Indigenous people citizenship and attempts to unilaterally define Indigenous identities through legislation.

In my study I use critical discourse analysis to investigate how Indigenous and non-Indigenous political identities have been constructed in Speeches from the Throne from confederation (1867) to present. I ask, 'How have these representations been shaped by Canada's history, and what does this mean for our current contexts of reconciliation and decolonization?' I find that up to about 1967 Indigenous people are largely excluded from state discourse constructions of citizenship and national identity. Afterward, Indigenous people are brought into the discourse under the auspices of multiculturalism and national unity. This is brought about as a result of declining public trust in government tied to conditions of economic and social uncertainty. Currently Indigenous political identities remain unilaterally constructed mainly in terms of equal participation in the economy. However the economy is predicated on colonial resource extraction and dispossession of Indigenous lands and rights, making these political identities extremely problematic. I argue for the decolonization of state discourses and constructions of political identity as one step in the process of reconciliation.

RC09-186.1

HRISTOV, JASMIN* (*University of British Columbia, Okanagan*)

Development, Coercion and Non-State Violent Actors in the Era of Globalization

This paper proposes a new way of theorizing non-state armed actors in relation to economic globalization. While my propositions emerge out of the experiences of a number of Latin American countries, which are ranked among those having the highest homicide rates in the world, the framework advanced is intended as an analytical tool that can be utilized to shed light on violent environments in many other parts of the developing world. An influential literature on the subject of violence in the era of globalization argues that violence today is urban and criminal (as opposed to agrarian and political), with the most frequently identified sources being drug-trafficking, urban slums, and gangs. These, in turn, are attributed to the rapid rural-to-urban migration, which is seen as an inevitable by-product of Latin America's economic development. However, behind criminal organizations and gangs, lies a different type of violence that is neither criminal nor a tool of war. Paramilitary violence has been widely employed over the past 25 years in land appropriation, forced displacement, and the repression of social movements. This paper makes a critical intervention by addressing the limitations of several prominent clusters of literature found in the field of conflict and development, including works on: political violence; civil war as development in reverse; the weak state/failed-state thesis, the concept of 'new wars', and criminal violence. By exposing the role of non-state armed actors in securing and reproducing conditions for capital accumulation, with particular emphasis on land dispossession, my goal is to highlight the significance of paramilitary violence not only as an enabler of capital, but as a generator of social conditions characterized by propensity for structural and sexual violence, femicide, human trafficking, organized crime, and gang membership, thus revealing the deeply-rooted causes that give violence its reproductive quality across time and social spaces.

TG03-966.2

HRISTOV, JASMIN* (*University of British Columbia, Okanagan*)

Sexual Violence, Land Dispossession, and Illegal Armed Groups

This paper analyzes the dialectical relationship between land dispossession and sexual violence against women by taking the Colombian case as a starting point and providing illustrative examples from other countries in Latin America.

While the scholarship on gender-based violence in Latin America is substantial, it is largely concentrated in the following three areas: intimate-partner / domestic violence, gang / criminal violence, and sexual violence as a tool of war in the context of armed conflicts. There has been no analysis of sexual violence as both, a mechanism that can generate land dispossession as well as a consequence or a symptom of the social conditions created by land dispossession. This paper traces the patterns in the interaction among global capital (both legal and illegal), paramilitary (irregular) armed groups, and sexual violence. It demonstrates the parallels as well as interaction between the dispossession of small-scale farmers from their land and the dispossession of women from their sexuality. The central argument advanced here is that the vicious mutually reinforcing relationship between paramilitarism and patriarchy, which results in the commodification of women and children, is functional to securing some of the fundamental conditions for capital accumulation. Interwoven into the analysis are critical globalization theory, transnational and Marxist feminist theories, as well as a political economy approach to human rights.

RC32-593.5

HSIUNG, PING-CHUN* (*Department of Sociology, University of Toronto*)

Feminist Praxis in People's Republic of China

One of the perennial challenges in transnational women's movements is adequately analyzing and theorizing local feminist praxis. This paper examines how a woman's NGO in the People's Republic of China (PRC) simultaneously de- and reconstructs the discourse of women's liberation in order to increase women's participation in rural governance. It analyzes the logic, mechanisms, and underlying principles of local feminist praxis. Through analyses of policies, training materials, women's narratives, and related documents, this paper demonstrates that the NGO takes a dialectic approach. On the one hand, it challenges and deconstructs the official claim that Chinese women have already been liberated under the PRC. On the other hand, it articulates an alternative discourse of women's liberation in order to restructure the fabric of women's political participation. The paper identifies de- and reconstruction strategies in policy-making, both among women and amongst the masses.

To adequately theorize local feminist praxis, this paper takes a bottom-up, rather than top-down, approach. It argues that such an inductive approach must recognize women's political participation in rural governance as a primary site of feminist struggle in the Chinese context. It further argues that it is imperative to analyze both the macro forces and micro processes that have shaped women's political participation. At the macro level, this paper identifies forces such as the feminization of agricultural labor, increasing inequality between rural and urban sectors, and the invisibility of women's presence in electoral politics. At the micro level, it demonstrates that efforts to advance rural women's political participation must challenge and transform local norms and practices that continues to perpetuate gender inequality in public and private spheres. This paper contributes to global dialogues on transnational women's movements by discussing the accomplishments, challenges, and sustainability of a community-based feminist praxis.

Gendered Competition Among Chinese Adolescents: From a Competitive Education System and Harmonious Culture

Escalated competition in the Chinese education system from kindergarten quota to college entrance, from school strict property to provincial college quota, ect, has become media headlines and the new middle class parents' unescapable anxieties. In Western countries, the aggression of school year children and youth, how their aggression develops from an early age was widely studied by psychologists. Yet, it has not been scrutinized in context of mainland China, with a highly competitive education system and a patriarchal tradition emphasizing relational harmony and gendered roles. To address this understudied phenomena, I conducted semi-structured interviews with 30 college students who are juniors or seniors to ask them about competitions with their peers from high school through college and to show complex dynamics of emotion creation in their educational environments. From their narratives, we have identified youth competition in the arena of academia, friendship, and romantic relations, which shows a clear gendered pattern in educational space. As a result, competition generally comes in same-gender level, the competition within cross-gender peers might be seen as not on the same level, or never been considered, which I ascribed to the factors of gender stereotypes and socialization. In terms of academic performance, girls are confident and willing to compete with boys in traditional girl's area; whereas, boys feel more stressful when competing with girls in subjects where girls conventional excel, contrary to their same-gender competition in most setting. Girls show more aggression faced with shared friendships while boys appear to be more acceptable for common friends. When it goes to romantic relationships, girls acts in an indirect, but competitive way with same-gender peers, while boys showed more direct aggression. Interestingly, we have found that informants tend to use

words such as “harmony” to describe, if not disguise, the factually competitive relationships in their daily life.

Nineteenth Century Map-Makers in China: In the Disjuncture between Western Modernity and Tradition

The presentation focuses on my experience of reading the Chinese geographical publication, *Examinations on Tibetan Maps* (ca. 1880). The text draws from literary genres, such as poems and anecdotes, being ascribed with evidential weight in accounting for geographical reality. The difficulty of reading the publication does not lie in discovering the unique heterogeneity of data. Rather, the difficulty lies in understanding why the heterogeneous data can be legitimized and validated as knowledge.

The publication manifests how the nineteenth century intellectual community in China read the book, how they view the heterogeneity of data as methodically authentic. Scholars were situated in the disjuncture between Western modernity and traditional apparatuses of knowing the world. Data from Sichuan Provincial Archives illustrate how the dynastic officials conducted mapping practices, transported data and recorded their methods of mapping. Other geographical works in the dynasty, e.g. Jesuit Vebriest's *The Universal Geographical Interpretations* written for the imperial astronomy academy in China, present different methodologies of knowing the terrain. In the presentation, I will examine how the scholarly community reacted to Western science accompanied by the colonial power, and how they accomplished works such as *Examinations on Tibetan Maps*.

HUALDE, ALFREDO* (*El Colegio de la Frontera Norte*)

La Reinserción Laboral En México De Los Migrantes Retornados y Deportados De Estados Unidos: ¿Otra Vez La Precariedad?

En la década del 2005 al 2015 alrededor de 2.4 millones de migrantes mexicanos que vivían en Estados Unidos regresaron a México ya sea de manera forzada o voluntaria. Un informe sobre el tema señalaba que este tipo de migrantes cuando se insertaban en un trabajo o en un empleo lo lograban en menos de 6 meses. Sin embargo agregaban que sus condiciones salariales y sus prestaciones eran inferiores a quienes no habían emigrado.

Este trabajo se propone reflexionar acerca de las condiciones de reinserción de esta población mediante un análisis de tipo cualitativo en dos ciudades mexicanas: Tijuana y Guadalajara. En él se documenta el tipo de empleos que obtienen los retornados y deportados, en qué sectores y con qué condiciones de trabajo. Se expone el tipo de competencias y habilidades aprendidas en Estados Unidos que son reconocidas en los mercados de trabajo mexicanos y cuáles no.

Los resultados expresan una heterogeneidad relativa dentro del tipo de actividades laborales que desempeñan que va desde trabajos formales con salarios más que aceptables en los mercados de trabajo locales a trabajos informales precarios rayanos en la pobreza. Se examina el papel que juegan en este panorama recursos como la preparación del retorno, el dominio del inglés, la escolaridad, la pertenencia a determinadas asociaciones cívicas y religiosas. Asimismo se toman en cuenta las características de los mercados de trabajo locales con el objetivo de conceptualizar las trayectorias como precarias o sustentables.

Excellence and Equity of Teacher Professional Development in Singapore

Excellence and equity are important concepts and contradictory issues of educational systems in various countries. Economic strength and educational achievement in Singapore are internationally visible, and Singapore's student achievement has also been outstanding in many international surveys, such as TIMSS, PIRLS and PISA. The wide income disparity of Singapore citizens, however, is also quite large. This income divide also decreases the intergenerational social mobility and promotes social inequity. Inequity, in Singapore educational policy text, often uses a pluralistic or diversity metaphor and moral discourse to legitimize the discriminative treatment in educational system, and also forms a unique elite ruling and meritocratic values of Singapore. These values are also reflected in the Singapore teacher preparation and professional development process, which, for the ensuring high standards and continuous refinement of teachers' quality, as well as the establishment of moral significance and excellent culture in teachers and teaching profession. Therefore, teacher professional development is also considered as one of the important factors in the outstanding performance of Singapore students. In view of this, this article firstly discusses concepts of excellence and equity in Singapore's education. Followed by reviewing the role of Singaporean professional development in the dialectics between excellence and equity. Not only original structural elements of

teacher education and professional development but cultural and social factors also play key roles in the process. TALIS survey results will be used as the basis for the discussion of teacher professional development in Singapore, it includes: teachers' commitment, the effectiveness of professional development, the ways supporting professional development and the exclusion of obstacles.

Meanings of Home for Chinese Immigrants in Toronto

Canada is an immigrant country with its founding history, current development, and future sustainability intimately linked to immigration. Over time, the composition of immigrants in Canada has shifted from mostly white European descendants to more visible minorities, with Asia as the largest source of immigrants between 2006 and 2011 (Statistics Canada, 2016). Toronto is Canada's largest and world's most multicultural city (Levine, 2014, 6); in 2011, 46 percent of its population was born outside of Canada (Statistics Canada, 2016). Toronto's demographic has changed from a “British and Scottish outpost” to an “urban, cosmopolitan, and multicultural” place, which has mirrored Canada's transformation (Levine, 2014, 5). Chinese languages were the most common among those whose mother tongue was other than Canada's two official languages, English and French (Statistics Canada, 2015). Throughout Canadian history, Chinese immigrants have been subject to systematic barriers including the Exclusion Act and Head Tax in the early 20th century (Chan, 2013), and have experienced inequality in accessing employment due to language barriers and foreign educational credentials, especially for the first generation immigrants (Hasmath, 2012). Yet, very little recent research has examined the lived experience of Chinese immigrants in Canada today, especially in relation to “home”. Existing research on home includes diverse and even contradictory meanings of the term, including home as a place, space, feeling, practice, and state of being. Most studies on the meaning of home in the multidisciplinary theoretical and empirical literature are conducted in a Western context (Mallet, 2004). My research seeks to understand the meanings of “home” from the perspectives of first generation Chinese immigrants in Toronto. I will use interpretive methods with qualitative data to describe their lived experience, identify provocative elements, and uncover fundamental assumptions to expose principles, thus opening a conversation for cross-cultural home-making.

Theorizing Immigrants and Home

Ambiguity in cross-cultural meanings is an unavoidable problem in the everyday life of immigrants. In particular, the meaning of home is enigmatic because immigrants are divided around the notion of what is their proper “place”. Furthermore, the notion of being modern makes immigrants' loyalty to place enigmatic. Where do immigrants belong? In this paper, I will present phenomenological research to understand the meanings of home in the life-world of immigrants. In addition, theorizing seeks to reveal underlying structure of disharmonies covered by linguistic ritual that tends to make such instabilities appear harmonious in any order (Blum, 2017). Guided by this principle, my research will theorize how meanings are made in situations with differing cultural expectations in the particular case of immigrants' pursuit of “home” in Canada.

Why in Korea Can Make Schooling with Social Justice? an Analysis on Results from 2013 Talis

Korea is among the OECD's top-performing countries in PISA and has positive equity indicators for 15-year-olds. Performance of students was above average in mathematics, reading and science in PISA 2012. Korea also had the largest share of top performers in the OECD in mathematics in 2012, with 30.9% of students at or above Level 5 (compared to the OECD average of 12.6%) and the lowest share of low performers, with 9.1% of students below proficiency Level 2 (compared to the OECD average of 23.0%). Despite being a consistently high performer in all PISA cycles, Korea has still improved continuously in reading and science, with unchanged performance in mathematics. Socio-economic background had less impact on student performance than the OECD average in PISA 2012, and this has been the case since PISA 2003. Korean students were also the top performers in the OECD for creative problem-solving in PISA 2012 (OECD, 2016: 6). The above results present that students whether or not come from advantage or disadvantage family can have the similar education quality. Around 96% of students or more in Korea attend schools whose principals reported that learning is not at all or very little hindered by teachers having to teach students of diverse ethnic backgrounds within the same class (OECD, 2013: 177). And only in Korea were public schools able to attract more advantaged students in 2012 than they did in 2003 (OECD, 2013: 145). This paper would like to explore the reasons why

in Korea can make more equality education more other countries in OECD. The paper will make some conclusions and suggestions to be references for education policy to achieve social justice.

Disaster Training Needs Assessment: Understanding Households' Perceptions on Stakeholder Roles and Protective Actions to Seismic Hazard in Sichuan, China

Research on debunking erroneous information suggests that programs for training people about how to respond during earthquakes are likely to be most effective if they explicitly address erroneous beliefs about the most appropriate protective actions. In addition, they should identify the characteristics of prospective information sources that are most likely to influence people's response actions. Accordingly, this study examined four seismic hazard response actions and their relationships with perceived stakeholder attributes, risk perceptions, and respondent characteristics. The results from 647 respondents showed that the most common response action intention was evacuation (4.77 out of a 1-5 scale, same as followings), followed by triangle of life (2.52), drop-cover-hold (2.47), and ignorance (1.66). Respondents rated ten stakeholder types on six characteristics—reliance, accessibility, amount of information, seismic hazard knowledge, trustworthiness, and responsibility for taking protective actions. In sum, respondents rated higher for responsibilities, trustworthiness, and expertise than for accessibilities and amount of information, indicating quality is more important than quantity. Correlation and regression analyses revealed that protective action was negatively correlated to stakeholders' responsibility. Respondents who had higher concerns on the amount of information would be more likely to ignore the shaking, whereas respondents who favored easy-accessed information sources and believed stakeholders' seismic hazard knowledge, would be more likely to take inappropriate protective action (e.g., triangle of life). Finally, immediate evacuation, which has been recognized as the easiest protective action, but is not recommended in an earthquake, was only correlated to risk perceptions, but not any of stakeholder attributes. The findings of this study suggest that risk communicators should consider the quality of information flow as well as individuals' information reliance behaviors.

Mary McIntosh and Queer Liberation in Britain

Mary McIntosh (1936-2013) is one of the names synonymous with British sociology. Her Marxist, feminist and sexuality based work in the second half of the 20th century has cemented her in the history of Sociology. This work does not go unnoticed now, just as it didn't then, for example, when she was deported from the US in 1960 for speaking against the House Un-American Activities Committee. McIntosh's politics, her activism and her academic research are intertwined. Perhaps her most famous paper 'The Homosexual Role' in 1968 was pivotal and sits across the bridge of her academic and activist life. Some files in the McIntosh archive offer a more in depth view of just how 'The Homosexual Role' came about and include details of her membership to lesser known British lesbian activist groups such as the Minorities Research Group and Kendri. In this paper I will explore these more hidden histories of queer liberation and academia in Britain and pay close attention to Mary McIntosh and the networks she had, which included psychologists, authors and activists. McIntosh's involvement with the gay liberation front has been well documented, however these lesbian organisations often get forgotten about in histories of queer liberation, and I pay closer attention to these more marginalised groups. At the core of what McIntosh fought against was injustice. Her work has contributed to our understandings of power and it is through studying and this history we might be able to recognise and contextualise our own time. In doing so, I argue, we might be able to tackle the stubborn injustices still present today more effectively.

Win-Win or Lose-Lose? Problematizing Women's Role in Household-Level Environmentalism

Environmental social scientists require better explanations of the relationship between environmental protection and women's economic status relative to men's. A growing body of literature finds evidence that gender equality augments national-level environmental sustainability. Required now is an

understanding of whether environmental protection efforts at the household level (pro-environmental behaviors or PEB) are related to gender differences in economic status. We contribute to this effort in two ways: (1) we develop a theoretical approach to understanding the relationship between PEB and gender differences in economic status; and (2) we empirically demonstrate gender differences in the relationship between PEB and economic status. Analyses using 2010 International Social Survey Program data from 32 nations find that women report higher frequency of engagement in PEB than men, regardless of economic status – and even when a woman has a higher economic status level than her male partner. We interpret these descriptive observations using the theoretical framework developed in the article's first section. The article concludes with recommendations for methodological and theoretical approaches that move beyond considering gender as a control variable toward identifying possible mechanisms driving the relationship between environmental protection and women's status relative to men's taking into account the possibility that engaging in PEB may exacerbate gender inequality.

Sustaining the Movement: Exploring Women's Roles in Islamic State Twitter Networks

This article investigates the social media content of women who are affiliated with the Islamic State. Throughout one year, ninety-three Twitter accounts were tracked to explore the patterns of engagement by pro-Islamic State women online, and examine how these patterns illuminate the roles that pro-Islamic State women occupy on social media networks. The study reveals that women who associate with the Islamic State mostly preserve the traditional gendered role of support in the online realm. However, support is not their exclusive role and some women are active in the organization, using Twitter to recruit, promote, and even commit terrorist violence.

HUI, ELAINE SIO-IENG* (*Pennsylvania State University*)

Hegemonic Transformation: The State, Laws, and Labour Relations in Post-Socialist China

This book contends that the Chinese economic reform inaugurated since 1978 has been a top-down passive revolution, in Gramsci's term, and that after three decades of reform the role of the Chinese state has been changing from steering the passive revolution through coercive tactics to establishing capitalist hegemony. It illustrates that the labour law system is a crucial vehicle through which the Chinese party-state seeks to secure the working class's consent to the capitalist class's ethno-political leadership. The labour law system has exercised a double hegemonic effect with regards to the capital-labour relations and state-labour relations through four major mechanisms. However, these effects have influenced the Chinese migrant workers in an uneven manner. The affirmative workers have granted active consent to the ruling class leadership; the indifferent, ambiguous and critical workers have only rendered passive consent while the radical workers has refused to give any consent at all.

Published by Palgrave Macmillan, New York (<http://www.palgrave.com/la/book/9781349700196>), early 2018

Endorsed by:

Hegemonic Transformation deftly weaves together breathtaking grand theory, meticulous explication of workers' thinking, and careful middle-range analysis comparing variation amidst the broad similarities. An original, important, persuasive and indispensable account that takes this much-studied topic to a new level—Prof. Marc Blecher, Oberlin College

After forcefully implementing capitalism in a passive revolution since 1978, in view of increasing workers unrest the Chinese party-state has recently moved towards establishing capitalist hegemony based on new labour laws. As Elaine HUI, however, demonstrates in this fascinating book, hegemony is always contested. A must-read for everyone, who is interested in the changing Chinese form of state.—Prof. Andreas Bieler, Nottingham University

Turning Associational Power into Workplace Institutional Power? the Case of Migrant Workers in China

While worker associational power, defined as "the various forms of power that result from the formation of collective organizations of workers" (Wright, 2000, p. 962), is often understood in connection to trade unions or other worker organizations (Chun, 2005; Silver, 2003; Von Holdt & Webster, 2008; Wright, 2000), this article distinguishes between two types of associational power: union-led

associational power and worker self-organized associational power. Based on this distinction, the author argues that China's rural-migrant workers, a deprived and precarious workforce, has no union-led associational power because official trade unions in China, which are under the manipulation of the state and companies, have failed to organize workers collectively (Chen, 2009; Friedman, 2013; Lee, 2007). However, in the past decade increasingly more migrant workers organized themselves collectively to stage wildcat strikes, elect their own strike leaders, set up solidarity fund, develop divisions of labor among activist-workers, and so forth. All these have strengthened their self-organized associational power, which is independent of the party-led trade unions.

This article also examines if migrant workers are able to convert their self-organized associational power into workplace institutional power, defined as workers' collective power, recognized by employers, that aims to influence employment terms and conditions on a regular basis. This will help us understand, at the conceptual level, the relations between these two types of power, what conditions are warranted for converting worker self-organized associational power into workplace institutional power, and what obstacles to such conversions are.

Data of this article was collected from 2010 to 2017 through two major means. First, the author interviewed over 100 migrant workers, labor NGO staff members, and labor experts in China. Second, the author conducted participant observation in worker meeting, strikes, collective disputes, and worker gatherings.

HÜLLE, SEBASTIAN* (*Department of Sociology, Bielefeld University*)

A Life-Course Perspective on Attitudes Toward Distributive Justice Principles

Why is a concrete degree of objective social inequality considered by some individuals to be just, while others consider it unjust and illegitimate? An individual's subjective evaluation of inequality depends on its normative orientation and attitudes toward distributive justice. These "order-related justice attitudes" comprise preferences for distributive justice principles such as equality, need, equity, and entitlement. Interestingly, there is little knowledge whether order-related justice attitudes are stable or change during an individual's life.

Over their life-course individuals are embedded in different structural contexts such as family, school, and workplace. Research provides evidence that specific distributive justice principles are typically applied within certain contexts. Hence, individuals experience and learn here how distributional conflicts are typically resolved within these contexts when certain justice principles are routinely applied. The paper assumes that people develop their individual preferences toward distributive justice principles due to these structurally mediated learning experiences (socialization) and an individual's position in the society's inequality structure that is systematically connected to specific interests (rational choice).

In order to analyze change and stability in order-related justice attitudes, one needs longitudinal data that systematically capture the structural conditions individuals are nested in. For the first time such data are available in the German panel study "Legitimation of Inequality Over the Life Span" comprising survey data and extensive context information regarding the household, social network, and workplace.

The paper analyzes the change and stability in order-related justice attitudes and tests various hypotheses using data of two waves. It provides empirical evidence for the relevance of change in an individual's socioeconomic position and workplace characteristics (gender composition, share of migrants). These findings give first insights of how preferences toward distributive justice develop over the life-course and consequently, also the legitimacy of inequalities.

Atypical Employment Forms and Health Inequalities – Multiple Job Holding As Mental Health Risk?

Physical and psychosocial conditions of Work and employment conditions like (lack of) social protection, job (in)security and income substantially influence the health situation of employees. Both employment and working conditions are largely determined by the employment form. As a consequence of socioeconomic and political changes atypical forms of employment such as part-time work, fixed-term employment and multiple job holding increased in the labor market. Consequences of atypical employment forms for employees are discussed controversially. On the one hand, atypical employment forms offer new possibilities for individual needs regarding the reconciliation of work and

family life. On the other hand, such employment forms are often associated with worth working conditions and various socioeconomic disadvantages. Therefore, the employment form has become increasingly important as health determinant.

In our contribution, we explore the pathways linking atypical employment to social health inequalities. Thereby, we focus on employees with more than one job (multiple jobholders) and investigate the health risks of different types of multiple jobholders.

Data refer to the German BiBB/BAuA-Employment-Survey. We analyzed data of 1'318 female and male multiple jobholders. Cluster analyses reveal eleven types of multiple jobholders. This typology is based on data on the economic situation, the professional status, the weekly total working time and the age of the employees. The data indicate that the different types of multiple jobholders follow a core-periphery stratification. In the peripheral area multiple jobholders have a combination of different social disadvantages and hazardous working conditions, while multiple jobholders in the core area have mainly a high-quality employment situation including job security, and appropriate salaries. Furthermore, (mental) health differentials are unequal distribute among different types of multiple jobholders.

Juggling Two Jobs (and a family): Working Time and Work-Life Balance

In recent decades, the working world has changed dramatically and the coordination of personal and professional life becomes more difficult. One of these changes is the substantially increase of atypical forms of employment in the labor market; one such form is holding more than one job. Multiple job holders must coordinate demands from two separate work roles and demands of personal life. Additionally, holding a second job in addition to a fulltime employment often results in long working hours - especially for those who hold a qualified or highly qualified job. Research has shown that long working hours negatively affect individuals' work-life balance. In contrast, working time autonomy has shown to have positive effects on employees' work-life balance. The aim of this study is to investigate the effects of the extent of working hours and work time control on the work-life balance of employees with and without a second job. Based on data from the BAuA-Working Time Survey a representative sample of 17 921 employees in Germany constituted this study's sample. Participants were 50 % female, aged 16 to 65 years (Ø 46 years), and 47 % had higher education. Six percent of the participants held more than one job. As predicted, results of hierarchical regression analyses showed that the extent of weekly working hours had a negative effect on work-life balance while work time control had a positive effect. Holding a second job had no direct effect on work-life balance. However, it moderated the effect of the extent of working hours on work-life balance: Multiple job holders with long working hours are less satisfied with their work-life-balance compared to employees with one job and long working hours. The results point to the challenge of balancing personal and professional life in the modern working world especially for multiple job holders.

Concepts of Well-Being of Children in Baku/Azerbaijan

The findings that ground the theoretical and methodological considerations of my presentation are based on empirical data collected in Baku/Azerbaijan. Ten qualitative interviews have been made with girls aged between ten and twelve years stemming from well-off but also non-privileged families living in various places in Baku. Besides group interviews with a range of 20 pupils (same age and younger) in various schools in Baku have been made discussing what "happy" compared to "satisfied" means to them – this was part of a prestudy of a quantitative project on children's well-being. The qualitative interviews as well as the group discussions showed how the children very clearly differentiated between a concept of well-being that can be called more "hedonic" ("being happy") referring to personal happiness as well as a concept that can be said to be more "eudemonic" ("being satisfied") implying that the expectations of the important others are met. There was on the first sight no obvious or clear positioning from the children telling that one concept of well-being was neither better nor preferable to the other, it more or less seemed to be part of the child's attitude and while some preferred being happy others judged being satisfied as more valuable and/or important for them.

Along this empirical example I want to highlight in my presentation the question of normativity of "the good" and the interrelation with concepts of well-being. I will then discuss methodological questions linked with this issue, notably the question of how to research and analyse concepts of well-being of children while taking their socio-cultural position into account. With reference to my empirical example I will at the end of my presentation try to answer the question, how, by

an praxeologically grounded, intersectional analysis, “preferences” of one concept of well-being towards another might be explained.

HUNT, WHITNEY* (Wayne State University)

Negotiating New Racism: “It’s Not Racist, It’s Not Sexist. It’s Just the Way It Is.”

Comic books have long been a cultural space dominated by white, masculine characters and audiences. More recently, comic books are being adapted into film and television series, encouraging underrepresented voices to become more prominent in comic book culture. While white men continue to dominate as creators, consumers and principle characters, women and people of color are purchasing comic books more than ever before, are more likely to go to the theater, and are just as likely to attend comic conventions. However, traditional leaders in comic books, Marvel and DC, have been slow to diversify their characters, and have been subject to substantial criticism for maintaining the dominance of white men. Movie goers have begun using social media outlets and online forums to engage in long overdue conversations about race in pop culture. Employing a qualitative content analysis of an online forum tailored to comic book culture and superhero movies, this research explores how fans negotiate their continued fandom of Marvel comics amidst claims that the comic book industry is discriminatory towards people of color. Drawing on sociological concepts of new racism and white racial framings, this study examines the wider societal context of race representation in film beyond imagery and content. Specifically, this research analyzes how forum discussion adopts framings of new racism when accounting for a lack of diversity in comic book films. Findings reveal that fans largely rely on white racial framings throughout discussion. Furthermore, central themes indicate that most forum participants suggest only overt discrimination implies that race matters, and minimize the effects of historical processes; moreover, few fans challenge traditional representations while most normalize white dominance. This study contributes to the growing body of research on new racism and the prevalence of white racial framings throughout mainstream media.

Portrayals of LGBTQ Older Adults in Canadian Newspapers and Popular Magazines

Bytheway (2011) has argued that media portrayals of later life “create expectations of what it is to be a person of a particular age” (p. 80) and how aging and older adults are seen and culturally (de)valued. While a wealth of literature has explored how heterosexual older adults are portrayed in the media, little attention has been given to the representation of LGBTQ aging. In this paper, we examine how LGBTQ older adults are portrayed in Canadian newspapers and popular magazines. We report on our thematic analysis of 81 stories collected over a one year period from three national Canadian newspapers (The Globe and Mail, The National Post, and Metro Canada), the top one or two most widely read newspapers from each province, and the five most popular and widely read Canadian magazines that include and/or cater to the mature market (Chatelaine, Canadian Living, Maclean’s, Reader’s Digest, and Zoomer). Our analysis of the stories revealed three key findings: a) “struggle and resilience” – living through a history of exclusion and discrimination over the life course; b) “back into the closet” – LGBTQ older adults as an invisible, marginalized, and under-served population in health care and social policy; and c) “nothing to hide” – LGBTQ celebrities such as Caitlyn Jenner who are challenging social norms and forging new ways of growing older. Drawing on queer theory, we discuss our findings in relation to theorizing and research pertaining to ageism (*the devaluation of later life and the concomitant discrimination against those who are old*), heterosexism (*the stigmatization, denial, and/or denigration of nonheterosexuality*), and femininity and masculinity norms and ideals. Thus, we consider how print media reproduce, reinforce, and sometimes disrupt socially constructed norms pertaining to age, sexuality, and gender, which collectively exclude older LGBTQ adults and heighten their cultural invisibility and vulnerability.

HURLY, JANE* (University of Alberta)

“I Feel Something Is Still Missing”: Leisure Meanings of African Refugee Women in Canada

Little is known about the leisure meanings of African women living in Canada, particularly of those who came as refugees. Using a hermeneutic phenomenological approach, underpinned by Heidegger and Gadamer’s philosophical stance focusing on interpretation (Van Manen, 2014) I examined the leisure meanings of three African women who arrived in Canada as refugees

and had resettled in a Canadian Prairie city. Joan, Naomi, and Michelle, who had fled conflicts in South Sudan and the Democratic Republic of Congo, had lived in Canada for between two and six years. All had experienced traumatic experiences of conflict, including personal loss, violence, and deprivation in their homelands. Their leisure meanings fell largely into two categories: purposeful leisure and pleasurable leisure. Purposeful leisure defined leisure for advancement, self-improvement and knowledge-gain, and much of it was centred in their faith, faith community, and church. They all cited learning as a leisure activity and saw learning as playing a dual role in their lives because it was also necessary for career advancement, and for carving their place in the broader Canadian society. Physical activity was engaged in for leisure and fitness, and enjoying nature-based leisure with friends and family were important for passing time pleasurably, enjoying companionship and cementing friendships. These same activities were also engaged in purposefully to mitigate their ongoing stress resulting from past trauma and resettlement stress. Because of the prominence of their faith and the church as central to these women’s leisure, collaborative efforts by faith-based entities, leisure and recreation organizations and practitioners, settlement agencies, and mental health bodies is strongly recommended to effectively and holistically address the unique challenges of resettled African women refugees through leisure.

Automated Diagnosis: Rhetorics of Technical Change in Radiology

When new technologies are adopted into professional workplaces, the existing allotment of work tasks is often altered. How do professionals respond to such shocks? Radiology, a highly digitized, high-status medical specialty, has profoundly changed in response to the progressive digitization of its tasks. The field was first affected by the digitization of diagnostic image production, through technologies such as computerized tomography (CT). The widespread adoption of Picture Archiving and Communications Systems (PACS) digitized the diffusion of diagnostic images, allowing for rapid and remote retrieval and interpretation, but once again changing the allotment of tasks. Most recently, the structure of radiology has been challenged through the advent machine learning technology, which may digitize the interpretation of images themselves. Each successive technology has generated unanticipated consequences, opening space for challenges to radiological expertise from technologists, non-radiological clinicians, and finally, from machines themselves. How have radiologists resisted or adapted to such changes? Content analysis of a major radiological journal offers insight about both the effects of technological change and radiologists’ strategies for resistance and adaptation. By analyzing the rhetorical repertoires and behavioral strategies that professionals use to respond to technical change within the workplace, we can better predict the effects of automation and design more effective responses.

Repairing a Bad Barrel? Selective Enforcement of Corruption Statutes in Corrupt Environments

In 2013, Xinhua, the Chinese news agency, announced that Chinese police were investigating the “massive bribery network,” organized by British pharmaceutical manufacturer GlaxoSmithKline (GSK), through which it had allegedly pocketed billions of yuan in illicit revenues. A regional court later found GSK liable for bribery and tax fraud, issuing a fine of 500 million Euros—the largest in Chinese history—and sentencing five employees to prison. The company quickly issued a remarkable statement of apology. Chinese regulatory oversight of the pharmaceutical industry had been historically lax; bribery of doctors had become common practice. The Glaxo case is a landmark. What explained the state’s strong reaction in this particular case? To construct the case, I conducted a content analysis of articles about GSK appearing in Xinhua, one of the principal means that the Chinese state communicates with the wider world—and a lens with which to understand Chinese government attitudes and values. Xinhua used a variety of rhetorical strategies to defend selective regulatory action against GSK. GSK’s record of corruption convictions in other countries, made the company an easy regulatory action. The conviction of GSK was intended to send a signal to pharmaceutical manufacturers (particularly multinationals), that the state intended to significantly curb kickbacks associated with drug sales. Xinhua also recognized that medical bribery constituted a large portion of the government’s rapidly growing healthcare costs. This case has clear implications for the understanding of the prevalence of organizational corruption within environments rife with corruption.

HUSBANDS, CHRISTOPHER* (*London School of Economics and Political Science*)

Sociology in Britain: Sociology Courses before the 'First' Sociology Course

There is probably still a residual belief in the once popular mythical claim that the first sociology course taught in Britain was that of Edward Westermarck at the London School of Economics in the 1904-05 academic year. The more modest truth is that this course was the first with the title of 'sociology' or with some part-of-speech derivative of the word that was taught as part of a syllabus – and in this case a rather small part at that – which led to a conventional Bachelor's degree in a statutorily accepted institution of higher education.

Various earlier-taught courses in sociology – one more than fifteen years earlier – may, however, be identified and, these having been identified, this raises several questions:

- What the character was of the institutions where they were taught;
- What, in curricular terms, they might have been teaching; and
- Whether their content had any relationship on the curriculum of Westermarck's first LSE course, when he came to teach it.

The institutions where these first courses were taught had a distinct focus to their teaching and their courses typically led, if passed, to the award only of a diploma of some sort. The particular locations for pre-LSE sociology were two: non-conformist religious college foundations and institutions whose philosophy was social meliorism. The first category contains two identified institutions, neither statutorily accepted as a full university; the second emerged from the philosophy and practice of nineteenth-century philanthropy as exemplified by the later role of the Charity Organization Society.

The paper presents discovered curricular information about these different courses and concludes with some specific observations on the well-discussed subject of how far these very different beginnings contributed to the slow, and disparate, growth of British sociology.

Interrogating Science Policy in a Pro Gender Equality Setting: The Case of Sweden

This paper interrogates science policy-making through a gender lens in a country setting that strongly promotes gender equality as a societal value and as an explicit policy goal. The paper asks: can something be learnt from this kind of a setting to benefit the implementation of the targets of the UN Sustainable Development Goals? Swedish society has among the smallest societal gender gaps in global comparison. With its long term history of gender equality policy and actions, and the current social democratic-green coalition government declaring itself as a "feminist government", it provides an interesting societal setting for this kind of exercise. Gender mainstreaming the activities of public authorities is a strong policy line, including, among others, public research funding and innovation agencies, and recently universities. The paper addresses the question in what ways are gender dimensions integrated in Swedish contemporary science policy. How are problems in this arena articulated, defined, and contested? How are gender dimensions taken into account in the governance and steering of science, in science policy strategies, and in the activities of different key stakeholders and inter-organisational activities? How does international collaboration, specifically within EU and the Nordic region, reflect on how gender dimensions are taken into account in the Swedish science policy landscape? What kind of dilemmas and contradictions can be identified? The empirical material consists mainly of science policy documents, and is supported by material generated through participant observation in some science policy arenas, such as research funding agencies and governmental advisory committees, as well as media coverage. An emerging issue in gendering of science policy-making that is of high relevance to the SDGs is highlighting the gender dimension of research content in funding of research, in addition to the gender distribution of scientific labour force and among gatekeepers and decision-makers in science.

Giving Back to Get Ahead: Development Industry Professional's Understandings of Public-Private Social Housing

In recent years local governments in North America have increasingly turned to public-private partnerships with developers to create social housing in response to the ongoing retrenchment of the welfare state. This paper examines the tensions and contradictions of new approaches to developing social housing "through the market," in a case study of two Canadian Cities, Toronto and Vancouver. Drawing from two years of ethnographic fieldwork in both cities as well as 97 interviews with developers, planners, politicians, NGOs and housing activists, I discuss the

production and contestation of what I refer to as "ethical development regimes." This urban regime type involves the use of density bonusing, or allowing excess height to condo developers, in exchange for units of social housing. Focusing on my interviews with developers I discuss how their understandings of "social responsibility" and philanthropy have become a mechanism for justifying surplus profit making. In doing so I advance the conversations around urban neoliberalism as well as what sociologist Emily Barman refers to as "caring capitalism."

David Against Goliath: How a Small Village on Jeju Island in South Korea Became a Hub of the Peace Movement in East Asia

David against Goliath: How a small village on Jeju Island in South Korea became a hub of the peace movement in East Asia

Since 2007, some 700 residents of the small village of Gangjeong on Jeju Island in South Korea, have been struggling against construction of a naval base: the official initiator was Korean navy however, the real initiator was US Navy. No one, not the even village residents, thought the struggle would last so long: it seemed lost in advance. Their competitors were the Korean government, the US Navy and major construction companies: they have power, capital and major media. Despite being only David, the Gangjeong people have already won: not only they rose up to defy "Goliath", but also the resistance is still ongoing after the construction of naval base in 2016.

The main question of this research is how a small community without many resources succeeded in maintaining the movement for a long period of time and became one of the important hub of the peace movement in East Asia. I conducted in-depth interviews and participate observations on June 2015 and on August 2017 in Gangjeong. My analysis will focus on the dynamics of the roles of three different types of actors in the place (native residents, activists and catholic religious), as they are bringing resources: material, non-material, creating frame of meaning for the movement and mobilizing people: nationally, internationally. Catholic religious actions are quite particular here: by celebrating 'street-mass' every day with parishioners, visitors, and activists in front of constructing site, they are creating 'protesting sanctuary' not only for activists but also 'common people'.

Just in Time

Difficulties - risk and opportunities, and perhaps incalculabilities – may take the form of an untimeliness which arrives exactly on time: Precisely this one and no other, and which comes just-in-time. Just, because it is anachronic and ill-adjusted. (Derrida 1994: 31)

The introductory citation from Derrida hints to a break with a common sense understanding of "just-in time". The understanding of time as pre-given and independently running without any reference to the social spheres of society is to be left behind in order to grasp how time works in social relations and in organisations. In the paper will be discussed how time appears in three different modalities in modern care institutions. With empirical data from Danish residential homes, it is analyzed how time follows either scheduled routines, appears as outcome from situational interactions or thirdly appears in a disturbed presence, where the timely readiness towards sudden needs are handled by alarm technologies. The paper show, how the three types of technologies change the care giving processes, the structures of decision making and the roles of the care givers and -takers. The approach used in the analysis of data is inspired by the German system theorist Niklas Luhmann. His work follows from a phenomenological understanding where time is a meaning category in the social among two others (social and fact dimension). Here the meaning horizon of time is closely linked to the fact that time is a scarce resource, which is also the case in welfare mediated care for elderly people in Denmark.

The paper is analysing qualitative data from a specific welfare organizational setting but also with an ambition of pointing towards more theoretical and perhaps generalizable implications of time and technologies used in service provision, social care and nursing.

Gendered Penalties of Divorce on Remarriage in Nigeria: A Qualitative Study

Seeking the views of metropolitan, university educated Nigerians in Lagos and Abuja (the previous and current capital cities respectively), our study explores gendered perspectives on the issue of remarriage after divorce to gain a deeper understanding of how customary, Islamic and statutory laws intersect. We build on previous studies (e.g. Therborn, 2004) to highlight that from the 1930s onwards, marital aspects of modern customary laws may be more patriarchal than some pre-colonial ones due to the colonial codification of customary laws in Africa. The empirical basis of our study is interviews with 24 Nigerian men and women, including female divorcees. The results suggest that what Ibrahim (2015) calls "the sociocultural penalties of divorce" are borne more heavily by women and this is exacerbated because traditional or customary laws in modern Nigeria were re-shaped by colonial Christian codification. We conclude that whilst Yoruba people seem to have thwarted some of the more negative legacies of religious codification on traditional laws more than other major ethnic groups, customary laws in Nigeria still require re-codification to take on board the perspectives of African feminism.

Socially Constructed Awareness of Radioactive Risks: A Case Study of Iitate Village

This study was based on a case study of Iitate Village. A forced evacuation order issued by the Japanese Government, due to the Fukushima Daiichi Nuclear Plant accident triggered by Northeastern Great Earthquake Disaster occurred on March 11th, 2011, has been released for the most part of the village since April 1, 2017. I interviewed 4 types of evacuees: a) who returned to the village after he had resumed farming outside the village; b) who did not return to the village after he had resumed farming outside the village; c) who returned to the village after he had stopped farming; and d) who did not return to the village after he had stopped farming, and documented the process to reach the present situations, especially regarding with the awareness of radioactive risks. Before the Nuclear Power Plant accident, there were approximately 960 farms in Iitate Village. After the forced evacuation, approximately 20 farmers resumed farming outside the village using diverse farming styles. The main findings of this study were: 1) type a and b farmers both shared a strong will "to engage in farming again" by obtaining farmlands in newly-settled places using public funds because the compensation for the damage paid by the Tokyo Electric Power Company (TEPCO) was insufficient although it played an important role in several cases; 2) type a and c farmers decided to return to the village because of their assurance that the radioactivity declined to the safe level although most of them were over 60 years old; 3) the awareness of the radioactive risks was quite different from one another because of not only the radioactive dose but also an individual situation; and 4) the individual situation was influenced by social conflicts among village people, and vice versa.

How Does the National Domestic Migration Promotion Policy from Urban to Rural Areas Let Rural Areas Transform?

This presentation will introduce that Japan's domestic migration promotion policy is progressing rapidly from 2009, and consider the merits and demerits of what this policy brings to rural villages. In Japanese rural areas, depopulation, low birthrate and aging, imbalance development compared to cities have become major serious difficult issues since the 1960s. Countermeasures against these issues by the state were public works and infrastructure development, but, from the 2000s, policies to supply support human resources to rural areas started. It is "Community-Reactivating Cooperator Squad", which was initiated by the government from 2009. Local governments employ citizen residents who are interested in revitalization of rural areas and rural life as regional cooperation volunteers up to 3 years. The national government pays their expenses. The amount is 4 million yen a year for each member. The number of members in the whole country started 89 people in 31 municipalities, but in 2016 it grew to 3978 in 886 municipalities. About 60% of the members settled in the same area

after the term of office. In general, it is evaluated as an effective countermeasure. Meanwhile, from my empirical investigation, in reality local governments and migrants are confused. Local governments do not know how to handle migrants, and migrants do not know what to do as a rural promotion activity. The administration couldn't provide effective support for settlement and employment. Urban residents move to rural areas through pluralistic motivations, for example, a desire to withdraw from urban neoliberalism. However, they tend to be judged by performance-based-evaluation of what kind of activities they conduct in rural areas. People with extremely neoliberal characteristics tend to remain, and human resources become extremely unified. Resulting in rather than being sustained as traditional rural areas, they are strongly incorporated by capitalistic free competition, depending on each efforts and self-responsibility.

What Is the Result of the Youth's Mobility? the Case of a Japanese Rural Areas.

In this presentation, results of Japanese youth's migration to rural areas is discussed while introducing the case of Japan's domestic migration promotion policy that is progressing rapidly from 2009. In this discussion, the mobility of youth will be shown to lead to managing and adjusting human relationships of young people. In addition, it will be inspected how coordination of youth's relationships influences the identity construction of the youth. In Japanese rural areas, depopulation, low birthrate and aging, imbalance development compared to cities have become major serious difficult issues since the 1960s. Countermeasures against these issues by the state to supply support human resources, especially youth, to rural areas started recently. It was initiated by the government from 2009. Local governments employ young citizen residents who are interested in revitalization of rural areas and rural life as regional cooperation volunteers up to 3 years. The national government pays their expenses. With the support of this system, many young people migrate from cities to rural areas. From my empirical investigation, one of their migration motives turned out to be an adjustment of human relations. How the youth coordinates relationships has been becoming the significant and difficult issue in today's Japanese society because of social fluidity, social multi dimensions. The youth must acquire a personal position in the society by creating relationships by oneself, and build one's identity. Young people emigrate in hopes of escaping human relations in their hometown. They will change to weaker ties and build a new relationship by acquiring strong ties in rural areas. However, there is a tendency for only young immigrants who can successfully coordinate these relationships to continue settling, and as a result young people are plagued by the adjustment of relationships even at immigration destinations.

The Relevance of Clinical Sociology to Situational CRIME Prevention

Prevention they say is better than cure. This statement is apt when it comes to the application of clinical sociology to situational crime prevention. clinical sociology is the practical counterparts to academic sociology and situational crime prevention is an approach that emphasis the idea that crime is better prevented by understanding the situations that give rise to crime and manipulating the situation to stop crime from happening. This paper therefore examines how clinical sociology can help situational crime prevention approaches achieve their ultimate objectives of crime prevention in communities and societies.

Varying Cosmopolitan Cultural Capital & Privileges: The Comparative Study on the Japanese Migration Agents' Promotion of Education-Led Mobilities to Hawaii, USA and Southern Johor, Malaysia

As globalization of economy and education has been intensified, varying patterns of international mobilities of families and youth has emerged in order for them to acquire cosmopolitan (or global) cultural capital, which enables ones to achieve upward social mobility in the emerging global social stratification. For Japanese families, the education-led international mobilities towards English-speaking West such as Hawaii, USA, has been predominantly known in the past two decades. But a newer mobility to Asia, such as the area of Southern Johor, Malaysia, has been recently emerged since 2010s. This study, comparing patterns of Japanese migration agents' promotion of education-led international mobilities to Hawaii and Southern Johor investigate how the meanings on kinds of skills children can obtain through international schooling in these two sites have been generated. I first provide a historical analysis on how the phenomenon on

the education-led migration started in Japan since 1990s mainly to Hawaii, and how the options of migration to Asia has gradually emerged. Next, I argue that families' choice of education-led mobilities is highly classed—Hawaii is selected as more authentic, prestigious and costly migration destination than Southern Johor. Lastly, I discuss how migration agents define and promote types of cultural capital children can acquire through their international schooling in these two sites. While both places are defined as locations where children can learn cultural tolerance and English, Southern Johor is actively promoted for children to obtain Chinese—an emerging regional cultural capital in the Asia region.

Re-Examining Social Integration in Transnational Contexts: A Migrant-Migrant Analysis

Transmigrants travel with cultural sensibilities from their countries of origin, some of which are well-established. These do not only influence their behaviours as individuals but scholars show that cultural beliefs from home contexts allow for diverse forms of organising within the transnational social space, e.g. hometown associations (HTAs). A category of transmigrants that constantly travel with such cultural beliefs are young men. These travel with entrenched gendered beliefs informed by their societies of origin that are brought to bear in the transnational social space, especially as they engage other masculinities (and femininities) in the new context.

Transmigration-masculinity scholars document the tensions that young men encounter as they live out their home-grown cultural identities as juxtaposed against those of local men in host communities. What is less probed, however, is how transmigrant men employ cultural discourses of masculine behaviour to reaffirm their identities in interactions among themselves.

Drawing on narratives from individual in-depth interviews and focus group discussions with forty-six young, African, transmigrant men in Johannesburg, this presentation uses the theoretical framework of translocational positionality to show how transmigrant men employ discursive practices of culture to enact masculine respectability among themselves. I argue that to get a fuller comprehension of how social relations operate in the transnational social space and the conflicts that arise thereof, one may not limit the discussion simply to local-migrant perspectives. Rather, inter and intra-migrant cultural appreciations of self are useful to getting richer and more nuanced understandings of existing social relations.

Arguments from the presentation will be useful for informing interventions geared towards enhancing social integration within the transnational social space.

RC05-108.3

IGBANOI, LEO* (*University of Johannesburg*)

Reconstructing Discourses on Local-Migrant Relations: A Nuanced Perspective from a South African Transnational Social Space

South Africa is a significant immigration destination in Africa because of its perceived potential for socioeconomic improvement of the lives of migrants from other African nations. Literature shows that this scenario has led to disenchantment among the local citizenry, resulting in anti-immigrant discourses. A pervasive narrative is that foreigners come to steal jobs and other social benefits meant for locals. This has led to a nationalist discourse, leading to verbal and physical violence against migrants.

Scholars in the context have duly examined how xenophobic sentiments play out in the context in diverse forms, and the implications for relations between migrants and locals. Yet, little focus has been given to investigating the nuances that impact on this state of affairs, particularly with respect to the reconstruction of migrant identities, and how these reconstructions feed into social relations, especially among migrants themselves.

Employing the theoretical frameworks of translocational positionality and intersectionality, this presentation argues that the local versus migrant narrative hinged on xenophobia discourses is inadequate to explain the shape and quality of relations between majority and minority groups in the transnational social space. Rather, an understanding of how migrant identities are reworked, and sometimes melt into local populations, and how this itself impacts on the quality of relations among migrants and locals is necessitated. Significant findings emerge from a qualitative study among forty-six young, transmigrant, African men in Johannesburg using individual in-depth interviews and focus group discussions.

The presentation re-examines and redirects the xenophobia discourse towards more nuanced perspectives and what implications this has for policymaking aimed at integration in the transnational social space.

Evaluation As a Two-Way Process

Evaluation tends to be seen as a one-way process; the evaluator evaluates the evaluated by its features. Asymmetry between the evaluator and the evaluated is often stressed, such as in research on processes of signaling/screening or stigma. What is overlooked within this framework is that the evaluated counter-evaluates the evaluator by the way (s)he evaluates him/her. This tendency brings shortcomings such as the underestimation of the agency of the evaluated. Thus, a theory of two-way evaluation is necessary in both descriptive and normative terms.

This presentation aims to explain the actual relationship between actors who were formerly called the evaluator and the evaluated, by drawing on a case study of job-matching in Japan.

As for job matching, economic and sociological theories were based on the framework of one-way evaluation. Human capital theory and signaling/screening theory both seek to explain how firms evaluate applicants, and discuss the effectiveness of the methods of evaluation, while the choice of firms by applicants are neglected. Even research focusing on the lived reality of job searchers share this framework. For example, Sharone (2014) describes how job searchers in the United States (where it is assumed one's personality is evaluated) who are rejected internalize the evaluation and experience self-blame.

Contrary to these descriptions, data taken from semi-structured interviews on job searchers' choice of firms revealed that job searchers are evaluating firms by the way the firms evaluate applicants. The job searchers' preference of firms were not fixed. They were judging from the questions the interviewer asked and the verbal/nonverbal responses to the applicants' answers the firms' competitiveness and culture. Also, despite the commonality of the evaluation processes, self-blame was not the main response to rejection.

Drawing on these examples, this presentation seeks to construct the framework of two-way evaluation, and discuss the advantages it brings.

Two Processes of Organized Irresponsibility in Post-Fukushima Japan

In this presentation I aim to grasp the paradoxical relationship between the two processes of "organized irresponsibility" in risk society and to discuss how it appeared in the Post-Fukushima Japan in a specific manner.

Ulrich Beck conceptualizes the organized irresponsibility as the system that tends to negate an existence of a new type of risk and responsibility for it. He observed it in the Post-Fukushima Japan and criticized that nobody accepts responsibility for Fukushima disaster. As one of the solutions, he stressed an importance of investigating and attributing responsibility.

On the other hand, Beck points out as another process of organized irresponsibility a transformation of "new risk" to "old risk" (Beck, 1988, *Gegengifte*, S.104). While new risk is characterized as decision-related but unpredictable, uncontrollable and unable to take responsibility, risk society tends to observe and underestimate it as predictable, controllable, responsible "old risk" and to make it invisible.

Based on it, I will point out that the transformation can be promoted through the very process of pursuing responsibility. Because in order to pursue someone's responsibility for a certain accident, it is necessary to prove that the accident could be predicted, controlled and avoided by someone. This process can strengthen "illusion of control" for the future new risks.

Finally, I will discuss that the latter process relates to the reason why Japanese energy policy could return to nuclear power in spite of the experience of Fukushima disaster. It should be noted that an intensive pursuing responsibility of government and companies has also prevailed in Japan after Fukushima disaster and in this process the Fukushima accident was gradually represented as an accident that could be certainly predicted and prevented. Japanese government cleverly inverted the very diagnosis and insisted that nuclear power technology is controllable by human and thus secure.

Concurrently 'Traditional' and 'Complementary': The Hybrid Professions of Chinese Medicine and Homeopathy in Ontario, Canada

In 2013 and 2014, the province of Ontario, Canada granted self-regulatory status to the professions of traditional Chinese medicine (TCM) and homeopathy respectively. TCM practitioners have been elsewhere regulated in the system's geographies of origin (China and Hong Kong), as well as in diaspora settings (Canada, the United States and Australia). Although several nations limit the practice of homeopathy (which originated in Germany) to medical doctors, lay homeopaths have been regulated in India, Pakistan and South Africa, where the practice has been widely indigenized. Of all applicants for TCM professional registration in Ontario in the three years after regulation, over one-third were reported to have been trained in an East Asian country (primarily China). Similarly, one-quarter of all newly registered homeopaths in 2014 and 2015 had been trained in Southern

Asia (primarily India). No other regulated Ontario profession has to date reported such high levels of internationally-trained practitioners within its membership. With reference to historical literature surrounding the two occupations, a range of public documents, and interviews with practitioners from the two groups (in progress), we compare, contrast and theorize the underlying hybridities evident in Ontario's new TCM and homeopathy professions. Each profession, we find, is differentially conceptualized as 'traditional' or 'complementary' medicine by sub-populations within. Across these ethnically-shaped divides, distinct views on biomedical science and the 'value' of regulation are particularly evident. We furthermore find that TCM and homeopathic regulators each created distinct policy responses to their specific occupational demographics with a similar aim of broad practitioner inclusion. Our analysis suggests a need to reconceptualize 'integrative medicine,' an increasingly important health systems movement in multiculturalist states, to be more culturally-inclusive.

Fathers' Work and Housework in Japan: Focusing on Deadline Pressure

It is well known that Japan is one of the most conservative societies regarding gender roles. In fact, Japanese fathers of small children spend less time doing housework compared to fathers in both Europe and the United States. Although Japanese studies on this issue found the most determinative factor to be long working hours, we must also be mindful of the quality of those working hours, considering the high value placed upon hard-work in the Japanese culture. Although the diligence of Japanese male workers has been well-known for decades, current workers admit to feeling more pressure, due to hectic work schedules with many tight deadlines, under competitions rating short-term outcomes.

According to our original data analysis, about one-half of full-time male employees with children under 6 years of age feel that they do not have enough time to spend with their children due to the tight deadlines of work. This "deadline pressure" has a significantly negative impact on their participation in housework on their work days, even if the length of their working hours is limited. It is also remarkable that full-time male employees who do not select their task to undertake tend to feel this deadline pressure; approximately 90% of respondents do assume responsibility for any work asked of them. This mindset is often called "stability of labor supply," which means workers are expected to always accept work from their supervisors or customers; this attitude is highly prized and quite common in Japan.

Although this hard-working cultural attitude might seem unique to Japan, there must be similar pressures in other countries in which the benefits of intensified economic competitions to pursue short-term are increasing.

Life of Orphans in Internally Displaced Persons' (IDPs) Camps in Northern Nigeria: Coping Strategies and Adjustments to Life in the Hands of Surrogate Families

Research on internally displaced persons (IDPs) often neglect orphans and lump the plights of children as a single homogeneous issue in peace and security discourses. Using qualitative interviewing and observations among a cross section of 50 orphans, this study examines their coping strategies and adjustments to life in the hands of surrogate families. The data revealed that orphans are inadequately catered for, and were hurriedly and compulsorily attached to surrogate families without detailed background checks, a situation which widens the social and emotional distance between orphans and their surrogate parents. Accounts of insecurity and child molestation were noted as rampant in the camps. The study concludes that social economic difficulties in IDPs' camps have greatly severed orphans living conditions and maladjustment in the hands of surrogates' families.

Socio-Cultural Conception of Albinism and Albinos' Access to Modern Healthcare Services: Narratives from the Field in South-West Nigeria

This study examines the cultural conception of albinism among the Yoruba ethnic group and the corollary effect on healthcare access. Specifically the study investigates the nuances endangering PWA from accessing modern healthcare services, the socio-cultural influences such as beliefs and traditions and the impact on behavioural outcomes of both PWA and medical practitioners. Using the health belief model as a theoretical framework, and a qualitative methodology in the collection of data from a cross section of 75 PWA and 30 medical practitioners, the study revealed that both medical practitioners and PWA are very much influenced and affected by the sociocultural dictates of their environment, which associate PWA as 'spirit beings', 'disables', 'harbinger of evils and death' and the 'creation of the small god (*Obatala*), and not of the Supreme God (*Olodumare*)' in the Yoruba cosmological explanation of albinism. This has a strong relationship with the perceptions and cultural stereotypes about PWA as materials for spiritual sacrifices and rituals. A situation which often put PWA away from public utilities and foster many to patronise expensive and privately owned hospitals and clinics irrespective of the cost. Other options at the mercies of PWA are: trade-medical care and home-service, clandestine and late night visitations and patronage of public hospitals. Similarly for medical practitioners, reservations and calmness towards PWA were narrated as often misinterpreted as stigma. PWA described the attitudes and services of non-medical staff in major healthcare facilities as appalling, uncomplimentary and a nightmare. Inversely, for PWA as medical professionals they highlighted their displeasures in the stylistic avoidance of non-albinos towards their services when on duties. The study concludes that PWA access to modern healthcare services are hindered by the sociocultural conceptions associated with the spiritual and derogatory attributes of who an albino is in Nigeria.

BOYADJIEVA, PEPKA (*Institute for the Study of Societies and Knowledge, BAS*)

Institutional and Structural Characteristics of Education Matter: The Influence of Secondary Educational Systems on How Young People Experience Early Job Insecurity

The paper aims to grasp the complexity of the influence of secondary education on young people's life trajectories by studying simultaneously the effects of individual's and systemic characteristics of education on how young people experience early job insecurity during the transition from school to employment. The analysis is based on individual-level data from the 2009 Ad Hoc Module of the European LFS on 'Entry of young people into the labour market', the ESS R5 rotating module on 'Work, Family & Wellbeing' (2010/2011), and country-level data from the official statistics and applies a multilevel modelling technique.

At theoretical level, two sets of features of the educational systems which influence are defined: institutional (stratification, vocational preference and standardization) and structural (expansion of education, development of lifelong learning, expenditure on education).

The paper argues that although the countries' educational systems and graduates' employability are embedded in the national institutional contexts, the educational characteristics at individual and macro levels have a significant and independent influence on early job insecurity. Thus, the analysis shows that individual levels and specificity of education are a strong predictor of employability across the European countries studied. Considering the institutional characteristics of the educational systems the paper reveals a positive effect of the vocational orientation of educational systems in facilitating early labour market integration. In contrast to previous studies, which have not yet revealed any effect of the standardisation of input and output on experiencing qualification mismatches, the study finds that whereas the standardisation of output decreases early job insecurity, the standardisation of input is associated with increases in early job insecurity. As regards the structural characteristics of educational systems, it seems that in countries that invest more money in education, the levels of early job insecurity index are lower and the odds of young people working part-time jobs decrease.

ILOGA BALEP, NATHALIE* (*Helmut-Schmidt-University / University of the Federal Armed Forces Germany, Hamburg*)

When Vocation Meets Quantification: The Empowerment of Experts in the German Prison Sector

Experts such as criminologists play a significant but underestimated role in the practices of 'office-holding' (Du Gay, 2017) in the German prison service. The hallmark of the German prison sector is its diversity which frequently leads to debates about the fairness among the different sixteen *Länder*. Differences are, for example, evident in practices of open prisons and systems of parole (Rowe & Turner, 2016). The standard explanation for the sector's diversity is Germany's federal system. However, differences in prison systems among *Länder* but also among single prisons were significant before the wider federalism reforms of 2006, suggesting the need for different explanations. One such explanation is that

individual initiatives induced by experts, mostly criminologists, and practitioners in prison administrations bring in diversity.

Recently, an increasing number of quantification practices have proliferated in the prison sector through trends such as New Public Management (Mennicken, 2013). Drawing on a case study of the German prison sector, this paper focuses on the very current introduction of systems for evaluation and benchmarking of treatment programs (Suhling & Guéridon, 2016). Such systems allegedly pave the way for improving the quality of public services (Hood, 2007) and prevent deviant practices (Osrecki, 2015). This paper explores the ambiguities experts face through quantification instruments. On the one hand, quantification paves the way for a neoliberal managerialisation of a sector which in Germany has been a stronghold of values of office. On the other hand, quantification empowers a small community of experts to put upfront what they consider to be both their vocation and the main task of 'the office' of prison services. What is at stake are the values at the heart of the offices in the penal sector: resocialization competes with neoliberal economization and neoconservative securitization – and experts are at the center of this struggle.

ILTZSCHE, ROBIN* (Goethe University Frankfurt)

The Co-Production of Confinement and the Psychiatric Government of Suicidality – Ethnographic Insides in the Practical Accomplishment of Involuntary Hospitalizations in Germany

On the empirical basis of a six-month ethnographic research (including participant observation, ethnographic interviews and document analysis, especially of patient files) on acute psychiatric wards in three different psychiatric hospitals in Germany, with a focus on the making, decoding and handling of suicidality, this talk will examine the co-production of psychiatric confinements through various agents.

In theory, regarding the German laws for the 24-hours or the long-term involuntary commitment, the authority over the decision lies alone in the hands of psychiatrists for short-term, and in the hands of local district judges for long-term hospitalization. In practice, there are many living and non-living agents from inside and outside the institution involved in the decision-making process. What is more, there are a lot of claims about the use, misuse and abuse of those laws through different parties (patients who are said "to pull the suicide-ticket"; doctors or judges who are interpreting the law from their conservative, "paternalistic" or liberal, "irresponsible" stance; families, police and retirement homes who are said to "deport" uncomfortable members; etc.). At the core of this talk are the socio-material entities (architecture of the ward; laboratory tests; psychopharmacological medicines; bodily signs; dangerous materials such as pills, ropes, broken glasses), which might configure, mediate or disrupt the production of involuntary hospitalizations as well as the question, how do they co-produce psychiatric confinements?

The co-production of confinement (with all the possible mis-usages of mental health law) might be analyzed as part of a medicine-political technology of prevention and intervention, which serves the regulation and government of risky, deviant and, in this case, suicidal bodies. It produces and structures a field of possibilities through which suicidality becomes an individual, psychiatric and manageable problem.

ILUN, SHIH* (Institute of Sociology, National Tsing Hua University)

A Regime's Learning Curve and Its Transformative Effect in Post-Occupy Hong Kong

The recent waves of global occupy protest have inspired a vast body of research on their organizational bases and mobilization structures from a long-term or cycle-of-protest perspective. However, only very few studies have attempted to understand the protests as singular "transformative events" (Sewell 2005; McAdam and Sewell 2001) and analyzed transformative effects derived from these protests. This article contends that the emergence of large protests does not necessarily bring about any positive reform, such as democratization, but rather causes demobilization, if there are irreconcilable cleavages within opposition camps that their opponents (i.e. the state) can exploit. It demonstrates that a government's evolving strategies of dealing with protests can be the product of a transformative event, that authoritarian governments can quickly learn and employ tactics adept at containing protests during and in the aftermath of the events.

By examining the case of the 2012 Anti-Education Movement and the 2014 Umbrella Movement, the two largest occupation movements in post-1997 Hong Kong, this article finds that the government has learned from the experiences of interacting with the two protests and has therefore begun to employ what I call a "rule-of-law strategy" to demobilize them. Methodologically, the data used in this article were collected through in-depth interviews with activists and by reviewing government statements made during the occupations as well as news coverage in their aftermath.

Procedural Fairness and Satisfaction with Democracy: A Case of Lithuania

Procedural fairness is an important indicator of rule of law and democratic performance. Democracy is rather fragile when it is based on formal institutions. The focus of my paper is perceptions of procedural fairness and its impact on satisfaction with democracy in Lithuania. What groups of citizens in Lithuania may be distinguished in accordance with their evaluations of procedural fairness? What are the factors which determine differences between the groups with different evaluations of procedural fairness? What are the causes of different perceptions of procedural fairness and its consequences on satisfaction with democracy among different groups?

Based on the survey conducted in Lithuania in 2010 and 60 semi-structured interviews, the paper draws conclusions that three groups of citizens (moral, mixed and immoral) may be identified in accordance to their evaluations of procedural fairness in public sector and they significantly differ by education, age, civic competences, interpersonal trust, satisfaction with life. From theories of procedural fairness, I argue that public perceptions of procedural fairness have significant effect on satisfaction with democracy and legitimacy of political system.

Traditional Active or Postmodern Citizens? Citizenship Practices Among Young People in Lithuania

Democracy is rather fragile, when it is based on formal democratical institutions. Support for governmental institutions and citizen participation in the process of political governance is an essential condition for the functioning of democracy and ensuring the stability of society.

The focus of this paper is to identify and to investigate citizenship practices among youth in Lithuania. What groups of young people in Lithuania may be distinguished in accordance with their level of interest in politics, political efficacy and participation in political acts? What are the factors that determine the differences between youth groups? What are the causes and explanations of different patterns of citizenship practices between youth groups?

Based on the survey conducted in Lithuania in 2010 and 40 semi-structured interviews, the paper draws conclusions that three groups of young citizens (trustful voters, distrustful active, distrustful non-active) may be identified and they significantly differ by age, membership in nongovernmental organizations, self-expression, satisfaction with life and evaluations of procedural justice. From theoretical perspectives of active traditional and postmodern citizenship, the characteristics of identified groups are mixed, because of socioeconomic and cultural conditions in Lithuania.

Academics' Unionised Struggles Against Neoliberal Transformation in Turkey before and Under State of Emergency

This study investigates the main features and dimensions of the academics' organised struggles against the peculiar form that the neoliberal transformation of higher education has taken in Turkey and the challenges that unionised academics have to cope with before and during the state of emergency, which also brings into problems of trade unionism against neoliberalism under an increasingly authoritarian political climate. The case of Turkey displays extreme changes, especially the dismissals of thousands of academics in 2016 and 2017. But the recent history of Turkish trade union activism in academia also shows partially successful struggles against precarious working conditions of research assistants and the building up of a strong position of trade union activists on campuses.

I will analyse unionised struggles of academics against neoliberal transformation with a specific focus on the activities of one of the leading unions, Eğitim-Sen, a union which has suffered greatly, as more than three hundreds of its members in the universities are dismissed. This analysis is based on a field study that I conducted in September 2017 in four public universities while collecting personal accounts of trade union activists with a focus on working conditions, trade union activism and challenges they faced under the state of emergency issued after the 2016 coup attempt in Turkey.

It seems that the struggles against the neoliberal transformation that have taken place to date have differed according to the types of universities and the rules regulating the employment of academics, especially of research assistants. It seems also to be the case that, with the help of decree laws, neoliberal changes in employment regimes could be enforced and accelerated – this is to be seen in the growing insecurity and precarity of research assistants.

Youth Employment in Nigeria and the Impregnable but Artificial Walls: The Urgency of a New and Inclusive Country

It is becoming patent that decent jobs and wages are fast evanescent from the labour market in Nigeria, leaving more citizens and particularly the youths in the precarity trap. Also erected as megaliths in the path of youth job seekers are impregnable walls which continue to narrow the chances employable youths have to secure decent jobs in the country. Although the artificiality of these walls cannot escape a careful observer, the impregnability of these walls nonetheless cannot also be denied since their anthropogenic, systemic and autochthonous natures have made them into the bugbears they presently are. Youth unemployment has continued to surge because of artificial problems created by the Nigerian state, narcissistic and clannish actions and words of politicians and their military overlords, a partisan public service, a skewed federal system, ethnicity, prebendal and primordial posturing, citizen and indigene dichotomy, quota system and federal character, state capture by an oligarchy, a kleptomaniac and expensive political system and a pseudo democratic state where equality, constitutionalism, human and citizen rights and meritocracy, among other democratic and equalitarian ethos, are treated as virtues that only exist in a political utopia. The youth constituency in the country is marooned and left with fewer noble options. There is therefore an urgent need to create a new country which would affirm inclusion, invest in youth employment, display exemplary leadership and tear down the artificial walls that have retrogressed the country for a long while. This study aims to examine youth employment in Nigeria and how this continues to deteriorate in the hands of existing impregnable but artificial walls, necessitating the creation of a new and inclusive country.

Youth, Politics, Entrepreneurship and Wealth Creation in Nigeria: The Priority of a New Narrative

The political system in Nigeria has remained iron-gated manned by mean and supercilious political iron-sides whose goal in governance is to perpetuate personal and clannish interests, objectives and motivations. The masses are treated as expendables needed to foster the political ambitions of these strongmen and are considered as cannon fodder only required to further and feather their access to power, private accumulation of national resources and state capture. Within this political disillusionment is a youth bulge full of existential dread because of the scarcity of opportunities or elite colonisation of the inadequate opportunities that the system allocates to them. These youths are largely unemployed or underemployed. They seem only useful to the political managers and party machineries during electioneering campaigns or as soldiers in their private armies. Sometimes, their utility is tethered to the services they render as political claquees organised to cheer their political lords during state functions or as demonstrators hired to revolt against any attempt to stain the credentials of their principals. The entrepreneurial environment that could have weaned some of these youths off idleness and crime is challenged. Thus, Nigerian youths have become the new denizens or citizens without benefits who are treated as undeserving of equitable state intervention. Poor healthcare facilities, expensive private education or low-standard public education, a degenerative infrastructure, spotty power supply and insecure environment, among others, precipitate a frightening dystopia, pushing these youths to the criminal economy or a violent *modus vivendi*. Weaving a new narrative has become a priority to safeguard the Nigerian state from coming apart at the seams. Drawing on the Social Conflict Theory, authors have attempted to peruse the study of youths in Nigeria and how they are situated within the political framework, entrepreneurial environment and wealth creation opportunities in Nigeria.

Reality or Rhetoric: Whistleblowing in the Democratic Republic of Congo

Research has widely demonstrated that whistleblowing is an important tool in fighting corruption. Likewise, a growing literature looks at reinforcement of the whistleblowing policy through the legal protection of whistleblowers. However, the effects of some socio-political and cultural factors on whistleblowing have been overlooked, particularly from the global South perspective. Hence, this ethnographic study conducted among public servants of the Congolese labor market institutions will fill that gap. This study draws from Rotberg's notion of failure of nation-state which postulates that failed states exhibit flawed institutions. In addition, it also expends Peck's theory of locally regulated labor market, in the context of failed-nation state whereby anomic behaviors become the norm, the implementation of whistleblowing appears un-utopian. Hence, despite the creation of Congolese post-war of anti-corruption agencies, which legally encourage and protect whistleblowers, this study notices that public servants of the Congolese labor market institutions do not denounce corrupted activities in their institutions. So, why don't they reveal these flourished practices of corruption? This study has found four main reasons below. First, in a country marked by the long-lasting practices of kleptocracy, fraud, patronage, bribery, embezzlement, the meaning attributed to corruption appears as a commonsense in the Congolese public administration. Therefore, whistleblowing culturally seems unfamiliar for some Congolese public employees. Second, the well-known high level of impunity engineered by Congolese ruling elites gives less room to people to disclose some cases of corruption. Third, many Congolese have ceased trusting state as it has continuously failed to deliver. Finally, the fear of countless repercussions (such as loss of jobs, assassinations, intimidations, etc.) leads some Congolese public employees maintain radio silence.

On Evacuees' mobility and Social Divisions after the Kobe Earthquake : How the Movement of People Is Exposed to the Power of Spatial Segregation?

In this paper, we would like to discuss an experimental perspective for analyzing the movement of people after the great disaster based on fieldwork research in Japan. Specifically, this paper aims to examine the process whereby the movement of people including Asian migrants is exposed to the power of spatial segregation, remembering the case of the Kobe Earthquake that occurred in 1995. In the time of disaster, existing social divisions are said to be amplified since the evacuees' vulnerability is influenced by social factors, such as class, gender, ethnicity, age, disability and status of residence (Wisner et al. 2004). Based on this thought, we will also consider how the condition of vulnerability would be changed through changing the public situations surrounding the evacuees' lives on the move. First, reviewing the previous research on this earthquake, we will overview the damage situation, the multiethnic situation of the city, and the diversified process of evacuation. Second, we will focus on some episodes of excluded migrants, and their situational changes, resulting from the shelter related with multiethnic assistances for disaster victims. This contrasts with transformation of the social sphere of mutual interactions among the evacuees, due to the urban reconstruction and urgent residence policy, through which their differences of vulnerability were gradually amplified by the public policy. Then, we will point out the social predicament that is called "*Fukkou Saiga*" in Japanese (Shiozaki 2014), the power of reconstruction that makes evacuee's mobility deprived, and segregates them spatially, not by the natural disaster, but by the construction of public shelters. Finally, for further comparative research on evacuee's mobility after the Tohoku Earthquake in 2011, we will indicate the problems for external evacuees beyond the limits of public policy. Does it mean free from the power to be divided and segregated?

The Ambivalent Criminal Control of Universal Citizenship: Analysis of the Brazilian Case

The construction of a new *legal subject* arises as an irreducible consequence of the global, cosmopolitan and multicultural way of life. This process is facilitated by the emergence of a *universal citizenship*, resulting from the normative consolidation of legal guarantees, arising from the universalization of rights and the relativization of sovereignty in the post-World War II period (ARENDT). The dilution of the imperative ties between the State and the citizen that characterize this process, however, did not prevent reactions from the criminal control systems in charge of the State, which began to expand to the inter-state level. In fact, criminal control, once exercised only over the citizen who was within the limits of a State by pressure of normative sovereignty, now broke the national borders. This process of increasing punitive power through the communication, transfer and delegation of penal power between States dilutes the sovereign limits of punishment and materializes itself in order to limit universal citizenship. This is evidenced at the in-

ternational level by the construction of a universal punitive power based on both the experiences of international criminal courts and the strengthening of the ties of international criminal cooperation between national jurisdictions. At the same time, at the national level, the preventive proposal of crime is materialized in the uncontested emergence of an even closer immigrant control network, in spite to the international determinations that demand the opening of borders as a form of guarantee of human rights. The present work intends to demonstrate this reality of growth of control as a response to universal citizenship with the analysis of the Brazilian case and its increasing binding to the construction of a system of universal criminal repression on the one hand and, on the other, the definition of a restrictive legislation and qualification of foreigners and immigrants.

Parental Leave and Family Satisfaction: Does a Change Towards a More Egalitarian Division of Labor within the Family Lead to Increased Satisfaction?

In 2007, Germany introduced a parental leave reform that aimed at increasing both mothers' participation in the labor market as well as fathers' uptake of parental leave. This study investigates whether those changes led to an increased satisfaction with family life since parents affected by the reform can choose their division of labor more freely. For this purpose, the reform is used as a natural experiment in the form of a *regression-discontinuity design* in order to examine the relationship in a causal manner. Past research has shown that the reform has indeed had the incentivized behavioral consequences: First, mothers who benefitted from the reform show a faster re-entry into the labor market after giving birth. Second, father's take-up rate of parental leave increased significantly. However, my analyses suggest that the reform did not lead to increased satisfaction with family life: On the contrary, fathers of children born shortly after the reform was introduced show less satisfaction with their family life compared to fathers of children born shortly before the reform. Mothers' family satisfaction, on the other hand, does not seem to be impacted by the reform. These findings are supported by a broad range of robustness tests.

Local Community Organisations in Australia and Their Role in Disaster Resilience

In general, Australia has excellent institutional response to disaster management, however at the local level community engagement with disaster preparation is relatively weak. Increasing resilience to disaster requires significantly greater community preparedness. Community preparedness in Australia is guided by the National Strategy for Disaster Resilience (NSDA 2011), which places a strong focus on 'shared responsibility' and directs local community and emergency organisations to cooperate in community disaster preparedness.

Local community organisations play a pivotal role in Australian communities. In particular, Neighbourhood Centres have a responsibility to build social capital and assist the most vulnerable. Recent disasters in Australia have demonstrated the importance of local community organisations in relation to knowing who and where vulnerable people are, organising disaster assistance, and delivering household disaster preparedness education in the lead up to the next fire or flood season. In a number of cases the work of local community organisations has gone largely unacknowledged by traditional response agencies and their communications have been marginalised by the official recovery authorities in the response and recovery phase.

Our presentation will explore the existing and potential roles of local community organisations in targeted disaster preparedness activities through a case study approach of NSW rural, regional and urban communities which have, and have not, experienced a recent disaster. We propose the strength of organisational connectedness as a measure of a community's disaster resilience, and that the strength of community organisation connectedness is a function of experiencing recent disaster. We argue that rather than measuring a community's resilience through a household by household, or postcode basis, the strength of a community's resilience could be measured by determining the strength of local community organisational connectedness.

Religious Practices Among Caste Hindu Women in India

Constitution of India has given fundamental rights to every person to practice and follow their respective religion. Hinduism has its Scriptures, the Vedas, the Upanishads, the Puranas, the epics Ramayana and Mahabharata, Manusmriti and Bhagvat Gita. Daily actions of caste Hindu women embodied in religious practices of one kind or the other. The foundation of Hinduism, based upon non-egalitarian social order, and justifies the Varna and caste system, as a divine scheme of ordering society. Moreover, Hinduism assigned inferior status to women.

The paper delineates the religious practices followed by caste Hindu women, which questioned their equal status. Some religious practices such as worshipping the Banyan tree for getting same husband for seven births, which is sanctioned by Hindu religion. Touching feet of the husband every morning, keeping fast for the husband good health and many other religious practices followed by caste Hindu women that further strengthen the systemic patriarchy that operates within the family.

The paper explores the nexus between the Hinduism, gender and family violence, which leads to the subjugation of women. Often, caste Hindu women became the victims of violence perpetuated by their partner. However, the violence is been justified on the name of particular relationship. Since, in Hinduism, husband is the God for wife. The paper argues that there is need for caste Hindu women to think rationally and reflects on the thoughts of Savitri Phule, Mahatma Phule and Ambedkar, who were the social reformer and fought for the equal rights for women in India. In doing so, caste Hindu women could liberate themselves from the religious practices, which suppress them and reinforces the patriarchal structure in the family

INGRAM, LINDA* (*George Mason University*)

By Her Own Hand: Crafts, Creativity, Commerce, and Community – Women-Owned, Tourism-Related Craft Businesses in the Verde Valley, Arizona

The economic restructuring that occurred during the 1970s due to globalization and social change ushered in significant changes for rural communities. As a result, tourism became a popular method within economic development programs for increasing revenue, often through cultural festivals. Many female crafters have chosen to utilize these events as venues for selling their crafts in order to enhance their livelihoods. The purpose of this study was to learn about female crafters in a rural area who have turned leisure activities/hobbies into home-based, handcraft tourism businesses. The focus areas for examination were 1) the meaning of creativity and craft in their lives, 2) the evolution of their creative experience from leisure to business, and 3) how they then contribute to and/or affect community development as a result. This study examined how women empower themselves through creativity and then use that power to create small businesses which, in turn, affect their lives, families and communities. In-depth interviews revealed that crafting entrepreneurs have much more complex relationships to creativity, business, and their communities than previously understood. Crafters approach small business ownership as lifestyle entrepreneurs and, in spite of many preconceptions, have diverse skill sets that inform their creativity and entrepreneurship. These study results open the door to further research on crafting entrepreneurs with the understanding that crafters take their leisure so seriously that they endeavor to reach the level of artisanship, and have shown themselves to be empowered businesswomen positively affecting their communities.

Global Hierarchy: Political-Military and Economic Power

The impacts of globalization on changing world economic and political structures and hierarchy have been widely debated in the Social Science literature. This study builds on the preceding research on economic and political power relationships that cause and sustain an unequal exchange between the core and periphery of the world-economy. The current study examines the dynamics of world cities in the context of long-run hegemonic cycles and the centralization and decentralization of political-military and economic power. The world city literature argues that the emergence of global cities has rearranged the state-based core-periphery structure, producing a global city system that cuts across earlier patterns of global inequality. The growth of world cities and the centrality of economic and political power structures are embedded in interstate system which is characterized by hegemonic rivalry. The dynamics will be examined with network analysis by constructing a relational dataset using transnational corporations and their city locations, inter-polity war, political alliance, and war expenditure data. The impact of political-military conflict has already been implicitly encompassed in the city dynamics literature, yet actual empirical examination of this relationship has not been done utilizing multi-scale network data. The primary goal of the current study is to explore the shifting relationship of economic and coercive power in the hegemonic sequence (power cycles) and its impact on city hierarchy dynamics.

RC46-769.2INOUE, MARIKO* (*Naragakuen University*)*Family Violence and Community Intervention in Japan*

Family violence have elicited enormous interest among citizens and scholars in Japanese society. For instance, the number of child maltreatment cases reported to Child Guidance Institution which is a branch for child welfare in local governments has been continuously increasing for last 26 years up to 120,000. Also, the numbers of adolescent-to-parent abuse, intimate partner violence, elder abuse have been increasing continuously.

The aim of this paper is to analyze the Japanese family violence, especially child maltreatment and adolescent-to-parent abuse, according to nested ecological theory. Among the explanatory theories of family violence, nested ecological theory is found to be the most effective one which is outlined the reciprocal interaction of four primary levels of influence: macrosystem, exosystem, microsystem and ontogeny.

Concerning macrosystem factors, I try to analyze the results of questionnaire method researches on child maltreatment prevention policies of all local governments. Then, I have the insights as follows; 1, The necessity of national data base on child maltreatment in Japan, 2, the necessity of strengthening reintegration policies of the families in which child maltreatment occur and civil cooperation, 3, the necessity of poverty related policies, 4, the necessity of policies concerning the child maltreatment occurred in foreigners families in Japan, 5, the necessity of assessment of effectivity of child maltreatment prevention and treatment policies, 6, the effectivity of supportive policies of early pregnancy as child maltreatment prevention, 7, the effectivity of civil cooperation to response child maltreatment reports.

In regard to adolescent-to-parent abuse, I also try to analyze the results of questionnaire method researches inquired to the juvenile department of the prefectural police headquarters and voluntary support organizations according to nested ecological theory.

RC57-JS-28.7INOWLOCKI, LENA* (*Frankfurt University of Applied Sciences*)*Insinuations and Threats of the (new) Extreme Right: Actors' Biographical Deployment in Visual and Verbal Terms*

Explicit and implicit threats against adversaries as well as references to violence in images and rhetoric characterize the extreme right. Focusing mostly on Germany during the last decades, I will point out changes and also continuities of topics and their visual and verbal presentation, by means of different biographical documents. These range from interviews in a research setting to photos taken during political demonstrations and to recent promotional videos of actors of the extreme right.

The self-presentation of women in these videos as main actors denouncing but also insinuating violence raises many questions for the analysis. Another important aspect concerns the relationship between biography and history: going from the explicit denial of the Holocaust and an implicit fascination with its power of destruction to seemingly more "subtle" forms of justification. Thus, as presently among Identitarians and their "post-modern turn", there is a disposal of history at will, "freeing" one's biography from its consequences.

RC38-673.5INOWLOCKI, LENA* (*Frankfurt University of Applied Sciences*)*Whose Privacy Is at Stake? Confusing Empathy and Consideration with Remaining Silent*

It could be that there are different styles of research and that the non-directive stance recommended in biographical research and in ethnography is a good enough explanation for not asking my interview partners about anything that they have not already brought up as a topic. But the methodological cues fit my own disposition only too well. How can I know that I am not mainly responding to my own need of privacy, even in research situations? That I am not shrinking away from what my interview partners would want to tell me about? And what would the bodily dimensions be to recognize whether I am respecting my interview partner's privacy or guarding my own?

RC22-418.2INTROVIGNE, MASSIMO* (*CESNUR, Center for Studies on New Religions*)*Gatekeeping and the Construction of "Cultic" Extremism in China: The Church of Almighty God and the McDonald's Murder of 2014*

On May 28, 2014, one of the most horrific murders in the story of new religious movements was perpetrated in a McDonald diner in Zhaoyuan, in the Chinese province of Shandong. Six "missionaries" entered the diner and asked clients to leave their phone numbers for further contacts. A young female client, Wu

Shuoyan, refused to give her number. She was declared an "evil spirit" and beaten to death with a mop handle. At the time of the murder, the Chinese government was engaged in a campaign for eradicating the Church of Almighty God, or Eastern Lightning, a new religious movement hostile to the government. Although it soon emerged that the McDonald's assassins were not members of the Church of Almighty God, but of a different group, Chinese propaganda, through an abstruse use of gatekeeper media, quickly persuaded first the Chinese and then the international public opinion that it was indeed this Church that was responsible of the crime, thus legitimizing its persecution as the ultimate "extremist" or "radical" group. The paper examines two results of this campaign. First, as of September 2017 there were some 20,000 Web sites throughout the world attributing the McDonald's murder to the Church of Almighty God, evidencing that gatekeepers controlled by the Chinese government did succeed in fashioning international public opinion's response to the alleged danger of "cults" in China in general and the Church of Almighty God in particular. Second, however, within a logic of deviance amplification, the campaign also had the unintended result to radicalize the Church of Almighty God and raising millenarian expectations among its members about a final confrontation between good and evil.

RC34-615.3INUI, AKIO* (*Tokyo Metropolitan University*)HIRATSUKA, MAKI (*Hosei University*)*Andy Furlong and Japanese Young People*

Andy Furlong had been interested in Japanese young people and frequently visited Japan in the last fourteen years. One of his interests was, of course, the commonality of difficulties that young people confront in the late modernity whether in the West or East. However, his particular concern was that Japan might represent the most serious scenario for young people in the neoliberal regime. He was particularly concerned about Japanese 'hikikomori', social withdrawal (2008), and argued that "the epistemological fallacy is one of the mechanisms through which frustration and anger is internalized as self-blame and self-doubt" (2015, 34).

Young people in the late modernity with precarious condition and unpredictable future suffer from the four As: anxiety, anomie, alienation and anger (Standing 2011). Standing argues that young people's anger will lead to political mobilisation. However, Furlong suggested another potential reaction, in which "young people withdrawing and suffering psychologically by their circumstances to their own actions rather than linking them to external forces" (2015, 29). He argued "the neoliberal discourse that underpins education and labour market policy promotes individualized responses, and therefore promotes self-blame rather than externally directed anger" (2015, 29). For Furlong, many of Japanese young people seemed to suffer from severe self-blame instead of anger directed to government and employers.

We will examine Furlong's assumption with our longitudinal data, and also the socio-cultural background of Japan.

RC34-630.2INUI, AKIO* (*Tokyo Metropolitan University*)SANO, MASAHICO (*Osaka Electro-Communication University*)HIRATSUKA, MAKI (*Hosei University*)HORI, TAKESHI (*Joetsu University of Education*)HIGUCHI, AKIHIKO (*Hosei University*)MIURA, YOSHIE (*Tokyo Metropolitan University*)BIGGART, ANDY (*Queen's University*)*How Young People Experience Their Transitions in Different Social Settings?: A Comparative Study of Japan and UK*

Young people's transition to adulthood, not only from school to work but leaving home or forming their own family, has become more prolonged and complicated over the last few decades. We have identified three main concerns. The first concern is how the transition from school to work affects other aspects of transition. The transition from school to work seriously impacts on young people's resources for other transitions. A further concern is how welfare state settings affect the transition of leaving home or family formation. Welfare state settings can subsidize or hinder the transition of leaving home or forming a family. The third concern is how these factors are mediated by gender. For examining these concerns, we will compare Japan's and UK's longitudinal data of youth transition, the Youth Cohort Study of Japan, and Understanding Society in UK. We will focus on those young people who leave education at a relatively early stage.

RC15-282.6IOANNONI, KELSEY* (*York University*)*Fattening up Health: Embracing a Sociology of Health in Fat Studies Research*

The medical field's obsession with the 'obesity epidemic' reinforces one of the most powerful discourses that influence the way in which health and bodies are conceptualized (Wright 2009). The field of fat studies has emerged to combat medical discourses of health and bodies, specifically around fatness. This paper looks at the use of a sociology of health in fat studies research. Studying health sociologically involves complicating our understandings of health knowledge and allows us to examine health by understanding how medical beliefs are constructed, the money behind health care, de-centering biomedical knowledge, and allows us to look at the social mechanisms that influence health, while reframing the dominant perspectives of health.

Critical scholars argue that obesity and fatness are not biological conditions, but socially constructed categories (Ellison, McPhail, & Mitchinson, 2016). The stigma associated with obesity has resulted in a process of othering fat people, which Ellison and colleagues (2016) call 'fatphobia'. Rooted in the concept of healthism, fat people are seen as bad and as failures, as they have failed to take responsibility for their health.

As Paradis (2016) notes, we have come to adopt medical language in discussing fatness, such as 'obesity', 'morbid obesity', and other related terms. As such, it is necessary to frame these concepts in an understanding of how the social construction of fatness is framed more broadly in the discussion of medicalization, and the social, historical, and political processes that frame obesity as a moral panic.

This paper explores the value of embracing a sociology of health approach in doing fat studies research. I conclude this paper by highlighting some of the research I have been conducting using a sociology of health perspective, looking at the way fatness may pose a barrier to accessing health care services for fat Canadian women.

ION, ALLYSON* (McMaster University)

Understanding Health Services for Mothers Living with HIV in Ontario

Women living with HIV are increasingly having children due to advancements in medical treatment, the evolution of HIV infection into a chronic health condition, and increasing acceptance and normalization of parenthood among people living with HIV and advocates working within HIV services. At the same time, pregnancies among women living with HIV continue to be classified as "high risk." An HIV diagnosis channels women into a system of specialist care that involves specific medical procedures and recommendations, and the expectation that women interact with a tertiary, academic teaching hospital to access maternity care. As a result, women living with HIV do not have the same freedoms as other women to utilize alternative maternity care including midwifery and community-based obstetricians. Furthermore, the specialist perinatal care women living with HIV are expected to utilize is organized by bodies of knowledge and practice guidelines that direct healthcare providers to monitor women's bodies and their behaviour throughout pregnancy and postpartum. This paper will describe an institutional ethnographic inquiry that was conducted within a regional hospital in Hamilton, Ontario and focused on the organization of perinatal healthcare for women living with HIV. This inquiry was conducted to make visible how women who receive care within this institution coordinate their lives to attend their medical appointments. The inquiry also sought to uncover who is involved in the delivery of care and support for women during the perinatal period; how tasks are delegated and organized within the hospital among those delivering care; and how medical discourses, language, and education influence how healthcare providers operate within this system of care. By uncovering how perinatal care is coordinated and organized, this research has the potential to optimize institutional policies and practices, as well as enhance the experiences women have when they receive care during pregnancy and early postpartum.

ROTH, MARIA* (Babes-Bolyai University)

Human Rights Practice in Social Work Process. an Exploratory Study on Romanian Social Work Professionals

Context: Human rights practice in social work offers a framework of action by operationalizing a rights-based perspective that provides practitioners and educators with a *human rights lens*, *human rights methods*, and *human rights goals* that can be integrated in their work. In Romania, this framework has the potential to improve social work higher education by adding heft and content to the National College of Social Workers' ethical code to "respect the human rights and implement the international provisions Romania is a part of" and to the professional competencies set by the National Authority for Qualification in Higher Education. **Method:** an online study on 50 social workers was applied using an online platform using an adapted form of the Human Rights Methods in Social Work questionnaire (HRMSW: McPherson, 2015). There were more female social workers and practitioners from urban settings, somehow reflecting

the general distribution in the field of practice. **Results:** in general, respondents reported a high usage of human rights methods in their practice. However, lower scores were obtained for their level of activism and micro-macro integration. **Conclusions:** By providing an exploratory picture for usage of human rights principles to social work practice, this study fills a gap that is currently felt by both teachers and practitioners who wish to integrate a rights-based approach into their work. This instrument also offers a way for social work educators to teach *human rights practice*, for social workers to integrate it, and for researchers to evaluate it.

IOVU, MIHAI-BOGDAN* (Babes-Bolyai University, Cluj-Napoca, Romania)

Life Satisfaction in Romanian Youth: The Effects of Perceived Economic Status, Self-Esteem and Quality of Family and Peer Relationships

Background: An important concept within the positive psychology literature is life satisfaction. **Purpose:** This research aims to determine to what extent socio-demographic variables, subjective material well-being, aspects of social relationships and personal resources influence adolescents' general life satisfaction. **Methodology:** This study is part of a larger longitudinal investigation on transition of adolescents to young adulthood in Romania (OoA). For this analysis we used data from the second wave available from 1509 Romanian youth aged 19-23. Using the contact information from participating in the first wave, during November 2014 and February 2015, youth were contacted via email, phone or Facebook account and asked to log-in again on the online platform and fill in the questionnaire. The participants completed scales measuring their perception of family environment, support from peer-group and global self-worth. The structured questions were used to assess youth' global satisfaction with life, perception of their economic status and socio-demographic variables. **Results:** The results showed that youth' life satisfaction could be best explained by their higher self-esteem ($\beta = .391$), parental support ($\beta = .132$), participation in decision process ($\beta = .111$), and higher material well-being ($\beta = .214$). **Conclusions:** The study confirms the significance of both environmental and intrapersonal variables in constructing positive life satisfaction, thus indicating the need for complex interactional models of positive well-being in transitioning to adult life.

Rural Agricultural Transformation and Policy Development: A Study of the Nigerian Situation

Rural Agricultural Transformation and Policy Development: A Study of the Nigerian Situation

Abstract

There are two major gaps currently facing agriculture in Nigeria; they include an inability to meet domestic food requirements, and an inability to export at quality levels required for market success. The former problem is a productivity challenge driven by an input system and farming model that is largely inefficient and subsistence in nature. We are also faced with an aging population of farmers who often do not have enough quality seeds, fertilizers, irrigation, crop protection and related support to be successful. The latter challenge is driven by an equally inefficient system for setting and enforcing food quality standards, as well as poor knowledge of target markets. Indeed, quite worrisome is the fact that most rural farmers are small holder farmers who often produce far below their production capabilities. The resultant effect is that the vast majority of Nigerians are highly food insecure. There is the need to rebuild the agricultural sector and transform Nigeria from a mono economy with total focus on crude oil to one that can be sustained through economic diversification. This paper which is an exploratory study focuses on the need for proper agricultural transformation that will help in putting Nigeria's agriculture sector on a path to sustainable growth and development with the ability to enhance food security for the people and be able to serve the Nigerian market and the export market thereby becoming a major foreign exchange earner.

Key Words: Agricultural policy, Agricultural transformation, Food security, Rural agriculture, Rural farmers, Rural Development

From Pilgrimage to Dark Tourism? A New Kind of Tourism in Palestine

Tourism has long been important to Palestine. Many of the Holy Land's historical and religious sites are located in Palestinian areas – in Bethlehem, Jericho, Nablus, Hebron, and East Jerusalem. Tourism currently contributes 14 percent of Palestine's gross domestic product (GDP). About half this revenue comes from domestic tourists, mainly Palestinians living in Israel; most of the rest comes from international tourists who arrive on pilgrimages to Christian religious sites.

After the establishment of the Palestinian National Authority in 1993, several essential steps were taken to market and encourage tourism development in Palestine. The first was an economic agreement signed between Palestine and Israel in May 1994 (Alternative Tourism Journal 2004). This economic agreement was focused on the free movements of tourists in and within the West bank and the Gaza Strip. The second was the establishment of the Palestinian Ministry of Tourism and Antiquities which took responsibility for recognizing and supporting the tourism industry in the West Bank and the Gaza Strip. The Ministry accomplished a lot, reorganizing internal transportation, developing tourism agencies and restaurants, and rehabilitating religious and cultural events. Palestine's tourism industry, however, is fundamentally controlled by Israel which has a stranglehold on the flow of international tourists, from issuing visas to flights, lodging, and the provision of Israeli guides and tours within the country (Isaac & Ashworth 2012). All major Palestinian cities also have Israeli checkpoints which control who enters and exists these cities, including tourists. What lead to this situation? And might the Occupation, ironically, provide a new tourism outlet?

Being Poor & Feeling Rich? Income Positions between Perception and Reality in Europe

Increasing poverty and inequality are still features of modern societies and a key issue of social science research. But the extent and structure differs strongly depending on the theoretical and empirical assumptions made, i.e., whether individual welfare and social position is sufficiently measured by objective parameters or whether subjective perceptions must be considered as well. In general, the relationship between the attributed social position and the subjectively perceived position can be consistent or not. Deviations between attributed and perceived social positions are relevant not only in terms of affecting individuals' real or potential opportunities for participation but are also an issue of importance for society and social policy, for instance, in the event of individuals who feel deprived even though their objective welfare position is rather favorable.

Against this background, the paper investigates the relationship between objective income positions and their subjective evaluation among the older population (50+ years) using data from the Survey of Health, Aging and Retirement in Europe (SHARE). The empirical results show that objective income positions can be congruent with or differ from subjective self-perceptions. Overall, the majority of elderly European households live in an objectively favorable income situation and are aware of this as well (well-being). In contrast, approximately one fifth of the elderly European population is characterized by deprivation in which a bad objective position goes hand in hand with a bad subjective evaluation. Moreover, almost one-third of the elderly surveyed display inconsistent objective and subjective welfare positions. However, the frequency of the satisfaction paradox and the dilemma varies widely across Europe. Further multivariate analyses investigated the causes of the two forms of non-congruence, namely, adaptation (satisfaction paradox) and dissonance (dissatisfaction dilemma) and identified in addition to socio-demographic and socio-economic determinants as well as social-psychological influences also structural variations explain country-specific differences.

Challenges Faced By Female Journalists: A Study of District Multan, Pakistan

In Pakistan journalism is a challenging profession where the female have less encouraged being a journalist. Recent time in Pakistan encouraging females to work outside of home. The objective of the study is to find out the challenges faced by female journalist in their professional environment. The descriptive study was carried out from 01-01-2017 to 30-06-2017 in District Multan Pakistan. The population of the study was all female journalists working in different media

houses in Multan District. These females were belonging to different media houses and working as anchor, producer, editor, reporters and feature writer. Questionnaire was used as a tool for data collection from 51 female's journalists through purposive sampling. Data was analyzed by using SPSS (Statistical Package for Social Sciences) 19.0 version software. The results of the study showed that female journalists faced unreasonable treatment, harassment by male colleagues and job insecurity as the common reason that make them to give up the profession. Female journalist faced different kind of discrimination on the bases of their physical appearance, age, during pregnancy and in motherhood. Their presence in media not easily accepted by the society because in many areas of Pakistan media has not considered a respectable and suitable career choice for female. Journalism related organization such as press club is approached and persuade to pay more attention to women's problems. Government must be more active for solving the female journalist's problems, issues and fields.

Contributing Factors of Domestic Violence Against Women: A Study of DAR-UL-Aman, District Multan, Pakistan

Women are neglected and discriminated in every aspects of life. In Pakistan women are considered as subordinate to their men by our traditions. Women are suffering in very sector; they don't know about their rights, they are less educated. Millennium Development Goals and sustainable development goals focus is on gender equality and much legislation has been passed in favor of women rights but still in Pakistan women are insecure even in their homes. They are considered as subordinate to men and are not allowed to participate in any matter of life. The objectives of the present study were to know the prevalence and types of domestic violence; to identify the root causes of domestic violence; to know the contributing factors compelling women into Dar-ul-Aman. The present study was conducted in Dar-ul-Aman, District Multan, Pakistan. The population for present study was all the women who faced domestic violence and living in dar-ul-aman District Multan, Pakistan. For the data collection interview schedule was used as a tool. Majority 72% respondents told that their husbands take drugs and 28% respondents told that their husbands do not take any type of drugs. Greater part of the respondents 83% reported that they faced domestic violence by their husbands, 7% respondents told that perpetrator was father, 9% respondents told that other family members were perpetrators of domestic violence and 1% told that any other was perpetrator of domestic violence. About 29% respondents faced verbal violence, 63% respondents faced physical violence, 7% respondents faced sexual violence. The study concluded that there should be equal participation of women in their life decisions and they also have certain parental, in-laws support for her better living.

Life-Is-like-a-Random-Walk Model of Class Identification

Social psychological aspect of social inequality and social stratification, such as people's cognition, attitudes and emotions in unequal or stratified society, can be seen as antecedent conditions of people's rational choices or actions which would be aggregated and lead to macro (un)change in the society. Thus, it is as important to rational choice approaches to social inequality as other aspect.

Among social psychological features, I will focus on class identification in this paper. Class identification is the extent to which people identifies themselves as members of a certain social class or stratum, and it has been one of main subjects in the social psychological study of social stratification. In this paper, I will introduce a new analytical framework for class identification by applying a mix method of simple mathematical modeling and Bayesian statistical modeling instead of conventional frequentist statistical analysis.

First, I will construct a simple mathematical model which can explain one of the major tendencies of class identification, that is middle concentration tendency where majority of people tend to regard themselves as middle. This is the life-is-like-a-random-walk model where it is assumed that succession of same Bernoulli m -trials with success probability p determines one's subjective class identification.

Second, I will estimate parameters of the model from empirical data by applying a Bayesian statistical model. The Bayesian modeling enables us to construct more flexible model which directly reflects the mathematical model and is able to explain generative mechanism of observed distribution. The distribution of latent success probability p and number of trial m are estimated by MCMC estimation and differences in distributions of p and m among different social economic categories are analyzed by hierarchical models. Japanese cross-sectional survey data from SSM and SSP surveys will be analyzed by the Bayesian model, and interpretation of results will be discussed.

RC28-514.12ISHIDA, KENJI* (*University of Tokyo*)*Educational Opportunities of Immigrant Children in Japan: Evidence from National Population Census Data*

This study aims to investigate the educational opportunities of immigrant children living in Japan, from primary until secondary school. The number of immigrants in Japan has rapidly increased since 1990, when the immigration control and refugee recognition act was revised. After their migration, migrants bring their children to Japan, or have them there. Some immigrant children are first generation, while others are second or subsequent generations. It is believed that many immigrant children neither enroll nor attend primary or secondary school in Japan. In relation to immigrant children, however, there is a paucity of data available on school enrollment and attendance rates. Furthermore, little is known about the relationship between educational opportunities and immigrant children's socio-economic background. This is partly due to the lack of nationally representative datasets in Japan that contain information about nationality, international mobility, and socio-economic status. Nevertheless, census data in Japan do record this information, which enables the educational opportunity structure of immigrant children to be investigated. Accordingly, population census data from 2000 and 2010 were utilized in the empirical analysis.

This study found that enrollment rates of primary and lower secondary schools are over 95%, regardless of nationality and survey year. However, there is an inequality in upper secondary school enrollment and attendance rates for different nationalities, with Southeast Asian and South American children being most disadvantaged. These disparities also remain after consideration of the children's socio-economic background. Indeed, international mobility is negatively related to the school enrollment and attendance rates of immigrant children. In addition, the relationship between parents' status and school enrollment is weaker for immigrant children than for Japanese-born children. These findings imply that first-generation immigrant children are disadvantaged in terms of educational opportunities, and parental resources do not favorably impact immigrant children's education.

RC03-69.7ISHIGAKI, TAKASHI* (*Tokai University*)*Cinema As a Tool for Community Development: Film Showing in Tohoku after 2011 Earthquake and Tsunami*

This paper looks at film showings (activities of showing movies) in Tohoku after the 2011 earthquake and tsunami and examines the relationship between film showings and local communities. This paper presents research on the case of film showings in Ishinomaki city, Miyagi prefecture.

In Ishinomaki, since July 2011, a non-profit organization has held outdoor film screenings in the local summer festival. Movies are projected on the wall of a building, and folding chairs for an audience are arranged at public space which was made by the tsunami; buildings were destroyed and washed away by the tsunami. Therefore it utilizes public space and transforms it into creative and cultural space. The non-profit organization started regular film showings since December 2012. It has shown many different kinds of movies, such as Japanese old movies, Japanese animation movies, and European classic movies. In regular film showings, there are cooperative relationships with local communities.

Based on a case study, this paper examines the role of film showing for development and revitalization of local communities, and also examines the role of local communities in supporting film showings. The role of film showings is to provide the enjoyment and pleasure of seeing movies and to create time and place for communication. It is the place where people get together and talk together before and after seeing a movie. In addition, film showings accompany civic participation and create cooperative relationships with local communities. Film showings in Tohoku have been creating local networks and engaging in community development.

6 years have passed since the earthquake and tsunami, however, local communities and an everyday local network of local residents are still developing. And there is still a great need to community development. In Tohoku, art and culture (including film showings and cinema) can contribute to community revitalization.

TG06-993.1ISHIJIMA, KENTARO* (*Teikyo University*)*Wish to be Normal: ALS/Mnd Patients' Strategies to Advocate Themselves*

This presentation aims to consider how ALS/MND (amyotrophic lateral sclerosis or motor neuron disease) patients deal with their own internalized ableism or the wish to be "normal." Taking this into consideration, we will critically rethink some of the logic that drives disability studies.

ALS is a chronic illness that deprives patients of muscle (control). They lose their ability to walk, speak, and even breathe. Thus, ALS patients can be categorized as physically disabled persons. Although they are considered disabled, they

often wish to be "cured" and become "normal" again. This gives rise to ask the question—does the existing logic of disability studies such as the social model of disability fail to empower them?

Through analysis of interview data researchers find that ALS patients use this logic in their own style along with their ableism. They find and use their invariable ability to empower themselves. For instance, a patient said that if only they get appropriate support, they can handle their daily life because they do not lose their cognitive ability. This logic is the same as the earlier one. Another patient also said that he stops walking on his feet and uses a wheelchair to rest his legs and maintain the ability to walk in case a treatment procedure for ALS is developed. He does not change his mind that ability should be maintained.

Paradoxically, ALS patients who gradually lose their ability do not develop logic that relativizes the value of ability but focus on the logic that acknowledges it. This finding implies that the logic of disability studies has to be reviewed to adjust to such a situation. Because some disabilities may be cured in the future, there may be many disabled persons who think that they should get more ability like ALS patients.

WG01-939.6ISHIZAKA, SHINYA* (*Ehime University*)*Glocal Development of Natural Farming Movement*

The purpose of this paper is to clarify the mechanism of how the Natural Farming has been spread around the world, especially in India.

The Natural Farming, a farming method under the principles of no-tillage, no-fertilizer, no-pesticides, and no-weeding, had been advocated by a late Japanese farmer and philosopher, Masanobu Fukuoka, since the 1950s. After the English translation of his book, *One Straw Revolution*, was published in 1978, the Natural Farming became widely known around the world, and the book has been translated into more than twenty-nine languages. After 1979, Fukuoka was invited to visit various parts of the world (in seventeen countries), and he was actively engaged in promoting his method. The Natural Farming has been regarded and accepted by many as a way of radical dissent to the conventional agriculture, and to the modern industrial civilization in general.

In India, *One Straw Revolution* has been translated into nine regional languages within India. Fukuoka was invited to India three times, and delivered lectures and gave instructions to farmers in various parts of India. Curiously enough, however, those translations and invitations were promoted separately by different individuals' voluntary efforts, and, in many cases, the each process of those promotions seemed, in fact, as if just a cumulation of incidental episodes of accidental encounters and unintended consequences. In other words, there has been no concrete organization or network for the Natural Farming movement in India, although the movement itself has been arguably active.

It is also important to note the aspects of diversity and change in the movement. The Natural Farming method is not rigidly structured and has been "re-embedded" repeatedly and differently at each place. Even for Fukuoka himself, there was no end in his process of "re-embedding."

RC53-874.1ISIDORIO, MARCELO* (*Pontificia Universidade Católica de Minas Gerais*)DOS REIS, MAGALI (*Pontificia Universidade Catolica de Minas Gerais*)*Modulation of Children-Adult Relations at School: Theoretical Notes for a Debate about Student-Teacher Interaction*

This study was motivated by the common-sense statements of teachers of basic education about a generalized difficulty in the relationship with the current student profile in the classroom. Here, we present the theoretical section of this doctoral study in progress in the Graduate Program in Education of PUC Minas - Brazil, presenting the configurations of the child-adult relationship in the school, personified in the figure of students and teachers, through sustained interrelationships by structure, power and agency. Our objective is to analyze the way in which the relations between both are being established in the present day, through the observation of the classroom and the listening of children and adults, supported by the theoretical references that treat: the structure as rules and resources to which individuals are based on the course of social interactions (Giddens, 2009); the institutions as a set of normative attributions about students and teachers through institutionalized practices and power exercises (Foucault, 1999) and childhood as a social phenomenon and, therefore, the child's social relations with his peers and of them with adults - intra and intergenerational relationships - (James et al., 1998; Alanen, Mayall, 2001; Qvortrup, 2010 and Corsaro, 2011). As a structure of: signification, legitimation and domination, we verify whether they refer to the mode of discourse, typification and control of adults over children; as power exercises, this process is in terms of transformation as well as domination of the subject and is directly related to their disposition in the particular structural configuration operated within the social scene; as a child as a social agent, we observe tensions and conflicts or involvement, attention and negotiation in the encounter of these different generational groups depending on

the way in which the adult recognizes the child as producer of culture in a world of intense transformations.

South-South International Circulation. the Mobility of Argentinian Social Anthropologists in Brazil.

The production of knowledge of a country does not occur in a vacuum. The constant movement of students towards an educational center of excellence usually promotes the circulation of ideas. An agreement signed in 1989 between the Postgraduate Program in Social Anthropology (PPGAS) of the Museu Nacional at the Federal University of Rio de Janeiro and the Department of Social Anthropology of the University of Buenos Aires allowed dozens of Argentinean anthropologists to enroll in the graduate program in Social Anthropology in that recognized and highly internationalized institution. Upon their return, some of these Doctors created and institutionalized new graduate programs in Social Anthropology in Argentina. Taking into account these processes, this paper proposes: (i) to make a historical characterization of the agreement that facilitated this flow; (ii) to describe, through interviews, how that circulation professionalized their later careers; (iii) and how and to what extent it stimulated the conformation of theoretical-methodological approaches and objects of study that influenced their research in Argentina.

Factors Influencing the Image of an Urban Tourist Destination By Gay Tourists: The Case-Study of Tel-Aviv

Tel Aviv is a well developed tourist destination that offers the general population of tourists a wide range of entertainments, tours and vacation possibilities. Within the general population of the tourists who visit the city, Tel-Aviv is a favorite destination for gay tourists, especially during the summer, who frequent Tel Aviv pride events that attract thousands of participants, locals and tourists. Tel Aviv is reach with entertainment and leisure sites for the gay people, including a beach that is specially assigned for their use, gay clubs and bars. In general Tel Aviv is considered as a liberal city known for its pluralistic approach toward different populations, including the local LGBT community and the gay tourists who visit in the city.

As other cities in the world, Tel Aviv also has invested resources in order to promote the gay tourism in the city, especially regarding Tel Aviv's gay parade. Yet, there are no precise figures on the number of gay tourists in Tel Aviv, their perceptions, satisfaction from the visit and the perceived image of the city.

This aim of this study was to fill the gap by examining the city's image in the eyes of the gay tourist. The study was conducted among tourists visiting Tel Aviv, at least once. Research area was the touristic center of Tel Aviv, Gay Space and was attended by 152 homosexual tourists. The tourists responded to a questionnaire containing open-ended and closed-ended questions. The research included also in-depth interviews with tourism promoters engaged in the gay tourism of Tel Aviv.

Findings show that image was improved significantly after the visit. Tel Aviv emerges as a preferred tourism destination for gay tourists, with a strong positive image of the city, despite being located in an area of unrest.

Does Leisure Involvement Relate to Interdependent Happiness Among Japanese Masters Athletes?

Leisure's effects on happiness have been discussed for over two millennia since the ancient Greek period (e.g., Aristotle). More recently, leisure has become increasingly regarded as a critical domain that contributes to our happiness (Kuykendall, Tay, & Ng, 2015). Although such positive relationships between leisure and happiness are widely acknowledged in all cultures, Hitokoto and Uchida (2015) highlighted that people in different cultures view happiness differently and developed the Interdependent Happiness Scale. This scale specifically measures an overarching construct of collective happiness (e.g., making others happy) (Hitokoto & Uchida, 2015). In contrast, non-Western research on happiness is still rare in leisure studies (Ito, Walker, & Liang, 2014). More importantly, given different cultural views on happiness, it is important to employ a culturally constructed happiness scale to capture more accurate relationships between leisure and happiness. The purpose of this study, therefore, is to examine

how involvement with masters games participation relates to interdependent happiness among Japanese masters athletes. Specifically, this study focuses on Japanese masters athletes because of: (a) a growing interest in masters games in Japan by hosting the Kansai World Masters Games 2021; (b) important roles of leisure in the aged Japanese society (e.g., reducing costs related to the formal welfare system); and (c) a positive association between overall leisure involvement and happiness among Chinese university students (Lu & Hu, 2005). To address the research purpose, a questionnaire survey will be conducted at the International Japan Masters Athletics in Wakayama in October 2017. Multiple regression analyses will be performed by using four factors of involvement (attraction, centrality, social bonding, identity expression: Kyle, Absher, Hammitt, & Cavin, 2006) as independent variables and interdependent happiness as a dependent variable. Both theoretical and practical implications will be discussed in light of an interdependent perspective on happiness.

How to Prevent Teenagers from Falling into the Addiction to the Internet: On a Panel Survey of the Problematic Internet Use of Schoolchildren in Japan

A study team of the Japanese Government (Ministry of Health, Labor and Welfare) executed a massive survey in 2012 and reported the next year that about 8.1% of high school students, which amounted to 518,000 teens, were estimated to belong to the high-risk group of the "addiction to the Internet." Since this announcement, the Problematic Internet Use (PIU) among teenagers has been regarded as one of the serious social problems in Japan. Not a few researchers, medical doctors and therapists point out that it is very difficult to recover from this "disease." However, different from other objects of addiction, such as gambling or drugs, Internet services are unavoidable in the digital age. Therefore, it is highly important to prevent teenagers from falling into the PIU. Nevertheless we have only few systematic studies on this problem and not only parents but researchers don't know what to do to decrease the risk of the PIU.

This paper attempts to find out how many schoolchildren are exposed to the PIU, and which factors affect the PIU in the long term on a successive panel survey we executed from 2015 to 2017 in primary and junior high schools in Maebashi city, Gunma prefecture, Japan. We attempt to probe relationships between students' PIU and several factors such as their values, attitudes or their satisfaction with their school lives, families or friends. Through this analysis, we want to find out some clues to remove the risk before it becomes serious.

Politics of Regularization and Migrant Domestic Labor: The Case of Filipino Domestic Workers in Paris

Based on fieldwork I have conducted intermittently over the past eight years in Paris, this paper examines how the politics of legal status among Filipino domestic workers in the French capital affects their lives in terms of labor conditions, social integration, life projects and social reproduction. With an estimated current population of around 50,000, the Filipino community, since its early phase of immigration in the mid-1970s, has been known for its high proportion of women migrants working in the niche sector of domestic work in the rich quarters of Paris. Another salient feature of this community is its high rate of irregular migrants. Fresnoza-Flot (2017) explains this phenomenon as a *de-facto* family reunification that induces a "chain of irregularity." Indeed, according to the Commission on Overseas Filipinos, the rate has stayed at around 80% throughout the 2000's, peaking at 88% in 2005. The politics of regularization has, therefore, been a constant issue for the social reproduction of Filipinos in France.

This paper focuses on the regularization struggles experienced by Filipino woman migrants during the period 2008-2012, a period marked by Sarkozy's neo-liberal policy to promote "selective immigration (*l'immigration choisie*)" and Horte-feux's circular for a case-by-case "regularization based on work." The period also overlaps with the government's policy to formalize the underground economy of domestic work. The purpose of this paper is twofold: First, it demonstrates how the "Private Household Workers" trade union made use of the neoliberal momentum to break the deadlock of "double irregularity" – i.e. irregularity both in terms of immigration status and worker's status— among Filipino domestic workers. Second, based on interviews, the paper discusses the different outcomes Filipino women may live in the post-regularization phase and conditions attached to them.

RC47-797.4IVANCHEVA, MARIYA* (*University of Leeds*)SWATRZ, REBECCA (*University of Cape Town/University of Stellenbosch*)*Digital Vs. Physical Disruption: The #Feesmustfall Movement in South Africa*

Situated within the literature on social movements and contentious politics, student movements are often explored solely from the perspective of student actors on the ground: their identity and frame formation, action repertoires, resource mobilisation and institutionalisation strategies. This paper takes a different approach by discussing how key decision-makers at South African universities responded to the #FeesMustFall movement. Drawing on qualitative interviews with thirty higher education leaders, government and non-government policy-makers, and digital technologists at six universities and first-hand experiences and observations during the protests, we discuss an unintended outcome of the disruptive tactics of the movement. In the face of physical disruptions on campuses, senior management and policy-makers have increasingly looked to ways of circumventing physical space as the main site of the educational process. This has coincided with the entry of private providers into the South African higher education field. These companies offer 'digital disruption' of traditional face-to-face degrees through 'unbundled' provision of short courses, MOOCs, and online degrees. These actors' entry into the South African market has occurred concurrently with an economic recession, and growing political crisis in the country. In the face of austerity policies and lack of government intervention, elite public universities began to search for alternative sources of revenue in order to respond to student demands for fee-free education. Our research shows that in this conjuncture, universities have increasingly opened up to partnering with for-profit actors offering market solutions to solve a crisis created by the increasing commodification of education in this context. Showing how physical disruption has made way for increased digital provision, we argue that the perspectives of those in positions of power need to be studied more carefully by movement actors and scholars as unintended outcomes threaten to subvert movement strategies and demands for a more just decolonial and decolonized university.

RC25-473.4IVANEC, ALEXANDRE* (*St.-Petersburg State University*)YAGUNOVA, ELENA (*St.-Petersburg State University*)*Quantitative Characteristics of Quality Social Texts*

Information has a leading role in the age of linguistic technology. Confidence in correct understanding information by other people is extremely important for everybody now - from primary school teacher to CEOs. There's a property of text information, that enables us to assess its difficulty for the different groups of people. It's readability. According to G. McLaughlin, readability is "the degree to which a given class of people find certain reading matter compelling and comprehensible". Different methods of predicting the difficulty level of the text were included in readability formulas, that were wide used in different researches. Now there is an ability to improve these formulas and to configure them for definite language. The research shows that different formulas are more relevant for various genres of text. Every method has to be tested on different text clusters and the results should be comparable to understand.

Some formulas were compared by implementing them on the same text clusters. Three types of corpora (and after processing - clusters) were used - fiction, newspapers and scientific articles. Some of clusters contained the similar texts, translated to different languages (English, Polish, Russian). The purpose of the research is to determine the field of application not only of each formula, but of different types of methods it used. The weak point was in lack of precision in scientific text clusters assessment, because of its extra complicated syntactic structure.

During readability formulas analysis, we got attendant information about difficulty various texts in different languages that enable to conclude the complexity of the different languages (and genres) and to estimate different translations of the similar texts. Cloze-tests is one of the basic evaluation variant with informants. Thus, our paper concerns the basic parts of Natural Language Processing and Cognitive Science.

RC35-635.6IVANOV, DMITRY* (*St.Petersburg State University*)*Fictitious Commodities Concept As a Source for Critical Theory of Postindustrial Capitalism*

The recent expansion of capitalism to new areas of commodification demonstrates correlation between Polanyi's concept of fictitious commodities and Marx's concept of capitalism existing as a permanent expansion of commodification. Polanyi considered commodification of elements of production - labor, land (nature), and money. Now commodification is extended to

elements of consumption - images and time, which become sources of capitalist accumulation as consumers are constructing their sociocultural identities with use of brands and trends.

The first wave of postindustrialization has resulted in virtualization of society based rather on image-intensive consumption than on knowledge-intensive production. People's life is immersed in virtual realities of branding, image making, and social media. Commodification of images takes form of branding that generates enormous market value in current economy. Capitalization on images intensifies communications and makes networks dominant structures.

The second wave of postindustrialization is related to formation of a glam-capitalism as producers in hyper-competitive markets saturated by brands have to glamour consumers by aggressively attractive products generating trends. Value creation process now is related more to trends than to brands not only in fashion industry and show business but also in high-tech and financial industries. Trends as short-term but intensive consumer movements represent a form of time commodification. Market value generated by trends is accumulated in flow-structures, which penetrate institutional boundaries and allow glam-capitalists to exploit consumers joining trendy communities.

Commodifying images and time, capitalism of networks and flows alienates identity as fundamental component of social existence. That provokes revolt of authenticity against ephemeral but powerful structures of glam-capitalism. 'Pirates', 'anonymous' hackers and activists of 'occupy' movements violate 'intellectual' property rights of glam-capitalism and 'majority' will of glam-democracy. Reaction of glam-capitalists to alternative movements is initially oppression and then absorption of them as a source of creativity. That is dialectical negation leading towards an alter-capitalism.

RC07-155.1IVANOV, DMITRY* (*St.Petersburg State University*)*Super-Urban Enclaves of Globality and BRIC Prospects in the Post-Globalization Age*

Globalization effects traditionally considered in terms of gap between two groups of nations identified as 'global North' and 'global South' or between the 'core' countries and countries belonging to 'periphery' and 'semi-periphery' of the global economy should be revised as wealth and power are concentrated in networks of super-urban areas playing role of 'command centers' in transnational economy.

The super-urban areas outperform national economies. According to the Brookings Institution research (2012), the largest 300 cities contain only 19% of the world's population but they generate 48% of the world's GDP. Brexit and Trump's campaign have showed sharp social divides inside 'global North'. Voters in small towns and rural areas less involved into transnational networks and flows are against political agenda supported by super-urban population.

The divide between the group of the largest cities and the rest of communities supports the idea that globalization has resulted not in the 'world society' or 'worldwide sociality' but rather in networked enclaves of globality. In such metropolitan areas as New York, London, Tokyo, Hong Kong, Moscow, or Toronto people experience globality as borderless, mobile, and multicultural life because there they are in hubs of transnational material, human, and symbolic flows. Globalization is not planetary spread of Modernity institutions but rather localized displacement of habitual social structures by intensive flows.

In the post-globalization age the 'core' of socioeconomic order is dispersed into networks of enclaves of globality. The nations' prospects of development depend on number, size, and influence of cosmopolitan super-urban areas attracting and generating flows. The index of super-urbanization is proposed to measure nations' prospects under post-globalization conditions. BRIC countries expected to be future leaders have actually moderate potential. Brazil (0,0226), Russia (0,0279), India (0,0076), and China (0,0240) are rated below many countries including US (0,0355) and ideal case of Singapore (close to 1,0).

RC23-425.11IVANOVA, ELENA A.* (*St. Petersburg Scientific Center of the Russian Academy of Sciences*)*Reforms in Higher Education in Russia: The Transition to a Market Model*

The pressure on universities to increase external sources of funding research became the global trend. This trend is consistent with the basic principle of a modern market economy - the demand of increasing the efficiency of all actors and to reduce government deficits.

In the last 20 years Russian higher education took several reforms. After 1992 many technical institutes have expanded the number of faculties and have become state universities. They were allowed to introduce tuition fees. In 2003 the special foundations, financing the first stage of innovations, were founded, including national and regional venture capital funds. The innovation activity of the universities was stimulated. In 2009 the government introduced status "research university" and began to support research universities with special mega-grants. To receive this status universities prepare projects for their research development.

The amount of funds received by the university from external sources is among the indicators that are taken into account during the competition.

A detailed analysis of the problems that arise after the reforms, shows the positive and negative effects of each reform on the research activities of universities. The positive results of the reform are: the expansion of research in the universities, the emergence of new laboratories and scientific equipment update, inviting well-known scientists to carry out joint research projects. But still the main source of funding for research in universities is the state budget. There are significant restrictions on the receipt of funds for research from other sources. Limited income of the population in Russia does not allow to raise tuition fees. The economic crisis and the reluctance of the innovative entrepreneurs restrict the flow of funds from the business sector. There is also a contradiction between the development of innovation activity and basic research.

Disruptive Methodologies

Research agendas the research methodologies and the underpinning thinking in tourism studies and related fields have increasingly been focused on transformation informed by qualitative methodologies.

Despite this refocus that has been echoed in publications and conferences there is still a primacy of management ways of thinking about the phenomenon (quite often only described as industry) of tourism, heavily influenced and driven by neoliberal agendas.

This is evidenced by significant problems and unrest in major cities against neoliberal development of tourism, research agendas still heavily favouring quantitative and positivistic / post-positivistic approaches and the primacy of management and marketing approaches to tourism as industry in the way we design our curriculums.

In this work I propose that transformation cannot happen before disruption and I want to examine how soft sciences and the methodologies we employ, can be disruptive first, drawing from some of the experiences and thinking from a number of fields such as education, nursing, sociology etc.

The focus is on disruptive research that has broader implication that critical theories although it draws on some of thinking of those approaches it does not neatly or easily fit into the critical social theories tents.

This work then seeks to examine the nature of research and its purpose, explore the need to disrupt before we can transform by building upon the work of Brown, Carducci, and Kuby (2014) and their five ways for scholars to disrupt qualitative methodology, namely to disrupt dominant notions of research roles and relationships, collection and analysis of data, dissemination of research findings, epistemological and methodological boundaries, and disciplinary boundaries and assumptive frameworks on how to do tourism research.

It seeks to examine the areas of this broad agenda where tourism and related fields have made strides and where there is need for more work to be done.

Changes of Family Values and Behavior in Four East Asian Societies Based on Eass 2006 and Eass 2016

This paper introduces the East Asian Social Survey project and reports the changes/constancy of one's family values and behavior in China, Japan, South Korea and Taiwan based on the data of EASS 2006 and EASS 2016. EASS launched in 2003 and consists of four research teams in East Asia: Chinese General Social Survey (CGSS), Japanese General Social Survey (JGSS), Korean General Social Survey (KGSS), and Taiwan Social Change Survey (TSCS). Four teams made common questions focusing on one's family values and behavior in East Asia, incorporated the module into a nation-wide social survey conducted by each team in 2006. The module includes gender role attitudes, patriarchal attitudes, values on childrearing, values on marriage and divorce, mate selection, marital relationship, family activities, and intergenerational support. Based on EASS 2006, the proportion of people who believe that "the authority of the family in a family should be respected under any circumstances" was smallest in Japan (53%), compared with China (84%), Korea (84%) and Taiwan (80%). In the last ten years, that proportion further dropped both for men and women in Japan. In 2006, the proportion of two-earner couples was largest in China (66%), compared with that of in Taiwan (57%), in Japan (50%) and in South Korea (48%). While Chinese husbands did housework most, Japanese husbands did it least in 2006. Not only Japanese married men, but also unmarried men and women in Japan did housework least among four societies, then. This paper overview the salient changes in one's family values and behavior across four societies in the last ten years and discusses the possible factors which had led those changes and the probable impacts those changes would bring about.

Gender Differences in Attitudes Toward the Nuclear Power Policies and in Pro-Environment Behavior: Empirical Results Based on Japanese General Social Survey Data

The accident at the Fukushima No.1 Nuclear Power Plant revealed keen gender differences in evacuation behavior. Voluntary evacuation from the surrounding area of the "residence restriction area" was pursued more by mothers with children than fathers. This paper examines gender differences in risk perception, in attitudes toward the nuclear power policies and in pro-environment behavior by analyzing data sets of Japanese General Social Survey 2002/2008/2010/2012/2015/2017. There is no gender difference in risk perception of an occurrence of earthquakes. There is also no gender difference in risk perception of an occurrence of nuclear power plants accidents (JGSS-2012/2015; age, education, marital status, work status, living standard, regional blocs, party affiliation, age of the youngest child, and distance from the nearest power plant are controlled. On the other hand, there are clear gender differences regarding the degree of anxiety about food contamination by radioactive substances and one's attitudes toward nuclear power policies. Women are more anxious about food contamination; the opinion on abolishing all the nuclear reactors has been supported more by women than men (JGSS-2012; JGSS-2015). Regarding pro-environmental behavior, both men and women in Japan tend to turn off lights or appliances not in use frequently (50%) or sometimes (35%); women turn off lights significantly more frequently than men. People came to turn off lights a little bit more frequently in JGSS-2012, a year after the East Japan Earthquake, but not much. In 2012, about 30% of people tried to save electricity more frequently and 45% of them tried sometimes. We found no relationship between one's pro-environmental behavior and one's attitudes toward the nuclear power policies (JGSS-2017). Both men and women in Japan try to save electricity regardless of their attitudes toward the nuclear power policies.

Social Perception Analysis of Introducing the Nuclear Power Plant Programme in Poland

The aim of the study was an assessment of social aspects of introducing Nuclear Power Plant Programme in Poland (NPP) with special consideration of public participation process. Poland is one of the few European countries without nuclear power, however in 2009 the government has started to develop NPP. For the country, which is one of the largest hard coal producer and the second largest coal consumer in Europe, nuclear power is a real huge transition.

Studies of peoples' perceptions of technological risk, decision making process and sustainable energy transition are crucial in respect to the nuclear power plants impacts' assessment.

Our methodological approach combines information from both qualitative and quantitative data in order to obtain results which are spectrum of knowledge from existing data (public opinion polls) and the qualitative sociological research. Internet monitoring of the nuclear discourse was being conducted as well as the analysis of public perception and expert assessment of nuclear Energy. To gain the understanding of different groups' subjectivity we conducted the interviews within Q-methodology [1,2] which is a quantitative-qualitative approach measuring the subjectivity (opinions, beliefs, attitudes of the respondents). In this study, we identify four main Poles' perspectives on implementing NPP and three different perspectives/narratives of the decision makers.

We present main results of the Q-methodology analysis conducted within chosen Polish citizens and decision makers from the Polish government in 2016 and 2017.

RC24-454.1IWINSKA, KATARZYNA* (*Collegium Civitas*)*Women Attitudes Towards Environment in Poland – the Case Study of Upper Silesia Region (Poland).*

Coal is a major energy source in Poland, including electricity generation sector. Most coal burning power plants have been operated for over 30 years, thus they soon will have to be modernized or decommissioned. During last years of transformation burning coal dumps have created serious socio-economic problems in many regions.

I present the case study research from Upper Silesia, a region of Poland, which is one of the most intensively mined areas in Europe. Moreover, one of the basic indicators of socio-cultural identity of the Upper Silesia inhabitants was an extremely intense (as of mid-nineteenth century) industrialization, the development of specific industrial monoculture (mining and metallurgy), and a strong work ethic.

In the paper I will present the results of the qualitative analysis of socio-economic activities and strategies of women, with particular emphasis on strategies in the context of changes in civilization (the idea of sustainable development) and transformation (decarbonisation). The subjects of the research are women, residents of Upper Silesia, who both have family and work responsibilities. Moreover, they are also active participants in the life of their local communities. Women create and reproduce "small community" (around the traditions of the local community) and struggle with the economic changes.

The framework of the analysis is sustainable development concept focused mainly on the quality of life, professional and civic strategies (economic) and attitudes towards environment (ecological values, energy awareness, etc). Within this frame I present the case study of an active research with Silesian women who adapt to the changing situation on the labor market (as a result of restructuring and blanking mines) and implement various solutions to meet the needs of their own, their families and the social environment (in the local community).

RC33-605.4JABKOWSKI, PIOTR* (*Institute of Sociology, University of Poznan*)CICHOCKI, PIOTR* (*Adam Mickiewicz University*)*Comparing the Quality of Personal-Register and Non-Personal-Register Samples in Cross-National Interviewer-Administrated Surveys Using Internal Criteria of Representativeness - Comparative Analysis Based on European Social Survey Data*

This presentation examines demographic representativeness of different types of probabilistic samples based on the results of 130 different surveys form 7 rounds of European Social Survey. Focusing on the distinction between personal-register (i.e., individual name) and non-personal-register (i.e., household or address) samples, it demonstrates that the latter exhibit systematically larger gender- and age-biases. Expanding upon a 'gold standard' evaluation (Groves 2006), an analysis based on internal criteria (Sodeur 1996, Kohler 2007) leads to the conclusion that the inferior quality of surveys involving interviewer-driven within-household selection of target respondents results from the impact of illegitimate substitutions. Such protocol-defying selection of individuals with higher levels of readiness and availability only superficially improves survey outcome rates while yielding samples of actually inferior quality. The internal-criteria approach provides a straightforward and undemanding way of monitoring representativeness of samples, and proves especially handy when it comes to large cross-country projects as it requires no data external to the survey results, and allows for comparing surveys regardless of possible differences in sampling frames, sampling design and fieldwork execution procedures.

RC04-JS-58.1JACKSON, CAROLYN* (*Lancaster University*)NYSTROM, ANNE-SOFIE (*Uppsala University*)SALMINEN-KARLSSON, MINNA (*Uppsala University*)*Men Students and Negative Emotions in Prestigious Degree Programmes*

This paper explores men students' experiences and expressions of negative emotions, especially shame and fear. We ask how these are informed by gender, social class and higher education contexts. Context and social categories inform affect-norms, which in turn inform understandings of which kinds of emotions are legitimate to experience and express. The importance of considering affective dimensions in education has been demonstrated beyond their effects on well-being; for example, joy and pride, as well as shame, fear of failure and test-anxiety, have implications for students' motivation, effort and choice of educational trajectories.

The paper draws on data from an ongoing qualitative, large-scale study about masculinity and self-worth protection in England and Sweden (2015-2018). Semi-structured interviews (approx. 1-1.5 hours) were conducted with approximately 150 students and staff in Law, Medicine and Physics engineering, i.e. prestigious and stressful programmes that recruit primarily top-achieving, middle-class young people.

The findings suggest that experiencing (overwhelming) pressure was expected and normalized in these milieus. This applied to both men and women, although men were seen as more likely to conceal stress and anxiety. Furthermore, expectations relating to degree programme, as well as gender, were important in shaping affect-norms. For example, whereas law and engineering students were expected to conceal 'weaknesses', medical students had considerably more leeway to be open about difficulties, and peers were expected to respond sympathetically. Of course, men students within programmes do not constitute a homogeneous group, so we also investigate differences at an individual level about how pressures were felt and expressed.

RC04-81.24JACKSON, CAROLYN* (*Lancaster University*)SUNDARAM, VANITA (*University of York*)*Sexual Harassment and Violence in UK Higher Education*

This paper explores sexual harassment and violence in higher education, focusing primarily on research findings that highlight gaps in institutional

knowledge about, perceptions of, and initiatives to address sexual harassment and violence.

The paper draws on data from a project that explored university staff perceptions and understandings of gender-based harassment and violence across 6 universities in England. Our research methods involved a combination of interviews and focus groups to explore the perspectives of staff with varying levels of responsibility for students in each institution. The staff who participated in the project ranged from senior management to security staff, resident tutors and Students' Union staff. The sample institutions were selected on the basis of characteristics that are known to influence institutional culture, such as campus/non-campus status, socio-demographic mix and pre/post-1992 status.

Our findings suggest that, generally speaking, gender-based harassment and violence is poorly understood by staff working in higher education. While some staff recognise that harassing behaviour can involve the objectification and degradation of women in a range of forms, the root causes and origins of such behaviour is not well-understood. The majority of staff tend to employ a discourse of individualism in their discussions of sexual violence, theorising instances they had personally experienced as 'misunderstandings' or 'mis-negotiations' between individuals. Links to wider social and cultural inequalities and power relations were rarely made in their analyses of gender violence. Some staff narrated 'laddish' behaviours, often associated with violent misogyny and objectification of women, as a typical – sometimes desirable – aspect of the 'male student experience'. Phipps (2016) has recently linked the neo-liberalisation of higher education to institutional cultures that are generative of structural and interpersonal violence; we will include discussion of this in our analyses.

Disaster (Im)Mobility: Migrant Caregivers' Experiences of the Fort McMurray Wildfire

On May 3rd, 2016, a wildfire swept through the remote community of Fort McMurray, leading to the largest prolonged evacuation in Canadian history. As the main service centre for the Canadian tar sands, the fire devastated what has become a notable outpost of transnational labour. Over the past 30 years, thousands of workers from around the world have migrated to the region, including hundreds of oft-overlooked domestic workers whose social reproductive labour braces this extractive economy. Migrant caregivers, in particular, are precariously tied to this 'land of opportunity'— bound by short-term employment contracts tied to single employers. Thus, in following the assertion that disaster reveals hidden power relations, I turn to the experiences of live-in caregivers to investigate how vulnerability is produced by (racialized and gendered) regimes governing migrant labour. Holding secondary citizenship status with the conditional promise of attaining permanent residency, I argue that caregivers' experiences of the wildfire were profoundly shaped by both their physical and labour (im)mobility. Furthermore, in turning to caregivers' transnational survival strategies, I argue that disaster scholarship must look beyond nation-state borders to better understand how experiences of disaster are increasingly entangled with, and shaped by new patterns of immigration policies, gendered labour, and border regimes.

Social Role Participation and Mental Health: Does Race/Ethnicity Matter?

The relationship between social role participation and mental health varies substantially among U.S. minorities. We propose to explore this association using the most contemporary and comprehensive data available. We argue that the U.S. continues to be fragmented by racial classification but the current tripartite model of race proposed by race scholars is oversimplified. We use 2001-2003 survey data from the Collaborative Psychiatric Epidemiology Survey (n=20,013) to evaluate (1) the association between role accumulation and psychological distress; (2) the association between type of primary social role (worker, spouse, parent) and psychological distress; and (3) the extent to which the relationship between social role participation and psychological distress differs by race/ethnicity. Analysis of survey data for 7 racial/ethnic groups indicate no association between role accumulation and psychological distress among Afro-Caribbean, Cuban, and Puerto Rican adults while African Americans, Asian Americans, Mexican Americans, and non-Hispanic whites benefit from occupying many social roles. This pattern of findings was further evident in examination of the type of social roles occupied by adults in this sample. That is, for the same set of groups (Afro-Caribbean, Cuban, and Puerto Rican), there were no significant differences between those who were not engaged in any of the primary social roles and those who were involved in all three primary social roles. Results suggest that certain racial/ethnic groups in the U.S. maintain relational practices that inhibit them reaping the full benefits of participating in American society. The groups

that appear the most disenfranchised do not fit neatly into the tripartite system described in much contemporary race scholarship.

How Do Muslims Respond to Far Right Political Mobilization in Their European State

This paper evaluates quantitative and qualitative evidence of Muslims' responses to the waves of hostility that washed over them during the 2016-17 election cycles in western European states. Far-right political mobilization stoked anti-Muslim sentiment in Austria, the Netherlands and France during the run-up to national elections for president and prime minister. The center prevailed in each case, but these campaigns further legitimized hostility toward the religious minority. Norbert Hofer's right-wing Freedom Party (FPÖ) platform, for example, rallied Austrians against "the invasion of Muslims" (*Washington Post*, May 19, 2016). Marine Le Pen's National Front promised France "fewer mosques and less halal meat" (*Guardian*, November 1, 2016). Geert Wilders led the Party for Freedom (PVV) in the Netherlands, declaring that "Islam and freedom are not compatible" (*USA Today*, February 21, 2017). Though they represent less than 10% of the population in each of these European states, Muslims are in the spotlight in the post-election period. Speculation abounds regarding their reactions to the hate speech directed toward them. Will they radicalize? Will they mobilize into new political parties (like Denk in the Netherlands) intended to promote the minority protections promised by democratic states in Europe, pushing toward multiculturalism and undermining the structures supporting images of white Christian nationhood? Or will Muslims, already shown to have greater trust in European institutions than their non-Muslim neighbors (cf. Jackson and Doerschler, 2012; 2016), continue to act like other Europeans in their social and economic class, striving to move themselves and their children forward economically and educationally? Evidence suggests that the latter course of action will prevail even in the current context. This project is intended to provide accurate information to policy makers and the general public in the face of widespread unsubstantiated stereotypes about the primary concerns of Muslims in Europe and their support for democracy.

Radical Right-Wing Parties in Western Europe and Their Populist Appeal: An Empirical Explanation

In a majority of western European states the percentage share of the vote cast for radical right-wing populist parties in national elections was over 10% by 2015, reaching 46% in Austria's 2016 presidential election. Policy agendas have also moved to the right, demonstrating greater restrictiveness on immigration and skepticism toward the EU. With data from the Chapel Hill Expert Survey, European Social Survey, Multiculturalism Policy Index, and Parliaments and Governments Database, we extend current models of electoral support for far-right parties by assessing whether the ethnic majority's sense of discrimination and safety help explain the allure of the right-wing message. Does right-wing populist voting by majority group members reflect their sense of being personally disadvantaged in a multicultural state beyond their more general opposition to immigration as bad for the country? Building on the multivariate model of voter preference developed by Inglehart and Norris (2016), we look specifically at majority group members in thirteen western European states and add two measures of personal grievance: sense of being in a group that is discriminated against and fear of walking alone at night. We examine voter support for stable radical right-wing populist parties identified by Akkerman, de Lange, Rooduijn (2016). Our results suggest that along with their stance against immigration and multiculturalism, their socioeconomic appeals and ideological signals, radical right-wing populist parties draw majority group members' votes by stoking their sense of personal grievance as members of a group that is discriminated against, the "forgotten ones . . . triple nothings" (Marine Le Pen in her 2011 speech in Metz, cited in Ivaldi, 2016:231). We discuss the significance of these findings for efforts to maintain liberal democracy in the face of the threat posed by the radical right.

The Idea of Design and the Theory of Popular Culture

Theories about modern popular culture tend to be divided between two general approaches – one that emphasizes ideology and structural domination; and the other that emphasizes agency, active audiences, and resistances. But these two approaches ignore the mediating role that intellectuals and critics play in the creation of objects and the circulation of meanings about those objects.

Furthermore, they ignore one of the most important influences that has shaped the creation and the meaning of popular culture in the 20th and 21st centuries: the idea of design. Examining the writings of three iconic architects of the mid-twentieth century – Frank Lloyd Wright, Charles Jeanneret (Le Corbusier), and Walter Gropius, we show how creative intellectuals were actively trying to create meaningfulness in the production of everyday objects. They saw design as a key resource for addressing the challenges of modern society. The utopian impulse of their ideas was denounced by social critics and post-modern architects during the 1970s and 1980s, mainly in response to the failures of modernist public housing projects. But the idea of design – linked to the iconic power of the design intellectual – is pervasive in the everyday objects that populate the domestic sphere and pervade popular culture.

Economic Integration of Refugees in Germany - a Question of the Institutional Framework

Past research has already provided evidence that refugees are one of the most vulnerable groups in Europe in respect of labor market integration. A causal analysis of this finding is still missing. We argue that labor market access and outcomes are shaped by two key dimensions: First, the institutional framework namely the residence title the humanitarian migrant is granted. Second: Vocational and academic degrees need to be recognized in order to succeed in applying for a job because Gatekeepers have difficulties to assess the value of the educational degrees.

To test this assumption, first, the paper aims at explaining which groups decide to get their educational certificates recognized. We assume that this decision is mainly driven by the residence title the refugee is granted. Second, we test if a recognition of certificates helps refugees to get access to the labor market and a job matching their education. Third, we analyze if recognized certificates help to generate superior outcomes in respect of gross-income. With this approach we are able to paint a broad picture of labor market access and selection mechanisms.

The analyzed data is the IAB-BAMF-SOEP Refugee Survey which is representative for all people that applied for asylum between January 1st 2013 and January 31st 2016 in Germany. In order to avoid endogeneity we restricted the sample to people that are between 18 and 65 years old, hold a title that allows to work, and live in Germany longer than 3 months.

First analysis suggests that the institutional framework is crucial for labor market integration. Those that are granted a safe status invest in labor market integration, such as recognition of certificates. In turn, recognized certificates help by increasing the chances of employment in general and avoiding an education-occupation mismatch. This in turn provides higher income.

Modernity on the Move – Theorising Tourism Power Relations in a Context of Modernity

Modernity has traditionally been described both as a gradually-reinforced adherence of rationality and as a monster while Anthony Giddens has suggested to substitute these images with that of the juggernaut, a powerful runaway engine that humans can to some extent control but which also threatens to rush out of human control. This presentation will discuss some power-related aspects that come with the advances of tourism as industry and human activities in places where leisure travellers arrive, including conflicts between locals and visitors, locals and locals, and area governance issues.

New Claims to the City: Women's Interventions in the Politics of Urban Infrastructure in Pakistan

This paper draws from my research on community networks and urban culture in Lahore, Pakistan that are mobilized for political purposes by economically and socially underprivileged groups in the city. Based on interviews and ethnographic fieldwork in the Mozang locality, this research has revealed that one of the key pillars of politics for such groups is the fixing and upgrading of urban infrastructure, particularly gas, water, and electricity supply lines and sewerage systems. Importantly, elderly women have played a key role in political mobilizing around infrastructure issues and demanding state delivery of these services. A few have risen to leadership positions in their communities by successfully mobilizing the community to address infrastructure issues

and influence the working of the state. These women have forged expanding networks in their neighborhoods based on existing neighborhood ties but also linking other communities in the locality. They have also established connections with local political leaders and acquired extensive knowledge and experience of the workings of state institutions. Furthermore, these mobilizations reveal the political potential of particular forms of social organization and specific cultural styles of employing affect, bodily gestures and speech for successful interventions in urban politics. Importantly, the public and political activities of these women also challenge patriarchal gender dynamics by redefining gender relations and offering possibilities for women to claim their city. My proposed paper will analyze the findings of this research to understand how women's participation in the politics of infrastructure has shaped the dynamics of urban citizenship and gender relations in urban neighborhoods. I will particularly demonstrate the importance of social and cultural capital for these women to establish a right to their city and intervene in its politics.

Performing Shahbaz Qalandar: The Marketization of Public Religion in Pakistan

This paper will explore recent transformations in the largest Sufi festival of Pakistan – the annual death anniversary celebration of the Sufi saint, Shahbaz Qalandar. Characterized by a breakdown in traditional forms of religious authority and the creative synthesis of a number of sacred and secular aesthetic traditions, the festival is at the forefront of an increasingly popular public expression of devotion and religiosity. Importantly, this fluid religiosity has yet to be systematically articulated in a system of belief but is primarily expressed through performance. In this paper, I explore the contours of this emerging religiosity by examining the performative practices and authority structure of a Qalandar celebration, called Shaam-e-Qalandar, in Lahore. My contention is that this emerging public religiosity highlights some of the new trends in the public sacred life of Pakistan. These include the increasing visibility of conspicuous consumption, market forces and secular performative genres in Sufi celebrations that are reflected in the aesthetics, style and form of performance. They are also characterized by a shift in the distribution of power and authority in the organization and patronage of these sacred celebrations. Thus along with new aesthetic forms that take inspiration from diverse sources, such as Pakistani films, wedding celebrations, pop concerts as well as 'traditional' Qalandar practices, the Shaam-e-Qalandar allows market actors, such as small business-owners, to assume important public roles in religious life through sponsoring such events. Shaam-e-Qalandar therefore represents a new form of public religion that is shaped, on the one hand, by the display of wealth and status and on the other by Sufi practices of ecstatic devotion.

How Does Housing Shape the Social, Cultural and Urban Landscape? Comparing Urbanism and the Built Environment Among Cities in France with Contrasting Profiles

The city has long been theorized and considered by urban planners and public official as the place for economic growth and production. Hence, housing has often been defined as a utilitarian solution to enable workers to live in proximity of their workplace. However, in recent years, some urbanists and social scientists have analyzed the city from another perspective. They emphasize "amenities" and "consumption" pattern as new drivers of urban dynamics and development. From these new analyses, the city is no longer defined solely as a "workplace" but as a place where people can also live, play and entertain themselves. These new theories put at the center of the analysis housing and residential choices as new transforming drivers redefining urbanism and the place where we live.

How are housing and residential forms related to urban amenities and facilities in the city? How does housing shape and influence the social, cultural and urban landscape? And how do the physical aspects of housing and residence relate to these social and cultural patterns? Should the quality of housing only be defined by the proximity to the workplace? Or do urban amenities and facilities also impact the built environment? Finally, what kind of housing environment favors or disfavors the development of urban amenities such as restaurants, shopping facilities, boutiques, cultural scenes and social life?

Using an original national data file, this paper aims to compare the housing environment in different French cities. By comparing different databases, our methodology permits analysis of over one hundred variables about housing in French cities, combined with data about urban amenities, and socio-economic characteristics of citizens.

RC19-354.6JAHN, KERSTIN* (*Institute for Employment Research (IAB)*)SCHELS, BRIGITTE (*Institute for Employment Research (IAB)*)*The Role of Social Welfare Benefits for Young People's Transitions from School to Work*

For every young adult, the transition from school to work (STWT) is of utmost importance. Success or failure at this career stage affects young people's life perspectives and labour market outcomes in later life. While smooth standard transitions into apprenticeship or into employment guarantee financial security, youth's labour market entries are often characterised by ruptures, detours or delays. Social welfare benefits aim at compensating these problematic episodes by protecting people from poverty. This study contributes to the current research by linking STWTs and financial independence trajectories via dual-channel sequence analysis. For the example of Germany with its well-developed social welfare system, we ask if young people require social welfare benefits temporarily or permanently during their STWTs. How do STWTs and financial independence trajectories of young people go along?

Using dual-channel sequence analysis, we examine young people's STWTs and their trajectories into financial independence simultaneously. Our data consists of administrative data from the career guidance of the German Federal Employment Agency and of integrated employment biographies (IEB) of the Institute for Employment Research (IAB) for young school leavers over a period of 6.5 years after compulsory school. As a result, we detect a variety of STWT patterns like smooth standard transitions, delayed transitions, detours and directionless patterns combined with various trajectories of financial (in)dependence. Our results support the hypotheses that standard transitions go along with financial security and that young people permanently end up as welfare recipients after directionless STWTs. Both results hold true for young people from welfare recipient households as well as from wealthier households. Between the two extremes, social welfare benefits only play a minor role for young people in Germany. We do not find typical transitions into employment that are systematically linked to (temporary) welfare benefits during detours or delays – at least not of relevant frequency.

RC04-93.20JAHNUKAINEN, MARKKU* (*University of Helsinki*)KALALAHTI, MIRA (*University of Helsinki*)NIEMI, ANNA-MAIJA (*University of Helsinki*)VARJO, JANNE (*University of Helsinki*)*Educational Equality and Diversified Transitions of Immigrant Youth with/without Special Educational Needs*

The national education systems construct various *opportunity structures*, which include different problematizations, mechanisms and solutions to issues in education policy and governance. One of the key principles of Finnish education is that the same educational opportunities should be available to all people irrespective of their ethnicity, age, gender, wealth, disability or place of residence.

During the last year in comprehensive school, all pupils face the first high stake choice making situation in the Finnish school system when applying for upper secondary education. This transition has proved to be problematic for youth with *immigrant backgrounds* and/or with *special educational needs*. They have reported to have difficulties in getting into mainstream education. In comparison with their counterparts, they face a considerably higher risk of either dropping out of education or remaining in various short-term training programs and projects.

In this study, we analyze with the discursive approach the ways in which local education authorities (teachers, study counselors, principals, n = 29) governing educational transitions consider the structural possibilities and obstacles that frame the educational transitions of young people with immigrant backgrounds and/or with special educational needs. The overall aim of this contribution is to combine the categorical interpretations of minority groups (immigrant backgrounds or special educational needs) with an understanding about institutional opportunity structures.

The solutions and practices targeted for these young people problematized as 'special groups' seem to be uniform and simple, offering often 'second chance' options for access to 'regular' and settled options. Those young people, who are not willing or able to set into these categories, have to face various multi-professional negotiations where the solutions for further studies are made. The presettled opportunity structure is a challenge to the overall emphasis of equal educational opportunities.

RC41-714.2JAIME-CASTILLO, ANTONIO M.* (*University of Malaga*)FERNÁNDEZ, JUAN J (*Department of Social Sciences, University Carlos III of Madrid*)RADL, JONAS (*Carlos III University of Madrid*)GARCIA, GEMA (*Universidad Carlos III de Madrid*)*Public Knowledge of Population Trends and Preferences over Pension Policies. Evidence from a Survey Experiment in Germany, Spain and the United States*

Demographic change, specifically the change in the age structure of the population, constitutes one of the most substantial transformations in the social structure of Western societies since the end of World War II. Furthermore, population projections indicate that the aging process is an ongoing process that is expected to have major impact on Western societies in the coming decades. Yet, the degree to which the population at large is aware about this demographic trend –together with its consequences– remains largely an understudied phenomenon. At the same time, however, a growing literature shows that popular attitudes towards public policies are sensitive to issue knowledge and the empirical evidence confirms that more knowledgeable individuals tend to prefer certain policy reforms over other ones. This study presents new evidence from an

online survey experiment on demographic knowledge carried out in the Autumn of 2017 in Germany, Spain and the United States. The first goal of the study is to know whether the public in these countries is aware of the (present and future) extent of the aging process. Secondly, we analyze if demographic knowledge at the individual level has an impact on preferences over pension policies (and a wider range of social policies) by providing hard, objective information about population projections to a random split of the sample and then comparing the preferences of this group and the control group (those who do not receive additional information). In a final step, we analyze how personal characteristics – such as age, gender, education, and prior knowledge – moderate the effect of demographic information on policy preferences. This project contributes to understanding how much individuals know about population indicators and to what extent this demographic knowledge might affect their support for certain types of policies and their reforms.

Social Mobility and Demand for Redistribution in Europe. a Comparative Analysis

The literature on preferences for redistribution has paid little attention to the effect of social mobility on the demand for redistribution, which contrasts with the literature on class-voting, and no systematic test of the hypotheses connecting social mobility and preferences for redistribution has yet been done to the date. We use the diagonal reference model to estimate the effect of origin and destination classes on preferences for redistribution in a large sample of European countries using data from the European Social Survey. Our findings are consistent with the logic of acculturation in the sense that newcomers tend to adapt their views to those of the destination class at early stages and that upward and downward mobility do not have distinctive effects on the formation of political preferences. However, even though social origins seem to have a limited impact on preferences for redistribution, we cannot accept the hypothesis that mobile and non-mobile individuals are alike. We also find that the effect of social origin on preferences varies largely across countries. The empirical evidence leads to the conclusion that the effect of social origin on preferences for redistribution increases in contexts of strong familism. Finally, social mobility has a limited impact on the distribution of preferences for redistribution. This is mostly because the potential reduction in class polarization caused by the high weight of social origin is partially cancelled by low rates of social mobility in some countries, while the potential increase in class polarization caused by the low weight of social origin is cancelled by high rates of social mobility in other countries.

Migrant Women: Issues of Equity and Justice

In the contemporary world of global order where a significant number of population, around 244 million people (2015), resides in a country other than where they were born, it is not only the issues of organization of the emigrants but also the issue of integration of immigrants of ethnic diversity in the receiving/ host country that gain significance. It has been observed that the administrative and registration systems are unable to cope up with the extensive population movements and the attendant implications on the Global socio-economic and legal and political order. The migration of women has always been an important component of international migration. Women often migrate officially as dependent family members of other migrants or to marry someone in another country. Female migrants are, however, increasingly part of flows of migrant workers, moving on their own to become the principal wage earners for their families. Most migrant women move voluntarily, but women and girls are also forced migrants leaving their countries in order to flee conflict, persecution, environmental degradation, natural disasters or other situations that affect their security, livelihood or habitat. Conventions, laws and practices governing the rights of women and migrants in receiving countries affect migrant women. Migrant women confront legal, direct and indirect discriminations according to their class position, nationality, sexualization and racialization. The present paper will focus its attention on the complexity of migrant women's multiple marginalities and the social structural contingencies including state's legal policy and the power of migrant women' struggle to survive.

Mobile Phones and Adolescents: Leisure in Their Hands

Mobile phones, one of the greatest inventions in the late 20th century, have now become the newest addiction in the world. The mobile phones continue to influence people's lives, especially those of adolescents. Literature suggests that globally young people especially adolescents have adopted the mobile phones

as an alternative to outdoor activities. Mobile phones have changed the way adolescents organize their daily life. Mobile devices now provide almost constant connectivity to peers, social networks and (increasingly) the media. While mobile devices may be creating an additional distraction, they are also providing new contexts for adolescents to access information, explore sensitive topics and develop their identity. Adolescents use mobile technologies to get information for schoolwork, understand changes in their health and sexuality, and learn about the news and current events (Lenhart, Purcell, Smith, & Zickuhr, 2010) Modern mobile phones support a wide variety of other services such as text messaging, MMS, email, Internet access, short-range wireless communications (infrared, Bluetooth), business applications, gaming, and photography. This enables the user to use the mobile phone as a single device for all his activities. This has both positive and negative consequences. On the one hand, the adolescents experience the freedom from surveillance of the elders on the other hand it can also lead to loss of interpersonal skills. The present paper explores the impact of mobile technology on the way adolescents organize their leisure time in India.

Social Movements Against Appropriation of Livelihood Natural Resources in India - Issues of Public Trusteeship Vs Eminent Domain

Jurisprudence in India on Natural Resources like land water, Forest and Water is based on the principle of Eminent Domain which empowers the State to assert their sovereign rights over these resources and acquire them through coercion and violence and in the process displacing the people, their livelihoods and often condemning them to life of pauperization. Along with the principle of Eminent Domain there is another principle which is also part of Indian Environmental Law but often ignored by the State – The Public Trust Doctrine (PTD). The Doctrine basically primarily rests on the principle that certain resources like air, sea, waters and the forests have such a great importance to the people as a whole that it would be wholly unjustified to make them a subject of private ownership. It is within this framework of PTD, the paper would look at different movements against appropriation of livelihood natural resources in India especially around Forests and Water.

Movements around Forests and Water in India have basically questioned the eminent domain, violence and coercion of the State and have asserted that the State holds the natural resources in trust for the people and cannot be sold or privatized even for a fair cash equivalent. The paper would study the Forest Rights Movement and the movement against privatization of rivers and water in India and understand their contribution in reestablishing the Public Trust Doctrine. Some example are the enactment of the Recognition of the Forest Rights Act, 2006 and the struggle to nullify the MOU of privatization of Sheonath river in Chhattisgarh State. The paper would be based on secondary data and discuss the above movements and their contribution.

The Changing Role and Position of Women within the Croatian Defence System

The aim of this contribution is to analyze following questions: What is the position of women in the Croatian defence system as minority in numerical and substantial terms? How is the policy of gender equality transferred into Croatian defence system – primarily Croatian Armed Forces (CAF) and Ministry of Defence – through legislative framework and the implementation of UNSC 1325?

Key questions in this analysis will focus on how women are recruited, availability of higher posts within CAF for women, trends in the percentage of women in the system of recruitment in education model designed for Croatian Armed Forces and factors contributing the decision to pursue military career among women.

Two aspects of the topic include: 1. posts held by women in CAF 1992-2017., and 2. inclusion of women through education system for military purposes. Hence the paper will offer the analysis of recruitment of women through the voluntary conscription since 2008 and the new undergraduate university study programs of Military Engineering (ME) and Military Leadership and Management (ML&M) which were introduced in 2014.

Research methods will include: content analysis of the Croatian legislative framework for gender equality and implemented international standards concerning gender perspective introduced by UN and NATO, as relevant referent points; analysis of available numerical indicators concerning the presence of women in the CAF and MoD (quantitative) and positions held by women (qualitative) in the stated period; qualitative and quantitative survey (questionnaire) among the 1st, 2nd, 3rd and 4th generation of students enrolled into the undergrad-

uate university study programs of Military Engineering (ME) and Military Leadership and Management (ML&M) on different aspects recruiting women into CAF.

The Faces of Oppression in Tourism: A Study of Cultural (In)Justice in Quintana Roo, Mexico

Although there is a robust body of research on the impacts of tourism on cultural and ethnic groups, very few have examined such impacts from a justice perspective. Cultural justice, a topic examined in disciplines such as anthropology (Fikentscher, 1991), education (Naude & Naude, 2005), sociology (Kwenda, 2003), socio-cultural studies (Ross, 1998), and political theory (Arneil, Deveau, Dhamoon, & Eisenberg, 2007) is a young area of research and very little theory building has been done in tourism studies.

Based on the theoretical work of feminist scholar Iris Marion Young's (1990), the Five Faces of Oppression, we examined how issues of justice in relation to tourism played out for the local Maya residents of the popular destination of the Riviera Maya in Quintana Roo, Mexico. Through intensive research *in situ* and empirical data from multiple sources, we found that Maya people suffered not only unfair distributional schemes that limit their access to tourism and marketing resources but also a *cultural oppression* that exploited them, inhibited their participation in tourism governance, and imposed a tourism culture upon them. Specifically, we identified four major cultural injustices towards the Maya that, although rooted in post-colonial and contemporary power dynamics, were replicated and perpetuated through tourism: Exploitation through labor and heritage appropriation, marginalization from tourism economic benefits and tourism decision-making, cultural racism experienced at the workplace and in interpersonal interactions, and cultural domination through the imposition of tourist landscapes, mainstream languages, and consumption patterns. Our study also uncovered important underlying roots of these injustices and the mechanisms through which they are enacted through tourism.

Based on our findings and drawing upon theoretical contributions from sociology and political theory we suggest key principles to address cultural injustice in tourism policy, management and marketing.

Growing a 'Community Garden': Theorising the Constraints and Possibilities of Climate Change Conscious Community Solidarities

This study considers the theoretical implications of both the ease and difficulties of creating new solidarities around gardening in a city neighbourhood associated with low incomes, and above average health and social problems. The population of the area is predominantly white Scottish but also residents of Polish and Turkish origin. For 4 years a 'community garden' has been developing on land owned by the local authority who are committed to the idea of asset transfer to the 'community'. Funding was raised by a climate-change-aware voluntary organisation wishing to help the residents to displace supermarket food with lower-carbon organically grown fruit and vegetables, foster wider take up of gardening, vegetable cookery and awareness of climate change. The project quickly attracted a small group of regular workers in the community garden, good relationship with the teachers and pupils of the neighbouring school for children aged 5-12 and with a number of local voluntary groups. It also attracted low level and, sometimes, spectacular theft and vandalism, such as the burning down of the poly tunnel. The project also revealed multiple reasons for limited take-up of gardening in back gardens. Struggles and uncertainties over ways forward led to a range of efforts at building alliances and 'community consultation', hoping to navigate competing agendas and complexities of power and status. Drawing a range of literatures and approaches back to a relational sociology and using multiple data sources (questionnaires, interviews and participant observation), we attempt to theorise the interplay of power, discourses and experiences that constrain and enable the possibilities of climate conscious 'community controlled' action and the growing of 'community solidarities.'

Organizing the Workerpreneurs in the Algorithmic Management Era

The application-based capitalist mode of production is changing the ecosystem of work and subsequently the forms of solidarity and collective actions. The

algorithmic-matching between supply and demand detaches the gig-economy workforce from both administrative and professional affiliations (Lehdonvitra, 2016). Hence, our understanding of labour should be amended to circumvent the "bogus of misclassification" and to enable an analysis of the functional transformation of workers' role within the production process. In this regard, this research paper seeks to break with a dichotomist vision of work relations within the gig-economy (micro-entrepreneur vs employees) and aims to investigate the organizational context producing atomized *workerpreneurs*.

Based on the Uber model of matchmaking, this research argues that the current transformations are setting the frame for a new type of labour that we labeled as *workerpreneurs*. Accordingly, it will first illustrate the conceptual underpinnings of this new category and shed light on the hybrid nature of the un/binding contractual relation. It exposes the pillars of the productive combination adopted by companies like Uber which embeds flexibility and market-based decision-making with the full automatization of control and management. Secondly, the paper will address the resistance of workerpreneurs by critically analyzing two forms of solidarity and collective actions pursued by Uber drivers; the traditional juridical struggle and the non-traditional application-based "unionism 2.0".

This research builds on firsthand empirical data collected through a series of observations and interviews with drivers in urban centers in both southern and northern economies (Montreal, Toronto, Fortaleza and Buenos Aires) and on a comprehensive literature review of both the gig-economy and on the dynamics of collective actions within different communities of so-called gig-workers

JAMIL, RABIH* (*Département de Sociologie, Université de Montréal*)

The Algorithmic Management of Production Exposed, the Case of Uber in Montreal.

From Silicon Valley to the world market, the capital venture enterprises are disrupting value chains and revolutionizing the processes of production. Sectors like transportation, logistics and hospitality are being globally disrupted by startups like Uber, Deliveroo and Airbnb. This new form of capitalist organizations recalls the concept of the 'network enterprises' (Castells M., 2000) which integrate the production chains on the global level and disperse labour in the local market.

Using their taxi hailing application, in less than a decade, Uber became the world largest transportation company without owning a single car. However, their model of algorithmic management of production allowed the company to become the world "Data-mine" on global transportation movement and traffic. In this context, the proposed paper aims at deconstructing the value chain of the company and exposing the configuration of relations that binds workers, users and the electronic application (Algorithm). Subsequently, it seeks to illustrate the organizational structure of Uber and evaluate it against the Atkinson's model of flexible firm (1984) and the mechanism of labour centrifugation (Durand, 2004).

This research work is part of an ongoing doctoral study which investigates the Uber model of application-based capitalism in the city of Montreal. To do so, it adopts a relational ethnography method (Emirbayer M., 1997 & Desmond M., 2014) and builds on more than one year of participant observations as a user of Uber application and on social media. Moreover, it benefits from the findings of various semi-structured interviews with drivers and customers as well as an extensive literature review of key research works and relevant publicly accessed documents (promotions, public statements, judiciary verdicts).

Between the Centre and the Periphery: The Beginnings of Sociology in Central Europe in a Comparative Perspective

The paper describes the main results of a longer-term research effort of the author concerned with the history of sociology in Central Europe before the Second World War. The paper discusses elementary methodological issues associated with applying a comparative perspective to the research into both institutional and discursive environment of the science in Central Europe and focuses on three thematic areas. Firstly, it summarizes the main steps towards institutionalization of sociology in Central Europe before the Second World War with respect to four areas of institutionalization: university courses, scholarly societies, journals and research institutions. It makes a distinction between institutionalization implemented "from above" (dominating in Central Europe) and that advanced "from below" (predominant in western countries). In its second part the paper compares - based on the results of content analysis of specialist periodicals - the topics dominating respective national sociologies and their sociological rendering in relation to the contemporary social and intellectual context. In order to characterise the position of Central European sociology in relation to world sociology, it uses a concept of sociological "semi-periphery." The third part of the paper draws attention to the still valid elements in the general sociological theory of some Central European sociologists. As opposed to the results of empirical researches which represent a sociological archaism today, and unlike the research on institutionalization which involves social and historical mapping of the science history, the general sociological theory remains that part

of the research in which the findings of the classics of sociology can still be applied in present-day research.

Natural, Environmental High Risk Disaster or Socio-Economic Injustice? the Case of the Knysna Veld Fires in the Western Cape, South Africa

In the month of June 2017 over two weeks, veld fires broke out and ravaged the natural environment, neighboring homes and even wild life as it spread across Knysna, a usually picturesque holiday and tourist destination in the Western Cape region of South Africa. This saw the destruction of hundreds of homes, several people's deaths, losses of animal and wildlife, and the eviction and displacement of thousands more people from their homes in a bid to save lives while millions of rands is estimated to rebuild the town. According to official reports, the uncontrollable flames started at a core site and spread over 300km spurred on wildly by high velocity winds. Existent natural and environmental conditions too (i.e. drought, water shortages and a dry winter) were all contributing factors that flamed the devastation along the Garden Route, one of the most ecologically beautiful regions of the Cape Province, a coastal land. Forensic experts ruled out arson in the start of the Knysna fires and confirmed a lightning strike that led to a condition called "localized smouldering combustion" (The Herald Live. co.za). Despite this, all too often break away fires are usually related to social injustices; especially in winter months when, typically in SA as elsewhere, vagrant or homeless individuals are prone to lighting contained fires to keep warm. This paper addresses and delivers findings relevant to disaster risk reduction in this case study through use of quantitative and qualitative content analysis of online media reports across several South African online newspapers. It questions the validity of arguments for climate change against social-economic injustices and delayed actions of authorities.

"Equal Pay for Equal Work"? Interpretive Knowledge of Merit, Labor Valuation, and Distribution in Cuba

The meritocratic principle of distribution "to each according to work, from each according to ability" may be one of the most tenacious societal beliefs (some authors go so far as to label it *ideology*) with respect to a fair distribution of income and social esteem. In capitalist societies, there has been a long tradition of analyzing and criticizing meritocracy from various angles, both theoretically and empirically. Previous research on societal perceptions on income inequality, merit, and performance in capitalist contexts has successfully shown that the valuation of labor is one of the most controversial and contradictory aspects of merit-based distributive regimes. Interestingly, those are not only a feature of capitalist, but also of socialist theory and practice – yet, little research on the topic has been realized in socialist contexts. The proposed paper focuses on the Republic of Cuba, where the above-named principle, along with the tenet "equal pay for equal work", is very prominent in the official discourse and serves as a normative ideal for the redistribution system – while, at least at first sight, Cuban labor valuation practices do not appear to cope at all with this ideal. Against the backdrop of Axel Honneth's theory of recognition, and by means of interpretive knowledge generated from discourse analysis, as well as expert interviews with stakeholders in the educational and political system, the proposed paper aims to gain a better understanding of labor valuation practices in contemporary Cuba. In order to decode how – and by whom – "equal work" is defined (and, amongst other aspects, which role market valuations play in this context), the paper examines the underlying ideal (or the ideology?) of merit, and how it affects the assessment of worth, as well as the distribution of material and immaterial recognition in Cuban socialism.

WG05-947.4

JARAMILLO MOLINA, MAXIMO* (*El Colegio de México*)

Tolerance and Legitimacy: Dynamics of Income Inequality and Its Perceptions, in Latin America and Worldwide.

Inequality has been positioned in the mass public debate on last years. In the case of Latin America, two important processes have occurred in the last decade: First, there had been much study on the decline in income inequality in the continent, at least for the period of the first decade of the XXI century, contrary to studies that shows an opposite tendency in other regions and countries of the world. Second, perceptions of inequality among Latin American individuals seem to "tolerate" the gap, in spite of considering that magnitude of the gap is "excessive". It is interesting how the perception of inequality in Latin America does not differ to a great extent to those of other countries where clearly the objective levels of income inequality are much lower.

Considering this, there are two research questions that together reveals another one: 1) What has been the dynamics of income inequality in the world and in Latin America, in the period after 2000? 2) How have been modified the perceptions of inequality, both globally and in Latin America? 3) How are related the various current dynamics of inequality with perceptions of inequality and the legitimacy of the social justice system?

There are several important results. First, there is a turning point in the trend of economic inequality for Latin America, after the economic crisis that began in 2008, and comparisons are made with the world trend. Then, regional differences are found in trends in the perception of inequality, placing a special focus on the Latin American trend. Finally, a reflection is made on the relation between the tendency of income inequality and the perception of inequality, and how this is associated with persistence of tolerance and legitimacy of the current socioeconomic system.

RC42-722.5

JARAMILLO MOLINA, MAXIMO* (*El Colegio de México*)

"Que Le Chinguen Más": Why Do People Support Redistributive Policies in México?

Support of people to the redistributive policies in a country it's an important issue to analyze the reproduction of inequality and the legitimacy of distributive justice. There are different explanations about factors related to support for redistributive justice.

At the beginning, some related factors were *observed levels of economic inequality, poverty and social mobility*. Then, other subjective factors such as subjective social class and bias in the perception of economic inequality and social mobility were integrated. In general, these new explanations relate representations of distributive justice to support to redistributive justice.

Although research on this topic at the global level has grown in recent years, few studies have focused on Latin America, due to the low availability of data.

In this research, I analyze the factors that support redistributive policies in Mexico, taking data from the National Poverty Survey of Mexico in 2015, and complemented with information obtained in interviews conducted in Mexico City.

In addition to confirming explanations of other countries on related factors such as social class, perception of inequality and representations of poverty, in this analysis I find new factors related such as the neighborhood of residence and the daily mobility routes of the people, because of its high relation with the subject's perception of economic inequality.

I find also important to highlight how support for redistributive policies changes according to what type of social policy is, particularly if it's universalistic or focused one.

JARKE, JOHANNES* (*University of Hamburg*)

I'm in a Hurry, I Don't Want to Know! Time Pressure Favours Self-Serving Behaviour Under Moral Ambiguity

Social behaviour is shaped by a constant battle waged in the evolved human brain between pro-sociality and self-interest. Which of the two sides prevails is contingent on the make-up of the decision situation: even minimal changes to its structure can sway individuals towards self-serving conduct. Science is just beginning to understand how such situational factors and cognitive processes interact to shape social outcomes. Here, we report on the results of a controlled behavioural experiment that was designed to investigate the causal effect of time pressure on the incidence of self-serving conduct, conditional on limitations of transparency that allows individuals to exploit moral ambiguity. Both situational features are ubiquitous in present-day human interactions, such as team-work, market exchange, or negotiations. We find that time pressure has no effect if decision-makers are fully informed about the consequences of their choices, but significantly increases the incidence of self-serving behaviour if avoiding information about the social impact is feasible. These results have major implications for the formation, organization, and management of human collaboration, and contribute to the understanding of the cognitive processes that shape pro-social behaviour.

JARKE, JOHANNES* (*University of Hamburg*)

Trust, but Verify? Monitoring, Inspection Costs, and Opportunism Under Limited Observability

Is feedback on trustworthiness necessary for the functioning of economic relationships? In many real-world economic environments, such feedback can at best be acquired through costly monitoring, raising questions of how trust and efficiency can be maintained. In the lab, we conduct a modified finite-horizon binary trust game in which we vary the observability of the trustee's actions. In the baseline condition, trustors can perfectly observe their trustee's actions. We

compare this to a condition in which that actions are unobservable and three conditions in which they must be actively monitored, at zero, low or high cost, respectively. Counter-intuitively, differences in observability do not lead to significant differences in trust and efficiency, but the levels are supported by very different information structures: while trustors monitored every action under zero observation costs, most of trusting actions were "blind"—trustors did not learn whether their trust was honored or not—under costly monitoring. Even under complete unobservability almost half of the available surplus was realized. There are distributive impacts, however: The gains from trust favor trustees under the more adverse informational conditions. The behavioral patterns are consistent with the fact that trustors' beliefs about their trustee's conduct are almost invariant across conditions.

Preparing a Local Labour Force for Fly-in, Fly-out Futures: The Case of Aboriginal Tradespeople from Remote Reserves in Northwest Ontario

This paper analyzes a recent community-based initiative by the Sioux Lookout Area Aboriginal Management Board (Northwest Ontario, Canada) to upgrade the skillsets and credential levels of reserve-based Aboriginal carpenters, electricians and plumbers in Northwest Ontario. The goal is the acquisition of vocational credentials that would be recognized off-reserve, thus broadening the labour market opportunities for reserve-based people. A model of the educational career path of the trades students is developed and critically discussed. The findings are then situated in the broader literature on gender and ethnic inequality in the labour market.

The Religious Media and the Sociology of Religious Transformations: Moroccan Youths As a Case Study

The religious field in Morocco has known a dynamic process of transformations. It is a process characterized by producing and reproducing concepts, practices, beliefs, values, and directions of orientation. With the emergence of the concept: "The religious media", two main trends have come into the surface: Values of consuming the religious products and Values of radicalization. For us, there are three key factors that shaped the emergence of "the Religious media" along with its results: First, the socio-political atmosphere, which helped new forms of religiosity to appear after the decline of political Islamic movements as a result of desacralizing its leaders and institutions, which paved the way for the radical Salafist discourse to exert its impact through numerous religious media outlets (more than 120.000 radical Salafist media outlets according to Brookings institute in 2016). Second, the economic factor, through exploiting the religious enthusiasm of a huge category of Muslims to consume Islamic foods, goods and services (commodification of religion and spirituality), where the religious media plays a great role in their process of advertising. Third, the intellectual and philosophical factor, represented in the wave of detraditionalization, or the fluidity and erosion of traditional religious values in favor of a secularized individualistic tendencies within the religion. These factors and others contributed to the emergence of the religious media and its subsequent impacts among the youths in particular. The present paper offers not only an insight into the aspects and Actors in the religious media in Morocco, but also traces, through a quantitative and qualitative fieldwork, the impact of this type of media on the youths stopping at discourse analysis of a number of religious media outlets, and utilizing questionnaires to discover the attitudes, representations and practices of Moroccan youths in regards to the religious media products.

The Uprisings of the Rif Area in Morocco: From a Protest Movement to a Social Movement

The recent uprisings happening in the north region of Morocco (Rif area) signifies a broad title of a deep political developmental crisis. Despite the overwhelming protests that took place during the "Arab Spring" in 2011 with the 20th February movement, the current uprisings in the Rif area reflects a profound transformation in the social, political and cultural structure of the Moroccan society. Without ignoring the linkages between the reasons of 20th February uprisings and the current one, the Rif protests confirm the birth of a new distinct and independent social movement from political, trade union, and associative involvements. An intersecting number of factors led to the emergence of this

social movement. Starting from the political one represented in the unsuccessful process of development and democratization, to the social factor manifested in the large number of social issues: unemployment, corruption, discrimination... etc Such aspects are to be considered in light of the increased awareness and social consciousness of the socio-political atmosphere especially thanks to social media interactive environment among the youths. These factors and others push us to ask questions about the explanation of the emergence of this social movement? And to what extent can we consider it as such? And how does the Rif uprisings interact with the state and the rest of political actors? What challenges and prospects can we anticipate based on the ongoing series of events? All these questions are the subject of a direct ethnographic approach to explore the manifestations of such uprising through a number of interviews with a number of Actors involved in the daily dynamics of the events to provide a clear and nuanced view to the topic.

Analysis of Subjective Wellbeing and Social Values in the Context of Macro-Level Behavioural Patterns.

Research find that social values have strong and significant effect on individual wellbeing across European countries. However, most studies use only economic indicators to set up the macro-level context for comparison, and ignore relevant behavioural patterns such as how much time is spent in contacts with others in each country. Existing time-use data collected within the Harmonized European Time Use Survey project in 14 European countries indicate that those macro-level behavioural patterns differ substantially across societies. This study explores how the effect of variables related to social and family values on subjective wellbeing is moderated by the relevant macro-level behavioural patterns. The study combines the 1999 European Value Study data and the Harmonized European Time Use Survey (1998-2005) data to allow for a comprehensive exploration of the topic. Macro-level variables include duration of social time with family/members of the household, duration of social time with friends, and duration of leisure. Micro-level variables include: importance of family, importance of friends, and a set of socio-demographic variables that have been related to subjective wellbeing. Multilevel models show that longer leisure as well as longer "family time" (including phone calls and, mostly, conversations with household members) is linked with higher satisfaction levels reported in the country. Moreover, in the countries where people spend, on average, more time socializing with their family and household members, high importance of the family is contributing more to individual's subjective wellbeing than in the countries with lower average time spent in such activities.

Who Shares the Meal? Social Differentiation in Family Eating Patterns and Its Determinants in Britain.

This paper examines social differentiation in eating patterns in Britain. It focuses on family meals among individuals with under-age children. Eating with family members has been associated with improvement in wellbeing, nutritional status, and school performance of the children. Modern lifestyles may pose a challenge to commensal eating for all groups, but the scale of the impact vary between social classes, with some groups at higher risk of shortening or skipping family meal time. Eating patterns are differentiated by individual's social class; they have also been associated with educational attainment, work schedules, and household composition. The objective of this study is to disaggregate the effect of these variables. Using data from the 2014/2015 UK Time Use Survey I analyse the net effect of social class, education, income, work and family characteristics on the frequency and duration of family meals. Individuals in the highest occupational class dedicate more time overall to family meals. However, class effect becomes insignificant when other variables, such as education or income, are controlled for. This study finds that higher educated individuals have more frequent family meals, and more affluent individuals spend more time at the table with their household members. Work characteristics are associated with frequency of meals, but not with their duration. Finally, household composition matters for how people eat. Parents of younger children eat with their family members more frequently than parents of teenagers. Single parents, a notoriously time-poor category, spend the least amount of time eating with their families and have fewer commensal meals.

How to Compare Changes, Struggles and Experiences of Inequalities in the Argentinian and French Gender Regimes?

In this communication, I would like to explore how to apprehend a cross-national comparison of gender inequalities in the Argentinian and French contexts. European comparative researches have developed a lot of theoretical and methodological tools, in a feminist perspective, such as the gender regimes or gender contracts approaches. How is it possible to extend and renew these approaches to compare gender inequalities in European and Latin American countries? How to capture the gendered impact of globalization, economical crisis and economic austerity policies? Thus, I will explore the evolution of gender inequalities in Argentina and France through the analysis of social, economical and political changes and struggles, focusing on women's access to intimate and economic citizenship. After a brief comparative historical record, I will first propose a state of the art of gender equality plans since the 2000s in both countries. I will then argue that social policies have had an impact on social behaviors, at the interface of different social markers such as gender, class or ethnicity. I will finally propose a reflection on the need to add meso-social and micro-social levels analysis to better apprehend dynamics of changes.

A New Hope – Integrated Information from Registers As a Chance for Policy Makers and Scientists in Poland.

The use of administrative data in social research, including the mobility and stratification research, has many benefits. It allows inquires of entire populations. Continuous data collection creates an opportunity for longitudinal analysis which is not affected by problems typical for surveys such as respondents' unreliable memory or unwillingness to disclose information. It reduces the cost of research.

The use of administrative records for research purposes has decades-long tradition in Scandinavian countries but was not common around the world. Lately, thanks to developments in information technology as well as the demand for evidence-based policy making, ever more countries decide to use their administrative registers for research. Poland is one of those countries.

We present the design of the Polish Integrated Analytic Platform (Zintegrowana Platforma Analityczna) currently developed by the Ministry of Digital Affairs in cooperation with the University of Warsaw and Warsaw School of Economics. The system incorporates data from following public registers: population registers, educational databases, health records as well as tax and social security registers. The system is created with policy evaluation in mind, including among others testing the efficiency of labour market interventions or assessing the allocation of health funding. However, the data will be accessible to research as well. The system has a tremendous potential for mobility and stratification studies.

As a demonstration, we present a longitudinal analysis of tertiary education graduates' job market outcomes (employability, wages, job stability) – controlled for socio-demographic characteristics (sex, age, average wages in region of residence etc.). Moreover, we show the impact of previous job experiences on different patterns of educational mobility between Bachelor and Master studies. The analysis uses the data of the Polish Graduate Tracking System (ELA), which constitutes the foundation for the larger national system for administrative data processing.

The (Ir)Rationality of Separatists - the Decision Model for Partially Homogeneous Societies.

The presentation will show the model for explaining and predicting collective decisions made by ideologically differentiated complex societies. Finding effective and easily understandable tools for these purposes seems today more important than ever. The reason for this is growing significance of local communities bound together with strong cultural and national bonds. These communities can violate the stability of current political and state structures, e.g. Catalonia in the Kingdom of Spain. The regional political differences in the United Kingdom have become visible and escalated in the wake of the Brexit referendum. The United Kingdom is not so united after all. For example most voters in Scotland and almost all voters in Gibraltar voted differently than most voters in UK. Regional separatist groups can be modelled as form of ideological communities. The severe regional political divisions endanger the integrity of the state. The presented model is based on the oceanic games theory (games with large number of players) created by Lloyd Shapley, and on the concept of the partial homogeneity structure (modelling the structure of ideological communities) introduced by Philip Straffin. The method for recognizing the ideological communities boundaries, including national communities, will be presented. Moreover, the model measures political power of communities within a divided society. It can be helpful to understand the reasons for renaissance of the idea of the nation state. The presentation will use the results of Brexit referendum in various regions of UK. The outcomes of

simulations will be compared with the empirical observations. The results of the model of oceanic games with various partial homogeneity structures will be the basis for building scenarios of future events. Local communities' attempts against the state might seem irrational at first, but they could be interpreted as rational strategies in a given structure.

JASSO, GUILLERMINA* (*New York University*)

Analyzing Migration Restriction Regimes

This paper develops a framework for analyzing migration restriction regimes, and illustrates it with the case of U.S. immigration law and policy. Nation-states regulate the entry of persons born abroad, and this regulation may be understood as an amalgam of three elements: the type of restriction, the apparatus of restriction, and the consequences of restriction. Restriction may be qualitative, quantitative, or both. Qualitative restriction notices the characteristics of persons, using them as criteria for accepting or denying admission. Quantitative restriction places numerical ceilings on admissions. The apparatus of restriction stipulates specific ceilings, whether some groups are exempt from the ceiling and, if so, by what criteria, and whether admission under the ceiling is first-come/first-served or instead preferential and, if so by what criteria. Two unintended consequences follow immediately: unauthorized migration and backlogs (visa processing backlogs under both qualitative and quantitative restriction and visa number backlogs under quantitative restriction). These in turn generate a range of policy devices: border enforcement, procedures for legalization and deportation, and procedures for clearing backlogs. Indeed, the history of a country's immigration law may be understood as a sequence of measures for altering the apparatus of restriction in order to address unauthorized migration and visa number backlogs. Viewing migration through this lens enables assessment of particular legislation and, more broadly, dynamics of a migration restriction regime, subject to world circumstances, and it also generates new metrics for a country's attractiveness and its innovativeness and creativity.

Are Top Shares a Good Measure of Inequality?

Newly precise evidence of the trajectory of top incomes in the United States and around the world relies on shares and ratios, prompting new inquiry into their properties as inequality measures. Current evidence suggests a mathematical link between top shares and the Gini coefficient and empirical links extending as well to the Atkinson measure. The work reported in this paper strengthens that evidence, making several contributions: First, it formalizes the shares and ratios, showing that as monotonic transformations of each other, they are different manifestations of a single inequality measure, here called TopBot. Second, it presents a standard form of TopBot that satisfies the principle of normalization - ranging from zero to one, with zero representing perfect equality and inequality increasing as the measure goes toward one -- but also finds that, compared to shares and ratios, the standard form is somewhat blunt in depicting changes in inequality. Third, it presents a new link between top shares and the Gini coefficient, showing that properties and results associated with the Lorenz curve pertain as well to top shares. Fourth, it investigates TopBot in mathematically specified probability distributions, showing that TopBot is monotonically related to classical measures, such as the Gini, Atkinson, and Theil measures and the coefficient of variation. Thus, TopBot appears to be a genuine inequality measure. Moreover, TopBot is further distinguished by its ease of calculation and ease of interpretation, making it an appealing People's measure of inequality. This work also provides new insights, for example, that, given nonlinearities in the (monotonic) relations among inequality measures, Spearman correlations are more appropriate than Pearson correlations, and that weakening of correlations signals differences and shifts in distributional form, themselves signals of income dynamics.

"Sex and Genders in the City:" Art Students Meet Applied Sociology

In this presentation I share experiences, visual material and reflections from a class I team-taught with an artist-architect at the Academy of Applied Arts in Vienna in 2016. We designed our interdisciplinary learning space around Aspern, a new urban district that is being built from scratch in Vienna, Austria. It offers opportunities but also challenges in terms of Gender Mainstreaming in urban space. We used the method of "collective mapping" (iconoclasticas) to research the area and were working with community contacts throughout the semester to explore implications for sexes and genders in this particular city part. The result of the class was temporary site-specific art which is a form of applied sociological approach.

RC18-346.7JAVADI, REYHANENH* (*Culture, Art and Communication Institute*)***Legalizing the Religious Exclusion: Emerging the Islamic Identity of the Modern Juridical Field in Iran through the Competition for Monopoly of Right in the Constitutional Revolution (1906-1911)***

In this paper I am concerned with the early competitions of the players of the Iranian Constitutional Revolutionary movement (1906-1911) regarding the monopoly of right in determining the Constitution and its effect on the Islamic identity of the judicial system in Iran. Accordingly, my question is "how the power struggle and the interactions of players in the Constitutional Revolution formed the Islamic identity of juridical field by effecting the first constitution through the claim for *the House of Justice*?" Applying Bourdieu's account (1987) regarding the juridical field, by reviewing the writings of intellectuals, the parliamentary debates, and the text of the constitution (1906;1907), I elaborate the role of revolutionaries' demand for *the House of Justice* –as their greatest claim– in the formation of a constitution with Islamic characteristics.

My answer to the question is that the players of the field of power were united over the slogan of the ambiguous demand for *the House of Justice*, however, they had different understanding of this demand. After the proclamation of the constitution, the competition of the intellectuals and *Ulama* [religious figures] for defining the supplementary fundamental law resulted in neglecting the promise of the House of Justice. More importantly, by instrumentally using the language of Sharia to promote the constitutional and modernist ideas, the secular intellectuals deprived themselves of a firm stance in the following power struggle in which traditionalist *Ulama* were persuading the legalization of the Islamic identity. As a result of this process of struggle in the field of power, the Iranian modern juridical field became highly dependent on and intertwined with sharia; and despite the early promises of the revolution, the continuous ongoing process of "legalizing" exclusion emerged in which the basic rights of the minorities –in particular, religious minorities as well as Muslim women– have been neglected.

RC56-917.3JAVADI YEGANEH, MOHAMMAD REZA* (*University of Tehran*)ZADGHANNAD, SAEDEH (*University of Tehran*)***Missing Ring of Travelogue Study in Iran (The neglect of two narrative "present ethnographic" techniques and "indirect free discourse" in travelogue studies)***

The two concepts of "present ethnographic" and "indirect free discourse" have been neglected in travelogue studies in Iran, especially in the fields of Iranian behavioral identifying and the study of the Iranian habits. According to the present ethnographic concept, the writer of travelogue captures information from a culture in a way that the elements of that culture are constant and unchanged, and the individuals belonging to that culture also follow a solid set of behaviors. Based on indirect free discourse, which is a narrative tool, collective beliefs and attitudes of all individuals of a culture are expressed in generalized forms. Accordingly, the authors of this article, by studying and analyzing more than 500 travelogues and travel reports that are the result of the look of foreigners to Iranian culture, in addition to displaying the moments recorded with these two techniques of narration in foreigners' travelogue, in a genealogical way indicate their footprint and their effect on the judgments of Iranian travelogue researchers and their reflection of the behavioral and habitual abnormalities of Iranians.

RC11-228.1JAYA, PERUVEMBA* (*Department of Communication, University of Ottawa*)PORTER, MARILYN* (*Department of Sociology Memorial University*)***A Tale of Two Cities in Canada: Immigrant Grandmothering in St John's and Ottawa***

In this paper we document the experiences of immigrant grandmothers in two very different communities in Canada. Based on interviews and focus groups with diverse immigrant women from many different backgrounds and countries of origin, this project aims at comparing and drawing out both the commonalities and differences between these cities in Canada.

The goal of this study was both to explore the process of grandmothering by immigrant women in these two cities and to compare those experiences. Some research questions that we wanted to pose and probe into are: How do immigrant grandmothers in St John's and Ottawa experience being and becoming grandmothers? How do immigrant grandmothers in Ottawa and St John's overcome the challenges if any in this process? How do they transmit cultural values and practices to their grandchildren? How do the experiences differ in both cities given their respective locations and demographics? How are the stories of the grandmothers similar in both cities?

In understanding the context of these women, we have adopted a nuanced and intersectional feminist approach (Crenshaw, 1989, 1993, 2001; Yuval Davis, 2006) to gender, being sensitive to and aware of, the intersection of gender with race, class, ethnicity, religion and cultural diversity. In addition, we find it important to locate this study in the context of multiculturalism in the Canadian context while being aware that multiculturalism itself is a debated and contentious concept (Bissonath, 1994; Kymlicka, 1995).

RC32-588.4JAYA, PERUVEMBA* (*Department of Communication, University of Ottawa*)***Our Faith Will Keep Us Alive: Religious/ Spiritual Identities of Diverse Immigrant Women in Ottawa***

An important aspect of immigrant women's identities is their religious identities. This paper will focus on examining the religious and faith/belief identities of various immigrant women of diverse backgrounds in Ottawa. By immigrant women I mean women who have immigrated in their lifetime and have been born outside Canada. An effort will be made to interview women from many varied countries of origin as well as different faiths, persuasions and belief systems : such as, women who identify with Islam, Hinduism, Christianity, Judaism, Buddhism, Sikhism, Jainism, Zoroastrianism, and others, or as being agnostic, atheist, being spiritual and not subscribing to any belief system.

The following questions will be examined: How important is religious/spiritual identity within the frame of reference of their larger identities? How does their religious/spiritual identity change or transform in their adopted country: Canada? How do they negotiate their faith/belief/spiritual identities in different spheres of their life: personal, professional and other settings? How do they express and practise their faiths/beliefs? Are religious/spiritual identities suppressed after immigration or do they take on new forms and gain ascendancy in the Canadian context? How are religious/belief and spiritual practices and rituals maintained and reconfigured in the Canadian context?

In this paper I examine and locate the study in the context of transnationalism (Glick Schiller et al. 1992; Appadurai, 1995; Levitt 2001; Vertovec, 2001). In this study the focus is on transnationalism as linked to religious/faith identity (Ysseldyk et al 2010) and spiritual identity (Kiesling et al 2006). At the same time an intersectionality approach will be adopted being sensitive to the intersections of gender with aspects such as ethnicity, race, class, religion, age.

RC18-336.7JEAN, JOANNIE* (*University of Ottawa*)***Political Disaffection and the Struggle Against Impunity in Chile***

The end of the dictatorship in Chile happened in a climate of almost euphoria for the historical associations of victims and their families. The return of democracy for the Chilean society was met with an incommensurable hope that they would go back to the agenda for social justice laid out by Salvador Allende. 27 years after the transition, the mobilisations of memory still struggle to be heard and have their claims met. Indeed, the groups are still ever present in the fabric of the society, searching for the complete truth and effective justice.

This communication seeks to shed light on the historical struggle for justice, truth and memory of three Santiago-based associations (Association of families of Detained Disappeared- AFDD, Association of families of Executed Politically- AFEP and the Association of Ex Political Prisoners- ANEXPP). Using a discursive methodology, I studied five historical conjunctures and came upon the realization that the efforts of the administrations were perceived as a way to close the box of the past, whereas the organizations still pursued their historical goals (i.e. effective justice and complete truth). The discourses produced and distributed through the written press present the dissatisfaction of the mobilisations of memory in Santiago. The ineffectiveness of the consecutive governments of the post-dictatorship era is perceived as a betrayal of the cause the victims and their families have suffered to defend all these years. Representations of the past, used by the mobilisations, are a way to defend a project for Chile's future. It also illustrates the political disaffection of the human rights movement in the capital.

RC44-749.2JECHT, TANJA* (*University of Bielefeld*)***Emancipatory options within post-Fordian precarious existence in the urban environment of Berlin (Germany)***

In my talk it will be made clearer, in what way the relations between the spheres of work and life are challenged through "precariousness" in the urban space of Berlin, Germany.

For one thing it is characteristic of Germany in comparison to Greece or Spain for example that traditionally there are less labour movements or coalitions on a broad base and therefore the isolation and individualisation of life patterns rather predominate and shape everyday life. On the other hand the metropolitan area

of Berlin always had the reputation to be a melting pot for “alternative” ideas and live spaces and in all times was considered to be a laboratory for experiments in various social contexts.

Through analysing everyday life experiences in these urban environments I have discovered resistant, and partly political motivated practices which the individuals unfold while facing everyday impositions of precarious life and neoliberal conditions. In the strategies of action and the self-interpretations the various correlations between economic exploitation and forms of subjectivation can be deciphered: the protagonists of my sample are willing to struggle for „new“ or „different“ categories of belonging and for social inclusion through self organisation, partial autonomy and by focussing on own or group related ideals and needs.

At that blue prints can be detected which challenge the neoliberal logic of exploitation and try to escape from it at least selectively and therefore also make visible the potential for societal change.

In my talk this will be illustrated by bringing in data from narrative interviews and case reconstructions that I conducted in my current dissertation project.

JEFFREY, HEATHER* (*Middlesex University Dubai*)

Maternity in the Tourism Industry

Maternity in the tourism industry

In many contexts adequate maternity protection is almost non-existent, especially in the tourism related industries. Maternity protection ensures equal access to employment, but also to the continuation of employment, a lack of maternity protection can alienate half of a country's human resource and perpetuate traditional biological sex roles. Drawing on the stories of women working informally and formally, and in the public and private sectors in the Tunisian tourism industry, maternity protection is presented as a major challenge to the UNWTOs assertion that tourism can aid in the attainment of SDG 5: “achieve gender equality and empower all women and girls” (UNWTO, 2016). Women's stories highlight the incompatibility of policy with pregnancy, presented here as culturally bound, and tourism.

JEFFREY, HEATHER* (*Middlesex University Dubai*)

The Academic Practice of (re)Presenting Immobilised Hosts

The academic practice of (re)presenting immobilised hosts

The term host is ubiquitous to the school of tourism studies. Utilised to (re)present local populations found in the tourist destination, its roots can be traced in the seminal anthropological work of Valene Smith (1989) *Hosts and Guests*. The terms hosts and guests are contested and have been critiqued for creating binary opposites, when it is suggested that both roles are in fact far more fluid than first thought (Sherlock, 2001). However, the binary opposites of hosts and guests have been useful for tourism theorising, providing a language to name things. Yet, in naming lies the potential risk of the reification of stereotypes and ‘in Tourism Studies we need to confront out permanent complicity in structures of inequality, injustice and violence that we spend so much time trying to alleviate’ (Swain, 2009: 520). Focussing on the tourism academics’ role in (re)presenting research participants, literature published since 2010 is analysed to highlight an (implicit?) complicity in the immobilisation of the female host. There is a propensity for research on gender and tourism to (re)present women and men from the West as guests and women and men from the Rest as hosts. It is argued that working within this dominant framework can equate to an overlooking of many issues facing women and men globally, in doing so it paves the way for future research and opens dialogue for important conversations on gender and feminist research in the academic field of tourism.

Indo-US Scientific and Technological Consortium in Energy Sector: A Public Policy Perspective.

Contemporary public policy debates on energy security are characterized by an intense focus on questions regarding access to resources and associated geopolitical and geo-economic challenges. Energy issues are highly significant for sustainable growth and development for the entire globe. The relationship between Science, Technology particularly energy technologies and our social life has traditionally been dynamic. In the global as well as local level energy has become an important political, economic and environmental issue. Certainly the study on interaction between technology and environment has received considerable attention from scholars around the world specifically concerns about energy utilization and its environmental impacts. Climate change and other environmental concerns associated with energy production and consumption are crucial issues for both Physical and Social Scientists. The social dimension of energy production, consumption and its impact in terms of social change is critical

questions in our contemporary social order. In this context the paper specifically focusses on the issue of Energy security, particularly the Indo-US Scientific and technology consortium in Energy sector particularly in Partnership to Advance Clean Energy in India. Secondly this paper will explore the political, social, economic and ecological impact of energy technology particularly to barriers, challenges and opportunities for the deployment of renewable energy. Finally it will further more look over the public acceptance and resistance of new energy technology specifically focusing on impact of climate change communication and popularisation of renewable energy utility.

“Community” Renewable Energy Projects: A David Versus Goliath Battle? Insights from Two Initiatives in Denmark and France

“Community” renewable energy projects are often presented as an “alternative” to a commercial and centralized model. By considering them as potential challengers within a strategic action field (Fligstein and McAdam, 2011), the renewable electricity market, this paper analyses to what extent these initiatives constitute market layouts in disruption and continuity with incumbents. Focused on two case studies, this contribution looks at the interactions between commercial developers and citizens’ organizations in respectively Denmark and France. Our hypothesis is that most of the time the citizen power plants actors do not challenge the incumbents and interact with them through two ways: absorption and hybridization. The former corresponds to limited partnerships between renewable energy companies and individual citizens around share offers or debt investment. The latter corresponds to protective coalitions from market forces between citizen groups, local authorities and/or commercial developers. However, there are some attempts from citizen actors to challenge directly the incumbents through two ways: competition when a citizen group competes directly with the incumbents and rupture when a citizen organization tries to develop a transformative initiative of the electricity market. This contribution will be focused on these two ways of interaction with two in-depth case studies, IDSE in France and Wind People in Denmark. Based on semi-structured interviews with citizens, NGOs employees, civil servants, our analysis of this confrontation between incumbents and challengers wishes to study the ability of challengers to shape the rules of electricity markets. To do so, our theoretical framework will be based on a similar approach used by scholars working on social movements influence on pharmaceutical firms (Weber and Rao, 2009), stock price returns (King and Soule, 2007) and recycling industry (Hirsch, Lounsbury and Ventresca, 2003).

Starchitects in Bohemia: An Exploration of Cultural Cities from the “Top-Down” and “Bottom-up”

Urban scholars have devoted significant attention to the “cultural city”, a phenomenon in which urbanization is tied to the production and consumption of artistic products. The cultural sector is highly diverse, however, and less is known about how different types of culture relate to each other and the larger urban environment. In this paper, we compare two quintessential forms of culture-led urbanization that represent opposite ends on a spectrum: iconic architecture and neo-bohemia. While iconic architecture is a “top-down” approach to culture involving large budgets, elite “starchitects”, and powerful clients, neo-bohemias tend to be a “bottom-up” phenomena formed as individual artists gravitate toward particular neighborhoods, establishing arts scenes. Using a combination of neighborhood case studies and national-level quantitative analysis, we investigate the ecological relationship between these two phenomena. In doing so, we provide new insights into the geographic and social structure of the cultural city.

Mrs. Lee, Who Has Lived in a Small Town with US Army Base in South Korea: Intersectionality with Power, Gender, and Class

This paper analyzes intersectionality, based on power, gender and class, through oral history of Mrs. Lee in seventies. With a question that how to analyze a biography with intersectionality as theory, it aims to extend possibility of feminist Epistemology especially in the context of South Korea, which could be situated as a post/colonial State. The approach without intersectionality as theory could scrutinize how a condition acted on research objects (narrativity) and what its result was (causality). But it has little attention to explain how the condition ‘constructed’ recognition and lives of objects (constructivism). Here puts the

importance of intersectionality. The storyteller has grown up in a small town of a region, 'Dongducheon', known for the station of US army base-a representative feature as considerable power over South Korea-. The experience that a son of the storyteller received treatment in a U.S. army hospital, which had advanced technology, critically changed her recognition about the US army from as strange neighbor to as the savior. Another experience is that she was 'sent' to husband for marriage in the hope of 'getting fed'. In terms of gender the right to live of women has been dependent on men's labor. While men earn wheat from work, women are situated in kitchen only to cook bread with it. During the interview, she exhibited her evaluation of herself with moral superiority compared to that of prostitutes, who live in a red-light district to 'comfort' US soldiers. However, in regard of economic status, the absolute poverty of the storyteller made her presume that the status of prostitutes would be higher than that of them. Hence, she is blinded to problems embedded on existing structure. On the other hand, we open our eyes from interpreting her experiences with intersectionality as theory.

"Is 'the Red Gay' a Matter?": Gender and Sexual Politics of the Military and National Security Ideology in South Korea

This paper aims to analyze the gender and sexual politics of the South Korean military validated by national security ideology in the system of Korean peninsular division. The gender and sexual politics of the South Korean military should be understood in terms of the traces left by the authoritarian regime and the legacy of the Cold-War. Since 1945 liberation, the authoritarian regime emphasized the anti-communist ideology to claim the legitimacy, creating a "real man" discourse centered on the military. Only men who had done their military service were granted the qualification as a 'first class citizen'. Until now, in the midst of inter-Korean tension, the male-centered military culture and the conscription system have been hardly challenged. This paper especially focuses on the military institutions which are based on the strict gender binary system: it criminalizes LGBT and Queer people in the military and normalizes and stabilizes the status of a cis-gender heterosexual male. For instance, MTF transgender is forced to surgically transform their body in order to prove that she is a *real* transgender, not a draft evader, during the physical examination. In addition, *article 92-6 of the Military Criminal Act* is originally written as an article that penalizes homosexual intercourse in the military, but in fact, this is a sodomy law that punishes the existence of gay soldiers. Furthermore, the recent military crisis of East Asia will be a stumbling block to the improvement of human rights of LGBT and Queer people in South Korea, because many challenges to the military institutions have been impeded by conservative groups that stigmatize and slander homosexuals as "Red Gay", pro-north Korean homosexuals. The effects of the gender and sexual politics of military should be analyzed thoroughly, as the political forces that encourage the politics of hatred and military tensions are prevalent today.

Authoritarian Neoliberalism, Civil Society and the Future of Democracy

The end of the 1980s and the triumph of liberal, parliamentary democracy as the only viable governmental form signaled a bright future for the peaceful and prosperous coexistence of democracy and capitalism. It signaled a bright future for the possibility of critique, contestation and transformation of the given order by the organizations, individuals and social movements of civil society. The existence of an independent and strong civil society was seen as the hallmark of a well-functioning democracy.

However, the reality has been somewhat different. With globalization, neoliberal policies and the dismantling of the Western welfare states, civil society has increasingly been mobilized for securing governmental and social aims that the states could or would no longer provide. The freedom, autonomy and critical role of civil society organizations and actors is becoming more and more precarious, originally in the periphery of the West, but now also increasingly in the core Western countries with increasing suppression – or at least defunding and delegitimation – of civil society associations and NGOs critical of the dominant neoliberal order. In this sense, we are moving more and more from what Nancy Fraser has called 'progressive neoliberalism' to what Ian Bruff has called 'authoritarian neoliberalism'. Those actors and organizations in civil society espousing a vision of a different society and a transformation of capitalism are increasingly delegitimized, if not outright suppressed.

This paper argues that despite the political and democratic promises of civil society – and thereby of alternatives to the given order – we have witnessed the political content of civil society being emptied. Civil society has become increasingly marketized and/or neutralized with regards to political critique and contestation and increasingly mobilized in order to neutrally and uncritically provide social services for a dismantled welfare state. This poses serious problems for the future of democracy.

Tackling Inequalities. Vertical Redistribution in Old Age Pension Schemes

A large literature has convincingly argued about growing income inequalities as well as the risk of welfare dualization and institutional maladjustment between labour market and welfare arrangements in advanced economies.

Redistributive mechanisms such as welfare schemes may in principle constitute effective tools to tackle increasing inequality. Nevertheless, this ultimately depends on the *vertical* redistribution capacity of the former. As the largest redistributive mechanism in most advanced welfare states, *pension* schemes are a case in point. However, most of redistribution they produce is between generations and not necessarily across income groups.

The paper therefore focuses on the vertically redistributive elements contained in the pension schemes of a number (around 6 or 7) of countries, and their changes in the last two decades. The analytical focus will mainly be on social insurance and mandatory private schemes, since means-tested schemes are by definition about income redistribution and purely private schemes are non-compulsory non-redistributive. The objective of the paper is twofold. First, we aim at mapping the different elements of vertical redistribution – i.e. progressive calculation formulas, differential access to retirement, etc. – included in the schemes covered. Second, we aim at accounting for the observed variation.

Countries and schemes will be selected in order to be representative of the main types of pension provision, and they will include countries belonging to different welfare regimes, as well as fully public schemes, schemes based on social partnership and private mandatory schemes.

To the best of our knowledge, there is no comparative research on this specific topic. The paper will therefore be of an exploratory nature. Possible independent variables are the power resources and political orientation of key actors instrumental in design of the scheme; the governance of the scheme (e.g. state governed or parity governance); the position of the scheme within the overall pension system.

Activity Tracking and the Bio-Politics of Uncomfortable and Confronting Data.

Sensor enabled data garnering technology such as the Fitbit produce data that is collected, coded and interpreted across a range of physiological and social practices that are shaped by the production and consumption patterns of particular epistemological contexts and industrial modes of production. Such devices afford a heightened awareness which can be thought to contribute better decision-making. Although data is expressed in goal-oriented terms (10,000 steps per day), it also has distinct characteristics resulting from processes involved in their production and ultimate value envisaged for them. In this paper, I explore the relations between activity tracking and of practices of data avoidance and interference. I argue that an exploration of idiosyncrasy in activity tracking exposes atmospheres, temporalities, energies and rhythms of living socially *with* data, and this paper engages with the coupling of technical and political affordances produced in the modulation of digital mediation, wearable sensors, data-schema, and algorithms with human knowledge-seeking, anxiety and insecurity. I present ongoing work that presents prevailing mindsets that relate to data production, interference, resistance and refusal in documented cases where these technologies are used idiosyncratically as a negotiation by paying particular attention to the idea that the technical scripts embedded in the workflow of data-garnering, wearable technology shapes the ways in which self-subjectivity is produced, environments are apprehended and programs of action are performed. I suggest that as socio-technical assemblages, activity tracking systems are inflexible in their ability to accommodate agency due to the technical contingencies resulting out of affordance configurations coded in during the design, prototyping and development phases of technology diffusion and assimilation. Practices of avoidance, interference, and refusal present an interesting paradox where technically mediated deception and self-delusion constitute a dimensional politics-of-self where the relevance of uncomfortable and confronting data is framed by ill defined configurations of space/time, interior/exterior, individual/population, and data/self.

A Preliminary Analysis of the Social Phenomenon of 'Youth Precariat' in the Taiwanese Society within the Context of Globalization and Its Implications for Teachers

For teachers, understanding what young generation thinks is paramount. Youth culture is a crucial topic in Sociology of Education because it helps adults (i.e., policy decision makers, school teachers) understand the youth's ideas and values so as to adjust the direction of educational policy, curriculum and instruction accordingly. However, new generation's ideas and values tend to change along with the changing of the society. Hence, the results of the prior research seem to be unable to account for what young people think nowadays. Especially, the youth today in Taiwan, due to the influence of internet, globalization, and neoliberalism, seems to move from 'strawberry generation' to 'precariat' and has a 'precarious' life. Therefore, this two-year study, utilizing the methods of interview (first year) and survey (second year), aims to collect Taiwanese young students' ideas and values, and then figures out their youth culture. Moreover, the research will also go further to see if the youth culture nowadays in Taiwan shows the social phenomenon of 'precariat.' Based on the research findings, some suggestions for policy decision makers and school teachers will be addressed.

Does the Expansion of Higher Education Reduce Gender Inequality in the Labour Market? Evidence from a Multilevel Analysis of Urban China

The higher education system in China experienced a dramatic increase in its capacity in recent decades. During the higher education expansion, more and more female students gained access to higher education, and the number of female college-educated workers in the labour market is unprecedentedly high. However, the impacts of higher education expansion on gender inequality in the labour market are less well understood in the literature. To fill this gap, this study examines whether and how women benefit from higher education in the labour market of urban China. Specifically, we investigate the advantages/disadvantages of college-educated female in terms of income and their employment in the labour market. More importantly, we take into account the new changes in labour market structure, i.e., the rise of informal sector (i.e., working in registered small-scale private enterprises, self-employed, and flexible employment), which accounts for about 60% of the total urban labour force. We also discuss the gender inequality in both income level and the sectors in the labour market (i.e. formal and informal sectors).

Drawing on a recent nationwide household survey (China Labour-force Dynamics Survey) and the city-level statistics, this study finds that higher education in general has a significant and positive impact on female workers' conditions. Interestingly, female workers may benefit more from a college degree compared to their male counterparts in securing a job from the urban formal sector (i.e., state-owned enterprises, collectively owned enterprises, limited liability companies, shareholding corporations, foreign-owned companies and joint ventures). However, "glass-ceiling" effect of college-educated female workers exists in the informal sector.

Local Policy Innovation and City Governance: Graduate Entrepreneurship Policies and Practices in Shenzhen City, China

In recent years, the East Asian countries witnessed a dramatic increase of higher education graduates, who have encountered serious challenges in gaining employment. China is not an exceptional case. The Chinese government has been making great efforts to promote graduate employment. The 'mass entrepreneurship and innovation' initiative that was launched in 2014, boosted the high-tech industry and strongly encouraged fresh university graduates to form start-ups. Embracing the calls from the central government, local governments aggressively created concrete plans to boost graduate employment through innovation and entrepreneurship. However, whether graduate entrepreneurship could succeed depends partly on local policies, and on the local endowment of technology, labour and capital.

Shenzhen City, China's first Special Economic Zone, is one of the most important sites for policy innovation and the delivery of social policy programmes. In addition, it is the only non-municipal city of most active entrepreneurship and received the largest amount of venture capital (Tencent Research Institute, 2016, *Internet Entrepreneurship and Innovation White Paper*). And Shenzhen is one of the pilot localities for mass innovation by the State Council in May 2016.

Against the backdrop, this study investigates how the Shenzhen government act to support the development of innovation and entrepreneurship of university graduates. The analysis will focus on policies and practices promoting graduate entrepreneurship in Shenzhen, including but not limited to financial support, the training of human resource, the collaboration of establishing *Qianhai Shenzhen-Hong Kong Modern Service Industries Cooperation Zone*, and other policy programmes for innovation such as incubators and institutional support. More importantly, this study will examine how Shenzhen government has been working closely with industry, higher education institutions, and social communities to

implement policy innovations. This study contributes to a better understanding of the local policy innovation in a developmental state.

Women's Movements in Latin American and the Visibility of Street Sexual Harassment /Movimientos De Mujeres En América Latina y La Visibilización Del Acoso Sexual Callejero

El acoso sexual callejero ha sido visibilizado como una forma de violencia por diversas organizaciones de mujeres en los países de América Latina, lo que ha permitido crear conciencia sobre una de las formas más normalizadas de la violencia contra las mujeres por razón de género, que afecta su derecho a una vida libre de violencia, limita su uso del espacio público y restringe su autonomía.

Sin duda, estas organizaciones han contribuido a que cada día sean más las personas que cuestionen el uso desigual de los espacios públicos y decidan denunciar estos hechos. Asimismo, han logrado establecer espacios de discusión e incidencia con diversos actores, contribuyendo a que distintos países de la región busquen legislar sobre esta problemática.

Por ello, estos avances y el surgimiento de nuevas formas de organización (a partir de las redes sociales y el ciberactivismo) hacen necesario describir las experiencias de acción colectiva de estos movimientos de mujeres, teniendo en cuenta las diferencias entre países y sus aportes para la teorización y conceptualización de este tipo de violencia.

En ese sentido, el artículo aborda y analiza las estrategias, acciones, obstáculos, logros, propuestas y desafíos de las principales organizaciones existentes en la región como Hollaback, la red de nodos del Observatorio contra el Acoso Callejero, Paremos el Acoso Callejero, entre otras. Dicha información ha sido recopilada a través de una investigación cualitativa que se ha desarrollado con los principales actores de estas organizaciones. De igual forma, el artículo pretende abrir la discusión sobre cuál es el rol de los movimientos sociales para prevenir y erradicar el acoso sexual callejero y cuáles deberían ser los mecanismos de interlocución con los gobiernos, que permitan, además, que esta problemática sea incorporada en la agenda pública y en las políticas públicas.

Procesos Identitarios De La Juventud Musulmana En La Sociedad Española: Género, Educación y Ciudadanía

Desde finales de los años noventa del siglo XX, España se ha convertido en uno de los principales países de destino de la inmigración en el continente europeo y, a pesar de la crisis económica, muchas familias de diferentes orígenes han decidido establecer en España su residencia definitiva. Sus hijos e hijas son o serán en breve ciudadanos españoles. Esta creciente multiculturalidad de la sociedad hace que exista una conjunción de diversas identidades culturales en el territorio, convirtiéndolo en un caso de estudio particular para analizar las identidades de población de origen inmigrado, desde una perspectiva de género.

Este proyecto pretende analizar las trayectorias vitales de la población joven musulmana en sus procesos de construcción identitaria teniendo en cuenta que, a pesar de que la quinta parte de la población musulmana que vive en España tiene la nacionalidad, sigue siendo socialmente percibida como "un otro". El universo de análisis es la población joven y musulmana residente en la ciudad de Alicante, donde este origen representa el 31% de la población extranjera de la ciudad.

El diseño de la investigación se aborda desde una metodología cualitativa, valiéndose de las perspectivas de la metodología comunicativa crítica, la investigación-acción participativa, y la etnografía. Las técnicas de recogida de información serán las entrevistas biográficas y los grupos de discusión, que permitirán cumplir con los objetivos estructurales, relacionales y comparativos de la investigación.

Los resultados del estudio pretenden ayudar a desactivar prejuicios y superar una mirada social sesgada sobre la juventud musulmana, avanzando en el conocimiento sobre los procesos de construcción identitaria, identificando elementos que sirvan de base para desarrollar políticas educativas y sociales orientadas a mejorar la cohesión social y la situación de esta población.

How National Laboratories Project into the Future. a Case from the Economic South

The concept of protecting national science and technology was born since the 17th Century when Great Britain and France decided to support national science for the benefit of their constituencies. The idea behind the National Laboratories, and its equivalents, is that they are sponsored by the national governments as a way of producing science, technology and innovation that could be used for the growth of their own countries, be it in the economic, health, agricultural, environmental or any other dimensions associated with the wellbeing of the population. In Mexico, as in many other economic South countries, concern for the use of S&T for development took shape as late as the 20th century with the creation of the National Council of Science and Technology (Conacyt), in 1970. Conacyt launched the invitation to laboratories to become national as long as they met some characteristics, in 2006. They would receive economic support for infrastructure and equipment. They will, in turn, prepare competent scientists, do research to the highest level, and provide high quality services. A number of labs have been studied by our team through personal interviews, field visits and revision of the literature. Based on these data we classify labs that will continue having an impact in the future, and those who will not. We provide an explanation why some labs will not continue being national in the future, and propose actions that will preclude them from been excluded of the distinction.

Gender Is the Key: An Analysis of the Gender Inequalities in the Access to Employment during the Great Recession in Spain

This article analyses gender inequalities in access to employment during The Great Recession in Spain. Using data from the Spanish Labor Force Survey for the period 2006-2016, we examine the individual, familiar and contextual factors that facilitate access to the labor market. The main hypothesis of the paper claims that during The Great Recession, while women have increased their probabilities of finding a job thanks to their investment in Human Capital, men have decreased their probabilities of finding a job due to the destruction of masculinized jobs during the crisis. The main analytic technic used in this paper is the logistic regression. The results confirm the persistence of a gender gap in access to paid work, although these inequalities have been decreasing since the beginning of the crisis for women with higher educational level. Finally we did not find evidence of the existence of motherhood penalty/ fatherhood premia in the job entry level during the crisis.

University Studies, Gender and Transitions to Work in Spain. Beyond the Appearance.

SPANISH

El presente artículo tiene como objetivo analizar el conjunto de factores que promueven la empleabilidad de los títulos universitarios en España. A partir de la Encuesta de Inserción Laboral de Titulados Universitarios (INE,2016) se han calculado mediante regresiones logísticas, las probabilidades que tienen los egresados universitarios de conseguir un empleo cinco años después de la obtención del título. 3 hipótesis fundamentales han sido comprobadas para comprobar la vigencia de las teorías del capital humano (Becker, 1993), del credencialismo (Thurow, 1972) y de la segregación (Barone, 2011; Reskin, 1993). Los resultados ponen en cuestión la idea generalmente aceptada propuesta por el capital humano de que mayor nivel de estudios conlleva necesariamente un aumento en las probabilidades de conseguir un empleo, y apuntan a la interacción de diversos factores entre los que destacan el género de las personas candidatas y el grado de segregación sexual horizontal existente en la carrera estudiada como factores explicativos del acceso al empleo.

ENGLISH

This article analyze the set of factors that promote the transitions from university to work in Spain. Using data from the Survey of Labor Insertion of University Graduates (INE, 2016), we examine the probabilities that graduates have to find a job five years after obtaining the degree.

The results call into question the generally accepted idea proposed by the Human Capital that a higher level of studies leads to an increase in the probabilities of obtaining a job and point to the interaction of several factors, such as the gender of the candidates and the degree of horizontal sexual segregation in the studied as explanatory factors for access to employment.

Women's Complicity in Linguistic Sexism: A Report on the Chinese Internet

This presentation describes emerging misogynistic personizers that are morphologically productive in the Chinese cyber lexicon. The analysis focuses on the way the personizers are used across the gender line in Chinese social media as a community of practice. The findings show that women participate in female pejoration as much as men do, and that men are more inclined than women to use pejorative personizers that specifically attack female empowerment. Additionally, men construct masculinity and power by using certain misogynistic personizers as generics. I argue that the verbal misogyny is part and parcel of a larger gender ideology by illuminating the mutual constitution of the linguistic pejoration of women and the gender order in post-reform China, which is characterized by the dominance of elite masculinity, female dependence, sexual objectification, and sexual commodification. This study has implications for research on women's condition in contemporary China, raises awareness of gender inequality, and lays the groundwork for social actions toward gender equality.

Persons with Disabilities and Justice Making on Canada's Juries - a Followup Study

In our previous work, using participant pool research, we have found that there is a bias, as indicated by respondents, against multiple disability types, from serving on the Canadian jury. This second study uses a new participant pool using the working language of Manitoba Justice's categorizing of disabilities in the context of jury formation. Using these Justice definitions, we explore whether participants are more inclined to remove persons with disabilities from jury service or to bar them from courthouse access. The study asks whether the the words of Manitoba Justice help instantiate bias in the jury selection process. Jury research in Canada continues to be limited by the *Criminal Code's* restrictions on speaking with *in vivo* jurors. Our *Constitution* mandates a representative jury for accused persons. We ask whether representativeness can be achieved if the practical socio-legal landscape continually fosters under-representation of persons with disabilities from the justice making process. The *Criminal Code* also provides generous excuses for persons with disabilities to be removed from service and allows for numerous challenges from counsel to remove jurors, in many cases without compelling reasons. Persons with disabilities represent one of the largest identity based demographics of Canadians, and systemic and personal biases may be preventing true representativeness from occurring in the jury trial. A failure to impart this representativeness in the jury process belies a social construction of disability that infantilizes persons with disabilities and which

sees persons with disabilities as inherently unreliable, unreasonable, impetuous and unintelligent. Representativeness in the jury box serves as a proxy, reflecting and refracting society's deeply held intolerances.

Information Technology Initiatives for Providing Efficient Service Delivery System in India

India has the highest number of mobile phone users, but its impact on growth is not clear given the diversity in socio-economic and demographic features across states. In India mobile telecommunication industry has witnessed a tremendous growth over the last few years, with one billion mobiles in the country. India has become second largest mobile phone market after China (economictimes.indiatimes.com). However, there is a wide variation in mobile diffusion as well as GDP growth process across various states in India, bringing in question of socio-economic disparities and how technology diffusion may help in convergence of growth process among various states. Empirical studies have found several factors such as per capita income, income inequality, population density, age profile of population, competition and regulatory structure to have a positive impact on mobile penetration. A study in the context of Kerala found that the use of mobile technology has increased information quality and overall efficiency of government processes. The computer illiteracy problem in India in general and in Punjab in particular, will also pose challenge to m-Governance application reaching to the citizens. As a result, the services that are provided by the government through mobile devices might not reach to the majority of the citizens of the state. With this above back ground, it is interesting to look into the initiative of m-Governance and its importance in empowering the citizens of the state of Punjab in terms of accessing information and utilizing the services of the government. The issue regarding improvement in the service delivery through use of mobile, internet and other electronic device would be discussed in detail in fully length of paper.

Micro-Finance through SHGs in the Reduction of Vulnerability of Women

The purpose of the present study is to improve understanding of the impact of micro finance services on selected non-income dimensions of poverty, specifically those related to risk, vulnerability, and assets. The study emphasizes the role of financial, physical, human, and social assets in reducing vulnerability by helping individuals and households protect against risks ahead of time and manage economic losses afterwards. The present study is about the role of micro credit through self-help groups to reduce the incidence of vulnerability of rural women. The issue of reduction of vulnerability and poverty through micro finance organized by the self-help groups has been discussed widely in the literature on development economics, and in our study, we analyze this role with reference to the case studies in the district of South 24 Paragana and Coochbehar in the state of West Bengal and district of Jalandhar and Patiala in the state of Punjab. To basis of objective of study is to improve understanding of the impact of micro finance services and to review the progress of microfinance programme with focus on quality of SHGs formed/promoted and on selected non-income dimensions of poverty, specifically those related to risk, vulnerability of consumption, income and assets. In our sample survey we have taken into consideration 2 blocks each in the selected 4 districts. two districts are selected from West Bengal and two from Punjab. In each block 32 SHGs were selected and from each SHG 10

members were selected and interviewed and a total of 2560 members were. The review of earlier study done on the subjected were taken to understand the research gap in our area of research. The main recommendation of the study is that all the families belong to landless, small and marginalised farmers, SCs and ST and all other disadvantaged Sections of Society should be mobilised in forming SHGs. The findings will be discussed in full length paper.

Work Value Transmission from Parents to Children: Seeds That Sprout in Adolescence and Bear Fruit in Adulthood

Using longitudinal data from the Youth Development Study, this paper examines the transmission of intrinsic and extrinsic work values from parents to children during an extensive developmental period from mid-adolescence to adulthood. Three theoretical models are investigated: a socialization model that highlights communication between parent and child during adolescence; a selection model that examines youths' occupational choices and experiences as mediating parental value transmission; and an activation model that emphasizes the increasing salience and application of parental values when offspring engage with the demands and vicissitudes of careers. Parents and children were both surveyed when the children were adolescents, starting in 1988. After high school, children were surveyed five times at 5-6 year intervals up to the age of 37-38 (2011). This analysis draws on data from 796 mother-child and 628 father-child dyads. Although parental values were measured more than two decades earlier, we find the strongest associations of parent and child values when the offspring were in their late 30's. Extensive multivariate analyses show support primarily for the activation model, indicating that parent-child value similarity is especially strong when adults navigate career uncertainty and change. Evidence of ongoing socialization into adulthood as parents and adult children discuss important decisions is documented as well. The findings reinforce the importance of extending research on vocational development and intergenerational value transmission well into adulthood. They also indicate the merits of extending the research purview to other vocationally-relevant orientations. Do parents transmit their job satisfaction, work commitment, and job insecurity to their children, in ways that may reinforce or counteract lessons from their adult children's own work experiences? We hope that the findings of this study, which may be the first to examine parents' continuing influence on children's work values from adolescence to adulthood, will inspire future research to examine these possibilities.

JOHNSTON, GLORIA* (University of New Brunswick)

"What I Want to Show, Not What You Want to See": Reflexive Photography, Symbolic Interactionism, and Transgender Representation.

In this paper the method of reflexive photography, or Photovoice, is discussed in a framework of Symbolic Interactionism (SI) to explore photography as a reflexive research tool that facilitates the interactions of participants and researchers as co-researchers. By highlighting five visual transgender narratives from current PhD research, the tension between typical and reflexive representation is exposed to complicate and challenge traditional research directives and proposed questions of power, authority and agency in our visual analysis. Schulze (2007) indicates that, theoretically, reflexive photography is embedded in the theory of SI, a perspective that places emphasis on micro-scale social interaction. Thus, Symbolic Interactionism may investigate the meanings which individuals ascribe to symbols and things through, and as a consequence of, their social interactions. Reflexive photography gives participants the opportunity to focus on these symbols, and elicit rich descriptions of the meanings attached to those symbols (Banks, 2001; Pink, 2001). In this research, the questions is, "What is the daily lived experience of

persons who identify as transgender?" Often facing oppression in socio-structural areas of health, legal, media and social systems, the typical transgender visual narrative is often highly voyeuristic and sensationalized. Reflexive photographs shift traditional narratives of representation to engage those with significant power with those who typically have less power to become the vehicle to initiate change in relationships (Wang, 2006). Reflexive visual methods document and represent the social world in ways that have the potential to challenge others to see and understand in new ways (Coronel & Rodriguez, 2013).

Defence and Security in the Cyber Age; The New Contemporary Operating Environment

This paper addresses how Twitter exploitation by state and non-state actors affects the contemporary operating environment (COE). There are six general effects of cyberspace on the COE, which are enhanced by Twitter and other forms of social media. *Virtual anonymity; Location irrelevance; Time insignificance; Space asymmetry; Weapon invisibility; Border insignificance.* These factors demonstrate that the cyberspace brings an increased risk of attacks on critical infrastructure, effectively introducing new challenges to the COE. After an introduction to the relevant characteristics of Twitter, this paper details the exploitation of Twitter by the Israeli Defence Force and Hamas during the November 2012 conflict. This Twitter war, parallel to the war in theater, is an example of social media becoming a significant new operating environment for the defence sector, in particular concerning influence operations. This paper concludes that Twitter significantly changes the COE – particularly regarding availability of information and organizing capabilities. This report also argues that Twitter is a highly effective tool for influence operations, and that the defence sector will benefit from utilizing social media tools beyond traditional public relations activities.

JOLICOEUR, PIERRE* (*Royal Military College of Canada*)
SEABOYER, ANTHONY* (*Center for Security, Armed Forces and Society*)
Effects of Armed Non-State Actors' Social Media Exploitation on the Contemporary Operating Environment; The Case of ISIS

This paper analyses the exploitation of social media (SM) by the armed non-state actor "Islamic State in Iraq and Syria" (ISIS) and the resulting effects on the contemporary operating environment. First, this paper describes the different methods of ISIS SM exploitation. In a second step, motivations for the very broad use are presented before finally the effects of ISIS SM exploitation are described. The paper concludes with recommendations on how to respond to this form of SM exploitation within the framework of democratic societies.

ISIS has used SM to significantly inflate its presence and command attention on the world stage, far exceeding its actual relevance and capabilities. Through this presence and the messages conveyed by manipulating international mass media, ISIS has succeeded in having significant effects though SM in the offline domain, for example in combat situations where intimidated opponents have given up without a fight. In this paper, we argue that ISIS creates international media attention through an activity and then proceeds to fill the subsequent information vacuum through information it spreads primarily through SM. It is therefore obvious that government institutions must prevent ISIS from being the sole information source to fill the news vacuum. Instead an open, timely, effective and trustworthy presence needs to be established on all relevant SM platforms that places ISIS and its actions into perspective. This alternative presence must effectively reach target audiences anywhere in the world – online and offline.

Perceptions and Reactions to Tornado Warning Polygons: Would a Gradient Polygon be Useful?

To better understand people's interpretations of National Weather Service's tornado warning polygons, 145 participants were shown 22 hypothetical scenarios in one of four displays—conventional polygon, conventional polygon + radar image, gradient polygon, and gradient polygon + radar image. Participants judged each polygon's numerical strike probability (p_s) and reported the likelihood of taking seven different response actions. The conventional polygon display produced p_s that were highest at the polygon's centroid and declined in all directions from there. The conventional polygon + radar display, the gradient polygon display, and

the gradient polygon + radar display produced p_s that were high at the polygon's centroid and also at its edge nearest the tornadic storm cell. Overall, p_s values were negatively related to resuming normal activities, but positively correlated with expectations of resuming normal activities, seeking information from social sources, seeking shelter, and evacuating by car. These results replicate the finding that participants make more appropriate p_s judgments when polygons are presented in their natural context of radar images than when they are presented in isolation and that gradient displays appear to provide no additional benefit. However, the fact that p_s judgments had moderately positive correlations with both sheltering (a generally appropriate response) and evacuation (a generally inappropriate response) suggests that experiment participants experience the same ambivalence about these two protective actions as people threatened by actual tornadoes.

JONES, HELEN* (*University of Huddersfield*)
Youth Work, Power and Brexit: The Impact on Young Roma Slovak People's Aspirations and Attitudes

Concepts of power and empowerment are central for youth workers. Some interpretations of empowerment focus on people taking control over their own lives whilst others look at addressing inequalities. Conversely Brexit leaves workers and young people alike facing new, essentially disempowering challenges.

In June 2014 tensions between recently-arrived Slovak and Romanian Roma people and existing residents in a South Yorkshire village led to discontent (exacerbated by media reports and right wing activism). Youth workers from a long-established voluntary organisation were funded to employ detached (street-based) methods to work with the young Roma people. They were tasked primarily with addressing the presumed impact of young people from Roma communities' cultural outlooks on their attitudes to education. They were also aiming to reduce barriers with other residents. The workers developed relationships with young Roma people who began to exert agency and to identify personal aspirations grounded in opportunities in the UK.

Brexit has undermined the young people's aspirations for their future lives profoundly. Some do not wish to return to Slovakia where they know they will face prejudice and systemic discrimination. The Casey Report (2016) emphasised the importance of integration to foster resilience and combat division in the UK. The young Roma people are keen to integrate but their position in the UK is dependent on parents' rights post-Brexit. Their position in the country is profoundly uncertain.

Based in data from our evaluation of the work, my paper will look at the extent to which youth work's response to power is illusory. There are tensions between youth work values such as empowerment in the face of international political decisions. I will look at how youth workers should support young people in their aspirations, however impossible to achieve.

The Limits of Child Justice in Ethiopia: An Exploration of Age- and Gender-Specific Experiences of Violence

Children's and adolescents' rights agendas have risen rapidly up the political agenda in recent years, but in practice the transition from childhood to adulthood remains fraught for many adolescent girls and boys in low- and middle-income countries. Adolescents continue to experience a range of discriminatory social norms and practices, and arguably particularly with regard to violations of their rights to bodily integrity and freedom from violence.

This paper draws on qualitative research in three distinct but marginalised geographies in Ethiopia (South Gondar, East Haraghe and Afar) with approximately 200 early (10-12 years), and older (15-17) adolescents, their peers, caregivers and service providers in 2016 and in 2017. The data collection is part of the new DFID-funded multi-country Gender and Adolescence: Global Evidence longitudinal research programme aimed at enhancing understanding around what works to enhance gender-responsive adolescent development and wellbeing.

The paper's conceptual framing centres around the threats and opportunities to adolescents' realisation of intersecting and overlapping individual and collective capability sets (Sen 1999, Nussbaum 2003). Our findings highlight that adolescent girls in particular but also boys in Ethiopia continue to face high levels of risk of sexual-, gender- and age-based violence at multiple levels. Experiences of violence cut across multiple settings including in families by siblings and/or parents, in and en route to school by strangers, classmates and/or teachers, in community spaces including as a result of recent political unrest, and beyond as part of migration and trafficking routes domestically and internationally. Exposure to these gender and generational risks are in turn compounded by deficits in other capability domains, including opportunities for participation and to exercise

voice and agency. The paper concludes by discussing how effective implementation of national child justice legislation and policies remains limited and under-resourced, and insufficiently tailored to intra-country context differences to bring about meaningful change.

JONES, PAUL* (*Research School of Social Sciences, College of Arts and Social Sciences, the Australian National University*)

Repatriologizing Demagogic Populism

The rebirth of 'populism studies' over the last twenty years has been starkly dominated by political science and political theory. Despite Peter Worsley's valiant advocacy of Weberian/Shilsian ideal-typification of modes of (demagogic) populism over inductivism in 1969, Canovan's field-defining 1981 opus, *Populism*, consolidated the 1950s separation of populism studies from critical sociological theory.

That schism occurred in the dispute within the US academy over the interpretation of McCarthyism. At stake then, and now, is the sacred role attributed to the nineteenth century US populists in a domestic narrative. Such terms of debate are still hyperbolically policed by the ostensible victors of that conflict. Figures such as Canovan and Michael Kazin have consistently rejected any 'pathologization' of populist practice and especially any suggestion that populist traditions and popular movements are susceptible to demagogic capture. For such stakeholders in the populism literature, 'the people'- at least those within the USA - can never be considered susceptible to demagogic leadership, nor can prominent demagogues be considered a serious threat to the democratic fabric. Those who disagree must repent the mortal sin of elitism.

This *intellectual* populism relies on unexamined integralist conceptions of the psyche, political tradition and oratory. It was ill-prepared for contemporary neo-populism. While the Laclauian formalist conception of populism provides one alternative here, it is unable to recognize a role for demagoguery.

This paper will elucidate a position drawn from that developed within the US-resident Frankfurt School and 'sociological' New York Intellectuals - the key figures in the early 'controversy' - as well as the recent work of Nadia Urbinati. Central elements of populist practice so emerge as thematic fragments of populist and other traditions, demagogues who are no longer definable by eloquent oratory and 'a kind of psycho-technics', as Adorno christened it, based in the culture industry.

RC42-721.1

JONES, PAUL* (*The Australian National University*)

The Frankfurt School Legacy and Contemporary Populism

The legacy of *The Authoritarian Personality* (TAP) within social psychology remains highly contested, not least for its alleged omission of left-authoritarianism. Adorno returned to Germany in the same year as its publication (1950). Former associates of the US-resident Frankfurt School amongst the New York Intellectuals, many of them sociologists, extended elements of this text to the analysis of McCarthyism. One key participant, the historian Richard Hofstadter, drew directly on TAP's account of pseudo-conservatism (and also, I would argue, paranoia). In the nascent populism studies this literature proved even more controversial, although few of its critics attempted to take its social-psychological dimensions seriously. Since 'the Hofstadter controversy', as US historians call it, it has been difficult to problematize the social-psychological dimensions of populist movements within populism studies.

A key element missing from all these discussions is the role of demagoguery. TAP was only one of five monographs published in 1949/50 within the larger *Studies in Prejudice* project, primarily concerned with anti-Semitism. One of these, Lowenthal and Guterman's *Prophets of Deceit*, was focussed on contemporary demagogues. More recently a short contemporaneous monograph by Adorno, *The Psychological Technique of Martin Luther Thomas's Radio Addresses*, has seen publication.

This theoretical paper argues that it is the figure of the demagogue, especially one rising from within the culture industry, that grants these texts renewed pertinence today, most notably but not only for the US case. It is the demagogue, rather than the susceptible authoritarian personality, that most embodies the key psychoanalytic elements the later Adorno advised were pivotal to the broader project: narcissism, paranoia and projection. More generally, the demagogic provides a means of reconciling some notorious 'ambiguities' of populism. Rather than regard populism as riven by 'left and right', we might consider all populisms highly susceptible to the risk of demagogic leadership or 'capture'.

HARNETT, TOVE (*Lund University, School of Social Work*)

Cheers Lads! Nursing Homes for Older People with Substance Use Disorder in Swedish Print Media

The aim of the paper is to investigate representations of nursing homes for older persons with substance use disorder in Swedish print media. Several municipalities arrange 'wet' facilities, where people aged 50+ may use alcohol. The aim is not abstinence but harm reduction. Wet facilities face moral dilemmas and challenges: watching people drink themselves to death, handling peer pressure to keep drinking, handling intoxication, aggression, visitors, bedbugs. Are these challenges reflected in print media? Data for the study consisted of all articles that reported on two nursing homes in the city of Gothenburg in the media database Retriever during 1995-2017: a total of 65 articles. Qualitative content analysis was used to identify relevant themes. The main finding was that the mostly positive reports on wet nursing home as a humane alternative to homelessness tended to become idyllic when facilities were described in depth and in these reports, managers and residents were interviewed and portrayed. The absence of attempts to treat was even presented as a means to reduce drinking in itself, rather than an attempt to work on a difficult dilemma in care for older persons with long term problems. A different type of reports appeared in July 2017 when members of staff at one of the facilities turned to the local newspaper, arguing that they had to face threats, abuse and violence from intoxicated residents, and did not get support from managers. During the scandal, the facility was described as "The house that God forgot" and voices were raised against "giving up" on people instead of providing treatment. The media scandal did not alter the municipal policy, and a likely reason for this is that problems that were highlighted had already been acknowledged by decision makers as part of the difficult reality of wet facilities.

TAGHIZADEH LARSSON, ANNIKA (*Department of Social and Welfare Studies, Linköping University*)

The Scandinavian Model of Successful Aging

The concept of successful aging has been closely related to the absence of disease and disability and tends to equate health and high functional capacity of individuals with success. In this paper we will redirect attention from the - much criticized - normative and individualized character of successful aging, into an innovative framework inspired by disability studies and activism that focuses on comparisons as means to argue for social rights of older people. Drawing on the Scandinavian normalization principle of disability policies, and its goal that persons with disability should have the right to life like "others", we will introduce the Scandinavian Model of Successful Aging where success is defined as the ability of society to support and enable its aging members to have a high level of functioning and an active engagement with life. With this approach, third age activities like travelling, participating in voluntary work or studying should not be regarded as ideals of old age but could be used as comparisons in order to claim rights of older people with disability to get support in order to be able to live like others. The proposed reframing of successful aging will be investigated using three research projects. The first and second are based on in-depth interviews with older persons aging with impairments and the third is a case study of a Swedish woman with late-stage dementia living an active and independent life supported by personal assistants and a variety of assistive devices. The paper concludes that a social rights approach forwards the debate on successful aging and although the concept is inherently problematic it may be used to highlight enabling and limiting context, linked to specific models of social policy.

LINDQVIST, ANNE (*Swedish Armed Forces*)

TÖRNER, BRITTA (*Swedish Defence Recruitment Agency*)

Attrition during Basic Military Training in the Swedish Armed Forces

Attrition from basic military training is a serious and costly problem for Armed Forces. When the Swedish Armed Forces transformed from a conscript-based force to an all-volunteer force in 2010 the knowledge about reasons for attrition decreased, due to changed procedures. Today a recruit can leave basic military training within 24 hours and without further explanations. The project "Systematic follow-up of the psychological selection", aims at developing the admission tests, the basic military training and the work environment at the military units in order to reduce attrition. The project is a collaboration between the Swedish Armed Forces including the Internal Occupational Health Care Center and Human Resources, the Swedish Defence Recruitment Agency and the Swedish Defence University.

Data is collected from the admission tests, questionnaires (first week/baseline, and last week of training) and interviews with recruits who drop out. The project aims to predict attrition caused by other factors than injuries and to predict further engagement/employment in the Swedish Armed Forces.

Partly due to difficulties to employ sufficient numbers to the Swedish Armed Forces, the Swedish Government have decided to reestablish the conscription in 2018. The conscription will be gender neutral and work as a complement to the volunteer recruitment. We believe that the methods of this project and the knowledge gained are as reliable for a conscript-based training as for a volunteer training.

JOOSSE, PAUL* (University of Hong Kong)

Of Folk Heroes and Folk Devils: Conceptual Affinities between Charismatic Upheaval and Moral Panic in the Case of Donald Trump

Although Stanley Cohen and Max Weber both made lasting contributions to social theory by modeling how moral enthusiasms trouble and establish the social order, thus far there has been little attempt to explore the complementarity between processes of moral panic and charismatic upheaval. Working beyond latently Durkheimian figurations of moral panic which depict a dialectic between 'right-thinkers' and folk devils, this paper integrates charismatic entrepreneurs into a tripartite model that sheds light on two new pathways of interaction that are relevant for the sociology of morality. First, charismatic leaders can perform an outflanking move on the moral territory of traditional leaders, performing acts of 'one-upmanship' in their castigations of 'folk devils' that are extreme, extraordinary, and therewith charismatic. Second, charismatic leaders can creatively subvert traditional mores, overturning value tables to 'bedevil' traditional leaders. Because moral panic and charismatic enthusiasm implicate distinct, complementary, and unitary social processes, I argue that, taken together, the work of Max Weber and Stanley Cohen offer a more theoretically profitable vision of moral denaturation and reformulation than either would alone. Donald Trump's charismatic ascent, which involved a continued interaction with folk devils, is used to illustrate the theoretical contribution.

RC16-312.3

JOOSSE, PAUL* (University of Hong Kong)

Populism, Trump-Style: Charisma and Counter-Charisma in Modern Political Performance

This paper conducts a negative reading of Weber's ideal-type of charismatic authority, seeking to anticipate and discern hidden social interactants that are implicated in his descriptions of charismatic social processes. In so doing, the paper advances the 'charismatic counter-role' as an umbrella term that captures the performative bearing of a variety of actors on processes of charismatic interaction. Specifically, in addition to devoted followers (already much discussed in the literature), this typology contains unworthy challengers (those who fall short when judged by the new terms of legitimacy that the charismatic leader creatively establishes); colossal players (those who serve as interlocutors that are appropriately 'to scale' for highlighting the extraordinary missions to which the charismatic leader aspires); and incredulous onlookers (those whose nay-saying, skepticism, and outrage is a precondition for the leader's performance of seemingly miraculous feats). Together, these charismatic counter-roles interact in ways that comprise a charismatic social system that gives a better account than has heretofore been available for the unstoppable momentum of populist movements led by charismatic candidates. Using the 'Trump phenomenon' as its empirical source, and employing analytical tools from symbolic interactionist and performative approaches to social theory, this paper has implications for future studies of how populism can destabilize traditional and/or rational-legal social orders.

JORDAN, MARIANGELA* (Cornell University)

Tlawmngaihna: Self-Sacrifice

The Young Mizo Association (YMA), an influential parastatal civil society in Mizoram (India) is a central actor in the "dreaming" of a Mizo independent nation is also the architect of virulent moral panic and purging campaigns meant to secure and promote a particular sense of Mizoness, aligned with Tlawmngaihna ("The Unspoken Law" or "Self-Sacrifice"), a hybrid set of traditional Mizo moral codes and Christian-inspired ethics. The YMA runs campaigns against miscegenation in middle schools; criminalizes the LGBTIQ community and the homeless; and fills up informal rehabilitation centers (known as "gospel camps") ran by self-proclaimed prophets, with alcohol and drug addicts, the mentally ill, and sex workers.

My film, *Tlawmngaihna: Self-Sacrifice*, attends to the sensorial experiences of a day in the life of such a "gospel camp," namely Thutak Nunpuitu Team (TNT).

TNT, seen as one of the most successful gospel camps in Mizoram, is run by Pu Sāngthankima a self-declared Mizo prophet and ex-drug addict himself; it serves (solely through faith healing practices) 2,000 individuals (drug and alcohol addicts, orphans, and persons struggling with physical and mental disabilities); is fully self-sufficient (with a farm, school, carpentry shop, and candle factory or its own) and depends only on the work to its 180 volunteers, ex-patients who have chosen to live in the camp to fully dedicate their time to running the place. The film follows the activities of these volunteers, with an explicit focus on their embodied experiences, from 2 AM when they wake up to cook rice for 2,000 patients, through the day as they care for 600 orphans and 300 individuals in its disability center, and until 7 PM when dinner is served and the compound prepares for evening worship and sleep.

JOSEPH, JOLIN* (York University)

Gulf Gatekeepers: Gendered Im/Mobility in the Recruitment and Regulation of Indian Women Migrants

Migration to the Gulf presents an important avenue of employment for Indian women (Thimothy and Sasikumar, 2012). However, women's migration from the state is heavily restricted through age- and gender-based controls and regulated recruitment processes. Legislative guidelines under the Emigration Act (1983) prohibit the operation of informal intermediaries within the Indian migration regime. An August 2016 ordinance (MOE, 2016) stipulates that emigration of low- and semi-skilled women workers is to be channeled solely through six state-run recruitment agencies. In practice, the migration of women from India depends largely on local recruitment relationships with nebulous networks of unregulated sub-agents and social actors (Rajan, Varghese, and Jayakumar, 2010).

The expansion of temporary migration and consumption of gendered reproductive labour, has created a profitable niche for migration mediators to engage in exploitative labour brokerage. In an attempt to protect women from exploitation, the Indian state prohibits the emigration of women under thirty years and designates Emigration Clearance Required/Not Required (ECR/ECNR) status. Such interventions point to a paternalistic, patriarchal state-structuring of migration; one that pushes women to seek informal and precarious pathways that exacerbate the risks associated with migration. Drawing on fieldwork and interviews with migrants and civil society organizations in key migrant-sending states of Andhra Pradesh and Telangana, this paper will analyze the implications of and gender ideologies underpinning policies that aim to reduce vulnerability through restricting recruitment and migration. Rooted in ethnographic analysis among return migrants and emigrant households, the paper explores the social organization of domestic work recruitment and interlocking macro-institutional processes that influence transnational migration of women from India. I map the social networks and institutional actors that organize these labour flows and chart how bringing in local actors and return migrants into the formal migration apparatus can help mitigate risk and uncertainty in the process.

RC43-734.1

JOSEPH, MARINA* (Youth for Unity and Voluntary Action)

Creating Neo Liberal Squatter Settlements - Mass Re Housing in Mumbai

Beginning in the 1990s, global capital flow and investment in infrastructure in Mumbai heightened the extent of urban restructuring. This brought with it a change in housing schemes that made redevelopment of auto-constructed slums a profit making venture. This led to the creation of 32 high-rise, high-density Resettlement and Rehabilitation (R & R) housing colonies ensuing from large scale displacement of the urban poor due to infrastructure projects. This one-size-fits-all, re-housing scheme has been one of the most lucrative real estate generators in the city.

These housing colonies were built by private developers with no thought of the everyday needs of the urban poor. Unlike auto-constructed housing, homogeneous, mass produced housing restricts people from exercising agency in their built environment. However, in the face of loss of livelihood due to displacement, transgressing imaginations of formal housing within R&R colonies is a means of adaptation. Within this re-housing scheme that does not holistically provide for 'rehabilitation', it is not just residents, but the State itself that is found transgressing its own norms in order to provide for basic services within the built environment.

These once informal settlements are forcefully formalised; yet owing to multiple transgressions, they are once again informalised leading to the creation of a neo liberal form of squatter settlements. Relying on extensive primary and secondary data, the paper engages with larger questions such as the need to contextualise housing needs, the social failings of such housing, adaptation and transgressions within the built environment of formal housing, and whether this form of habitat can at all be considered formal. The paper stresses on the urgent need to re imagine adequate resettlement housing and re consider what rehabilitation means for the urban poor displaced by infrastructure projects.

RC32-589.2JOSEPH, SUZANNE* (*independent scholar*)*"Marriage-like Cohabitation" with Female Slave Captives (i.e., Concubinage): Institutionalized Violence and the Family Structure in Islam*

Slavery denotes an extreme form of violent dehumanization with concubinage recalling women slaves as victims of sexual (as opposed to economic) exploitation in particular. Islam is believed to have softened the blow of slavery, but it did not eliminate that blow. In terms of marriage and perpetuation of the family, both contractual marriage with a free woman and "marriage-like cohabitation" with an enslaved woman were permissible. While it is true that freeing a slave was regarded as a religious virtue, evidence argues against romanticization of slavery. It was illegal for a "master" to force a slave woman into prostitution; nevertheless, male slaveholders enjoyed legally sanctioned sexual access to a slave woman's body. Similarly, although slaves could marry, they required the "master's" permission to do so. Female parity within Islam is often inferred from the doctrine of sexual exclusivity—the requirement that women, free and enslaved alike, are only permitted one licit sexual partner at a time. However, the doctrine was applied differently to enslaved women and undermined by the fact that a child born to a concubine was not automatically considered legitimate. Muslim "masters" were encouraged, but not required, to acknowledge children born by their slaves. Thus, there appears to be an implicit assumption that concubines were often engaged in non-licit, non-exclusive sex. Yet other evidence suggests that enslaved women were seen as sexually "unchaste." Specifically, freedom from slavery was seen as a requisite of chastity, prompting some jurists to declare male intermarriage with non-Muslim women of the Book unlawful if that woman was a slave. Primary source material from the nineteenth century will be used to frame questions on concubinage and the family structure in Islam. Conceptual-empirical insights from anthropology, sociology, history, and women's studies will also be sought to broaden our understanding of nonlethal/lethal masculine violence within intimate relationships.

RC39-686.2JOSHI, DEVI* (*Former Director Geological Survey of India*)*Evaluation of Recurring Flood Disasters in Indian Cities: High Urban Vulnerability Vs. Extreme Weather Events*

In recent decades flood disasters have become a recurring menace to human settlements in India. Here, it is imperative to focus on urban areas as they are the permanent settlements having extensive systems for housing, transportation, sanitation, education, health and other utilities, concentrated within a limited area. To understand the flood devastation suffered by the urban communities, an analysis of the recent floods (Mumbai, 2005; Kedarnath, 2013; Srinagar, 2014; Chennai, 2015) was undertaken. Two of the disaster events are highlighted here. Extreme rainfall event of November 2015, in the megacity of Chennai located on a coastal landscape, gave rise to catastrophic floods resulting in hundreds of human fatalities, loss of property, damage to infrastructure, and disruption of basic services like health, education, etc. An evaluation of the devastation reveals that uncontrolled urbanization encroaching over wetlands, marshes and natural drainages, was responsible for the Catastrophic floods. The flood disaster of June 2013, in the sacred town of Kedarnath, located in the Higher Himalayan terrain, was triggered by intense rainfall followed by breach of a glacial lake, resulting in thousands of human fatalities and disruption of tourism in the area. However, the devastation was mainly caused by high vulnerability of the town, inherited from unplanned urbanization and its siting on the hazardous floodplain of Mandakini River.

Present study concludes that the flood disasters occurred due to uncontrolled urbanization imparting high vulnerability to the built environment. However, the extreme rainfall events have played to enhance the severity of the flood hazard. Moreover, fourth assessment report of IPCC, warns that climate change would increase the risks of hydro-meteorological disasters in South Asia. Besides, weather patterns also indicate more frequent occurrence of such events in future, necessitating a comprehensive strategy for adaptation, mitigation and urban renewal for reducing the vulnerability and strengthening resilience of our cities.

TG04-983.1JOXE, LUDOVIC* (*Université Paris Descartes*)*Doctors without Borders: How Trust in the Hierarchy Reduces Frustration*

Behind the traditional smile of the humanitarian workers, the reality is shadier. Tensions, tiredness and frustration can arise on the fields of intervention (conflicts, epidemics, natural disasters, etc.). Within the non-governmental organization Doctors Without Borders (MSF), two different kinds of international workers can be identified: the "frustrable" and the "non-frustrable". What are their respective profile? To which extent is frustration related with trust?

The "frustrable" are usually committed. They expect MSF to have a political impact, to save lives and to be 'efficient'. Depending on the context, they can come back from their humanitarian mission highly frustrated. The non-frustrable are more 'career-oriented'. They expect a salary from the organization, a career evolution that MSF actually provides. There is no space for frustration. And they affirm they are "never disappointed". Indeed, I show how frustration lies in the intersection of the expectations of the individual and the "zones of uncertainties" of the organization (Crozier and Friedberg, 1977).

However, by looking more in the details, I show that frustration is also a matter of trust. Most of the "frustrable" mistrust the headquarters and discuss the decisions taken by the managers whereas the "non-frustrable" are humbler and say they "do not have all the parameters" to challenge the decisions of the headquarters. Trust seems to reduce the perceived uncertainties of the humanitarian activities and reduce the feeling of frustration. Rephrasing the original German title of Niklas Luhmann's book "Trust and Power" (Luhmann, 1968), my talk will try to explain how trust can be seen as a mechanism that reduces uncertainties, and consequently frustration.

My communication relies on fifty interviews with MSF expatriates and notes taken during ten humanitarian missions on three continents.

RC09-179.5JOXE, LUDOVIC* (*Université Paris Descartes*)*How Doctors without Borders Is Erasing the Frontiers between North and South*

Since the beginning of the years 2000, the landscape of the humanitarian sector has evolved. There are more non-governmental organizations (NGO) created in the South, and more international workers coming from the South in the Northern organizations. The NGO Doctors Without Borders (MSF), founded in France in 1971, seems to follow the same trend. In 2015, 24% of its international staff came from the South. Which reasons can be identified to explain this evolution? And to which extent does it have an impact on MSF and on the humanitarian mindset?

Among the almost 500 projects led worldwide by MSF, more than 1000 positions for international workers are not covered. Forced to broaden its sources of recruitment, MSF is hiring staff from the South through its new sections in Brazil, Argentina, South Africa, etc. MSF is also hiring online which allows more and more workers from all over the world to be recruited. Yet the main source of staff coming from the South is the promotion of MSF own national staff. Indeed, only 10% of the staff are called "international". The other 90% are "national staff" and work locally, in their home country. The national staff is a treasure for the organization. They often have worked for MSF for decades. They are skilled, trained and know the organisation and its values.

The current president of MSF-France is a former national staff from Liban. The Western supremacy, carrying the former developmentalist thought, is disappearing. The new international staff from the South bring new ways of management, new strategies, new values. The current trend is erasing the distinction between North and South. And the organisation, mirror of its members, is more and more diverse, multi-sited and cosmopolite, becoming paradoxically more "without borders" than at its origins.

RC33-607.5JOYE, DOMINIQUE* (*Lausanne University*)SAPIN, MARLÈNE (*FORS Lausanne*)*Measuring Social Networks and Social Resources in Comparative Perspective*

The ISSP 2017 is dedicated to social networks and social resources. As a world wide survey, ISSP has always given great attention to the issue of comparability in the questionnaire. In the case of social networks, this is even more challenging as different societies can shape different types of social relations which gives rise to support through different means, such as state, market and personal relationships. Therefore, it is important to assess different aspects of social networks and social resources that will be complementary: Therefore, we implemented both position and resources generators, as well as other measures of social integration and exchanges, in order to tackle the different aspects of social networks and social resources. While the position generator assesses the diversity and hierarchy of social networks, the resource generator captures important support needed by individual in concrete life situations.

However, the exact properties of these measures have to be empirically analysed in a comparative perspective. That is why we have conducted a large instrument development survey covering eight countries and more than 3'000 respondents. Based on empirical results of this survey, we will discuss more specifically the equivalence of the instruments measuring social resources, their similarities and differences across countries and how far the social context influence who provides these resources.

RC15-JS-72.2JUAN, HSIAO-MEI* (*National Chung Cheng University*)*Meaning of Meaninglessness: Operational Logic of Hospice Care in Taiwan*

Taiwan is an aging society and cancer has recently become the leading cause of death. With the development of medical technologies, it is possible to prolong the physical sign of life. However, patients as well as their families often suffer physical and emotional pain in the use of the invasive treatment. Hospice care is therefore introduced into the medical practice, as a reflection of medicine, turning invalid cure into palliative care.

This essay treats hospice care as a new form of medical treatment. It deals mainly not with the illness, but the pain – in regard to body and mind. Using in-depth interview texts, this essay examines the operational logic of hospice care in Taiwan. Some patients and their families reveal in the interviews that it is meaningless to continue accepting general treatment. Further examination, however, shows us that this meaninglessness means a lot. It does not connote abandonment of treatment. Instead, this meaninglessness is precisely where we can see how hospice care in Taiwan is operated and transformed. Reflecting on this meaninglessness, this essay examines the following issues: the reshaping of value of life and death in light of ethics of time, ethics of economy, and relational autonomy, the shift of filial piety, the idea of good dying and finally the withdrawal and employ of technologies. By so doing, it hopes to figure out the transformation of hospice care from impossibility into possibility in medical treatment.

RC56-910.2JUBELIN, ALEXANDRE* (*Université Paris-Sorbonne*)*Boarding Parties in EARLY Modern Atlantic Warfare and the Recomposition of Violence*

Within the field of Early modern warfare, it has long been argued that a "Military Revolution" (Parker, 1988) took place from the 16th to the 18th centuries, creating a deep recomposition of warfare and from there, politics itself - due to the apparition and diffusion of artillery in Western Europe. However, details of this evolution have long been overlooked - and specifically the precise experience of combat by its actors - which would tend to put into perspective any idea of a brutal evolution or revolution due to the limitations to the technical implementation of artillery at sea.

This contribution would argue that something specific is at play in the naval war experience of the 16th and 17th centuries. First because of the uncertainty of most battles of that time, since an encounter at sea is almost always unexpected, contrary to most land battles - hence an experience of waiting and chasing an enemy, then expecting the action, followed by the unleashing of brutal violence in the case of boarding parties - since there is almost no escape in these battles. But also because the development of artillery changes the equation and the representations of battle - being both viewed as a decisive advantage and a somewhat dishonourable weapon compared to previous unavoidable boarding tactics.

Hence a very specific form of combat, at the articulation between close and interpersonal fighting (in which the sensorial environment of fighting would be questioned), and an emerging means of fighting at a distance - in which both psychological warfare and cultural representations come into play in an environment very different from that of land warfare (the wind advantage for instance remaining a cornerstone of naval warfare).

RC21-JS-19.5JUHNKE, SEBASTIAN* (*Humboldt-Universität zu Berlin*)*Becoming the 'creative Self': On the Relationship between Urban Environments and Biographical Desires*

The relationship between the city and the individual is reciprocal: urban environments influence biographies and life stories, and biographical desires in turn take part in shaping the city. This is the case for members of Richard Florida's (2003) creative class, a demographic attracted to cities that display tolerance in the form of openness and diversity. Whereas this conceptualization has been criticized for its neglect of intra-urban inequalities and often problematic applications by urban policy-makers around the globe, little is known about the relationship between 'creatives' on a personal level and the urban environments that attract them.

Based on qualitative interviews with creative professionals in London and Berlin neighbourhoods attractive because of their diversity and urban change, this paper will shed light on the biographical construction of a 'creative self' that is dependent upon a particular urban form. Furthermore, this paper will discuss the ways in which a 'creative' self-understanding and biographical desires impact upon the city, both materially and discursively (e.g. in the form of representation, gentrification and segregation).

Questions of living together with difference in diverse and tolerant (socio-geographical features), and particularly 'creative' urban environments (materialities such as Victorian/Wilhelminian housing stock, industrial architecture, street mar-

kets, the 'right' degree of urban decay) are directly related to the biographical construction of the 'creative self'. This not only relates to working conditions such as the presence of other 'creatives' and being inspired by diverse and 'edgy' neighbourhoods but also to the construction and narration of individual biographies through norms, values and questions of lifestyle, taste and distinction. This becomes particularly evident when creative professionals contrast their arrival to the city with their past in 'non-creative' urban or rural places.

RC48-802.6JUNG, CHUNGSE* (*Binghamton University*)*Mobilizing for Democracy Again: Rising New Political Activism in East Asia*

Why does claiming democracy come back to a central issue in social movements of East Asia in the 2010s? Between 2014 and 2017, the East Asian countries experienced one of the most revolutionary moments in their history of democracy. Unlike the Arab Spring, mobilization for democracy such as the Sunflower Student Movement in Taiwan in 2014, the Umbrella Movement in Hong Kong in 2014, Japanese Anti-War Rallies in 2015, and South Korea's Candlelight Protests from 2016 to 2017 occurred in the process of democratic regression after their democratic consolidation. In this paper, I explore the structure and dynamics of the recent political activism in East Asia. By comparing the cause, process, and outcome of the movements, we can find several key juxtapositions of the four protest waves. The protests were triggered primarily not by transnational issues, but by domestic political decision and corruption. The most shared claim at the protest events, "realizing democracy," was consistent across the regions. Younger generation occupied the scenes of protests. I take such parallels, but critically assess, asking what it takes to draw them and what work they do in the East Asia of the 2010s? In the world-historical perspective, I examine rising political activism in the Asia could occur in periods of world hegemonic transition, the rise of China and the decline of the U.S., and capitalism-in-crisis, and argue the new political activism links to economic and geopolitical instability in the region. In addition, I show demanding democracy has become a key claim in the last two global protest waves in the 1980s and in the early 2010s in the global South.

RC39-696.2JUNGSMANN, ANDREA* (*Disaster Research Unit, Freie Universität Berlin*)SCHULZE, KATJA (*Disaster Research Unit (DRU), Freie Universität Berlin*)SCHANDER, JULIA (*Disaster Research Unit, Freie Universität Berlin*)*Health Related Services in Crisis Situations – a Study on Care-Dependent People*

Against the backdrop of rising numbers of weather-related disasters worldwide (UNISDR, 2015) and an increasing reliance on infrastructure like electricity, communication, and health services, the question of what will occur if we fail to keep those services running during crises and disasters arises. As a result of long-term demographic developments, the number of people in need of personal care has continuously increased in most western societies. In Germany, the number of care-dependent persons increased by 9% in the past two years up to 2.86 million people in 2015 - 73% of whom live in private households (Statistisches Bundesamt, 2017). The ability to provide for their special medical needs in a crisis or a disaster presents a great challenge to the agencies and organizations tasked with public security. Given the paucity of centralized information about this vulnerable group, new ground needs to be broken to integrate their social networks, medical and nursing services as well as disaster management concepts and organizations.

Referring to data from an ongoing research project on the context of care-dependent people in disaster and crisis situations (KOPHIS), we will present the results of one qualitative and two quantitative studies. In these studies, we explored the anticipated needs of care-dependent people living in private households during a disaster scenario involving a long lasting water and power outage. The contribution will allow insight into the perspectives of disaster professionals, medical and nursing staff as well as care-dependent people and their relatives. It also discusses the extent to which care-dependent people, despite their alleged vulnerability, are accustomed to experiencing crises on a daily basis and whether they may have therefore developed individual mechanisms and resilient support networks that can be activated in disaster situations.

RC11-214.3JUOZELIUNIENE, IRENA* (*Vilnius University*)BUDGINAITĖ, IRMA (*Vilnius University*)*Intergenerational Solidarity and Transnational Familial Care: The Case of Lithuanian Migrant Families*

This paper aims to examine how intergenerational solidarity contributes to organization of familial care across borders. Familial care is the main source of

social care for elderly in Lithuania. Since accession to the EU in 2004, families face new challenges due to the emigration of working age adult children, elderly family members stay living 'at home'. Elderly people play a dual role in migrant families. On the one hand, close kin, especially grandparents, become involved in childcare arrangements across borders and are seen by migrants as a familial resource helping to cope successfully with the hardships. On the other, migrants confront the dilemma of needing to transfer grandparents to a destination country or organizing care at home country.

Transnational families remain unacknowledged as a new family type in the national legislation and public discourse; the policy measures to support them remain scarce and unsystematic. Therefore, intergenerational solidarity is the major source of support within families and, as such, is fundamental for understanding the circulation of emotional support, instrumental help and financial security.

To analyse how intergenerational relations are maintained across borders and in which ways care is provided for/by older parents in long-distance family situations, we build on intergenerational solidarity approach, broadening the focus to include relations with close kin, and view family relations through the lens of transnational care chains and renegotiation of family responsibilities. We draw insights from two representative surveys of Lithuanian population (aged 15 to 74) carried out in 2013 (N=1016) and 2017 (N=1400) in the network of the project financed by Research Council of Lithuania. The questionnaires integrate part of an international comparative study VOC-IR questionnaire on intergenerational solidarity.

The data reveal how experience of migration re-defines relational networks, which way intergenerational solidarity contributes to re-organization of familial care, and how care networks are gendered.

Father-Friendly Workplaces: Possibilities and Barriers for Balancing Male Work and Involvement in the Care of Children

This paper studies workplaces that facilitate their male employees' involvement in caring for their children. We draw on data from three focus groups and six case studies of businesses officially recognized a promoting work-life balance and gender equality in Spain. We analyze the interactional and institutional levels: the interactions between employees, involved fathers, and their supervisors, and the organizational culture and norms of the businesses that ease work-life balance.

Research on this topic shows that more and more men identify themselves as care providers and want to act as involved fathers, but policies, gender ideology and even practices hinder it. We analyze the factors, barriers and opportunities that fathers find at their workplaces when they want to get involved in care. There are also tensions between conditions theoretically thought to promote work-life balance and practices that make it difficult.

We focus on the business-specific and external factors from a retrospective perspective to understand the changes within businesses leading to father-friendly organizational cultures over time. Taking into account the businesses' position on the goods and services markets, we are interested in how some of them used their degrees of freedom to innovate work schedules and the management of human recourses by offering flextime, leaves of absence, reduced work hours and telework. We also take advantage of the comparison between occupation, professional categories and hierarchical levels within a business to understand why some work-life measures are not offered to some occupations or are less used by them.

Cognitive and Behavioral Environment Concern Among University Students in a Western Canadian City: Implications for Institutional Interventions

Informed by Stern and colleagues' Value-Belief-Norm (VBN) theory and their empirical work on the linkages between social forces and social-psychological processes that impel people to act pro-environmentally, we examined levels and predictors of cognitive and behavioral environmental concern (EC) of post-secondary students in a setting heavily focused on expanding resource extraction. Students are worth further study; they will be affected by and will have to provide solutions and take competent action in civic participation for sustainable environmental development. Data for this investigation were obtained through completion of self-administered questionnaires during the 2009/2010 academic year from a sample of 421 undergraduate students attending a medium-sized

public university in southern Saskatchewan, Canada's second largest oil-producing province and third largest producer of natural gas. The rise to power of the "pro-extraction" Saskatchewan Party for the third consecutive term since 2007 has intensified neoliberal environmental governance to facilitate economic growth. Results showed no widespread pro-NEP oriented attitudes. Students were more prone to place responsibility for environmental protection at the door of government and industry than themselves. Students practiced a range of environmentally supportive behaviors (ESB) with varying intensities. To test the causal structure of the VBN, hierarchical multiple regression models were used, which provided replication for several of the theory's propositions in predicting generalized and specific environmental beliefs and ESB. Findings highlight the complex relationships between personal background, academic and cognitive variables as influences on pro-environmental participation. Notably, the impact of formal instruction on the environment in influencing cognitive and behavioral EC, both directly and indirectly, suggests it is essential educational institutions have formal curricula that expose students to the necessary types of environmental knowledge, awareness, attitudes, and critical thinking skills to promote environmental literacy and address unsustainable lifestyles and attitudes. Institutional interventions are discussed, including the role of universities as "effective change agents".

Human Behaviour during Residential Cooking Fires in a Canadian Prairie City: Trends, Concerns and Implications for Safety Promotion

Human behaviour in residential fires has received limited attention from Canadian fire and rescue services. Canada does not have an ongoing national fire information database, leading to important gaps in fire research. This means that with regard to residential fires, Canadian fire services have only very limited knowledge and lack supporting empirical data about ways people behave during residential fires. To complicate matters, there are many messages which are contradictory about ways to handle small residential fires, and there is little empirical research on effectiveness or fire injury risks associated with different approaches, despite widespread acceptance of people's predisposition to intervene and potential danger associated with ineffective host intervention. The impetus behind this research came from Regina Fire & Protective Services (RFPS). Residential careless cooking fires (RCCFs) are an ongoing and serious problem in the City of Regina. A community-based participatory research partnership between RFPS and the University of Regina, this project is providing key data to understand the human dimension of RCCFs: It's people who start these fires, not technology. Applying concepts of Brennan and Thomas' Paradigm of Human Behaviour in Fires and the Haddon Matrix to facilitate a better understanding of the circumstances and influences that act on hosts implicated in these occurrences, the present study analyzes primary survey data collected between 2014-2015 using RFPS' *Residential Cooking Fire Form*, developed to meet the objectives of this project, to examine nature, correlates and casualty risks of host intervention behaviour and specific actions taken in response to RCCFs and how these behaviours relate to effective safety strategies. The benefits of making decisions informed by empirical data from "real" behaviour in RCCFs are considerable for design, targeting and dissemination of relevant fire-safety messaging; messaging that to achieve the best outcomes accounts and works with what people actually did during such fires.

K**RC19-363.3**KAASCH, ALEXANDRA* (*Bielefeld University*)KOCH, MARTIN (*Bielefeld University*)*Global Social Regulations of Domestic Work – the Case of Migrant Domestic Workers from Asia*

While working relationships have undergone tremendous regulations in the past century, regulating domestic work is still in many ways difficult as besides formal employment relationships there is a huge amount of (illegal) migrants and other 'invisible' persons engaged in informal (paid) domestic work. It is migrants who usually possess less knowledge of the language of their host country, as well as about their social rights, culture and other important information, that end up in vulnerable employment relationships. Migrants tend to work in less regulated and less monitored working sectors in particular if their residence status is not firm. These problems generate different forms and dimensions of discrimination across and within countries. This paper centres around the protection of domestic workers. It addresses the questions of how the concern to protect domestic workers has emerged in world society; and to what extent global actors attempt to establish social policy regulations at the national and regional level to address the social needs of domestic workers.

Solutions to these challenges cannot only come from nation states but are rather at the heart of global social policy. IOs and NGOs have been involved in developing political measures and regulations to protect domestic workers. We are particularly interested in how the situation of domestic workers migrating from Asian countries such as Indonesia is described by global actors and in the policy recommendations to address their situation.

We use qualitative data (documents), and a combination of global social policy, world society and international relations approaches to study the role and ideas of global actors in the framing of domestic workers' issues. We seek to make contributions, to a better understanding of global policy mechanisms to protect domestic workers, and to help improve the theoretical and methodological tools to analyse social policy from a transnational perspective.

RC09-182.6KADIO, KADIDIATOU* (*Université de Montréal, Programme de doctorat en Science Humaine Appliquée*)DAGENAIS, CHRISTIAN (*Département de psychologie, Université de Montréal*)RIDDE, VALÉRY (*Institut de recherche en santé publique de l'Université de Montréal (IRSPUM)*)*De l'Intention De Formulation d'Une Politique Nationale De Protection Sociale (PNPS) à Une Compilation D'actions De Protection Sociale.*

Pour améliorer la protection sociale des populations, le Burkina Faso a adopté en 2012 une politique nationale (PNPS). La présente recherche analyse sa formulation en s'appuyant sur la perspective de « policy design » (Howlett et Mukherjee, 2014).

Des données discursives et documentaires ont été collectées auprès de 36 répondants issus d'institutions nationales et internationales. L'analyse thématique inductive a orienté le processus de collecte et de traitement des données (Blais et Martineau, 2006; Paillé et Mucchielli, 2012).

Les résultats montrent que le processus de planification de la formulation n'a pas permis de conduire une réflexion sur le problème à résoudre, d'identifier les besoins spécifiques des bénéficiaires, d'évaluer la capacité des solutions pour choisir celles appropriées, donnant lieu au constat empirique du « non-design » ou de « non-formulation ». Il a plutôt conduit à une PNPS qui s'est résumée à un document dont le contenu tous azimuts rassemble toutes les actions possibles de protection sociale sans faire un arbitrage. Trois facteurs ont favorisé cette non-formulation : (1) le manque d'orientations gouvernementales claires pour guider les discussions; (2) le faible soutien ou volonté politique se traduisant par la faible implication des décideurs de haut niveau dans le processus; (3) les acteurs nationaux avaient une méconnaissance conceptuelle et technique sur la protection sociale faisant recours aux conseils des organismes internationaux. L'annonce gouvernementale de jouer un rôle principal dans le processus de formulation relevait de la rhétorique. Dans ce contexte, d'autres visions et logiques ont guidé le raisonnement des acteurs. Les acteurs nationaux recherchaient un consensus sur le contenu de la politique dans une logique de captage de ressources financières, ceux internationaux ont priorisé les interventions relevant de leur mandat institutionnel.

Ces lacunes dans le processus de formulation pourraient engendrer des difficultés de mise en œuvre, voir un échec de son efficacité.

RC15-287.7KADOBAYASHI, MICHIO* (*Japan Women's University*)*The Transition of Cancer Tobyoki (illness narrative) in Japan*

In Japan illness narratives called "tobyoki" have been published actively, and among them cancer tobyoki account for half of them in number. Cancer tobyoki has remarkably increased since 1980's with the rising incidence of cancer. In my study about 600 volumes of cancer tobyoki from 1960's to the present, I examined the authors' consciousness, the relation to the "truth-telling", and the chronological change of the views of cancer in those memoirs. And I found the existence of the master narrative which symbolizes the era. Cancer tobyoki has been changing. That was caused by the change of the medical policy toward "truth-telling", which was influenced by the flow of cancer treatment. This transition of the policy affected the view of cancer in society and patients' consciousness, and changed the content of tobyoki. I classified cancer tobyoki published until around 2000 into four categories according to the period as follows; 1. until 1980, it is common that the patient was not informed the truth. 2. the latter half of 1980's, "truth-telling" began. 3. the latter half of 1990's, the rate of truth-telling rose. 4. around 2000, the "truth-telling" was generalized as a necessary information for patients and a lot of authors declared "symbiosis and coexistence" with cancer. After that the diversification of cancer tobyoki was seen for a while. And now one out of two people get cancer, and tobyoki has changed greatly. The authors try to grasp their situations as it is and face cancer. Most of writers are considering how to finish their lives even in the last stage of life. Tobyoki is the story of diseases, and the story composed of the personal experience and social or cultural factors. I'm going to indicate the master narrative and mention about some factors of the transition.

RC04-96.2KAGAWA, MEI* (*Institute of Social Science, University of Tokyo*)*Declining Birth Rate and Changes in High School Opportunities in Japan*

Maintaining opportunities in high school when the number of students is decreasing is challenging in many aspects. When education was expanding, the primary concern was to cope with the growing demand quantitatively. However, when education is being downsized, providing adequate education involves dealing with problems quantitatively as well as qualitatively. The challenge is to downsize education while guaranteeing equal opportunities for everyone. In other words, society has to offer a variety of programs that students want, while simultaneously shrinking them in size. How can this be accomplished? What can cause its failure? What kinds of problems can arise in the process? I focus on the changes in the high school structure in Japan, namely providers and programs offered, to answer this question.

The number of high school students in Japan has been decreasing over the past 25 years; the highest number was recorded in 1992; it then declined sharply to about two-thirds in 2016. Despite the decline in student enrollments, public and private balance in terms of ratios remains unchanged. The reason for this is that the public-private high school cooperation council in most prefectures sets the permitted allocation of students in each sector. However, a change in the functions of the council is indicated in the coming years. Regarding the variety of programs, two changes can be pointed out. One is the decline in the number of public schools that offer vocational programs, especially in prefectures where the drop in student numbers is severe. The other is that the education contents that each school offers are diversified reflecting high school policy. We will discuss the consequences of these changes to the high school structure.

RC50-837.5KAHANA, NETTA* (*Hebrew University of Jerusalem*)*The Beautiful Israelis: Volunteer Tourism As an Ethical Consumption in the Israeli Context*

Volunteer tourism is part of the wider trend of ethical consumption, as it allows untrained tourists to assist disadvantaged communities around the world, and thus to express moral ideas via consumption. Although ethical consumption is a global phenomenon which is used by different social actors in varying social fields, volunteer tourism research focuses on European and North-American organizations and volunteers. This research examines moral conceptions in volunteer tourism in a non-European and non-North-American framework – the Israeli context. Since 2007, a number of volunteer organizations offer special volunteer programs for Israelis around the world. The research examines how volunteer tourism as a form of ethical consumption is organized beyond European and North-American society, and how the moral ideas which are embedded in this global phenomenon are integrated into the Israeli context.

An integrative methodological strategy of content analysis of the websites of all active organizations in the field, and in-depth interviews with volunteers is used. Results indicate that both the organizations and the volunteers ascribe local meaning to the global phenomenon of volunteer tourism. The organizations

attribute both national (Israeli) and religious (Jewish) meaning to volunteering, and by doing so they showcase the moral aspects in volunteer tourism as an Israeli and Jewish matters. On the other hand, volunteers perceive volunteering as an expression of individual morality. Practicing ethical travel allows them to display global values and habitus, and to distinguish themselves from other Israeli travelers. The study offers a powerful example of the ways in which volunteer tourism as ethical consumption is organized differently in a local context, due to the varying local meanings ascribed to the phenomenon.

What Happens When Work and Family Spheres Are Reintegrated? Quantitative Analysis of Unpaid Housework Among Women Home-Based Workers in Canada

Since the 1970s, developed countries like Canada have witnessed a rise in women's home-based work as a result of economic restructuring and firms' flexibilization strategies. Although home-based work is touted by the media and businesses as an ideal arrangement for women to balance work and family, sociologists are critical of this upward trend as a re-integration of the sphere of work and the sphere of family. Qualitative research has explored the gendered consequences of home-based work and highlighted work/family challenges facing women home-based workers. However, a quantitative assessment on the work/family challenges of women home-based workers is limited to date. To address this gap, this paper quantitatively evaluates how the unpaid housework hours of women home-based workers compare with those of on-site workers and their male partner. We perform OLS regression and generalized decomposition analyses using data from the 2006 Census, the last Canadian census that asked about one's unpaid housework. We find women home-based workers spend seven hours per week more on housework than their counterparts who work onsite and are doing a greater share of housework in the couple than their onsite counterparts, suggesting home-based work reinforces the gender division of household labor. Male home-based workers are also doing a greater share of unpaid housework in the couple than their on-site counterparts, which slightly helps reduce the gender division of household labor in the couple. Moreover, although 20-30% of the gaps in housework hours between women home-based and women onsite workers can be explained by the differences in their work-related and other observable characteristics, the gap persists, suggesting unmeasured characteristics such as traditional gender role attitude may play a role. Finally, we discuss the importance of re-instating the questions of unpaid housework activities in long-form Canadian Censuses.

KAIZUMA, KEIKO* (Iwate University)

The Logical Structure of Japanese Far-Right Female Politicians' Writings; The Harmonized Femininity with 'masculine' Xenophobia or Militarism

After 90s', new generation of female political leaders attract much support of Japanese people. They openly express their xenophobia, militarism, and hardline diplomatic policy stance. This study aims to analyze how they resolve a discrepancy between their presence as female politicians and their 'masculine' hardline policy stance.

In this study, their logical structures justifying xenophobia and militarism are extracted from the books and articles written by them from 1978 to 2017. They are divided into three groups by their logical structures; (1) xenophobic-neoliberalists, (2) moral conservatives and historical revisionists, (3) offensive realists.

(1) xenophobic-neoliberalists and (3) offensive realists describe themselves as competent experts, more daring than mediocre male politicians. They camouflage their discriminatory policy with rational technical terms of economy or of diplomacy. They successfully draw some people's expectation that the fresh energy of female politicians might bring Japan a victory of merciless international power game.

On the other hand, (2) moral conservatives and historical revisionists prefer to call themselves the represent of ordinary housewives, who are daily facing 'the destruction of Japanese community caused by immigrants from China and Korea'. They also blame the Chinese and the Korean for hurting the Japanese by 'false accusation' of war crimes at World War II. They assert that Japanese female, including themselves, are more suitable for opposing 'false accusation' of war crimes like the sex slavery than male who are looked like misogynist.

As the updated discussions in response to the international relations after the rise of China, those far-right female politicians' articles are admitted by the male-dominant popular conservative magazines, like *Seiron* (meaning "The fair argument") launched in 1973. Those far-right female politicians become famous and some of them are succeed to gain the positions of ministers, while many feminist politicians struggle to break through the glass ceiling of left-wing political party.

KAJIWARA, KATSUHIKO* (Ehime University)

German Prisoners of War As "Military Immigrant" and the Meaning of an Occupation: A Forced Global Migration and Subsistence in Locality

This paper will investigate the global migration of German POWs interned by the Japanese during the First World War and their occupation in locality, and explore that their occupational activities had an effect on both local population and prisoners.

In WW1 the global migration occurred, producing numerous POWs. In the Far Eastern front the Japanese Army captured about 5000 German and Austrian soldiers and sent to camps in Japan.

Recently studies on the treatment of POWs during WW1 have made progress. The cases in Europe pointed out their similarities to immigrants or refugees, considering in terms of "military immigrant." In contrast, while researches on Japanese treatment of POWs clarified their activities in camps and "intercultural contact" with local citizens, it had not yet inquired what significance their "occupation" had on them. Furthermore, factors that motivated them to the Far East in the first place and their activities as regular immigrants in Qingdao, Vladivostok and several Japanese cities have not been paid attention.

While having similarities, there are also differences between POWs and immigrants. Firstly, POWs were forced to move into camps. Global migration of POWs assumes a compulsory character. Secondly, they were compelled to live an idle life, deprived of their occupations. Compulsory works are often seen as negative, yet recent studies revealed POWs of WW1 found the "meaning" of life in such works. This is indeed the case of POWs captured by the Japanese. They worked by original or new occupations, sometimes contributing enemy and enjoying cultural exchange with local people.

There are various aspects in global migration of German POWs and their life in Japan. This paper illustrates how POWs' subsistence guided them to the Far East and how it developed after being interned, using cases mainly in Matsuyama Camp, located in Ehime, South-West of Japan.

KALALA MABULUKI, ETCH* (EHESP)

Cross Sectoral Youth Policy and Power

This contribution aims to analyze the experimentation of a transversal approach in terms of appropriation by local actors at a local level. It is based on the material collected in an ongoing research project on the Breton territory. The project "Jeunes en TTrans," the first winner of the Future Investment Program (co-financed by the French State, local and regional authorities, agencies, and joint organizations), supports the emergence of integrated and global youth policies.

Our contribution will consist of two main points: the characterization of an ambiguous notion which appears to be unifying in nature but which actually hides multiple perceptions and public youth problems definitions (1); the study of the local actors relations to the transversal approach and the way it questions the notion of power (2).

On the first axis, we will pay particular attention to the process of explaining the usefulness of the transversal approach. We observe an ambiguity in the virtues assigned to it. They mask a plurality of different qualifications, and as a result the actors are sometimes tempted to give direction to the process corresponding to their own agendas. For example, elected officials see an opportunity to reduce costs and act on the "proliferation" of actors, while some youth professionals mobilize external resources to try to transform public policy and influence their own institutions.

On the second axis, we focus on individual and group figures at the beginning of the implementation of a cross-sectoral approach. After analyzing the divergent interests of the local actors, we will study more precisely their postures and enrollment in this global approach. Through this path we discuss the notion of power in the design and implementation of youth policy.

By attempting to answer these questions, we position ourselves to answer the needs of this session.

World Views and Carrier Groups: An Interactive Dynamic in Weber's Works

Max Weber's term "tracks" (Gleise) refer directly to a civilization's world view as established at its origin. This world view demarcates the "pathway" (parameters) along which a civilization's "ideas" develop. However, highly fragile, every world view requires carrier groups if to possess a viable impact. Yet these groups often assert an independent influence upon the world view; Weber rejects a linear unfolding. This interaction dynamic, with illustrations, stand at the center of this paper.

RC48-801.17KALE, SAMPAT* (*Tata Institute of Social Sciences - Tuljapur Campus*)***Accumulation through Dispossession and the Role of Non-Violent Social Movements in India***

India is in transition and hence experiencing development paradox which has resulted in high complexities and contradictions with the advent of new-liberal state. This paper argues that the pathways of hegemonic development induced in formation of new class of dispossessed and marginalized sections of society. State has become an eminent domain, thus apex power leading violence in several parts of the country. This paper emphasizes issue of globalization of resources as a agenda of urban fringe, widespread displacement and land alienation of marginalized people, land pooling for real estates, industrialization, urbanization, modernization and swift economic growth and investments.

In recent years, peasants' and workers movements have been resisting state led land acquisition. However, it has resulted in peaceful dissent to ongoing development paradigms. The contemporary movements are not just advocating the issues of displacement but giving alternatives to development and engaging state. This paper looks at regimes of dispossession and peasants' opposition to Special Economic Zones (SEZ), Delhi Mumbai Industrial Corridor (DMIC) and Maharashtra *Samruddhi* Expressway through empirical research. The struggle has primarily taken two forms; some have used violent methods to express resistance and some social movements have employed non-violent strategies of political activism to express their aspirations. In order to protect the rights over livelihood resources many social action groups, advocacy campaigns are engaging in non-violent struggles across the country. This paper argues that non-violent social movements have enhanced spirit of civic engagement, deepening democratic values of the Indian Constitution, Social Justice and Human Rights. It also stresses that the debates need to address policies towards substantive economic growth, elimination of inequalities, social exclusion and regional imbalances.

RC22-405.3KALER, AMY* (*University of Alberta*)PARKINS, JOHN R (*University of Alberta*)***Acts of Faith: Belief as Skilled Work in International Christian Humanitarian Organizations***

Philip Caputo's acclaimed 2005 novel *Acts of Faith* depicted the travails of evangelical Christian organizations doing humanitarian relief work in what is now South Sudan. While Caputo, like most other observers, equates the "acts of faith" with the observable consequences of faith-motivated action, in this paper we argue that prior to and contemporary with those readily visible acts are more subtle acts, the cognitive and affective practices through which faith-motivated actors engage in "world-making and world-sustaining" activities of aligning personal experience in South Sudan and elsewhere with Christian belief in transcendent realities (Lynch 2013). We take our cue from Luhrmann's (2013) study of personal prayer as a skilled activity learned through social interaction and critical reflection. Our data come from interviews in 2015 with 30 self-identified evangelical Christian humanitarians from north America and Europe who are or have recently been working for emergency relief and development work in South Sudan. South Sudan serves as a limit case for faith-based humanitarianism because of the extreme volatility of the social and political situation. It also has an extensive history of international Christian involvement. These interviews are supplemented by more recent interviews at the Canadian headquarters of faith-based Christian relief organizations and by analysis of the narrative cultural products of these organizations including blogs and YouTube videos. We attend to the stories people tell about themselves as faith-motivated subjects, with particular attention to the skilled work involved in personal and collective "acts of faith".

RC13-248.3KALERANTE, EVAGGELIA* (*University of W. Macedonia*)NIKOLIDAKIS, SIMEON (*E. College*)***The Effects of Underhanded Economics on Education. Life Long Education Undermines One's Right to One's Leisure Time Disposal***

Initially, we analyse the interdependent trends between economic imperatives and incentives in a capitalist system and educational approaches.

We concentrate on indirectly controlled education within a routinized daily existence via the constant quest for "educational packages" necessary for job placement.

A worker's life is dominated by work insecurity imposed educational choices. Focus is shifted from following one's interests to facing practical demands. Leisure time shrinks in favor of utility time.

Gradually, unequal wealth distribution brings on unequal leisure time availability co-relating free time activities with profit making pursuits.

Also, we look into formal and informal educational methods within an evolving life-long education environment. Mechanics and strategies of entrapment of individuals by an economically motivated system of measuring success and progress at the expense of individually determined terms of happiness, self-satisfaction, and cultural exchange enjoyment.

Aspects of individual humanistic value deprivation leading into society's humanistic denudement are exposed.

The individuals interconnection with society is emphasized, so as to reveal that a loss of free time constructively used to an individual's pursuit, progressively leads to the degradation of the social and political experience. That is to say that beyond the surrender of the humanistic educational capital lies the enfeeblement of the political determinants of democracy.

As ideas and problematics partaking declines along with the social co-existence and acceptance of others, through solitary trails in theoretic convictions in long life education as an investment in oneself, each one becomes an economic operative toward a rising social inequality destination.

RC31-570.7KALESHI, ENTELA* (*Institute for Change and Leadership in Albania*)***Effects of Migration on Poverty, Inequality, and Human Capital Formation in Albania***

The fall of the communist regime in Albania in 1990 initiated a continuous wave of migration of Albanian population that it is still ongoing. The political and social instability, poor economic conditions and changes in government brought the largest flow in modern times and favored by cultural, linguistic and geographic vicinity and low migration cost it was mainly directed to neighboring countries of Italy and Greece. Nowadays Albania has one of the world's highest emigration rates, relative to its population, at -3.3 migrants per 1,000 people, and a total migrant population of more than 1.25 million in 2014.

Although during the last years it is observed an increase number of return migrants, Albanian citizens continued to migrate and it is observed an increase of the number during 2014, and the new trend now is requesting asylum in EU member states increased during 2014. According to EUROSTAT data show that 65,000 Albanians applied for asylum in 2015, 55,000 of them in Germany, half of them belong to the age group 18 - 34 years old, but 99 percent of Albanian asylum requests have been refused from European countries.

Due to the poor economic and living conditions in Albania, the labor market in Albania is still vulnerable and it affects the on-going migrant flows from Albania to the most developed labor markets of other countries. These migrant flows are directly linked with labor market development especially level of unemployment and poverty. They have a social development impact and poverty implications in several levels. At the individual level migrants benefit economically from their movements, having better employment opportunities and income; at the household level it reduces poverty and contributes positively to human capital formation, and better education and healthcare conditions, while at the national level it bring positive changes to the national economy.

RC11-225.6KALIDOSS, RAJESWARI* (*Dr.*)***Elderly Caregiving in Indian Families - Changing Perspectives***

India has 100 million people over the age of 65 and is expected to be by 16 % of the population in 2040. In Indian culture care giving is considered as a highly important task and considered immoral and cruel to neglect the needs of one's elders. Earlier care was given by the family, but on disappearance of joint families and mounting pressure from work it is leaving very little time for family members to care for the elderly. As support systems shrink families consider taking care of elderly as an added burden and this often leads to disputes between spouses. Eventually, the elders feel unloved and uncared for and unheard. The elderly have physical, financial, social, emotional needs and so on. Physical needs are like giving them a bath, clothing them, giving food and medicines at regular intervals, accompanying them for a walk and so on. Financial needs means arranging for their monthly expenditures, managing their bank accounts and other financial transactions. Emotional needs are like sparing time to listen to them even if it did or did not make sense, or making them feels useful by assigning tasks which they can perform. They also have their social needs like attending functions, visiting temples or travelling to new places. A sample of 120 caregivers in the families in Tamilnadu, India has been taken to identify the challenges faced by the caregivers in meeting the multiple needs of the elderly in their families. The results of the study showed that the surprising proportion of those caring for older adults are younger and there is a gender difference in the availability and provision of care to the older persons.

Family and Partnership: Motivations in Applying for Same-Sex Partnership Certificate in Shibuya, Tokyo

In this paper, we will examine how official recognition of same-sex couples is related to individuals' relationships with their family of origin.

In a previous study conducted in the late 2000s by the Rainbow Talk 2006 research team, we concluded that same-sex couples in Japan would intentionally try to maintain a cordial relationship with their kin, especially their parents and siblings, as a "safety net", since absolutely no legal rights or recognitions are given to same-sex couples (Sugiura, Kamano and Yanagihara, 2008).

In 2017 now, ten years after the previous study, more than a handful of municipal governments in Japan offer some form of official recognition of same-sex couples. Shibuya-ward in Tokyo was the first to do so, allowing same-sex couples to obtain a "same-sex partnership certificate", based on an ordinance that took effect in November 2015. While this certificate does not give the couple any of the rights given to heterosexually married couples, the requirement of the submission of a notarized private contract means that the couple would formalize their relationship in the form of a pledge or an agreement.

Based on face-to-face interviews of 16 individuals in a same-sex couple relationship conducted in July-August 2017, we examine how the individuals view the certificate offered by Shibuya-ward, factors motivating the couples to obtain the certificate, and the effects it has on their lives. We will also extract ideas of marriage and families that emerge from the interviews. Preliminarily, we found that for some individuals, being accepted by their family of origin is important before they move toward obtaining the certificate, and that such a certificate is meaningful only when their relationship is celebrated by their family members. Our findings would provide additional insights to the idea of the "families we choose" (Weston, 1991).

Formation of Consciousness to Permit Corporal Punishment Based on a Questionnaire Survey on "the Life of High School Students in Okinawa, Japan"

This report focuses on the formation of consciousness that permits corporal punishment and on the factors influencing this formation.

In this paper, corporal punishment is defined as "a harmful stimulus inflicted on children by parents, teachers and others in the name of discipline".

Many countries have already prohibited all corporal punishment for children, but in Japan corporal punishment doesn't only go away at school but it doesn't also go away at home. There are many people who permit corporal punishment because they don't connect corporal punishment with the Rights of the Child.

How is the consciousness of corporal punishment formed in each person?

Based on the preceding research, I created some hypotheses on the formation of consciousness that permits corporal punishment and I investigated this issue by using a questionnaire survey obtained by 936 high school students in Okinawa.

I tried covariance structure analysis using the variables that are composed of experiences of receiving corporal punishment, gender, household composition, male dominant consciousness, the feeling that the child's own actions justify the corporal punishment, and the feeling of being loved by one's parent(s). And so I obtained the following results:

(1) On the one hand, experiences of having received corporal punishment from one's parent(s) enhance the consciousness to permit corporal punishment,

(2) On the other hand, the experiences lower the feeling of being loved by parent(s) and lower the consciousness that permits corporal punishment.

(3) As the feeling of being loved by the parent(s) increases, the consciousness to permit corporal punishment increases too.

Also, (4) the influence of the feeling that the child's own actions justify the corporal punishment is the largest in the formation of the consciousness that permits corporal punishment. It is also followed by the feeling of being loved by the parent(s), and by the male dominant consciousness, etc.

Globalized Epidemic: Which Individual-LEVEL Political Communication Effects Contribute to Growth of Right-Wing Populism BOTH in Autocracies and Democracies? the CASES of US and Russia.

History presents numerous examples of right-wing populism being the disease autocracies fall prey to. However, recently more and more democratic societies find themselves in danger of losing to the autocratic fears and aspirations. Anti-immigration, anti-elitism, racism and Islamophobia - are among some of the views and attitudes shared by large parts of population both in some democratic and in some autocratic societies nowadays. This study focuses on major individual-level political communication effects that contribute to the formation and growth of right-wing populism both in U.S. and Russia (as examples of divergent political and societal cases). Specifically, it addresses: (a) opinion formation and change, (b) cognitive, (c) perceptual, and (d) behavioral effects.

The study is based on a series of nation-wide representative opinion polls conducted in U.S. and Russia during the past 2 decades.

Work-Life Balancing Effect of the Welfare States: Comparing Experiences in East Asian Cities

How mothers' and fathers' experiences of balancing work and child-rearing are influenced by the macro conditions such as labor market, welfare state, and culture? Focusing on the cases of Taiwan and Japan, with comparison to other advanced countries, this paper shows the welfare states decisively influence the quality of work-life balance and its demographic outcome. It is interesting to include the case of Taiwan where the rapid increase in female labor force participation has occurred without sufficient provision of formal childcare services. Various data from OECD family database, national statistics, as well as the International Social Survey Programme (ISSP2012) are examined together with interview data obtained in our field study in Taiwan (Taipei and Taichung) and Japan (Nagoya). International comparison is effectively combined with the city level observations. The main analytical findings are: 1) While female labor force participation correlates with fertility outcome in most advanced welfare states, there are some significant outliers like Taiwan, Greece, Spain, and Portugal, where high participation is accompanied by low fertility. 2) Long working hours seem harmful for balancing work and child-rearing. In most advanced countries, less than 20% of mothers with babies work 40 hours a week, the rates exceed 50% in Taiwan and Portugal where the fertility rates are especially low. 3) Availability of formal childcare services matters. Enrolment rates of formal childcare roughly correlate with fertility of each country. Informal childcare such as that provided by grandparents, which is prevalent in Taiwan, cannot substitute the formal services in a societal level. These findings suggest that individualization without the support of welfare state is not sustainable. This problem seems to be shared by some late-developing welfare states.

A Marriage Market Model for Clarifying Factors Contributing to Declining Marriage Rates: A Consideration of the Two-Sex Problem

The rate of marriage in Japan has been declining since the 1970s. In recent years, a similar trend manifests itself in other East Asian countries. This paper predicates such a phenomenon on the schematic proposed by Coleman (1986). In an effort to clarify factors contributing to declining marriage rates, we need to appropriately control the size of demographic cohorts for macro-level social changes so as to reinterpret them as aggregations of micro-level individual decisions. However, the respective rates for men and women being unmarried and the probability of first marriage used as explained variables in previous studies are only controlled by the population size of a single sex, and the influence of the population size of the other sex (possible marriage partner) has not been excluded. This problem is related to the so-called "two-sex" marriage problem, which remains an unresolved problem in demography.

Given this two-sex problem, this paper aims to construct a simple model based on the marriage market theory proposed by Becker (1973). Let N_f and N_m represent the unmarried populations of women and men, respectively, with y as the number of marriages. By letting S_f and S_m represent the benefit gained by women and men, respectively, who opt to remain single, and M as the benefit gained by men and women who marry, the marriage supply curves of women and men can be respectively represented by $y = N_f \{-\exp(-x + S_f) + 1\}$ and $y = N_m \{-\exp(x + S_m - M) + 1\}$. Therefore, $M - (S_f + S_m) = \log[N_f N_m / \{(N_f - y)(N_m - y)\}]$. The right-hand side represents the "tendency towards first marriage" controlled by the population size of both men and women. A multivariate analysis based on this equation will help us clarify the true factors contributing to the decline in the marriage rate.

Setting a Research Agenda on International Trading of Political Capital and High Level Experts

In the context of trans-national policymaking as well as the global knowledge economy (GKE), high-profile cases involving former Presidents and Prime Ministers, and senior public servants of Western governments engaged as experts/consultants for foreign governments and commercial interests raise questions about how political capital is traded in trans-national policy-making. This article maps out the scope of the field of international trade of political capital by looking at the 'commercial lives' of 'high level experts' engaged in this emerging industry. We review the webpages of ten UK-based Think-Tanks in understanding their business, services they provide and the role of so-called 'hired guns' as brokers and negotiators of policy change in the global South and as agents of the 'soft power' of the states in which they were once employed. Informed by Bourdieu's conceptual analysis of political capital we set out a research agenda on i) how political capital is traded internationally, and ii) how/why former political leaders and public servants of Western governments are getting involved in global trade of expertise.

Emerging Effect of Mobility on Subjective Well-Being: Evidence from the SSM Surveys 1975 – 2015 in Japan

[Objectives]

The effect of social mobility on human behavior and psychology has been one of the classical issues in social stratification studies since Sorokin's pioneering work. Subjective well-being is one of such consequences of social mobility, but empirical evidences between mobility and well-being have delivered mixed results so far. Nevertheless, some of the recent research have suggested the sign of increasing effects of mobility. Thus, this paper examines changes in the effect of mobility on well-being by comparing Japanese longitudinal data in these four decades.

[Methods]

Japanese national representative data from the SSM (Social Stratification and Social Mobility) surveys in every ten years from 1975 to 2015 were used. Well-being was operationalized by overall life satisfaction. As mobility experience, we focused on inter- and intra-generational moves in EGP class scheme. In addition to this traditional operationalization of mobility, we also employed the patterns of trajectories of respondents' occupational status, which were extracted by sequence analysis with optimal matching. Ordered logit regressions of well-being to mobilities were conducted for the above five datasets.

[Results]

The effect of mobility experiences on subjective well-being has rapidly increased in the recent decade, which is consistent with the recent literature in other advanced economies. Intra-generational mobility, rather than inter-generational one, had remarkable effects on well-being in 2010's. Besides, downward mobility instead of upward one had a significantly negative impact on one's well-being. These findings suggest that policy intervention to prevent instability of occupational status and living arrangement should be further required.

[Discussion]

The merits of this research are (1) to track changes during forty years in the same society using reliable longitudinal data with national representative sample, and (2) to employ trajectory patterns as an indicator of intra-generational mobility, thanks to the full-fledged retrospective data on respondents' occupational status in the SSM surveys.

Environmental Injustice and Social Interrelationship: Examples from Illegal Logging Issues of Tropical Timber

For the past few dozen years, Japan has been the world's largest importer of tropical timber. The high quality tropical timber from Southeast Asia is used as cheap furniture material, or as disposable formwork panels for concrete structures. The destruction of Asia's tropical rainforests is partially due to the lavishness of Japanese people, and as a result indigenous people face the tragic fate of being deprived of places to live and means to make a living. It has been pointed out that the dichotomous framework that characterize the relationship between victimizers and victims (between the strong and the weak). With the accuracy of satellite observation data increasing, logging and deforestation suspected of being illegal has come to be covered in the news. If people perceive a need for measures to address illegal logging, will environmental injustices begin to be corrected?

This study focuses on the tropical timber producing area of Malaysia's state of Sarawak, and the consumption site of Japan by a "follow-the-thing-approach" to understand where the tropical timber comes from and where it goes. The data for this study is also based on the both participant observation and interviews. In the background to the various problems involved in illegal logging and timber trade becoming visible were the activities by NGOs. At the same time, we cannot overlook the actions over many years of the indigenous people who have continued to resist on the ground. In the EU, the United States, and Australia, laws to

prevent the distribution of illegally logged timber are already enforced. Japan's legal system has developed accordingly. However, a question mark still remains in its effectiveness. It is necessary to look into the victimizers/victims relationships and its mechanisms in illegal logging issues.

Strategies of Health Care Functions in Japan: An Application of Parsons' Theory

This presentation analyzes the strategies of health care functions, especially primary care function, in Japan, using Parsons' discussion of control modes (symbolic generalized media).

Japan's public health care insurance basically adopts the free access system, which we can consult any physician in clinic or hospital with the insurance card. Many patients go to hospital with many physicians at the first visit, so that hospitals are crowded with patients. The government and health care providers have recently introduced the various measures that encourage people to have their family physician.

Firstly, the government has introduced the control strategies using medical fees. Since 2016, patients have had to pay extra fees whenever they go to large hospitals at the first visit. This control strategy is inducement (money). Secondly, Japan Medical Association, which is the professional organization of physicians in Japan, started the three years training program to improve primary care ability for practitioners in 2016. Practitioners get the certification after taking this program. It is expected that patients admit the primary care ability of practitioners with the certification and go to them instead of hospitals at the first visit. This control strategy is a kind of persuasion (influence).

Inducement and persuasion are positive sanctions in the Parsons' paradigm while coercion (power) and activation of commitments (generalization of commitments) are negative sanctions. Coercion and activation of commitments have not been introduced yet. Therefore, positive sanctions are the control strategies which are likely to be introduced.

Science-Policy Discourse on Climate Change: A Critical View on Dominant Regimes of Truth

This paper presents a critical analysis of the role of discourse in understanding and acting on climate change. The investigation is dedicated to finding explanations for controversy and inaction that continue to characterise societal responses to scientific information on climate change. This problem is examined in relation to the practices of knowledge production and dissemination of one of the most authoritative actors in the climate change debate, the Intergovernmental Panel on Climate Change (IPCC). The paper performs a critical analysis of implicit argumentation in the IPCC Summary for Policymakers (SPM). The structures of implicit argumentation are approached with a linguistic method based on the theoretical framework of Scandinavian Theory of Linguistic Polyphony. Consequently, the findings are discussed according to the traditions of critical discourse analysis from the point of view of the production as well as the consumption of the text. As climate change already produces insecurity and deprivation in people's lives, this paper addresses the ways language may contribute to renegotiating regimes of truth in relation to social dominance and power.

The findings indicate that implicit argumentation in the SPM provides no systematic message of encouragement for urgent social transformation to tackle climate change. Considering the quasi-scientific, quasi-political production process of the SPM, the findings are discussed in relation to ideological underpinnings and inequalities concerning access to knowledge production processes of the IPCC. On the other hand, the socially constitutive role of discourse is considered by discussing the findings in relation to consumption of the SPM by target audiences including policymakers, media and the publics. The findings of this critical analysis demonstrate the discursive practices of dominant institutional regimes of truth and how these discursive practices should be changed in order to accelerate social transformation required to tackle climate change.

From a Fisherman to a Migrant: The Devastating Impact of Saemangeum Project on Life of a Fisherman

Since 1991, the coastline of western part of Korean peninsula has been altered by one of Korean national land development projects named Saemangeum Reclamation Development Project. The project consists of mega-sized sea wall construction and land reclamation. It was seriously criticized for a lack of

economic feasibility as well as expected devastating environmental and social impacts, however, the construction has been carried out till now.

This study reveals how the project has affected people's lives, especially those who have lived in the neighboring area to construction site, through the life history research and in-depth interviews. The life history of a resident of Kyehwa-myeon in Buan-gun, the most affected area by the project, has been explored by a series of in-depth interviews.

Born in the same village where he lives now, a resident used to be a fisherman who had earned bigger money than employees of well-known companies. However, as the project had launched without any community briefing, the destroyed fishing ground forced him to change his occupation from a fisherman to a farmer. In addition, he could not avoid experiencing various conflicts with villagers and government, since he has been strongly against the project. Recently, he plans to move out of his hometown, where he has always been proud of, due to the contaminated environment, decreasing income and broken relationship with villagers.

In short, his life history vividly shows how the development project has devastated one's life in terms of occupation, human relations, attachment to hometown and trust in government. This study implies large-scale national development projects without participation and agreement of local residents whose life is depend on nature are violence disguised by development and progress.

Older Active Users' Understandings of Digitization: What the Critical Lens Can Offer

Critical internet and media scholarship has focused primarily on contributing to the theoretical debates within the field of media and communications. Very few empirical studies have applied the ideas that this theoretical lens offers. This presentation uses therefore the critical perspective in order to shed light on older active ICT users' experiences and understandings of digital technologies and digitization. The presentation – which is based on a project that uses focus group interviews with older active ICT users – aims to contribute to the literature on older ICT users which tends to be characterized by the celebratory accounts on digital technology and its impact on everyday life; accounts which critical internet and media scholars call “digital sublime” or “digital discourse”. Inspired by Boltanski's pragmatist sociology of critique and the notion that people's own take on their situation are fruitful sources of information from which projects of emancipation can be launched, this presentation uses the notions of *ideology, power and inclusion* – which are central to critical scholarship – to make sense of older active ICT users' understandings of digitization. In doing so, we explore the fruitfulness of the critical lens for studies of ICT users while bringing attention to older active ICT users' own critical capacities.

Online Disconnection and Media Refusal: Toward an Agenda for Critical Research

This paper discusses the currently existing body of research on online disconnection, also often referred to as voluntary non-use of technology or media refusal. It provides a mapping over this rapidly growing field of research based on scholarly sources across disciplines. It does so, by pointing two main logics that research on technology non-use and digital disconnection has been pursuing so far. The first one is the utility logic, where non-usage is perceived mostly as deficiency and social problem. The second one is the networked logic that emphasizes the socio-cultural significance of media refusal as a response to dominant normative discourses on connectivity. Following the latter logic, the article highlights six main rationales why research on disconnection is worth developing further. First, because it challenges the hegemonic ideas about technology, progress and the primacy of usage. Second, because it has the potential to reveal the dark aspects of online engagement, such as cyberbullying and privacy violation. Third, it points to disconnection as socially embedded and flexible over time. Fourth, research on disconnection goes beyond the rhetoric of novelty, progress, self-control and self-empowerment and fifth, by emphasizing the materiality of the digital it has the potential to address the politics of social media. Lastly, it points towards various forms of media resistance, such as digital detox, slow media movement and others.

Finally, the paper argues for an expanded critical research agenda on this topic and some directions for critically-oriented and sociologically informed research are outlined along theoretical and methodological challenges that might arise along the way.

KAO, ANDI* (*Cornell*)

Labor Law Reform in Taiwan: At the Intersection of Emancipation and Decommodification Movements

The Kuomintang (KMT) enacted sweeping pro-labor reforms to the legal framework governing labor relations in Taiwan in 2011. The revisions entered into law not only when the pro-business KMT controlled both executive and legislative bodies, but also at a time when other governments across the globe were passing anti-labor legislation and austerity measures to further erode the strength of labor relative to capital in the aftermath of the 2008 Great Recession. Legal scholars predicted the package of revisions would strengthen the Taiwanese labor movement by boosting union membership, facilitating collective bargaining, and protecting workers' rights to unionize.

Scholars have largely adopted a historical institutionalist framework to explain the passage of the reforms. According to this perspective, both major parties battled to secure key electoral support by implementing progressive revisions to Taiwan's anachronistic labor laws. Intense electoral competition after the end of martial law in 1987, in particular, created avenues for incorporating working class interests into formal political processes.

A broadly Polanyian framework, however, provides greater analytical clarity to the passage of the 2011 revisions. In this article, I argue that the KMT enacted the series of reforms to deflect worker demands to employers, undermine opposition to negotiations with the Chinese Communist Party (CCP), and substantiate the party's claim to be an equal stakeholder in democratization despite persisting anti-democratic institutions and practices associated with the party. Viewed in broader socio-historical perspective, the pro-labor 2011 reforms ironically helped to both facilitate an expanding neoliberal policy regime and subdue emancipatory demands associated with Taiwan's 'dual transition' from authoritarian state corporatism to electoral democratic neoliberalism. With a broad cross-section of social groups suspicious of cross-Strait economic negotiations, implementing reforms to decommodify labor was designed to placate and fragment political opposition while simultaneously defusing emancipatory demands and safeguarding the core tenets of neoliberalism.

Surveying Syrian Refugees in the Netherlands

The Netherlands Institute for Social Research/SCP has a longstanding tradition of conducting both qualitative and quantitative research among ethnic minorities, migrants and refugees (see for example, Dagevos & Gijsberts, 2007; Dourleijn et al 2011; Gijsberts & Dagevos, 2009; Huijnk, Gijsberts & Dagevos, 2014). As a result, it has accumulated extensive methodological knowledge and experience in conducting research among such hard-to-survey populations (e.g., Kappelhof, 2015).

In 2016, The Netherlands Institute for Social Research/SCP was asked by the Dutch ministries of Social Affairs and Employment, and Security and Justice to conduct a study among refugees –mainly from Syria– who received a (temporary) residence permit in 2015 as a result of being designated refugee status. The aim of the study is to map and monitor their socio-economic and socio-cultural integration for a period of five years as well as observe changes. This study includes the use of registry data sources, a longitudinal survey with two measurements, a survey among their children and qualitative research.

This presentation will briefly describe the design of the overall study and the definition of the target population. It will then zoom in on the survey design where we will –among other things– discuss the sample design, methodological choices (and trade-offs) concerning mode of interviewing, contact strategies, questionnaire design, questionnaire content, translation, etc. We will also give an initial assessment of the success of the survey design in achieving its intended goal to obtain a representative sample based on fieldwork results as well as discuss the next steps, such as retention methods, in this ongoing study.

Migrant women creatively intervening in policies and practices of social exclusion : A Participatory Arts and Social Research Project

Erene Kaptani, Tracey Reynolds, Umut Erel and Maggie O'Neill.

In this presentation we share research findings from our collaborative research project (<http://www.ncrm.ac.uk/research/PASAR/>) 'PASAR: Participatory Arts and Social Action in Research' which combines Playback, Forum, Physical Theatre and walking methods in order to understand the way in which three groups of racialized migrant women - i) migrant mothers ii) adolescent girls from migrant background and iii) Black migrant mothers with no recourse to public funds - creatively intervene in creating new forms of citizenship that challenge the status quo. The research team coming from feminist, migration, applied arts and PAR disciplines and practices engaged the migrant women and young girls in coproducing knowledge and interventions within academic research, policy and practice debates. The study takes place against the backdrop of current exclusionary politics of immigration to the UK that denies and undermines the rights and contributions of the migrant families to place making, social cohesion and belonging. We examine the ways in which devised theatre and walking methods create citizenship practices. By applying these PAR methods we demonstrate that the subjugated knowledge of the research participants can contest and challenge current policies and statutory practices of social exclusion. The combination of these methods used in social research also highlight that knowledge production is embodied, dialogical and performative (Kaptani & Yuval Davis, 2008; Maggie O'Neill 2017). In our presentation will share our reflections on the strengths and challenges that are part of the collaboration process with the migrant women. By doing so we aim to decolonise knowledge and propose ways of bridging the gap between academic and public debates into practices of inclusion.

Urban Poor in India: A Case Study of Kolhapur City

India is the second most populous country in the world. Of this, 467 million individuals constitute India's workforce. Among this only 7 percent engaged in the 'formal sector' is entitled to social security benefits. The coverage does not extend to the overwhelming majority (93%) of the workforce engaged in the unorganized sector. For a workforce that is so large and highly scattered, Trade unions and membership organizations have a vital role to play in social protection of workers. As per the National Sample Survey Organization (NSSO) 2009-10, the total employment in the country was of 46.5 crore comprising around 2.8 crore in the organized and the remaining 43.7 crore workers means 93% of the total workforce has been engaged in the unorganized sector. Out of these workers in the unorganized sector, there are 24.6 crore workers employed in agricultural sector, about 4.4 crore in construction work and remaining in manufacturing and service.

Therefore, the Government of India has made various acts but the coverage does not extend to the workforce of those are engaged in the unorganized sector. Though this section is so large, it is highly scattered and therefore, first step to access social security is to organize and unite them. The present scenario does not apply only to India but other developing countries also.

Therefore, this research paper focuses on 120 urban poor who are working in the unorganized sector and live under the below poverty line and consequently are living in the slum area. The existing structure of the slums in Kolhapur City indicates that there are forty declared slums and sixteen slums are unauthorized. Out of these, eight slums have been selected on cluster method and the researcher has found that, they do not any social security.

Violence Against Elder in the Middle South Asia: A Case Study of Pune, India

In India, the aged section of the population assumes greater significance since the last few decades. The growths of industry and migration to cities and immigration have deeply affected ingrained values and norms in society. In India, social prescription and codes of conduct have assigned an honored status to aged person.

The 20th century has also witnessed the widespread urbanization in the industrialized countries of Europe, North America and Japan. This trend is gradually spreading to the Third world countries too. The new industrial structure, along with the political and social value system together alters the social structure of society drastically. In the developing countries like India, rapid economic and social changes are eroding traditional status, roles as well as support structures for the old people. Every society and culture attaches different social meanings in different chronological age grades. Despite the myriad changes in the family relationships in urban areas, the Indian family system is still very resilient. There are many changes in intergenerational relationships too.

In this paper the researcher has analyzed 200 aged persons who are living in Pune, Maharashtra. Pune city is marked for its educational facilities, Industry and Information and technology as well as western culture. It is also known for its versatile cultural activities like classical music, spirituality, theatre, sports and literature. These activities and job opportunities attract migrants and students from all over India and abroad.

The Researcher has found that, the number of aged person is increasing. The numbers of people living away due to work and the problems of aging widowhood are also increasing considerably. The home for aged is the last alternative. The adult group faces many problems too, and their needs must also be understood in financial and social terms.

Women and Domestic Violence in India: Sociological Perspective.

Violence against women and girls is very high in the present world. Any kind of violence is a violation of their human rights which often causes due to their lack of protest and easy submission in and out of the house. Many researchers have found that, in Indian culture, since the very early periods, women as a group have been dominated by men. Their status in the family and society has been low. Everett Jana Matson has identified five specific factors responsible for the low status of women in India, which are Hindu religion, caste system, joint family system, Islamic rule and British colonialism. The values of Hinduism held that males were superior to females and this practice is still continued.

The main problem is that, the importance of the domestic work has been totally ignored in our society. Domestic violence is behavioral problem which is related to the emotional, psychological and physical aspects. It is observed that, a person who is in an intimate relationship tends to control the other on the bases of gender. India has a long social tradition of having male dominance over women. In the context to the dominant family structure, it becomes a system in the household wherein the father dominates the whole family. Domestic violence includes harassment maltreatment, cruelty and even the threat at assault intimidation.

This study focuses on gender based disparity in family relationship especially, the dominance overpowered by man. The researcher has selected the cases of domestic violence in the court of Sangli district and total sample size is 50 and the researcher has used purposive sample method and analyzed the cases from the legal and sociological perspectives.

KARADEMIR-HAZIR, IRMAK* (Oxford Brookes University)

Cultures of Child-Feeding: Parenthood and Foodwork in Families with Diverse Resources

With the rise of neoliberal health discourses around 'foodwork', parenthood and responsibility (Bell et.al 2009, McNaughton 2011), there has been a growth in the academic and popular literature aiming to 'solve the problem' of 'unhealthy' feeding by developing 'effective parental interventions for child obesity prevention' (Carnell et.al 2011, p.666). These studies identify parental 'feeding styles' and motivations (i.e. Hughes et.al 2005, Cardel et.al 2012) and quantitatively question how they relate to socioeconomic status, yet currently little is known about how feeding is understood and practices negotiated in families with different resources. To unpack differences in practices and understandings around 'proper' feeding, this research will draw on theories of practice (Warde 2005, Halkier et.al 2011), class (Bourdieu 1984), and parenthood (Miller 2005, 2010) and use the data collected as a part of author's ongoing ethnographic and longitudinal project on pre-school (1-4 yo) children's feeding. Feeding will be interpreted broadly as comprising a series of daily processes involving different family members and including parents' emotional and domestic management of their children's eating (Wright 2015). This more nuanced approach is achieved by using a technique of 'go along interviews', where daily practices -including shopping, cooking, feeding and eating- are shared with parents in the home and beyond. Findings will demonstrate how parental responses are shaped and routines are established -as well as 'lived'- in the context of varying levels of cultural and economic capital and broader health and parenting discourses.

Subversive Gaming, Protocol and Ideology: Reading Hayles, Galloway and Bakhtin

Digital games are cybernetic systems *par excellence*, since they involve feedback loops between human and non-human components. During these feedback loops, a process of continuous access and modification of signifiers by the player is accompanied by transcoding of chains of information in the machine memory, typically inaccessible to the operator. This constitutes a semiotic/informatic phenomenon specific to digital media, which N. Katherine Hayles calls *flickering signifiers*.

This paper argues that this phenomenon is ideological in two aspects: Firstly, as Mikhail Bakhtin (V. N. Vološinov) argues, physical bodies become ideological products when they acquire meanings and thus become signs. This can be expanded to include information: Although, according to Hayles, information is a

pattern utterly without meaning and context, informatic objects become meaningful, and thus ideological, when they are displayed to the operator as signifiers. Secondly, the transcoding between information and signs within the machine is governed by algorithms which ultimately control and limit the human operator's access and interaction, forming the second ideological aspect of digital media and gaming. It follows that, subversive gaming practices include not only the deconstruction of the meaningful/ideological content of games, but also transgressions of the protocols by which this meaningful content is made available to the user.

The aim of this paper is to explore subversive digital gaming practices by offering a reading of Hayles's *semiotics of virtuality* and Alexander R. Galloway's concepts of *gamic act* and *Protocol* in the light of Mikhail Bakhtin's elaboration of signs and ideology. In the scope of this paper, the notion of subversiveness is taken as subversion of ideology, and ideology's relation to semiotics and informatics is formulated drawing from Bakhtin's views on the ideological character of signs and Galloway's concept of Protocol as a mode of control in decentralized societies.

Building Resilience: Learning from the Court Cases Related to Regeneration Schemes in London and Istanbul

This paper addresses the place of courts in providing a contestation over regeneration schemes that result in dispossession of homes and jobs in London and in Istanbul, and their potential in reconfiguring resilience through the participation of the civil society. While the instrumentality of law in underpinning the legal framework for the formulation of policies ultimately structuring and planning the built environment has been widely acknowledged (Newman/Thurnley 2002), its impact as a channel to challenge spatial decisions made by authorities has been gaining special prominence (Sheppard et al 2017). This is also highlighted by a globally shared assumption that indicates a universal "judicialisation of politics", since an intensifying recourse to judicial remedies is undertaken by those who are excluded from the politics of spatial arrangements (Bahn 2016, Sheppard et al 2017). While the political economy literature explores this exclusion related to the increasing non-transparent practices accompanied with the financialisation of cities, learning from spatial conflicts that found their way in court could shed light on the strategic use of knowledge and information in the legal form by various actors, which might substantiate the claim for public interest and therefore resilience (Holston 2007, Valverde 2003). In that vein, the paper will observe court cases related to regenerations that have been taking place in Mecidiyeköy, Istanbul and Vauxhall Nine-Elms, London, in the hope to offer a different but crucial perspective that might contribute to wider debates on how spatial justice can be established. Paying attention to the different configuration of actors in the legal setting and different administrative and legal systems, the paper aims to elucidate a shared spatiality of the urban (uneven development represented in the legal arena), as an effort motivated by the latest theoretical and methodological works pursuing the aim of making urban studies "more global" (Robinson 2015).

MATTHEWS, JACOB* (Paris 8)

Platform Activists: Competing or Reiterating Dominant Social, Cultural Forms and Material Relations of Production?

This research focuses on "commons", "collaborative", and "sharing" platforms and asks whether by introducing new ideological-material productions, they are competing or reiterating dominant economic social forms and material relations of production. For the relation between the material and the ideological realms Garnham (1979) uses a 3-level declension a. material relations of production, b. social forms of these relations of production (as in the capitalist "economic" form of waged labour and, c. cultural forms of these relations of production. This type of analysis examines intermediation platforms as producers of material relations of production, social forms, and cultural (ideological) forms. In particular, it interrogates how digital intermediation platforms are positioned in relation to (and feed into) the discourses of the "commons" and the "collaborative economy". Here, we are discussing Garnham's hypothesis that the more autonomous a cultural form is with regard to the social form and the relations of production themselves, the less effective it is (either for opposing them or for re-enforcing them). In other words, we are approaching the problem of the low effectivity of many oppositional cultural products and discourses and the stronger effectivity of discourses that "cling" to the social forms of capitalist exploitation and the material relations of production that these are based upon. Empirically, we draw from fieldwork research carried out between 2015 and 2017 in Barcelona, Paris and Berlin, with over thirty players from varied institutional settings, from platforms representatives (such as Uber, Airbnb and crowdfunding sites), sharing economy watchdogs, to platform cooperativists, public players, commons-oriented alternative governance groups, as well as digital activists and artists.

KÄRGEL, KATHARINA* (Goethe University Frankfurt)

Is Destructive Obedience a Matter of Social Identity? an Empirical Investigation of Professional Identification Being a Predictor of Destructive Obedience at the Workplace

Milgram's obedience studies (Milgram, 1963) are usually understood as demonstrating people's willingness to perpetrate atrocities on authoritarian order (e.g. Zimbardo, 1999). In recent years, however, a new stream of research is growing, that takes on a social identity perspective on social influence. Therefore, obedience is expected to depend on the extent to which individuals identify themselves with the parties confronting them, i.e. the authority, ingroup, and outgroup (e.g. Reicher, Haslam & Smith, 2012).

The present study expanded on this viewpoint by applying the social identity model of deindividuation effects (Reicher, 1987). Thus, it was suggested that obedient behavior at the workplace can be explained by social identification processes promoted by deindividuation manipulations. Focusing on destructive obedience [1] it was assumed that uniformed employees are more likely to follow such commands than non-uniformed employees.

The conducted partly participatory mixed methods research design includes semi-structured interviews as well as an experimental role play conducted within the Swiss Armed Forces, a German university hospital, a German correctional facility and the police force of one German federal state.

Summing up, an interdependence of social identity and obedience at the workplace was uncovered. Besides, according to the theoretical framework, being uniformed proved to strengthen the degree of professional identification as well as organizational identification. Nevertheless, the role of the uniform differed between the four organizations, indicating that the process of social identification is determined by factors specific for the respective organization.

Against the background of a majority of participants reporting an unquestionable willingness to follow destructive commands at the workplace, the high topicality of obedience studies is shown.

[1] Destructive obedience is defined as following an order that is either illegal or falls into a regulatory grey area or causes moral scruples.

KÄRGEL, KATHARINA* (Goethe University Frankfurt)

Organizations' Alleged Fear of Being Publicly Blamed for Sensitive Issues – an Insurmountable Challenge? a Critical Reflection Exemplified By the Investigation of Destructive Obedience in Public Institutions

Destructive obedience [1] in organizational settings is a sensitive issue, often attracting media attention and public interest, especially if tabooed and moral values are at stake. In general, research on sensitive issues posing a risk for an organization's or individual's reputation is challenging with regard to field access and productive long-term research cooperations. Thus, this contribution discusses one of the causes for this, namely organizations' alleged fear of being publicly blamed.

The illustrating research project aimed at uncovering whether social identity is a predictor of destructive obedience in organizations by conducting semi-structured interviews and an experimental role-play within public corporations and agencies in Germany.

Despite the successful agreement on the research cooperation, the research project was steadily doomed to failure. The reason for that was a continuous subtext of an alleged fear of being publicly blamed which, among other things, came up by negotiating the existence of both destructive orders and blind obedience, often referring to the end of Nazi Germany.

Subsequently, the research process was subject to strict organizational governance, causing a series of problems. Interview partners have, for example, been directed to draw a positive image of their organization and to negotiate the existence of rigid hierarchies. Further, the access to interview partners was limited to a very small number of carefully chosen employees and research ethics were almost disregarded. In order to remedy the challenges that occurred, the methodological approach was extended by participatory research methods. The adequacy of this solution will be discussed just as alternative approaches and further (unforeseen) challenges.

The outlined field experience calls for strategies encouraging the collaboration of research and practice.

[1] Destructive obedience is defined as following an order that is either illegal or falls into a regulatory grey area or causes moral scruples.

Indigenous Peoples' Wage Labour and Engagement in the Canadian Labour Movement

Critical scholarship about Indigenous peoples' social movements in Canada tends to focus on the colonial-state denial of Indigenous rights to traditional lands, water and natural resources. However, little is known about Indigenous peoples who have performed wage labour and their engagement in labour movements. Many scholars assume that Indigenous peoples were irrelevant to the development of Canada's emergent industrial economy after the fur trade, but thousands of Indigenous men, women, and children, turned to wage labour when they were faced with land dispossession. In the West Coast, for example, Indigenous peoples worked in virtually every commercial resource industry as wage labourers, or as independent owner-operators. This presentation will focus on the crucial role of Indigenous wage labour in Canada's economic development, and Indigenous workers' activism through unions and Indigenous-led organizations, such as the Native Brotherhood of B.C. I will also bring attention to challenges in the Canadian labour movement regarding the racist constructions of Indigenous peoples as "primitive" and "lazy", the positioning of Indigenous cultures as incompatible with industrial labour (despite the evidence of Indigenous workers' widespread labour participation), the belief that Indigenous concerns remain separate from, and less important than, non-Indigenous workers' struggles, and industrial development and employment conflicts involving contemporary Indigenous land claims.

The Fight for \$15 and Fairness and Push Back Against Right-Wing Populism

Workers in Ontario have experienced decades of austerity measures designed to promote "flexibility" and competitiveness, and to reduce government expenditures and redesign labour laws and policies. But after two years of organizing in the Fight for \$15 and Fairness, a campaign to raise the provincial minimum wage to \$15 an hour and demand better work conditions, the Ontario Liberal Party made a promise to enact the \$15 minimum wage and progressive labour law reform. This campaign, along with the preceding Fight for \$15 movement in the U.S., has renewed the struggle for decent work by raising class demands and uniting workers across sectors in a manner unprecedented in recent decades. Of key importance in the Fight for \$15 and Fairness was the campaign's response to Ontario's business lobby and right-wing groups. These groups flooded mainstream media with false claims that raising the minimum wage will result in increased inflation, catastrophic job loss, automation, and growing debt. On the ground, immigrant workers and workers of colour have not only challenged these economic discourses but also intersecting issues of racism, xenophobia and Islamophobia that they experience in their workplaces and communities. This presentation will give an overview of past and current minimum wage campaigns in Ontario strategically aimed at building workers' confidence to overcome right-wing populist discourses justifying low-wage work and perpetuating racism.

Multiculturalism, Anti-Racism and Neighbourhood Ecology in Canada

The rising tide of revanchist nationalism—buoyed by a fear that the hallowed walls of civilization will collapse under the weight of unfettered diversity—has served as an endogenous shock to political systems the world-over. Yet, while anti-immigrant sentiment has surged in most industrial nations, it is comparatively rare in Canada; indeed, 82% of Canadians believe that immigrants benefit the economy, and 54% view multiculturalism as an important cultural symbol (Enviro-nics Institute, 2015). Given the popularity of multiculturalism, relative absence of far-right radicalism (since the dissolution of the Reform Party of Canada), and a sizeable foreign-born population, it's worth wondering if *multiculturalism*—independent of other explanatory factors—functions as a bulwark against anti-immigrant sentiment in Canada; if it does, we must consider why racial disparities (see Cardozo & Pendakur, 2008) continue to persist in the country, and if *pro-immigrant attitudes* and *anti-racism* are necessarily commensurable. Finally, we must incorporate spatial considerations into our analysis, and weigh whether the effects of multiculturalism are distributed evenly across Canada, or if they're only appreciable in ethnically diverse neighbourhoods. To answer these questions, we will a) use a nationally-representative data set—*The Enviro-nics Institute's* 2015 Survey on Immigration and Multiculturalism—to clarify the links between Canada's multicultural policy regime, pro-immigrant attitudes and anti-racism; and b) calculate neighbourhood-level ethnic fractionalization measures to see how demographic or ecological factors condition the extent to which multiculturalism bears down on individuals' ideologies.

Organizing Social Movements – the Cases of Women's Umbrellas in Poland and Sweden

In relation to EU accession, both the Swedish and Polish women's movements saw the emergence of a new type of organization in the field: the *Swedish Women's Lobby* (SWL) and the *Polish Women's Lobby* (PWL). These two meta-organizations were set up in order for the movement to have a voice and membership in the Brussels-based, professional NGO the *European Women's Lobby*. However, even though SWL and PWL are supposed to be each other's equivalents, in the sense of being national umbrellas for women's organizations and a link to the European level, their stories of emergence and subsequent development differ considerably. Whereas one has established itself as an influential formal organization, the other is at the very moment going through its third attempt at formation. Both cases show important similarities in struggles characteristic of meta-organizations, as the issues of power, identity, and autonomy are prevalent. Embedded in different national opportunity structures, however, the SWL and PWL show how the meta-organizational form is more suitable in some contexts than in others. The aim of this paper is thus to explore the development and impact of meta-organizing in a social movement field through a comparison of two similar attempts at organization in two very different and specific movement contexts. Other interesting aspects such as the role of external actors (the state, international donors) will be considered. There is also an ambition to contribute to the integration of organization theory and social movement research.

Dysconscious Ableism: De-Linking Elementary Curriculum from the Colonizing Forces of Ableism

The "miseducation of teachers" suggests King (p.133, 1991) contributes to the persistent perpetuation of "dysconscious racism". According to King "dysconsciousness is an uncritical habit of mind... that justifies inequity and exploitation by accepting the existing order of things as given" that has a profound impact on the relationships amongst students and teachers (p.135, 1991). The purpose of my paper is to explore the ways "dysconscious racism" and "dysconscious" ableism are inextricably linked and mutually supportive of sustaining colonialism. This paper will apply the work of decolonial thinkers such as Mignolo (2000, 2011) as well as indigenous scholars such as Million (2013) along with scholars in critical disabilities studies such as Goodley (2007, 2013, 2014) to assessment and evaluation guidelines that persist in sustaining a hierarchy of what counts as human through the implementation 'best practices' in childhood pedagogy. I conduct this analysis in order to reveal how our education system remains rooted in a colonialism that impacts our youngest learners through process of exclusion and/or conditional inclusion. Further, I consider how both the study of dysconscious racism and ableism offer fruitful possibilities to mutually contribute to a re-imagining of what might be possible in a reconfiguring of the current educational landscape. In these ways my paper demonstrates the import of "delinking" from the "colonial matrix of power" (Mignollo, p.8-9, 2011) through a framework that includes disability studies; and avoids the trap of perpetuating ableism along with exclusionary hierarchies sustained in the power imbalances within our relationships to each other.

KARNAD-JANI, RASHMEE* (University of Toronto)

Silent Voices: "South Asian" Mothers and Transition to High School

This paper, a decolonizing institutional ethnography, brings to light the mothering work done by "South Asian" women for their children's transition to high school within the GTA (Greater Toronto Area) in the province of Ontario. Seven South Asian mothers participated in my Master's research in 2013 and spoke in their heritage languages about the various tasks in which they engaged for their children's transition to high school. The data and recommendations reflect their standpoints, and lived experiences of being immersed in the problematic of the everyday world in which they do their mothering work that is subsumed under the umbrella of parent engagement within the province of Ontario.

My research brings forward the voices of South Asian mothers whose aspirations and ways of knowing about their children's educational pathways to and through high school are largely marginalized in the mainstream educational discourse within the GTA. I posit that the mothering work of South Asian women is undervalued and goes largely unacknowledged. I incorporate Vijay Agnew's explication of the racialized naming of women as South Asian, and Dorothy Smith's explanation of SNAF as an ideological code while analyzing the data. I also incorporate Himani Bannerji's question "Who Speaks For Us?" as I situate myself within my blended standpoint as a mother, Ontario Certified Teacher, and "South Asian" researcher. I make practical recommendations to support high school transition work that is expected of families, especially mothers.

This paper aims to help policy actors and researchers develop a deeper understanding of the ways in which specific print and digital texts of Ontario's Ministry of Education coordinate the work processes of parents, especially South Asian mothers. This paper is the foundation for my current Ph.D research where I am interested in the intersections of mothering work and teachers' labour in the GTA.

KARPINSKI, VIKTOR* (*Criminological Research Institute of Lower Saxony, Hannover*)

The Thin Line Where Tackling Organised Crime Ends and Discrimination of Deviant Subcultures Begins

This presentation concerns so-called Outlaw Motorcycle Gangs (OMCGs), which are supposed to have a major share in Organised Crime for their participation in drug traffic, human trafficking, sexual exploitation and violent crime. It presents how states address this cross-border crime by conjoint measures. Most recently the European Union set up an innovative kind of regulatory and punitive measures which allows to circumvent the trial court and thus the presumption of innocence. Being dependent on arbitrary decision based on sole discretion the envisaged measures may be used in a twofold way: in order to prevent dangers for public order or being misused in order to discriminate an unpleasant subculture. Due to non-compliance to the overall society's values the Bikers' subculture becomes stigmatised by authorities while not every Biker is criminal. One has to differentiate even in this setting which seems to be strongly adherent to violence and crime due to its norms and values based on a specific image of masculinity, honour and hierarchy. That's why discretionary power is a thin line between preventing criminal associations from (mis-)use of legal assets and harassing a disaffectionate subculture when employing these so-called "Administrative Measures" without a judicial process proving the perpetrator's guilt.

Focusing on the point, where power, violence and justice converge the responsible political agenda setters, their operating principles and the aims of their policies shall be identified. A review of the UE's methods and their outcomes should be presented as well as critical reflection on the undersized evaluation period: scheduled too narrow to the policy's implementation, it precludes taking into account the time-delay of problems which are yet to come.

Since the potential punishment depends on an individual's assessment being non-transparent, vaguely defined by legal acts, barely reproducible and thus being vulnerable to appeal and contestation, differentiation remains of key importance.

WYSIENSKA-DI CARLO, KINGA (*Institute of Philosophy and Sociology at the Polish Academy of Sciences*)

Gender Pay Gaps, Cost of Motherhood, and Evaluations of Just Earnings: The Case of Poland

The gender wage gap in Poland is among the lowest in OECD countries, and existing analyses show that the gap has not changed substantially over time. This may suggest that neither legislative changes in antidiscrimination protections for women nor trends in economic growth have much effect on gender inequalities in Poland. We propose that the stability in estimates of the adjusted gender wage gap may be related to parenthood status (motherhood penalties and fatherhood premia) rather than simply gender. Using nationally representative panel survey data from Poland (POLPAN), which cover the period from 1988-2013, we estimate fixed effect models to account for the effects of changes in family status on wages. Our results show that, for both men and women, having children has a positive effect on wages. We observed, however, a significant and negative interaction between weekly working hours and the number of children. That is, women working shorter hours actually benefit from having a child, but for women working longer hours an additional child has an adverse effect (after controlling for human capital and job related characteristics). We interpret those results in the context of double-standards theory. To complement our analysis, we also provide results of a multi-factorial design study of just earnings conducted in 2017 on a representative sample of Polish respondents currently in the labor force. This study, which yielded almost 38,000 observations, confirms the hypothesis that mothers are perceived as less deserving than non-mothers, especially in high status jobs.

Shifting Identities of Young People on the Arabic Peninsula: The Example of Kuwait

Identities of young people on the Arabic peninsula have never been tied exclusively to the comparatively young nation states of the region: tribes, sects, religions and families have played and continue to play instrumental roles in defining identity and are now partly complemented, partly challenged by transnational mobility and digital arenas. A series of independent youth surveys across the region, initiated in 2017 and set to continue until 2020, explores how senses of belonging of young people are shifting on the peninsula. It is the first time that young people are surveyed independently in the region, bringing the voice of young people to policy and research.

The first of these youth surveys in the region was conducted in Kuwait, surveying more than 5,000 young people in the first half of 2017 and discussing key findings with more than 500 young people in focus groups in the second half of 2017. This contribution will use the quantitative and qualitative data from the survey and focus groups to explore how young people's layers of identity and senses of belonging are changing in Kuwait, and which new forms of youth activism and participation are emerging in response to and reflecting these changes in the country.

The Politics of Poetry on the Arabic Peninsula

While responses to the Arab Spring differed across the Arabic Peninsula, the hereditary regimes of the region did their best to ensure that protest were stalled in the moment rather than become a movement. 7 years on, young people's impatience with the status quo and desire for — not necessarily revolutionary — change becomes palpable once more, in particular through music and poetry.

This contribution will present and explore anonymised examples of songs and poems of young people across the region, showcasing how criticism and activism are being expressed in music and poetry. The examples were collected offline at a mixture of underground and public poetry slams and concerts across the peninsula by the authors, who are based in the region for a series of independent youth surveys, and online on the regionally leading social media platforms, Instagram and Snapchat.

The Risk Factors of Attrition Among Estonian Conscripts

Conscription has been abolished in many countries; however, changes in the security environment and recruitment needs have brought the question of conscripts back on to the table. Conscription has its pros and cons from different perspectives – societal and individual. An indicator of the effectiveness of conscription is the attrition rate during the service period. Based on data from an Estonian Conscript Surveys (I and II), we estimate the risk of attrition among draftees during the service (8 or 11 months). The surveys were carried out in 2016-2017 and 2017-2018 among conscripts who were drafted during this time period. The first survey had three waves: in the beginning of service, in the fifth month of service, and at the end of service. The second survey had two waves: in the beginning of service and at the end of service. We apply multivariate survival analysis (Cox proportional hazards regression) to estimate the effect of sociodemographic characteristics, attitudes and experiences during the service on attrition. Although the official reasons for being discharged from service are related to health problems, our analysis shows that there is a range of other contributing factors. Conscript attrition is also related to attitudes and the conscript's degree of military readiness.

Particularly Vulnerable Tribal Groups and Affirmative Action Policies of the State

India is a home to the number of tribal communities and Particularly Vulnerable Tribal Groups (PVTGs) are one among them. Post-colonial state has initiated number of development programmes as part of the affirmative action for the benefit and upliftment of the Particularly Vulnerable Tribal Groups (PVTGs) in India. Further, Government has set up a committee and asked the committee to study about their social, economic and political conditions. Further, there are numerous studies on the living conditions of the PVTGs and in order to have a holistic understanding of their livelihoods, an empirical study was conducted among the Particularly Vulnerable Tribal Groups (PVTGs) of Central India. The study largely depends on primary data gathered from an ethnographic fieldwork. The secondary data is collected from the published sources of books, journals, documents of the state and central governments and unpublished sources.

The study also discusses the development initiatives of the postcolonial state in order to ameliorate the conditions of the marginal communities as part of their affirmative action policies. In the paper, an attempt is also made to look at the existing programs in the study area. Further, how far these programmes are helping to ameliorate the conditions of Particularly Vulnerable Tribal Groups (PVTGs) in the study area and lastly to know how far these programmes are sustainable in the life of PVTGs.

From the Distant Crusades to 'local' 'Islamic Terrorism' – from European Civilizing Processes to a Contemporary Western De-Civilizing Process?

From the distant Crusades to 'local' 'Islamic terrorism' – from European civilizing processes to a contemporary Western de-civilizing process?

This paper takes as its point of departure a number of wars fought in the Middle East and Eastern European countries, far away from most of the European survival units in the 11th/12th centuries. Our argument is that distant wars fought at the frontiers of 'Europe' in the 11th/12th centuries, often named as the Crusades, were perceived as crucial to the development of the European civilizing process and its later consolidation by the defeat of the Ottomans in front of Vienna in 1683.

From the early 16th century until the peace of Westphalia war is fought within and between the European survival units partly due to the great power rivalry between France and the Habsburgs and partly due to a set of religious wars between Catholics and Protestants. This dual set of conflicting relations created a specific set of conditions for the development of European civilizing processes: the external 'Islamic' threat contributed to a European civilizing process in which Christianity became an important force, an aspect sometimes overlooked by Eliashian scholars. This Islamic 'threat' also functioned as a common enemy for most European survival units with some continuity from the 7th and 8th centuries to the 16th and 17th centuries and it returns in the 21st century. During this period of time, war against 'Islam' moves from being a distant war in the Middle East to an internal war ('War against terrorism') in large cities in Europe. Finally, we argue that future European civilizing processes might turn into a de-civilizing process if current European survival units do not succeed in removing the perceived 'enemy' within Europe – ironically this might be one of the significant unintended consequences of the European civilizing process.

From the Streets to the Polls: When Lebanese Activists Leave Their "Comfort Zone"

This study examines a turning point in the wave of anti-sectarian mobilizations in post-war Lebanon; a predominantly youth-led grassroots movement defying the deeply-rooted sectarian regime and aspiring towards building a more effective democracy. This paper analyses the activists' first attempt to leave their "comfort zone" and venture in the realm of conventional politics. It focuses on the efforts of "Beirut Madinati" (arabic for Beirut is my city) to channel the energy and expertise of a vibrant civil society working in parallel to a dysfunctional system since the end of the civil war (1975-1990) and make its voice heard from within, by taking back the city council. Held on May 8 2016, municipal polls were the last remnants of a functioning democracy, the presidential and parliamentary elections having both been adjourned. Born from the ashes of the summer 2015 "you stink" widespread protests against a "rotten" system unable to resolve the garbage crisis, "Beirut Madinati" sought to make the voices silenced in streets, heard in the ballot boxes.

This paper sheds the light on the movement's innovative way of blurring the lines between institutional and street politics. It reveals how the activists embarked on a different road while remaining faithful to their roots; how they engaged in electoral politics while maintaining their "alter-activism" culture. It discusses how the political victory of the movement lies far beyond the score itself; highlighting how it succeeded in disrupting the Lebanese electoral scene, challenging the old-ways and imposing a more democratic practice. Its citizen-centric and community-based approach, horizontal and leaderless structure opened spaces of dialogues and reconnected citizens with politics. Likewise its issue driven platform challenged the traditionally "personality-based" campaign, revamped electoral practices and asserted that electoral politics can no longer be reduced to sectarian loyalties.

Conflicts for Supporters of Aid in Dying: Comparative Study Among Three States in the U.S.

In the U.S. some of the States have Aid in Dying Law. Pioneer is Oregon, where Death with Dignity Act had passed in 1997. Washington State was followed in 2008, and also in Vermont where they had passed in 2014. These three States are different from the euthanasia in Europe because of that the patients take lethal medications for themselves after physicians prescribed. Oregon and Washington States disclose the patients' data submitted by the physicians as annual reports on website. These reports say that typical patients' profile is Caucasian, high educated, suffering from cancers, and living in urban area.

The purpose of this paper is to show the conflicts for the supporters of patients who had prescribed lethal medications under this Law. The reason why to choose these three States as research targets is to pass this law before the turning point, which means that 29-years-old woman, Brittany Maynard, who had advocated for the legislation by using social media collaborating with national organization, Compassion & Choices.

Qualitative data was collected by in-depth interview on August in 2016 and 2017. Research targets are executive directors, prescribed physicians and support volunteers in these three States.

Comparative content analysis brought us some insights in terms of conflicts when they support. Firstly they had a payment conflict, which means whether the patients can apply to use state insurance in order to get lethal medication. Secondly they had conflict on physical pain, because ironically some patients had severe physical pain after taking medication. Thirdly they have philosophical conflict sandwiched between the personal value and the organization one. Forth conflict is the gap between the patients themselves and their family members, or the gap among their family members. Fifth one is that they notice spiritual conflict which is related to existential anxiety for the patients.

Arranging the Identity As "Communication Disorder"

This presentation focuses on the "communication disorder" in a unique usage among Japanese young people. They often say, for example in a case of self-introduction, "I'm *commu-sho*." *Commu-sho* is an abbreviated word from communication *shogai* and they use the word very casually. *Shogai* means a physical obstacle or a kind of barrier; it also includes disability or handicap. *Commu-sho* originally indicates real disorders: talking too much to ignore the surroundings, breaking human relations because of their irascibility. Almost all of those who call themselves as *commu-sho*, however, does not have any experiences of medical or psychiatric diagnostics. They just feel that they may be shy especially to the unfamiliar person and may have a bit difficulty on expressing their intentions. It can often be seen that Japanese young people sort out a person as a template character, for example, earnest, idiot, incompetence, healing and so on. They are typical characters in animations and games. Young people play the character in their everyday life as they are recognized and they think that the feature of the typical character is their own personal identity. Identifying as communication disorder can be seen as a version of the characterizing. Actually, *commu-sho* also often appears in many animations. In the contemporary society, the contingency of reaction in a communication is increasing so that young people try to make it simple on setting some typical characters that have already been seen in media. In other words, arranging their identity can be the reduction of complexity on a symbolic interaction. Setting templates can stabilize the reaction and the expectation of the next reaction and it can also reduce unnecessary troubles and verification processes. This simplification is valuable both to recognize the other and to identify the self and make presentations of self.

Conflict and Expertise of Volunteer Probation Officers in Their Treatment Practices As "Civilians": Focusing on the Establishment and Development Phase of Offender Rehabilitation System in Japan

In recent years, the prevention of re-offending and juvenile delinquency is regarded as one of the important issues for "establishing the safest country" in Japanese criminal justice policy. In addressing this issue, the volunteer probation officers (VPOs) who are community members are given an important role as civilians. They work with no pay and encourage probationer to rehabilitation in cooperation with probation officers who are civil-service workers and have specialized knowledge and skills for treatment of offenders. One of the characteristics of probation in Japan is that the way of treatment practices is different by every VPOs. This presentation discusses conflicts and expertise of VPOs in their treatment practices as "civilians", focusing on the treatment practices of the VPOs in the 1950s and 1960s, which is in the process of establishing and developing the offender rehabilitation system. In analysis, journal articles written about treatment practices of VPOs are examined. This journal is made for a person who are interested in offender rehabilitation and particularly VPOs are supposed to be the main readers. The journal includes such things as required knowledge, view of treatment and how to deal with difficult cases. As a result of

the analysis, it shows that the journal has become a place for accumulation of "experiences" beyond provision of "knowledge" about treatment, and it played a role as a "practical community." In addition, it can be pointed out that treatment practices tend towards one direction centralizely to respond to society's eyes to offenders and juvenile delinquents. However, on the other hand, it also reveals the diversity of treatment by VPOs, such as trying to improve the lives of the probationer with utilizing the resources available.

Livable Longevity: Remaking Survivorship in Old Age

This paper explores the relationship between biomedical life extension and the cultural field of longevity as a livable old age. As more older people are treated for health conditions that challenge the traditional limits of human life, new characterizations and expectations of surviving populations are emerging. The promise of longevity has deep historical roots in earlier 'prolongation' and 'rejuvenation' movements, as well as within science fiction and fantasy literature, and the utopian fascination with exotic centenarians. However, only in the last century between 1900 and 2000 has the dramatic increase in the human lifespan (by 30 years) invited new social interests, such as financial and insurance industries promoting 'longevity products' to avoid risks of 'outliving' assets, patient autonomy groups promoting 'advanced healthcare planning' and ethical self-determination, and retirement communities promoting lifestyles in heavenly after-life imagery. The gerontological sciences have also contributed to the popularization of longevity as a 'revolution' with its own social 'dividends.' This paper, in outlining longevity as a cultural field, draws on Judith Butler's idea of 'livability' but concludes with a critique of the prospects and problems of newly life-extended worlds; in particular, the professional reframing of 'resilience' as an ontological 'bouncing back' capacity of older people, the merging of survivorship with 'successful aging' and the ethical dilemmas of what Sharon Kaufman refers to as a medicalized 'reflexive longevity.' A recent Alzheimer's Association advertisement boasts: 'The first person to survive Alzheimer's is out there, enjoying their life, smiling, dancing and watching their family grow. The Alzheimer's Association promises to help everyone else still fighting until they find that first survivor.' Here, as with other new life-extending disease movements, the worthiness of life is relegated to a hopeful, disease-free longevity that, paradoxically, can diminish the experiences of suffering and vulnerability associated with surviving old age.

Race, Class, Gender, and Movement Vision for the Current Moment: Lessons from the League of Revolutionary Black Workers

Through a historical materialist lens we analyze the revolutionary process within the contradictions and antagonisms of global capitalism in the 21st century, focusing on the U.S. We explore lessons for today's generation of movement actors and revolutionaries rooted in decades of political practice of former members of the League of Revolutionary Black Workers (LRBW) in the Detroit auto and related plants and communities, 1968-1970, who remain engaged in revolutionary struggle. Black labor represents a concentrated expression of capitalist alienation, exploitation, and oppression. Black workers at the point of production and in their communities in the 1960s are today at the point of crisis, dispossession, and state violence. They are a conscious and powerful force within today's multiracial and multigendered transformative class struggle for humanity and the planet.

We locate this analysis and vision within the current political moment. The world is in transition and embodies an irreversible capitalist crisis, and intensifying state violence, white supremacy, patriarchy, xenophobia, ecocide, war, political polarity, and struggle from below. The 2017 Trump presidency ushered in an intensification of the polarization of wealth and poverty, "democracy" for billionaire capitalists, and developing fascism for the masses. Forces of resistance and revolution are rising up. The underlying cause of these crises is rooted in the revolutionary process of economic revolution – robots and automation, social and ecological destruction, and political revolution. The resolution calls for fundamental systemic transformation – the creation of a cooperative and egalitarian society in which all human needs are met and the earth is protected. It is urgent that conscious movement forces engage in collective study and leadership, and develop a collective vision, revolutionary consciousness and strategy.

We will share a short video (15 minutes or less) from LRBW Media & Education Project www.revolutionaryblackworkers.org

Environmental Habitus: The Intergenerational Transmission of Environmental Behaviors in Cross-National Comparison

The environmental agenda has inspired discussions on the social mechanisms through which people acquire a pro-environmental behavior. We propose a conceptual framework that is an alternative to the current emphasis on demographic and attitudinal characteristics as correlates of environmental behaviors. We propose a shift of focus to the family unit, to examine the importance of intergenerational transmission of dispositions that are favorable to pro-environmental behavior.

Our main theoretical heuristic is *environmental habitus*. It argues that a pro-environmental disposition runs in the family; if one's family holds values and behavioral dispositions of frugality, modesty, or conservation, it will have consequences for everyday pro-environmental behavior. Adoption of environmental behaviors does not take place only because people follow the imperatives of the environmental movement or government, or because they hold an environmental ideology, but it also lies in the mundane, daily practices and rituals of a family.

We examine environmental habitus comparatively, asking if it takes different forms in three different national contexts – *Israel, the United States, and South Korea*. These countries are characterized by different cultural and economic contexts, different framings of environmental issues, and different economic and historical trajectories. Our analysis is based on two original data sources: group interviews of family triads (grandparents, parents, children), and nationally-representative surveys of family dyads (parents and children).

This presentation discusses preliminary findings on the areas in which environmental concern is manifested (food, product reuse, healthy lifestyle, energy saving); habitus transmission mechanisms (idioms, mimicking nonverbal behavior, family routines, verbal discussions, limiting access); and motivation mechanisms (ideology, convenience, cost, citizenship, respect for family, routine practices). These findings shed light on the comparative differences and similarities in environmental habitus within families and across nations, and its impact on pro-environmental behaviors and motivations.

Situated Cultural Cosmopolitanism between East and West

Contemporary cultural cosmopolitanism is closely linked to the global spread of cultural genres, ideas, and products, facilitating the adoption of openness to a diversity of ideas and experiences. The consumption of culturally diverse genres, ideas, and products is particularly prevalent among and interesting to young people, who tend to be more mobile, influenced by mass media, and exposed to global trends in fashion, food, and culture.

Analysis of cultural cosmopolitanism often fails to recognize the social conditions of its own construction, presenting it as free from social belonging rather than as a special sort of belonging. Strong attachments to national, religious, or community-based solidarities may create varieties of cosmopolitanism. The interest in such cosmopolitanism, which is an amalgam of contradictions, stems from the central role that cosmopolitanism, as a form of competency in culture and consumption, plays in contemporary society especially among young adults, in shaping inequality and various forms of attainment.

In this presentation, we discuss cultural cosmopolitan dispositions and practices among young adults who have different forms and degrees of attachment to local and global cultures and occupy different positions in the social structure. Empirical evidence is drawn from 60 interviews conducted with young adults in Seoul in 2016 and 2017.

In the presentation of findings, we emphasize new evidence in a field that tends to focus on Western societies; we explore perceptions of the "other" and motivations for engaging with other among young Koreans; we outline the way our research can advance theories of cultural cosmopolitanism by extending the analysis to non-Western and traditional societies; and we identify the antecedents of cosmopolitanism and offer a typology of motivations to engage in cultural cosmopolitanism.

KAUR, AMARPREET* (University of Cambridge)

A Theoretical Analysis of How and Why British Citizens May Feel Forced to Access Transnational Care to Fulfil Their Reproductive Desires in Relation to Genetic Editing

As advances in genetic editing on human embryos continue to develop, British citizens with genetic diseases are among those patiently waiting for their reproductive choices to be extended. According to Plows (2011) there are approximately 10,000 monogenic diseases, around 4,000 - 6,000 of which can be diagnosed. Theoretically, such figures suggest that just as many genetic diseases could be edited out of the human germ line as research continues to progress. However, whilst other countries have been fairly proactive in providing genetic testing and diagnoses, the British National Health Service continues to function in a reserved and limited capacity. Marica Inhorn's insightful research details how 'ReproTravel', i.e. transnational healthcare in the field of assisted reproduction, persists in flourishing. Whilst ReproTravel may sound exotic, the 'necessity' in many instances has emerged from individuals/couples trying to legally fulfil their reproductive 'rights' and desires in an affordable manner. Thus, in light of genetic editing and the confines of British legislation, there is a strong possibility British citizens may essentially be forced to access transnational healthcare if they wish to pursue creating a genetically related child without the fear of transmitting a hereditary disease. My paper draws upon my own research and my analysis of the global positioning of genetic editing on human embryos to explore, share, and discuss reasoning and motivation behind Britain's reluctance to enable its citizens to have a greater range of reproductive choice and power.

KAUR, AMARPREET* (University of Cambridge)

Britain's Stance on the Genetic Editing of Human Embryos and Its Potential to Inhibit and/or Exacerbate Disparities in Inequalities Surrounding Assisted Reproduction

Disease and disability can be argued to remain at the root of many social inequalities (Shakespeare, 2013). Biotechnologies such as Preimplantation Genetic Diagnosis, alongside prenatal diagnostic testing have been repeatedly contended to assist in aiming to alleviate the potential for humans to be born with preventable genetic conditions, most especially those which have been proven to be highly debilitating (Franklin and Roberts, 2006; HFEA, 2017). Whilst such diagnostic tests have been revolutionary in assisting reproductive choices, they have remained fairly bespoke to access in Britain, particularly to individuals/couples who are not economically wealthy. Within the current confines of available assistive reproductive technologies in Britain, my research suggests that disparities and inequalities surrounding access to biotechnologies in relation to reproduction are unlikely to diminish. However, as transformative technologies such as genetic editing continue to develop globally, the possibility of greater initiatives to bridge such disparities may be forced to emerge. My research indicates that a far greater and more unified appreciation of assistive reproductive technologies may materialise with the hypothetical introduction of genetic editing to reproductive choices. Thus, in response to prophesised societal pressures, a highly plausible future in which access to genetic editing is desired and fought for may initiate a demand for more equalised access to assistive reproductive technologies. In this context, my paper draws upon my own research to discuss the potential genetic editing could have on inhibiting and/or exacerbating inequalities in accessing technologies which could transform the lives of individuals/couples living with a genetic condition in Britain.

Interdimensional Analysis of Social Disability: A Study of Backward Communities in Haryana, India

This paper will explore the nature of social disability and its multiple dimensions- economic, cultural and socio-ecological amongst backward communities- *Rai Sikh, Nayak, and Banjara*. The traditional occupation of the *Banjara community* was trading and supply of goods, whereas that of *Nayaks* and *Rai Sikhs* was hunting. According to anthropological and sociological studies, they are identified as tribes and nomadic communities, without home and hearth, pose a threat to society. They were declared as criminals by the Criminal Tribes Act, 1871 and as *Vimukt Jatis* (denotified tribes) in 1952. The respondents for this study have been selected from the aforementioned communities from different districts of Haryana, India.

The concept of social disability is measured in terms of subjective perception to ascertain marginalisation and deprivation with an economic, cultural, and socio-ecological context. Economic disability is conceptualized in a Marxian term, whereas, cultural disability falls under Oscar Lewis' concept of "Culture of Poverty", and socio-ecological disability in terms of stresses and strains experienced in inter-community interaction. A separate scale for each dimension and a composite scale of social disability are constructed by adopting interdimensional analysis. The *Banjara* perceived high economic disability because of their entry into trade and business. It has been noted that almost an equal number of respondents with high and low level of economic disability experience a high degree of cultural and socio-ecological disability. This is indicative of the fact that irrespective of one's economic disability, their cultural and socio-ecological disability remained high. *Nayaks* are believed to have experienced a high degree of socio-ecological disability in intercommunity interaction, especially in their relations with higher castes.

Intergenerational conflict is experienced between parents/elders, who wish to preserve their cultural values, whereas the younger generations tend to show resistance because of their mutation to the global world.

WG01-938.3

KAUR, KIRANPREET* (Panjab University)

The Social Mobility of Dhobis in Haryana, India

The traditional Indian society has been stratified via the dominant institution of caste hierarchy based on the principle of *purity and pollution*. The traditional occupation of *Dhobis* was washing and ironing of clothes; falling under the 'serving caste'. They were placed on the lower spectrum of the caste hierarchy and were categorized as untouchables and outcasts. The Government of India adopted legal measures to abolish untouchability and granted privileges to the 'untouchable castes' under the policy of 'Protective Discrimination', which was not made available to the *Dhobis* in Haryana. Their counterparts in other states of the India had access to the above mentioned policy. This paper will examine social mobility in terms of inter and intragenerational mobility among *Dhobis* in different districts of Haryana.

Mobility is measured in terms of occupation as it is considered an appropriate measure of status and prestige. In the case of intragenerational mobility, the past and present occupations of the respondents are compared, whereas, in the case of intergenerational mobility, the occupation of the son is compared with that of his father. In the context of this study, occupations of children (sons and daughters) are compared with both parents. The findings of this study show that less than five per cent have gained upward mobility by establishing dry-cleaning shops. However, more than half of them are continuing with their traditional occupation, and one third have substituted it with labor and other petty jobs. Unable to make ends meet they remain partially involved in their traditional occupation with the assistance of women, who demand autonomy for their entry into the external world of work which has been resisted by men. Hardly anyone has acknowledged to have experienced untouchability, but they continue to face economic hardship, and are victims of discrimination, deprivation and humiliation.

KAUR, MANJINDER* (Department of Sociology)

Gender Marginalization and Gender Discrimination in Punjab, India: The Study of Son Preference and Lower Status of Girl Child in Two Villages

Gender marginalization is by now an accepted theoretical concern and enough empirical evidence is available to substantiate a strong presence of gender discrimination, oppression and subordination in all societies, whether developed, developing or the underdeveloped. The status of women in a society is a significant reflection of the level of social justice in that society. A girl is disadvantaged from the time she is born. In most developing and under-developed countries today, the girl child has a lower status and enjoys fewer of the rights, opportunities and benefits of childhood than the boy child who has first call on family and community resources. The situation of the girl child results commonly from prejudices rooted in culture and customs. The birth of a daughter is unwelcome. Marked preference for sons has led to the neglect of the girl child. Improvements in literacy, fertility rate and greater workforce participation of women have not significantly improved the lot of the girl child. The purpose of this study is to compare and understand variations in status of girl child in the Punjabi family. The paper is based on primary data collected through interview schedule method from total 50 respondents out of which 25 respondents from Fatehpur village in Rupnagar district of Punjab and remaining 25 respondents from Badheri village in Chandigarh respectively. The paper likes to highlight that despite efforts by the government for equality between both the sexes in terms of health, nutrition, employment, education etc. there has not been significant change in the status of girl child. The patriarchal values are so culturally deep rooted in the minds of the people that they always give preference to male child and female child is still unwanted and has to be eliminated through abortions.

Abstract on Improving Livelihoods of a Vulnerable Community through SHGs – Lessons from the Mewat Region of Haryana State.

Poverty alleviation in rural areas has always been a daunting task. Government agencies undertaking this task have often met with modest success. In contrast, the Grameen Bank initiatives in Bangladesh have been a path-breaking success. Adopting the Grameen Bank framework, Self Help Groups were made in the Mewat Region of Haryana (India) in 1997 onwards under an IFAD Initiative. On getting the IFAD Project for the Mewat Region, a detailed Baseline Socio-economic

Survey was carried out during 1995-1996. The SHGs were formed as part of social development component of the Project to empower the rural women. As such substantive field data is available. The present paper takes into account this field data as well as Focus group discussions and interviews with opinion leaders. The Research paper presents the findings of the mid-term evaluation and the post assessment of the Project. The paper also presents the relationship between various socio-economic variables and the improvements in the livelihoods of SHGs members. A qualitative and quantitative approach has been adopted by using primary data and a plethora of secondary data to present a realistic assessment of the SHGs and their impact on women empowerment of Mewat Region of Haryana State.

Key Words- Haryana - IFAD- Livelihoods- Mewat- Self-Help Groups- Socio-economic - Women -

"I Asked for It": How Women Experience Stigma in Their Transition from Being Infertile to Being Mothers of Multiples through Assisted Reproduction Technologies

Although researchers agree that infertility is a stigmatizing attribute, scholars are largely divided in their criticism of assisted reproduction technology (ART). Some criticize the increased and invasive medical interventions as disempowering women, while others argue that ARTs empower women by protecting their right to reproduce as they see fit. Research on the stigmatization of infertility and ART in the context of mothers of multiples is conspicuously missing from the literature, a notable lacuna in knowledge given ARTs are more likely to result in multiple births. Drawing on in-depth semi-structured interviews with 23 mothers of multiples, we show how these women interpret the stigma of first being "infertile" to then being "artificially" fertile to becoming mothers of multiples. The stigma of using ART is arguably an extension of the stigma of experiencing infertility that exerts stressors in different realms of women's lives—the ramifications for which be loss of self-esteem, pride, and confidence that can lead to status loss. Interviewees reveal that despite the agential freedom they have in regard to choice in fertility treatments, they feel disempowered, even judged, when undergoing ART. An interesting and novel finding of our study was that 'fertility' mothers of multiples thought of themselves as less deserving of support or help when compared to other (non-ART) mothers of multiples. They tend to degrade themselves because they think they had "asked for it" deliberately whereas for other mothers, it had happened naturally. This abasement of self is arguably the result of internalized stigma imposed by the society on "fertility moms" because they were unable to meet the 'natural' standards of idealized motherhood.

Health Care Delivery System in Punjab: An Analysis

The human rights approach is central to the development of a robust public health care systems. Right to health is a recognized human right. In order to make this right a reality, among other factors, role of public health care providers is of great significance. Public health care providers are instrumental in connecting the beneficiaries with the health care delivery system of the State.

According to the World Health Organization (WHO), healthcare sector is facing a shortage of health workers in India. The Government of India (GoI) in the year 2005 with the intent to improve the public healthcare delivery system in India as one of its major tasks had set up National Rural Health Mission (NRHM) which was subsequently renamed as National Health Mission (NHM).

Universal immunization forms an integral and a significant component of public healthcare delivery systems. The objective of this paper is to look into implementation and delivery of the immunization services particularly in the remote and inaccessible areas where the services provided by the government machinery could be the weakest. It seeks to deal with the empirical data collected from the Accredited Social Health Activists (ASHAs) from district Pathankot, Punjab. It attempts to understand the role of these service providers especially in the field of immunization and services related to immunization in the district (inclusive of rural and urban areas) Pathankot, in the State of Punjab within the Union of India.

Missing Environment in Cultural Heritage Discourse: The Case of Water in Western Himalayas

Heritage as a concept originated in the west in 19th century from where it travelled in world through colonial policy. However, heritage as it is known today was conceived and propagated by global agencies like UNESCO through concepts

of World Heritage in the second half of the 20th century largely concerned with heritage management. Walsh argues heritage refers to a set of attitudes and relationships with the past. This paper is reflections on pursuance for heritage status for Chamba which was ruled by a single dynasty until independence and having records dating back to 5th century. This demand of heritage can be seen as part of globalisation where heritage means for some a 'brand' for marketing a place for tourist attraction or for others preservation of antiquities and also as veneration of past which plays a decisive role in negotiating, maintaining, and creating group identity. Although underlying notion of heritage discourse has been oriented towards protection of 'valuable' things which is threatened by loss, damage, and misuse for future generation. However, in this whole discourse 'environment' or "natural heritage" has been missing in Ravi valley. Various practitioners and scholars focus more on tangible artefacts and less on intangible aspect. What has been missing in the whole discussion is environment which has been deteriorating in the vicinity of the town. In the present paper I will focus on environmental heritage which has been part of folklore but has not found its place in present heritage discussions. Thus, paper brings out how rivers in general and water in specific like any other environmental feature is not heritage whereas artefacts associated with it are considered as heritage which reveals multiple meanings of heritage in Chamba valley.

Facilitate People's Networks As a Basis for New State Legitimacy

The maintenance of a state's legitimacy depends on whether it can keep satisfying people's legitimate demands. In the aftermath of WWII people regarded as legitimate the desire for full employment and various social benefits, followed since the 1980s by the pursuit of wealth through a deregulated market. Question is what are the legitimate demands in the Trumpist and post-Brexit world?

Supporters of populism insist that the state should exclude irregular members of society and provide job protection and income redistribution only to citizens. However, the desire to limit immigration cannot be legitimate because it would injure the government's legitimacy as a protector of human rights and would actually not relieve the supporter's concerns. The real cause of their anxieties is that their jobs are increasingly substituted for cheap and standardized ones. A solution would be to make their jobs less substitutable by situating them in more diverse, creative and meaningful social contexts in which unique skills and knowledge are valued. Immigrants should also be included in these social networks because problems they allegedly pose and that populists detest are often caused by their social isolation. In the end, both populists and immigrants have a similar desire of being included in diverse and meaningful social networks.

This network desire has been regarded as a favorable but not central one that states must meet to maintain their legitimacy, because welfare regimes and labor unions based on strict membership protected people's lives. However, membership has decreased and therefore states have to focus more on supporting open networks. People, regardless of nationality, should have equal opportunity to pursue meaningful life in social networks. States should promote public endorsement for this ideal by strengthening support for people's networks and showing that this benefits all of them.

How Do Patients Compromise Diagnosis?: Practices of Making a Diagnosis

This presentation shows how "diagnosis" itself makes diagnostic culture possible.

Previous studies have focused on lay expertise instead of the normative culture of diagnosis, which involves the exclusive use of knowledge by physicians. Some patients actively participate in diagnosis and treatment. This requires them to rewrite their past experiences with the process of diagnosis and treatment, thus participating in the process. However, describing past experiences involves rewriting from the current viewpoint.

So, the following question emerges: "How do patients correlate past experiences with diseases and make compromises?" To answer this question, I analyzed interview data from the viewpoint of ethnomethodology. The interviewee was a patient who was re-diagnosed with bipolar disorder after having been diagnosed with depression previously. Results of the analysis reveal the following. First, the meaning of past actions has changed, and the logical conditions that enabled the action have also changed. For example, the past experience of "ups and downs of drive" was reinterpreted as an episode of bipolar disorder. Second, reorganizing past experiences also enables the creation of a new reality. Finally, a change in the positioning of expert knowledge occurs while rewriting. In other words, these analyses clarify how expert knowledge is embedded in everyday life.

This phenomenon shows a 'looping effect' (Hacking 1996), which indicates the interaction between the professional concept, such as doctors' diagnosis, and the ordinary concept of the understanding experiences and behaviors of people; the current report presents the looping process in detail. As described above, patients rewrite their past experiences according to the diagnosis and create a

new reality. By making a compromise with the diagnosis, patients have a way to manage diagnosis well without refusing diagnosis. Such practices make diagnosis meaningful and enable a diagnostic culture.

Self-Efficacy and Family Resilience Among the Japan Ground Self-Defense Force Families

Japan Self-Defense Forces (JSDF) has engaged in various types of new missions overseas since 1992. In addition, the 3/11 East Japan Great Earthquake in 2011, subsequent tsunami and nuclear power plant disaster in Fukushima, resulted in the largest-ever domestic disaster relief operation in the JSDF history. One of the lessons learned from the all-out domestic disaster relief operation is that family support for mobilized JSDF personnel during the operation requires further improvement. Over the last few years, JSDF have committed to improve institutional family support programs while coordinating family support efforts by local governments, and associations of veterans, military families, and civilian volunteers. This paper examines how social support networks for military families have developed in Japan, focusing on the Japan Ground Self-Defense Force (JGSDF). In particular, we explore effectiveness of the institutional family support programs from the individual family's perspective based on quantitative and qualitative data. We conducted a 2000-sample survey on JGSDF personnel and their families, while interviewing 55 JGSDF families, covering 15 different bases all over Japan. As a result, we found that whereas majority of the JGSDF family members and personnel recognize importance of institutional family support programs, institutionalization process at the local level has not yet fully developed. Formal and/or semi-formal networks of social support for JGSDF families are still under development, although increasing number of local governments now have official agreements with local JSDF bases to provide public support measures, including monitoring family safety, providing temporary child care, and health care services in time of large-scale natural disaster and other contingency operations. In conclusion, it is suggested that "self-efficacy" and "family resilience," instead of "community capacity" model, would best describe current reality of social support for the JGSDF families.

Recent Differentiation between Two Cultural Industries By Cultural Policies: Singapore's Cultural Transformation and Inequality Problems Since 2012

Singapore has been developing as a top level of global cities since 1990's. They always take advantage on implementing with economic policies and on posing political regulations against artistic activities, particularly art expressions. But at last their government began to establish both an art culture and popular culture (including ICT culture) since 1990's. Because of continuing cultural policies, cultural level (both appreciation and participation) among Singaporean has been rising and cultural inequality has been gradually a little bit improving. However according to their economic inequality (15% new rich and other relatively poor stratification), there still existed cultural inequality among them. In my presentation I would refer to the three points. One is to give an overview of 5 terms (from establishment to development) consist of cultural institution in Singapore. Second point is to point out the separation between an art culture and popular culture. And last one is to analyze their recent changes and reorganization of culture policies from a long-term national plan since 2012. For example, the recent plan contains supporting basement of national identity by an art culture and directing toward bottom up cultural level among Singaporean. Contrasting with an art culture, cultural industries, that is popular culture, has been accepted with governmental support with considerable regulations, but market of cultural industries (e.g. movies, music, etc.) have been expanding and growing an innovative transformation. Finally, in addition I would cover the different multi-cultural background compared with U.S.A, Canada and Western Europe. Singapore has kept a typical example as a unique way of advancement through an art system in context of globalization.

KAYHAN, GULIN* (*Waseda University, Graduate School of Asia Pacific Studies*)

Edgetalk: Beyond the 'indescribable' Moment at the Edge

Risk is commonly treated as a negative concept and risk aversion is the dominant orientation to risk that scholars have in mind when they study how 'ordinary' people approach and live with risks. Stephen Lyng's work on edgework reminds us that for individuals who actively seek risks, risk is not only "good" but also very dynamic and unstable. The edgework approach and its attempt to explore "the complexities and contextual specificities of risk" (Lyng 2014: 2) offers important

insights to understand individual journeys in life, where actor motivations cannot be generalized and their terms ever changing as they strive to make meaning of their lives. I argue in this article that this emphasis on edgeworker's agency to define the meaning of their own experiences creates a blind spot in studies on voluntary risk taking that are influenced by Lyng. While edgework approach attempts to understand *sociologically* why individuals engage in voluntary risk taking, by suggesting a causal relationship between their individual motivations to act and the social position they find themselves in, due to societal forces that are beyond their own control, a sociological analysis of how they talk about the edge and why they choose the terms they choose to define what they do is scarce. Those who watch edgework but not undertake it talk about it, too. How do we study the vocabulary around edgework and its social circulation in relation to other cultural notions? I develop the concept of edgetalk in this paper to approach this question. I suggest edgetalk as an alternative path for study that does not focus on the reasons for participation in edgework, but instead, on the choice of cultural idioms when participants and spectators talk about voluntary risk taking.

TG04-969.1

KAYHAN, GULIN* (*Waseda University, Graduate School of Asia Pacific Studies*)

Why Define Risk?

Risk is defined in many ways and risk scholars react to this multiplicity of definitions in different ways. Some appreciate the fluidity of the notion and study the historicity of risk as "a category of experience" (Doron 2015) while others despise what they see as confusion and widespread misinterpretation of the risk concept, and attempt to clarify what risk refers to. Boholm (2015) argues that risk mainly refers to the negative manifestation of contingency and should not be confused with adventure, nor with luck or good fortune which address the positive outcomes. She stresses the need for a stable definition of risk. Only then, she argues, an interdisciplinary communication on risk will be fruitful. Aven, on the contrary, argues that risk definitions that are based on probability "restrict risk to a measurement tool" (2016:59). There are many other representations of uncertainty, which co-exist alongside one another with regards to a given issue, that a risk scholar needs to take into account. In this article, I attempt to understand the potential reasons behind the definitional policing in risk studies, by drawing from Bruno Latour's (2005) discussion on "sociologists of the social". Reading Asa Boholm's work from a Latourian perspective, I argue that risk as a stable theoretical construct is incompatible with a relational methodology once we agree with Latour's work on actor-networks and 'the end of the social' as Boholm does. I advocate instead a broader perspective that treats risk as a collector-concept that conjures up, in a given context, many different co-existing notions, many possible definitions and ways of thinking. We should treat risk as a 'collector' and not insist on our own 'collection', that is a stable scholarly definition, is the position I take in this paper.

KAYSERILIOGLU, ERDEM* (*Koc University*)

Turkey-Somalia Relations: State Making Is Market Making Is Institutional Matrix of Politics?

This study questions Turkey's efforts in Somalia's state-making process as a market-making intervention while analyzing the political economy of Turkey's new capitalism. In 2011, Turkey's AKP government made a high-level visit to Somalia during the Ramadan to start a humanitarian campaign when Somalia suffered from a severe drought and famine. Until then Turkey spent an enormous effort to bridge diplomatic and commercial ties with Somalia. Though Turkish representatives maintained their humanitarian rhetoric and donations, Turkey's operations in Somalia aimed to reinforce extra-national market investments, which have included infrastructural and educational projects, airport and seaport constructions, land and naval force implementations, together with bilateral commercial agreements. In the end, Turkey's investments allowed its export to Somalia to increase from \$2 million to \$115 million between 2005 and 2016, while letting Turkey to become the world's second largest donor country in 2016 with \$6 billion humanitarian assistance. In fact, what enabled Turkish government's fiscal efforts to develop at the global level was the new organizational matrix established under neoliberal Islamic AKP rule. A closer scrutiny on Turkey-Somalia relations reveal that Turkey's new business and civil society matrix, which have articulated pro-AKP business actors, Islamic foundations, and religious NGOs, played a prominent role in Turkey's involvement in Somalia's state and market-making. Therefore, this study analyzes Turkey's market-making intervention in Somalia as an extension of Turkey's new capitalism that benefits the power matrix established under AKP rule.

RC22-419.8KAZEMIPUR, ABDIE* (*University of Calgary*)*Sacred As Secular in a Muslim Context: Religion and Secularization in Iran's Islamic Republic*

The recent wave of scholarship on secularity has challenged many of the previous assumptions and biases in the field, including a Western European bias, focus on the Catholic world, and viewing sacred and secular as mutually exclusive. Despite these challenges, this body of research still remains heavily focused on Christianity and the West, and maintains a disciplinary bias towards political philosophy, political science, and religious studies. In the study proposed here, I discuss the secularization forces in a Muslim context, namely, the Islamic Republic of Iran. Drawing on a vast amount of data that have recently become available -- e.g., survey data covering a 30-year period, government documents for the last three decades, etc. -- my research shows a deep process of secularization in Iran, which reflects itself not only in the beliefs and behaviours of the populace but also in the structure and behaviours of the state and the religious institution. This fundamental shift towards secularity in the Iranian society is directly related to the governmental policies adopted in the four decades since the Iranian Islamic Revolution in 1979 -- ironically, with the purpose of Islamizing the Iranian society. The findings offer several nuances to the existing scholarship on secularity in the contemporary world.

RC22-424.4KAZI, UZMA* (*Lund University*)*Caught in between or Bridging the Gap? Intergenerational Transmission of Religious Identity within Second and Third Generation Pakistani Muslims in Sweden*

In an unprecedented Muslim migration context in Sweden, with changing demographics as well as pressures on the welfare state against the backcloth of heightened securitization, terrorist attacks, and Islamic extremism, for second-generation Pakistanis, inheriting a Muslim identity from their parents can barely be considered a windfall gain. On the contrary, as they forge both roots and routes to integrate into the country in which they were born and raised, second-generation Muslims acknowledge/react to the pressures associated with holding a Muslim identity. Moreover, in constructing and maintaining this identity, they are also actively making choices between competing and seemingly opposing *identity scripts* i.e. religious/ethnic (parental transmission within the Pakistani diasporic context) and secular (Swedish societal context). In this paper, I would like to make an attempt to understand why and under what conditions does a religious identity endure through generations and what role it plays in a 'Muslim' individual's everyday life in Sweden. Drawing on data from qualitative interviews in three major cities of Sweden, the case selected will focus on personal life-story accounts of one family i.e. two siblings from the second-generation and their offspring adult children that belong to the third-generation. Through these narrations, it is possible to see that identities are constructed by intergenerational co-histories that are met with contentions, frustrations, disjunctions and are de(re)-constructed in the life-course of an individual. The social environment, with its various institutions, can serve as a catalyst in *triggering/activating* a certain aspect of an identity more than another at a certain point in time. It is also evident that second generation is the buffer generation allowing for the move away from conflict to creative pathways for dual belonging as well as both recognizing and tolerating ambiguity arising from managing inconsistent identity frames. The concept of *Mestizo Muslim identity* will elucidate these findings.

RC42-JS-54.4KAZIBONI, ANTHONY* (*University of Johannesburg, South Africa*)*Understanding Citizenship and within the Context of Access to Water in South Africa*

The issue of lack of access to water in South African townships and rural areas is a critical issue for the government and communities countrywide. Chapter 2 Section 27 (1) (b) of the South African Constitution states that "[e]veryone has the right to access to sufficient water". However, this right continues to be infringed upon particularly in these poor and indigent communities. Water service delivery has been poor in South Africa. As citizens are becoming increasingly dissatisfied with water service delivery they have gone to the streets to protest. These protests are over the infringement of their right to access water. The right to protest is protected and also guaranteed within the confines of the South African Constitution Section 17 which states that, "Everyone has the right, peacefully and unarmed, to assemble, to demonstrate, to picket and to present petitions." It has been documented that the South Africa Police Services uses "excessive" force when dealing with [water] protesters, and in some instances protesters have lost their lives. Juxtaposing the notion of "universality of citizenship" with the ruthlessness of the state, I interrogate the meaning of citizenship to the populace since. It thus becomes important to probe how in South Africa the effective participation

socio-politically requires that individuals and groups possess some minimum conditions related to politically relevant knowledge and skills. In this paper I argue that the lack of access to water, and the state's response to protest coercively has developed a situation in which "groups like women, ethnic minorities, the poor and the unemployed, commonly regard themselves as "second class citizens" because social disadvantage prevents their full participation in the life of the community" (Heywood 1994:159).

RC38-675.6KAZMIERSKA, KAJA* (*University of Lodz*)*Doing Biographical Research – Ethical Dilemmas in Changing Social Contexts.*

When biographical research started rapidly developing in last decades of the 20th cent. ethical problems of biographical interviewing were focused more on the very relationship between a narrator and interviewer, the promise of anonymity and methodological responsibility and mutual trust. Recently, the dynamic changes in different spheres of social life (especially commercialisation of science, digitalisation of data, explosion of social media) have influenced definitions of research situation and approach to results in social sciences. Some new standards have been implemented from hard sciences, the research situation has been shaped by circumstances related to wider cultural changes which can be recognized as a sort of cultural shift especially in the sphere of new media communication. In my presentation I would like to comment on these phenomena. I try to discuss such problems as e.g.: consequences of digital archiving, changes in social definitions of public vs. private spheres, the expected style of doing research with the strong expectation to disseminate results or, last but not least, possible consequences of implementing informed consent with illusory expectation that it removes the danger of ethical dilemmas.

RC06-126.9KAZYAK, EMILY* (*University of Nebraska-Lincoln*)PARK, NICHOLAS (*Gavilan College*)*Doing Family: The Reproduction of Heterosexuality in Accounts of Parenthood*

In this paper we address how people respond to LGBQ-parent families in everyday interactions. Specifically, we analyze what accounts or assessments others make of adults with children when determining whether or not they are a family. Our analyses draws on data from 75 in-depth interviews with LGBQ parents in the United States who have become parents in a variety of ways (donor insemination, adoption, surrogacy). The sample is also diverse with regard to race, class, gender, and geography. We find that when LGBQ parents are alone with their children, others assume that they are heterosexual and that there is an absent different-sex parent. When both parents in a same-sex couple are present with their children, others do not always assess them as being parents or a family, but rather might understand them to be friends. Our work thus shows how heterosexuality is a key component of the how membership to the social category of "family" or "parent" is produced in social interactions. Additionally, we show how assumptions about heterosexuality are predicated on assumptions of biological connection between parents and children. These assumptions rest on racialized and gendered assessments insofar as parent-child pairs that are seen as racially matching are read as family in a way that pairs that are seen as racially different are not. Likewise, gender matters to people's assessments insofar as LBQ women with children are understood as mothers, but GBQ men are not always understood as fathers. Those who are perceived as gender normative also report that they are more likely to be seen as parent (with a presumed biological connection to their child) than those who are perceived as gender non-normative. Our focus on accountability foregrounds power in everyday interactions and provides a lens through which to understand how inequality is reproduced.

RC36-651.3KEDZIOR, BOZENA* (*Collegium Civitas*)*The Reproduction of Domestic Violence in Poland*

The problem of domestic violence has received relatively little attention in the public discourse in Poland. A very important factor in this regard is the great reverence for the institution of the family expressed by the ruling right-wing party (PiS), which defends the role of the Catholic Church as the dominant source of conservative norms and values. The resulting mixture of political propaganda, cultural dynamics, and the prevailing psychologically-informed rhetoric fosters a negative public image of the victim of domestic violence, which then serves to elicit various forms of alienation. In addition, public policy measures that focus on the victim's individual problems quite often add to her existing feelings of social incapability. A sound understanding of social and cultural causes is thus needed in order to further the emancipation of women in general and of victims of domestic violence in particular. I draw upon Zygmunt Bauman's classification

of the meanings of culture and the ensuing conceptualization of the need for freedom in terms of deviation and norm-breaking as I argue that adherence to a specific habitus prevents the confirmation of public identity on the part of domestic violence victims, 91% of whom are women. I utilize the identity-theoretic model developed by Peter J. Burke and Sheldon Stryker (where cognitive and structural approaches complement one another) in an effort to illustrate how the interplay of the social structure and self prolongs and heightens the durability of an oppressive condition. The perspective of cultural criminology, with its focus on meaning and transgression, is also fruitful for evaluating the victim's position in the light of her previous experiences, including violence in childhood.

KEIM, WIEBKE* (*SAGE (Sociétés, Acteurs, Gouvernement en Europe), University of Strasbourg*)

Gauging the Global Trends Towards Authoritarian Restoration – a Research Agenda

From the ideologues and practitioners of Hindutva to the FN, a variety of authoritarian voices demands the restoration of community against formalized society and local traditions against the stranger. In Europe, "populism" dominates theoretical analyses. The term "authoritarian restoration" encourages a more fundamental theoretical reflection. My aim is to provide a comparative analysis of the conditions for the current strength of a variety of movements, parties and regimes, their similarities and differences.

Theories of fascism offer an overarching theoretical framework as a basis for research, providing internationally comparative typologies and explanations. From this conceptual starting point, I make adaptations in order to analyse the following cases: from populist to extreme rights in France, Germany, Italy and Hungary; their transnational networks and Russia's role in them; the radical right in the US; Turkey under Erdoğan; jihadism, the case of Daech; and India under Modi. The idea of a "family resemblance" between them is taken from Mann (2004).

Mann's approach explains how fascism offered solutions to major economic, political, ideological and military crises. Furthermore, he empirically shows which constituencies were attracted by those solutions because of their particular social location. In order to distinguish between the ideological appeal of authoritarian restoration in general, the emergence and strengthening of movements and parties, and the successful establishment of authoritarian regimes as a last step in a few of the cases under study, I introduce a stage-by-stage distinction based on Paxton (1998). This leads me to the following research questions:

Do we face similar broad crises today?

Can we understand attempts at authoritarian restoration as responses to those crises?

How do they develop over time and on which constituencies are they drawing?

Under which conditions are they successful in gaining and transforming state power?

KELEMEN, MIHAELA* (*Keele University*)

Researching the City through Arts-Based Methodologies

This paper introduces a new arts-based methodology used to research a city in crisis, i.e., Cultural Animation (CA) through personal stories of loss and hope. Cultural Animation is a methodology of community engagement and knowledge co-production which relies on an array of visual, performative and experiential techniques (Barone and Eisner, 2007). Its aim is to create a 'safe' space, away from existing hierarchies, in which academics and community members dream, tell and enact their stories using their own bodies and everyday objects.

By giving equal status to academic expertise, practical skills, common-sense and day-to-day experiences, CA embraces the view that theories are plural, embodied, relational and impactful on the people who co-construct them. The methodology is inspired by American Pragmatism, in particular John Dewey's work on democratic experimentalism (Vo and Kelemen, 2017).

The project was funded the Arts and Humanities Research Council in the UK and was carried out in an economically and socially deprived city based in the Midlands. A one day long Cultural Animation workshop was held at a local award winning theatre to explore the past of the city, its present and to imagine/construct new worlds through the stories and biographies of diverse individuals living or working in the city: academics, policy makers, commu-

nity members, NGOs and public sector employees. Some of these individual stories and biographies are captured in a podcast commissioned by the AHRC: (<http://www.ahrc.ac.uk/research/readwatchlisten/filmsandpodcasts/weatheringthestorm/>).

Encouraging participants to express their emotions and thoughts about their cities via this embodied and visceral process ensured that the past came alive in individual biographies and opened up endless possibilities to collectively re-imagine the future of the city. In more general terms, the process enabled us to bridge the gap between thinking and doing, theory and practice, academics and communities.

Diaspora Politicisation and Cultural Entrepreneurship: Entrepreneurial Activity in the Kurdish Diaspora

Janroj Yilmaz Keles/ Stephen Syrett
Diaspora Politicisation and Cultural Entrepreneurship: Entrepreneurial Activity in the Kurdish Diaspora

While scholars from cultural studies, sociology, law, international relations and human geography have conceptualized the articulation and mobilization of diasporas for their real or imaginary homeland, the politicization of diasporic identity in shaping diasporic entrepreneurial activity has remained largely unexplored within the existing literature.

Drawing on a cross-national research with Kurdish entrepreneurs in the UK, Germany, Sweden and Kurdistan-Iraq, this paper seeks to examine the impact of a politicized diasporic identity and its relation to the transnational entrepreneurial behavior evident within certain diasporic communities. The paper will particularly focus on the parallel linkages between the process of politicization, articulation, transnational mobilization and the entrepreneurial reproduction of ethnic culture, language and politics within certain diasporic contexts. Business ventures that emerge in these diasporic contexts, whether in the form of commercial and community services in adopted/settlement countries or reconstruction related ventures in homeland areas may have a politicized characteristic. This produces a form of transnational diasporic entrepreneurship where diasporic ethnic identity and politicization play a central role in the forming, networking and market creation of diasporic economic behaviours.

Findings from this study demonstrate that Kurdish diasporic entrepreneurs operate within a politicized diaspora group and pursue venture activities that not only develop the diaspora economy but also promote political engagement, cross national solidarity and an enhanced diasporic consciousness. Together these contribute to the revival and re-establishment of their own imagined political community and related language, culture and future political vision. In this paper, we attempt to conceptualize the phenomenon of politicized diasporic entrepreneurship (PDE), an entrepreneurial form which has not been specifically identified and studied within the existing literature with the consequence that there is limited understanding of its nature, form, scale and scope.

Insecure Legal Status and Work: Failed Asylum Iraqi-Kurdish Applicants in the UK

Insecure legal status and work: failed asylum Iraqi-Kurdish applicants in the UK

The number of young people without rights of residence and/or work in many Western countries is growing. Although undocumented migration has become the subject of a number of studies, the dynamics of youth migration from Iraq to the UK has not been studied. Displacement and forced migration from Iraq has a distinct historical meaning in international migration and the ethno-national, sectarian and unequal distribution of resources continue to be the major cause for war and internal displacement as well as refugee outflows. However, the discourses and representations of undocumented migrants, including failed asylum-seekers, by the British Government and media are extremely hostile and consider undocumented people as 'illegal immigrants' who must 'go home'.

The current hostile financial environment and anti-immigrant public and policy climate in the UK have pushed undocumented young migrants to live without civil or social rights in one of the wealthier states in the world. However the undocumented young migrants are trying to develop different strategies to survive and have access to the labour market to counter social disadvantage.

Drawing on a survey of 178 undocumented Kurdish young people from Kurdistan-Iraq, four focus group discussions in different parts of the UK including London, Brighton, Birmingham and Derbyshire and, nine key informant interviews, the paper explores the experiences of Kurdish people without rights of residence and/or work in the UK and, the strategies that they adopt to secure labour market participation and gain new skills.

RC16-318.5KELLER, REINER* (*University of Augsburg, Germany*)*Positioning Power*

This presentation introduces a new concept for use in Foucault-inspired power analysis: the concept of positioning power. For power analysis in the social sciences, this opens up a specific way of accessing a number of contemporary phenomena that are currently being discussed in the context of a sociology of the numerical, of assessment, or of evaluation. The positioning power concept is well-suited for the purpose of distinctly contouring the effects of these phenomena as they unfold in society. Conceptually, it is situated at the same level as Michel Foucault's idea of biopower. Like the latter, positioning power is directed at diagnosing a specific form of governmentality regimes. The suggestion of introducing a distinct concept in conjunction with these regimes is connected to the social importance of the power/knowledge complexes it encompasses, complexes that have become very prominent in the last few decades. The talk will focus first on the social construction of value as a basic process of human cultural production. Subsequently, the positioning power concept will be explained in detail. A final portion of the presentation will then introduce fundamental considerations regarding a sociology of positioning power.

RC23-441.1KELLER, REINER* (*University of Augsburg*)POFERL, ANGELIKA* (*Technical University of Dortmund*)*'Knowing' Society. the Making of Sociological Knowledge*

Referring back to the work of Karin Knorr Cetina and Ludwik Fleck, we conceive of epistemic cultures in Sociology as ways of producing and distributing sociological knowledge. The core 'action problems' of such an endeavor can be resumed as follows:

- What concrete dispositions and practices allow for the sociologist's claim to know something about society, which other people do not know and cannot know? What is the particular sociological way of knowing?
- Why should third parties (peers, the public, individuals, grant givers) accept what the sociologist knows and presents as 'sociological knowledge'?

Using data and results from a comparative research on qualitative analysis in French and German sociology from the late 1950ies to 2013, we would like to present examples and discuss two different solutions to such challenges: *individual inspiration* and *procedural legitimation*. These two different ways of establishing evidence are routinized and stabilized solutions to the core action problems of epistemic cultures. They find their concrete *Gestalt* via strategies of field work, hermeneutic procedures of textual analysis and other devices of 'doing knowing'. They shape methodologies and methods beyond surface similarities. They account for the observation that sociologies and sociological knowing and knowledge differ largely between different communities of sociological discourse.

RC11-216.3KELLY, CHRISTINE* (*Community Health Sciences, University of Manitoba*)JAMAL, ALIYA (*Community Health Sciences, University of Manitoba*)AUBRECHT, KATIE (*Continuing Care - Research, Nova Scotia Health Authority*)GRENIER, AMANDA (*Gibrea Centre for Studies in Aging, McMaster*)*Directly Funded Home Care Programs in Canada: A National Inventory*

One effort to relieve the pressure on home care infrastructure is directly-funded programs, a model expanding throughout Canada and the developed world. Direct Funding (DF) programs provide individuals or families with cash to hire and manage workers for home care or respite. Most often, this means locating and hiring people from the community, with or without training. DF is also known as self-managed or self-directed care, consumer-directed care, individualized or personalized budgets, and/or direct payments. DF is associated with feelings of empowerment and high levels of user satisfaction, and is *at least* cost-neutral as a policy mechanism. DF can engender tension with labour perspectives, and be at odds with feminist scholarship on care. DF is an evolving policy approach that highlights the complex politics of care.

In this presentation, we share findings of a comprehensive inventory of Canadian DF programs, gathered through qualitative interviews and questionnaires conducted with program administrators. We outline key program elements that characterize the Canadian policy landscape, and emphasize the implications for older clientele. We consider two themes that emerged across the country. The first theme considers the lack of information on the workers employed through DF home care. Care workers in a variety of settings can be an under-documented population. This issue is exacerbated by the informal hiring practices and low entry requirements of DF, paradoxically two of the programmatic features lauded

by clients. Finally, we consider the increasing role of agency care providers within DF schemes, considering the advantages and the ways that these organizations can conflict with some of the DF policy aims. In doing so, we demonstrate the diversity, and at times, inequity, in available DF options in Canada.

RC32-575.6KELLY, MARGARET* (*Macquarie University*)*The Wizard behind the Curtain: Transgender Women's Experiences of Navigating Male Privilege***Abstract**

The aim of my Master of Research project was to explore how transgender women experience and navigate male privilege when they lived socially recognized as men and now as women. Qualitative life-history interviews were conducted with twelve transgender women from diverse backgrounds, and aged from 20 to 70. The data was analysed thematically through the lens of Raewyn Connell's concept of hegemonic masculinity and masculinity's ideology of supremacy and claim to authority. Transgender women participants' responses evidenced that privilege is unevenly distributed among multiple masculinities, and this unevenness is reflected in participants' experiences of and attitudes to male privilege and hegemonic masculinity, pre and post-transition. Participants exposed the wizard behind the curtain, and turned a spotlight on a complex social structure of gender inequality that is difficult to identify, define and, therefore, to challenge. This project argues that it is the very complexity and elusiveness of the structure and the opaqueness of the advantages this structure bestows on some men that is one of its strengths. And, that the unique insights and reflections of transgender women on their experiences of privilege, pre and post-transition, illuminate these mostly invisible and paradoxical social structures and the gender inequality they perpetuate.

RC34-627.5KELLY, PETER* (*School of Education, RMIT University*)*Young People and the Politics of Outrage and Hope*

In this edited collection we suggest that late in the second decade of the 21st century millions of young people around the globe are marginalised in educational, cultural, social, economic and political contexts that are local and global; that are characterised by increasing wealth and poverty, and a widening gap between them; by the remaking of the markers of marginalisation in which some forms appear to wane while new forms seem to emerge; and by global ruptures that are marked by austerity, recession and the remaking of the welfare state in the aftermath of the GFC.

During the so-called Year of the Protester (Time 2011) we witnessed many young people around the world – the Spanish Indignados, the global Occupy movement, the young people of the various and different revolutions in the so-called 'Arab Spring' – voice their anxiety, uncertainty and anger about their experience of these diverse and emerging circumstances.

High levels of youth unemployment and precarious employment, student debt accompanying increased costs for higher education, housing costs that lock many out of home ownership, and the challenges for young people's physical and mental health and well-being are re-shaping young people's sense of self and of their chances for meaningful participation in relationships and settings that have, in the past, identified someone as an adult, as a citizen (Kelly 2016).

The collection draws on a range of theoretical, methodological and empirical work to identify, explore, map and debate some of the challenges and opportunities of the politics of outrage and hope that should accompany academic, community and political discussions about the futures that young people will inherit and make.

RC39-687.1KELMAN, ILAN* (*UCL*)*Creating Causal Chains from Disaster-Related Activities to Disaster Diplomacy*

Disaster diplomacy <http://www.disasterdiplomacy.org> examines how and why disaster-related activities (disaster risk reduction and post-disaster actions) do and do not influence peace and conflict processes. The key analysis is whether or not a causal chain can be established between (i) dealing with disaster risk or a disaster and (ii) outcomes in peace (or conflict). The answer in all case studies examined so far is that the causal chain is complex with multiple inputs to and outputs from the chain. In effect, intersecting input and output sequences are generated with respect to disaster-related and diplomatic activities, yet it is rarely articulated where, when, and why these sequences start and stop.

Irrespective, no evidence has been found thus far to suggest that disaster-related activities are a prominent factor in conflict resolution. Instead, disaster-related activities often influence peace processes in the short-term—over weeks and months—provided that a non-disaster-related basis already exists for rapprochement. This pre-existing basis could be secret negotiations between the warring

parties or strong trade or cultural links. Over the long-term, namely the timeframe of years, disaster-related influences disappear, succumbing to factors such as a leadership change, typical patterns of political enmity, or belief that an historical grievance should supersede disaster-related bonds.

This time-dependent conclusion suggests that possibilities might exist for active interventions at key nodes to ensure that disaster-related activities do actually create new, long-lasting diplomacy. If this approach might be successful, then it suggests that creating disaster risk could be a useful pathway, especially for permitting disaster diplomacy. Then, moral dilemmas emerge. Active disaster diplomacy efforts might backfire, disaster risk created might not be resolved, or it could lead to a slippery slope of aiming for a disaster in order to create peace.

KELMAN, ILAN* (UCL)

Global Health Diplomacy through a Disaster Diplomacy Lens

Disaster diplomacy research <http://www.disasterdiplomacy.org> examines how and why dealing with disasters does and does not influence peace and conflict. This work covers disaster response and recovery and disaster risk reduction including climate change adaptation, from community to international levels. Global health diplomacy is in turn both a field of research and an interdisciplinary endeavor to negotiate, shape and manage the policy environment for health at all scales. One challenge in both disaster diplomacy and global health diplomacy is the continual emphasis on being reactive, rather than enacting 'prevention is better than cure' which saves lives (as well as money). This presentation explores a research and policy agenda for intersections between the fields of global health and disaster diplomacy, including the importance of preventative action--despite such lessons being consistently overlooked in policy and practice--and discusses how insight from disaster diplomacy research can inform international cooperation to strengthen health systems globally. It is particularly poignant in the context of epidemics and pandemics being disasters, so preventative efforts such as vaccine diplomacy could be seen as disaster risk reduction whilst responses to cross-border outbreaks, perhaps called disease diplomacy, would be part of disaster response.

KEMPLE, THOMAS* (University of British Columbia)

Infinite Ends and the Tempo of Life: The Marx/Simmel Convergence

Chapters 1 and 4 of Simmel's *Philosophy of Money* on value-in-exchange and individual freedom can be said to complement the analysis of commodity-value in Marx's *Capital*, while chapters 2 and 5 on social substance and individual freedom in many ways contradict Marx's arguments concerning labour-value. Arguably, in chapters 3 and 6 Simmel's discussion of the transformation of means into ends as the basis for a new style of life converges in key respects with Marx's examination of the dynamics of objectification, alienation, and reification in the capitalist money economy. This paper elaborates on this convergence with reference to the examples of the miser, the spendthrift, and the fetish character of the commodity as figures of the pace and tempo of modern life in the work of both Marx and Simmel. To the degree that these discussions left a lasting impression in the work of Siegfried Kracauer, Georg Lukács, and Ernst Bloch, some attention will also be given to their implications for post-Marxist critical theory. The paper argues that the conceptual problem of *capital conversion*, especially the process of valorization and transvaluation through money and machines, provides the common ground between their approaches, and a fruitful source for future analysis.

KEMPLE, THOMAS* (University of British Columbia)

The Propertied and the Poor in the Big City: From Parsons to Park Via Naegele

Simmel's influence in North American sociology is often traced to the interest and research generated by his 1903 essay 'The Metropolis and Mental Life', along with the short excursus on 'The Stranger' and other parts of his 1908 book *Sociology*. The vicissitudes of his early reception move from celebration in the work of Robert Park (especially the collection he edited with Ernest Burgess in 1921, *Introduction to the Science of Sociology*) to disappearance in the work of Talcott Parsons (where a discussion of Simmel was excised from his 1937 *The Structure of Social Action*). This paper retraces the path back to Park's ideas on urban life, which germinated from the seminar he attended by Simmel in Berlin in the spring of 1900, by way of Kaspar Naegele, who published a seminal paper comparing the cultural theories of Simmel and Durkheim in the *American Journal of Sociology* on the 50th anniversary of their deaths in 1958. A German émigré who was among Parsons' favourite students at Harvard before settling in Canada, Naegele convinced his mentor to include selections from Simmel in their monumental edited collection *Theories of Society* of 1961. Naegele emphasizes Simmel's unique way of seeing 'the "severalness" of social arrangements in their vivid or dull, up and down "thereness"'. This paper argues that this perspective on

Simmel's later writings, particularly on the negative dynamics of social life, allows us to highlight features of Park's approach to urban sociology that were nearly eclipsed by Parsons but are well worth recovering and reflecting on today.

KENDRA, JAMES* (University of Delaware)

The Ethics of Quick-Response Disaster Research

Research on hazard and disaster is essential, owing to continuing shifts in the nature and prevalence of various dangers. Quick response disaster research, a method for studying disaster made prominent at the Disaster Research Center, remains an important part of the scholar's data-gathering methods. To reach the scene of a disaster as early as possible allows the researcher to make observations that might not be possible otherwise, such as the fleeting decisionmaking context, challenges defined and overcome, or events whose import might be dulled, diluted, or magnified in retrospective accounts such as after-action reports. Yet recent critics assert that quick response research is improper, even deviant. Using actual quick response field studies as cases, this presentation will rebut current misunderstandings about the nature and practice of quick response research, finding that research does not consume scarce local supplies; research does not distract officials from their duties; and people in affected areas retain their ability to give informed consent. Prudent research practices, familiar from all domains of social science research, are adequate in the disaster setting. Given that freedom of speech and inquiry are highly treasured human rights, this paper concludes by asserting that quick response disaster research, like all research, is an important element of freedom whose curtailment would itself be ethically suspect.

Hate Crimes with Religious Bias Against Women

Hate crimes with religious bias are usually against the non-religious other. However, among those who share the same religion, stemming from different interpretations of religious content hate crimes can be observed. The Islamic religion did not place serious limitations on men's clothing, but made certain restrictions on women's clothing. This reflects in the social life as follows: The religiousness of conservative men, cannot be evaluated according to their clothes, but the religiousness of conservative women can be evaluated according to their clothes. Therefore, women are more likely to be exposed to hate crimes. In the case of Turkey, the most concrete example of this is the headscarf. Turkey is a country in which both secular and conservative sections live together. And hate crimes with religious against women in the conservative and secular groups of the society can be different. For example, because a woman is headscarved, she may be exposed to discrimination and hate crimes in her/his work and life, and may be seen as a possible danger of sharia by secular people. On the other hand, a woman can be a victim of hate crime and discrimination because she does not wear headscarf. Apart from hate crimes against women due to the restriction of clothing, other forms of hate crimes with religious bias against women can also be observed in the society. For example when a woman is not married or is divorced, she may be subjected to hate crimes with religious bias. Another example is honor killings. So, women who do not follow the norms dictated by the society and religion are victims of hate crimes. The purpose of this paper is determine the reason of hate crimes and discuss with examples reflected in the media in Turkey and how we can keep from/stop hate crimes.

KENNEALLY, NOAH* (Ontario Institute for Studies in Education-University of Toronto)

What Do Children Have to Say about Childhood? Getting Children's Help in Theorizing Social Life

My current doctoral research investigates children's perspectives about childhood using the visual ethnographic methods of graphic and narrative elicitation. The questions guiding my research are the following: What are the working images or core metaphors children have and use to describe what childhood means to them? How do these images and metaphors influence their social interactions? And finally, how can creative visual methods assist in involving children in data analysis processes? This presentation explores some preliminary findings from my ongoing research.

Engaging with children directly in research has become a way to involve children in investigating social life. Building on the theoretical foundation provided by James, Jenks & Prout (1998) and Mayall (2002), contemporary theorists in the sociology of childhood (Corsaro, 2015; Gabriel, 2017) consider children to be competent informants, as well as sources of information unobtainable by other means. Methodologically, visual ethnographies present a range of tools that can help to make children's ideas more visible and concrete, and provide children with multiple ways to engage with the topics of inquiry (Bagnoli, 2009; Einarsdottir, Dockett and Perry, 2009; Farmer and Cepin, 2015; Tay-Lim and Lim, 2013). I discuss some

of the ways that using visual ethnographic methods – drawings, cartoons, and concept maps – to capture children's ideas and perspectives in a variety of modes yields important insights about childhood, and can also provide a platform for involving children in analysis processes. Engaging their help in pushing our theoretical envelopes regarding school, families, and social life can be a concrete way to share the power of knowledge production about children and childhood with children themselves.

Critical Reflections on the Craft of Participatory Research with Young People: Unsettling Dominant Narratives

This collaborative paper draws on the diverse participatory research experiences of three youth researchers in Canada and the UK, in order to critically reflect on the limits and possibilities for what we are calling the *craft* of participatory youth research. By invoking 'craft' rather than 'techniques' or 'methods', we seek to foreground the intuitive, embodied, and often unspoken elements of participatory research, with its inherent unpredictability, inter-relationality, and potential for both generating insights and reproducing dominant narratives and power structures. Recognizing that there is no singular approach that might encapsulate how to 'do' participatory research with youth, we nonetheless identify shared themes and dilemmas that cut across our various research experiences. These include: ethical challenges related to institutional IRBs and questions of informed and ongoing consent during the research process; questions of ownership and obligation, or, who does this research belong to anyway?; questions about degrees of influence and what counts as 'participatory enough'; tensions between the goals of education/community development versus those of research projects; and the role of ambivalence in our research processes. Through vignettes, we highlight the infrequency with which inter-generational relations, the rules of the academic game, and researchers' own attachment to creative outputs are unsettled. However, we suggest that when the goal of participatory research is to challenge dominant regimes of truth rather than ensuring shared ownership of research resources, the craft of participatory research -- focused on dialogue and layering of reflection and meaning -- still has potential. The paper is built upon a combination of shared conversations and written vignettes that detail specific instances within our respective research; the vignettes serve as case studies through which we illustrate how, despite the ambiguities of ownership and influence, the craft of participatory research with youth can enable moments where dominant narratives are unsettled.

KENNY, BRIDGET* (*University of Witwatersrand*)

Consumption, Capital and City Spaces: The Everyday Politics of Retail Workers in Johannesburg Shops and Streets

This paper examines the relationship of low wage, low skill service work which employs a majority of young, black women in Johannesburg to 'consumption' and capital investment in shops and malls. Employment in service jobs, such as retailing and catering have in general expanded over the past several decades, offering precarious wage work. This work contributes to structures of inequality as these workers find themselves 'lucky' to get one of these jobs. Through affective labour, service workers also constitute spaces and relations where a diverse group of people in South Africa meet to consume. They make possible the malls, shops and restaurants of consumer pleasure in Johannesburg. In doing so, service workers tie together a low wage labour regime with forms of economic distribution and new symbolic hierarchies of consumption in city spaces. Furthermore, service workers materialise forms of capital investment in retailing, property development and finance, itself explaining the vast growth in malls and Johannesburg Stock Exchange listed property portfolios. In turn, state regulation as well as local government economic development practice help to define directions taken. The paper traces these connections and explores multiple forms of retail worker 'everyday politics', from union strikes shutting down streets to networks of care and solidarity, which tie workers to other forms of sociality in the city. In short it examines the constitutive connections between labour, consumption and capital expansion in place. How gender and race explain such intensifying inequalities and their concomitant forms of struggle are crucial considerations.

KENNY, BRIDGET* (*University of Witwatersrand*)

Retail Worker Politics, Race and Consumption in South Africa: Shelves in the Service Economy (Palgrave Macmillan, 2018)

Retail Worker Politics, Race and Consumption in South Africa: Shelves in the Service Economy traces the long history of retail workers' contestations in South Africa from the 1930s to today. Based on twenty years of research, including ethnographic, interview, survey and archival, this book argues that we need to focus attention on the ways that workers themselves have invested subjectively in what it means to be a worker. By doing so, we gain an explanation that moves us beyond the economic decisions made by actors, the institutional constraints faced by trade unions, or the power of the state to interpellate subjects. These more common explanations make workers and their politics visible only as a symptom of external conditions, a response to deregulated markets or a product of state recognition. Instead – through a history of retailing as a site of nation and belonging, changing legal regimes, and articulations of race, class and gender in the constitution of political subjects from the 1930s to present-day Wal-Mart – this book presents the experiences and subjectivities of workers themselves to show that the collective political subject 'workers' (*abasebenzi* in isiZulu) is both a durable and malleable political category. From white to black women's labour, the forms of precariousness have changed within retailing in South Africa. Workers' struggles in different times have in turn resolved some dilemmas and by other turn generated new categories and conditions of precariousness, all the while explaining enduring attachments to labour politics.

Connecting IE to Bodily Affects through Massumi

An IE "inquiry begins where people are and proceeds from there to discoveries that are for them, for us, of the workings of a social that extends beyond any one of us, bringing our local activities into coordination with those of others" (Smith, 2006, p. 3). Many IE researchers, including ourselves, examine the role of texts in the coordination of people's 'actual doings' in order to understand the social relations that operate, particularly at the front-line of people's work. Our data speaks to another form of coordination of teachers' work at the front-line. A coordination that we believe has strong resonances with Brian Massumi's view of affect as extending beyond the individual. For Massumi, it's not just about the individual in isolation from others because "affects... are basically ways of connecting, to others and to other situations. They are our angle of participation in processes larger than ourselves" (2015, p. 6). Massumi's treatment of affect as a "bodily movement", a "mode of activity" and the associated "capacity to come to do" (2015, p. 7) is for us, the glue that binds affect to the 'actual doings' that are the focus of an IE inquiry. Drawing on data collected from teachers and students working in classrooms in Canada and Australia, we explore ways in which a consideration of the effects of affect have extended our appreciation of how teachers' work comes to be coordinated, or not.

HIRSELAND, ANDREAS (*Institute for Employment Research*)

Mixing and Combining Methods: Unexpected Transitions from Welfare to Work

Qualitative research often attempts to give voice to those who live, e.g. as welfare recipients, in the shade of society. Social processes and mechanisms that shape life-courses, foster or restrict individual agency are much less at the core of qualitative inquiry and analysis. The presentation targets that field of inquiry by featuring a sequential explanatory mixed method design applied to detect the occurrence of statistically improbable events. Based on the standardized German panel survey 'Labour Market and Social Security' (PASS; ~15,000 respondents in ~10,000 households), carried out by Germany's Federal Labour Agency's research institute, more than 75 percent of German long term welfare recipients have multiple impediments such as low education, poor health, advanced age, immigrant status or obligations to care for children and other relatives. Their chances to find a job decrease continuously towards nil corresponding with the number of impediments and the duration of unemployment. Albeit, exceptions could be observed and conditions of their occurrence were traced back through qualitative inquiry. Aiming at reconstructing unlikely transitional pathways from welfare to work the study applied between-methods-triangulation, combining in-depth interviews focusing on biographies and episodic narratives on transition-processes with modified techniques of software-based qualitative network research, which provided insight of relevant actors and activities involved in the transition-processes. Taking the transition itself as the 'case', we came to understand, that impediments are no entity accessible to standardized measurement but rather a relational feature embedded in a multitude of structural conditions, social relations and dynamics. The presentation will address theoretical and methodological backgrounds of our approach and show how principles of agency, biographical reconstruction and structural embedding can be fruitfully applied to generate a model of the conditions under which transitions from welfare to work are more likely to happen.

RC21-402.4KERZHNER, TAMARA* (*Hebrew University of Jerusalem*)*Integrating the Informal Economy in Urban Development: The Politics of Transport Formalization in East Jerusalem*

Public transport is a critical pillar of 'the right to the city' for lower-income groups with limited access to cars in the global south. The state often lacks the political will or financial resources to provide it, and the gap is filled by private operators. While informal transport has substantial drawbacks, exploiting labour and often being unreliable, dangerous and expensive, there is a growing understanding that these services, and the informal economy more broadly, need to be included in delivering equitable urban development.

This study analyses the 10-year process of integration of Palestinian informal transport in Jerusalem by the Israeli government, which has been accused of marginalizing the Palestinian population of the city, but which is also responsible for daily services. Based on a survey of the eight separate operators, and interviews with regulatory bodies, passengers and community organizations, the research aims to theorize the motivation and ability of the formal state to incorporate informal operators, analyse which ones benefit, and understand under what circumstances this translates to improvements for passengers.

We find that the atomization that characterizes the informal transport sector undermines efficient planning from the point of view of the regulator, but also retains a locally-controlled service for neighbourhoods. This allows communities to maintain themselves as 'urban islands' by limiting mobility options, acting both as a source of autonomy under an occupying power, and shoring up local power structures. The state, meanwhile, requires operators conform to its norms in terms of technology, culture, management and politics, and it is able to increase regulation by providing funding conditionally, but shifting responsibility and accountability towards passengers onto the operators. Those with higher initial skills and capital are able to consolidate, professionalize, and effectively access state resources, while others – and the communities they serve – are left out.

RC54-JS-27.1KESKINEN, SUVI* (*University of Helsinki*)*Postethnic Activism in the Neo-Liberal Era: Antiracist Feminist and Queer of Colour Mobilizations in the Nordic Region*

During the last decade, retreat from multiculturalism and othering narratives of Muslims and non-western minorities have characterized media and political discussions in many European countries. Racialized minorities have been framed as problematic outsiders claimed to separate themselves in 'parallel societies' and enhance illiberal cultures. Simultaneously, profound changes have occurred in conditions for political action. Neoliberal political rationality implies an emphasis on individualization and entrepreneurialism, but has also brought fore a call for civil society actors, such as NGOs and political subjects seen to embody diversity, in the public sphere.

This presentation examines postethnic activism in which people mobilize on basis of their racialized minority position in the society rather than on ethnic group membership. Based on interview, observation and media data gathered in Sweden, Denmark and Finland, the presentation explores the new forms of organizing that antiracist feminists and queer of colour activists have developed in these countries. Several newly established networks and social media platforms have mobilized especially young people, who are born and raised in the Nordic countries but not accepted as part of the national (white) community. Young feminists and queer of colour activists have established platforms developed 'by us for us', often using separatist strategies in relation to gender, sexuality and/or race/ethnicity. But several of them also write in mainstream media, creating new public spaces as journalists, columnists or commentators (often on temporary basis). This presentation discusses the variety of strategies that antiracist feminists and queer activists of colour have adopted, as well as the neoliberal, gendered and racialized power relations within which this activism navigates.

RC06-139.5KESLER, CHRISTEL* (*Colby College*)*More School, More Work? Variation in Early Childhood Education and Mothers' Employment across U.S. States*

In recent years, young children in the United States have, on average, attended more school. This is the result of more widespread (and in some states universal) pre-school or pre-Kindergarten, as well as a gradual shift over recent decades from part-time to full-time Kindergarten programs. While there has been significant scholarly attention to the implications of these changes for inequalities in children's educational outcomes, we know less about the implications for the work-family lives of parents, and for employment patterns of mothers vs. their childless counterparts, in particular. In this paper, we leverage state-level variation in funding for and availability of early childhood education to examine impacts on mothers' employment. We draw on macro-level data from various sources, including the National Institute for Early Education Research (NIEER)

State of Preschool and State of Head-Start Yearbooks, as well as the Care Index of the New America Foundation. We combine the macro-level data with micro-level data from the Current Population Survey (CPS) and the Survey of Income Program Participation (SIPP). We pay particular attention to differences in the effects of early childhood education by parents' socioeconomic status, race, ethnicity, and nativity status, because we expect that state-level variations in funding for and availability of early childhood education will have greater impacts for more disadvantaged mothers. Explicit comparisons of immigrant and native-born parents also help to address concerns that local and regional attitudes and cultures may drive both policies concerning early childhood education *and* the employment patterns of mothers of young children, challenging our ability to identify causal effects of the education programs. We conclude the paper with a discussion of the importance of considering the role of early childhood education in the lives of both children and parents.

RC42-725.8KESSLER, GABRIEL* (*Universidad Nacional de La Plata-Conicet*)*¿Puede La Psicología Social Contribuir a Una Agenda De Investigación Novedosa En La Desigualdad De América Latina?*

La desigualdad ha sido uno de los temas más trabajados en los últimos años en las ciencias sociales en general y en América Latina en particular. Con controversias, hay consensos sobre una tendencia a la disminución de distintas desigualdades en América Latina en la última década. Esto plantea un interrogante por ahora poco trabajado: ¿cuáles son las consecuencias y las reacciones frente a la disminución de la desigualdad? Me interesa cómo lo que sucede en los niveles micro y meso y se conectan con la escala macro influyen en la desigualdad general. Se trata de ver el pasaje de los factores micro y meso a nivel macro en cuanto a procesos cognitivos, narrativas, acciones cotidianas y mecanismos institucionales. El objetivo de la presentación es plantear líneas de debate en el estudio de las desigualdades en Sociología a partir del relevamiento de trabajos de psicología social y psicología política y datos de América Latina y otras regiones. La presentación presentará hipótesis y líneas de investigación futura para una mayor comprensión de la desigualdad en América Latina ¿Por qué estas dimensiones son hoy importantes? En América Latina la inclusión económica y la mayor democratización han que al tiempo que se mantiene una fuerte segregación residencial y escolar, las interacciones entre clases y grupos distintos se han intensificado. Nuevos derechos también conlleva mayor visibilidad en los espacios urbanos de grupos más conscientes de sus derechos. Tampoco la extensión de políticas sociales deja indiferente a gran parte de la sociedad. Es preciso poner la atención en estas implicancias y las reacciones de distintos grupos ante la disminución de la desigualdad a nivel micro y meso. Los aportes de la psicología social y política sobre estos temas son un área de vacancia en los estudios sobre desigualdad en América Latina.

RC34-621.8KESTILÄ, LAURA (*National Institute for Health and Welfare (THL)*)KARVONEN, SAKARI* (*National Institute for Health and Welfare (THL)*)PARIKKA, SUVI (*National Institute for Health and Welfare (THL)*)*Inequalities in Young People in Finland – a Comprehensive View on Dimensions of Well-Being*

Background: Differences in well-being have roots in childhood living conditions and early experiences that develop over the life-course. There is some evidence that inequalities in well-being exist already in youth but most studies focus either on single indicators or on a specific dimension. Few studies are able to provide a comprehensive view covering several dimensions of well-being. Objectives: Following Erik Allardt's conceptualization, we defined three dimensions of well-being: having (material and impersonal needs), loving (social needs) and being (identity i.e. needs for personal growth). The study aims to explore how different dimensions of well-being in youth are structured by socioeconomic status. More specifically, we analysed how well-being of young people aged 14 to 18 old varies by i. the family background (mother's level of education) and ii. the type of secondary level school (vocational institutes (VI) vs. upper secondary general schools (USGS)), and in addition, whether these intersect with gender. Furthermore, secular trends between 2013 and 2017 in the social patterning of well-being were analysed. Data: Questionnaire data derive from the School Health Promotion Study that covers biannually all Finnish primary schools (response rate 63%) and USGS (50%) and VI's (40%). Results: The results indicate that well-being of young people varies clearly by mother's educational level but differences are smaller according to the type of the secondary level school. Gender, however, interacts with both family background and the type of school. Over the study period the inequalities observed seemed to vary quite little regardless of the level of the factor. Conclusions: Young people having a mother with only basic education appear quite consistently worse off suggesting that the differences deriving from childhood are important in diversifying the life-course in youth. However, these associations are not uniform as gender and to some extent also the type of school intersects with them.

RC33-598.3KEUSCH, FLORIAN* (*University of Mannheim*)SAJONS, CHRISTOPH (*Walter Eucken Institut*)STEINER, SUSAN (*Leibniz University Hannover*)LEONARD, MARIEL MCKONE (*University of Mannheim*)*Using Smartphone Technology for Research Among Refugees in Germany*

Researchers attempting to survey refugee populations face a number of methodological issues, in part due to their transiency. Collecting longitudinal data using traditional methods (e.g., f-2-f, telephone) is a particular challenge. We explore the use of smartphone technology as an alternative data collection mechanism, combining passive mobile data collection, i.e. the automatic collection of smartphone data about an individual's behavior, with mobile web surveys. While passive mobile data collection is still a relatively unexplored method, this approach allows for collecting richer and potentially more accurate data than just self-reports from surveys. However, whether people in general and refugees in particular are willing to participate in such studies allowing automated data collection has not been studied yet.

We first conducted personal interviews with refugees in Germany. As part of the interview we collected consent to contact participants again via email or WhatsApp message for further data collection on their smartphones. Participants were then invited to participate in four follow-up web surveys over the course of three months about different aspects of their integration into Germany, labor market participation, personality traits, and political positions. In addition, participants were invited to download a research app to their smartphones for passive mobile data collection to infer measures of refugees' mobility, social interaction, and labor market participation over time. We also conducted an experiment on the effect of incentives on participation rates.

Overall, we found that refugees are very skeptical towards passive data collection; we had low participation rates in the app experiment: 7% compared to 30% and 13% for the first two surveys, respectively. Additionally, the incentives provided a slight but insignificant positive effect on participation.

RC40-702.4KHAIRNAR, DILIP* (*Deogiri College, Aurangabad(M.S.)*)KHARAT, KIRAN (*Deogiri College, Aurangabad*)*Farmers' Suicides in Marathwada Region (India): Understanding Causes and Remedies.*

Farmers from Marathwada region (India) are in a very stressful conditions. The increase in number of suicides every year leads to the introspective analysis of the problem. Suicide is not related to biological or cosmic phenomena, but a social phenomenon that consists of family, political, economical, social and religious groups. We found various reasons for the suicides of the farmers in Marathwada region like- Frequent droughts, economic crises, debt, health issues, and family responsibilities, changes in the government policies, alcohol addiction, low produce prices and poor irrigation facilities are among some of the common factors that contribute to farmer suicides in Marathwada. In this report, we also suggest four important remedies for the suicide prevention -Supply of farming aids, improved traits of seeds, the potential market for the farm products and education and counselling facilities for the social values and well-equipped gramsabha.

RC33-609.3KHAN, IQBAL* (*Self Employed*)ROTH, CHRISTIAN (*Agricultural Systems Program CSIRO Ecosystem Sciences*)GRUNBUHEL, CLEMENS (*Asian Institute of Technology, Bangkok*)*Doing Participatory Research in a Patron-Client Society: Learning from Developing Multi-Scale Climate Change Adaptation Strategies for Farming Communities*

In recent times, focus has been given more on Community Based Adaptation practices in understanding and addressing modern drivers, such as climate change and their impacts on local populations. Today the use of participatory methods when working in a local community is considered a must. The problem, in doing so, is with the notion of community which is practically in many societies not homogeneous. Rather, local rural communities are complex social systems, which include multi-layered hierarchies and patron-client socio-economic settings. This paper links the challenges and opportunities in practicing participatory climate change adaptation research in a patron-client social arrangement in Bangladesh - the outcomes of the project entitled 'Developing multi-scale climate change adaptation strategies for farming communities in Cambodia, Laos, Bangladesh and India'. We examine experiences made in the participatory analysis of socio-

ecological dynamics in the saline prone area of the *Sundarbans*, in the Khulna district of SW Bangladesh. In our discussion, we reflect on difficulties and options in administering participatory socio-ecological research in a patron-client society to foster better involvement of farmer community.

RC11-220.4KHAN, MEHEDI HASAN* (*Department of Population Sciences, University of Dhaka*)*'Responsible Innovation in Public Policies Oriented to Ageing Population' in Bangladesh: A 'Medium Human Development' Country's Initiatives*

Bangladesh, the 8th largest populous and a 'Medium Human Development' country in the world in 2016 is gradually moving to adapting with the emerging ageing context of the country. The main objective of this paper is to discuss different recent public policy initiatives for the aged population. Aged population has gradually appeared in the population-development landscape with a significant 7.5 percent which constitute an overwhelming 11.3 million people in the last Population and Housing Census 2011. A significant enthusiasm is observed to dealing with this huge vulnerable population in the urbanization-modernization induced changing milieu of a traditional society where aged people's status and roles were diminishing. Government has declared the 'National Policy on Older Persons 2013'. A very innovative law named 'Feeding and Lodging to Parents Act 2013' was enacted to legally ensure food, housing and other related maintenance provisions for the aged parents by their children. Aged people were declared as 'Senior Citizens' by the President of the country in 2014. The 8th National Pay Scale 2015 has conceived an idea of a three-generation family composed of husband-wife, children and grandparents to fix proper salary structure and housing provision of an employee. The ageing issues are also addressed in National Health Policy 2011, Bangladesh Population Policy 2012. The major public policies have incorporated the ageing issues under the broad umbrella of population and development. Emphasis on increased ageing research and academic activities, increasing amount and coverage of different social safety net programmes, celebration of different ageing related days, major political parties' awareness are some of the examples of the ongoing activities for the aged population. An attempt to understand these recent legislative, policy and planning changes is proposed here for the understanding of these adaptations with the emerging ageing society in Bangladesh.

RC26-JS-23.3KHAN, TAHSINA* (*American International University-Bangladesh*)*Microfinance Interventions of Social Enterprises in Promoting Sustainable Development: Evidences from Bangladesh*

Purpose of the paper: This research explores the emergent micro-finance interventions of social enterprises to stimulate sustainable development in Bangladesh, which are not sufficiently addressed in current social enterprise debates and discourse. From the context of developed new triple bottom line products, services and business models from the social entrepreneurs, this paper encapsulates the development implications derived from the social enterprises in the country.

Rationale of the study: Despite the persistent poverty and climate change adversity, Bangladesh sustained a notable advancement in recent years with gross domestic product growth exceeding 6% from the period of 2013-2016. To comprehend this development conundrum, social investors and scholars in development studies, denote several key factors including an active civil society and social business ventures initiated by government and non-government organizations.

Methodology: By utilizing Key Informant Interviews and field observation, the paper manifests the socio-economic and environmental welfare derived from the evolving social enterprise communities in the country. To inform this proposition, this study additionally consolidates the development initiatives and micro-finance experiences from the pioneering rural development organizations in Bangladesh, BRAC, Grameen Bank and other non-government organizations.

Findings and implications: In spite of being home to two world-famous social enterprises, presently, Bangladesh has no explicit policies required to govern and nurture the diverse social enterprise fraternity. As multidisciplinary considerations are essential in achieving sustainability, this paper attempts to identify the stakeholders in the domain of social enterprise and suggests a framework on multilateral collaboration consisting of policy makers, social investors, practitioners and scholars worldwide. In doing so, the study aims to set out the current theoretical landscape of social enterprise development.

Research significance - This paper sheds light on development potential from triple bottom line landscape and proposes a holistic framework for the sustainability of social enterprise research.

Nuclear Waste Risk Governance

The management of nuclear waste is a big problem for even the most technologically advanced societies. The risk associated with the nuclear waste is the inherent radioactivity of the waste itself which makes it practically impossible to keep it isolated and to prevent it from contaminating the ecosystem of the surroundings by exposing it to dangerous radiation. This is due to the extraordinarily long half-life of the radioactive elements which are part of the waste. Half-life of an element is a measure of the time in which its radioactivity is reduced by 50%.

There is no extant technology on the planet that can safely dispose of the nuclear waste generated. This scientific fact should be made known to all the stakeholders involved. Even the most technologically advanced societies are at a loss when it comes to finding a safe way to dispose nuclear waste. One of the effective ways to dispose it till date has been burying the waste deep under the surface of the earth. This may prevent the surrounding ecosystem from getting contaminated for the time being, but this disposal method has its limitations. One of the factors to be taken into account is the fault lines in the earth's crust which often lead to earthquakes. Such events may cause the sealed vaults of nuclear wastes to rupture, thus, endangering the surrounding ecosystem.

Nuclear waste is generated primarily as a result of electricity generation in nuclear reactors. Nuclear energy is projected as a cleaner alternative to the fossil fuels for electricity generation by policy makers. It is highly imperative for the policy makers to communicate the risk of nuclear waste and the associated problems of nuclear waste management to the general public before pursuing the path of electricity generation by utilizing nuclear energy.

Political Dissent in Society

Howard Zinn had said, "*Dissent is the highest form of patriotism.*" This does not seem to be how things appear to most people in power across the world. Evelyn Beatrice Hall had written: "*I disapprove of what you say, but I will defend to the death your right to say it*" as an illustration of Voltaire's beliefs. Unfortunately, the space for a civil debate about differing opinions regarding issues of common interest has shrunk considerably in our society.

The governments across the world seem to be bent upon a kind of surveillance that is alluded to by George Orwell or Aldous Huxley. They are making every attempt that either dissent does not arise at all or that it is seen as a criminal activity. Organisations like WikiLeaks and people like Edward Snowden, who undermine the narratives which the world powers offer for their activities and attempt to uncover the hidden facts and motives behind those activities by providing us with alternative narratives, are forced to go underground.

Another example would illustrate the ways in which political dissent is being criminalized in developing societies. In India, there is prominently a single media company speaking truth to power and its founders have had to face the music for doing so. There have been numerous attempts to silence their dissenting voice.

The treatment of political dissent as a criminal activity has serious implications for the society. Conformity with the political norm is a refined form of mob mentality. Political dissent, that is deviations from the norm established by the political powers, reflects the freedom of expression which is essential for the healthy functioning of democracy in any society. Treating dissent as a criminal activity seriously undermines the right to freedom of expression which is the core characteristic of democratic societies.

The Politics of Housing and New Property Ownership Regime in Iran

The urban land has become a highly contested issue in urban politics and planning as steep rise in land prices has continued in last three- four decades. The value of land relative to GDP fell constantly in 19th and first half of the 20th century. Since then it started to increase. In 1980 economists suggested that just as increase in agricultural productivity led to a decline in the relative value of agricultural land, the relaxation of strict limits on urban development would lead to a decline in the relative value of urban property. As a result, the rising skyscrapers and development of the suburbs were to lower the prices of the urban land-- by adding the land supply or increasing its productivity, in the process of planetary urbanization. 'Land grabbing' supposed to reflect the 'demand' for shelter (Ansoms 2014; Kaag and Zoomers 2014; Liberti 2013), and less regulation supposed to serve the "supply" side (Glaeser 2015).

Looking at changing governance of urban land one decade after the 1979 revolution in Iran, this paper examines unleashed speculative activities in the real state market supported by the 1990 urban reform in Tehran. My focus is on major

legal changes in land ownership, property rights and land use regulating practices and their dramatic effects on urban inequality and polarization of households' assets. Comparing the impacts of intensification policy (irregular extra construction permits for larger plots of land) on two different neighborhoods in Tehran, this paper suggests property rights matter most for wealth inequality, which tends to be more extreme and stable than income inequality. Intensification policy works against the very small landlords and tenants in Iran and condemned them to live in their old units till the building collapses. Tenants are the main losers of such policy.

Does One Size Matter?

For the past few decades, Western bullying researchers defined bullying pragmatically based on three distinct characteristics, which includes the asymmetrical power relation, the intention of inflicting undesirable actions, and the repetition and continuity in the occurrence of the adverse actions (Olweus, 2003). Dan Olweus (1993) first introduced these features in response to three cases of suicides among Norwegian young boys (Kallestad, 2012). His sample selection was homogeneously selected based on convenience and availability of Caucasian youth (Statistics Norway, 2016). However, this homogeneity did not stop bullying researchers from using Olweus's results as their theoretical background. Based on the current researches, laws and regulations are introduced to prevent and control bullying among diverse youth population (Kandel, 1978; Byrne, Ervin & Lamberth, 1970). With popularity of multicultural ideology, the majority of bullying research participants remain to be from the dominant culture (Omidvar, Richmond & Laidlaw Foundation, 2003). The homogeneity of the participants results in biased outcome, which fails to represent the ethnically diverse Canadian populations. Based on an ongoing research, which I began in India, the results revealed that cultural relativity of the bullying phenomenon renders the field inaccessible for all ethnic groups. Through my three-month long research in India, I revisited a fundamental question: Does one size fits all? I explored how one can relate a fatally violent phenomenon to a population whose language has no word or a different term to describe the phenomenon. My research in India demonstrated the unfamiliarity of the Indian youths with the Western concept of bullying. Yet, my research confirmed the Indian youths have a culturally specific concept with characteristics which are fundamentally different from the globally recognized bullying characteristic.

KHOO, SU-MING* (National University of Ireland, Galway)

State Institutionalization of Left and Radical Social Movements in a Context of Inequalities – Comparative Insights on the Dynamics of Contestation, Incorporation and De/Politicization

This paper offers ways to theorize complex historical assemblages of social movements, political institutions and state power over time. Taking a comparative historical approach, this paper highlights temporal processes and institutional dynamics, when comparing rich historical case-studies. The first empirical paper examines how diverse social movements resisting military dictatorship in Brazil were channelled into an electorally successful political party, PT. From 2003-15, PT introduced innovative social policies – these later stalled in the wake of Rousseff's 2016 impeachment and authoritarian turn. The next contribution examines state institutionalization of one specific social policy: conditional cash transfer (CCT) programmes, comparing Brazil's *Bolsa Familia* with Philippines' *Pantawid*. CCTs can be understood as attempts to politically institutionalize leftist social demands via progressive policies in a post-dictatorship context. Alternatively, CCTs might be seen as relatively low-cost measures stabilizing broader neoliberal dynamics by taming radical political demands without ameliorating inequalities. The comparison of two major programmes enables the identification of distinct phases and strategies: redistributive programmes initially integrating and expanding social-democratic demands, followed by recapture or retrenchment of the state redistributive institutions and programmes by countervailing political forces. The final paper examines the historical institutionalization of progressive social movements in Ireland, leading ultimately to stalled social partnership arrangements. A theoretical framework for considering the institutionalization of left social forces should address the dynamics of crisis and recession, trends of diminishing unionization, the structural role of unemployment and precarious work, and the changing socio-political imaginary of the 'millennial generation'.

Methodologically, comparative historical analysis (CHA) extends critiques of assemblage theory, connecting social movement, institutional and state-oriented theories, enabling new research perspectives and questions to emerge. This framework opens out discussion about how far social movements can go in seeking to articulate and institutionalize social-democratic and redistributive demands within broad trends of rising inequality, insecurity, precarization, authoritarianism and violence.

The People's Health Movement: Understanding a Transnational Network's Contribution to Global Health Governance

This paper places a sociological spotlight on the Peoples Health Movement (PHM), a transnational social movement mobilizing for 'Health for All' globally. Emergent, organically evolving and apparently less-coordinated, 'bottom-up' networks are important in global health governance, but they can prove difficult to define, analyse and theorize sociologically. This paper presents a grounded theory analysis of the People's Health Movement, based on a thematic content analysis of its networked communications. The data consisted of all email messages (n=244) communicated via PHM's global email listserv, the PHM-Exchange, during one calendar year, 2016. Synthesising global sociology, transnational social movement theory, international relations and communications theory, we define PHM as a **transnational connective mobilization network**.

PHM messages communicate a paradigm of global health governance centred on the rights-based approach and Social Determinants of Health, substantiating PHM as a global network mobilizing towards Health for All. PHM messaging operates on two levels: (i) country-level communications typically mobilizing local support and actions, and (ii) global-level communications performing a "watching" role: documenting, educating through international advocacy, and sharing information. The two levels build solidarity, however key tensions can also be identified: messages show a critical awareness that North-to-South communicative dominance may potentially compromise equitable networking, while the discursive shift from Primary Health Care to Universal Health Coverage may detract from primary, preventive and promotive priorities, while favouring service-delivery.

PHM does not fit definitions of a civil society or social movement organization, nor can it be evaluated as social movement organizations are conventionally, viz. success or failure in securing the aspirational 'health for all' goal. It functions as a peer network, significantly influencing the complex and changing landscape of global health, countering some dominant discourses, while steering the global governance agenda towards gradually realizing the conditions which may one day make health for all possible.

KAMANO, SAORI (*National Institute of Population and Social Security Research*)

Same-Sex Partners and Practices of Familial Intimacy

Drawing on the findings from two comparative research projects on Japan and Hong Kong, one related to mother-(non-heterosexual) daughter relationships and another related to legal recognition of same-sex relationships, this paper looks at how family relations and norms are negotiated, challenged and/or reinforced through the practices of intimacy of non-heterosexual daughters and their partners in their relationship with their mothers, and also the kin work these daughters and mothers perform in extended familial relationships. Preliminarily we found that lesbian-identification and the presence of a female partner does not interfere with the practice of intimacy, and indeed, disclosure and acceptance by the mother of the daughter and her partner could enhance intimacy. For some, it provides an additional target for the mother to perform mothering. When accepted, female partners are more readily integrated into the kin network than a male partner is, whom many heterosexual daughters in both Hong Kong and Japan have described as "function-less". For some, seeking legal recognition consists in negotiating obligations and priorities with their family of origin, which could result in a closer couple relationship rather than an integration of the same-sex partner into an extended kin network. In considering whether to seek legal recognition or not, however limited the protection is, many share anxiety about the future, and such consideration is at times iterated with little reference to kin relations, and rather more about the everyday world of neighbors, workplace, hospitals, insurance companies and so on. It raises the question of whether legal recognition might restrict freedom and creativity in negotiating kin relations for same-sex partners and their parents.

An Investigation of the Relationship between Social Trust and Political Participation (a Case Study of Citizens of Gorgan, Golestan, Iran)

The aim of the present study is to investigate political participation with an emphasis on the role of social trust among citizens of Gorgan in Iran. The theoretical framework is based on the theories of scholars, namely as Lipset, Almond, Verba, Engelhart, Nelson and Huntington. Methodologically, this

research study can be categorized as a survey whose data has been collected by using a researcher-made questionnaire in the research field. The population of the present study consisted of all citizens of Gorgan, north of Iran, based on which 407 people were selected as a sample through stratified random sampling and thereby they were studied. In doing so, face validity was used to prove the validity of research variables and Cronbach's alpha coefficient was used to assess the reliability of the research tools, which were determined for social trust (0.778) and political participation (0.780) respectively. The results of testing the hypotheses showed that there was a positive and significant relationship between social trust and its different dimensions (i.e., institutional trust, public trust and personal trust) and political participation and its different dimensions (electoral behavior and active participation). Furthermore, the results of the regression analysis indicates that, in total 61 percent of the changes in dependent variable can be explained by variables of social trust, age, gender, marital status, and education.

KIA, HANNAH* (*University of Toronto*)

We're Here: Subjugation and Resistance in Older HIV-Positive Gay Men's Experiences of Seeking and Receiving Care across Health Settings

Despite the prominent role of systemic discrimination in impeding equitable access to health care among older HIV-positive gay men, this population's subjective accounts of subjugation in health systems remain limited in the literature on gay aging. Accordingly, this qualitative study sought to investigate experiences of subjugation among older HIV-positive gay men in health settings, and to examine this population's accounts of resistance to such mechanisms of marginality. To this end, 16 Toronto-based HIV-positive gay men over age 49 underwent semi-structured interviews in which they were asked to reflect on their cumulative experiences of seeking and receiving care in health settings. Drawing on poststructuralist traditions of grounded theory to inform data analysis, these accounts were then used as a basis from which to infer discursive processes of subjugation and resistance that may be most salient for older HIV-positive gay men in care contexts. The accounts of participants revealed, among other findings, (1) complex intersections of gay identity, HIV history, and aging experience as potential targets of subjugation and sources of resistance across health settings, and (2) the role of informal and formal HIV care networks in both reinforcing historical conditions of subjugation and catalyzing opportunities for change. Unique configurations of identity and life history, among other factors, often constituted grounds for variable experiences of subjugation in health settings among older HIV-positive gay men with diverse social locations. HIV care networks, though often entangled with the legacy of HIV stigma, appeared to potentiate resistance among those in this population. The study's findings promise to inform the development of health care policies that more closely address the intersectionality of subjugation among older gay men living with HIV, along with practice initiatives that capitalize on the emancipatory potential of HIV care networks.

KIDA, YUSUKE* (*Sugiyama Jogakuen University*)

The Rise and Fall of Populist Mobilization: The Urban Populist Movement in Nagoya, Japan

Political mobilization is a difficult task in the age of "post-democracy" (Crouch 2003). Populism, that is, populist mobilization (Jansen 2011), is a solution for political mobilization, although it has been criticized from a normative point of view. Populist politicians try to lead people to act collectively to support them (Mudde & Kaltwasser 2017). Cities in Japan are no exception to populism. This paper analyzes a populist movement in Nagoya, which is the third-largest city in Japan. It indicates how a populist movement rises and falls in a contemporary city.

Takashi Kawamura has served as mayor of Nagoya since 2009. His political belief is in local economic prosperity through a tax cut. He often criticizes "too professionalized" corrupt politics and calls for political reform for "ordinary" and "amateur" people using mass media. He organized a recall campaign against the city council in the summer of 2010. In the recall referendum of 2011, 73.35% of the voters approved the recall. In this process, he established a local party, *Genzei Nippon* (Tax Cut Japan (TCJ)). However, TCJ failed to get a majority in the city assembly election of 2011. Furthermore, TCJ members met with severe criticism because of their political scandals.

According to a quantitative data analysis using the logistic regression model, participation in the recall campaign strongly encouraged people to vote "yes" in the referendum. This indicates that not only media power but also direct participation is important for populist mobilization. However, another analysis shows that the participation increases support for TCJ only slightly. In sum, Kawamura succeeded in his personal leadership and the recall movement but failed to give power to his party. The populist movement is explosive, but it is so short-lived because of the difficulty of continuously organizing city dwellers.

RC05-115.3KIDMAN, JOANNA* (*Victoria University of Wellington*)*Doing Time in the Colonized City: Indigenous Youth Solidarities in the 'Vivid Present'*

Colonization has fundamentally changed the shape and experience of time for indigenous youth. In public discourse, settler-colonial society is characterized as moving progressively towards a united, equitable and just future for all its citizens. Native youth experiences of the colonial state are largely absorbed into redemptive storylines of nationhood that take for granted that the harshest injustices of the settler past are resolved and that they shall, accordingly, derive a sense of national belonging as indigenous citizens in a shared future.

For indigenous Māori youth in New Zealand, creating a 'vivid present', what Alfred Schütz referred to as a collective experience of time tied to both past and future, requires that they step outside these colonizing narratives into different sites of temporality where Māori time-space perceptions take precedence. In these sites, time-space relationships are shaped around intergenerational collective memories of colonization, invasion and dispersal/landlessness but they are also spaces where indigenous solidarities and communities of cultural resistance are established.

This paper is concerned with the chronopolitics of Māori young people's lives in the racialized spaces of the settler-colonial city. Drawing on a study about young people's hopes and fears about the future, we examine how three groups of urban Māori youth living precariously at the economic margins navigate competing temporal frames of reference. We focus on how they mobilize and deploy 'native time' to imagine an extended range of possible futures for themselves that would otherwise be limited by the urban 'clock-time' of the colonial nation state.

The social lives of indigenous youth are under-theorized in much sociological research but we argue that these kinds of studies have the potential to disrupt white temporalities and activate a broader range of thinking about alternative indigenous futures.

RC18-337.1KIENSCHERF, MARKUS* (*John F. Kennedy Institute for North American Studies, Freie Universität Berlin*)*Indeterminate Security Governance: US Policing As Pacification*

As security threats in and to Western (neo)liberal regimes are problematized as increasingly ambiguous and amorphous, security 'solutions' prescribed to counter perceived insecurities have become more and more indeterminate. The broadening of the concept of security to include an ever-wider array of interlinked risks, insecurities and threats has brought about responses that completely blur what is still left of any boundaries between policing, intelligence operations and warfare. Yet, attempts to critique contemporary (neo)liberal security are still lagging behind, because the scholarly analysis of security continues to be structured by the dichotomy between internally pacified state territory where security is enforced by the police and the sphere of international relations where at least a semblance of security is provided by the armed forces.

This paper will argue that contemporary (neo)liberal security governance is best understood as a form of pacification. Pacification combines risk management and sovereign violence into a political technology for reproducing a racial and class order formatted according to the imperatives of capital accumulation through the selective and differential targeting of particular populations and spaces. This political technology aims to (re)produce more pliable populations through a combination of coercion and consent, while trying to weed out those who are deemed recalcitrant to (neo)liberal rule. Pacification, moreover, highlights the complex cross-fertilizations of security governance across metropole and colony.

This paper will use the analytic of pacification to discuss how US domestic policing has been and continues to be shaped by experiences of foreign security governance. Thus, the paper will, on the one hand, show the critical force and explanatory value of the analytic of pacification through a genealogy of US domestic practices of policing; while trying to bridge some of the disciplinary divides between critical security studies, on the one hand, and research into domestic urban policing, on the other.

RC01-41.3KIENSCHERF, MARKUS* (*John F. Kennedy Institute for North American Studies, Freie Universität Berlin*)*Violating Boundaries in the Name of Self-Governance: The Violence of (Neo)Liberal Intervention*

Whenever we talk about borders and boundaries we also inevitably talk about sovereignty in the double sense of supremacy and autonomy. Turned inwards, sovereignty means having control or jurisdiction over something. Turned outwards, sovereignty means a capacity for self-rule, for independent action. Sovereignty – in the sense of an individual and collective capacity for self-governance – thus inevitably entails a boundary between an internal sphere

over which one has control and an external sphere where one has the capacity for independent action. The link between self-governance and the construction of boundaries underlies both state-making and the establishment of private property. The capacity for individual and collective self-governance also happens to be a guiding principle of (neo)liberal governmentality.

But what about the violation of boundaries, and hence also of self-governance? (Neo)liberal violations of individual and collective boundaries, including the violent and lethal transgression of bodily boundaries, is often based on problematizations of sovereignty. Western state and non-state actors intervene in the internal affairs of sovereign states while claiming that bolstering the very sovereignty of the state being intervened in is a key objective of their intervention. At the same time, state and non-state actors regularly intervene in the lives of citizens for the sake of improving their capacity for self-governance. (Neo)liberal rationalities and practices of intervention thus problematize individual and collective autonomy and deploy specific governmental assemblages to (often coercively) violate the boundaries of those who are seen as incapable of responsible self-governance – both at home and abroad. The production and protection of self-governance frequently entails the, often brutal, violation of the very boundaries that guarantee the capacity for self-governance. This paper will critically interrogate the illiberal consequences of (neo)liberal violations of individual and collective boundaries that frequently occur in the very name of self-governance.

TG04-973.5KIERSTYN, ANNA* (*University of Warsaw, Institute of Sociology*)*Job Precarity and the Life-Course – How Polish Youth Manage Their Unstable Lives*

The way that increasing labor market risks impact the young and their transition to adulthood has become an timely and policy-relevant subject of inquiry. In particular, a much-debated issue concerns the potential effects of the growth in atypical employment on the biographies of labor market entrants. In Poland, these issues are of special significance: the rates of temporary employment among youth are among the highest in Europe, and precarity for young workers appears to have become the norm. In addition, recent studies suggest that the transition rates from temporary to stable employment are low, so many workers entering the labor market over the past years face high risks of prolonged job instability. Under such conditions, an important question concerns the ways that young precarious workers perceive their current situation and prospects for the future, how they cope with labor market risks, and how these perceptions and coping strategies affect their biographies.

This paper addresses these questions through an analysis of 34 qualitative interviews, conducted in 2016 among young (age up to 40) Polish temporary workers who have completed full-time education. The interviews offer a vivid illustration of the economic risks associated with precarious employment, and the process of individualization of risk (Beck and Beck-Gernheim 2002), whereby the young view (and legitimize) their job and life trajectories as self-constructed and not subject to structural constraints. For a broader view of the life-course outcomes of labor market risks portrayed in the interviews, I supplement the qualitative results by an analysis of quantitative data from the Polish Panel Survey POLPAN 1988-2013. POLPAN is a rich source of biographical information for a representative national sample of Polish adults, enabling the assessment of long-term trends in the timing of key biographical events, such as: leaving the parental home, migration, marriage and childbirth, across successive cohorts.

RC30-541.4KIERSTYN, ANNA* (*University of Warsaw*)*The Empowered and the Powerless: How Polish Youth Experience Their Precarious Careers*

In the past decades, the precarization of work has become a subject of concern among scholars and policymakers, due to the growth in the incidence of non-standard employment arrangements, such as fixed-term jobs, temporary agency employment or free-lance work. The young are among the ones most affected by these processes: their access to well-protected insider jobs is often limited, and many of them now face the prospects of unpredictable careers consisting of recurrent spells of short-term employment. However, the link between 'objective' job precarity and subjective perceptions is far from obvious – unstable employment may be defined and experienced in differing ways, depending on individual characteristics, family situation or workplace relations. For some, precarious jobs may be associated with independence and regarded as an opportunity for professional development, while for others, they bring about a sense of vulnerability and entrapment.

I identify three mechanisms which may shape these perceptions among young precarious workers. The first assumes that their bargaining power, determined by the level and specificity of skills required to perform their jobs and the ease of performance monitoring, is the main factor affecting perceptions of security. The second associates such perceptions with precarious workers' access to various coping resources, such as a sense of self-efficacy brought about by individualization, or economic and social support. Such resources, by minimizing the negative

psychological and economic impact of possible job loss on workers, allow them to maintain a positive view of their careers. The third focuses on perceptions of (in)justice: viewing their employment relations as 'fair' and 'reasonable' is likely to decrease precarious workers' perceptions of insecurity. In this paper, I analyse these mechanisms on the basis of qualitative data from in-depth interviews with young precarious workers in Poland, and discuss their implications.

MWANGI, PHYLLIS (*Kenya University*)

Hate Speech on Social Media: Uncovering the Language Crevices Where Hate Mongers Hide

In Kenya elections have a history of being divisive. This has become very pronounced in the 2017 disputed presidential poll in which campaigns have become synonymous with hate speech. The hate speech is not limited to campaign trails or to politicians: it has spewed into social media platforms and the perpetrators are supporters of the politicians. Kenya has a law against hate speech, but the said law has led to no convictions and has therefore done little to tame hate mongers on social media platforms. Indeed, the National Integration and Cohesion Commission has considered shutting down social media platforms in the run up to the repeat presidential election (October, 2017) as the only way to ensure that these sites are not used to lead the country to chaos. For some, this would be a violation of fundamental freedom of expression guaranteed in the constitution but the Commission argues, it would be a necessary move to ensure that hate speech on social media platforms does not lead to physical violence. Many have lamented the rise in hate speech and the apparent inability by concerned authorities to reign in the perpetrators. This paper poses the general question: is it totally impossible to deal with hate speech on social media platforms? Drawing data from the legal statutes on hate speech, selected Facebook and Twitter posts as well as online blogs, and interviews with legal experts the paper sought to answer this question. Preliminary finds show there are language crevices in the National Cohesion and Integration Act (2008) make it difficult to prosecute hate speech. In addition, there are linguistic features evident in hate posts that make it difficult to prosecute them as such. Give these findings, the paper suggests a language based criteria can be used to determine hate speech

RC22-405.24

KIJONKA, JUSTYNA* (*University of Silesia in Katowice*)

Between the Polish Catholic Mission and the German Catholic Church: A Case Study of (Spät-)Aussiedler from Upper Silesia in Poland

The paper discusses the problems of the national, ethnic and regional identity of (Spät-)Aussiedler from Upper Silesia in the context of the language of religious practices. For this group of migrants, the choice of the language of the service, prayer and confession often was and is still combined with their national identity, biography and the religious socialization from the region of their origin and the peculiarity of the Catholic Church in Upper Silesia.

Migration from Poland to the Federal Republic of Germany after 1970 was one of the most significant demographic processes not only for Poland, but also for Germany. Between 1970 and 2000 more than one million Polish citizens – especially from Upper Silesia – were recognized as being of German descent. Some of the migrants joined the German Catholic Church and some joined the Polish Catholic Mission. There are also numerous groups of migrants who participate in both the German and Polish ministries. Emigrants from Poland who came to the Federal Republic of Germany as (Spät-)Aussiedler were mainly Catholic and are still an important group of the faithful in Germany.

The paper is based on research that I carried out on migrants who had come to West Germany from Upper Silesia between 1970 and 2000 and received (Spät-)Aussiedler status. An important part of that research was also the participant observations during religious services and pilgrimages. The data collected during an enquiry in the archives of the Bishopric of Essen is also analyzed.

In my paper, I will try answer the question of how and in which aspects regional and national identity determines the choice of the language of religious practices. The long time perspective and the characteristic of (Spät-)Aussiedler migrants from Upper Silesia and the differences between Polish and German Catholic Churches play important roles in my presentation.

RC38-677.7

KIJONKA, JUSTYNA* (*University of Silesia in Katowice*)

The Question of Language, Identity and Biography on the Example of Upper Silesians in Germany.

The main aim of this paper is to present the problem of the language of (Spät-)Aussiedler migrants from Upper Silesia in the context of their identity and biography. The paper is based on research that I carried out between October

2014 and July 2015 on migrants who had come to West Germany from Upper Silesia between 1970 and 2000 and received (Spät-)Aussiedler status. The research was carried out among different generations of migrants.

Although (Spät-)Aussiedler from Upper Silesia migrated to Germany without any acquaintance with the German language in most cases – German was the mother tongue only for the older generations, they wanted to assimilate as quickly as possible so they learned the new language, speaking only German and avoiding speaking Polish. Parents did not teach children their mother tongue, because at that time Polish was considered to be unnecessary. Hence, the second generation of migrants quite often did not speak Polish or possessed only passive knowledge of the language. This situation has changed, because after EU enlargement Polish became another language on one's CV.

Today, the choice of language is the choice of identity, and therefore Upper Silesians in Germany live in different social worlds depending on whether they speak German, Polish or the Upper Silesian dialect. Sometimes, they live in all three worlds at the same time, which can be seen briefly during the interviews especially when they are using different languages to describe different aspects of their own biographies.

In my paper, I examine how these life strategies – assimilation, speaking only the new language and avoiding speaking their mother tongue and speaking Polish/Upper Silesian dialect once again influenced the professional and private lives of the migrants, their communication with family members who remained in Upper Silesia and with their descendants in Germany.

Caregiving and Paid Work Among Midlife Women in Japan

Japan is one of the most aged countries in the world. The proportion of its population being 65 or older has increased rapidly, from 7% in 1970 to 27.3% in 2016. This rapid aging of the population has had two important consequences for women's lives. First, increased elderly population has meant that more women face the responsibility of caring for their elderly parents in midlife. Second, the relative scarcity of working-age Japanese, along with economic destabilization, has required more women to enter the labor market. However, these two roles—caregiving and paid work—are considered to be rather incompatible in social environments that continue to be based on gender division of labor.

How do Japanese women balance caregiving and paid work? Previous research documented a negative correlation between participation in the two activities. This negative association could result from either of the two possible causal processes: non-working women may be more likely to start caregiving than working women, and those women who become caregivers may be more likely to quit working. However, the causal relationship between women's caregiving and work decisions in Japan has not been fully elucidated up to this point because most prior research relied on cross-sectional data.

Drawing on the first two waves (2005, 2006) of a nationwide panel survey of Japanese adults in their fifties, this study explored the relationship between caregiving and employment among middle-age Japanese women. The results of multivariate regression analyses showed that the causal relationships are bidirectional: non-working women have a higher likelihood of providing care, while caregiving reduces the chance of participation in labor force. These findings will be interpreted in terms of the Japanese social context, in which the transition away from the traditional model of male breadwinners and female caretakers has not yet been fully achieved.

MUELLER-STIERLIN, ANNABEL (*Ulm University*)

Criminal Victimization, Social Capital and Mental Health: The Impact of Gender

Background: The experience of criminal victimization was found to have short and long-term negative effects on mental health, particularly PTSD, anxiety and depression. Social capital was identified in several studies as a factor reducing the negative impact of criminal victimization on mental health. On the other hand it is widely known that prevalence of depression and anxiety disorder is higher in women than in men. In this study it will be investigated, if the negative effects of criminal victimization on mental disorder are moderated by gender and if the moderating effect of social capital differs between sexes.

Method: In a representative study 3000 inhabitants of a major urban region in Germany were asked about their experience of criminal victimization, their perception of social capital and their subjective mental health status.

Results: Study results revealed strong negative effects of criminal victimization on mental health. As indicated by significant interaction effects the perception of

social capital was found to reduce the negative effects of criminal victimization in both sexes. While the negative effects of criminal victimization on symptoms of depression and anxiety were stronger in females than in their male counterparts, the moderating effects of perceived social capital was also stronger in women than in men.

Discussion: Negative effects of criminal victimization on mental health are stronger in women than in men. However, women seem to benefit more from the perception of good social relationships with regard to cope with the negative mental health effects of victimization.

Barrington Moore Jr. Revisited: Landlord, Peasant and the Collapse of Liberal Democracy in Central-Eastern Europe

In my paper I attempt to look at Barrington Moore's *Social Origins of Dictatorship and Democracy* as a source of hypotheses that help to explain the recent illiberal turn in Central-Eastern Europe. Moore suggested that political development paths of democratic and non-democratic countries were the outcome of the unresolved problems related to the capitalist transition of the agriculture and the dominance of the landed aristocracy. What makes his argument surprisingly up-to-date is the fact that the two Central-Eastern European societies marked by are Poland and Hungary, in which landed nobility remained a dominant class for a long time, and the two which did not solve the peasant question in the interwar period. The paper is an attempt to answer the question whether the collapse of liberal-democratic institutions could be related to the long-term heritage of the agrarian relations.

Apparently, the influence of the Socialism and another, post-socialist capitalist transition, which changed the agrarian relations in a significant way, is more important than the heritage of the nineteenth century. Consequently, any answer to the question about the relevance of Moore's hypotheses as a possible explanation of the recent collapse of liberal democracy requires two-step analysis. In the first step I will compare the agrarian development in selected European Communist and post-Communist countries, showing that there is a factual correlation between the two phenomena. In the second step I will try to analyze the configuration of the changing relations between the peasant, state apparatus and other institutions (especially and the catholic church), showing how they were transformed. This will enable to show the possible ways in which the post-feudal heritage of the nineteenth century influences the contemporary constellation of urban and rural interests, and the contemporary political development in Poland.

KILIAS, JAROSLAW* (*Institute of Sociology, Warsaw University*)

The Lay and Professional Public and the Institutional Development of Sociology

The paper deals with the processes of the institutionalization and professionalization of sociology, and attempts to describe the relation between the development of various types of sociological institutions and the sociological public. The sociology came out of the interplay between at least three circles: general lay public, academia, at which many sociologists worked before the discipline had been officially recognized, and the professional public, which emerged as the final product of the establishment of the academic sociology.

Most of institutional histories are case studies, while the comparative ones deal mostly with the formal academic institutions. In my paper I will compare four cases that represent a variety of timing and development paths of the institutional development of this social science branch: France, Poland, Czechoslovakia, Great Britain and Italy, in order to understand the relation between the development of academic and extra-academic institutions and the change of the sociological public, including the formation of a fully professional one. My hypothesis is that despite most institutional histories seem to suggest, that the most important moment in the development of the discipline is the establishment of academic institutions, the institutionalization often remains shallow and the discipline remains fragile. In my opinion the key moment is when the discipline is able to reproduce itself without any serious interference with lay public or other branches of social science.

Kurdish Political Movement and the Akp in the Face of Political Transformation in Turkey

In the last three decades, Turkish State and Kurdish political movement have concurrently gone through major transformational phases. Kurdish political movement restored its military position and remodeled its political and ideological outlook towards development and establishment of self-government in the early 2000s, which coincides with the coming into power of the Justice

and Development Party (AKP) in Turkey. With the AKP's rule, Turkish state has departed from a Kemalist ideology to a structure redolent with commitment to social conservatism (political Islam) and a neo-liberal economy. Since 2002, the AKP has ruled the country based on various political strategies, such as an intensification of peace talk followed by a dramatic cooling off, then escalation to a state of war, and crackdown on the oppositional groups including academics, journalists, politicians and activists. In this context, this paper discusses the Kurdish Question in Turkey through the antagonistic relation between the political and organizational change of the Kurdish political movement, and AKP government's policies towards election reversal and the crackdown on Kurdish civil society in relation to its road to regime change.

States and Social Movements: Revisiting Western Based Social Movement Theories in the Context of the Middle East

Since 2009 the Middle East region has been going through a massive transformation. These remarkable changes concretized through a widespread social uprising around the region from the Green Movement in Iran to the Arab Spring affirming the people's power in Tahrir Square and elsewhere and the Gezi resistance in Taksim Square in Istanbul. However, more recently, these uprisings have transitioned into devastation, as it is most visible in Syrian case. In analyzing these developments in the region from a social movement perspective, there have been many discussions around contention under authoritarianism, repertoires of contention, advantages of movement-centered vs. institutional-centered analysis of movements etc. These discussion reflects a re-direction in analytical and theoretical focus that corresponds to a larger problem about the production of knowledge on the popular movements in the non-Western world, specifically the Middle East. The problematic stems from the analysis of the powerful and the visible social and political actors or exceptional events in contentious politics without locating them within a larger historical or political context or trajectory.

With this in mind, this paper aims to explore whether the social movement theories developed within the European and the U.S. contexts are useful to comprehend the urban popular movements in non-Western, especially in the Middle Eastern countries. In doing so, there is a need to understand how regime/repertoire relations work under repressive state contexts and how these relations transform states into more repressive institutional apparatuses. Given these two points of inquiries, mapping out the characteristics, advantages and limitations of social movement theories embedded within the Western context will provide an opportunity to question the methodological and epistemological validity of them regarding the non-Western contexts. This will also bring an alternative way to extend and revise existing social movement theories based on the U.S. and European experiences.

The Contestation of Family Rights of Migrants in Europe's Free Movement Regime: Brexit and Beyond

In this article we bring together different sources of data, including critical policy analysis, stakeholder interviews and migrant interviews, and adopt an historical and comparative lens, to explore migrants' lived experiences of shifting migration regimes. The central focus is migrants' family rights within the European Union (EU) Freedom of Movement Regime. Our particular emphasis is on the potential implications of Brexit - the UK's withdrawal from the EU - and the shifting migration rights this entails, for EU migrants in the UK and their family members back home in other EU Member States. Understanding migrants' family rights as constituted at the intersection of migration and welfare policies, in our policy analysis we examine two aspects: firstly, the formation of a 'family of choice' in terms of family/household membership and its geographical location - co-territorial in the UK or transnational; and secondly the distribution of economic risk between the UK State and the individual (family) for forming a 'family of choice'. Detailed policy analysis of the potential implications of Brexit is supplemented with two sets of interview data. The first comprises data from interviews with policy stakeholders in the EU, the UK and Germany, examining the position of family rights in the European Freedom of Movement Regime, and the dimensions of contestation of family rights in the 'Brexit debate'. The second comprises data from interviews with EU migrants living in the UK both before and after the Brexit decision about the role of family rights within the EU Freedom of Movement regime in their migration and family projects.

When Roots/Routes Matter: The Appearance and Disappearance of Asylum Seeking Families from North Korea in Canada

Between 2010 and 2014, hundreds of asylum seekers from the Democratic People's Republic of Korea (a.k.a. North Korea) arrived in Canada, many with children, hoping to obtain refugee status. Some of the initial applicants were accepted while later applicants in this period have, for the most part, been rejected. Since 2013, Canada has been verifying fingerprints with the government of the Republic of Korea and discovered many asylum seekers, though not all, initially settled there; the Constitution of the ROK recognizes North Koreans as South Korean nationals. Since asylum seekers given legal status in one country cannot apply for asylum in another country, North Koreans who migrate through South Korea cannot obtain refugee status elsewhere; they are identified as South Korean. This effectively shuts Canada's door and explains the drop in, and perhaps the end of, North Koreans seeking protection and settlement in Canada, at least for now, unless there is a policy shift, or a viable, alternate passage to Canada emerges; very few North Korean families have arrived in Canada since 2014.

Although larger refugee populations clearly deserve research attention, this brief and fleeting wave of North Koreans, who will soon escape research attention, also raises many questions for Canadian policy-makers and on the ground practitioners, who could influence Canada's position. Canada's policy is negotiable; the former Citizenship and Immigration Canada minister, Jason Kenney, claimed during the previous federal election that Canada would recognize North Koreans as refugees if the Conservative government is re-elected. This suggests that a larger wave could be in Canada's future. This study's objective is to explore how domestic and international policies and refugee legalities affect the movement of North Korean refugee families to Canada and their settlement experiences.

Legitimation in Developing Countries: South Korea and Taiwan during the Late 1940s to Early 1950s

This paper aims to seek alternative explanations to find sources of power and legitimacy in underdeveloped countries. Throughout history, the transformation process of world order led by states of strong powers by and large shared substantially similar patterns within systemic institutional boundaries and socio-political structures. However, state transformation and legitimation of leadership in undeveloped countries often show distinct patterns. In such countries, institutions tend to be weaker and civil society either do not exist or function properly to curb leaders from being authoritarian rulers. Especially during junctural periods, deep intervention from external actors takes place in the name of supporting development or aiding post-crises statebuilding. In such cases, legitimacy may be given from external states or intervenors instead of solely from the people of its own.

In this context, two East Asian country cases (South Korea and Taiwan) will be examined on their transformational period during the late 1940s to the early 1950s. With a historical institutionalist approach, focus will be put on how Rhee Syngman and Chiang Kai-Shek administrations were able to gain legitimacy even under the periodic settings of US intervention in line with the execution of land reform. The distinct relations among the people, the government, and stationed US institutions (USAMGIK and JCRR) show probable initial conditions of legitimate governance in underdeveloped countries under strong external influence. Hence, this paper intends to contribute by providing alternative explanations in finding determinants for leaders to gain legitimacy, specifically for developing countries where transition large in size and wide in scope such as land reform takes place with the presence of diverse influence from external actors during junctural periods.

How Does Love Matter in Culture?: Alienation Versus Authenticity

Love, intimacy and dating are very important themes for youth especially in the era of neo-liberalism. Although people are atomized and alienated from each other, people still try to overcome their own alienation by making intimate relationships. Modern scholars have showed how people put hope in love to find safe zone in the face of existential anxieties stemming from uncertain life-circumstances or too much pressures in the competitive labor market places (Beck 1995). In other words, love is not just personal emotion but a structurally formed and reproduced one (Illouz 2011). Illouz has emphasized how authenticity and reflexivity work in romantic relationships in late capitalism where everything could be consumed-even emotion. Therefore, this research aims at empirical explanation on relations between authenticity, reflexivity and alienation based on a romantic relationship to find the way how people try to overcome their alienation in terms of emotion.

Our research team conducted mixed-methods, quantitative and qualitative: 368 surveys and 20 in-depth interviews with college students in Seoul, Korea. Statistical findings show that the internal capacities -authenticity and reflexivity-affect self-growth and satisfaction in dating relationship independently. Also, the narratives of interviewees show that youth generation date to overcome negative

feelings such as loneliness, isolation, and alienation; however, the romanticized dating culture especially backed up by consuming market forces, cannot be a solution to overcoming alienation or to retrieving the authenticity of the agents. On the one hand, Confucian and patriarchal traditions emphasize the cultural propriety more than one's free expression. On the other hand, modern consumer culture drives youths to be more attentive to erotic capital (Hakim 2010) and high cultural capital (Lamant 1992). Thus, culture matters among modern Korean youths' love and dating. However, practices of authenticity and reflexivity may function to cope with alienated emotions in the Korean youth culture.

KIM, HANGYEOL* (*Sogang University*)

How People Believe Love Is Real: Actors in Structure

Love, romantic relationship and dating are important themes in terms of an intimacy problem for youth. As youth generation are suffering from uncertainty of modern society, they depend on intimate relationship. While romantic love remains one of the hope for people who want to obtain stability in life, social scientists have argued that how fantasy of love is constructed by social structure, such as patriarchy, monogamy for nuclear family in industrial society, gender structure (Jakson 1993). While, social science has succeeded in analyzing why love is not personal emotion but a social construct, there is a problem remaining: Where is actor who do not just reproduce the structure but act in structure? Therefore, this research aims at an empirical explanation on how actors interpret situation and make meaning through interaction in romantic relationship.

This study was conducted using mixed-methods; 20 in-depth interviews, romance type examinations and 368 surveys with heterosexual college students in Seoul, Korea. From actor's point of view love is not social construct but social reality, although social structure embedded in their actions. Regardless of gender, interviewees show how they distinguish whether their relationship is love or just dating. Also, this way of interpretation for relationship is supported by statistical findings on how authenticity and reflexivity related with romance. However, the influence of social structure is huge. Since love is a process of negotiation with partner, heterosexuals interpret and shape meaning of situation in dating under the pressure of gender structure. Furthermore, modern consumer culture and consuming market force make romantic dating scripts. Uncertainty of society is matter as well. Lovers maintain their relationship as intersubjective definition of situation under social structure which affects not only their own gender, sexuality, but also daily interaction - behavior, facial and verbal expression, interpretation of situation.

Weberian Approach to the Theology of Yong-Gi Cho

RC 16, Session on

Revisiting Weber and Habermas on Rationality and Compacity from Asian Perspective

Hong-Jung Kim

Professor, Seoul National University, Department of the Sociology

Abstract: In this article, I attempt at discussing some interesting themes underlying the theology of Pastor Cho Yong-gi. Having founded Yoido Full Gospel Church which is the biggest mega-church in the world as charismatic leader of Korean protestantism, he systematized a singular theology articulating the pentecostal religiosity and Korean tradition religiosity. It is usually called the theology of three-fold blessing and five-fold gospel. His spirituality is characterized by the accent put on this-worldly prosperity and success, on the quasi-material force of the Holy Spirit, and also on the positive mindset moulded by the religious practices. This kind of theological doctrines articulated with practices of worship and ministry typical to Full Gospel church rhymes perfectly with the developmental mentality of Korean modernity which reigned in the middle of the 20th century. It is in this sense that the meaning of Pastor Cho's theology overflows the boundaries of the Christianity. It can be interpreted as the "spirit of Korean modernity", let alone Korean capitalism. Drawing on Max Weber's perspective of the capitalist spirit, I will explore the way how Cho's theological doctrines and practices constituted a specific Korean modern 'regime of the heart', and produced a singular type of subject, a strange conjunction of radical passivity towards the irresistible and of radical activity towards the secular world.

Key words: Yong-Gi Cho, theology of problems, theology of blessings, Korean modernity.

Emotions through Audio-Visual Product Consumption: Intensity, Popularity, and Variance

In the history of development cultural consumption technological innovations have been thought of as a key factor in media globalization. New digital technologies have allowed new forms of accessing markets through social media and online broadcasting platforms and have been generated leading to a dematerialization of the media products.

Within the traditional way of promoting cultural productions, promoters have enjoyed a monopolistic power on the market due to the use of traditional media, allowing them to choose the next stars, confounding quality and popularity. While the audiences were left with a passive role, take it or leave it. Consequently, the research also has focused on the consumption of USA production in other countries. However, thanks to social media the *cultural production flow* has become *multidirectional* from both Western and Eastern countries. And the role of the audience interacting in social media has changed the mechanism of being popular in the market. It is evident that a new model and thus new research on cross-cultural consumption is needed to understand this new phenomenon.

With this article, we contribute to fill this gap by conducting cross-cultural media consumption from non-US to western countries. We applied a quantitative analysis to qualitative textual data, comments of audience, based on the size of the data in three languages: English, French and Spanish.

In particular, we inspect the emotions expressed by viewers during media consumption in order to suggest the new measurement of popularity in cultural market by relying on several stardom theories. The relation of high popular series with emotion sharing is mediated by an exponential process fueled by the series' market size, but effect has change with social media.

Syrian Refugees in Amsterdam: A Look into Their Home Experiences and Home-Making Strategies

The recent sociopolitical situations in the Middle East caused an enormous number of refugees in Europe. They lost home in their country of origin, and are in search of new place(s) to call their home again. This study aims to understand how Syrian refugees experience home in a new living environment and which home-making strategies they develop. By providing an in-depth understanding of home in multidimensional perspective (Mallet, 2004; Easthope, 2004; Duyvendak, 2011; Kusenbach and Paulsen, 2014; Smets and Snee, 2017; Boccagni, 2017), this paper highlights how Syrian refugees cope with frictions of home-making practices by taking into account material (e.g. house, interior design, and decoration) and immaterial elements (e.g. discrimination and exclusion, uncertainty of the future, and social and legal status).

To understand how home experiences and home-making strategies of Syrian refugees differ in environmental settings, this study looks at the two housing projects in Amsterdam. Both projects have mixed residents of refugees and locals, but differ in population, type of project and location. Methodologies used in this study include observations and interviews with various participants such as Syrian refugees, fellow residents in the housing projects, program managers and professionals of related fields. Furthermore, the benefits and drawbacks of two housing projects in terms of 'feeling at home' will be analyzed and improvement strategies will be presented.

Building Social Coalition for Representing Marginalized Workers : Focusing on the Case of the National Minimum Wage Solidarity in Korea

Increasing the number of non-regular workers (*bijeonggyujik*) has become the most serious social problem in Korea due to the poor quality of job and income security. Those workers also have difficulty in making their voice through the conventional union activities such as strikes and collective bargaining because male-regular-dominated labor unions excluded them. Especially, non-regular workers' interests have been hardly represented in the decision-making process for minimum wage. It is because only male-regular-dominated labor unions can participate in the decision-making process as the representative of workers.

Against these difficulties, new attempts to building social coalitions among labor union and social movements have emerged since 2000s. The *National Minimum Wage Solidarity(NMWS)* is one of the most influential and long-lasting social coalitions in Korea, which have dealt with low wage workers' problems. From its established in 2002, various organizations, including not only labor unions but also new labor organizations (i.e. *Korean Women Trade Union* and *Korean Youth Community Union*), and other new social movement organizations(i.e. *Citizens' Coalition for Economic Justice and People's Solidarity for Participatory Democracy*) have joined in NMWS.

How NMWS could be shaped and various organizations have sustained to work together from its beginning? What kinds of roles have been played by each organization?

By adopting "four elements" for coalition building (Tattersall 2010), which includes the nature of common concern, the structure of organizational relationships, organizational capacity and commitment, and the scale of coalition activities, this study will search for understanding the process, that a variety of organizations could be engaged in NMWS despite of their political orientation and different style of activities, and the roles of each organization in the minimum wage campaign.

This study will make contribution on the extending the framework to understanding sustainable conditions for keep the cooperative relationship among labor unions and other social movements.

Comparative Analysis of Health Trajectory: European and East Asian Welfare States

This study compares European welfare regimes and major East Asian countries, in terms of the inequalities of longitudinal change of health (self-rated health) and the effects of socioeconomic status (SES) on initial values and slopes of the trajectory among older adults. This study selected three countries from the Social Democratic (Denmark), Conservative (Germany), and East Asian (South Korea, Korea hereafter) welfare regimes from two nationally representative longitudinal datasets, the Survey of Health, Aging and Retirement in Europe and the Korean Longitudinal Study of Ageing. Latent growth curve models revealed that, overall, all of the Danish, German, and Korean older persons had gradually decreasing trajectory of self-rated health. However, the starting point is highest among the Danish, followed by the German, with the Korean respondents being the least healthy. The estimated trajectories between the advantaged and disadvantaged SES groups showed that the relative differences were biggest in Denmark. Controlling for other factors, gender was significant in shaping the initial level of health in Korea while it was not important in Denmark and Germany. Having a partner affected higher initial levels in Korea and a gentler slope in Denmark while it was not significant in Germany. Compared to post-secondary education, elementary (Korea)/lower secondary (Germany), and upper secondary education (Korea and Germany) lowered the initial degree of health, while only lower secondary education turned significant in Denmark. Household income was associated with higher starting point in the three countries and sharper deterioration in Korea and Denmark. The findings suggest that (1) Korea showed the least favorable health trajectory in terms of starting value and the effects of varied SES variables; and (2) Denmark showed the most favorable trajectory with the highest initial level and the least prevalent effects of SES variables, except the fact that relative inequality is not necessarily smallest.

The Impact of Urban Scene Distribution for Local Development – Analysis of Urban Amenity in Seoul

In recent years, the positive prospects for the creative class and the creative city have diminished. It is because of the frustration of hoping that attracting creative and innovative talent and occupation groups in the city will stimulate the local economy. Instead, discussion of gentrification is vigorous. The gentrification is completed in several steps. As a first step, creative activities and talent gather in the areas that have been in underdeveloped areas, and they are characterized by local characteristics. In the second phase, people and money gather in newly emerging areas. At the end of the day, excessively concentrated capital raises rents to eliminate local features and create a crowded city. This process not only deepens the inequality of cities but also lowers the city's growth potential. The phenomenon of gentrification has been overlooked in the discussion of creative city. More amenity is not synonymous with a better growth environment. This study analyzes the change of city scenes in the major regions of Seoul and analyzes the process of transforming creative and free - spirited regions with capital input. People's feelings about space analyze the various texts posted on the web and compare them year by year. Changes in the distribution of amenity within the space are mapped and their density is analyzed. This analysis explains the factors that reduce the competitiveness of space.

Income and Obesity: What Is the Direction of the Relationship? a Systematic Review and Meta-Analysis.

Background: There is evidence that socio-economically disadvantaged groups experience worse health and higher morbidity, including obesity. However, obesity does not only constitute a risk of the economically disadvantaged (causation hypothesis). By switching perspectives, people with obesity can also be seen as a disadvantaged group, since they are prone to labor market discriminations that include decreased chances for higher education and job security, higher unemployment and lower income (health selection hypothesis). By exploring obesity as a risk of the socially disadvantaged and the obese as a socially disadvantaged group, this review aims to examine the relative importance of causation and selection processes in the linkage between income and obesity. In particular, we raise the question on the direction of the link between income and obesity, while also discussing the contribution of both causation and selection processes to this relationship.

Methods: A systematic literature search was conducted that focused on medical, psychological and sociological databases (i.e. Medline, PsychInfo, Sociological Abstracts, International Bibliography of Social Sciences and Sociological Index).

Results: 14 studies on causation and 7 studies on selection were found. Meta-analyses revealed that lower income is associated with subsequent obesity (odds ratio: 1.27, CI-95: 1.10 to 1.47; risk ratio: 1.52, CI-95: 1.08 to 2.13), though the significance weakened once adjusted for publication bias. Studies on selection indicated a more consistent relation between obesity and subsequent income, even after taking publication bias into account (standardized mean difference: -.15, CI-95: -.30 to -.01). Sensitivity analyses implied that the association is influenced by obesity measurement, gender, length of observation and study quality.

Conclusion: Findings suggest that the association between income and obesity is bidirectional. Therefore, both causation and selection processes should be addressed to fully understand the relation between income and obesity.

Insurgent Counterpublics: An Origin of 2016-2017 South Korean Presidential Impeachment Mobilizations

This study introduces a meaningful origin of a large-scale mobilization pressuring for the presidential impeachment in 2017 in South Korea. One of the earliest analysis (Nan Kim 2017) on the presidential impeachment mobilization focuses on roles of symbols, which catalyzed building greater solidarity amongst activists and lay-citizens, originating from a shipwreck tragedy of Sewol in 2014. In fact, many social movement literatures have profiled episodes based on 'factors', failing to provide composite temporal-spatial perspective. I aim to overcome the extant limitation of the scholarship with logic of social sequence, which is a relatively novel network analysis technique, and present not only an episode but also 'stream' of contention. I have collected substantive amount of library, interview, and survey data to develop a sequentially emergent network structure taking account of three key actors (i.e., 'lay-citizens', liminal counterpublic group, and rank-in-file labor unionists). Indeed, a seed of wide-range solidarity in South Korean civil society had already formed in 2008-2011 and continued to play a key role in the subsequent stream of contention. I approach this history with refined conceptualization of 'counterpublics', which is an emergent entity containing multiple identities. A liminal counterpublic group was formed in 2011 when Hope Bus campaigns were organized by activists from various civil society sectors (temporary workers', peace, environment, LGBTQ, and artistic movements) and this group provided movement infrastructures for ensuing mobilizations even until now in 2017. Furthermore, the notion of solidarity building and artistic tactics expanded through emerging network structure to other entities including Korean Confederation of Trade Unions (KCTU), which had been deemed to be 'compromising' to Hegemony ever since the late-1990s. Indeed KCTU turned to play a central role in a large-scale mobilization in 2015 encompassing wide-ranged voices of civil society, and the theme of this campaign repeated in the 2016-2017 presidential impeachment mobilization.

Why Should Social Investment be Redistributive? : Effect of Parents and Shadow Education on Academic Performance and Labour Market Income

With the advent of the 21st century, social investment has been one of the key social policy paradigm in many OECD countries. Social investment policies are argued to contribute not only to equal opportunity and human capital development but also to the sustainability of welfare states. Yet, many also criticize the role of social investment policies as they tend to focus much on the (re-)commodification of labor force and are unable to cope with increasing inequality. Indeed, education policy within the social investment package largely neglect the equitable social outcome in many countries. In this context, this study aims to discuss what role social investment should play against rapidly weakening

social mobility in South Korea. First, this study will analyze how family background and shadow education influence educational attainment and subsequently, how educational attainment affects labor market income. For measuring educational attainment, we will utilize the university ranking since most of Korean young people go to the university. Using the Korea Education and Employment Panel (KEEP) database, we will conduct path analysis to figure out how strong the effect of family and shadow education is on students' academic performance and labor market income. Then, this study will discuss the analysis result and the role of social investment policies in Korea. We will argue that family background has strong influence on educational attainment and labor market income and that social investment policies should actively play a re-distributive role in reducing gaps from family backgrounds. Finally, we will discuss policy implications.

Stigma, Passing and the Interaction Order: A Game Theoretical Analysis

Although Erving Goffman rigorously analyzed the condition that a stigmatized person succeeds in passing and his theory of interaction order has an affinity with rational choice theory, it remains a challenge to formalize his argument. In this paper, by distilling the essence of his argument, rather than by duplicating the episodes he cited, I will formulate a game theoretical model of stigma and passing to examine the condition for successful passing.

A "discreditable" person and a stranger play a game with incomplete information that consists of three successive moves. Firstly, Nature determines the type of the discreditable person, "discredited" or "normal," according to its probability distribution. The type is in the realm of private information: the discreditable person knows his or her type while the stranger cannot gain direct access to it. Secondly, the discreditable person decides whether he or she will provide false information about his- or herself by costly fabrication. Thirdly, the stranger decides whether he or she will talk to the discreditable person.

The discreditable person's payoff is a function of the fabrication cost, the attractiveness of the fabrication device, and the embarrassment that the both players experience when the interaction order is threatened. The stranger's payoff is a function of the joy of conversation and the above-mentioned embarrassment.

There are three classes of Perfect Bayesian Equilibria of the game: separating, pooling, and hybrid equilibria. In pooling and hybrid equilibria, passing will be successful. A tentative analysis suggests that the attractiveness of adopting the fabrication device for the "normal" person may be the most important for successful passing.

Power and Politics in Social Policy Reform: The Case of State Housing in New Zealand

New Zealand's centrally administered housing programme for low income and vulnerable citizens ('State Housing') has been a core part of the welfare state since the 1930s. Recent reforms have transformed the programme into a new 'quasi-market' system where the government provider now competes with community housing providers for tenants and funding. scholars have questioned the economics of the reforms (Dykes 2016) and questioned the efficacy their efficacy in a time of increasing housing scarcity (Howden-Chapman & Baker, 2014), little attention has focused on the provenance of the reforms. My paper addresses why and how the reform agenda was pursued by the New Zealand government with special attention paid to the political interactions of actors inside and outside of the state. The 'policy worlds' approach outlined by Shore and Wright (1997, 2011) provides an interpretivist perspective for analysing the myriad strands and connections of people, ideas, and spaces that interact in a policy field with the 'aim to deconstruct policy in order to reveal patterns and processes in the organisation of power in society' (Shore and Wright, 2011: 4). This necessitates tracing key ideas and arguments across multiple sites of activity through the analysis of materials with ethnographic value (including documents, interviews, newspaper articles, parliamentary proceedings). In my paper I apply this approach to examine the use of narratives and modes of political organisation used by key actors inside and outside of government in the development of the reform agenda. I argue that the political claims of a fledgling NGO housing sector seeking a greater role in the housing system elided comfortably with a Treasury and Cabinet agenda to consider new models while seeking overall to minimise the fiscal impact of the existing programme. The paper sheds new light on a major area of social policy reform in New Zealand.

Affective Cartographies: Visualizing Affective Infrastructures of Control in the "Networked" Society

We begin from the assumption that bio-sensorial changes are an indication of 'affective' intensity and fluctuation, (Massumi, 2015). These biorhythms can be added to an existing assortment of health metrics developed in the quantified-self-movement — what Moore & Robinson (2015) call the 'dataist self' — as well as by corporate and state interests, to build detailed profiles of people as individuals, dividuals, and populations. Entrenched and multivalent, these biorhythmic technologies (hardware, interfaces) and self-quantification (disciplinary apparatuses, sensorial regimes) appear to offer the colossal possibility of being able to record emotional states anywhere in the world (what we call "Affective Cartographies") through their emphases on self-management, rational self-optimization, and technologies-of-the-self as add ons to, and thus not co-constitutive of, human and social becoming, (Deleuze, 1992; Rheingold 2002; Galloway, 2006; Turner, 2008; Morozov, 2010; Danter et al, 2016). Drawing from theories of spatial production (Lefebvre, 1991) and deploying modern technology, our project attempts to map emotional reactions to constructed spaces and aesthetic encounters. We ask, in what ways is it possible to map the affective impact of highly ordered urban environments emerging across a network of global cities (Sassen, 1991) central to neoliberalism and what might such maps reveal about the role of spatial construction in controlling flows of subjectivity? To optimize this experiment we designed and built an Affective Mapping Device (AMD), which is a portable and wearable tool recording electrocardiography, (heart rate), electrodermal activity, (skin moisture), and electromyography (motor neurons), while a GPS records the spatial location of the wearer as they pass through moments where these affective intensities occur. Our hypothesis is that through a blending of biosensorial information, geographical positioning, and phenomenological encounters such embodiments will help us to re-visualize the affective infrastructures of control in the "networked" society.

KINOSHITA, SHU* (Osaka City University)

The Role of Family Caregivers in Dementia Care: Telling Life Histories

In this presentation, I describe how family members of Japanese elderly persons with dementia participate in the caring process. In Japan, the person-centered care paradigm (Kitwood 1997) was adopted in the 2000s, and the government has declared establishing this model for dementia care as one of the most important national goals (Ministry of Health, Labour and Welfare, 2015). However, little attention has been paid to the role of family caregivers. In "a new century in dementia care" (Iguchi 2007), what roles have families adopted?

To answer this question, I analyzed data from participant observations and interviews in several care settings, including nursing homes and self-help groups for family members. Data contained over 500 field notes and 20 videos. I will focus on interactions among family caregivers, professional care workers, and elderly persons.

The role of family caregivers is described as "telling life histories." Under the person-centered care paradigm, the key concept in providing care is "personhood" (Kitwood 1999). Caregivers must respect elderly persons' personality, past, preferences, etc. when planning care strategies. Life histories of elderly persons have become an important standard in dementia care. However, under this paradigm, we often encounter a very characteristic problem: professionals do not know their clients' past, and elderly persons cannot narrate their life histories because of their dementia symptoms. In this difficult situation, caregivers play a crucial role: telling other care providers the life history of their family member with dementia. In dementia care, the information provided by family caregivers is treated as "privileged knowledge" (Gubrium & Holstein 1990) by other caregivers.

To conclude, I emphasize two points. First, regardless of the severity of dementia symptoms of an elderly person, his/her personhood is sustained through interactions among caregivers. Second, family caregivers assume a characteristic responsibility and burden under the person-centered care paradigm.

Anti-Fascism and the (neo-)Colonial Question: A Radical Geographical Concern

The theories that inform current debates about power, space and (in-)justice in radical geography have deep historical roots. For example, Lefebvre's critique of everyday life, without which the idea of the right to the city and the production of space are unthinkable, benefitted in no small way from his analysis of the mystification brought about by nationalism and fascism in the 1930s. This paper will place Lefebvre's interventions at the time within debates about anti-fascist

strategy during the time of the French Popular Front. More specifically, it will confront Lefebvre's insights with what is widely recognized as a crucial aspect of French politics in the 1930s: a nationalization of the French left (above all Lefebvre's own Communist Party) and a concomitant struggle among the nascent independence movements in the French empire (for example Messali Hadj's *Parti du peuple algérien*) to define themselves as both anti-colonial and anti-fascist. Given the return of (anti-)fascism in the current conjuncture, which is strongly shaped by an anti-Muslim racist common sense as well as a renewed struggle over public space, the debates of the 1930s are not irrelevant for contemporary debates about space, violence, and (in)justice. In the conclusion, I will draw on my own empirical work on anti-fascism in contemporary France to draw links between debates about the national question in the 1930s and contemporary arguments for and against strategies to counter the right-populist and neofascist right with a new kind of nationalization of left political strategy: claims to national economic sovereignty. In longer historical context, such arguments lead us to an urgent, and also very old problem: what are the prospects for an effective and spatially nuanced articulation of anti-fascist, anti-colonial, and anti-imperial political currents?

KIPFER, STEFAN* (York University)

The End of Anti-Fascism? the Role of the Labour Movement in France

The problematic of fascism is back with a vengeance. From Hungary to India, Germany to the U.S.A., it threatens to outgrow what Stuart Hall called authoritarian populism, either because explicit fascist elements have risen from margin to centre within the populist right, or because forces with direct links to fascist or neo-fascist histories have outflanked their radicalized counterparts in the bourgeois right. The latter case applies to France. There, the resurgence of the *Front National* (which appeared moribund for a second time a mere ten years ago) has put the problem of 'antifascism' back on the agenda with a vengeance. Yet, during the 2017 Presidential election, which saw the FN garner a record number of votes in the second round, some commentators announced the death of antifascism; they noticed the disintegration of the electoral 'republican front' that had led to the massive defeat of the FN's presidential candidate in 2002. Taking issue with this hasty conclusion, I begin with an overview of a current constellation of left and anti-racist forces in France that one may call anti-fascist in name or practice. In this broader context, I will pay particular attention to a national anti-fascist network sustained by labour unions. *Vigilance et initiatives syndicales antifascistes* (VISA) represents a bridge between today and the most broad-based anti-fascist formation between the early 1990s and the mid-2000s: *Ras l'front* (Enough with the FN). As other forces, VISA now faces not only recurrent challenges of antifascist politics since the time of the Popular Front, the (neo-) colonial question included; it also confronts a normalization of the far right that has reached new levels since the 2000s. Due to forces that far exceed the FN itself, this normalization can be observed also in a range of municipalities run by the far right.

Theoretical Visions: How Social Theories Can Inform the Elaboration of Future Visions and Scenarios

The development of future visions and scenarios is a well-established practice in scientific, private and public contexts. However, it is often the case that the project or research organisers' pre-reflective social theories concerning the operation of society are fuzzy and ambiguous. This may lead to the selection of inadequate methodologies. In this paper, the authors argue that it is highly important to incorporate social theoretical considerations into scenario and vision creation since various theories can not only provide different starting points but they can also guide the very mindset about the future.

Furthermore, since vision and scenario elaboration are often conducted by utilising various methodologies, especially in a participatory context, it might be advisable to aim for a match between the aims of the process, the theoretical starting points and the methodology.

With reference to the above mentioned arguments, this paper discusses a participatory backcasting process about the future of Hungarian higher education where the organisers have attempted to synchronise social theoretical considerations, the choice of methodology and the aims of the process.

In the first part of the paper we introduce the project by presenting its aims and the theoretical and methodological choices made before the project. In the second part, we present the methodological lessons to be learned from this project as far as scenario and vision elaborations are concerned. Lastly, we return to the original question, that is, how social theoretical considerations be involved in scenario and vision creation and why it is important to do so.

RC03-68.1KIRCHBERG, VOLKER* (*Leuphana University of Lüneburg*)*Changing Implicitness – Functions of Arts and Culture in Urban Planning and Policies across Times and Places*

In recent years, arts and culture have gained prominent roles in post-industrial urban development. However, contrary to many publications on the topic, these roles are not permanent across place and time. This presentation will emphasize differences of such intended usages for urban development for almost three decades, and on both sides of the Atlantic.

In Baltimore, Maryland, and Hamburg, Germany, the presenter has compared uses and interventions that recognize the arts as agent of urban development. In these places, and for years, the objectives of this usage were undisputed. However, often unbeknownst to the experts (artists, arts managers, arts administrators, politicians, urban planners, and project developers), the meaning of utilization has changed dramatically – and differently so for the two compared cities. The understanding of an urban utilization of arts and culture is everything but permanent.

The author interviewed 70 local experts and compared their statements in Baltimore, in 1988, 2004, 2010 and 2016, and in Hamburg, in 2006 and 2013. The study uses qualitative expert interviews as data gathering method and systematic interview analysis (with Atlas.ti) as data analysis method.

RC08-174.5KIRTCHIK, OLESSYA* (*National Research University Higher School of Economics*)*From the United States to the Soviet Union and Back Again: A Transatlantic Story of Machine Learning*

Machine learning algorithms based on so-called “neural networks” are often considered today as the future of the AI (artificial intelligence) and a solution to many major problems faced by the humanity. Highly optimistic and futuristic narratives produced by (and around) this field generally obscure its mid-20th century origins, in particular its deep connection to cybernetics. The concept of a “neural network” itself was introduced by Warren McCulloch and Walter Pitts back in the 1940s. A subsequent career of this idea and of its implementations has been quite turbulent, from high expectations to complete oblivion, and numerous rediscoveries. Although its history begins to be known today, these narratives generally omit the European perspective, and especially the Soviet experiences in this field. This paper intends to bring into focus a transatlantic travel of the idea of Perceptron developed by Frank Rosenblatt in 1958. This machine designed to learn pattern recognition became one of the first implementations of the artificial neural network. The model of Perceptron was adopted and creatively appropriated by Soviet scientists early after its first appearance in the United States. I will consider the case of the Soviet Institute of Management Problems (IPU), whose researchers were among the pioneers of algorithms for automatic image recognition in the 1960s (motivated by demand from the military). Inspired by the Perceptron model, members of the IPU led by Mark Aizerman developed a geometric learning method (a so-called method of potential functions) quickly recognized and adopted by American and European scientists and engineers. This work was a part of a larger theoretical research program in the domain of image recognition and self-learning machines (“unsupervised learning”). This episode is not only an important chapter in the history of artificial intelligence, but also an exciting case of the effective intellectual and technological transfer through the Iron Curtain.

RC25-JS-45.4KISEMBE, EVERLYN* (*Moi University*)*Who Are We and Where Do We Fit? the Terik Community Search for Belonging*

Questions on the linguistic and ethnic origin of the Terik community, an endangered minority group in Kenya are not known. Some believe that they originated from the Luyia. Others think that the Terik people came from the Kalenjin group since Terik seems to be mutually intelligible with Nandi Kalenjin dialect. The number of Terik speakers is not known. The Terik inhabit parts of Kakamega district (neighboring the Luyia) and Nandi district (Kalenjin neighbors). Terik speakers have never been treated as a distinct ethnic group (Heine 1992) and have and still encounter violence, rejections and disputes from both the Kalenjin and the Luyia communities.

What are the opportunities and pressures the Terik community is facing regarding the language? What are the language related goals of the Terik community? What aspects of the language are most valued by the Terik community? What aspects of the Terik language are most endangered? are questions we seek to answer.

The data analyzed was collected from interview sessions held between Terik elders, chiefs and chair persons of the community, elicited utterances from Terik

speakers and from everyday communication practices in a wide range of social spheres such as market days, circumcision and marriage ceremonies among Terik speakers. Results indicate that the Terik community share strong cultural strengths; personal and cultural beliefs, values, cultural knowledge of the people, the community's spirituality, creativity and traditional technologies in an environment where ‘forced’ assimilation comes out so strong resulting to both stable and shifting multilingualism within the community.

RC19-369.5KISSOVA, LENKA* (*Masaryk University*)*Individualised Welfare: The Rule of the Risk-Security-Deservingness Nexus in the Material Need Policy*

Slovakia is one of the countries where the welfare cut-backs affected also the basic benefit in material need. The individualisation rationality seems to be the leading one as the main argumentation includes ‘motivation’, ‘adjustment’, ‘self-responsibility’ and ‘deservingness’. In the paper I argue that the ‘deservingness’ phenomenon further co-occurs with the security and risk-prevention arguments. Based on the critical discourse analysis of the parliamentary debates I argue that the formation of a risky other legitimises the adoption of measures which restrict social benefits and exclude people in need from solidarity.

The goal of this paper is to examine the perspective of the policy-makers, motivation and arguments legitimising the recently adopted Act on benefits in material need from the critical perspective, based on the political discourse analysis. Welfare beneficiaries are stigmatised from multiple perspectives – on the basis of ethnicity, social or economic status as they are depicted as abusers, living an abnormal and pathological life. They become subjects of regulation and control, re-establishment of the social order. Policy objectives seem to be legitimised in the political discourse through the images of risk and threat to the society, using the assistance beneficiaries as subjects of these security threats, having an ethnic dimension – and so, aiming at the social, economic and symbolic exclusion of the Roma.

RC51-853.3KIVELÄ, MIKAEL* (*University of Helsinki*)*Volatility of Digitally Mediated Knowledge Co-Construction*

Distances in time and space are nowadays quite fascinating in relation to the structures and possibilities of communication. Digital information and communication technologies bring us seemingly ubiquitous and instant connectivity and equally omnipresent volatility. That is to say things can move and transform very quickly in relation to reference frame(s) of human observation. Moreover, increasingly capable systems, sometimes called Artificial Intelligences, perform more and more tasks with inhuman speed and competence. This present paper inquires whether there is a need to grasp better the temporal aspects as well as blackboxed control of digitally mediated communication in social systems. We base this assertion on five years of fieldwork in Higher Education focused on knowledge co-construction employing a variety of technical means from sticky notes to online solutions. However, the internal complexity of these technical means is neglected as long as they continue to perform as expected, hence the term blackboxing. If and when social systems as relationships of interconnected elements constantly reproduce themselves and differentiate themselves from their environment in whose temporal reference frame(s) this happens or should be observed? Texts like Tække & Paulsen's *Bildung in the Era of Digital Media* (2016) and Serres' *Thumbelina* (2015) have elaborated on several challenges and tensions in formal education fostered by digitally mediated communication and its means. However, we have not observed much resonance to these challenges and would like to find out to what extent this caused by our theoretical choices and other limitations in the acts of observing. The question of this present paper as a work in progress is: To what extent can contemporary theories and models of social systems grasp a) the speed, b) the complex interdependence of digital media as well as the c) amount of influence these aspects have on human communication?

RC34-616.3KIVIJÄRVI, ANTTI* (*Finnish Youth Research Society*)AALTONEN, SANNA (*Finnish Youth Research Society*)MYLLYLÄ, MARTTA (*Finnish Youth Research Society*)*Surveying the Oversurveyed – Conducting and Analysing Questionnaires on Well-Being of Marginalised Young Adults*

Young people's well-being is under relentless interest of authorities and policy makers and, thus, repeatedly measured both on national and regional level. Measurements are executed throughout young people's educational trajectories in particular but in line with the concern over youth marginalisation young adults not in education or employment are increasingly being studied and surveyed. Filling in questionnaires has become a routine activity included in various welfare

services, and manifold research and development projects target the very same young adults. Producing data on the marginalised may mean that respondents are exposed to questions that reflect the dominant assumptions on well-being and good life. Thus, while knowledge production may aim to be value-free, surveys can evoke various reactions among respondents from disempowerment to amusement. In some cases, setting frames for a desirable state of well-being can function as a normative and categorising force for young adults in marginal positions. In this paper we draw upon a study focusing on well-being of 16-29 year old clients of targeted youth services in three cities in Finland. The well-being of the respondents was surveyed by using an extensive questionnaire that included scales related e.g. to the quality of life and loneliness. The questionnaires were filled in in a supervised setting and the discussions between the respondent and a researcher form a qualitative data set that is used to contextualise the survey data. Thus, in this paper we aim first to give an overview of the well-being of young adults not in education or employment and second, focus on such notions as reliability and ask what types of repercussions conventional quantitative research settings may have for marginalised, oversurveilled young adults.

KIVISTO, PETER* (*Augustana College and St Petersburg State University*)
SCIORTINO, GIUSEPPE (*University of Trento*)

Assessing the "Universal Aspiration" of Civil Sphere Theory

In this paper, we will offer a critical assessment of the civil sphere theory (CST) project as it has evolved during the decade since its articulation in *The Civil Sphere* in 2006. That book offered a robust articulation of a new way of viewing civil society, one that included the development of the idea of binary codes structuring political discourse, the significance of public opinion, the mass media, the law and regulative institutions, the inherent tension between the civil and uncivil, the role of social movements, and the emergence of multiculturalism as a new mode of incorporation of heretofore marginalized groups. At the same time, CST is also construed as a project, not a closed theoretical system, and so it is not surprising that theoretical developments have occurred in the intervening years. CST is intended as a general, universally-applicable theory. Given that the book limited its principal empirical examples to the United States, a series of case studies have been initiated to test what Alexander has called its "universal aspiration." We offer an analysis of the findings of the empirical projects that are currently underway—involving Latin America, East Asia, radicalization, and the Nordic social democracies—in order to assess CST's universality.

The Problem with the Participatory Turn: Improving the Accountability of Research Practice in Communities of Solidarity

Environmental sustainability researchers are increasingly using action research with the expectation that stakeholder participation could improve uptake of their research project outputs while accelerating societal transformations towards environmental sustainability. The potential for using participatory processes to integrate both the social and natural dimensions of sustainability has made action research a promising methodological approach. However, this *participatory turn* in research practice has been scrutinized due to concerns raised both by critical researchers and by members of *communities of solidarity*, both due to the way research is conducted, and due to the divergence between the narratives reported by researchers and communities. A lack of accountability for participatory process outputs risks widening the trust gap between communities of solidarity and researchers. How can environmental sustainability researchers decolonize their participatory practices to reduce power imbalances and diminish the potential of misrepresentation or co-optation of communities of solidarity?

Taking a solutions-oriented approach, we reframe the problem of decolonizing participatory practices by explicitly defining *participation* through two categories; namely, procedural participation and substantive participation. We use these categories to evaluate both our primary empirical findings from interviews with members of Sweden's Transition Network, and secondary data from a critical literature review of articles. Finally, we use these insights to suggest a framework to approach participatory processes using greater reflexivity and accountability. Communities inviting researchers to document environmental justice issues are practicing Activism Mobilising Science (AMS). We discuss the pros and cons of applying our framework to both AMS and non-AMS situations as part of the formulation, implementation and monitoring of both procedural and substantive criteria of participatory practice. We then conclude that an over-emphasis on procedural metrics of success over substantive ones has undermined researcher accountability. Applying more substantive success criteria for participatory processes could improve interactions with communities engaging with action researchers.

KJELLMAN, ARNE* (*Independent*)

Why Did Plato Oppose the Miletian Nature Philosophy?

The Western world is in a deep crisis - and so are its sciences. The paradoxes continue to stack, one after another, but Western technologies roll on, fuelled by reckless market economies. There are still measures that can be taken to make things right - primarily, the payment of Nature's bill, and the renouncement of the mistakes of Western elites in power.

Scrutinizing the billions of years of natural evolution has not only shown, but *pragmatically proven* that Nature cannot be defeated unless life is totally wiped away. Yet, the elites of Western cultures strenuously try to place themselves outside Nature, attempting to dictate their own laws. Such a suggestion will of course stir up a tremendous outcry, which is only a whisper compared to the horrendous roars from the countless that have been tortured in the darkness of Plato's cave. It all comes down to the natural language and its inability to finalize the endless bickering in processes of social decision and planning.

Logical positivism were not misguided, it just stumbled upon the misguided principle of verification. The principles of practical reason, made plausible by Leibniz and Kant, has already emerged as the useful new foundation in the quest for scientific knowledge. My claim is that lingering Platonism is the hidden villain preventing scientists from understanding craftsmanship, consciousness and the human production of knowledge. The prevailing "scientific" rhetoric can, like all other truths, easily be disputed in its characteristic epistemological discourses, and indeed are, which was convincingly demonstrated by Gödel and Tarski already in the 1930s, but very few seem willing to take seriously. Its possible to prove there is just one option left - a radical shift of paradigm into the Subject-Oriented Approach.

KJÆMPENES, WENCHE* (*UiT The Arctic University of Norway*)

Shared Jurisdiction, Different Reflection?

In Norway, after a 15 year long struggle the aquamedicine biologists gained in 2005, the right to prescribe veterinary medical products for aquatic animals. In addition to medical doctors, dentists and veterinarians, they are the fourth profession in Norway with this right. Control of diseases is the x-factor in the rapidly growing aquaculture industry. In Norway, universities and individual actors were driving forces in the professionalization of aquamedicine biologists. It is unique that veterinarians and aquamedicine biologists have shared jurisdiction in the fish health work field.

First, by using a five-actor model, I will show how the aquamedicine biologist profession has been shaped by factors that mark the Norwegian aquaculture industry. The professionalization is an outcome of strategies and interaction of practicing professionals, other professions, the state, the users and the universities (Kjæmpenes, 2012).

Second, I will use this unique empirical field, to address some research questions related to the fact that is now 12 years since the veterinarians and aquamedicine biologists got shared jurisdiction in the fish health work field. Fish health management and the professionalization of the field is taking place in a socio-political process involving power and interest in the market. The tendency in ownership in Norway are now for large-scale and stock exchange companies. The professional services will take place in both a national and international context. Professions tend to advocate that their authorization oblige them to take ethical responsibility. How does the two involved professions, address ethical responsibility in care and cure of fish? How do they take care of the public interests either they are employed in the public or the private sector? How do the professions solve the classical tension between production/profit, food safety and protection of the fish welfare and the environment?

HOFBAUER, JOHANNA (*Department of Sociology, Vienna University of Economics and Business*)

Working Anytime, Anywhere: Digitalization and the Work/Family Challenge in the Crowdfunding Sector

This paper discusses the impact of digitalization on the relationship of employment and family in the frame of an emerging platform economy. Digitalization has caused a rise of new forms of business and service provision. By diffusing *gig work* and *cloud work*, internet platforms offer access to a more flexible workforce and increase job opportunities for those willing to or in need of "working anywhere, anytime". While existing literature accounts for new opportunities, e.g. increasing autonomy to self-organize working life or better reconcile employment with other needs (family), it also points to a number of pitfalls. Critics point to the dangers of the lack of regulation in the sector, reproducing gender gaps and causing intergenerational inequality. Literature has also pointed to the complex

problematic of precarious employment, to the blurring boundaries between work and non-work, to the rising disproportion between paid and unpaid labor, to the rising disproportion between paid and unpaid labor, and to new challenges for employment and family relationships.

We argue that internet platforms are key agents in shaping opportunities and pitfalls of digital work. They determine the conditions of performance and delivery, the modes of and access to reputation, reshaping the parameters of work identity and social relations. Accounting for varieties of modes of organization, we will provide research on various platform architectures. Case study material will illustrate differences in the organization of work and resulting challenges for managing the 'work-family challenge'.

Overall, we dispute technological determinism, arguing that digitalization is neither a one-way road nor imposed upon us by external forces of market society. A better understanding of the mechanisms that platforms use in order to manage labor and exert power upon digital workers is a necessary step towards developing regulations that can reduce inequalities and strengthen the social sustainability of platform economy.

KLAUSER, FRANCISCO* (*University of Neuchâtel*)

Learning to Look Down: The Swiss « Drone Academy » and the Making of the Contemporary Politics of Visibility

Camera-fitted drones are now easily affordable to the public. The resulting proliferation of the vertical gaze breaks off the longstanding privilege of the powerful to look down on the ground from above, spanning from the ancient emperors' city towers to the modern state's satellites. Thus civil drones add a new chapter to the long history of the top-down perspective, adopted to understand, order, control and act on space.

Connecting with this basic problematic, the paper asks this simple question: How do civil drone users learn how to look down? Put differently, what are the mechanisms and forces that shape the societal discovery of the vertical gaze? These questions are based on the assumption that watching is not a neutral act or pre-given ability, but a social practice that is mediated through specific understandings of both the tools and objects of watching.

To address this problematic, the presentation draws upon a case study relating to the first Swiss « drone academy », which offers courses in drone piloting across a range of Swiss cities. Hereby, the drone academy is approached as a key site in the societal formation and transmission of the knowledges and practices related to the technology's use. Anchored in an ANT line of thinking, my purpose is to unpack the chain of mediations through which relevant actors, ideas and objects connect and interact in the academy, and to explore how these assemblages produce specific forms and logics of watching. Importantly, this question will also be re-instituted as part of a broader problematic of the processes and relationships behind the changing regimes of visibility that characterise the present-day world of big data.

Thomas Paine, Conflicted Cosmopolitanism, and Global Insecurity

One way to critically examine the operations of cosmopolitanism in today's cultural and political practices is to clarify past influences on our thinking about national and global aspects of security. This paper critically examines an influential cosmopolitan political actor, American revolutionary Thomas Paine. Two centuries after his death Paine continues to influence politics, to be misunderstood, to spark academic debate, and to generate conflicting interpretations.

This U.S. "founding father" reflected and fostered both pro- and anti-cosmopolitan thinking at the heart of U.S. political culture. Despite Paine's genuine radical and liberating contribution to a more cosmopolitan world, Paine's legacy is part of U.S. ideological ambivalence about whether to "play well with others," that is, how cosmopolitan and sharing the U.S. should be regarding "national" security. Paine evidenced both cosmopolitan and imperialist ideas. He was an exceptional critic of the British empire, but was restrained in criticizing slavery and genocidal treatment of American Indians, and offered little support for the 1791 Haitian Revolution.

Examining Paine can help us theorize cosmopolitanism's challenges. The historical example of Paine helps illuminate how some peoples' precariousness becomes more important than others'. Paine's ambivalence about U.S. nationalism and future empire fits with Butler's (2009:43) insight that although cohabitation presupposes interdependency, this interdependency can be disavowed, enabling destructiveness. As she has argued, we need a rethinking of global politics in which we acknowledge that nationalism works in part by producing a version of the subject, via media and culture, which renders the subject's destructiveness righteous (Butler 2009:47). Similarly, looking at Paine can help us follow Beck's (2006:25) call for a New Critical Theory of our cosmopolitan era to expose how the asymmetry of perceptions of inequality is bound up with the national outlook, banishing global inequalities from the field of vision.

Direct and Indirect Effects of Grandparent SES on Grandchildren's Cognitive Development: A Prospective Mediation Analysis

Using the British Cohort Study 1970, we investigate whether grandparents' SES affects their grandchildren's cognitive development solely through parental SES or also through direct pathways such as financial aid or caregiving. Assessing the contributions of resources and behaviours of different generations on children's life course outcomes potentially faces severe methodological challenges. More specifically, estimating the direct effect of grandparent SES and its indirect effect through parents' SES may be plagued by two issues of endogenous selection bias (Elwert & Winship, 2014). Firstly, adjusting for a mediator (parental SES) via the traditional approaches to mediation analysis may induce spurious association between exposure (grandparents' SES) and outcome through unmeasured common causes of mediator and outcome. Secondly, conventional approaches ignore family formation and childless individuals, thereby potentially introducing selection bias into estimates of how characteristics in one generation affect an outcome in the next.

Our contribution to the literature is threefold. Firstly, we integrate the literature on social stratification and child development and consider multigenerational SES effects on children's cognitive development. Secondly, we use a novel approach to mediation analysis (VanderWeele 2016) addressing the shortcomings of the traditional approach and allowing for effect decomposition in the presence of an exposure (grandparent SES)-mediator (parent SES) interaction using a potential outcomes framework. Thirdly, we follow the prospective approach on intergenerational social mobility (Breen & Lawrence, 2016) and correct for grandparent and parent SES effects on having a child in the parent generation by estimating marginal structural models with inverse probability of treatment weighting.

The BCS70 age 34 wave (in 2004) randomly selected half of the cohort members who lived with their children for an additional battery of questions about their children. Hence, we have information on children's cognitive ability and SES information for parents (at various ages) and grandparents (measured when parents were aged 10).

Children Born of Occupation in Germany after World War II – Problems and Coping Strategies

Children Born of Occupation in Germany after World War II – Problems and Coping Strategies

Since the turn of the century, some books and articles have been published on the conditions of the growing up of children born of occupation in Germany after the end of World War II. In the post-war period, children born of occupation was the term for children who had emerged from connections between members of the allied forces and local women. The line between amicable and forced sexual contacts is not easy to draw. There were as well genuine love affairs, fleeting sexual encounters, survival prostitution as rape in all four zones of occupation.

In a project currently funded by the German Research Foundation, we (my PhD student and research assistant Rafaela Schmid and me) use narrative interviews to collect the life stories of former children born of occupation. We examine structural, institutional, and individual discriminations that our interviewees were exposed to as children, and ask more, as has been the case in research now, how the children coped with their adverse life circumstances. Discrimination and exclusion experiences can, on the one hand, considerably aggravate a healthy psychological development, but on the other hand they also contribute to the development of psychological resistance. To answer this question about the resources from which the children of occupation drew and the importance of this for their development of identity, I will go back to some of the case studies we have developed through a qualitative biographical approach.

Between Agency and Structure: Towards New Perspective on Urban Communities in Postmodern City

Having the latest findings of community studies regarding "Community Question", as well as current trends in urban sociology and urban policies as points of departure, the paper addresses the problem of contemporary urban communities' production and reproduction processes, as well as cultural mechanisms and factors of these processes. Rejecting both the ecological determinism and cultural reductionism of community studies, I assume that postmodern city is a space of structuration of diverse urban communities that go far beyond the traditional concept of neighbourhood, personal networks or imagined communities. I assume that culture in general and symbolic meanings

of territory in particular (urban scenes), play crucial role in the process of structuration of urban communities, and that structuration process takes place in collective cultural consciousness and is mediated by territorially embedded cultural (community) practices of individuals. I will argue that urban scenes provide socio-cultural opportunities structure for community integration and that spatial segregation of diverse cultural practices reinforces their capacity for community structuration through symbolical construction of social boundaries. The paper aims to answer the questions on how various cultural dimensions of urban space impact communal symbolic practices of individuals and what kind of cultural mechanisms shape various urban social forms. The paper provides a new theoretical and methodological perspective to analysis of cultural mechanisms of processes of urban community structuration, in which cultural practices of individuals and symbolic dimensions of urban space interact, leading to emergence, reproduction and reconstruction of a given type of social entity. Some preliminary research data will be provided in order to exemplify and support the arguments of the paper.

The Impact of "Big" and "Small" Art on Urban Change

The paper discusses various perspectives on arts and culture in urban context. It provides case study of Katowice, (post)industrial city in Upper Silesia Region in Poland and analyses uses and misuses of arts and culture in urban development and community integration. Answering the question why some cultural interventions and investments favour urban change, while others seem to have no significant impact, the paper points to the problem of participation and empowerment on the one hand and city branding on the other. It analyses interactions between uses and misuses of "big" and "small", mainstream and alternative arts, top-down cultural policies and bottom-up art initiatives and attempts to identify mechanisms that underlie urban change.

On the Government of Bisexual Bodies. Asylum Case Law and the Biopolitics of Bisexual Erasure

Research into asylum case law in many countries (including the USA, Canada, Australia, New Zealand and the UK) suggests that bisexuals are at serious risk of having their claims dismissed, because their stories and identities are cast as non-plausible or non-consequential. The legal claims of non-heterosexual applicants have been met with ignorance and excessive scrutiny in the legal apparatus of many countries for a very long time. While positive case decisions of gay male and lesbian claimants are increasing in some jurisdictions, bisexuals are still likely to find their claims on the grounds of persecution because of their sexuality rejected. While the "discretion requirement", i.e. the expectation that lesbian, gay, bisexual or trans* applicants have to live "discrete" lives (or, in other words, to "stay in the closet") to prevent persecution, has been successfully challenged in many jurisdictions, bisexuals are still alleged to being able to "pass" without hassle, if they only entered heterosexual relations. Bisexual claimants often find it impossible to prove their membership in a 'particular social group'. The fluidity bound up with bisexuality and the lack of acceptance for bisexual identities is at odds with the 'immutability' assumption of sexual orientation models. The common discrimination of bisexuals in asylum law is a direct outflow of what Kenji Yoshino calls the 'epistemic contract of bisexual erasure'. The hurdles against making bisexual experience intelligible in the field of law and against materialising a right for asylum for bisexual claimants is part and parcel of the regulation of the sexuality of migrants' bodies through biopolitical acts of government with all too often necropolitical consequences.

KLEY, STEFANIE* (*University of Hamburg*)

Facilitators and Constraints at Each Stage of the Migration Decision Process

Behavioural models of migration emphasize the importance of migration decision-making for the explanation of subsequent behaviour. But empirical migration research regularly finds considerable gaps between those who intend to migrate and those who actually realize their intention. This paper applies the Theory of Planned Behaviour, enriched by the Rubicon model, to test specific hypotheses about distinct effects of facilitators and constraints on specific stages of migration decision-making and behaviour. The data come from a tailor-made panel survey based on random samples of people drawn from two German cities in 2006–07. The results show that in conventional models the effects of facilitators and constraints on migration decision-making are likely to be underestimated. Splitting the process of migration decision-making into a pre-decisional and a pre-actional phase helps to avoid bias in the estimated effects of facilitators and constraints on both migration decision-making and migration behaviour.

Outlaw Motorcycle Gang Related Crime in Germany: Prohibition of Biker Jackets As an Approach to Prevention

Outlaw Motorcycle Gang related crime in Germany:

Prohibition of biker jackets as an approach to prevention

Ina Klopp (*Criminological Research Institute of Lower Saxony, Hanover*)

On March 16th 2017 the amendment of the act of association became effective. Ever since the members of rocker clubs are not allowed to wear their biker jackets in public if one chapter/charter of their club has been banned. In addition to that they are not allowed to use their symbols at clubhouses and on webpages. Up to now it was possible that the clubs wear biker jackets with symbols of the club or the emblems in spite of the prohibition of a particular chapter/charter. It was only not allowed to wear a biker jacket with the name of a forbidden chapter/charter on it. The amendment is an approach to prevention against "Outlaw Motorcycle Gang crime in Germany".

In January 2017 the Criminological Institute of Lower Saxony started a research project, investigating "Outlaw Motorcycle Gang crime". The project is funded by the European Union fund for internal security. The contributed presentation informs about first results of interviews with experts. It should illustrate how experts, especially police and prosecution experience the prohibition of biker jackets, which effects it has on their work and which difficulties exist.

Boundary Maintenance, Leisure Spaces, and "Respectable Segregation": The Case of an Urban LGBTQ Neighborhood

Lesbian, Gay, Bisexual, Transgender, and Queer (LGBTQ) leisure spaces have historically provided an important opportunity for marginalized sexual and gender identities to cultivate a safe space of open expression, identity negotiation, and political activity (Ghaziani, 2014). This is particularly the case for "gayborhoods," or neighborhoods that feature a large LGBTQ population, numerous LGBTQ businesses, community centers, cultural attractions, and leisure opportunities. Such neighborhoods have long attracted a "gay migration" of individuals with marginalized identities searching for safe spaces (Weston, 1995). This is the case for Chicago's Boystown neighborhood, the world's first official gayborhood. However, recent perspectives of LGBTQ spaces demonstrate the ways in which these spaces are in fact dominated by white, upper-class, normative values to the detriment of those who are gender nonconforming, of lower socioeconomic status, and racial minorities. This neoliberal process of gay assimilation based on heteronormative hierarchies of power has been coined "homonormativity" (Duggan, 2002). Such dynamics have led Orne (2016) to describe Boystown as a "gay Disneyland" that is focused on marketing itself based on normative, heterosexual respectability. Further examples of this normative processes have been found in other LGBTQ spaces through the processes of hegemonic masculinity (Johnson, 2008), misogyny (Johnson & Samdahl, 2005), racial preferences (Green, 2008), social class (Berube, 1996), and respectability (Ahlm, 2017; Ward, 2008).

Using ethnographic observations and semi-structured interviews, this study demonstrates the ways in which Boystown creates and maintains boundaries of exclusion based on hegemonic norms. The neighborhood actively "defends" itself (Kefalas, 2003) from the perceived dangers of neighborhood change, thus sustaining a segregated white, upper-class, LGBT neighborhood. This is accomplished through (1) the symbolic boundary of respectability, (2) policing, and (3) nonprofit practices. The outcome of this negatively influences both access to and experiences in leisure spaces for individuals who do not conform to the neighborhood's respectable identity.

From "Control Centers" to "Centres of Coordination"

In this paper I shall argue that surveillance has been transformed in such a way as to exhibit new features. These new features of contemporary forms of surveillance become particularly visible when looking at paradigmatic studies, such as David Lyon's *The electronic eye: the rise of surveillance society* (1994) and their historical situation. More specifically, the paper will focus on what has been often called the "control centre", which include video surveillance of human bodies as well as of car, trains, planes and a huge range of infrastructures.

Control Centers are locales which are observing, regulating and controlling processes, actors and things in other spaces by mediated communicative actions using sophisticated technologies. While these technologies had been analogue in the 1990s, the article will address the role of digitalization and other new and cutting edge forms of mediatization, as e.g. in Smart Cities projects. This change is not sufficiently designated by the notion of "control centres". On the basis of an ongoing comparative empirical study of control centres, I shall rather support the thesis that there is a dramatic change in the tasks assigned to control centre, in

the forms of interaction and (technologically mediated) interactivity and, consequently, in the way they are exerting social control.

What Is Communicative Constructivism?

In the last decades, a new sociological approach has been emerging mostly in Continental Europe which came to be called communicative constructivism. It is mainly based on empirical studies in sociology, communication, and other social sciences studies. Although they are inspired by the "Social Construction of Reality", they avoid the presumed "cognitivism", "subjectivism" and "relativism" as ascribed to Social Constructivism" by postconstructivists. In this presentation I will sketch the basic theoretical frame of the emerging theory of the communicative construction of reality. Correcting some of the problems of the Social Constructivism raised by its critiques, it is based on a notion of communicative action as suggested by Habermas, yet avoiding his idealist bias. After sketching some of the most basic categories of communicative action, such as reciprocity, performativity and relationality, the paper turns to the question how the approach can address the notion of knowledge. In the conclusion it indicates the relevance of these social theoretical notions in order to understand the move from what has been called the "Knowledge Society" to the "Communication Society".

Work Organization and Nonstandard Workers: A Case Study of a Multi-Layer Subcontracting System in Taiwan

There is a large and detailed literature on the use of nonstandard workers in different parts of the world, but few attempts have been made to understand the relationship between nonstandard workers and the kinds of organizations that use them most frequently. The primary focus of this paper was clarifying how a common organizational form in East Asian countries, particularly in Taiwan—multi-layer subcontracting system—serves as a motivating factor for using nonstandard workers, with the China Steel Corporation multi-layer cooperative subcontracting network serving as an example of such a system and the economic and social mechanisms that support it.

According to my analysis of the economic and social mechanisms that support this system, China Steel and its subcontractors operate according to a "flexible firm model" (Atkinson 1984, 1987; Kalleberg 2001) that requires supportive social mechanisms in order to achieve optimum economic benefits. The data used in this study confirm that truth. Flexible labor deployment—especially demand for subcontracted and temporary labor—explains how multiple levels in the China Steel Corporation cooperative subcontracting system work, and how nonstandard work arrangements are generated. In the process, I found that the more one moves toward the outer layers of subcontractors, the more one finds weaker connections between those layers and increasingly significant trust and control problems. China Steel and its subcontractors are required to use the various social mechanisms in their arsenals to resolve communication, coordination, and control problems, and to generate institutional trust and supportive social networks.

Cultural Inequality and Freedom: Rational Choice Approach to SSP 2015 Data

This paper theoretically and empirically examines how a sense of freedom is associated with cultural inequality. Bourdieu argues that cultural tastes and activities are exclusive since people with higher socio-economic status exclude others from high cultures. Peterson and others provide a different view. High status people consume not only high cultures but also middle and popular cultures.

Still, both lack what micro individual mechanisms work. So, we hypothesize that people invest in diverse human capital to be cultural omnivores. Using SSP 2015 data in Japan, we measure cultural omnivorousness by a geometric mean of high and middle cultures activities. We analyze a subsample of 2,769 respondents. "Diverse human capital" is measured by sense of freedom.

This paper shows that (1) by the distribution, 52.5 % of the sample were omnivores. (2) By main effects in regression analyses, higher status promotes cultural omnivorousness. Yet (3) by interaction effects, freedom bridges status and cultural activities. Therefore, higher status people are culturally omnivorous, but only when they have enough sense of freedom. This paper specifies how people choose cultural activities at the individual level.

Why Do Happiness and Satisfaction Not Coincide? Strict Comparison of Two Sub-Domains of Subjective Well-Being

This paper investigates why subjective happiness and life satisfaction do not coincide. So far, these two sub-domains of subjective well-being have been regarded as interchangeable. This paper measures the two concepts in a strictly comparable way to examine their determinants.

Data are collected in a survey with a representative sample in a Japanese city. The two concepts are measured in four-point scales. They are coded into dummy variables.

The paper shows that (1) (by distributions) there are more happy people than satisfied people by 13.4%. (2) (By a cross table) happiness and satisfaction do not coincide in 14.8% of the sample. (3) (By a logistic regression analysis) people become happier with more education while they become more satisfied with employment and more income.

Therefore, it turned out that happiness and satisfaction are different sub-domains of subjective well-being with different determinants.

Dilemmas behind Life Stories: Naming and Research Ethics in Autobiographical Writing Movement Research

I will discuss a problem of research ethics that I have confronted in my research on the autobiographical writing movement in Japan. I have conducted life story interview research through an analysis of autobiographical works from the autobiographical writing movement that emerged in the 1980s and continues today. I recognized that it is remarkable that people writing their own lives displayed the authors' independence and their identity. The writers intend to describe their experiences by publishing a book. I have pointed out that it is important that they express themselves under their own name by providing their name as the author expressing the subjective within the contents of the text. Following the definition of P. Lejeune, I have regarded it as a prerequisite of autobiography that the author corresponds to the subject of the experience described in the book. The name of the author is therefore pivotal in autobiographical writing. However, I encountered an ethical research issue over the naming problem when I wrote sociological papers about whether or not to use anonymous names. If I respected the authors as individuals with their proper names who wrote their own life stories on their own initiative, using some kind of pseudonym, for instance, may violate research ethics. There arose another contradiction when I aimed to understand the idiosyncratic individual through their autobiographical writings at the same time as I had to orientate my analysis so as to generalize from that writer's specific experiences. These dilemmas can be studied as the results of an ambivalent perspective in research practice. I will explore this kind of sociological contradiction from the point of view of dilemmas in life story research.

KOBERINSKI, JODI* (*University of Waterloo*)

Multi-Dimensional Food Values: New Metrics Integrating Food, Water and Energy

A mechanistic view of agriculture and food dominates siloed institutional spaces. This paradigm ignores scientific linkages connecting food, energy and water. The externalized costs of industrial food systems are well documented, calling into question both the mono-dimensional valuation of food-as-commodity and the metrics supporting that valuation. An ecological view of the natural world calls for new metrics and decision tools that overcome policy silos and implement 'joined up food policies'. Creating food policy that recognizes the intersection of food, energy and water requires a normative shift from reductionist, mechanistic models for both the economy and food systems towards diverse, ecological models. When food is viewed only as a commodity, yield per acre and selective 'productivity' calculations are dominant metrics. This review synthesizes seminal works from diverse disciplines of economics, environment, and political ecology to develop new metrics and decision tools designed to create just food systems. First, I examine the inadequacies of 'yield per acre' from both a technical and institutional perspective to adequately measure costs and benefits of industrial food systems. Next, I review the utility of 'health per acre' and 'wealth per acre' as metrics for linking food, water and energy. Using Kate Raworth's Doughnut Economics framework, I discuss Jose Luis Vivero Pol's Six Food Dimensions model to begin exploring legal and political frameworks. Finally, I conclude that adopting these new metrics may be a necessary pre-condition to achieve 'joined up food policy'.

RC40-JS-43.1KOBERSKI, JODI* (*University of Waterloo*)*Taking the Pulse of Canada's Industrial Food System*

Industrial food systems produce cheap calories, reinforcing an almost homogeneous food science/ productivist view of food and agriculture. This view obscures the role of industrial systems in creating social and ecological injustices, including climate change, nutritional deficiencies, and water insecurity. Scholars are challenging that homogeneity, offering a food systems/ multifunctional view that reveals the ecological and human rights costs of cheap food. (Weis 2007; Winson 2013). Shifting diets away from meat towards protein-rich pulses—lentils, beans, fava, chickpeas, dried peas—could reduce industrial agriculture's ecological footprint by lowering nitrogen and water use (FAO 2016). Critics argue, however, that introducing pulses within unsustainable industrial systems rather than transitioning to the regenerative agroecological systems in which pulses thrive simply trades one set of socio-ecological issues for another (Shiva 2016). For example, pulse proteins require less water to produce than meat proteins. Yet industrial pulse producers rely on pre-harvest use of glyphosate, recently declared a probable carcinogen (WHO 2015). Socio-ecological and human rights costs of industrial food are well documented (Clapp 2016; Erickson 2008). Regardless, this evidence has not resulted in adoption of agroecology, due largely to what critics describe as political and economic 'lock ins' (Frison 2016; Rotz 2017). I ask how these lock-ins favour industrialization within Canada's food system using pulses as a case study. Applying Causal Layered Analysis (Inayatullah 1998), I unpack conventional narratives about 'choice', 'efficiency' and 'safety' derived from a food science/ productivist view, analyzing these narratives in the context of four hidden drivers—consolidation, incentivization, nutritionism, and financialization. Next, I investigate the role of these drivers in perpetuating industrial food systems lock-ins through the lens of Canada's pulses sector. Finally, I discuss possible transitions towards diverse agroecological systems in light of these drivers as a pathway towards achieving social and ecological justice.

RC06-142.4KOC, ISMET* (*Hacettepe University*)*Realized, Unrealized or Excess Fertility? Evidence from Comparative Asian Family Surveys in China, Japan, South Korea, Taiwan and Turkey*

The mismatch between achieved fertility and desired fertility is well-studied especially for the western developed countries. However, there are limited studies on the issue in Asian countries especially for the countries that levels of fertility have already declined to the replacement level. This study focuses on the relationships between achieved fertility and desired fertility in five countries (China, Japan, South Korea, Taiwan and Turkey) in order to understand the mechanisms behind the mismatch between achieved fertility and desired fertility. The data comes from the Comparative Asian Family Surveys that was conducted during the period of 2010-2016 in all countries. The study examines the issue by creating three sub-groups: (1) Achieved fertility equals to desired fertility (realized fertility) (2) Achieved fertility is lower than desired fertility (unrealized fertility) (3) Achieved fertility is higher than desired fertility (excess fertility). The study looks at the issue with a series of logistic regression models for each of the sub-groups by controlling all possible covariates. The preliminary descriptive results of the study put forward that for both sexes younger age cohorts experience unrealized fertility, as age advances unrealized fertility turns into excess fertility in China, South Korea, Taiwan and Turkey. However, Japan seems to be an exceptional case as all age cohorts appear to have unrealized fertility. When samples limited to ever-married women who already completed their family size, there exists a clear mismatch between achieved fertility and desired fertility in the form of unrealized fertility in Japan (48%), South Korea (50%) and Turkey (58%), on the other hand, we observe a match between achieved fertility and desired fertility in China (47%) and Taiwan (46%). The shares of excess fertility are at the level of 8-9% in Japan and South Korea while it increases to 14% in Turkey, 18% in China and 25% in Taiwan.

RC40-702.8KOC, MUSTAFA* (*Department of Sociology, Ryerson University*)
OZUGURLU, METIN (*Ankara University, Faculty of Political Sciences*)*Looking Beyond Neoliberalism: Tragedy of Turkish Peasantry and the New Populism*

This paper deals with impacts of policy changes in three different agricultural sectors in Turkey since the 1980s where Turkish state has switched from and import substitution model of industrialization to a model of export promotion. This period was also characterized with further integration with global economy, decline in real wages and unionization and depeasantization. Many observers correctly pointed out the role of neoliberal ideology and policies adopted by the domestic elite, state bureaucracy, as well as penetration of global capital and the role of international financial institutions in this process.

By looking at the impacts of policy reforms in sugar beets, tobacco and animal husbandry this paper examines the domestic and foreign dynamics in the demise of peasant farming in Turkey since 1980s. While we will identify the role of neoliberal reforms adopted under various governments during this period, we will argue that neoliberalism has become a misnomer, an overgeneralized explanation for complex political processes.

The paper argues that by looking at different sectors and policies, we can examine the complex factors behind depeasantization. The paper will explore the complex convergence of actions and priorities of political elite, domestic bourgeoisie, transnational capital industrial and financial capital in depeasantization. It is also argued that changes in policies would also trigger complex new dynamics with unintended consequences triggering a series of new developments.

The paper also explores the role of nationalism and populist politics in political legitimacy and stability by diverting the attention of the victims of the "neoliberal" assault to presumed internal and external enemies, a process that has been happening in many parts of the world in recent decades.

RC02-JS-56.4KOCABICAK, ECE* (*London School of Economics and Political Science*)*New Varieties of Domestic Patriarchy: Evidence from Turkey*

This paper extends existing theories on varieties of patriarchy by developing a theory of premodern domestic patriarchy. Building on existing analyses that associate gender-based segregationist strategies with public patriarchy and gender-based exclusionary strategies with domestic patriarchy, it proposes that domestic patriarchy has two forms: In the modern form, men sustain their exploitation of women's labour within the home by excluding women from free wage labour; in the premodern form, they exclude women from landownership to maintain patriarchal exploitation of labour in agriculture. The methods of comparative and historical analysis are used to identify the two forms and distinguish the factors sustaining the premodern form in Turkey, namely that male peasants constitute a patriarchal collective subject whereas rural and urban women are divided. Both methods are required and complement each other in terms of identifying the implications of gendered landownership for patriarchal and capitalist transformations. The paper argues that the premodern form of domestic patriarchy slows the transition to public patriarchy by establishing gendered patterns of rural to urban migration, and as such, limits women's access to education and paid employment. In such conditions, women are divided: women living under the conditions of gender-based exclusion and women who confront gender-based segregation. A lack of alignment in their feminist demands and strategies weakens women's overall capacity to achieve significant advances in gender equality. Premodern domestic patriarchy in Turkey also has implications for capitalist transformation. It enabled production of the agrarian surplus necessary for initial industrialisation yet prevented expansion of capitalism in agriculture by shielding peasants' landownership from market-led dispossession of land. It further leads to a shortage of free wage labour by limiting women's access to paid employment which, in turn, obstructs industrial quality despite a high level of industrial capacity.

RC24-JS-89.2KOCH, FLORIAN* (*HTW Berlin - University of Applied Sciences for Engineering and Economics*)*Implementing Urban Transformations to Sustainability: A Review on Transformative Adaptation Practices*

Recently adopted global political sustainability agendas such as the Sustainable Development Goals (SDGs) consider cities as 'powerful actors' with a role to play in seeking a more sustainable and resilient world. There is agreement on the need to transform existing urban development patterns and on the strategic role of local governments to achieve ambitious sustainability goals. How these urban transformations should actually take place remains rather blurry and requires further discussion.

Adaptation to climate change is a core dimension of transformations to sustainability. In recent policy documents, the need for a transformative adaptation, which requires radical, non-linear changes is highlighted (EEA 2017, Revi et al. 2014). Transformative adaptation tries not only to reduce the increasing risks related with climate change, but focuses also on further causes of risk such as poverty, lack of institutional capacity or knowledge. This way, transformative adaptation is highly politically as it challenges the status quo and existing power structures. Furthermore it needs to be considered that adaptation measures can reduce inner-urban socio-economic differences relating to environmental risks and vulnerability. At the same time, adaptation measures have also the potential to increase existing inequalities (maladaptation). This makes decision-making processes on adaptation difficult as different objectives and trade-offs need to be considered (Anguelovski et al. 2016).

In my presentation, I will analyze how adaptation processes in different cities took place and whether a transformative agenda has been implemented. Based on an extensive literature review on empirical cases, the key factors for implementing transformative adaptation policies as well as the obstacles are identified.

The aim of the presentation is to contribute to a better understanding of the gaps between ambitious transformative policy agendas and the implementation of these agendas on the ground.

Once Learnt Never Forgotten - Recognition of Qualifications Acquired Abroad: A Key to Labour Market Integration in Germany

Once learnt never forgotten - Recognition of qualifications acquired abroad: A key to labour market integration in Germany

On April 1st 2012 the German „Law to improve the assessment and recognition of professional and vocational education and training qualifications acquired abroad“ (Recognition Act) entered into force. The aim of the law is to foster the labour market prospects for skilled workers, who gained their professional or vocational qualifications abroad.

The Recognition Act provides migrants, not depending on their residential status, with access to an equivalence assessment of their professional or vocational qualifications with the German reference qualification. It applies both for regulated and non-regulated occupations. In addition, relevant occupational experience can be used to compensate substantial differences identified in the equivalence assessment.

Our presentation will be based on empirical data and is going to present a case study of how skilled working migrants can be integrated into the German labour market. Therefore, the implications of the Recognition Act will be discussed focusing on experiences from 5 years since the law has been in place.

We are going to present the latest data of the German official statistics for occupations governed by federal law covering data currently available from 2012 to 2016. The official statistics consists of reportable data, which is delivered by the competent authorities.

Results of the year's evaluation of the Recognition Act regarding its impact on labour market integration of migrants

Experiences with skills assessment tools developed and applied in the project Prototyping Transfer. An well-established procedure when migrants cannot produce the relevant documents or certificates to prove their formal qualifications.

Furthermore by presenting findings of the IAB-BAMF-SOEP survey focusing on refugees (2017) we put a special focus on refugees and put these into perspective with aforementioned data from the official statistics.

Protest Research at Its Limits: Surveying Right Wing Movements

PEGIDA (Patriotic Europeans against the Islamization of the Occident) is a perfect example for the limits for protest surveying on right wing movements. In the autumn of 2014 PEGIDA caused perplexity: The German public, politicians, and the scientific community were simply surprised by how quickly a (radical) right-wing protest movement had evolved, demonstrating its xenophobic and anti-elite attitudes in a public space on each Monday. After all, PEGIDAs mobilization was stunning: With only 350 protesters at the first demonstration (20th October 2014) the number of participants nearly doubled each week – with a peak on 12th January 2015 at – according to the police – 25.000 demonstrators (our team counted 17.000 participants). And even though the numbers declined PEGIDA's persistence is remarkable: Even today PEGIDA mobilizes up to 3.000 supporters for their weekly events.

PEGIDA's considerable power of mobilization coupled with its embrace of behaviors that are considered taboo in Germany (xenophobic slogans, rejection of media etc.) got the attention of the press, who formulated assumptions about the motives and the composition of the demonstrators. This situation called for protest researchers. Therefore different scholars conducted surveys at PEGIDA demonstrations. Until now five different teams have collected data in the field on ten occasions in total. This makes PEGIDA likely the most closely investigated protest movement in Germany. The aim of the submitted presentation is to give an insight into the (limits of the) different methodological approaches of protest-surveying on right wing demonstrations and to develop some ideas in overcoming them.

Malnutrition and Health in the Era of Climate Change

India with the population of 1.21 billion according to the latest census (Census 2011), economic instability and climate change, food security presents

a demanding challenge for states and national governance. The overall improvement in nutritional status has also been very slow. There is chronic under-nourishment in about half of the population, particularly among the vulnerable groups of children (75%) and women (20%) as per the study conducted by me at Chintapally Mandel of Visakhapatnam District; Andhra Pradesh (India). The study shows certain nutrition related clinical symptoms and points toward ragi (finger millet) as the most suitable food. Keeping this in view it is suggested that people need to be made aware, the nutritional value and health building properties of the millets to maintain better health.

Each millet is extraordinarily superior in nutritive value compared to rice and wheat. Germination of these millets still improves the nutritional quality. Sprouts are easily available to all sections of society and the biggest store house of all nutrients. The dishes like chapati, puri, health drink and payasam were prepared and tested the colour, texture, flavor, taste, overall acceptability and calculated nutritive value. The vitamins, minerals and protein content substantially increased with a simultaneous decrease in calorie and carbohydrate content. Hence, the dishes prepared with combination of germinated finger, pearl and foxtail millet in combination with other pulses to feed pre-school children, pregnant and lactating women improve the health condition and minimize the clinical symptoms.

In addition these crops are 'climate change complement crops'.

A Global Dismantling of Progressive Social Policy: Reversing the Social Turn

The social turn, starting in the 1990s, accelerated in the 2000's. It brought a significant rise and spread in regulation around progressive social policies, especially in the area of social protection. Over 100 countries adopted varied forms of social transfers. In South Asia, six countries adopted social assistance policies, and China, after its policy retrogressions of the 1980s, re-introduced a minimum income guarantee and health insurance. The SAARC and ASEAN introduced regional social policy agreements. At the global level, the ILO was able to adopt a reasonably strong commitment to a universal, unconditional social protection floor with its Recommendation 202 of 2012. Regarding decent work, too, some regulatory policy progress was made (e.g. ILO Homework Convention of 1996, ILO Domestic Workers Convention of 2011). After this 'golden age' of global social policy, we are now confronted by a - seemingly global - rollback of progressive national social policy regulation and practice. The aim of the paper is fourfold: 1) to offer an overview of reversals in progressive social policy regulation in a range of countries, particularly in the Asian region; 2) to attempt an explanation of the earlier success of the social turn; 3) from that explanation, to try to uncover the factors that are enabling its current reversal; and 4) based on positive counter-examples, to compile ideas for progressive regional-level (with a focus on Asia) and global policy advocacy and regulatory provisions to protect, defend and transform the (eco)social turn.

"to Him That Hath Shall be Given": The Intergenerational Transmission of Wealth through the Life Course

Intergenerational solidarity through the whole life course is an important characteristic of family relationships and cohesion. Support of parents for their children does not stop after the adult children have left the parental home. However, although solidarity between family members has been a frequent subject of research over the past years, comparatively little is yet known about the influence of social inequality on intergenerational solidarity in adulthood. In what way does social inequality influence intergenerational transfers, and what is the effect of family support on social stratification?

The paper addresses this research gap and examines the determinants of intergenerational cash flows in the context of social inequality using the Survey of Health, Ageing and Retirement in Europe (SHARE) in 15 European countries, from north to south and west to east. The analyses employ a multigenerational perspective by investigating various types of financial transfers, namely monetary support such as cash, gifts, or valuables during lifetime or thereafter in the form of inheritances.

The multilevel analyses indicate a perpetuation of social inequality over generations and even a cumulation of (dis)advantages across the life course. Financial resources and wealth largely remain in higher-class families and are transmitted over generations. Better-educated and rich parents have abundant resources that they use for the benefit of their offspring. Children are born into higher- or lower-class families – which has tremendous consequences for their whole lives. The connections between intergenerational solidarity and social inequality also apply to functional solidarity between generations in adulthood, showing country-specific influences of economic and political conditions. Wealthy parents are

in a much better position to support their adult children with money – and these children are much more likely to receive something, thereby confirming the Mat-the principle: “To him that hath shall be given”.

A Biographical and Family Historical Approach in Researching Gender and Right Wing Movements

Since the beginning of the 1990s, alarming images from the Federal Republic of Germany have been going around the world: pictures of right-wing teenagers raiding homes of refugees and attacking foreigners; brutal attacks, frequently with fatal results. Meanwhile, independent sources register about 200 fatal incidents of right wing violence.

Media and also academic research reports focus on male youths and men, so the impression arose that girls and women aren't involved in the right wing scene. The consequence of this gender stereotypic few is that women are not recognized as political actors in the public field. By the media, authorities and researchers, girls and women with this background are not seen as actively contributing, as they are not as frequently involved in violence, compared to boys or men. However, this widely spread view is specific to an orientation, which diminishes female participation in right-wing extremism, leading to a misinterpretation and trivialization of their actual involvement.

In this presentation, a biographical case study on the participation of girls and young women in the right-wing sphere of the Federal Republic of Germany will be introduced focusing also on the strategy of the right wing groups infiltrating public organizations and spaces.

How Refugees Live in Germany and Australia: Biographical Reconstructions between Insecurity and Trauma

In view of the fact that in global terms there are over 65 million refugees, the topics of migration and asylum are gaining in importance. Immigration countries – especially in the 'global West' – often have a negative attitude to immigration, trying to keep numbers as low as possible by guarding their borders and developing strict asylum procedures.

My current research project is concerned with examining the asylum system and asylum procedures in two of these 'Western' host countries: Germany and Australia. The aim of the research is to show the effects of these two systems on refugees. By reconstructing the biographies of asylum seekers, I want to find out how people from different social and national backgrounds and with very diverse lived realities are able to adapt to life in their host country, and what opportunities and restrictions result from the immigration and integration systems of that country. I am interested in why people leave their country of origin, their experiences during their migration, and their settlement process. In Germany, I am recording the biographies of people who have arrived in the country recently, and following up their experiences in Germany in a long-term study (10-12 years). In Australia, by contrast, I record the biographies of people who have already lived in Australia for some years, and who can give me a retrospective account of what they have experienced in their host country.

My paper is focused on this research. On the basis of the experiences of the refugees/asylum seekers, I will briefly discuss the differences between the two immigration systems, and what kind of effects and impacts they have on the lives of people. Specifically, I will show differences in coping with lived-through traumas, and how people talk about these at the time of the interview.

Emociones y Violencia: El Rap En El Callao

Como género musical, el rap ha sido reapropiado en diferentes partes del mundo, manteniendo el sentido de resistencia, denuncia o protesta sociopolítica que deviene del descontento que genera la discriminación que enfrentan diversos grupos sociales marginales. En ese contexto, el caso que analizamos resulta atípico, pues las letras de rap de los cuatro grupos más importantes del Callao – la primera ciudad puerto del Perú– reflejan sentimientos y emociones de desesperanza, desconfianza y arrepentimiento individuales, que emergen de la interacción cotidiana con diferentes modalidades de violencia como el narcotráfico, el sicariato, la represión policial y los conflictos interbarriales. El rap en el Callao –en vez de desplegarse como un género musical contestatario– funciona como una forma de trabajo de las emociones ante un contexto altamente violento. “No se necesita ser un poeta ni un músico para rapear”, “he dejado el reggaeton, la salsa o la cumbia, para poder expresar mis sentimientos”, “rapear es como ir al psicólogo”, manifiestan algunos de los raperos entrevistados. A diferencia de otros grupos de rap limeños que habitan en barrios con menores niveles de violencia, con instituciones municipales que permiten formas de

expresión emocional a partir del arte o el aprendizaje de oficios– los raperos del Callao, convierten el rap en una práctica para procesar emociones complejas, pues la transgresión de la norma siempre es una tentación para el dinero fácil en esos barrios violentos y tugurizados en los que habitan: “el robo, el sicariato, el tráfico, nos persiguen... la tentación siempre está en la calle... pero el rap nos permite entender la calle... buscar salir de ella”. El texto que presentamos es el resultado de una investigación empírica que consistió en el análisis de contenido de letras de rap y de entrevistas a raperos del Callao.

Privilege and Uncertainty: Life in a New Delhi Middle Class Neighborhood

My research is based on a case study of a middle class neighborhood in New Delhi that was established in the mid 1960s as a retirement community for government officials. Based on ethnographic work I investigate the intersection between the history of the neighborhood and the life course of its residents. My research addresses the impact of the changes in the Indian political economy on the neighborhood, and how different types of capital are accumulated and deployed as the owners/residents make the transition from public officials to private citizens. By incorporating the spatial (neighborhood based) and temporal (neighborhood history and the residents' life course) I enhance our understanding of middle class experience in the Global South and contribute to the theoretical formulations of the middle class in terms of its contradictory class location and its relative advantage with respect to certain types of capital.

(De)Hierarchizing Culture? Practices and Aesthetics of Transcultural Music Production in Berlin

This paper contributes to the study of contemporary cultural production, specifically dealing with the emergence of transcultural aesthetics and practices in music and the way these might interrogate established Western-European paradigms of cultural value and legitimacy. More specifically, I look at the programme 'Selam Opera' situated in Berlin's highbrow music sector, which seeks to promote Turkish and Turkish-German artists to develop a sort of grounded aesthetics which exceeds forms of expression connoted by Western-European history. Building on ethnographic data, qualitative interviewing and musical analysis, I examine the music created by the Turkish and Turkish-German artists and interrogate to what extent these forms of cultural production might stretch beyond established constructions of national musical paradigms and institutions. I herein hold that musical texts and scores, like other forms of cultural scripts, bear crucial cultural information within them, illustrating processes of cultural fusion and synthesis or of co-optation and misrepresentation. With regard to techniques of composition, instrumentation and performance, I suggest that the musicians embody specific transcultural positions within Berlin's music sector which internalise the blurring of and interweaving between Western and Eastern musical systems. However, while such musical practices challenge bounded Western-European notions of aesthetic value and legitimacy, their organisational frame of production and dissemination is decisively shaped and often restricted by Berlin's established musical institutions. Thus, the paper points to both opportunities and tensions in the renegotiation of Berlin's urban spaces as sites of transcultural production. It further critically assesses how these might provide platforms for Berlin's Turkish-German communities to resist, challenge and possibly redefine their often-marginalised position in the cultural field. Thus, the paper links an analysis of the aesthetic and organisational nature of contemporary music-making with broader debates on postcolonial representation, thereby highlighting the intersection of hierarchizing discourses of 'race' and ethnicity in relation to contemporary cultural production.

Violent Confliction. Armed Conflicts and Global Competition for Attention and Legitimacy

The persistence of violence in international politics is often depicted in terms of a gap between the normative ideal of non-violence on the one hand and the actual behavior of governments and other actors on the other. This paper proposes to see this gap as an object of empirical research rather than just as a normative dilemma. We argue that the institutionalization of global norms of non-violence since the mid-to-late nineteenth century has changed the conditions for the reproduction of violent conflicts by embedding local conflicts into global competitions for attention and legitimacy. At the heart of this process we see a type of observer that we call universalized third parties: international

organizations, social scientists, journalists and similar agents who, by positioning themselves as proponents of universal norms and by objecting violence in the name of humanity, have made violence particularly likely to attract the attention of the so-called world public opinion. This global attention, however, can impact conflicts in different and contradictory ways: On the one hand, violence now is particularly likely to undermine the legitimacy of conflict parties, inciting them to refrain from violence or to try to direct attention to the violent behavior of their opponent; on the other hand, violence attracts attention to the conflict, inciting conflict parties to make deliberate use of it in order to call attention to their cause. This complex interplay between local conflicts and global competition is what we call violent confliction – a neologism coined to indicate the concurrence between conflict and competition.

Who Do We Trust for Being a Smart Green Consumer?

Japanese Government has been encouraging to introduce Home Energy Management System (HEMS) since 2012. The government says HEMS changes our life style (e.g., solar power generation device on your house saves electric bills). HEMS may be effective for low-carbon societies, but it costs much higher than daily green consumption. We need to see if HEMS is worth both for society and our daily life. For being a smart green consumer, we need to have reliable information on environment. Whose sayings do we trust for? Governments? Mass media? Friends?

The aim of this study is to examine relations between reliabilities for other people's sayings and green consumption (including HEMS). We conducted an internet survey in 2015 in Japan. We got 2,500 respondents over 18-years-old proportionate to gender and age.

The results are as follows. 1) We got three factors from factor analysis on 18 types of organizations' and individuals' reliabilities. Those were reliabilities to mass media, government and academic institutions. 2) Reliabilities to those three informants' sayings were related positively to respondents' daily green consumption (e.g., to eat locally produced food etc.). Especially the reliability to mass media was strongly related to the consumption. 3) Those who already introduced HEMS were about 7% of the respondents. They tended to trust mass media and academic institutions. Those who were in reviewing to introduce HEMS were about 15% and they tended to trust government. And over 50% of the respondents wouldn't even have a plan to think about introducing HEMS. They had less reliability to all three informants' sayings than other respondents.

Those results suggest that mass media have strong leverage both on daily green consumption and introducing HEMS in Japan. For being a smart green consumer, we need to have an ability to evaluate sayings of mass media.

Organizational Assessment of Sustainable Agriculture Multi-Stakeholder Initiatives in the United States

Metrics and standards are leading tools for fostering transitions to more sustainable technologies and practices in food and agriculture. Private governance organizations, particularly multi-stakeholder initiatives, have become the lead actors in developing and diffusing sustainability metrics and standards. However, despite their position at the forefront of sustainability transitions, there is a dearth of knowledge regarding the competency of such organizations to effectively develop and implement metrics and standards. Building on Wolf and Primmer's (2006) organizational competency assessment approach, this paper presents assessments of the three multi-stakeholder initiatives that have developed sustainability metrics and a standard for US agriculture: Field to Market, the Stewardship Index for Specialty Crops, and the National Sustainable Agriculture Standard. The assessments include analyses of (1) the human capital, (2) organizational routines, (3) resources, and (4) networks of each of the initiatives. We find that the three MSIs have different levels of organizational competency, as well as strengths and weaknesses in different areas. Building on these findings we theorize the ways that the differential attributes of private governance organizations affect the development, adoption, and diffusion of sustainability metrics and standards generally.

Gender Occupational Segregation and Its Impact on the Gender Wage Gap Among Migrants in China

China's Economic Reform in the 1980s led to rapid urbanization and a concomitant increase in the number of migrants. In 2016, the number of migrants reaches to 245 million (National Bureau of Statistics of China), and as shown by the census data from 2010, around half of the migrants in China are women. Previous research found that in China, unlike in other developing countries, the increasing number of migrants does not necessarily lead to feminization in agricultural activities, as women's off-farm labor participation rate is as high as, and sometimes surpasses their male counterparts. Meanwhile, it is also shown that female migrants earn substantially less than males.

Gender occupational segregation is argued to explain gender wage gap, whereas few study has examined this causal link for migrants in China before. One exception is the study of Meng (1998). However, he only studied four occupational groups: construction, industry, service, and self-employed, and used a relatively small sample (1504 migrants) collected in one city (Jinan) that is not among the most urbanized cities in China. Nowadays, as a result of educational expansion and the diversification of labor demand, migrants work in many more occupational groups. Moreover, a recent study showed that broad occupational groups are not sufficient to show the dynamics of labor market in China (Xiu & Gunderson, 2015).

In this paper, we aim to use decomposition methods to examine to what extent gender occupational segregation explains the gender wage gap among Chinese migrants. We will answer our research question using data from a national survey, the China General Social Survey, wave 2003 and 2013. In the data, detailed information is available on educational attainment, occupation, migration, and demographics. We will show what part of the gender wage gap is explained by gender occupational segregation and how this changes over time.

The Role of Mid-Career Income for Gender Differences in Pensions

This study investigates the importance of mid-career earnings for the gender gap in pensions and potential scarring effects of low income earlier in life. Swedish income register data from 1990 to 2015 was linked to the 'Health, Ageing and Retirement Transitions in Sweden' (HEARTS) survey from 2015. We investigate the gender pension gap of 960 retirees and worries about pension income of 2518 older workers between the age of 60 and 66 years. Oaxaca-Blinder decompositions were applied to analyse the gender gap in pensions and linear regressions were used for the analysis of financial worries. Results show that gender differences in mid-career income play a stronger role for the gender gap in pensions than late career earnings. Mid-career earnings are furthermore related to higher subjective worries about pension income and explain gender differences for this variable. Results are related to the context of the current Swedish pension system and the role of the preceding pension reforms is discussed. It can be concluded that different aspects of the reformed pension system potentially contributed to higher gender gaps in pensions.

Beyond Gender: The Experiences of Immigrant and Non-Immigrant Female Engineers in the Canadian Labour Market.

In Canada, women represent less than 15% among the individuals with engineering training, placing engineering on top of the male-dominated professions. The negative consequences of women's rare representation in organizational contexts have been widely documented across different occupations including engineering. These studies highlight the multiple barriers that women often experience with their entry into the male-dominated fields. At the same time, these findings raise the question regarding the homogeneity of this experience. Women do not represent a homogenous group. Their experiences vary depending on the additional social categories that they carry to the organizational setting, such as being immigrants or belonging to a visible minority group. These women may experience complex intersectional barriers, that are referred to in the literature as a "double disadvantage" or "multiple jeopardy".

Informed by the Tokenism and Intersectionality perspectives, this paper focuses on the patterns of exclusion that immigrant female engineers may experience in the context of a male dominated-field. Using a mixed-method approach, that includes the nationally-representative 2006 Canadian census data and data from

in-depth interviews with women working in the engineering field, this paper compares the career experiences and outcomes of female immigrant and non-immigrant engineers in Canada. The findings reveal that the processes of establishing and advancing in engineering, as well as the outcomes of professional careers differ between immigrant and non-immigrant female engineers. The findings highlight that female immigrant engineers are subject to the intersectional patterns of exclusion and are simultaneously penalized by being a woman in a male-dominated field and being an immigrant who seeks recognition of her foreign skills and being ethnically/racially visible. This paper concludes with a discussion of the implications of these findings for the intersectionality and tokenism perspectives.

Contested Medicalization, Fundamental Questions and Fragmented Responsibility: Governing Non-Invasive Prenatal Testing (NIPT) in Germany

NIPT is a socio-technical innovation that bears the potential of profoundly altering the meaning of prenatal care. In Germany, since market entry in 2011 it has become a matter of public controversy. Experts, policy-makers, and civil society actors tend to agree that NIPT raises fundamental social and ethical issues and that it requires responsible governance. Yet, who is responsible, and for what exactly, and who, in particular, is responsible for addressing the fundamental issues involved, is matter of struggle and contestation.

Drawing on the pragmatic sociology of critique (Boltanski et al.), we focus on the ways actors account for their own part within the governance process. Based on narrative interviews, document analysis and participant observation, we examine how various actors interpret and allocate responsibility and reflect upon their own part within it – or not. We show that the question of responsibility is linked to the question of the “whatness” – of what is at stake: Is NIPT a medical product? If so, what is medical about it? Or is it rather a selection technology? Is it just another method for achieving well accepted ends or a new screening practice? A means of risk elimination or a manifestation of ableism? We show that the fundamental question of what is medical about NIPT was not negotiated, due to institutional routines of fragmented responsibility: decisionmakers tended to construct the issue in technical terms, bracketing substantive questions of ends and purposes. Public reflection about fundamental issues only came up when civil society actors disrupted institutional routines from outside. Further, we see a tendency of shifting responsibility for substantive questions to other forums without decision-making authority. At the end of the day, NIPT is effectively governed by the individual and the market.

Toward a Sociological Re-Engagement with the Social World: Insights from John Rawls's Social Theory

Has social science, supposedly formulated to give us the power to create a better society, actually prevented us from becoming effective actors who can resist forces that corrupt our manner of living together with others? The question looms large in today's world, where individualization and consumerism seem triumphant, and people are endlessly divided by distrust and mistrust. This presentation analyzes what could be called “the problem of incapacitation” by the social sciences, especially sociology, and proposes a way to rebuild sociology as an endeavor truer to its defining aspiration for social engagement by centering on normative inquiry.

The problem of incapacitation is deeper for sociology than for other social science fields. As the discipline with the widest scope of critical social inquiry, its institutionalization has facilitated people's learning about how to assume a detached observer's viewpoint toward almost every aspect of their social environment, material and conceptual. The transformative effect of this reflexive attitude can easily undermine the existing social fabric and blur the reasons for acting collectively. Various works of now-classical sociology may have exacerbated the problem. Can we envision a sociology the aim of which is to create and support social actors who can also identify hopes for our future and act on them? Granting a more central role to normative inquiry may provide a way forward, making sociology not only scholarship “about society” but also “in society”, a force that can itself help generate faith in our capacity to cooperate with diverse and often antagonistic others to construct a better world. Although not usually seen as a sociologist, John Rawls set out a social philosophy, especially with regard to his concept and practice of “ideal theory”, that is particularly relevant in this context. Useful sociological insights drawn from his social theory are discussed.

A Cross-Cultural Investigation of Leisure, Place Attachment, and Meaning in Life

Leisure is a life domain that powerfully shapes our mental health or well-being (Kuykendall et al., 2015). Also known is the positive relationship between well-being and place attachment (e.g., Rollero & De Piccoli, 2010). Place attachment is conceptualized as people's emotional bond with a certain space, and consists of three sub-dimensions: (a) place identity (i.e., the relationship between self-concept and space), (b) place dependence (i.e., space's capacity to satisfy people's functional needs), and (c) social bonding (i.e., social ties that bind people and space) (Kyle et al., 2005). Kyle (2016) points out that despite abundant research on leisure and place attachment, its implications for mental health have been severely understudied especially in the community context. Thus, our study's purpose is to examine whether community attachment mediates the relationship between leisure participation and well-being.

Data were collected through online survey from 205 Canadian and 208 Japanese middle-aged and older adults. Frequency in leisure participation was measured by 10 items (Walker et al., 2011). The three sub-dimensions of place attachment in the community context were measured by 10 items (Kyle et al., 2005). In terms of well-being, we focused on a construct called meaning in life (MIL)—purpose, significance, and comprehension of one's life, which was measured by 10 items (George & Park, 2017). Data were analyzed through a statistical technique called partial least squares structural equation modeling (PLS-SEM).

We first ensured that we could meaningfully compare structural findings between the two cultural groups by performing a measurement invariance test (Henseler et al., 2016). The following PLS-SEM revealed that community attachment, especially social bonding, significantly mediated the leisure-MIL relationship. The subsequent multi-group analysis suggested that this mediation effect was significantly stronger among Canadians than Japanese. These findings will be discussed in regard to Canadian and Japanese communities and their respective residents.

“Please Deport Me As Soon As Possible”. Incommensurable Realities in Immigrant Detention

Despite increasing attention on the psychological harms of immigrant detention for asylum-seekers and irregular migrants, empirical researches completed in the detention facilities rely often on a limited number of interviews without addressing the diverse situations of detainees. The presentation emphasizes ambiguities in detention based on a mixed-method and multi-sited ethnographic research on the immigrant detention system in Finland. Analysis of all the detention orders issued by the police in 2016 (N=1080) supplements the long-term ethnographic fieldwork in two detention units and in the respective district courts, providing together a comprehensive and unique perspective on the operation of immigration detention in all its diversity. In Finland, detention times vary between hours to one year depending on the country of return and the level of compliance. Instead of the asylum system, the immigrant detention is mainly intertwined with the criminal system: indeed, the largest detained group in Finland are Eastern Europeans, including EU-citizens, who have an entry ban due to the previous criminal activities. Many of the detainees have been before in other European countries, implying an emergence of south-north irregular migration inside Europe.

Despite the tendency to dramatize immigrant detention in the migration research, detention can be a normal part of life for migrants, who have been deported and detained several times. While detention designates agonizing indeterminacy in a desperate situation, those having a possibility of re-migration often request a quick implementation of the removal. I argue that immigrant detention constitutes an incommensurable reality depending on the personal-legal history in the country (e.g. family ties, employment, legal status), and on the situation in the country of removal (including the costs of re-migration). In order to challenge immigrant detention, it's necessary to acknowledge the heterogeneous backgrounds of detainees, and the actual ineffectiveness of the detention/deportation system in the management of migration.

The Identity of Sociology of Law: A Survey of the Sociolegal Community Members' Perceptions and Beliefs

Identity issues remain a matter of controversy in sociology of law. This paper aims at contributing to this debate in an innovative way by means of a survey of the sociolegal community members' perceptions and beliefs. As Thomas Kuhn's theory suggested, the existence of a scientific paradigm and its core elements can be discovered by scrutinizing the behavior and constellation of beliefs shared by the members of a given scientific community. Based on this theoretical insight, a survey of the sociolegal community members' perceptions and beliefs was designed to test the hypothesis that, in spite of multiple existent approaches to the study of law in society, there is paradigm in the field of sociology of law. Data was collected through an online anonymous questionnaire administered to members of the Law and Society Association (LSA) and the Research Committee on the Sociology of Law (RCSL/ISA). Using quantitative data from respondents who are affiliated to scientific networks that can be considered broadly representative of the sociolegal community at a global level, this survey provided empirical evidence that allows us to understand better the identity of sociology of law as transnational and transdisciplinary field of scientific knowledge in current times.

Changing Welfare Market Structures and Politics of Re-Regulation

This paper investigates the changing structures of welfare markets in Germany and Sweden. Both countries experienced a growth of private schools since the 1990s and the foundation of private pensions in the early 2000s. While we have a fairly good understanding of the origins and politics of these developments (Gingrich 2012, Köppe 2015), we know less about subsequent changes and re-regulation efforts. For Sweden we also have relatively good analyses of how the creation of markets changed the operations of providers and affected inequality and access to services. In the German case such data is largely missing apart from some general survey data. Yet, in both countries we can observe regulatory changes to private schools and pensions. This paper has two aims.

First, it maps the changes to welfare market structures from 1990/2000 to 2015. Swedish schools and pensions were altered substantially over the observation period. In contrast, only the German private pension market saw some product additions without changing the existing product types. The regulation for the German private school market remained unchanged from the 1990s, despite the expansion of private schools and changing parental choices.

Second, it uncovers the politics behind the re-regulation. In Sweden the changes in welfare markets follow a similar pattern to those of the foundation period. The partisan conflict around private schools dominated subsequent changes, while the consensus politics of the pension reform are continued. Swedish pension politics are replaced with technocratic (and even some evidence-based) policy-making. In Germany we observe rather a policy drift. The increasing problems of underinsurance and mis-selling in the private pension market and a gradual decline of state schooling are largely ignored. Reasons for these different welfare market governance patterns are functional (lack of data, problem pressure), political institutions (state commissions) and agenda setting of partisan actors.

"Marriage-Hunting" Among Japanese Youth and Its Impact on the Transition to First Marriage

Marriage used to be one of the most important life events representing the transition to adulthood in Japan. Though most Japanese still want to get married one day, young people face difficulties finding marriage partners nowadays. One reason of this is a remaining traditional belief that a man should be the breadwinner, so Japanese women search a partner with a certain income level. Another reason is a lack of opportunities to meet a potential partner.

To solve a partner meeting problem participating in "marriage-hunting" (partner searching activities) became popular within Japanese youth over the past few years. This research aims to examine an effect of "marriage-hunting" on the chances of getting married. The main research questions were as follows: 1) do partner searching activities and which of them effect one's marriage probability; 2) are there differences in these effects between men and women.

We used the Japanese Life Course Panel Survey held every year since 2007 that consists of follow-ups of Japanese aged 20 to 40 in 2007. Using discrete time logit model with respect to age, education, type of employment and income, we examined which "marriage-hunting" activities had an effect on one's probability of getting married during the next year after the survey.

The results were as follows. Among women, participating in *goukon* (organized group dates) reduces chances of getting married, despite the fact that *goukon* is the most popular partner searching activity. More formal activities like asking parents and siblings for introduction, visiting matchmaking parties or using matchmaking agencies positively affected both men's and women's probability of getting married. However, this was true only for men with an annual income of more than 3.5 million yen (approx. \$31000-). These suggest that "marriage-hunting" can partly solve partner meeting problem, but economic reasons remain a barrier to marriage in Japan.

Population Ageing, the Problem of Inequality in the World System, and the Global Financial System

Concerns about population ageing apply to both developed and many developing countries and it has turned into a global issue. The population ageing is likely to become one of the most important processes determining the future society characteristics. The present paper analyzes some aspects of the population ageing and its important consequences for particular societies and the world. In 2010, there was one pensioner per four working-age adults, whereas in 2025, according to the UN Population Division's forecasts there will be less than three working-age adults per a pensioner in the developed countries, and there exist even more pessimistic forecasts. Who will fill the pension funds in the future? If we don't find new social measures, the increase in generational conflicts will face us in every developed society as well as in the form of the conflict between the "old" Global North and the "young" Global South. It can also influence the increase in global inequality. On the other hand, now we can observe the process of Great Convergence when the gap between developed and developing countries is decreasing. If this process, as we forecast, continues in the forthcoming decades, it might influence some integration of capitals of the "old" developed countries and labor force of the "young" developing countries which could ease the problem of provision for the Global North pensioners. In the paper we present one of possible ways of such a combination. We suppose that the financial instruments can help to solve the problem of pension provision in the developed countries. We think that a more purposeful use of pension funds' assets together with an allocation (with necessary guarantees) of the latter into education and upgrading skills of young people in developing countries, perhaps, can partially solve the indicated problem in the developed states.

Interpretive Practices in the Museum

One of the ongoing challenges of museums and galleries is how to make the interpretive repertoires of exhibits accessible and intelligible to the public. Museums spend billions of dollars on exhibits, but too often such display leads to little more than the perpetuation of constructivist learning models – or what Menszaros (2007) has called the production of a "whatever" interpretation from the perspective of visitor experience. It emerges by focusing on the visible and literal object of display. This approach relies on freeing the individual from the tyranny of received ideas by emphasizing a highly individualistic experience. Ironically, this individualistic approach undermines the visitor's ability to reflect about the very tradition from which such understanding came from (Menszaros 2007). Moreover, it is not clear whether the display became any more accessible or intelligible during such a visitor experience.

This paper will examine hermeneutics as a more meaningful theoretical alternative for the modeling of ethical interpretive practices in museums, particularly art museums. Hermeneutics posits that interpretation is not an individualized, private, or personal act, since interpretation is always an act of participation from within a particular tradition (Gadamer 1989). Similarly, what is seen on display in an exhibition is understood, valuable and meaningful only because of the access it offers to a realm of significance that cannot itself be seen (Pomian 1990). This paper will further examine the ethical implication of making display more intelligible and accessible to the public – beyond the visible and literal – within the hermeneutic means of interpreting museum collections.

Mapping Wealth over the Longue Durée: Kondratieff Cycles and Creative Destruction in the Long Twentieth-Century.

This paper uses original historical data on what Fernand Braudel called the "top layers" of production, trade and exchange, to map out the unique geographical and social configurations that have characterized networks of wealth accumulation between 1500 and 2015. Our comparative dataset, spanning from the fifteenth century to contemporary times, is important because it provides a unique empirical basis for reassessing many of the prevailing debates and assumptions about the role of elites, labour and the accumulation of wealth in the development of capitalism. For example, our comparative data challenge many accounts of capitalist development (including some world-systems perspectives)

that uncritically reproduce an eurocentric bias in their narratives, showing instead that wealthy merchants and bankers in areas such as India and China played crucial roles, and profited enormously, from the global expansion of trade between the seventeenth and nineteenth centuries. Moreover, we are able to map the changing spatial characteristics of wealth accumulation, identifying how epicenters of wealth creation moved across the world, in a process of creative destruction that constantly enriched some locations while impoverishing others. We also find that the growth of wealth recurrently entails shifting resources into finance, where heightened mobility allows some elites to minimize their exposure to, and exploit the opportunities created by, the uncertainties of creative destruction. However, shifts into finance appear to be a rather constant feature of accumulation rather than cyclical phenomena. Finally, our data allow us to both reassess and enrich key interpretations of the temporal and spatial characteristics of economic cycles.

Social Inequality, Stratification, and Mobility: The Effects of the Great Recession in India and the United States

In this paper, we map shifting patterns of inequality, stratification and mobility in India and the United States over the course of the Great Recession. How have various sectors of the population in India (a lower-income country) and the United States (a higher-income country) fared relative to other populations within and between the two countries? To what extent has upward and downward mobility within and between the two countries resulted in differential but interacting patterns of stratification? Drawing on previous work by the authors, this paper further explores the theoretical premise that inequality, stratification and mobility processes are global in character. To demonstrate the feasibility and utility of such a perspective, we present a new longitudinal and cross-sectional dataset (drawn from nationally-representative household surveys, with household incomes harmonized for both countries) addressing social inequality, stratification and mobility in India and the United States – in effect, a map of where various populations stood and moved within “more national” and “more global” distributions-- over the course of the economic crisis. Our data allow us to conduct a systematic and comparative analysis of changes in occupations, human capital, and earnings across two countries that represent opposite ends of the world income spectrum. More specifically, we use this original dataset to discuss trends in: (1) the extent and direction of change in between- and within-country inequality; (2) changing patterns of occupational stratification (e.g., which occupations, and levels of human capital, make up the global deciles represented in the data? How are changing differentials between and within skilled and unskilled workers linked to globalization?); and (3) changes in the relative access to well-being of various sectors of the populations of India and the United States.

KOSAKOWSKA-BEREZECKA, NATASZA* (*University of Gdansk*)

ZADKOWSKA, MAGDALENA* (*University of Gdansk*)

First a Woman, then a Mother - Maternal Wall in STEM.

The research done among women working in Bio-technology at the University of Gdansk shows that: 1) cultural stereotypes that make women more responsible for family life and childcare are very strong and 2) power relations between women and men who in a way make it uncommon for a woman to be the authority and have power over men is still existing (Bourdieu, 2004). The study's participants strongly emphasized the visibility and strength of the so-called “maternal wall” – before the birth of the child no significant differences between women and men academics are visible, though they are fully aware of difficulties in managing work-life balance when leading a career of a passionate scientist. However when the baby appears they indicate that:

- they are torn between enough family time (childcare) and working time - they lose their chance to develop and to be competitive in their field
- their careers are at risk
- the sense of guilt is often “unbearable” if you are a committed mother
- negative social assessment and backlash for being a devoted researcher instead of devoted parent affects both women and men
- they lack to support from the institution in managing their career and managing their work-life balance (as opposed to their colleagues in other countries).

Female academics still confront workplace barriers that hinder their advancement at the upper levels of organizations and their academic careers. However, most people fail to recognize that such gender barriers still exist. Mothers' decision to quit academia or become less involved are not a matter of personal choice which undermines potential systematic actions that need to be taken to tackle the gender gap. It is important to note that when people think this is women's choice they might be less willing to do something about it.

The Electronic Handbook of Child Welfare in the Systems of the Finnish Welfare State

The Finnish welfare state represents one variant of the Nordic welfare state model. Various solutions provided by the development of information and communication technology have been utilized as means of implementing the welfare state policies and programs. In Finnish child welfare, the electronic handbook is maintained by the National Institute for Health and Welfare under the Ministry of Social Affairs and Health. The purpose of the handbook is to support the practical work in child welfare and the implementation of the Child Welfare Act (417/2007). Since its establishment in 2007, the handbook has provided open access to child welfare information. Currently, the handbook has over 30 000 users monthly.

In this paper, some results of the analysis of the empirical data concerning the development and use of the handbook are highlighted. The data includes three surveys (2010, 2013 and 2016) of user experiences as well as documents and expert interviews related to the creation of the handbook and its further developments. The data covers the period from launching the handbook in 2007, to the ways it is utilized in 2017. The emphasis in this paper is to examine the ways this handbook, as a social and technological innovation, has been and is participating in the systems of the Finnish welfare state.

Mobile Aging and Transnational Familial Care between Turkey and Germany

The talk will present first results from a three-year research project that investigates the connections between the border-crossing mobile ageing practices of retirees and their social networks in the context of care needs and services between Turkey and Germany. A growing number of elderly people from Germany – with and without prior Turkish migration background – temporarily settles in tourist areas of Turkey as mobile retirement locations. Starting from the Turkish coastal city of Alanya, two sub-studies have been carried out on the mobility practices and care networks of retirees from Germany both with and without prior migration backgrounds from Turkey. The project aims to understand comparatively for both groups the conditions under which border-crossing lifestyles can be maintained, to identify causes and motivations, and to understand how forms of care and support circulate in transnational networks. It is particularly this latter point that will be the focus of our presentation, paying particular attention to intersectional dimensions of gender, class and racialization.

Saying No to Military Service - Obligation, Killing and Inequality As Experienced Problems in Conscription Army

While studying citizen-soldiers their dual identities as a soldier and a civilian have been highlighted. The phenomenon is closely associated with relation between armed forces and society. Finland's defence is based on general conscription of men and voluntary-based conscript service for women. The majority of Finnish men are citizens but reservist also. Because of this, there is a specific interface in the relation between citizens and Defence forces in Finland.

In recent decades an average of 75 percent of each male age group has conducted their mandatory conscript service of around 6-12 months and 6 percent have conducted civilian service in Finland. General conscription enjoys widespread and increasing support. Lately there has been debate, and also political support, to introduce a gender-neutral, mandatory civic service system to supplement the conscript service.

Reserve soldiers are transmigrants between civil society and armed forces. Citizen-soldier's role is linked to citizenship and its obligation. The dual identity or critical voices of the conscription or reserve forces have not been recognized neither in research nor in the public debate in Finland. The aim of the paper is to analyse the reasons why some conscripts raise critical voices concerning their relation to conscription and their role as reserve soldiers.

The main problems with regard to conscription and armed defence relate to inequality of the conscription system, obligation and lack of discretion. For individual conscripts as citizen-soldiers, the problem of killing has special weight when they reflect upon their own role in the possible act of war. Conscripts and

their expertise could be used more extensively in a wider range of security related issues than in armed defense alone.

The study is based on interviews of 38 civil service men and 33 men resigned from the reserve in 2017. The data was analyzed using content analysis.

KÖSSLER, REINHART* (*Arnold-Bergstraesser-Institut, Freiburg*)

Contradictions of a Legitimate Claim: The Negotiation Process about the Consequences of Genocide between Namibia and Germany.

The ongoing process of negotiations between the governments of Namibia and Germany about the consequences of the colonial genocide of 1904-1908 in what was then German Southwest Africa reveals a range of dimensions in a postcolonial and transnational relationship. These concern conflicts both between the former metropole and its former colony and within the Namibian postcolony. Chief among these are the issue of representation at the conference table and the demand for reparations. While the latter is opposed by German diplomacy and is uncontroversial in Namibia, the demand of victim groups for an autonomous role in the negotiations challenges the claim of the postcolonial state to represent its entire population. Victim groups claim to be treated as indigenous and minority peoples which is denied by the Namibian government. This might be considered an expression of internal colonialism. These rifts are articulated in divergent narratives of the anti-colonial resistance and liberation struggle, as set forth by the state on the one hand and the dissidents on the other. However, a critical appraisal of the exigencies faced by postcolonial states needs is also called for, since according to the discourse of failed states, avoidance of such classification necessitates precisely the fulfilment of the territorial principle.

In a wider perspective, issues of nationalism and statism need to be considered, since these entail a preoccupation with control and unity that may be discerned, both in the actions of the Namibian state in connection with the genocide negotiations and in representations of national history it has recently commissioned. On the other hand, victim communities' practices of mobilisation and memory enter an transnational arena, not least with direct appeals to a German public.

KOSTNER, SANDRA* (*University of Education Schwaebisch Gmuend*)

Riding the Waves of Crisis Migration to Electoral Success: An Austrian-German Comparison

On 4 September 2015, the chancellors of Austria and Germany jointly decided to open their borders to refugees stranded at Budapest's Keleti train station. Although the border opening was a response to an escalating crisis and was envisaged by both governments as being of an exceptional nature, it turned into an open-border period that lasted until March 2016, when the Balkan corridor was declared shut and the EU-Turkey deal came into effect. This six-month open-border period has thrown competing narratives on refugees into sharp relief and provided a powerful campaign issue for right-wing populists.

In my paper, I explore how the Austrian right-wing populist party FPÖ (Freiheitliche Partei Österreichs/Austrian Freedom Party) and its German counterpart the AfD (Alternative für Deutschland/Alternative for Germany) have used and exploited emotive images of crisis migration to advance their nationalist-collectivist agendas. To ascertain the commonalities and differences in the parties' usage of emotive images at key stages of crisis migration to Europe, I compare and contrast campaign material produced by the FPÖ and the AfD between early 2015 and late 2017. My analysis focuses on: (1) the strategies employed by the FPÖ and AfD to tap into migration-related anxieties among the Austrian and German electorates to gain traction with them; (2) whether, how and why the two parties' usage of images has changed over time, e.g. from simple reproductions of crisis images to gross distortions of them; and (3) the narratives that have underpinned the parties' representation of refugees in general and regarding specific developments in particular.

Seeking Asylum in Germany: How Social Stratification Affects the Length and Outcomes of Asylum Processes

In this paper we investigate whether and how the social stratification of refugees and their access to social and economic resources such as ethnic networks determine the length and the outcome of asylum recognition processes. We employ the IAB-BAMF-SOEP-Survey of Refugees in Germany for this purpose. The IAB-BAMF-SOEP-Survey enables us to draw representative inference on the

refugees which arrived from 2013 to the beginning of 2016 in Germany, i.e. it covers the recent surge in refugee migration there. To the best of our knowledge, this is the first paper which analyzes systematically how the social stratification of refugees and other economic and social aspects affect the outcome of asylum recognition processes. Our findings indicate that the length and the outcomes of asylum recognition processes are determined by human capital and behavioral characteristics of refugees, their economic and social status in home countries, their access to personal networks of the same ethnic group in Germany and other social aspects after controlling for origin country fixed effects and individual concerns about persecution in home countries. We thus conclude that the social and economic selectivity of refugees affects the outcome asylum recognition processes.

Do Strangers Trust Strangers? Perceived Generalized Trust of Fellow Citizens As an Indicator of Social Capital

One of the most common indicators of social capital is generalized (social) trust, which expresses to what extent people trust each other – including also those they do not personally know. A common idea behind of generalized trust is that others will act in a reciprocal manner and will not intentionally harm you. The importance of reciprocity, moral obligations and encapsulated interests for the definition of generalized is often acknowledged. Thus, besides trustworthiness, the operationalization may also contain survey items about the fairness and helpfulness of other people, for example. There is a huge body of literature about the variation, predictors and outcomes of generalized trust in which generalized trust is operationalized as described above. Little is known, however, whether the respondents of the survey questionnaires perceive that other members of society share the similar views about the trustworthiness of the others.

The idea of the study is to analyze the perceived generalized trust of fellow citizens for the first time with a representative national survey data. The data come from the welfare and services survey (HYPA) gathered in 2013 in Finland (N=4,226). In the questionnaire, the Finns were asked whether they think that "People trust each other in our society" with a Likert scale item. Besides correlations and descriptive statistics, we apply logistic and linear regression models with average marginal effects as the methods. Our results show that generalized trust operationalized in this way produces different results compared with the standard measures of generalized trust. For example, the association with the institutional trust is stronger and with the civic engagement weaker. The theoretical and methodological implications are discussed.

CLASS Reproduction and RE-Formation during Young People's Education to Employment Transitions in South and EAST Mediterranean Countries

This paper uses evidence from nationally representative samples of approximately 2000 15-29 year olds in five South and East Mediterranean countries, focusing on those aged 25-29 who had nearly all completed their education. It analyses the job characteristics of those in employment and identifies four main employment classes. Just two of these, a business class and a salariat, are found to have survived since the samples' parents' careers were constructed. These advantaged classes alone are found to possess the demographic coherence – likelihood of the individuals remaining in their classes, distinctive life chances of children born into these classes, and characteristic biographies of those who reach these class destinations – to acquire common socio-cultural features and political proclivities. While sometimes acting as a channel for social mobility, education is also found to screen and render opaque the extent and processes whereby class advantages are transmitted inter-generationally.

The Impact of Mobility on the Life Transitions of Young Emigrants from Post-Communist Bulgaria

European youth policies encourage young people's mobility as a measure raising their employability and more broadly, contributing to economic growth in the EU as a whole. However national policies in EU member states build upon an ambiguous understanding of the reasons and consequences of mobility and impose various power restrictions to the free movement, thus enhancing social inequality. While migrants from the new member states of Bulgaria and Romania have better prospects than migrants from outside the EU, they still face significant barriers in their labour market integration and social acceptance in the host countries.

This paper presents results from in-depth interviews with young adults aged up to 32 who emigrated from post-communist Bulgaria to look for work and better life prospects in the UK, Germany, Spain and Italy. The material was collected under the framework of a comparative study on mobility in Europe funded by the Horizon 2020 Program. A sub-sample of twelve interviews were examined to highlight the opportunities and constraints that the young immigrants in different mobility types faced in their life transitions in the four receiving countries with different migration regimes, labour markets and climate of reception. We consider their motivations to leave Bulgaria, the mobility channels they used, the strategies they employed in the job search and community integration. In the analysis, we focus on the agency-structure nexus and explore the social networks the young men and women created and mobilized along the way and how these impacted their identity construction.

The Growth of Gig Science and Its Gendered Effects

The growth of gig science and its gendered effects

The analyses of existing leaky pipelines in academia list a number of reasons for the diminishing number of women in scientific careers. The reasons for leaving or opting out of academia range from individual factors to factors beyond individual control, such as processes and work place and organizational cultures, to list but a few (e.g. Schiebinger & Klinge, 2013; Schiebinger & Schraudner, 2011). The leaky pipeline in general results in relatively small numbers of women entering those positions in science which emphasize basic research and publications over patents, or allow for long-term commercialization interests in academia. Studies analyzing the reasons for differing positions show that the most common reason for the gender-patenting gap arises from the fact that women do not get to be in charge of research groups that actively work on inventions leading to patents (e.g. Campbell et al., 2013; Whittington, 2011). It is known that gender, human capital, technical background, type of business and the social networks of the entrepreneur importantly shape decision making on invention activities and patenting, and in other, related types of work. One of the key aspects is the discrepancy between the organizational ideal worker and the actual resources of women and men working in the organization. Increasingly though, in the wake of market based higher education activity with stronger competition and overflow in the education system, the metaphor of a pipeline does not accurately portray current neoliberal higher education institutions and R&D policies. This paper focuses attention to the increasing precariousness of the academic careers in science and in research and in the wake of this precariousness also calls for replacing metaphors for the leaky pipeline – metaphor originating from the industrial period of science rise which no longer carries accuracy in describing situation.

Theories of Professionalism and Theories of Entrepreneurship – Alignments and Differences in Contemporary Capitalism

The rise of the global platform economy, and with it, the increasing number of professionals among the gig workers and the increasing number of precarity among highly skilled professionals and professions (Poutanen & Kovalainen 2017, 2016) all give rationale for the question of how adequately the current theories used are explaining the professionalism and its legitimacy and legitimation basis in contemporary societies. This paper addresses the question of theories used in analyzing professionalism and professions. This is done by scrutinizing the theoretization of professionalism vis à vis theoretization of entrepreneurial activities and entrepreneurship. Several new ways of organizing professions increasingly emerge through and with the help of digital platforms and global work platforms even for professionals. The liminal space of not being waged worker nor entrepreneur puts professions into new situation. On the other hand the 'easiness' of starting up a business and the 'toughness' of building up the reputation into trustworthy professional do raise new questions concerning the organization of professions. The argument developed in the paper is to relate, align and dissect the theories used for the analysis of professions and professionalism and the theories used for the analysis of entrepreneurship vis à vis another, in order to seek for new theoretization for the changing professions in the contemporary societies.

Measuring the Radius of Trust As a Indicator of Social Capital: Results from a Nationwide Social Capital Survey in Japan

Generalized trust has been a predominant topic throughout the social sciences as the key component of social capital. As discussed by Fukuyama (2000), excessive

in-group trust reduces the ability of group members to cooperate with outsiders. Delhey et al. (2011) found that the radius of "most people" whom respondents imagine varies considerably across countries and matters for civic attitudes and behaviors in cross-country regressions. This research, therefore, shed some light on the individual and regional differences in radius of trust within a given nation or culture and the differences in communities. The primary goal of this report is to investigate this issue by examining how the radius of trust affects outcomes (e.g. fear of crime, life satisfaction), and is affected by independent variables, based on data from a nationwide social capital survey carried out in 2013 in Japan (N = 3406 in 99 municipalities). This survey asks respondents to rate several items (e.g. friends and acquaintances, colleagues at work, and neighbors) on a scale of 1-5, where 1 is "very reliable" and 5 is "not at all reliable". In this study, the scale of "radius of trust" was created by summing up the number of items rated 1-2. A multi-level analysis conducted in this report show that the radius of trust, after controlling for SES and some regional variables, is associated with the outcomes, at both the individual and municipal level. On the other hand, the standard trust question is only associated with the outcomes at individual level. These findings suggest that we can capture social capital more fully with the trust radius, and that dilution of solidarity is easy to be linked to a sense of deteriorating public security for residents living there.

Gender and Violence in the Oral Testimonies of Holodomor, the Ukrainian Famine of 1932-33

Until the late 1980s, *Holodomor*, a massive artificial famine which occurred in 1932-33 in Soviet Ukraine was an unknown and forbidden, topic for generations of Ukrainians as well as academics in former socialist bloc and beyond. Since late 1980s the process of the opening of the Soviet archives together with attempts to collect the testimonies of the survivals led to the conceptualization of knowledge of this humanitarian crisis, in the consequence of which almost 5 million people died. Still, in the process of the unraveling of the silenced past, the experience of women have often been neglected.

In my presentation, I built on two important oral history projects conducted first in the late 1980s by the Harvard-based team of James Mace and secondly in the beginning of 2000s by the Ukrainian Canadian Research and Documentation Centre in Toronto among members of the Ukrainian Diaspora in Northern America. My research of oral testimonies show that for many witnesses "the embeddedness in the family life" plays an important role in their recollections of the past. For many witnesses, their survival was possible only thanks to various strategies of gathering and preparing food developed by their mothers and grandmothers. In the testimonies then mothers appear as active and creative agents opposing the coercive policies of local communist but also fighting the famine through various techniques of preparing food from scarce resources.

I argue that the oral testimonies of *Holodomor* centered of the experience of women point to the important role of gender in conceptualizing memory and violence of famine. In a wider context, through the case study of Ukrainian famine I want to reflect on the problem of knowledge production of famines and the very often silenced position of women in ways in which we conceptualize the history of this atrocity.

Buddhist Monks on-Line – on the Impact of Modern Technologies on Monastic Life in India and Nepal

Technical modernization as well as use of Information and Communication Technology (ICT) strongly contributed to social and cultural change among Tibetan monks in exile. It's an example of a modernization of a very homogeneous and traditional society. Under the influence of television and internet very strict monastic life had started to widen and experience new spheres of existence. ICT provided knowledge about different ways of living, new ways of entertainment. Under its impact monastic life have changed on physical and mental levels. For example monks started to watch Bollywood movies and football on the TV, use facebook and online messengers, speak English, and learn how to become a managers of different Buddhist ceremonies. Young monks have started to live different lives, changed their way of communication, and social organization

In this paper I will present flow and process of these changes and their effects. I will discuss various examples from the four-year ethnographic research project conducted among Karma Kagyu monks in India and Nepal.

"Change Is Inevitable" – on the First and Second Generations of Tibetan Monks in India and Nepal

This presentation explores subject of Tibetan monasticism in exile. It outlines the process of migration of institution and tradition. It introduces the story of how Buddhist monasteries led by XVI Karmapa have settled down and been evolving during last sixty years in India and Nepal. Moreover, it explains and presents how this monasteries function nowadays, how they have developed and changed.

Tibetan monasticism in exile clashed with cultures of countries giving asylum had to adjust and learn how to deal with cultural diversity, technological innovations, and capitalism. Along with institutional changes, transformation of monks's attitude have occurred as well. The first generation had to primarily face many difficulties so that today it could be responsible for conveying the tradition and knowledge to newborns. Youths born in exile don't have to traverse the Himalayas with all their families and possessions. They are born in safe places where they can practice Tibetan Buddhism freely. All they have to do is learn from the elders. How this knowledge transfer is happening? With what kind of effect? Is social cohesion among Buddhist monks in exile preserved? What is the relationship between the first and second generation in exile? These questions are subject of this presentation. Presented thoughts are based on a four-year research conducted among Karma Kagyu monks in India and Nepal.

Symbolical Violence Against the Elderly As a New Form of Their Social Exclusion? A Few Reflections from the Research in Poland

Symbolical violence is one of the crucial categories in Pierre Bourdieu's considerations. He understands it as a subtle form of manipulation or some kind of hidden control, thanks to which the dominant people teach those who are dominated their ideas, which are the only ones perceived as true in a specific culture. Bourdieu explains that symbolical violence is a conflict between *habitus* of different social groups. This great sociologist's conception might be used to say that symbolical violence is a conflict of *habitus* of the younger generation and the elderly - in Poland - the post-war generation. Nowadays, there is a very strong focus on the youth and its attributes, such as beautiful look, physical attractiveness, vitality, strength, energy, etc. People who have such features receive positive feedback in society, unlike people who are far from the socially promoted ideas. Those people may experience social exclusion. One of the social groups that is at such a risk is the seniors. The rules and rights (*habitus*) that had been internalized by them in the process of socialization led to a concentration on different values than those cherished today. However, those seniors still have to find a new role for themselves in today's body-oriented culture, while being subjected to various types of veiled manipulations.

On the basis of the research conducted in Poland among young people, middle-aged people, and elderly people, this paper will answer such questions as: is true to assume that seniors are experiencing symbolical violence in the context of their body? Do they feel social exclusion pressure in this aspect/area? If yes, how do they deal with it? Do the representatives of younger generations also see the risk of seniors' social exclusion in relation to their body? Answers to these and other questions will be the content of this paper.

National Socialism and the History of Sociology in Austria

Recently, the relationship of Sociology and National Socialism has been intensely debated in Germany again. The debate concerns both the "contaminated" roots of German post-war sociology and the potentials of current sociology to contribute to the research of National Socialism. In Austria, this debate has not been held yet in detail. Our hypothesis is that the institutionalization of sociology in Austria, which was taking place within a framework of conservative science policies in an overall corporatist political system, depended on the covering of political cleavages by an application-oriented research and a lasting expulsion of sociology's critical dimension during the years of 1934 to 1945. In our presentation, we try to answer the following questions, drawing conclusions from an "inventory" of contributions of research on the topic published by the authors in a forthcoming anthology: Was there sociological research during 1938 to 1945 in Austria, and which differences, if any, are to be observed between Austria and Germany? What are the epistemological and institutional reasons for the observable "de-thematization" of National Socialism by Austrian post-war sociologists during the phase of the institutionalization of sociology in Austria? In which way is this development connected to the Cold War, in which ways is it comparable to "contaminations" in other countries? How can we conceptualize the relationship between internal disciplinary factors and external social developments? And finally, in which way does this de-thematization shape the state of current sociology in Austria?

The presentation will draw conclusions from an anthology on the topic edited by the two authors of this abstract. The anthology, to be published in May 2018, is the result of a three-year-project on „Sociology and National Socialism in Austria“.

"Putting on a Poncho Does Not Make You an Indian": Identity, Class, and Strategic Framing in Bolivian Indigenous Movements

Social movement scholarship has often pitted 'old' class-based organising against 'new' identity-focused movements. At the same time, indigenous people across the globe continue to struggle for both cultural recognition and material redistribution. Indigenous mobilisations have recently garnered renewed media attention, such as protests of Native American communities and their allies against the Dakota Access Pipeline in the US. Yet what do we mean by allies, and how easy is it to distinguish who is indigenous and who is not in the first place? In many instances, such as the case of Bolivia, this identity boundary is often blurred with fluid self-identification and indigeneity being taken up in various, often conflicting, political struggles. Even though Bolivia as a case of spectacular indigenous mobilisations has been studied extensively in the academic literature, less has been written about the complex interactions between indigenous communities and rural unions in Bolivia, and the way in which in which indigenous, rural and class identities are developed, negotiated and rallied around in rural politics and protest. This paper seeks to fill this gap by using the perhaps unique but illuminating case of Bolivia, specifically by comparing five indigenous social movement organisations in the country, two based on traditional community institutions and three on rural union structures. In particular, this paper traces both the alliances and the discords between these organisations since 2000, through their evolving relationship with the Evo Morales presidency they had helped bring to power. It conceptualises the symbolic use of indigeneity as a framing strategy, rather than a given, which indigenous social movement organisations have used in varied ways at different times. In doing so, it shows the strategic decision-making of indigenous leaders and activists throughout an evolving political landscape, and shows how the meaning of *indigeneity* itself is often part of such strategies.

Female Engineers As Part of the Sales Team: (Un)Doing Gender and Differences

My contribution is based on my own empirical research related to the (un) doing of gender and other differences performed by women working as sales engineers. It draws on the aspect of what sales engineers wear and therefore on clothes as material artefacts which shape the body. My research focuses on a field which I denote as a twofold male dominated and connoted field. First, technology is male connoted. Second, sales in the sense of business-to-business sales and including face-to-face customer contact and travelling is connoted as a male occupation.

In Germany, there are many initiatives to get more women into study programs and professions in the field of STEM-disciplines (science, technology, engineering and mathematics). One can see this as an economic need but it is also a question of justice as professions within this field are highly remunerative. Additionally, there are also voices saying that women are perfect candidates for sales and distribution. Therefore, women should not face discrimination.

However, my findings show that it is still difficult for women working in technical sales. Their body plays an important role as they face injustice and sexualized violence. Related to their biography and on different situations they encounter in their job (the fair, the customer visit, the training of industrial workers) they have and need different strategies and options to handle their situation. Clothing is one important aspect.

But violence is not only practised by male customers or colleagues against women, violence can also be found in the language female sales engineers use to describe "other" women as not being feminine enough or being too feminine. Presenting oneself as an exceptional woman therefore is one strategy to both emphasize that one is "really" a woman and be able to be part of the powerful male world of sales engineering.

The Becoming of Complex Socio-Environmental Reality: Violence As Side-Effects of Dehumanization

The becoming of complex socio-environmental reality brings unintended consequences producing new violence as side-effects of 'civilizing process' that is accompanied by a cynic reflexivity: man's freedom increases greatly, and so does the variety of the behavior patterns, but it is not always good for humans and nature. Formal pragmatism of neoliberal biopolitics facilitates the permanent production of latent aggressiveness enforcing violence into our lives. Modern actors possess tremendous knowledge which is a great factor of social and

environmental change, but without a humanistic orientation in man's reflexivity innovations oppose civil society, exploit and destroy nature. I argue for a humane creative activity and a humanistic turn in sociology and other social sciences – the goal is to search for new forms of humanism, humane knowledge including the humanistic orientation of any research that is an ethical imperative of the global community.

KRAVCHENKO, SERGEY* (*Moscow State Institute of International Relations (MGIMO-University)*)

Violence of "Non-Food": Side-Effects of Transnational Expansion of Cosmopolitan Taste

Under the consequences of globalization there emerged "nothing" and correspondingly "non-food" – both refer to social forms that are generally centrally conceived, controlled, and comparatively devoid of distinctive substantive content and make sense only when paired with "something" including that of food the content of which has a bio-cultural integrity and is inseparable from the institutionalized local cultural values, norms, beliefs, and rituals, governing not only the essence of the diet, but the actual human relations. Transnational network enterprises produce flows of non-foods overcoming barriers of countries and boundaries of their places of origin that is accompanied by the transnational expansion of cosmopolitan taste. The side-effects of the global agribusiness pursuing pragmatic interests of increasing profits by imposing non-foods are expressed in violence against the values of indigenous foods and national lifestyles producing new challenges to Food Sovereignty and Food Safety.

Social Trust, Corporate Governance and Participation Experiences in Germany, Europe and Developing Countries

Up growing mistrust in Soviet-Stalinist and capitalist institutions and politics had led to the breakdown of the iron curtain and the Berlin wall. The expectations of destruction of Eastern bloc and so called "state socialist economy" were getting more democracy and efficiency by direct participation of the people, workers and citizens. Social trust in institutions as participation, industrial democracy and corporate governance was very high in former eastern bloc and developing countries. There were big political changes from Russia, former Soviet Union, South Africa and other African countries till South East Asia and China.

After more than 27 year's German and European unification and a lot of world-wide political changes there is a high mistrust in existing democratic systems, institutions and politics, which are in crises. Economic and monetary systems are in crises and the national and international institutions (governments, European institutions, IMF and world bank as well as UN) are unable to present useful solutions for up growing humanitarian and world problems. The way out will be seen by a lot of people and movements by turning back into nationalism, destruction of international organizations, institutions and up growing new national conflicts.

The contribution will summarize the results of empirical studies of the author made in different countries and regions in Europe, Africa and Asia. Touching some crucial points will questions as "how can be re-established social trust in economies, social life and in the global world development?"

"What a role can play peoples, citizens and workers participation and basic democracy in a process of re-establishing social trust as precondition for a working global economy, for way out of financial crisis and the crisis of capitalist institutions? How can be re-established democratic inter-organizational, -personal and -social co-operation connected with the communal and individual actors?"

Time, Aging and Governmental Precarization: On Work Transitions Among Men in Manual Work

Policies on extended working life have tended to focus on individuals, and the debate has to a great extent described older people as the problem. However, behind the rhetoric about selfish, uninformed and problematic older workers, there are well-documented organizational practices which create age-based marginalization and limit older people's participation in working life. Insufficient emphasize on this age organization in work organizations opens for increased inequality within the collective of older workers through an individualization of the risks of working life.

Departing from interviews with 11 men between the age of 56 and 74 working in Sweden for an international company in the metal industry, this paper contributes to the discussion on how the organization of workplaces relates to organizational ageing. Based on the idea that temporality makes up a fundamental dimension of human existence and organization, I discuss notions about when employees are expected to make transitions within a work organization.

The result, showing that transitions within the work organization are based on norms of duration and assumed to follow a given sequence, indicates that the expectations on transition constitute social norms – temporal regimes. While some movements are labelled as on- and off time respectively, other are described as expected, unproblematic and generic, and thereby given a position as the age normality. Even if the older workers express a perceived need for physically easier work tasks, transitions towards less physically demanding work tasks are not socially expected or recognized. Thus, they do not belong to the social temporal order of the work organization. Departing from these results, I argue that temporal orders create age normality and marks older employees. They also make up a disciplining element of the older employees which is based on increased social insecurity, what has been described as governmental precarization.

KRETSCHMER, DAVID* (*University of Mannheim*)

The Emergence of in-Group Friendships in the Absence of Intrinsic in-Group Preference: The Role of Experience and Expectation Formation

A plethora of past research shows that individuals primarily tend to form friendships with other in-group members, such as their same-sex, same-race, or same-age peers. In this paper, I introduce a formal model that attempts to explain how such preferences for friendships among individuals with similar *observable characteristics*—such as race, sex, or age—can emerge even if they are intrinsically indifferent about these characteristics.

Instead of these readily observable characteristics, the model assumes actors to only be interested in similarity to their friends regarding another set of attributes—characteristics that are *hard to observe*, such as their sense of humour, leisure time interests, or aspirations. The issue with these characteristics is that they usually only become observable once a relationship has been created, forcing actors to form expectations about these attributes on the basis of their previous experiences when deciding who to become friends with. If the differentiation between the in-group and out-groups is salient, expectations are likely to be formed separately for the groups. At the same time, actors tend to be more experienced with their in-group than the out-group because of different exposure in everyday life. In the model I show that, due to this lack of experience, out-group expectations tend to be both individually more uncertain than in-group expectations and more widely dispersed in the population of actors overall. Higher uncertainty and dispersion of expectations tend to be evaluated negatively if actors prefer similarity on the hard-to-observe attributes, and thus disfavour out-group friendships.

I provide formal results for a static version of the model and investigate dynamic friendship formation—with expectations being updated according to new experiences—using simulations. Finally, I consider how the processes discussed above are amplified or mitigated in the presence of structural constraints to friendship formation.

Risk and the Body in Public Health

Work in public health relies on the concept of health risk, but how do folks understand what 'risk' means? This project takes a poststructuralist, critical qualitative approach to health research, combining theory from physical cultural studies, public health, and the sociology of health to solicit peoples' stories about how they understand embodied health and risk. Through sculpting, life-lining (an innovative method), and interviews, 13 participants shared their understandings of the relationship between the past, present, and future body in the context of health. Folks expressed their ideas of normality and interacted with experiences of social position, power structures, and public health discourses. Participants spoke about what sorts of actions in the past affected a body's present and future, and how; including discussions of how concepts such as 'luck', 'fate', 'control' or 'randomness' factor in. Participants also shared how they make sense of the uncertainty and unpredictability of 'health', and spoke of 'risk' as a heuristic for simplicity. This project directly addresses what risk means to people as part of embodiment and health, and expands on ideas of risk through researching our experiences of the body as a present, physical mediator between an ever-changing past and an uncertain future.

FREY, PHILIPP (*ITAS-Karlsruhe Institute of Technology*)

Bridging the Sociological Knowledge Gap between Technology and Work

The study of Frey & Osborne (2013) has motivated the 'classical' question of the relationship between automation processes and job losses. Besides the

methodological critique of the study with regard to its specific design as well as to the comparability to other countries (Wolter et al. 2016, Pellizzari & Fichen 2013, EPTA 2016), its outstanding resonance in scientific and political communities seems remarkable. It shows that actual technological advance is mobilizing fears, doubts and hopes of future working conditions in highly industrialized societies (here: in industry). We argue, that although the debate on the future impact of automation is varied, there is relatively little conceptual knowledge about the impact of advanced technologies on working environments, working organization and working settings in different branches and sectors.

Following sociological theories of work, the focus of our analysis of technological changes lies on shifts of organizations as well as on the shifts of qualifications and skills. Due to the "second wave-mutation" (Zuboff 2010) of technological and socio-structural changes, however, the ubiquitous use of information-based technologies is providing a high variety of human-machine interactions (HMI) in all sectors and branches. Thus, HMI is rarely sketched empirically with respect to the shifts of work in concrete working environments like in administrative, caring, machine operation or managing work. Furthermore, the mutual relationship between technological progress (production forces) and socio-economic relations (modes of production) is rarely taken into account when analyzing the application of new information-based technologies.

Building on the fruitful debates sparked by Frey & Osborne, interdisciplinary knowledge about HMI is needed based on approaches of STS, case study research, job observation etc. Furthermore, we will argue that the implementation of the employees' needs at the level of technology design is also needed in order to bridge the gap between work and technologies.

Domestic Violence and Gender: Legal Interpretations By India's Supreme Court

Laws are an important site for examining discursive struggles regarding gender inequality, both with respect to formal and substantive equality. Using archival data comprising decisions of India's Supreme Court on 217 domestic violence cases for the period 1995-2014, we show the distressing statistic where, in 73% of the cases, the woman had already died even before the domestic violence case had been filed. Favorability in verdicts from the court also varied based on whether the woman is deceased or alive. We explain this variation by examining the court's interpretation of gender as they adjudicate domestic violence cases. We demonstrate how the content of domestic violence laws influence the judicial interpretation of gender to develop a 'sameness' or 'corrective' approach. A formal equality approach assumes women to be naturally different from men, resulting in the justification of differential treatment of women. Thus, judges may normalize or understate emotional violence such as control and intimidation as they may not recognize structural aspects of gender inequality in families that allow for such violence to happen. Second, we find that the content of the law can be influential in developing a corrective approach among judges. Certain laws encourage judges to take a corrective approach and look beyond the need for typical forms of evidence that is difficult to provide in the case of domestic violence crimes that occur in private spaces. However, even when the content of the law upholds substantive equality, the judiciary may not take a corrective approach, if the woman does not conform to the 'good victim' narrative, resulting in less favorable outcomes for living women who approach the court for justice. Thus, even though the law has the potential to make some positive dents towards substantive equality, the judiciary may still be influenced by assumptions of gender difference.

KRISHNAN, PREETHI* (*Purdue University*)

Framing Entitlement, Framing Inequality: Women, State, and Frames

Social movement scholars have examined frames to explain emergence and mobilization of movements that target the state from outside. However, the notion of the challenger distinctly separate from the state, overlooks the role state institutions play in shaping those challenges. Neoliberal state policies such as privatization are implemented in societies embedded in the unequal relations of gender, class, and caste that lead to different outcomes for different groups of people. If and how people demand their entitlements from the state is influenced both by state policies and local inequities. I integrate the concept of frames in social movement theory, and inequality to address the following research question: How do women interpret their entitlement to basic services in the context of increasing privatization in India? I develop two key concepts - frame appropriation and reactive adoption - to demonstrate how state policies facilitate and hinder radical entitlement claims. State welfare services provide women the opportunity to demand basic services as an entitlement. While claiming those entitlements, women may appropriate and adapt state frames in welfare policies to challenge mainstream narratives that justify gender and caste inequality, what I refer to as frame appropriation. In contrast, other state policies may encourage

women (from marginally better SES) to uncritically adopt dominant neoliberal frames that exacerbate gender, caste, and class inequality, what I refer to as reactive adoption. Based on five months of ethnographic fieldwork in rural Tamil Nadu (India) where I studied the Indian government's welfare initiative, Integrated Child Development Services (ICDS), I utilize observations and 50 semi-structured interviews with mothers, childcare workers, and state representatives to delineate the conditions under which women deployed two frames regarding entitlement to basic services: the resonant frame, 'entitlement to food' and the radical frame, 'entitlement to redistribution of care-work from family to the state.'

The Role of Social Networks in Explaining Benefit Receipt across Ethnic Groups

Much research has focused on explaining the differences that have been observed in most Western countries in the labor market outcomes - including benefit receipt - of native people and first- and second-generation migrants. Empirical studies from the Netherlands show that around 50 percent of the native-migrant difference in benefit receipt can be explained by accounting for compositional differences in socio-economic characteristics. Theoretically, this is typically related to unevenly distributed human capital across the ethnic groups, selective immigration policies, and labor market segmentation. Less is known about to what extent social networks and social capital can account for differences in benefit receipt between natives and people with a migrant background.

The aim of this study is to quantify the role of social networks in explaining the native-migrant differential in the receipt of social assistance, disability and unemployment benefits. We draw on research on (1) the role of social networks for benefit receipt, and research on (2) the role of social capital in explaining the labor market outcomes of ethnic, racial, and/or migrant groups, and expect that social networks will explain a significant part of the native-migrant difference in benefit receipt.

To investigate this we employ a unique combination of Dutch register and survey data. The register data provide the best way of measuring individual benefit receipt, which is often under-reported in surveys, while the latter contain a wide range of social network indicators. A particular novel feature is that we can test to what extent the impact of social capital in the neighborhood (a register-data measure) varies by contact with neighbors (a survey-data measure). The combination of data sources sheds new light on the theoretical mechanisms underlying social network effects in benefit receipt among different ethnic groups.

Strategically Constructed Identities: Hybridity of Self-Presentation and Changes in Belonging within One Speech Event

In this paper I argue for the dynamic nature of hybrid identities not only across changing situations and speakers but within the same speakers in the same speech event. My study is based on identification patterns emerging in the language use of seventeen Brussels based civil servant and lobbyist in similar types of semi-structured interviews. While this target group was rather homogenous in terms of racial and educational backgrounds, variation could be found across the backgrounds of the members in terms of national, supra-national, regional, political, institutional, linguistic, (broader) gender and ethnic belonging. The interview data was analyzed by means of corpus-driven systemic functional linguistics focusing of pronominal deixis and verbal semantics (Transitivity) and the findings indicate that various kinds of self-presentations and types of belonging were represented by the interviewees at different points of the interview situation. Furthermore, it seems that both the dynamism and hybridity of these constructions were strategically driven by the actual communicative goals of the speakers.

RC57-924.4

KROCHMALNY, SYD* (*University of Buenos Aires*)

Journals of Hate

'Journals of Hate' is based on the reader's comments in electronic versions of major newspapers in Argentina where they are enabled to express their views without boundaries. Some of these phrases are written on the walls of the exhibition space.

The chosen fragments specifically track those discursive cores where the dehumanization of whole sectors of society occurs. The construction of the other as an object of extreme hatred seeks to define certain people as a social surplus. 'Shit', 'trash' and 'waste' are some of the metaphors that make the other as excrement that social body must expel. This embodied view of society also appears when

medical terms such as 'cancer', 'infection' or 'gangrene' that must be removed are used.

However, all haters needs an object as long he defines its identity in relationship with the hated. Thus we see that the commentators perceive themselves as Argentinian by regarding the "bolita", the "paragua", the "perucho", the "mexican" derogatory categories that describe immigrants from nearby countries. They perceive themselves as belonging to the white race by denigrating colored people; they feel more masculine when they humiliate women; they entitle themselves as educated by stigmatizing the uninstructed. They feel themselves as middle classes in relation with the degraded poor. No matter how poor you are it is always possible to imagine someone poorer.

These observations do not say anything new. You may even think that the comments that we selected in the newspapers are just anonymous rants. Nevertheless, it should not be forgotten that many main massacres in history were preceded by dehumanizing discourses, public narratives which went unheeded at the time.

Performance, Poetry and Installation like a Methodological Tools to the Sociological Research

My proposal is present the art project 'Journals of Hate' ('Diarios del Odio', Buenos Aires, 2014-2017) like a complex research in wich I used differents art medias like a methodological tools.

'Journals of Hate' is based on the reader's comments in electronic versions of major newspapers in Argentina where they are enabled to express their views without boundaries. Some of these phrases were written on the walls of the different exhibition spaces in Argentina.

For the poems that form Journals of Hate I didn't want to just the document of a transtextual procedure with political and documentary value but also pretends to be read as "poems", putting the ear in the zone of ambiguity that the statements have, and facing us to chance more horrifying realization that pushes us to constantly question the categories and parameters with which we value art.

Finally, the performance Journal of Hate, it is a prayer, it is an old choir but it is completely modernized and has internal sarcasm, the bodies have all the plasticity of the history of the theater, the choreography, therefore we attend an argument, a great juxtaposition of the theatrical text, of the theatrical game.

The chosen fragments used in the installation, in the poems and in the performance specifically track those discursive cores where the dehumanization of whole sectors of society occurs. The construction of the other as an object of extreme hatred seeks to define certain people as a social surplus. 'Shit', 'trash' and 'waste' are some of the metaphors that make the other as excrement that social body must expel. This embodied view of society also appears when medical terms such as 'cancer', 'infection' or 'gangrene' that must be removed are used.

Reproductive Justice, Childlessness and Disability. Perspectives of Women with Disabilities Living in Poland

The presentation will discuss how women with disabilities navigate reproductive autonomy within social, cultural and legal context that constructs norms on parenthood and childlessness. I will present results of empirical research based on qualitative methods (IDIs). The interviews were conducted both with childless/childfree women and mothers women with physical and sensory disabilities creating diverse family forms. The research aimed at analyzing the emic perspective of women in order to understand negotiations related to the construction of gender, disability, adulthood and care work as well as embodiment and heredity. The study is based on the social and phenomenological models of disability. This hybrid model depicts disability as a multidimensional phenomenon combining both social factors and embodiment theory. Understanding the dynamics of childlessness/childfreeness of women with disabilities is especially important as the group historically was often deprived of reproductive autonomy and in case of Poland still faces restriction of rights. The presentation is based on the research project *Disability, motherhood, care. Reproductive autonomy and experiences of motherhood of women with disabilities in Poland* funded by National Science Center, Poland (2015/19/N/HS6/00789).

KROS, MATHIJS* (*Utrecht University*)

Negative Interethnic Ties in Secondary Schools in the Netherlands: A Three-Wave Longitudinal Network Study.

There is a growing interest in negative networks. Despite their relative rarity, negative ties may be more likely to drive attitudes, behaviors, and network dynamics than positive ties (Labianca & Brass, 2006). The interest in negative

relationships is also apparent in research on interethnic contact (Pettigrew, 2008). Driven by the contact hypothesis' promise to improve intergroup relations, most research has investigated positive contact. But contact can also be negative (Paolini, Harwood & Rubin, 2010). Furthermore, while research on contact theory has typically relied on self-report surveys, scholars in this field have become convinced of the benefits of social network analysis (Wölfer & Hewstone, 2017).

We aim to make several contributions to both the empirical understanding of negative interethnic contact and the conceptual understanding of negative networks by explaining the formation, maintenance, and breaking of negative ties between pupils from different ethnic backgrounds in the Netherlands. First, a common critique on contact research is that it only looks at attitudes, like prejudice, but fails to explain behavior. We fill this caveat by explaining negative interethnic ties. Second, studies on negative ties often rely on structural balance theory, despite a lack of empirical support (Yap & Harrigan, 2015). We also apply status theory and homophily to predict negative ties. Third, we analyze a range of negative ties, measured in the same sample, to explore the extent to which findings on negative networks are robust across different measures. We thereby contribute to the discussion on analytical techniques catered to negative networks (Everett & Borgatti, 2014).

We use data from a three-wave study amongst high school pupils, aged 12 and 13, in the Netherlands. The sociometric part of the survey includes a wide range of nomination measures of negative ties (e.g. dislike, avoidance, negative contact, physical and verbal aggression), in addition to positive ties.

KROS, MATHIJS* (*Utrecht University*)

The Iterative Effect of Negative and Positive Outgroup Contact on Outgroup Attitudes. Results from a Two-Week Diary Study in the U.K.

This paper focuses on the relative openness of attitudes of the majority population towards Asian migrants in the U.K., and vice versa. By analyzing a two-week diary study conducted in July 2017, we study the net effect of a combination of positive and negative outgroup contact experiences on outgroup attitudes.

Contact with outgroup members typically leads to more positive and inclusive attitudes toward that group as a whole (Brown & Hewstone, 2005). However, most of this research has investigated positive contact experiences (Pettigrew, 2008), but recent studies also show the detrimental effects of negative contact (Pettigrew, Tropp, Wagner & Christ, 2011).

We extend this research by appreciating that people can have both positive and negative contact, and that people are likely to have more than one outgroup contact experience. First, we test whether the effects of contact –positive and negative– are stronger when people have had little to no contact in the past. Second, we test whether the valence of the contact one has previously had influences how a new experience affects one's attitudes. For example, we will investigate whether positive intergroup experiences one has had in the past buffers against the detrimental effects of a new negative encounter.

These hypotheses are tested using unique, high-quality diary data. Besides filling in extended pre and post-tests, members of both the majority and the Asian migrant population were asked to keep a diary for 14 consecutive days. They could freely describe their intergroup contact, while also filling in some quantitative items. The data will be analyzed using a multi-level approach, with the diary entries nested within individuals. The diaries will also be subjected to a content analysis. This will result in additional descriptive results with examples of what people actually consider to be contact with members of different ethnic groups.

KROZER, ALICE* (*Centre of Development Studies, University of Cambridge*)

Relative Affluence: Elite Perception of Inequality in Mexico

Results from interviews with members of the Mexican elite show that their perceptions of inequality condition their response to the problem, in terms of perceived urgency and policy space for action. Thus, elites and the perceptions they hold feature prominently in both the production, and reproduction of inequality. Their privileged position fosters a voluntary segregation from the top, i.e. the retreat of elites from public life as experienced by the majority, both in terms of physical spaces, cultural and intellectual spheres, and usage of public goods such as healthcare, education, transport etc. This leads to a "wealth delusion": an alienation from society at large, and distorted view of "reality" as experienced by other socio-economic groups. Members of the elite interviewed consistently underestimate their own socio-economic position as well as the extent of poverty from the masses, decreasing perceived urgency to act against inequality. Differences between them and other, poorer population groups are often amplified by insistence on different "cultures" (language, leisure activities, interests), appearance, education and aspirations between groups. The observation that personal experience of immediate environments tends to condition the general perception of the state of, and often also trends in, distributional dynamics, can be understood as "relative affluence" (as analogous

to relative poverty). Despite the general worry about inequality in the abstract, interviewees largely share a feeling of entitlement that justifies their own position as “deserving” and shapes their preferred policy reactions to inequality, overwhelmingly limited to demands for better education and extreme poverty relief. Other key topics addressed in interviews include: considerations as to the perceived origins, potential consequences of, and means to deal with inequality; inequality's relation with corruption, impunity and violence; interviewees' “ideal” society and their take on the state of socio-economic affairs in the country.

Depression Among Men and Masculinity – First Results from the Mende Study

Prevalence rates of depression are higher in females than in males although men have much higher suicide rates. According to the concept of ‘male depression’, men may differ from women in regard to depression symptoms and coping. However, little is known about male mental health behavior, service needs, coping strategies in the context of discourses of masculinity and/or depression. Furthermore, there is a lack of knowledge on how men's specific needs are addressed and/or met within mental health settings. The mixed-method-study MenDe aims at a comprehensive analysis of men's masculinity constructions and consequences for their mental health behavior by identification of subgroups of depressed men with regard to masculinity constructions, job involvement, stigmatization and social factors. Subsequent in-depths interviews provide insight into men's mental health behavior. In addition, semi-structured interviews will be conducted with mental health professionals to understand their views and attitudes towards depressed men and their service needs. Background and study design as well as preliminary results will be presented.

Violent Victimization of Mental Health Service Users.

Background: Mental health service face high risk of victimization but this issue is still neglected compared to studies on the risk of violence committed by mental health service users. Victimization can lead to severe physical and mental health consequences and self-stigmatization.

Method: Based on a systematic review, recent findings on the prevalences of adult victimization will be introduced and risk factors will be discussed against criminological concepts including the routine activity approach.

Results: International studies consistently indicate high adult victimization risks compared to general population. Risk factors include psychopathology, substance abuse, (former) experiences of violence, and a lack of social integration. Disclosure of victimization is hindered by several barriers.

Discussion: Preventive and interventive measures should be provided at individual, service, and societal level.

Between Strategies of Transnational Activism and Tripartite Dialogue: The Strategic Mechanism of Market-Based Lobbying

Between Strategies of Transnational Activism and Tripartite Dialogue: The Strategic Mechanism of Market-Based Lobbying

Social movement organisations and labour unions team up on the transnational level in order to cope with the global power of multinational companies and missing or ineffective labour regulations that put labour conditions at risk along the global value chain. What are the common strategies of these cross-movement alliances in the global governance architecture?

Recent literature on global labour governance point at the helpful guidance by complex and dynamic models of strategy-making in private politics (Den Hond/de Bakker/de Haan 2010, den Hond/de Bakker 2012, Mena/Waeger 2014, McDonnell/King/Soule 2015) and at the interconnections of transnational attempts for

institution building between the state and the market arena (Fransen/Burgoon 2013, den Hond/Stolwijk/Merk 2014, Zajak 2017, Kryst/Zajak 2017 forthcoming).

By the further development of a strategic-interactionist approach (Jasper 2004) and its adaption to the global labour governance architecture I identify strategies of alliances of social movement organisations and labour unions in two varied qualitative case studies: The *Clean Clothes Campaign* (1990-2016) and the *European Banana and Agro Industrial Product Action Network* (1994-2016) both develop strategies between a) transnational activism and b) transnational social or tripartite dialogue that are within each case strongly interconnected over time.

One of the interactive mechanisms between these two types of strategies that I trace back is the *strategic mechanism of market-based lobbying* (a->b): Private governance schemes, originally invented by social movement organizations, are supported in the political(-administrative) arena, amongst others by labour unions. Examples of this mechanism show how social movement organisations and labour unions with different strategic preferences jointly develop strategies that blur the lines between the actors' groups and their strategic actions and arenas, and emphasise the need for longitudinal interactionist strategy analysis.

Using Global Certification Schemes: Strategic Mechanisms between Strategies of Transnational Activism and Tripartite Dialogue

Using Global Certification Schemes: Strategic Mechanisms Between Strategies of Transnational Activism and Tripartite Dialogue

Alliances of social movement organisations and labour unions emerge at the transnational level and develop common strategies between private and public governance. How are global certification schemes strategically used in the global governance architecture?

Recent literature on global labour governance point at the helpful guidance by complex and dynamic models of strategy-making in private politics (Den Hond/de Bakker/de Haan 2010, den Hond/de Bakker 2012, Mena/Waeger 2014, McDonnell/King/Soule 2015) and at the interconnections of transnational attempts for institution building between the state and the market arena (Fransen/Burgoon 2013, den Hond/Stolwijk/Merk 2014, Zajak 2017, Kryst/Zajak 2017 forthcoming).

By the further development of a strategic-interactionist approach (Jasper 2004) and its adaption to the global labour governance architecture I identify strategies of alliances of social movement organisations and labour unions in two varied qualitative case studies: The *Clean Clothes Campaign* (1990-2016) and the *European Banana and Agro Industrial Product Action Network* (1994-2016) both develop strategies between a) transnational activism and b) transnational social or tripartite dialogue that are within each case strongly interconnected over time.

Global certification schemes serve in interactive mechanisms that I trace back as starting points for further strategic attempts between these two types of strategies (a<->b). First, I identify a *strategic mechanism of market-based lobbying* (a->b), where private governance schemes are supported by the alliances in the political(-administrative) arena. Second, I show evidence for a *strategic mechanism of new regulatory initiative opportunities* (b->a), where global certification schemes are used in a confrontational manner to further target multinational companies at the transnational level. Both examples emphasise the need for an interactionist strategy analysis in the current global labor governance architecture.

Multidimensional Approach to Studying Gender Equality - Results from Geq Study of Gender Equality and Quality of Life in Poland and Norway

The paper presents an approach for studying gender equality, which was elaborated by the Norwegian scholars (Holter, Svare, Egeland 2009) and later tested in many countries, also in Poland. The original multidimensional framework allows for in-depth analysis of gender equality and quality of life relationships, in the light of both women and men participation in employment and growing involvement of men in care work.

Gender equality was researched in the following dimensions: gender equal practices (housework, care, decisions), resource distribution in the family, pro-equality attitudes, attachment to traditional gender roles in connection to family and work, male power, gender identity, and experience of gender equality in childhood. Self-assessed quality of life (QoL) was measured with use of GESQoLS (new scale based on WHOQOL-bref) consisting of six dimensions: somatic functioning, psychological well-being, social/personal relations, material conditions, infrastructure and life satisfaction. The results indicate that gender equality impacts on quality of life of women and men in Poland. For example, pro-equality attitudes have positive impact on most dimensions in both genders, similarly to equality in care duties in case of parents. Equality in decisions brings

positive impact on most QoL dimensions for men, while male power and control negative on all dimensions for women. Work burden negatively impacts QoL of men in all dimensions, besides financial one.

The proposed framework indicates that the relationships between different gender equality dimensions are context specific and differ between men and women, also considering their work engagement. The proposed questionnaire proved to be an interesting tool for cross-cultural comparisons.

The presented results come from the project "Gender Equality and Quality of Life" (GEQ) funded by the Polish-Norwegian Research Programme. The survey data was collected in Poland in 2015 (representative random sample of adult men and women, address sampling, 1501 respondents).

Ecological Democracy for the Just and Sustainable Society

Ecological democracy can be defined as the political practice in which the right of social minorities, future generations and non-human beings can be deliberated and realized in the open and participatory public sphere and policy process. Ecological sustainability and the intrinsic value of non-human beings should be deliberated in ecological democracy. Though ecological democracy can develop on the basis of deliberative democracy, the former goes beyond the latter. Ecological democracy needs to be extended to the economic and political system. It is because ecological sustainability and social justice can be attained when the state and market are re-embedded to the society as Karl Polanyi said. Environmental justice movement, ecological cooperative movement, energy transition movement, etc. are the social actions for ecological democracy.

Developmentalism and industrialism can be transformed to ecological democracy at a certain policy sector such as energy policy. New administration of South Korea and Taiwan started the nuclear phasing out policy in 2017. Energy transition in Taiwan and South Korea can be a representative case to explain the possibility of eco-democratic transition in developmental states.

Rural-Urban Alliance As Collaborative Politics in Fighting Against Global Capitalism: A Case Study of Food Sovereignty Movement in China

China has been increasingly engaged with global capitalism since China's WTO entry in 2001. Agrarian globalization impacts China's rural transformation as well as the sustainability of overall development. Same as other countries, food security becomes very critical in mainland China. Recently, food security was listed as the first major issue to be tackled by Chinese government. Food security issue in China is related to food subsistence and food safety. In facing the food security crisis, NGOs in China have grasped and readily embraced the concept of "Food Sovereignty" in recent years. A growing number of food sovereignty movements emerged in the form of rural-urban alliance that encouraged rural producers to grow and produce organic crops and foods to cater for increasing demands for higher quality rural produce in urban centres. By selling directly to these markets at a 'fairer' price with the assistance of NGOs, these initiatives became a new way of assisting rural producers to lift themselves out of poverty through producer-consumer cooperation and sustainable development (Shi, et al. 2011; Ku & Ip, 2011). In this paper, authors are going to introduce China's food security crisis and analyze how it affects people's livelihood in both villages and cities. Based on our participatory action research in Yunnan province of China, authors will point out that in facing the food safety crisis caused by the globalization of agriculture, Chinese local producers and consumers are not passively waiting for government's policy change or the mercy of capitals, but actively search for alternative way to save themselves through a new form of collaborative politics of rural-urban alliance.

Confessions of an Ethnic

Using autoethnography, this paper analyzes three moments of public expressions (in the form of words in published texts) of the author's ethnic identity to explore her social location and situatedness in relation to her "community". These public expressions I take up are understood as "confessions" (Rey Chow) through which we enact our ethnic identities. Employing the concept of "native informant" (Gayatri Spivak) and "protesting ethnic" (Chow), the paper will engage with these expressions and re-memory to explore the formation of ethnic identity in the age of global capitalist "postracial" society. How (racialized) ethnic femininity is recognized and acknowledgeable is discussed here. Implications drawn include examining the usefulness of autoethnographic method in investigating formation of ethnic identity and community in relation to race, in seeing intersectionality

and multiple mediations, and for collective ethnic and activist narratives when applied to more collaborative community research.

The Changes in Housing Condition in Aging Japanese Suburbs: A Case of the Nagoya Metropolitan Area

Japan is a rapidly aging society, recording 26.0% of its population as aged in 2015 (Cabinet Office, Government of Japan 2015). In addition, the current low total fertility rate, which has recovered from the lowest recorded number of 1.26 children per woman in 2005 to 1.42 in 2014, accelerates the aging process of the entire society. One of the typical phenomena triggered by aging and low fertility is a decline in residential environments, the number of residents, and the number of required facilities in suburban neighborhoods. The following results have been found: (1) a lack of opportunities to socialize or communicate with others results in people remaining in their houses alone "solitary death" or "dying alone," which denotes that a body has not been found by others for several days after the person has passed away in his or her home, is now regarded as a social problem in Japan (Matsumiya 2013), and (2) there is limited access to fresh food or public transport (Morland et. al. 2002), and (3) an increase in housing vacancies can cause disorder on a block-level scale or in a neighborhood as a whole, and can even reduce the life satisfaction of residents (Accordino and Johnson 2000, Benediktsson 2014, Kubo et al. 2015). Scholars have paid attention to each aspect of the declining residential environment in aging communities, but little is known about regional systems of the problems as a whole. This study identifies how residents' perceived lives in aging Japanese suburbs change in housing estates with different mobility patterns through our field surveys in the Nagoya metropolitan area, the third largest metropolitan areas after Tokyo and Osaka. We conducted a field survey on an increase in housing vacancies, mobility patterns and housing supply in case districts, topographic conditions, and the activities of local communities.

Business Improvement Areas and the Justification of Urban Revitalization

Business Improvement Areas (hereafter BIAs; but also known as business improvement districts in the USA) have become a central feature of downtown revitalization across North America, Australia, Western Europe, and South Africa. Faced with limited funds to fuel urban revitalization, municipal governments now rely heavily on BIAs to manage urban spaces directly by taking on day-to-day tasks including security and crime control, beautifying city streets and sidewalks, and marketing the neighbourhood through various promotional and branding campaigns. As BIAs gained prominence throughout the early-to-mid 1990s, various perspectives in sociology, geography, and criminology attempted to provide a general framework to understand BIAs' form and function. As I argue, the dominant conceptualization of BIAs, which often emphasizes BIAs' pro-market neoliberal tendencies, creative cities agenda, and regulatory crime control logic, fails to take into account how active meaning-making processes shape justifications of their urban revitalization initiatives. Drawing upon qualitative data collected in London, Ontario – including interviews with BIA members, participant observation of city council debates, and document analysis of urban policies and BIA-produced materials – this study uses Boltanski's "pragmatic sociology of critique" to show how BIA decision-making processes are the outcome of socially produced "orders of worth" based around morally configured "common goods". This study intends to shed some light on how neoliberal urban policies are given meaning through cultural and social processes in particular grounded locations.

Managing Territorial Stigmatization from the 'Middle': Business Improvement Areas and Urban Revitalization in the Post-Industrial City

Wacquant's concept of territorial stigmatization asserts that state-led bureaucratic and commercial agents mobilize discourses of stigmatization about specific areas in a city in order to legitimize simplistic spatial solutions in an attempt to solve complex political-economic problems. With the increased popularity of Business Improvement Areas (BIAs; or Business Improvement Districts in the U.S) across the globe, these organizations play a significant role managing the image of stigmatized neighbourhoods. Unlike conventional studies of territorial stigmatization which delineates the concept of territorial stigmatization between the production of stigma from 'above' (by state-led and

commercial entities) and the resistance of stigma from 'below' (by residents in low-income neighbourhoods) this paper argues BIAs do not fit either of these categories but rather negotiate territorial stigmatization from the 'middle'. From this middle role, BIAs strategically perpetuate territorial stigmatization to attract external funding while simultaneously resisting territorial stigmatization in order to maintain solidarity with local community groups. We highlight BIAs unique middle position by drawing on data collected from media articles and urban planning reports in London Ontario's Old East Village over a fifteen-year period.

Sexual Harassment Among University Members

Sexual Harassment among university members have always been important topics, requiring further investigation and more specified research. Moreover, current events in Germany have shown that especially cyber harassment, such as cyber defamation, cyber bullying or cyber stalking has become a prevalent issue. This paper will present the findings from a (web-based) victimisation survey among 4.628 university members (age 17-78), covering especially the perspective staff members. It will outline the prevalence of sexual harassment and various other offences and capture both, the perspective of victims and the perspective of offenders. The design of the study makes it furthermore possible to light up the relationship between the groups and the background of the offences. Consequences for the victims and the motivation of the offenders will be outlined likewise. The results will be especially discussed in terms of gender differences.

Towards a Holistic Understanding of the Prevention of Violent Radicalisation in Europe

The presentation delivers results from a critical review of existing prevention projects and programmes in Europe. This comprehensive review will raise awareness of which tools/measures practitioners require in order to better enable their ability to tackle radicalisation. Results indicate that a vast majority of the programs analysed within this review share a similar framework. Efforts often involve 'softer' preventive measures such as community driven projects, mentoring schemes and community partnerships. These counter-radicalisation efforts demonstrate a shift away from the terrorists themselves and focus more on community engagement and community empowerment. However, evaluations giving insight into the effectivity of such measures are largely inadequate. Furthermore, counter-measures that are often suggested in policies and programmes are sometimes not addressed in reality.

It is recommended that existing prevention mechanisms should be strengthened and personalized for different populations. Projects and programmes should utilise a 'bottom up' approach and build networks and relationships with key players from local communities. Such de-radicalisation measures should not only be put in place for communities but also for individuals at different stages of the radicalisation process.

The Construction of Belongingness to an Imagined Nation State – Contradictory Narratives and Ambivalent National Identities in a Globalized World

While some discourses already claim a post-national era in times of globalization, current nationalistic tendencies on the political level in various western countries provide a different picture. For an increasing amount of people, nationalistic narratives seem to present an important identity frame within a globalized world.

The electoral success of the populist right-wing party AfD (13%) within German parliamentary election 2017 is just one of many illustrations of such tendencies. Reflecting on national identity and different constructions of belongingness to the nation state becomes a more and more critical issue for German politics and the related public discourse.

In order to understand these tendencies, we regard it as important to analyze national identity from a combined structural and subjective perspective.

Based on several qualitative interview studies on national identity conducted by the authors in Brazil and Germany, the authors want to line out different narratives of belonging to a nation in a globalized world. It's striking that competing and contradictory narratives often can be found within one interview with the

same person, reflecting uncertainties and ambivalences regarding the contemporary meaning of national identity, citizenship and belonging to nation states. The same person in different social and discursive contexts might stress or neglect the importance of the nation state.

We will analyze how these ambivalent accounts of belonging are fundamental for the construction of different social identities in our contemporary globalized world. Focusing on different social imaginaries and representations of the nation state allows us to explain why nationalism and transnationalism are in fact not contradicting phenomena, but rather coexisting forms.

Calling for a post-national era alone does not end exclusion, rather, the structure of narratives of belonging have to be understood in order to find more inclusive forms of social community.

KUENEMUND, HARALD* (*University of Vechta*)

Evaluation of Problems, Processes and Structures – Overcoming the Limitations of User Centered Design

For a long time, the development of Gerontechnology has been criticized for not taking into account user needs and capabilities. As a consequence, user centered design and related strategies like transdisciplinary development have become standard procedures. However, some serious problems remain. This paper criticizes that we rarely see an evaluation of a theoretical problem as a starting point for technology development. More frequently, either user stories and personas – based on prejudices and mostly negative images of aging – or small and biased samples of potential users are the starting points for technology development and process evaluation. Both strategies are most likely resulting in products failing to match end users' demands on the market. For example, in the first case these stereotypes may become integral aspects of the technology, in the second case we may receive biased information for product development. Based on results from quantitative and qualitative studies in Germany it is argued that we should start from both large scale sample surveys and detailed theoretical as well as reconstructive methods of problem evaluation from very early stages of technology development.

BURAU, VIOLA (*Aarhus University*)

'Good Governance' and Stakeholder Involvement: Why We Need a Context-Sensitive Approach

Assessments of health systems governance have shown that strengthening stakeholder involvement is a major policy lever for governance innovation and an important tool for improving performance. We argue the need for a more critical and context-sensitive approach on stakeholder involvement as an indicator of good governance. Health workforce governance in European countries serves as empirical example; the aim is to identify different models of stakeholder involvement and their capacity to drive integrated people-centred care. The analysis is explorative and draws on policy documents, public statistics and other secondary sources. Three models of involving stakeholders in health workforce governance can be identified: corporatist professional involvement either in a continental European model of conservative corporatism (e.g. Germany, Belgium) or in a Nordic model (e.g. Sweden, Denmark) of public corporatism; managerialist and market-centred involvement of professions as organisational agents; and a more inclusive, network-based involvement of plural professional experts at different levels of governance. The power relations embedded in these models of stakeholder involvement have different effects on capacity building for an integrated people-centred health workforce. Corporatist governance models embody risks, albeit in different ways, to remake professional silos rather than serving patient needs, while managerialist stakeholder involvement has some capacity for more integrated care but the effects are uncertain and shaped by market logics. Most promising is a bottom-up driven model, that connects diverse professional groups and care sectors through network-based governance and shared values of 'good care for patients'. The results highlight that stakeholder involvement must be assessed in the context of power relations embedded in health workforce governance.

Aesthetic Capital at the Intersections of Age, Gender and Class

In recent discussions physical appearance is increasingly conceptualised as a form of capital, so as to complement Bourdieu's theory by highlighting the role of the body (Anderson *et al.*, 2010; Hakim, 2010; Mears, 2015). Aesthetic capital can be understood as a combination of different resources or assets related to physical appearance including facial beauty, body shape, size and physique, as

well as styles of grooming and clothing (Anderson *et al.*, 2010). One's position in social space conditions one's sense of possessing aesthetic capital, and the means and incentives to develop physical appearance-related resources (cf. Bourdieu, 1984).

In addition to social class, discussions around aesthetic capital have often focused on gender. It's generally held that appearances are more important for women, and accumulating aesthetic capital is more pronouncedly a feminine task (Sarpila *et al.*, 2017). However, we suggest that not enough attention has been paid to age and the ways in which it interacts with class and gender. For example, discussions on the so-called 'double standard of ageing' have suggested that as women are more defined by their looks, ageing may be more consequential for them than it is for men (Sontag, 1972; Twigg, 2004). Moreover it is worth considering whether ageing affects the aesthetic capital of men and women of different social classes asymmetrically.

We utilise a unique survey data, which is nationally representative of 15 to 74 year-old Finns (N=1,600). By means of multivariate analysis, we ask how gender, age and class intersect in conditioning to what extent aesthetic capital is given importance and cultivated, and (subjectively) possessed in Finland. Finland is a particularly interesting context for our study; not only is Finland a Nordic welfare state with low levels of gender- and socio-economic inequality, but furthermore Finnish taste has traditionally been characterised by modesty and practicality.

Countering Myths, Conspiracy Beliefs and Attempts to Discredit Public Health Interventions: How Should HPV Vaccination Program Efforts Proceed?

Vaccines and family planning rank among the most significant public health achievements, but in many countries, their success has done little to diminish controversies that have marked their histories. Programs have been disrupted by patient fears and anxieties, provider hesitancy, misinformation, localized sociocultural dynamics, and anti-vaccination and anti-birth control movements. This paper describes the commonality of such problems across fields and contexts, assesses measures taken to address these challenges, and derives lessons to improve program efforts, particularly for African countries now starting to introduce human papillomavirus (HPV) vaccination and struggling to raise low contraceptive prevalence rates. Regarding these challenges, we (1) set out and compare major misperceptions regarding contraceptives and HPV vaccines, efforts made to dispel such myths, and reasons for their chequered success; (2) compare and contrast the roles of junk science and scientific uncertainty in such controversies, along with research strategies to counteract their impact and to improve communication of risk; (3) compare strategies of movements against vaccination, abortion and family planning, and how they can be mitigated; and (4) compare the role of policies across countries, particularly regarding HPV vaccination, for youth in the WHO recommended vaccination ages of 10-14 years. The situations in Africa and the USA are given greater weight. The U.S. helped pioneer family planning and HPV vaccination programs, being the first country to distribute the HPV vaccine in 2006, but its potential to prevent morbidity and mortality is still not being met. By mid-2016, 65 countries had established HPV vaccination programs. This includes few African countries, yet Rwanda now has among the highest HPV vaccination rates in the world, comparable to those in Australia and the UK which have also pursued successful school-based HPV vaccination programs. This paper addresses lessons for both the U.S. and African nations now implementing HPV vaccination programs.

The Political Importance of Indicators in Global Development Efforts: Maintaining the Focus on Reproductive Health in the Sdg Era

In the latter twentieth century, population policies were institutionalized in many developing countries confronted by rapid population growth. Global collective action aimed to reduce birth rates through national family planning efforts. Their sometimes coercive methods led reform advocates to engineer a backlash against demographic targets and fertility-related policy levers, culminating in the 1994 Cairo Agenda. The Millennium Development Goals (MDGs, 2000-15) reframed the international development agenda and sidelined Cairo's goal of reproductive health and rights for reasons of political expediency. MDG5 aimed to reduce maternal mortality ratios (MMRs). It attracted resources, became the focus of national and international efforts, and maintained attention on reproductive health. Substantial progress towards all three health-related MDGs resulted from funding increases, invigorated country actions and global partnerships, and scale up of new interventions. The Cairo and the MDG agendas led to the adoption of an array of global and national reproductive health indicators that have helped clarify the magnitude of problems. The resultant expectations have helped sustain a reproductive health movement and served as a rallying call, comparable to the earlier international population movement, along with

a vigorous countermovement. The world has now transitioned from the MDGs to the 17 more ambitious Sustainable Development Goals (SDGs). The new 2030 agenda has 17 goals, 169 targets and still more indicators, many of varied quality for monitoring phenomena of interest. There is only one SDG, whose 13 targets include the three health MDGs but a limited vision of issues such as provision of safe, legal abortion. This paper examines attempts to institutionalize key reproductive health indicators in the UN's global development efforts and their operation as instruments of imagination, with particular reference to the MMR; and explores the prospects for sustaining focus on reproductive health in the 2030 agenda and for addressing the needs of marginalized groups.

Paradoxes of Modern Scientific Publication Activity in the Field of Contemporary Russian Science: Genesis, Diagnosis, Trends

The paper provides empirical review and preliminary theoretical analysis of various practices and strategies of scientometric indicators manipulating in Russia. The authors consider those practices to be the means of unfair competition and struggle for resources between individual and collective / institutional actors in the field of science and higher education. The paper reveals the negative consequences of the proliferation of technocratic, managerial and bureaucratic mechanisms of authoritarian regulation and administration in scientific research (as "quasi-effective" ways of control in the field of science and higher education, leading to the destruction of the "last islands" of academic autonomy, and in the far-reaching prospect, to dangerous mutations of the structures of the academic world in general).

A lot of efforts are made to change the situation in the field of scientific publications in many ways – from state and commercial regulation to the foundation of expert communities such as public council on the scientific publications ethics. The authors would like to emphasize the impact of the objective background of everyday work of scientists and dilemmas faced by the authors. It is important to consider five crucial aspects that form the internal and external context of contemporary scientific articles production: 1) the rule, which Robert Merton formulated as a "publish or perish"; 2) so-called "academic gangs" that force scientific environment to operate on the basis of unwritten rules; 3) the main competition in the Russian scientific community is not for ideas, but for resources; 4) with the implementation of short-term contracts, constant variability and flexibility of labour relations, the position of university employees is getting close to precarious, which is characterized by emotional instability, anxiety, lack of confidence in the future; 5) there is no institutional framework for the diligent work of scientists.

The Question of Citizenship in the Context of Slum Dwellers

The Question of Citizenship in the Context of Slum Dwellers

'Slum' connotes a residential area in a city or town in which people live with lesser basic amenities compared to other residential localities. Slums are not unique only to the developing world, but most of the developed countries are struggling to cope with them. Like in many developing countries, over the last four decades, high rate of rural to urban migration is taking place in India. Rural to urban migration largely consists of economic migrants those who come to city, to earn their livelihood. These economically disadvantaged people are forced to live in the cheaper accommodation, or they prefer to live in a slum, squatter settlement, Jhuggis, near the river bank, nallah or vacant private or public spaces. Hence, it is a common feature since they cannot afford to pay high rent in the posh localities situated in the middle of the city.

The paper will explore the urban citizenship of slum dwellers in Delhi city and examine how citizenship rights of slum dwellers are determined by their living conditions, livelihood opportunities and lived experiences in the city. It will also focus on questions related to citizenship rights, the right to city and political economy of slums in the backdrop of currently existing policy framework, urban governance, and civic activism. This paper will analyze the role of the state in providing the basic amenities to the slum dwellers in South Delhi.

The Slums, Poverty, Inequality and Marginalization of Slum Dwellers in North-Western India: A Sociological Study with Focus on Housing, Basic Services, Environment and Livelihood

Marginalization, poverty and inequality in urban areas of Northwestern India have become crucial issues in the recent past which largely seem to be due to serious deficiencies in urban environmental infrastructure and deprived human conditions in slums. Situation is worst in metropolitan towns and larger urban areas of North-western India which are growing with deficiencies in urban infrastructure and deprived human conditions in slums. Housing is grossly inadequate and in dilapidated conditions. There is fear of eviction among the slum dwellers due to insecurity of land tenure. The access to basic amenities, civic services and livelihood is grossly inadequate. Some recent studies/ surveys of slum dwellers indicate extremely poor environmental infrastructure and deprived conditions. With the growing marginalization of urban poor and inequality in the form of access of housing, basic amenities and livelihood options, the social and environmental conditions in cities have been deteriorating. Although there are few local initiatives which have improved the human conditions and environmental infrastructure in some neighborhoods in the region but they remain fragmented. The paper, based on some recent studies is an effort to highlight deficiencies housing, basic services, environment and livelihood in the slums in Northwestern Urban India to see the emerging patterns of marginalization and inequality and environment.

Engineering Education and Work: A Study of Young People in Emerging Market in National Capital Region of India

Twenty six years of economic reforms has brought about far reaching changes in Indian economy. Highly flexible labour market, located in global market economy, has emerged. The workforce is required to be multi-skilled and flexible in new economy. This along with demographic pressure has resulted in massification of higher education including engineering education. Education is being treated as commodity that can be purchased from market. In fact growing economic instability and rapidly changing technoscapes pose a big challenge for making smooth transition to work life.

This paper answers two research questions: What are the different aspects of vulnerability in engineering education today? How caste, social class, social capital and agency of young people in hierarchical career structure of emerging economy determine their work opportunity? To answer these questions grounded theory methodology is used whereby sixty four young engineering graduate in National Capital Region of India were subjected to qualitative in-depth interview.

The study reveals that engineering education is of poor quality. There is no link between engineering education and work opportunity in labour market. This has resulted in division of workforce into two types: 'core workers' and 'periphery workers'. Career decision making are mainly about 'opportunity structures' which in turn is strongly influenced by caste, social class position, social capital and agency of young people. Young people are not a homogeneous group, they belong to different caste and social class, and their social capital and agency also vary. Dalits and lower middle class youth are at disadvantage in emerging market. They need constant re-skilling to adapt themselves continually to new and more demanding work opportunities using permutation and combination of opportunities, social capital and agency.

Locomotor Deprivation Among Older People in Selected States of India

Ageing brings with it many problems. Locomotor disability is one such problem which affect quality of life of older people. However, little information is available about locomotor deprivation of old people in India. The objective of this study is to estimate incidence and intensity of locomotor deprivation in India and its subgroup decomposition according to some selected variables. The paper also examines the contribution of different indicators to locomotor deprivation.

Data from 'Building a Knowledge Base on Population Ageing in India, 2011' survey carried out in seven states - Himachal Pradesh, Kerala, Maharashtra, Odisha, Punjab, Tamil Nadu and West Bengal - having a higher percentage of the population in the age group 60 years and above is used in this study. The six indicators of locomotor deprivation included in this study are vision, hearing, walking, chew-

ing, speaking and memory. These indicators are equally weighted for analysis. Further, some variables - age group, gender, residence, living arrangement, level of education, wealth quintile, and social group are also included in the study. The analysis is based on the Alkire-Foster method on the final sample size of 9726 respondents.

Findings indicate that incidence and intensity of locomotor deprivation are 0.430 and 0.522 respectively. Subgroup decomposition shows that older people of age 80 years and above, female older, rural older, old people living alone, illiterate older, older from poorest wealth quintile and Scheduled Caste old people face more intensity of locomotor deprivation. Further, among six indicators, the contribution of vision disability is the most in locomotor deprivation. Overall result shows that it is important to look at the intensity of locomotor deprivation along with incidence to assess the state of locomotor deprivation in India.

Education, Communication and Development: A Policy Perspective

Education requires reciprocity of the interests and activities of a wide range of stakeholders who are part of the developmental process. To ensure successful partnership among this vast array of stakeholders, communication plays vital role and it is necessary and indispensable. It should be part of the strategic planning which requires of being comprehensive, holistic and inclusive. The content of dialogue and its approaches are also equally important in the discourse of development. Through information-sharing, building consensus and confidence, by advocacy and social mobilization, communication strategies provides support for educational policies and their implementation at various levels. This is essential for the leaders, communities, civil society groups, media and donors, and those who are recognises the need to work together to have a better education and development. Education and development are coterminous and supports and strengthen each other. However, it is quite impossible without proper communication and strategies. Further, strategic communication is not institutionalized in the structures and practices of educational affairs. This is also in case of NGOs working on education issues. Hence, this paper advocates developing and framing a policy perspective to create enabling environment and instruments by which national or sectoral communication strategies for education can emerge. This is possible through framing the curriculum, training of communication officers and journalists reporting on education. This training needs to inculcate some basic elements of multi-dimensional communication strategies for education.

Information Technology and Agricultural Education in India: Some Concern

Indian agricultural education today finds itself at the crossroads. To make it an active agent for development thrust needs to be on information technology and its proper implementation at grassroots level. Further its success and utility requires a special focus on marginalised and small farmers. This can bring real empowerment which is a multi-dimensional social process and helps people to gain control over their own lives and life situations. It is a process that fosters power in people which they use in their own lives, their communities and in their society, by acting on issues they define as important. Ostensibly, empowerment as an objective of agricultural development should be a welcome addition to the democratic discourses by making use of information technology. In this context, to become empowered and prosper in agriculture, information technology can be vital vis-à-vis agricultural education. The break through made in satellite technology and communication system inaugurated many changes which have had enduring and far reaching impact upon almost all aspect of human life, including agricultural education. But it has not made any significant penetration to the rural and peripheral areas and educational institutions. As a result its impact and utility is restricted and could not bring desired and substantial results. In this context the present paper is an attempt to provide a comprehensive picture of the linkages between agricultural education, information technology and its coverage in terms of its implementations at rural and peripheral educational institutions.

KUMAR, PRAMOD* (College of Commerce, Arts and Science, Patna (India))

The Concept of Purushartha and Contemporary Indian Society.

Indian thought conceives human values or *Purushartha* as fourfold. According to the Indian tradition, the values consciously pursued or to be pursued by human beings for fulfilment of life are said to be fourfold. These values are, in Sanskrit, called the *Purushartha* (objects or aims of man's existence). All the desired and desirable objects in earth and heaven are subsumed under four categories: *Dharma*, *Artha*, *Kama* and *Moksha*. The scope of the *Caturvarga* schemes thus covers

the entire life of an individual, society and culture, the material world and the realm of spirituality. The scheme of the fourfold ends of man, *Caturvarga*, is one of the principle ideas of *Hinduism*. Like many other things, it is based on the *Vedas*, though the scheme as such is not found therein.

In the contemporary age, the advancement in science and technology has expanded the horizon of human knowledge and made life more comfortable and more secure. On the other hand life has become more insecure too. The rising number of crimes, corruption, unrest and demoralization almost at every level of the society can hardly convince one that we may rest complacent. In these circumstances it is wise to consider whether the old values are enshrined in our ancient texts may be useful in solving the crisis of the contemporary age problems. When science fails to check such propensities, the ancient scriptures have to be restored for moderating influence. If we get more and more power from science and more and more moderation from the scriptures, their combination will certainly yield a very balanced way of living.

Dilemma in Indian Democracy

Keeping in view the prevailing contemporary global scenario, an attempt is being made to discuss, describe, debate and deliberate the **DILEMMA IN INDIAN DEMOCRACY**.

What are the problems that dilemma of democracy has created in our society?

The core issue is what is the root cause of discrimination, exploitation and oppression in Indian democracy?

Whether Indian democracy is having success or failure in the last 70 years?

Do Indians really deserve Democracy?

In the quest for explanations to the aforementioned questions, various factors and forces responsible for sustainability of the system have been examined/evaluated:

- Voting behaviour based on parochial identities during elections
- Governability and dissent
- The issues and challenges like casteism, communalism, corruption, criminalisation, regionalisation, sub-regionalism, regional leadership, regional sentiments, regional parties, migrants, movements, adivasis, transgender, dalits, youth, children, minorities, inequality & injustice, poverty, unemployment and violence etc.
- Inefficacious programs, policies, plans, schemes aiming to various sections of society
- Democracy based on distribution and devolution of powers

It is pertinent to mention here that dilemma in present-day Indian Democracy is prevailing. It is widely accepted and recognized that despite of various efforts by the successive governments, democracy has failed to fulfil the expectations of the people and also to eradicate poverty, injustice, social evils and inequalities from the society.

This paper attempts to examine the various controversies viz. defining the democracy, contextualizing Indian democracy, democracy in action, election process, parties, constitution, secular democracy and religion based politics, economic development and problems of nation-building process etc.

For strengthening, survival and sustainability of the democracy, efforts have been made to study and evaluate the party system, voting behaviour, federalism, institutions, governance and foundations of Indian Politics by analysing ground realities of Global and Indian economy in the larger perspective of the state, society and system.

KUMAR, VINAY* (*State University of New York at Buffalo*)

The Concept of Moral Order: Spatializing Morality

This paper aims to marry two bodies of literature by combining a spatial turn to the new sociology of morality and a moral turn to urban sociology, and offer a conceptual framework for inquiry into morality and space. While sociologists have generally recognized that morality is contingent on social and historical context, the spatial dimensions of morality have been under-theorized. This paper seeks to make a case for more attention to be cast on the spatial dimensions of morality. More specifically, in this paper, then, to incorporate the spatial into discussions of morality, I recall and revitalize the classical concept of "moral order." While the origins of the concept of moral order—or something close to it—in urban sociology can be traced back to its classical incarnations—in the work of Ferdinand Tönnies and Robert S. Park, for instance—and has since had an intriguing, if intermittent, career, I intend to repurpose the concept and offer it as a heuristic device. I proceed by: (i) offering a theoretical definition of "moral order," by conceptualizing moral order as a process, constitutive of a general order of things, and as part of a wider cultural paradigm; (ii) outlining its epistemological implications for sociological inquiry, particularly on the questions of moral truth, value freedom, and conceptualization of morality as an object of inquiry; and, (iii) spelling out the potential significance of incorporating the spatial into sociological inquiries into morality.

Hope, Trust, and Planning: Socio-Spatial Groundings of the German Middle-Classes' Diverging Perceptions and Processing of Current Irritations

Sociology has identified multiple irritations of the middle class way of life that are behind the much diagnosed surge in middle-class anxieties in the global north. However, the way in which the different factions of the middle class cope with these irritations are far from uniform. In this presentation, I will use preliminary results of our study on the German middle class' conduct of living to reconstruct the socio-spatial groundings of these differences.

In our project we conduct and analyze biographical-narrative interviews with middle-class members in Germany. The aim is to reconstruct the habitualized conducts of life that form the background and the generative grammar for the diverging ways in which the multiple challenges and irritations that the middle class is subjected to are processed and coped with. We find that a variety of factors greatly impact both the perception and the processing of risks, ranging from different familial backgrounds that foster or prevent structural optimism in socio-biographical crises and close social networks that provide trust and limit the ambitions that one measures one's success with, to the institutional and economic peculiarities of different career-paths that prevent, enable, or enforce planning as a way of coping with risk.

RC16-306.1

KUMKAR, NILS C.* (*University of Leipzig*)

Investing in Status As a Mode of Living? the Conduct of Life of the German Middle Class

The last decade saw vivid debates about disturbances of the middle-class life across diverse live-spheres, such as the labour market, parenthood and civil society engagement. Those debates have led to diverging conclusions and mostly lack a comprehensive, empirically grounded understanding of the habitualized everyday practices of the middle classes that are called into question by those social developments.

In our research project, we focus on the reconstruction of the variety of conducts of life in the German middle class and the identification of circumstances under which routinized patterns of "doing life" are irritated. We assume that the specific mode of doing life of the middle class in Germany has been – and largely still is – characterized by a continuous investment of economic and cultural capital to pursue the reproduction and, if possible, improvement of one's social status. Empirically, we rely on narrative biographical interviews with members of the German middle-class.

My presentation will focus on the reconstruction of diverging habitualized status-orientations of middle class members, as they influence the perception and thus the subsequent processing of irritations. We find a broad range of status-orientations across the varying factions of the middle class – from seemingly boundless striving for social and monetary recognition, to rather modest status-orientations based on local anchoring and dense social networks. The contribution will provide empirical illustration of those orientations and suggest factors that systematically produce them, such as family backgrounds, social networks and the availability of economic resources, or traditions of professional pride.

Jihadist Movements in Africa from Local, Regional and Global Perspectives

Africa is the worst devastated continent by jihadist violent conflicts particularly from 1998 when terrorist groups guided by Osama bin Laden attacked the US embassies in Kenya and Tanzania.

Such violent movements founded in many countries of Africa which can be classified as two types: 1st type are branches of Al-Qaeda, established by former Arab mujahedeen fighters in Afghanistan in many north African states such as - the Egyptian Islamic Jihad, Al-Qaeda in Maghreb (with its sub-organizations Al-Qaeda in Mali, Al-Qaeda in Mauritania, Al-Qaeda in Morocco and Al-Qaeda in Sudan) and Libyan Islamic Fighting Group. The second type are sectarian violent groups founded independently from Al-Qaeda but gradually attracted and developed working relations with Al-Qaeda and accepted as part of the organization, such as Al-Shabaab in Somalia and Boko Haram in Nigeria (a movement now spread to Niger, Cameroun and Chad in those areas inhabited by communities of Kanuri nation). The activities of these jihadist movements recorded in 19 states of Africa (Hans Krech 2011).

In the first place, the paper analysis the internal problems of these countries from economic, social and political points of view: unemployment, lack of secular education, the corruption of political and military elite.

Secondly, Western states influence the violent conflict in Africa in order to promote their geo-strategic interests in Africa's precious natural resources and to expand their military bases in Africa in the name of fighting against the so called global terrorism.

Finally, I will discuss what should be done to solve this problem from African indigenous conflict resolution perspective.

The Ethiopian Government Violent Repressions through the Prism of State Terrorism

State terrorism is the intentional use or threat of violence by state agents or their proxies against individuals or group who are victimized for the purpose of intimidating or frightening a broader audience. The direct victims of violence are therefore not main targets, but are instrumental to the primary goal of frightening the watching audience, who are intimidated through the communicative power of violence. The intended effects of violence are achievement of specific political or political-economic goals [Jackson, Murphy and Poynting 2010:3].

The state security apparatus uses many forms of state terrorism against the targeted group of people, which it considers as its own potential opponent to its power. The main forms of state terrorism are disappearances, which are designed to terrorise a targeted group through kidnap of an individuals, illegal detentions, torture and assassinations.

Ethiopia was created by Abyssinian Empire led by King Menelik II at the end of nineteenth century during the scramble for Africa, colonizing its independent neighbouring nations like Oromo, Somali, Sidama, Kaffa and others. Compared with other African Colonizers, the Abyssinian conquest and colonial rule was the worst of all.

The Abyssinians are two nations (Amhara 27% and Tigray 6.1%) of the Ethiopian population. Other colonized peoples (Oromo 35%, Somali 6.2%, Sidama 4%, Gurage 2.5% Walaita 2.3% and other).

Ethiopia starting its creation to May 1991 was ruled by Amhara Emperors (to 1974) and Military Government (1974- 1991) and from 1991 by Tigray People's Liberation Front (TPLF) under the cover of Ethiopian People's Revolutionary Democratic Front (EPRDF).

We examine the TPLF led government for the last twenty six years through the prism of above mentioned state terrorism form of repressions in Ethiopia and its neighbouring countries particularly in Somalia.

"Honey, I'm Hungry": Feeding Habits of Commuter Couples in Jos, Nigeria

Commuter couples are married couples who do not share the same residence on a daily basis usually due to work commitments. The commuting spouse returns to the primary home weekly, fortnightly or even after a longer time interval not exceeding three months. This work-family arrangement comes with its benefits and challenges among which are feeding and eating habits. Interviews were conducted with 17 commuter couples in Jos, Nigeria, where couples narrated various experiences in a commuter marriage relationship. The narratives on feeding and eating habits were portrayed differently among men and women. This portrayal had much to do with changing gender roles, cultural expectations and societal norms as well as the dynamics of the living arrangement the couples find themselves in. The societal expectation of the Nigerian wife is to live together with her husband, primarily to satisfy his needs including feeding him properly with the food he usually gives resources to purchase. Women are quite happy, and oftentimes proud to perform their marital duties in this way even though, they express how tedious the process of meal preparations are: from bargaining in the market to buy the food ingredients, to actually cooking the meal three times a day, every day for the entire family. Women in this study, indicate they have some respite from this duty when their husbands are away at work, but face a social and emotional dilemma when they do not perform their duties in this way. Wives are fraught, with various strategies to try and remedy this situation. Men on the other hand, complain that due to work commitments, they do not eat as well as they should and look forward to coming home at opportune times.

KUNIMOTO, SATOSHI* (*Hitotsubashi University*)

Discourse of Justice in Japanese Press Conference of Apology

Nowadays, if you cause a political or scientific frauds scandal, you will be demanded a press conference for apology by mass media. One of the most well-known examples in Japan, is stem-cell (STAP cell) scandal. Haruko Obokata, a then postdoctoral stem-cell researcher, was accused of fabricating data and canceled her paper in Nature. She had a press conference in 2014, she apologized to civil peoples in front of the press corps.

From the perspective of the sociology of knowledge approach to discourse (SKAD), apology is a constructed discourse influenced by justice-related social knowledge. SKAD is a new approach to discourse, which was founded by Reiner Keller, who integrated Peter L. Berger and Thomas Luckmann's sociology of knowledge with Michel Foucault's discourse analysis. Keller identifies discourses as regulated and structured practices of sign usage, and theorizes that discourse freeze meanings, fix them in time, and institutionalize a binding context of meaning, value and actions/agency within social collectives.

Based on SKAD, I take up two press conferences of apology including STAP cell scandal and apologies in politics. I analyze rhetoric of apology and its interaction with the audience. For example, Obokata's explanation at the press conference included her own interpretation as to why she must apologize or what she should say. Also, journalist's questions included their interpretation as to why they demanded apologies, what explanation they could accept. Her apology and their utterance reveals how to constitute the dominant knowledge about justice and what features of symbolic order are at the conference. I will then compare this result with political case, which gives an account of symbolic differences between heterogeneous realms.

I conclude that SKAD has advantages in comprehending what social representation is and how we can examine it. This approach enables us to focus on current ideas and media representation.

KUNOVIC, MARTINA* (*University of Wisconsin-Madison*)

Opportunity and Inequality in a Changing Economy: Navigating the Emerging Real Estate Market in Havana, Cuba

As part of a broader package of state-led, market-oriented reforms aimed at improving the Cuban economy, the Government of Cuba legalized the free-market purchase and sale of homes in November 2011. As a result, a half-century after having banned home sales in Cuba and having declared that housing was to serve a "social" function, a residential real estate market is once again emerging—and with it, transforming the urban and social landscape of the island, creating "landscapes of inequality". In this paper, I examine how Cubans in Havana are navigating this "opening," and how they get sorted into winners and losers in the process. In so doing, I highlight the uneven social and economic impacts of the much-celebrated opening of the real estate market in Cuba. I go further by interrogating the ways in which the emerging landscape of inequality in Havana is structured by and exacerbates historical inequalities among the population but also serves as the foundation for new axes of inequality.

Complementing Climate Change Adaptation and Disaster Risk Reduction: Stakeholders' Perspectives Toward Climate Change Drought Risk in Taiwan

Drought is one of serious natural disasters in Taiwan due to its uneven precipitation distribution across seasons. However, it is observed and projected that climate change would very likely change the precipitation pattern (i.e., increased extreme wet-dry seasons), which results in possible enhanced drought risk in Taiwan. The potential water shortage problem would not only affect economic development and the daily life of the general public, but also cause social conflicts over the issue of justice and fairness of water allocation among various users.

Moreover, foreseeing climate change and disaster risks are both key threats to humans' sustainability, many researchers and policy makers recognize the need to integrate climate change adaptation and disaster risk reduction for policy cohesion and synergy in practice. Therefore, it is of interest to investigate how these stakeholders perceive of this issue and how these perspectives can help complementing climate change adaptation and disaster risk reduction.

Targeting Northern Taiwan—a relatively high drought risk area due to potential reducing precipitation and high water demand, this study first conducts in-depth interviews to collect valuable perspectives from several key institutions (i.e., Water Resource Agency, Irrigation Association, Taiwan Water Corporation, Industrial Park Service Center). The study then further conducts quantitative surveys to investigate and compare multiple stakeholders' drought risk perception (i.e., farmers, manufactures, general public, and public sectors) (n>1300).

The preliminary results show that the relation between drought and climate change is disconnected in both sociological and political aspects. While stakeholders recognize the risk of climate change, they tend to more focus on short-term

drought problems, which also reflects on current policy and practices. The study concludes that to complement climate change adaptation and disaster risk reduction effectively, one key gap that needs to overcome is to produce and communicate policy-relevant scientific information that integrates multiple stakeholders' perspectives.

RC24-450.14

KUO, SHIH-YUN* (*National Science and Technology Center for Disaster Reduction*)

Public Understanding of Climate Change in Taiwan

Global climate change has been contributed by humans' behaviors (e.g., energy use, consumption) and its adverse consequences has also affected humans' wellbeing (e.g., extreme events, agriculture). It is impossible to decouple climate change and the socio-economic human systems, which makes the sociological study on the complex interrelationship so significant and interesting. Due to Taiwan's high greenhouse gas emissions and high climate change impact and risk, we cannot avoid the responsibility in terms of climate change mitigation and adaptation issues. Therefore, it is particularly important to investigate how citizens of a newly industrialized country perceived, comprehend and respond to this high scientific-complexity global problem.

This study first develops a comprehensive structural survey instrument that not only covers aspects of climate science, mitigation and adaptation but also includes aspects of general attitude, scientific knowledge, and behavioral intentions. The survey is composed of four dimensions and 40 variables in total. This questionnaire was carried out in May 2017 to measure the general public's understanding of climate change within the random-sampling telephone survey method (n=1254). The preliminary results show that while Taiwanese citizens are highly concerned of climate change risks, they only consider themselves hold a medium level of understanding, which reflects on their performance in the scientific knowledge dimension. Moreover, Taiwanese citizens show a relatively high willingness to take climate actions and support climate policies based on a strong sense of ecological citizenship. This empirical study ultimately hopes to contribute the development of science education and science communication of climate change (i.e., how to effectively communicate with individuals) and contribute the development of climate change decision (i.e., how to formulate a public supported policy).

KUPKA, PETER* (*Institute for Employment Research (IAB)*)

Social Inclusion and Integration into the Labor Market: Mentally Ill Unemployed in German Job Centers

The German welfare-to-work system (Social Code II) sets a low threshold of three hours a day to define work capacity. Thus, a large number of persons who are very remote from employment are subject to labor market activation. Among them, a considerable share are mentally ill.

In the course of a research project about the situation of mentally ill unemployed persons, we examined how case workers (counsellors, placement officers) in German job centers deal with mentally ill benefit recipients and how strategies of integration into employment affect social inclusion or exclusion. The analyses presented are based on 34 qualitative interviews with case workers from eight job centers and 43 benefit recipients with diagnosed mental disorders.

Our results show that attempts of activation have to consider conditions like the type of disorder, severity and chronicity. Most jobseekers argued that unemployment worsened their well-being and impaired their health. Having a job was seen as a core aspect of inclusion into "normal" life. Others, however, feared they couldn't handle work requirements, stress or unfriendly supervisors.

Clients faced different approaches when they met case workers in job centers: Some of them chose an open and trusting approach towards job seekers, others used instruments of coercion. Also, few case workers focused on integration through employment while most took chose an approach to wait for clients to "get better first". Often this happened although clients would have preferred to pursue a strategy of integration into employment.

Restricting factors for an inclusive strategy of case workers are little knowledge of mental illnesses, lack of support for labor market integration and a hierarchic communication. On the other hand, a trustful relation with case workers and granting the clients an active role in the counselling process can support social inclusion of mentally ill welfare-to-work clients.

Cultural Mechanics of Mystery: Competing Interpretations of the Dyatlov Pass Tragedy

Mystery plays a fundamental though still not fully known and acknowledged role in modernity serving as important means of re-enchantment of social life. Thus, under certain conditions seemingly unimportant or irrelevant events can nevertheless attract enormous attention and emotional involvement. One of those cases is the Dyatlov Pass Tragedy that happened in 1959 in Northern Ural, where 9 hikers died under mysterious and still unknown circumstances. Nowadays, more than 50 years later, there are thousands of lay-researchers searching for the truth about the case and building competing explanatory accounts. I argue that mysteries of such a type reveal the hidden role of cultural structures and thus pave the way for a cultural explanation. In this paper, I propose a model explaining the relation between the mystery, governing narratives and forms of sacrality and transgression, and apply it to the Dyatlov case. I argue that the emotional effect of mystery is based on dominant cultural structures and narratives, challenged by 'triggers' – particular symbols attracting attention and emotional excitement. Every pattern of perception of mystery can be characterized by the tie between trigger and its corresponding narrative; this tie is based on the transgression of the narrative by a trigger-event. I argue further that the most important features and conditions of mystery are uncertainty and tension, and the emotional effect of the mystery in every particular case largely depends on the ways of establishing those conditions. Thus, in the Dyatlov case the effect of mystery is caused by a rare balance between the plausibility of competing versions of solving the puzzle. The proposed model allows us to understand the cultural construction of mystery which is crucially important for explaining how deep cultural structures energize people's urges, concerns and fascinations.

Immigrants and US Elections: Race, Religion, and Indian American Partisan Identities

How might religious identity interact with national identity to shape the partisan politics of immigrants? This paper draws on primary and secondary material to describe and explain the voting patterns of most Indian Americans (overwhelmingly Democratic despite the fact that a large proportion claim to be independent without a strong partisan affiliation), and discussions about the reasons for the partisan identities of some prominent Indian American politicians. Drawing on my interviews with 17 Democratic activists, 9 Republican activists, as well as media interviews with other activists, I then discuss how and why some Indian Americans become activists for one party versus the other. I show how race and religion (in addition to national origin) interact with each other to shape these patterns, sometimes working together, and sometimes in opposing ways. These factors have been shaping the mobilization of Indian American partisan activists in interesting ways in the national elections, beginning from 2000. I conclude with a discussion of Indian American mobilization around the 2016 elections and in the early period of the Trump administration.

KURITI, ANANDA* (*Centre for Economic and Social Studies, Hyderabad*)

Networks As Vehicles for Social Transformation: An Exploration of Youth Social Capital in India

Social capital among youth is usually based on the theoretical approaches of James Coleman, Pierre Bourdieu and Robert Putnam. Their focus was on parents' social capital and how it was merely used, rather than created by youth. Putnam's approach is based on the hypothesis that the structural aspect enables the development of generalized trust and civic norms and the latter encourage the continuation of existing cooperation. This study regards youth as a social resource that encapsulates the potential to contribute to society's social capital and thus

applies Robert Putnam's theoretical approach to social capital. The combined quantitative and qualitative enquiry is advocated to aid the exploration of social capital within young people's lives as a process which has to be negotiated in a continuous interaction between the different domains of self, situated activity, social settings and context. For the study, the data has been gathered from four hundred eighty college students who are studying in twelve different colleges in Visakhapatnam city by using simple random sampling method. The study is achieved through enhancing young people's existing social capital by building their existing resourcefulness, strengthening their existing support networks, opening up new horizons and creating access to new resources within a strength perspective. The results show far less attention has been given to the production of social capital among young people themselves, in making the transition from dependent child to independent adult. Through findings, this research fills the gap by examining how young people develop and use social capital in different contexts at colleges and outside, in cementing friendships, in developing identity, in smoothing the passage through education and in resisting coercion into pre-designed adult roles.

Re-Defining Women's Social Status By Optimal Matching of Occupational Career.

This study attempts to define Japanese women's status by the occupational career of their own. In the social stratification studies, it has been a serious problem of how to define the women's status. Since J. Acker (1973) has pointed out that there was a limit in setting the family as the unit of stratification. This problem has been discussed also in Japan, however, there is no clear consensus on how to measure the women's status. In this study, focusing on perspective of the individual as the unit, some difficulties will be overcome by measuring women's status of their occupational careers.

The dataset used here is "Questionnaire Survey on Occupational Career and Working Style" from JILPT. This dataset was collected in 2013, and contained each respondent's job data from 15 years old to the survey period by retrospective method. This study created occupational career variable by Optimal Matching method (OM) that is a method of analyzing sequential data. We can get information on what kind of work experiences they have so far, how diverse the women's working lives are, by using OM. Occupational career was measured by employment status such as regular employment or temporary employment, and including those who are not working. By doing this way, we can properly consider the process of exit from and re-entry into the labor market in conceptualizing the social status.

This study presents three advantages of measuring women's status by occupational career. First, it needs only the information on occupational career of women themselves. Second, we can measure the status of all women on the same standards with or without husband or male partner. No women are excluded from this analysis. Third, there is a possibility of gender-neutral concept of stratification as this way can be applied equally to men.

Institutional Ethnography in Social Work Research in Finland

Ever since the 1990s, Dorothy E. Smith's institutional ethnography has been widely known in Finland among feminist researchers in social sciences. More recently, it has found its "home" especially in social work research. Some Finnish researchers who have adopted institutional ethnography as their methodological and theoretical approach concentrate more on texts, textual analysis, and the notion of textually mediated social relations. Others have their standpoint and the "point of entry" more in the everyday world of certain groups of women/people and in their experiences, and how it is organized in certain institutional contexts, usually by certain social service systems.

This paper will discuss these different approaches and contributions into institutional ethnography in Finland, and especially in the Finnish social work research. It will also introduce the author's and her research team's own ongoing research project titled "*Transforming welfare service system from the standpoint of women in vulnerable life situations*" (Academy of Finland, no 294407, 2016-20). In this project, we want to find the missing link or bridge the gap between research studying experiences of women in vulnerable life situations and a more structurally oriented research tradition studying policies and practices of the welfare state and welfare services. We want to get beyond women's experiences, even if those are also important to hear. We suggest that a possible and promising approach to achieve this is institutional ethnography. For us, it means a commitment to begin the inquiry from the standpoint of women – drug abusing women, poor single mothers, and women sentenced to prison – and analysing how experiences and actualities of their everyday world are organised by social relations, structures and institutions, such as the welfare service system, to make this organisation visible, and help women to understand "how it actually works" as Dorothy Smith has put it.

KURTOGLU, AYCA* (*Acibadem University*)

Discourses and Politics of Visual Research Methods

The proposed paper deals with and questions two things at the same time: visual methods used and studying animals. A juxtaposition of the two questions, the paper argues, renders visual methods problematic in that visual methods deliver outputs that can be associated with methodological human-ism and homo-centrism. Against this, the paper first presents a survey of visual methodologies in terms of discourses of methodological human-ism by presenting their constructions of the world as apprehended by human animals. Afterwards, it discusses the (im)possibility of methodological *faber-ism*. The paper finally wages a discussion on the politics of methodological human-isms in social research.

KUSA, ZUZANA* (*Institute for Sociology Slovak Academy of Sciences*)

Process of Displacing Dignity from the Post-Socialist Slovakia' Welfare System.

A paper's attempt is to contribute to understanding why the process of displacing of the "life in dignity for all" principle from being the corner stone of social protection and welfare policy did not face stronger resistance in the post-socialist Slovakia.

This attempt is informed by Hans Joas's theory of affirmative genealogy of human rights (2013) that emphasizes the importance of legal, organisational discursive and emotional buttresses for sustaining the value of personal dignity as the core value of society as well as by the concept of moral exclusion (Opotow 1990) and Jeffrey Alexander's emphasis on the need of public dramas for widening social solidarity (2017).

The paper uses the data from the author's long term study of social protection reforms in Slovakia (1990 -), political discourse substantiating them, actors involved in the decision-making process as well as of opinion pools and value surveys (EVS 1990 - 1999 - 2008 - 2017) and focus group research that provides insights in commonsensical understanding of social justice and its principles. The findings indicate that displacing the dignity principle from the welfare policy (and the most radical cuts in social rights) corresponded with the accession process of Slovakia in the European Union (1999 - 2003) during which social protection was debated only from economic and budgetary perspectives and that the social protection cuts were legitimized by employing the moral rhetoric of obligations first and work motivation. The strong voice of municipal representatives (as expressing *vox populi*) in the policy-making process might serve as crucial support of massive infusion of populism (with its strict reciprocal understanding of social support, seeing nonwork as moral failure and Roma-visible minorities as morally othered) that finished displacement of "dignity for all" principle from the political vocabularies as well as from discursive stocks of the common sense.

KUSCHE, ISABEL* (*Aarhus Institute of Advanced Studies*)

Degrees of Populism. the Use of Distinctions in (Populist) Political Communication

What is it about the early 21st century that makes an increasing number of people in many countries susceptible to populist appeals? Superficially the answer seems clear. The last decade has brought a cumulation of events and developments against which politicians have seemed quite powerless. Yet, previous decades also had their fair share of worries and fears and some recent populist discourse, for example in Greece, is closely related to older instances of populism. Against this background, the paper will embed the familiar populist distinction between 'people' and 'elite' in a communication-theory framework that relates it to two other distinctions. The first is the distinction between crisis and non-crisis. On the one hand, populism can make use of a crisis frame in order to justify the need for a strong leader who directly implements the will of the people. On the other hand, non-populist political communication can invoke a state of crisis in order to justify specific extraordinary measures that may well stretch the established framework of democratic procedures to new limits. Once the latter is the case, the former becomes easier, since a specific form of observing current events has already been established in political communication. The second distinction is the one between causes and effects of a state (of crisis). Populist political communication tends to attribute causes to the 'elite' and focus on effects for 'the people'. But not all issues lend themselves in equal measure to such attributions, which require a radical reduction of complexity. Taken together, we can differentiate the strength of populist movements according to whether they only use the familiar 'people'/'elite' distinction, achieve the congruence of this distinction with the one between causes and effects of a salient political issue or even manage to confirm this congruence by linking it to observations of crisis.

RC20-381.2KUSCHE, ISABEL* (*Aarhus Institute of Advanced Studies*)*Non-Programmatic Politics and the Impact of Austerity*

The paper presents results from a multiple-case study about political consequences of the turn to austerity after the financial crisis in Ireland, Greece and Spain. The project starts with the assumption that in times of fiscal crisis, governments must turn to something else than programmatic politics when attempting to secure a level of popular support sufficient to remain in power, and even the opposition will face unusual constraints with regard to what it can credibly promise. The countries that were selected as cases have a well-known history of using non-programmatic appeals, such as clientelism or a focus on constituency service, in political competition. The question is how these appeals have been altered by the turn to austerity. On the one hand, one could expect them to be weakened due to a lack of resources and a wish to break with practices that contributed to the severity of the crisis. On the other hand, a contrary effect could also be expected, since politicians are aware of the discontent of voters and increasing numbers of voters face severe economic difficulties that render particularistic support of any kind more valuable to them. Based on the analysis of quantitative surveys, documents, newspaper articles and qualitative interviews, the paper maps the impact of austerity on well-known non-programmatic strategies and the emergence of alternative populist appeals in the three countries.

RC03-68.7KUSENBACH, MARGRET* (*University of South Florida*)*Who Owns (the Memory of) Leonard Cohen in Montreal?**Examining the Politics of Representation and Authenticity in Urban Spaces*

Since singer and writer Leonard Cohen passed away in November 2016, different cultural and political actors in his home-town of Montreal, Canada, have created (or planned) various memorial events, ranging from make-shift shrines to murals to a large museum show. While locals agree that he is one of the city's most emblematic sons and deserves to be honored, there are ongoing disagreements among officials, cultural actors, journalists, and residents on exactly *where* and *how* Mr. Cohen—an artist known for modesty and understatement—should be memorialized. Based on ethnographic observation as well as an analysis of news articles and online discussions, this paper chronicles the various showplaces and negotiations surrounding the cultural representation of Leonard Cohen in Montreal during the first year after his death. The paper reflects current theoretical debates and raises new questions regarding the politics of urban authenticity through and about the arts.

RC18-344.4KUTHADI, ARJUN* (*Osmania university*)*The Socio - Cultural and Political Ecology of Tribal Groups in Telangana: From the Annals of the History of Tribal Movements*

This paper predominantly argues that the Indian economic reforms of 1990s, especially public policy changes in the intertwined domains of development and forest ownership rights, mark the watershed movement in the historical trajectory of tribal groups in post-independent India. Consequently, the changes that followed have exposed the tribal groups to multiple vulnerabilities from external forces besides their internal social challenges such as illiteracy, superstitions, and ignorance. This study is based on historical data on various tribal groups of Telangana. The Telangana region has been home for diverse tribal groups, whose socio-cultural historical trajectory is uniquely in contrast with the mainstream Indian population. These frontier tribal groups consist of the Gonds of Adilabad, the Chenchus of Mahabudnagar, the Koyas of Khamman and Warangal who lived mostly in the forest areas. Except a few comprehensive studies by P.Sethumadhav Rao and Himendorf, there are no studies in the recent past on Tribal groups of Telangana to enhance our understanding of these marginalized social groups. This paper further traces the historical trajectory of tribal unrest in the Telangana region starting from the Nizam regime to the contemporary times with a special reference to demonstrate their socio-economic plight and to accommodate their growing political aspirations.

RC25-465.3KVIRIKASHVILI, ANI* (*Illia State University*)GULEDANI, LALI (*Illia State University*)*Hate Speech in Israeli and Georgian Political Discourse*

The paper aims to explore the impact of different socio-cultural environment on the political discourse and analyze the place of hate speech in this discourse,

the reasons for its use and influence on the society. The issue requires interdisciplinary approach, not only linguistic, but sociopolitical analysis too, so we consider it to be the interest of sociolinguistic research.

Based on the comparative case study methodology, it highlights the similarities and differences between the discourses of Israel and Georgia in terms of using hate speech. Special emphases are made on the use of verbal abuse by the Israeli and Georgian politicians and public officials.

Besides linguistic research methods (data collection, coding, content analysis of social media posts, articles, interviews, pre-election meetings and debates) the paper relies on the theories of **Elliot Aronson** (developed in his books "Social Animal" and "Age of Propaganda: The Everyday Use and Abuse of Persuasion") for explaining the possible reasons of hate speech (we will try to explain, which reason seems more applicable and how it's represented in each research country). The paper refers to **Aristotelian Triad (Ethos, Pathos & Logos)** in order to analyze hate speakers' rhetorical appeals and efficiency of means of persuasion used by them.

The paper analyzes those special cases from the modern Israeli history, when freedom of expression is restricted even in this kind of free, developed and democratic state due to national interests and suggests that this kind of legislative regulations on hate speech should be implemented in Georgia as well (we will criticize existing ineffective restrictions from Georgian Legislation).

The paper argues that considering the importance of peace, sustainable development and security and the necessity of protecting specific/minority groups from prejudice and discrimination may sometimes lead to restriction and censorship of political and civil rights, as well as freedom of expression.

RC19-357.1KWON, HUCK-JU* (*Gradatue School of Public Administration, Seoul National University*)KIM, HYOJUNG (*Korea Educational Development Institute*)*Searching for Normative Grounds of the Universal Welfare State*

In recent years, universal welfare has attracted a special attention from policy makers as well as academics in social policy because universal policy instruments have been proposed and introduced across world. Unconditional cash transfers in developing countries have been introduced in many developing countries and universal basic income in developed countries have been fiercely debated in countries like Switzerland and South Korea.

This paper pays special attention to the moral obligation for citizens in universal welfare, as they are responsible for sustaining universal welfare. It critically reviews political theories on social welfare to construct normative grounds for universal welfare: a human rights approach, the Rawlsian theory of justice, and the republican idea. Although none of these normative theory strands provide automatic justification, they can provide an important rationale for universal welfare. By expanding these political theories, this paper will construct a universal welfare state with a solid normative grounds and identify social policy instruments that could be parts of the universal welfare state.

RC19-360.5KWON, HUCK-JU* (*Gradatue School of Public Administration, Seoul National University*)CHO, JU RYUNG (*Graduate School of Public Administration, Seoul National University*)*Social Protection for Migrant Workers in the Developmental Welfare State: The Case of Low Skilled Workers in Korea*

Migrant workers increasingly play a significant role in the labour market in East Asian countries. Due to the demographic shift to an ageing society with decreasing working populations and higher labour costs in East Asia, countries in the region, such as Korea, host more and more migrant labour. Because of the legal barriers related to immigration and labour market regulations, migrant workers are exposed to various social risks while working in foreign countries. This paper will try to analyse the social protection of migrants in Korea from a perspective combining the migration and welfare regimes. In particular, this paper will examine how entry status and eligibility of social policies affected social protection of low skilled migrant workers and further stratified them in the migration regime. This paper will seek to elicit policy implications for policy reform to meet the social protection needs of migrant workers in the future.

RC42-722.2KWON, HYE WON* (*University of Iowa*)*The Sociology of Grit: A Cross-Cultural Examination of Social Stratification of Grit*

This paper presents a cross-cultural examination of the currently fashionable psychological notion of 'grit' and explores its potential for contributing to

understanding social stratification, bringing grit into sociological discussion of agency, one of the core tenets of life course studies. Grit, comprising of perseverance and passion towards long-term goals, has received growing attention from academia and the general public as a strong predictor of academic achievement. Yet grit researchers have been less interested in potential antecedents of developing grit and largely centered in a single nation (e.g., the United States). Current scholarship largely fails to consider structural and cultural contexts that may impact grit's development. Suggesting that grit could work as a "behavioral engine" transforming subjective beliefs about agency (i.e., personal sense of control, the traditional measure) to actual agentic practices that potentially produce better life outcomes, I analyze data from four nations (France, South Korea, Turkey and the U.S.) and provide evidence that grit operates in a fashion useful for understanding stratification. I find individuals who are strong believers of one's control over life outcomes (i.e. personal sense of control) are more likely to develop grit in four different countries. This finding adds power to the concept of grit as these relationships are found in four distinct nations with distinct cultural orientations of valuing agency. This study provides significant insights into how social structural factors contribute to the development of grit, particularly highlighting the mediating role of the sense of control in four different cultures.

HITLIN, STEVEN (*University of Iowa*)

"They Do Not Value What We Value": Cultural Consistency and Dissimilarity in Distinctions between in- and out-Groups

We often think that the reason we feel strong negative emotions toward out-group is because they have different views, perhaps even immoral ones. Humans seem to universally categorize as "us" and "them," but little work examines the extent that perceived values play a crucial role in distinctions between in- and out-groups. Previous work often explores a targeted, single in/out group distinction (based on race/ethnicity or gender, for example), limiting our understanding about people's perception about in- and out-groups in a more realistic setting where people have an array of groups at one time. Additionally we know little why and how people draw the boundary constructing positive feelings about valued in-groups against members of a certain group such as political opponents, homosexuals, or those who use different languages. Using cross-cultural survey data collected in the United States and South Korea, we offer a novel cross-cultural exploration using a wide range of possible in- and out-groups in two emblematic countries of the widely cited individualism vs. collectivism continuum. We find (a) people in two countries commonly select those with different political orientations and homosexuals as their least preferred out-groups, despite presumed cultural differences between the two countries. In addition, (b) both Americans and Koreans in our sample tend to think "we are nice people, but they (out-groups) are not," as they see their out-groups are more self-interested while their in-groups care for others. This pattern is, however, intertwined with structural factors in complicated ways. We find (c) higher educated people in both countries use more internally consistent values to draw boundaries against out-groups; for the less educated, it appears that out-group discrimination is not necessarily linked to a coherent set of values but reflects an unarticulated general prejudice.

Ways out of Dualism? the Politics of LM Reform in Japan and South Korea

Liberalization processes often forced industrialised countries to undergo several reforms of their labour markets (Streeck and Thelen 2005, Fleckenstein et al. 2011): East Asian countries are no exception to this (Dore 2000, Chan and Ngok 2011, Lee 2016). This study aims to describe how the traditionally 'frozen' industry-based coordinated market economies of South Korea and Japan (Soskice and Hall 2001, Amable 2003) coped with this challenge. By using a most-similar-systems research design (Ragin 2014), we highlight how political features such as the constitutional and partisan distribution of veto power are more useful in interpreting recent labour market reforms in South Korea and Japan, than structural elements such as globalization and industrialization. Our comparison is going to be focused on recent labour market reforms from the conservative Abe government in Japan and the centre-left administration of Moon in South Korea. We argue that they are both showing signs of a path shift in their recent labour market reforms (2016 in Japan, 2017 in South Korea). This might be the result of a gradual change that took place since from the neoliberal reforms of the 1990s, in the face of a worsening dualization of their respective labour markets. However, concerns exist over difficult implementation of such policies, as it often happens for gradual institutional change (Streeck and Thelen 2005). In Japan, although a stable majority in the Diet has been secured for a long time, de-regulatory and

re-regulatory reforms are only gradually taking place, the latter being ostracized from organized labour and the white-collar class from the Komeito and the politically independent parties. In Korea, notwithstanding a strong presidential system, highly fragmented labour unions, several strands of opposition power in the general assembly, and the conservative stance of most of these political actors, are creating strains in reforming the labour market.

Cultural Leadership of Local Surfers in South Korea: Sustainability for Business or Community?

Surfing has witnessed remarkable growth during the recent two decades in South Korea. This paper explores the South Korea's recent surfing boom to analyze ways in which the Western countercultural leisure pursuit has been actively embraced and localized in one of the country's three major surfing scenes – YangYang County, Gangwon Province. First, the process and features of the regional surfing community development are investigated. Second, particular focus is given to the process of cultural leadership formation and relevant controversies, associated with the localized surfing development in the region. An ethnographic field work has been conducted for data collection. It is noted that the regional surfing community has been organized around South Korea's unique domestic surfing tourism for non-local recreational and novice surfers who tend to maintain their surf club membership identity. Established local surfers are predominantly local surf shop owners – also surf club managers who have successfully mobilized hegemonic cultural leadership for the regional surfing community development. There have been increasing tensions and conflicts between the established local surfers and those newcomers seeking for surfing business opportunities. The primary concern of the local surfers is the sustainability of the regional surfing community where they have maintained cultural leadership for establishing 'desirable' local surfing culture. It appears that local surfers' cultural leadership is justified by the formation of a particular version of localism and the establishment of community network. The localized development processes of localism and community network will be further analyzed and discussed.

Do Individuals Prepare for Major Disasters in Rio Grande Valley, Texas?

The Rio Grand Valley (RGV) is located at the southern tip of Texas, along the Rio Grande River. The valley which hosts more than 1 million population is in fact prone to major disasters such as hurricanes and flooding. Throughout history, it was badly impacted by various hurricanes. To mitigate the threat of such disasters, one of the best practices is personal disaster preparedness. This study collects data utilizing a survey questionnaire from individuals living in the valley on their preparedness for disasters. First, the study measures perceived and objective disaster preparedness, and investigates any difference between the two kinds of preparedness. Second, the study also identifies factors that influence individual disaster preparedness. Third, in an attempt to predict the likelihood of individual disaster preparedness, the study constructs and validates a predictive model with the collected data. Finally, the study's findings reveal that there is a need to increase efforts in educating disaster preparedness and disaster planning.

KYRIAKIDES, CHRISTOPHER* (*York University*)

The Refugee: Contested Resettlement and the Borders of Mass Destruction

This presentation is drawn from an on-going 5-year study of the reception of Syrian refugees in 5 countries – Canada, the US, Jordan, Greece and Italy. The presentation will draw specifically on preliminary results from the Canadian context. Kyriakides' focus is on the Canadian government's Private Sponsorship of Refugees (PSR) program which in 2015 enacted specific entry requirements in response to 'the Syrian refugee crisis'. In-depth interviews with a purposive sample of 105 participants drawn from private sponsor groups, public agencies and sponsored Syrian refugees in their first year of resettlement in Ontario, Canada, reveal that 'successful resettlement' is contested. Persons-of-self-rescue actively transition to a we-for-self-rescue against the disconfirming 'forces' of displacement. Active-existence - deliberative practices of relational-autonomy - destabilizes Western reception protocols premised on voluntary/involuntary binaries with consequential effects on resettlement. Kyriakides' proposes the concept of 'status eligibilities', which includes the related conceptual components of 'eligibility to exist' and 'authority to act'. Post-refuge 'status eligibilities' inconsistent with active-existence can lead to a 'refusal to resettle'.

RC05-113.1KYRIAKIDES, CHRISTOPHER* (*York University*)*Words Don't Come Easy: Al Jazeera's Migrant-Refugee Distinction and the European Culture of (Mis)Trust*

Al Jazeera's August 2015 editorial decision to substitute 'refugee' for 'economic migrant' in its coverage of 'the Mediterranean Migration Crisis' provides an opportunity to re-frame the relationship between the politics of race, immigration and media representations of refugees. Situating the broadcaster's publicly announced rationale for the decision within a critique of the migrant-refugee dichotomy enforced by European public policy, this paper, first, demonstrates that the policy couplet mobilizes oppositional yet interdependent identities. The discursive distancing of 'migrant' from 'refugee' in news content does not dislodge their mutually reinforcing power to define the parameters of 'inclusion'. Second, the article examines how the policy onus placed on refugees to justify their claim as 'victims' reproduces racialized codes of belonging that perpetuate the denial of autonomy. Persons seeking refuge in Europe must sustain an identity of 'non-threatening victim' if they are to gain recognition in a securitized culture of (mis)trust. Al Jazeera's intervention strengthens the media representation of refugees as human beings without choice; yet, the broadcaster's decision to 'give voice' by 'challenging racism' does not break the European political consensus on immigration and asylum that positions 'non-Western' peoples as victim/pariah, to be 'saved' and 'suspected'. The media-policy-migration nexus ensures that refugee exclusion is always possible.

CHUBATENKO, OLEKSANDR* (2018)

A Global-Local Approach in Researches of Future Society Based on Modern Information Technology

Modern experience of international social researches based on Information Technology (IT) opens the opportunities for the development of global-local methodology for conducting of such researches in the field of studying of future society.

The global-local approach in social researches involves the use of common methodology that includes a unified system of social indicators, as well as a unified system of technologies for collecting, processing and analyzing information. Examples of such researches are the United Nations Global Internet Survey "My World" (on-line) and the UN Happiness Report, which ranks countries by their happiness levels since 2012 and in which statistical and sociological indicators are integrated.

The development and implementation of global-local sociological research programs is possible on the basis of modern IT, such as LimeSurvey application and SPSS Statistics program, which allow sociologists to conduct surveys anywhere in the world where there is access to the Internet, and process any data sets.

Global-local studies of future society based on the modern IT will significantly expand and qualitatively improve the empirical basis of futurology. They will create new analytical opportunities for forecasting, modelling and designing the future global society based on: method of extrapolation of statistically and sociologically grounded tendencies of its development; expert evaluation method; information and knowledge about the dominant values and ideal aspirations of the majority of people on the planet.

Realization of scientific projects of global-local studies of the future society presupposes a global level of integration of scientists from all over the world and from international organizations, such as the International Sociological Association, the World Futures Studies Federation, the World Values Survey Association, the International Social Survey Program, UN, UNESCO, the Club of Rome and other.

DUTCHAK, MIROSLAV* (2018)

Global Research of Physical and Sports Activity: Problems of Methodology and Prospects of Development

Sociological measurement of the level of physical and sports activity of the population has developed primarily in the developed countries of the world, such as the US, Great Britain, France etc.

In the late 1990s and early 2000s, first international studies of physical and sports activity in the territory of the European Union by the COMPASS project and Eurobarometer were conducted. In 2007, the ISSP conducted an international study "Leisure time and sports" in 34 countries in different continents.

A significant contribution to the development of the methodology for the study of physical activity was made by WHO experts who developed the International Physical Activity Questionnaire and the Global Physical Activity Questionnaire (2002).

The scientific potential that has been achieved as well as the development of modern information technology have created the prerequisites for transition to global studies of sports and physical activity. Such global studies presuppose integration of sociologists within the framework of a special global scientific project supported by ISA, ISSA, IOC, UN, UNESCO, WHO etc. Preparation and implementation of such a project includes: development of a unified methodology for global measurements of the level, forms, factors of sports and physical activity of the population of the countries of the world; the use of advanced information and computer technologies in the collection, processing and access to the results of the study.

The experience of global sociological researches and Internet surveys, that have been carried out during the last decades by Gallup Organization, the UN, confirms the prospects of studying sports and physical activity on a planetary scale. This reveals new opportunities in the field of cross-national and cross-temporal analysis of the level, trends and problems of sports development in all countries of the world.

Social Order and Organizational Dynamics in Alternative Currency Movement Network

This paper follows a novel approach to the sociological study of organizational dynamics and social movements building on the theoretical notion that social order in organized settings is both emergent and decided. Our paper empirically examines a local social movement initiative within the so-called 'alternative currency movement'. We ask: *Which processes and practices can be found in the organizational dynamics of this social movement initiative, and: To what extent and how can they be explained as a blend of emergent and decided sources of social order?*

In their idealizations, formal organizations and non-organizations are extreme cases of, respectively, decided and emergent social orders. We propose that the realization of purpose and / or the survival of various organized settings is in reality associated with maintaining a balanced blend of decided and emergent elements of social order that evolve over time. We shed light on the broader puzzle of how social order in organized settings evolves, as organizational dynamics change through the interplay of networks, institutions and decisions, the different forms that elements of organizing obtain when participants rely on different blends of emergent and decided sources of social order.

Drawing on relational sociology, we approach organizing processes as patterns of relationships that allow interlinking the individual and collective action that constitute social movement spaces. Concentrating on how the participants in the social movement initiative negotiate a blend of emergent and decided sources of social order, we use a mixed-method design to describe and explain dynamic and inherently relational organizing activities that unfold in the community's day-to-day interactions. In-depth analyses of these processes will enable us to explain how decided and emergent social order is maintained and balanced in practice by the initiative's participants. Our study culminates in a dynamic process model informing future research on partial organizations.

Ambivalences of Autonomy and Control Under Digital Information Communication Technology Led Managerial Regimes.

The methodical collection, storage, analysis and display of information of workers' effort via sophisticated Digital Information Communication Technology (DICT) has gained increasing relevance. Yet, literature on digital performance management is characterized by a dichotomy: Much of the orthodox HR and management literature highlights (Armstrong, 2009) that employees gain autonomy thanks to DICT's ability to focus on individual strengths and weaknesses, identifying training and development needs. Meanwhile, critical sociological scholarship unravels that digital performance monitoring strengthens primarily managerial control linked with punitive practices (Laaser, 2016; McCabe, 2015; Taylor, 2013). Therein, research that provides a nuanced picture experiences of control as well as autonomy under DICT remains scant (Findlay and Thompson, 2017).

This presentation is informed by case study research from the German energy industry and the British banking industry. Utilizing Labour Process Theory, it explores how occupational communities (e.g. technical workers and service workers) in the Energy and Banking industry experience and react to DICT along the dynamics of control and autonomy. Thanks to the de- and re-regulation of the respective markets, both sectors witnessed significant transformations of the labour process.

The banking industry in the UK has been understood as a prime example of introducing performance management systems (PMS) with the help of DICT, aiming to increase profitability and product sales numbers (Laaser, 2016; Gall, 2017). Meanwhile, digital workforce management has been implemented in the energy industry to monitor the work of technicians that radically changed in the last decade due to a government led re-regulation of the market. The experience of both groups of employees converge towards a draconic digital regime that reduces radically autonomy and enhances managerial control. Yet, the presentation also discusses how both group of workers develop informal practices to sustain and create pockets of autonomy and regain some levels of control over their work.

Fighting the Government: A Cycle of Protests in Pará (Brazil)

The aim of this presentation is to analyse and describe ethnographically the cycle of protests performed in the municipality of Novo Progresso, Southwest of Pará, Brazil.

The notion of cycle allude to the moments of the events but also to the in-between, when the mobilization which mediates the protests takes place. During this cyclic process, the conflicting state branches and agencies, as well as national and international NGOs, research institutes and communication means (press, radio and social media) have had a key role producing the recognition (or not) of the sometimes contradictory demands of heterogeneous social agents: farmers (large and small), land reform settlers, gold prospectors, lumber companies, merchants and indigenous tribes. These various social and political categories have formed changing alliances called *movements* among themselves to *fight the government* – i.e. to contest different environmental and land management public policies implemented in the region – through collective actions, but also legal and judicial disputes.

We argue that this notion of cycle of protests brings to light the variations of the relative value of the demands on space and time, as well as the conditions and creative effects of these events repeated ritually almost every year since 2003, when the first blockade of the BR-163 highway in Novo Progresso was organized by farmers and lumber companies against the demarcation of the Indigenous Land Baú of the Kayapó people. Since then, the expertise acquired by various social agents in the making of *movements* to *fight* is enabling the reduction and flexibilization of the National Forest of Jamanxim, a federal conservation unit, and of the rural settlement Sustainable Development Project Terra Nossa.

National Origins, Social Context and Length of Time on the Physical and Mental Health of Caribbeans in and Outside Canada

Objectives: Research shows that the health of immigrant groups deteriorate the longer they are in host countries. This study examined the health of Caribbean descendants within and outside of Canada. The association between length of time and poor physical and mental health was also measured.

Method: National data collected in Canada (2000/2001, 2003, 2005), Jamaica (2005) and Guyana (2005) were used for the study. Physician-diagnosed and self-rated health was used to assess physical and mental health.

Results: Rates of chronic conditions were generally higher among Caribbean descendants in Canada compared to those living in the Caribbean region. Rates of self-rated fair or poor general health, however, were higher among participants in the Caribbean region. Higher rates of any mood disorders were also found among Caribbean region participants. Multivariate results showed that new Caribbean immigrants (less than 10 years since immigration) were less prone to poor physical health than more established immigrants. Those who immigrated more than 20 years ago showed consistently better health conditions than those with 11-19 years of immigration. However, this healthy immigration effect did not appear for certain chronic conditions for specific immigrant groups. Moreover, mood disorder was highest among new immigrants.

Conclusions: This study suggests that where you immigrate to and emigrate from matters to health and this has implications for policies in support of marginalized groups that relocate to host countries. The study also provides suggestions for future studies particularly with respect to the mental health of Caribbeans within and outside the region.

Social, Economic and Racial/Ethnic Influences on the Health of Canadians

Objective: Immigrants and racial ethnic minorities in Canada experience challenges and barriers that can affect their physical well-being. Focusing on Caribbean migrants, this study examined the influence of social, economic and migratory influences on the health of racial and ethnic groups in Canada.

Methods: Three waves (2001, 2003, 2005) of the Canadian Community Health Survey (CCHS) data consisting of over three hundred and thirty (n=334, 000) adult participants in Canada were used for this study. Self-rated and physician diag-

nosed (cardiovascular disease) criteria were used to address the physical health of participants using hierarchical logistic regression analytic procedures.

Findings: Similarities and notable differences in health between racial and ethnic groups were found, with generally higher rates among participants of African descent. Caribbean blacks and Canadian whites showed significant differences in most health indicators. The adjusted multivariate models showed that socio-demographic and migrator factors all contributed to poor health. When all things are considered, greater odds for cardiovascular or metabolic conditions were noted for Black Caribbean Canadians relative to whites. With the self-rated health indicator, the odds reduced among Caribbean Blacks, but significantly increased among other minority Canadians.

Conclusions: The study provide some understanding of the health differences between immigrant and racial groups in Canada, but also recognizes the need for more investigation surrounding other influences of the health between racial and ethnic groups; particularly Black immigrants who are prone to adverse outcomes. Areas for future studies and consideration were also discussed.

Are There Conversational Strategies in Groups Devoted to Mafia and Corruption?

Mafia and corruption are increasingly broad problems, not only for Europe or Italy. Studying the language of groups devoted to mafia and corruption is very interesting, especially if focused on discursive strategies of the leaders and their social practices. Unfortunately, scientific production about language and organised crime is timeworn, particularly based on jargon, in spite of an increasing number of researches in social sciences about corruption and organised crime. According to me, language sciences have to achieve a key-role in organised crime researches, because the internal and external communication of criminal groups is an unexplored world, and it could portray an in-depth organised crime outline. My research has as starting point a polyphony of corruption and organised crime's definitions (Vannucci 2012, Sciarrone 2012-2016, Santino 1995).

Language used in criminal groups is not a jargon, but a standard language adapted by criminals to obtain their communicative goals. Today it is possible to study real conversations thanks to information sources more extended compared to the past. The corpus construction is based on electronic surveillance and telephone tapping, arrest reports, interrogatories, trials, etc.... The case-study of my first year of PhD, that concerns *Mafia Capitale* trial, seems to corroborate our hypothesis. Discourse Analysis applied to this type of corpus can reveal connections between language and identity construction for example, or the contribute of conversational strategies to the myth construction. Legitimation strategies and implicit meanings are other interesting research perspectives.

LAFONTAINE, SIMON* (Université libre de Bruxelles)

An Ordinary Journey? Getting on the Road, a Place Both Imagined and Realistic

The present communication addresses the road as a place of contrasts and contingencies in order to discuss the ambivalent logic of experience and action in everyday lifeworlds. Yet such an account depends on a renewed awareness to randomness, creativity, and historicity just as much as to the significance of cultural structures and available meanings in this context.

Comprehensive interviews conducted in Brussels with car drivers about their everyday journeys are mobilized to emphasize the "intermediate" time-space of the road. In fact, the system of automobility impacts travellers' more or less explicit itineraries, motives, projects, and plans for life in such a way that it may prompt differences in meaning and flexible coordination of action and interpretation in occasions, accidental episodes and encounters on the road. Remoteness and relatively vacant landscapes combined with the incessant flow of diversified social biographies constitute an exemplary case to explore a specific orientation toward the upcoming experience, namely the unexpectedness of events.

In order to flesh out this orientation, literary realities drawn from contemporary American road novels are brought into discussion. Fiction acts here as an analyzer of implicit strata of meaning which are more or less unnoticed and taken for granted in everyday life. Wandering is a form of experience of space freed from the temporality of the project, with its typified goals and expectations. It is often depicted as a restless impulse to move forward, an openness to the future and its possibilities. Proposing the hypothesis of a continuity between the quotidian and the exceptional, the present communication works to understand how the structures of the motorized time-space, embodied through taken for granted typifications and routines, continuously shape the upcoming experience and pave the way to an active readiness to cope with the surprising features of events.

RC16-308.3

LAFONTAINE, SIMON* (Université libre de Bruxelles)

The Social Type of the Adventurer and Its Relation to the Unexpectedness of Events

Reconstructing the ambivalent logic of ordinary experience and action in the social world is a growing concern in contemporary sociological debates about the praxeological definition of sociology. Such an account depends on a renewed awareness to randomness, creativity, and historicity without entirely sacrificing the problem of the reproduction of social structures through human action.

Bearing that in mind, the present communication revisits the social type of the adventurer as depicted by Simmel. The adventurer epitomizes a form of experience in which the experiencing subject is directed toward the unexpectedness of events. This implies a restless impulse that counteracts the course of everyday activities and reaches out by intimate necessity a "transcendent" meaning in the shifts, accidental episodes, encounters that shape one's life.

Life transcends itself and through this movement of incessant formation it creates "something more", "extra-social imponderables", that "fragment" the continuity of social and individual forms. The experience of transcendence is indeed a fragmentary one. And yet, being fragmented is no mere state of incompleteness but has a more fundamental significance: being only fragments of the social world and of our own unique possibilities.

In this respect, the adventurer is intimately acquainted with individuality and difference in meaning by embracing the usually unnoticed and incidental rush of life against historical patterns, cultural and personal forms. Since the adventurer *qua* social type remains a part of the world and of the self, the form of experience assumed here does not lead to an openness to the absolute indeterminacy of life. As a projection and expectation of upcoming experiences, it continuously shapes the future and therefore paves the way for an active readiness and flexibility that both generate differences in everyday journeys and enable the coordination of action through a hold of their potentially surprising character.

LAFUENTE HERNÁNDEZ, SARA* (ETUI)

Building Transnational Collective Identity in Internationalized Boards: The Experience of Worker Directors in German Societas Europaea

Board-level employee representation (BLER) exists in at least 14 countries of the European Economic Area, although with different institutional features, social practice and functions. The European Company (*Societas Europaea*, or SE) Statute and its Directive on employee involvement introduced the possibility to internationalise BLER. Other routes also enable workers' directors from different countries to gather in a single board, but despite its still limited social impact (67 SEs have BLER), the implementation of the SE Directive undoubtedly promoted this trend.

The phenomenon rises several socio-political questions, but scholars in European industrial relations have paid more attention to the development of European Works Councils as transnational industrial relation's institution with longer and wider practice. Indeed, studies from different disciplines and methodologies contributed to broaden our knowledge about actors' practices, roles and the processes towards building a transnational identity in this arena. Conversely, the existing literature on BLER mainly enquired into the causal effects of workers' involvement in performance, corporate governance, and macro-social indicators, revealing a strong econometric bias.

BLER as a European IR institution remains largely unexplored from an actor-centred focus interested in understanding its social function and practice, with its underlying conflicts, uses and understandings. This paper addresses the gap by questioning how worker directors do experience their mandate in internationalized boards of German SEs. The aim is to uncover discourses and processes of interaction influencing the emergence of a specific transnational collective actor and identity within internationalized BLER.

As methodology, we draw on a ten case-study selection of internationalised German SEs boards (with at least three countries mandated on the workers' side), and conduct an interpretive analysis of thirty semi-structured interviews to German representatives and worker directors mandated in foreign subsidiaries. Additional documental sources are also analysed as contextual support, such as board annual reports and SE agreements.

LAGESE, ELISABETH* (Cridis-Université Catholique de Louvain)

Subjectivity and Subalternity in the Food Movement: Two Ways to Rethink Social Movements.

Starting from the food movement questioned on the basis of his relation to the subaltern subjects, this communication seeks to think the concept of social movement and what it means to be an actor. By their prefigurative actions, the will

to change the world in the everyday life rather than in mass mobilizations, these actors of "the way of subjectivity" transform the concept of social movement and social change. They believe in a personal change to change the world and thereby put the relation to themselves at the heart of their engagement. But it appears that the actors of the food movement are generally characterized by high social and cultural capital. Social conflict and antagonisms are not very present in their discourses, sometimes giving way to moralism to think about social change on a larger scale. How can we articulate this « activist culture » with the condition of the subaltern subjects, which are invisibilized, including as actors of social change? Several authors have tried to show how to refuse the idea of subalterns as passive actors of change, by turning away from the concept of social movement. They have shown that these subaltern subjects try to transform their daily living conditions by acts of resistance, subversive practices, participating in the transformation of norms and improving their life. The purpose of this communication is therefore to make a dialogue between these two ways of being an actor in the everyday life, away from institutions, in order to understand where the tensions are and how they can interact, starting from the terrain of local food.

The Rise of Gastronomic Capital in São Paulo, Brazil

This research intends to discuss the connection between the expansion of restaurants in São Paulo in the last two decades, as the data point out, and the internationalization of gastronomy as a set of aesthetic protocols that inform the act of eating, contributing to its entry into the category of urban cultural practices. Based on an ethnographic approach, our intent is to question how consumers, cuisine chefs and entrepreneurs articulate these new references, consolidating globally-informed strategies of economic and cultural capitalization. Notably, these strategies are driven by bodily emphasis, since *taste* (in its double sense) is precisely what's being organized by these different agents. Considering the emerging force of the global lifestyles, our intention is to address the way in which a new landscape of power and consumption is formed by joining together the gastronomic knowledge and the habit of eating out. In this context, there is also an increase in the scope of social normativity around food tastes, since new instances – restaurants, chefs, critics, gastronomy schools, TV shows, magazines, newspapers, digital apps – come to mediate more closely the choices of consumption, acting both in supply and demand. Therefore, eating out is increasingly part of "cultural capital" and contemporary relationship with food requires, more and more, a prior learning process and a sort of bodily knowledge acquisition that needs to be ethnographically investigated as such.

Separation Experiences of Lgbtiq People

In this presentation, I introduce my postdoctoral research project, which explores relationship break-ups of Finnish sexual and gender minorities. According to the demographic research divorce rate is higher among same-sex couples than among other-sex couples. Female couples are likelier to break up than male couples are. Yet, there is a paucity of research on the causes and separation experiences of LGBTIQ persons.

There are some distinguishing characteristics to LGBTIQ break-ups. Non-heterosexual couples' path to legal recognition have been long and complex. In the long and heated media debate on registered partnership and later on gender neutral marriage law in Finland, same-sex couples' right to legal recognition was defended by emphasizing their equal worth and similarity to heterosexual relationships within the discourse of romantic love. The long battle for equal rights has placed LGBTIQ people's relationships under a lot of pressure to succeed and to be as ordinary and happy as possible. It is thus difficult to discuss publicly that problems occur also in these relationships. Consequently, the partners in LGBTIQ relationships might keep silent of their problems.

The data of the research project consist of both qualitative survey and interview data of LGBTIQ persons who have experienced recent relationship-break up. The research questions are the following: What kind of matters have strained LGBTIQ people's relationships and led to the break-up? How do break-ups look like when approached as processes? How are these processes experienced? What kind of support the partners have got from relatives, friends and authorities in the break-up process? How do the continuously changing social positions of LGBTIQ persons and their relationships, entangle with the affective processes of break-ups? The presentation will discuss further the research questions, the data and outline some preliminary findings of the project.

Examining the Performances of Feminist Art on the Global Art Stages: Comparing Three Female Curator's Practices in 2005, 2013 and 2017 Venice Art Biennales

Art biennales as artistic forms of global stages and events (Roche, 2000, 2017; Urry, 2003) provide experimental platforms (Latour, 2007), but also perform the dominant global cultural imagination (Delanty, 2009, Winter, 2016) and governance with experience economy (Bennett, 1995, 2007). Feminist art as a marginal genre recently has emerged onto the main global art scenes- from the inclusion of female artists, curators and new feminist and queer art genre, and relates to the alternative global cultural and new sex/gender imagination reencountering differences- which echoes the feminist debates of historical developments of feminist art and curating practices (Pollock, 1990, 2007, 2010; Deepwell, 2006, Bai, 2007).

Drawing upon theoretical debates on global events and feminist art, this paper explores the performance of feminist art on the global art stages taking Venice art biennales as examples. It will especially examine three female curators' practices: the first Venice Biennale curated by female curators, Maria de Corral and Rosa Martinez, in 2005; in 2013, famous feminist artist Cindy Sherman as guest curator for the middle gallery in Venetian Arsenal; in 2017, a female curator Christine Macel was invited as director after a decade. This paper will especially analyze four dimensions in this historical comparative studies: inclusions of multiple different female and LGBTQ artists, multiple performances of new art canons evoked by feminist art in the main Arsenal exhibition hall and Italian pavilion, the performance of feminist and LGBTQ art in the national pavilions and parallel exhibitions area that create different global cultural imaginations, as well as their power-laden relationship.

This paper explores the issues based on spatial and cultural analysis of the representation of biennales, discourses analysis of art critics on major global art media, and interviews with some artists and curators engaging feminist art, as well as my ethnographical fieldworks at these biennales.

Teaching and Doing Creative Futures Studies As a New Sociological Craft: Exploring the Creative Dialogues of 'Art and Social Engaging Research', 'Utopia As Method' and Future Scenario Methods

Recent debates in sociological research methodology has paid great attention to the limit of current empirical social research methods that prevent people from creatively imagine the future. In the era of global complexity (Urry, 2003), non-linear social forces and unpredictable social change, from disaster, new technology, great events, have all disturbed the current social order and academic disciplinary boundaries that can neither be understood nor predicted by the traditional sociological research methodologies and methods.

Currently, new social research crafts (Bourdieu, 1991) have been suggested by some leading scholars. Art-related and social engaging research methods (Lury, 2014; Back, 2016) argue for not only doing social research within social science, but also to appropriate multiple art forms as tools for the social engagement and creativity formation. Future studies have long been developing special methodologies, including historical analysis, future triangles, back-casting, scenarios and utopia research methods (Levitas, 2013) that encourage inter-disciplinary forward-thinking research, can be combined as a new research craft.

This paper aims to develop the combined research methods in doing and teaching the creative futures studies. It begins with the discussion on future studies in sociology (Schulz, 2014; Urry, 2016); then it explores the multiple research methods, including utopia as methods, scenario analysis, and art-related research, based on current methodology debates. Finally, it reflexively examines how to do and teach creative social research based on my former teaching experiences in futures studies, creative research and critical methodology courses in Taiwan.

The "Perfect Abortion" Paradox: The Sales and Experiences of Private Abortion Services in China

What kinds of influence do private abortion services and the development of healthcare industry exert on women's health? How are women's experiences of private abortion shaped by and contextualized in specific socio-cultural and political structures? This study aims at answering these questions by examining the advertising strategies that private hospitals use in their selling of abortion services and the experiences of women undergoing premarital abortion in post-socialist China. The author gathered qualitative data by surveying the websites of 317 private hospitals in China, interviewing 62 young women who had experienced

abortions, and conducting ethnographic observation in private hospitals in a city in Northern China. Six sales strategies were identified based on the data: the celebration of high-end technology, the construction of “perfect abortion”, the mobilization of “woman-centered” principle, the emphasis on professionalism, the promotion of humanized services, and the exhibition of international affiliations. The findings show how private hospitals in China strategically co-opted feminist “woman-centered” principles and incorporated modern western medical discourses to attract customers and generate profits. They also reveal the gap between the alleged services and the actual treatments, as well as its potential health risks in, particularly, young women. The paper demonstrates the enabling and constraining effects of private abortion services on women's agency. On the one hand, private hospitals demonstrated an accepting attitude towards women's exercising of their autonomy – these hospitals approved of female sexuality and stressed their care for women's health. On the other hand, they imposed limits on women's agency by reasserting women's duty to reproduce, and enhancing the supremacy and domination of medicalization on women's bodies. These paradoxical effects mirror the changes and continuations of both conventional gender ideologies and prevailing perceptions of modern medical technologies, as well as the interactions of these ideologies and perceptions with the market in post-socialist China.

Searching for the Microsociology of Social Movements: Everyday Emotions, Interaction and Conflicts in Radical Action

The extant research on social movements have been traditionally relying on structural explanations and focused on either resource mobilization, political opportunity structures, framing processes, or social movement organizations. However, these approaches have for the most part ignored actors' choices and desires and situational dynamics, and hence treated the participants of these movements as taken-for-granted. Through an exceptional in-depth ethnography of radical protest movements, this research aims to analyze and reveal the underlying microsociological dynamics constituting the here-and-now of the formation, survival, and decay of these radical movements: Experiences, interactions, and emotions of those initiating and participating resistance and movements outside conventional forms of organization resulting in choices on morality and tactics, enthusiasm and devotion, commitment and solidarity, as well as conflicts, apathy, and emotional burnouts. This research joins in, and contributes to the emerging discussion on interaction and emotions in social movements. Hence, by focusing on the experience and situated interaction, in contrast to structural approaches relying on third-person explanations, this study contributes in providing phenomenologically valid first-person explanations of the dynamics of radical social movements. The analysis is based on in-depth ethnographic study and a rare empirical data on the in-crowd of a radical movement. Although social movements are widely studied since 1960s, as well as the rise of environmental movements, the microsociology, rooted in embodied experience and interaction, of such movements and protests has been by large still neglected. Therefore, this research contributes to the understanding of the meaning of internally oppressive structures such as forgotten underlying everyday meaning making and work in a protest.

'Contact Zone' Developers Facing Inhibitors. Volunteers' Experiences of Refugee Movements and Racism in Finland

In this article, I analyze the experiences of 15 Finnish volunteers who have done volunteer work with refugees in Finland between the fall 2015 and spring 2017. When analyzing their experiences as actors in refugee movements, it was recognizable how in all three phases (arrival, waiting period and after decision) these volunteers had crucial roles in building, carrying and promoting 'contact zones'. Mary Louise Pratt's (1992) defines contact zones as 'social spaces where disparate cultures meet, clash, and grapple with each other, often in highly asymmetrical relations of domination and subordination – like colonialism, slavery, or their aftermaths as they are lived out across the globe today'. In this paper I analyse what kind of transculturation takes place in these 'contact zones', and what kind of alliances are established inside these movements. What is more, I also analyse a case study of a specific movement that has been successful to influence policy decisions. Second part of the paper explores the obstacles of volunteers' actions, namely racism, negative public atmosphere and inhibiting politics and policy reforms. Through editorial work of a Youth Knowledge Book “Young Refugees and Youth Work” by the Youth Partnership between Council of Europe and European Commission, my paper also reflects the current situation on more general level across Europe. This way the paper reaches to understand, what is more country-specific and what is more common in current Europe.

Towards the Emergence of a European Civil Disobedience Movement for Climate Justice? the Case of Ende Gelände

Even though the concept of climate justice was coined at the end of the 1990s, it is not until the perceived failure of COP15 that it became central in the global climate movement. In Europe, the climate justice current emerged from a merger between the global justice and anticapitalist movements and the “radical” stream of the climate movement. Although the burning of fossil fuels have always been a key issue, it became highlighted with the rise of the “keep it in the ground” initiatives, incarnated in complementary forms of resistance, including divestment campaigns, protests or fossil fuel infrastructure blockades (e.g. mining facilities, train tracks or port terminals, gas pipelines etc.).

These infrastructure blockades have multiplied, reflecting a progressive climate disobedience escalation in various European countries, including the UK, the Czech Republic or Germany. However, these blockades often happen within national lines, echoing difficulties to construct narratives and networks that would span borders. The recent success of Ende Gelände (“here and no further”), a cross-border massive civil disobedience action against coal mining in Germany, raises questions on the ways activists can achieve transnational civil disobedient mobilizations. In other words, how did Ende Gelände manage to attract activists from all over Europe and what can we learn from it?

Drawing on literature review, interviews and participant observation, this presentation seeks to offer findings on the internal factors (e.g. organizational structure and mobilization networks, framing and values, action repertoires) potentially fostering transnational mobilization capacities. These capacities are essential in order to achieve greater visibility and legitimacy. In particular, we argue that the movement managed a successful framing of the issues at stake, relying on a systemic approach of climate struggles. We also acknowledge a certain “mass effect”, acting as a way to convince civil disobedience first-timers to increase their level of engagement.

LAKATOS, ZOLTAN* (*Budapest University of Technology and Economics*)

Challenging Substantialist Orthodoxies in Value Research: Why Values Are Less Important Than They (Are Made to) Appear

Relational sociologists regard the culture-economy dichotomy as empirically meaningless. In contrast, mainstream value research—which includes Hofstede, Inglehart, and Welzel—rests on the scholastic fallacy that conceives of the symbolic and material aspects of agency as self-subsistent entities. Stemming from Cartesian epistemology, this school of thought consists, in effect, of inquiries into substances and their impacts on each other. Their divergences regarding the primacy of either the “material” or the “cultural” notwithstanding, these currents share in their advocacy of “noble” substances (e.g., “achievement motivation”, “Confucian dynamism”, “cool-water condition”) as catalysts of outcomes that the investigator deems desirable. Challenging this school, this empirical study looks at religiosity, authoritarianism, and materialism from a field analytical perspective, applying four considerations that are common to all relational approaches. First, regarding their ontological status, relational sociology suggests that values function primarily as “cognitive simplifications” (Martin 2003) as opposed to the tendency, informed by a misreading of Weber's Protestant Ethic thesis to consider them as imperatives that “drive” behavior. Second, to unravel the structure of values, as well as their embeddedness in the social fabric, the focus shall shift from the variables to the units of observation, preferably by using non-linear methods (e.g., multiple correspondence analysis, as in this study). Third, explanation involves a higher level of generality than what is conceivable in mainstream value research, preoccupied with maximizing explained variance. Fourth, and summing up the previous points, against the substantialist proclivity to view values as “disembodied” codes of conduct, empirical research shall flesh out their inherent materiality. As an illustration, I discuss why the three values presented in this study may be no more than cognitive simplifications of the principle that, according to Bourdieu, underlies all cultural practices—namely, the distance actors take from the open expression of material interest.

LAKATOS, ZOLTAN* (*Budapest University of Technology and Economics*)

Racialization of Muslims Among the Pundit Corps in Hungary: Vintage Anti-Semitism Recycled, Made Respectable

Racism qua essentialism—the tendency to ascribe “essences” to groups and make sense of socio-economic outcomes on that basis—is a staple of dominant ideologies. Feeding off this disposition, post-9/11 political commentary in the

West has come to accommodate more explicit streaks of cultural racism. The current refugee crisis in Europe is seeing a ratcheting up of this discourse—sometimes with a scholarly veneer, in part thanks to the pundit class's (re)discovery of Samuel Huntington's "Clash of Civilizations" thesis. This study compares two subclasses of racialized discourse in Hungary: On the one hand, the racist rhetoric accompanying late-19th century Jewish migration from the Russian Empire to Hungary, and on the other, anti-Muslim pundit commentary on the current European migrant crisis. The latter is formulated in terms that are not only reminiscent of, but in effect, recycle the building blocks of the former. Like Jews in the anti-Semitic press of pre-World War I Hungary, migrants fleeing the conflict-torn regions in the Middle East, North Africa and South Asia, as well as Muslim Europeans, are portrayed as driven by culturally ingrained penchants—for violence, sexual predation, world domination, etc.—at odds with "European civilization". Increasingly, prominent intellectuals, some of whose public persona includes a professed opposition to racism join this chorus. As a result, while anti-Semitism, which made a comeback in Hungarian public discourse following the transition to democracy in the early 1990s is still condemned across most of the ideological spectrum, the nascent anti-Muslim racism is not confined to the fringes. Complicating matters further, a variant of the latter is being branded as not only compatible with but a requirement for combating anti-Semitism. Highlighting trends in anti-Muslim punditry, the discussion includes results from a recent survey of anti-Semitic and anti-Muslim attitudes in Hungary with an emphasis on cross-fertilization, strategies of accommodation, and framing.

LAKIKA, MULPOPO* (ACMS - Wits University)

'How Can You Call Her a Woman?' the Perceptions of Female Soldiers By Their Male Counterparts in the DRC Army

The patriarchal conception of womanhood has always considered women as tender, motherly, vulnerable and in constant need of male protection. This patriarchal portrayal of women also finds expression in the labour market, where women are excluded from some sectors viewed as exclusive preserve for men. This dichotomy also manifests in the wage differences between male and female staff. While patriarchal hegemony has prevailed in African societies, much attention has not been paid to some institutions like the army which employs both men and women. More so, less focus has been given to how men perceive their female counterparts in the armed forces. This paper emanates from my PhD research exploring the lived realities of former Congolese soldiers resident in Johannesburg. It seeks to provide an insight into gender hegemony in the Army. This paper uses unstructured interviews and Bourdieu's concept of field to examine gender hegemony in the Congolese army. The findings of this study suggest that manhood or womanhood is not about genetic differences between men and women, but more about the capabilities to embody the hegemonic military masculinities. A female soldier entails some level of masculinisation, but I argue that female masculinisation of women does not change their genetic nature. Women who joined male-dominated institution put on male identity and rejected to be seen as vulnerable women. Refusing to be called women is a way of rejecting an identity relating to male domination.

Employment with Social Security in Informal Sector: CASES from Various Sources

Social security legislations for organized sector in India include, Employees' provident fund and the miscellaneous provisions act, 1952; Employees state insurance Act, 1948; Maternity benefits Act, 1971; Workmen compensation Act, 1923; Payment of gratuity Act, 1971. However, the welfare schemes for the unorganized sector is widely fragmented and scattered. In Public Enterprises too it was found most of the non-executive jobs are outsourced through contract labourers. This can be one reason for increase in informal labour. Where, the implementation of ILO convention is in query. Therefore, this study attempted to find out how informal labour puts into practice of the social security measures which can guard the ILO conventions. Study findings threw light on the Government schemes for informal sector, like, Atal Pension Yojana; Pradhan Mantri Suraksha Bima Yojana; Pradhan Mantri Jeevan Jyoti Bima Yojana; Micro Units Development Refinance Agency Bank; MGNREGA; National Skill Development Mission. In conclusion the study also joined other studies which focus on the need for a holistic approach to deal with the issue of informal sector employment, where informal sector includes, large number of poorly educated labour force, following traditional occupations, with poor financial inclusion, and, lacking motivational skills. Here, registration of micro and small enterprises can be encouraged where, it would benefit access to finance, better infrastructure, market information, government incentives, a platform for formal association, providing them legal framework, efforts to overcome uncertainty in financial returns and safety nets for them as well as their workers. To large extent this can help to overcome challenges to informal sector not only in unorganized sector

but also arrest the growth of informal employment in organized enterprises and improve the workforce bargaining power to settle for decent wages, social security and job security. The study was based on secondary data sources following the content analysis method.

Social Security, Informal Labour, Voluntary Organisations: Survival for Workforce from Marginal Communities

Social security is a primary part of the development process, which helps in establishment of constructive approach to face the challenges given by liberalization, privatization and globalization and the technological changes to the workforce in both formal and informal sectors. This study tries to answer how the link between the Governance of State which bears the responsibility for developing appropriate system to provide protection and assistance to its workforce and prevent deprivation, assure the individual of a basic minimum income for himself and his dependents and to protect the individual from any uncertainties. This study focuses on tribal population from Chota Nagpur region of India which has largely migrated to urban setup in search of work. Today, they are mostly engaged as domestic workers in families in metropolitan cities. Among them, most of them are school dropouts. Results in this study how, reason behind their dropping the school are their small land holdings, and, with increasing industries in their villages have resulted in low agricultural production for survival. These poor finances and survival conditions aggravated with questions arising for the survival of their families. This exploratory study finds out the life of twenty-five domestic workers who have left their families and roots long time back. Attempting to look at their state after years of gap that has been created among them and their families, the study looked at tribal domestic workers who have migrated to work in Mumbai and have completed more than ten years of their service. Though domestic workers have been a mean to curb joblessness among the school dropout tribal population, yet, it has been one of the most difficult form of informal labour, where today many voluntary organisations have been coming up for their liberation along with providing them some better environment to work.

Generational Shift in Meaning of Parenthood Among Chinese Parents

The project examines the historical trends of parenting and generational shifts in meaning of parenthood in the Hong Kong Chinese context. Although the importance of historical perspective in understanding a phenomenon has been well-recognized, attempt to study generational shifts in parenting is meager and is almost non-existent in Hong Kong. Contemporary parenting is characterized as fraught with problems – anxieties about children, anxieties about one's own adequacy as parents, and worries about adverse consequence of parenting on children. Rhetoric abounds such as irresponsible parenting, overprotective parenting, anxious parents, "helicopter parents", and "monster parents" are terms frequently found in mass media sounding alarms over contemporary parenthood. However there is little study attempt to trace how contemporary parenthood has become characterized as such. This study seeks to unravel generational shifts in parenthood in Hong Kong, and investigates how the interplay between history, culture and contexts shaped and re-shaped the "ecology of parenthood".

Employing a qualitative study method, the research process starts with an archival study of discourses on parenting, then with 120 in-depth interviews with 60 parents, each interview individually for twice. There were 30 mothers and 30 fathers involved. Narrative accounts of parents reveal generational shifts and gender disparity in meaning of parenthood, parental responsibility and identity as a parent. The findings provide indigenous understanding to generational shifts in ideology and practice of parenting; and look into the discursive formations of dominant discourses that shape parenting beliefs and conditions constrain parenting practices in the Hong Kong Chinese cultural context. Based on the findings, the presentation discusses implications for parenting work and proposes directions for child and parenting services.

Solutions of Early Childhood Education and Care in Families with One-Year Old Children in Finland

Family policy in Finland supports parents of young children in reconciling work and family by providing them leave possibilities with income-related benefits until the child is about 11 months old.

After parental leave, the policy model is dualistic: parents can choose either home care (care leave with a flat-rate benefit until child is 3 years old) or high-quality daycare (both public and private ECEC are subsidized).

"Freedom of choice" is the main ideology of family policy; however childcare choices and are made in the context of gendered practices as well as significant variation in local policies. About half of fathers use their parental leave quota, but care leave is mainly taken by mothers. Highly educated mothers return earlier to work while mothers with lower education level take care of their children at home longer. Some municipalities provide local supplements with various conditions to child home care, and support to private ECEC services varies.

In this paper, childcare solutions of parents with one-year-old children, and possible inequalities between children are analysed. The analysis is based on a survey carried out in 2016, exploring the utilisation of ECEC services and benefits and the justifications for related choices. The analysis shows that instead of a dualistic model (homecare vs daycare), childcare of one-year-old children is often a combination of several different forms of care including the utilisation of both statutory and local possibilities as well as part-time solutions and informal help.

While national policies have been stable, local measures are more volatile and can be changed according to state of public economy and local labour market. Thus, inequalities are constantly re-shaped not only between men and women, but also between children living in different parts of the country.

Mediating Social Spaces of Dissent: A Methodological Exploration

In this paper we argue that in order to grasp the ontic and epistemic roots of current social movements, and discuss possible actions towards and practices of dissent in Western democracies, it is necessary to use new approaches and methodologies that cut across different disciplines, such as sociology, critical event studies, communication and law. Moreover, these studies should go beyond the traditional methods of these disciplines, such as public opinion surveys, descriptive analysis of empirical data on violence and law enforcement, or traditional anthropological studies and discourse analysis. We begin by addressing the apparently contradictory challenges to present democracies, such as the rise of counter-democratic social movements, followed by a literature review that presents new approaches to concepts around political dissent, such as protests as events, public spaces and the city as both symbolic and concrete venues, violence as performance, and the social mediation role of media and communication channels. After that, we challenge the dichotomies of traditional methods used to analyze these concepts, such as 'insider' and 'outsider', 'objectivity' and 'subjectivity' or "researcher" and "object". We conclude proposing a combination of techniques that connects values from personal narratives and group storytelling with militant research approaches that question the divisions between academic knowledge and social practices, and establish horizontal relations among researchers and participants, highlighting knowledge production as a tool for social transformation into more egalitarian societies. This method challenges the apparent predefined social places of researchers, research participants, and political actors, taking them out of their "comfort zones", and gathering them around spaces that foment dialogues that are not common in everyday research and dissent practices. These dialogues may, in the end, enable the participants and researchers to learn from each other, and transform themselves and their agencies in the research process.

Measuring Family and School Effects on Reading for Pleasure: Getting the Most out of Dissonant Data

Reading for pleasure is an important component of all-round education and contributes to a young person's individuality and future academic as well as social success. As it happens with most educational variables, schools and families have been identified as important factors contributing to the love of reading for young persons. For the purposes of this study, we used a short questionnaire to investigate the attitudes and the behavior of pupils, parents and teachers regarding reading for pleasure. The research was conducted in Cyprus and covered both primary and secondary education. The analysis of the data yielded results which were consistent with past literature but also yielded some new findings. Unexpectedly, our analysis revealed similarities but also non-negligible discrepancies between students', parents' and teachers' responses to the same questions (even to factual questions). Although having survey data from multiple informants increased significantly our capacity to answer our research questions, we found that making sense out of dissonant quantitative data is not straightforward. We discuss the methodological challenges of interpreting dissonant data in quantitative educational research and suggest ways to turn this "problem" to an advantage.

Negotiating Care Culture and Ethnic Difference: Employment of Migrant Care Workers in East Asia

The need for outsourcing care has expanded globally due to population aging in postindustrial societies. East Asian countries, facing a similar problem of care deficit, have recruited migrant care workers from Southeast Asia while negotiating the cultural meaning and institutional arrangement of care: Should care be viewed as a familial duty or professional work? Is care a culturally embedded practice or a form of market service that can be easily transferred to a foreigner? Do the ethnic boundaries and cultural differences between care providers and care recipients interrupt or facilitate the performance of care work, which requires intimate encounter and emotional labor?

These propositions, often posed as exclusive dualisms, are intertwined with each other and dynamically reconstituted in the daily practice of care work. This paper compares the recruitment of migrant care workers in Taiwan, Japan and South Korea to explore how carework is culturally defined and institutionally regulated in different ways. Many employers prefer to hire migrant workers for the benefits of status hierarchy and labor subordination, but they are equally concerned about whether these ethnic others are suitable for the role of fictive kin in a modern household. Southeast Asian women are often associated with essential characteristics, such as a "natural inclination" to care, and therefore considered ideal candidates for the performance of affective labor. And yet, the receiving society also questions their qualification for professional care in a cultural context which is not their own.

Gendered and Racialized Employability Practices and Trajectories into [and out] of Precarious Employment: The Case of Caribbean and Latin American Migrants in Toronto

This paper examines how racialization, gender, networks and life stage mediate migrant workers' employability practices, as well as their trajectories into and out of precarious employment. We find that, like all job seekers, migrant workers engage in employability strategies of uncertain effectiveness to morph into the ideal worker-in-waiting and find a job. Employability strategies -- identity-management, self-training, and networking -- does not occur in isolation and is institutionally embedded. In the case of migrants, a specific subset of institutional actors -- employment counselors, settlement workers, family, friends and acquaintances in places of settlement -- play a particularly important role in shaping the kinds of employability practices undertaken by migrants, and the resulting trajectories into and out of precarious employment.

We draw on data from a mixed-method survey of 110 Caribbean and Latin American men and women who entered Canada as permanent residents with secure legal status to examine how social location shapes employability practices and employment outcomes, as measured by an index of precarious work. Our analysis identifies formal and informal, time and resource intensive employability practices developed by recent immigrants, and how these intersect with racialization, gender, social networks, and life stage. We consider the relationship between employability practices and job outcomes.

The case demonstrates the importance of conceptualizing immigrant labour market integration as contingent and institutionally embedded chutes and ladders of incorporation; and points to the nefarious relationship between employability practices that normalize job uncertainty and unpaid work, and precarious employment.

Sustainability of Cities Beyond Fossil Fuels: A Comparative Analysis

All cities will eventually have to live without fossil fuels. The transitions will occur in most regions during the late 21st century (oil, gas) and early 22nd century (coal). The impacts of these transitions will be profound. What will cities look like after the depletion of fossil fuels? There are few certainties, but one is that no contemporary major city is sustainable, with current population and levels of consumption, beyond fossil fuels. It appears that unconventional sources of oil and gas (eg. from 'fracking') can provide only a temporary boost to supply (Inman, 2014). In most city-regions, there is no possibility of replacing more than a small fraction of the energy from these fuels with renewable energy, especially for transportation of goods and food (Friedemann, 2016). Nevertheless, cities vary greatly in sustainability (Day and Hall, 2016) depending on local renewable-energy sources, hinterland food production, population size and density, extent of urban sprawl, and access to a regional economy in which transportation is water-borne or uses renewable energy. This paper identifies the features of more sustainable

versus less sustainable cities, with examples from Asia, the Americas, and Europe. Policy-implications are outlined, including initiatives (some already underway in some cities) with short-term benefits but which would also ease the inevitable and difficult longer-term transitions to the post-fossil-fuels urban futures of the late 21st century.

Do Parents Treat Children Differently? How Social Stratification and Genes Influence Parental Reactions to Twin's Birth Weight

Parenting is highly relevant for offspring's development in general and also for the transmission of social advantage. When parents make decisions about how they raise their children, they also react to their children's perceived developmental potential (PDP). However, they may follow different norms and considerations which are influenced by their location within the structure of social inequalities. Theories and empirical studies are inconclusive whether and in which direction parents of higher social strata are more prone to reinforcing or compensating parenting behaviors. This may be due to the different study designs used: singleton, sibling, or twin studies without control for genetic heterogeneities. All of these designs carry the risk of mixing up parental reactions to PDP with other factors. Our paper provides a comprehensive look at between- and within-family social stratification of parenting for 1,022 twin pairs at age 10 to 12 taken from the German TwinLife study. We apply ACE- β models, which in contrast to former studies take genetic variation into account. We analyze different parenting dimensions and indicators of parental social stratification; and use birth weight as proxy for PDP. Our results confirm the compensation as well as the reinforcement hypothesis, but dependent on the dimension of parental social stratification: Higher parental education is linked with compensating parental reactions to PDP, while higher parental occupational status leads to reinforcement. However, this applies only to stimulating activities commonly seen related to cultural capital accumulation. For other parenting dimensions we do not find significant differences in parental reactions to PDP.

Does Africa Have a NON-Colonial Existential Reference? Contesting PRE-Post/Colonial Categorization of African Higher Education, Science and Technology?

Is it possible to conceive African higher education, science and technology outside of the historical and sociological categories pre/post/colonial existence? This paper grapples with the epistemic and methodological questions about the possibility of apprehending Africa as a social reality and knowledge object transcending its existential reference to colonialism. The paper attempts to address the following questions (a) is there any evidence of higher education, science and technology, which historical and sociological existence can be described without the markers of the colonial space and temporality? (b) What knowledge and empirical categories can be used to present the realities of African higher education, science and technology in its own existential right? We argue that although significant segments of African modernity is negotiated in the encounter with colonialism, considerable features of the ancient and contemporary African society are not necessarily moulded by historical reference to colonialism. While acknowledging, in line with Derek Gregory argument (2004), the colonial present, it is simplistic to establish breaks between historical periods, and that colonial constellations of power, knowledge and geography are powerfully at work in the present, there are accounts of the current society that can be made without the historical demarcation of colonialism. Drawing on examples from higher education, science and technology, the paper presents alternative ways to account for African "post-colonial" realities.

Dealing with the Unspeakable – Some Challenges of Biographical Research in War Contexts

Doing biographical research in war contexts often confronts the researcher with embodied traumatic experiences of extreme violence and suffering that cannot be expressed in interviews narratively. Traumatic experiences damage or destroy the very ability of an individual to symbolize, i.e. to meaningfully represent his or her experiences in biographical narratives. Additionally, cultural – always gendered – limitations to articulate these experiences may be at play. Only traces of these experiences sometimes remain, giving witness of the underlying social trauma: stumbling, narrative gaps, or even pure silence. Participatory biographical research aims at creating spaces for articulating what otherwise would remain silent and unheard, at being partner in a process of re-gaining biographical agency – an ambivalent task. Referring to biographically informed interviews with adolescents in Afghanistan, the following challenges will be addressed in the presentation: How do you deal with silent accounts in the interview encounter – without either risking re-traumatization or fueling the silencing dynamics? How do you make sense of it in the analysis – without over-interpreting these accounts in terms of a "deep story" of what has not been told. And how do you represent the silence in your writing – without colonizing it?

School Representation in a Context of Poverty, Violence and Social Exclusion: What Do the Children Say about It?

Childhood, as a permanent category in society, is the most impacted group by the crises, wars, natural disasters and by all the inequalities in general. In addition, childhood as social category of the generation type is also structured by the others social categories, as ethnicity, race, gender. In order to understand the way children from a context of social exclusion in South Brazil build the relations with their school, we conducted a research focused on children's points of view and knowledge about the representations they attributed to the institution based on their social belonging. Each child attributed a different meaning to the school formed by their experiences in life. In context surrounded by violence, poverty and exclusion children's reveal that school is an important context of protection and learning for their present life, as well as perspectives for a better future from school attendance. To most of the children, school is the promise of a different future and is now, the only place where they can have a break from the problems they have in their lives. By listening their voices, it was unveiled to us the impact of social inequalities in their lives. In a country marked by huge social inequalities, listening to children's voices is a way to understand how their lives are affected by poverty, social exclusion and violence. Listening to children is also a way to affirm the competence of the children to provide an unique and accurate reading of reality. The research also revealed the agency of children to find protections mechanism between themselves.

Contesting and Reconceptualizing the Care in Early Education and Child Care Policies in Canada

As part of gaining insight into current conceptualizations of care and gender in the Canadian early childhood education and care (ECEC) context, recently released government (federal and provincial) documents addressing childcare and its workforce were analyzed. Overall, the analyses reveals that while these documents aim to restructure/revision the Canadian childcare sector, there is an explicit effort to move *beyond* care to a conceptualization of services that embraces "learning" and "development" and "education". While the term "child care" is frequently used to refer to programs and services themselves, justification for government investment/leadership in the childcare sector is almost always achieved through a futuristic, outcome-based education lens. Caring experiences for children, families and a highly gendered workforce – precisely what is emphasized in ethics of care theory – is never prioritized as the main goal of childcare. From our perspective this is a major problem as the importance and value of respectful, responsive relationships is the cornerstone of quality childcare experiences. If this is consistently downplayed or overlooked

– or equated with low-level custodial services – than policy solutions will never address the real needs of young children, their families and the ECEC workforce. This paper critically assesses alternative ways to reconceptualise care in childcare to elicit concerted support and action for careful and ethical policy solutions.

Workplace Conditions and the Subjective Well-Being of British Workers: The Interactive Role of Income Inequality and the Size of Firms

ABSTRACT

Using merged data from the 2004 and 2011 series of the British Workplace Employment Relations Survey (WERS) for both employees and employers, we explore how workplace conditions affect the subjective well-being of British workers. Previous studies have shown how income inequality measured at the national-level has a substantial impact on the subjective well-being of citizens. However, research has yet to apply the same logic to a workplace-level analysis. To fill this gap, using hierarchical models, with employees clustered within workplaces, we explore how within-workplace income inequality – measured by the Gini Coefficient – interacts with firm size to affect the subjective well-being of workers. Paralleling the results for research on geographical units of different sizes (Wilkinson and Pickett, 2010: 27-28), we anticipate that within-workplace income inequality will have a negative net effect on workers' subjective well-being in larger firms, but little or no effect in smaller firms.

TO THE RIGHT: BACKWARDS MARCH!

As the second decade of the 20th century began, the world seemed moving toward a more progressive, democratic moment. But that was not to last, the "pink tide" of South America, turned blue as a number of progressive leaders were supplanted by conservative if not reactionaries, in Europe, Austria, Hungary, Poland, Holland etc. took sharp turns to the right, as did Britain/Brexit, Turkey and the Philippines. And then came Trump. How did this happen? Indeed, this was the result of two intertwined moments rooted in neoliberal globalization primarily the growing economic hardships faced by many members of the then "growing" middle classes while the affluent classes, the 1% prospered. But equally important were the cultural changes that came along with growing migration, rapid cultural change such that many felt displaced, left behind. These two moments, comprise a distinctively unique form of 21st century alienation in which the 1844 *Manuscripts* meet the digital age. "The primary result of these 'crises of legitimation' (Habermas) has been a growing *ressentiment* in which growing populations, especially those hard-hit by the economic/cultural changes not only can be aggrieved and angered, but seek "enemies" to blame for the duress they feel, these enemies include both corrupt and dishonest elites, as well as various other scapegoats. The result has been massive shifts to the right in which "strong" leaders representing the people would avenge, punish and perhaps destroy the "enemies" of the people. While these various right-wing, reactionary if not neo-Nazi/actual Nazi movements have become the dominant social force of today, at the same time it should be noted, throughout the world, there are growing masses of highly progressive young cohorts that not only reject these reactionary tendencies, but spearhead growing progressive, egalitarian, humanistic agendas.

Media, Migrants, and Mayhem: Newsprints' Representation of African Refugees, Asylum Seekers and Foreign Nationals in South Africa during Periods of Violence

Xenophobic attacks in South Africa have resulted in over 100 deaths since 2000. Hundreds of refugees, asylum seekers, and foreign nationals have been displaced due to attacks and fear of persecution. Newsprint media has played an important role in representing and interpreting the events during the 2008 and 2015 xenophobic attacks. Yet, few studies have attempted a thorough investigation of the text used by newsprint media to represent refugees, asylum seekers and foreign nationals living in South Africa. To date, no studies have looked at their representation in international, transcontinental, national, and local newsprint sources comparatively. The proposed research project focuses on the media's representation of refugees, asylum seekers, and foreign nationals in South Africa during the periods of mass violence in 2008 and 2015. The proposed study addresses a significant gap in literature with a mixed-methods approach

-- employing analytical frameworks from Corpus Linguistics (CL) and Critical Discourse Analysis (CDA) to quantitatively and qualitatively examine texts from articles in international, transcontinental, national and local newspapers during the periods of violence. As an introduction, the author provides a brief account of the global migration crisis with an emphasis on the growing population of displaced persons. An explanation of migration patterns in South Africa is also included for context and to argue the importance of the proposed project. Applying Van Dijk's (2011) Ideological Square Model, specific cases from *The New York Times International Edition*, *BBC Monitoring: Africa*, *The Sunday Times*, and *Cape Times* are highlighted. The author concludes with a discussion of the findings, real-world implications and solutions to address any recurring issues of representation of refugees and migrants uncovered from the research.

The "Elementary Forms" of Mobile Communication: The Social Uses of the Mobile Phone Among Portuguese Adolescents

This paper argues that is useful to adopt a Durkheimian cultural model to look at the *functions* or *uses* of the mobile devices by essentially looking at their capacity for normative and social integration or, on the contrary, to jeopardize these types of integration, when, for instance, they constitute a factor of individuation and segregation. Following this perspective, the basic units of analysis include the shared symbol but also the rite impregnated of meaning such as the exchange of messages or the mediated ritualistic forms in a *media* saturated society. For adolescents, personalized, distinctive and original uses of symbolic forms on the mobile phone can be a routine method of peer-sharing and support, a means of separating the "we" from the "others", reinforcing an emotional attachment and the cohesion of a group that shares the same symbols, culture and domestication of mobile communication. However, they also bring the prospect of segregation. Despite recognized problems in functionalist approaches, their usefulness lies in the ability to interconnect cultural aspects with concrete social action. Therefore, it is argued that the Durkheimian model is profitable in *media* studies and it converges with the empirical results on the domestication of mobile devices among Portuguese teenagers. Albeit Giddens' (1984) criticism of functionalist arguments within the social sciences, it is also argued that the Durkheim's model is not inconsistent with the role of mobile devices in the maintenance of the ontological security of agents, and with the domestication approach in communication studies. For example, the breakdown of the moral order of permanent connectivity can cause disorientation when connection to mobile networks is no longer available. These perspectives, when applied to the study of mobile communication, all congregate in the same direction: they underline the emotional importance and consequences of mobile devices in teenagers' daily life.

LAPOIRE-CHASSET, MIREILLE* (*INRS*)

Laying Down the Mental Health Law to Prevent Psychosocial Risks in France: A Way to Contribute to Exercising a Particular Form of Social Justice?

While in France law is incorporating mental health into the field of health at work, how occupational health professionals are they using it to prevent psychosocial risks for employees? Paradoxically, the methodologies for occupational health intervention that are disseminated there are mainly developed by psychology and psycho-ergonomics researchers, who use clinical approaches to work (Fillietaz & Billette) and who are highly critical of the regulations on mental health at work. They say that the regulations reduce health to the concept of risk, and thus facilitate exclusion of workers who are considered to be exposed to hazards and presumed to be weakened or diminished, and, in any event, that the regulations make it difficult to conduct a debate on work and suffering, even though such discussion is necessary to mental health construction. Researchers then suggest that occupational health professionals free themselves of the regulations on mental health at work and place their intervention within the framework of other legal fields. In this context, we have conducted an analysis of how law is used socially (Ewick & Silbey) in a Weber's perspective, attentive to the legal arguments that are exchanged between the parties and to the identities they activate for each person (Lapoire-Chasset). It appears that, paradoxically, the professionals who adopt the legal posture recommended find themselves in a confusion of roles, sometimes to the extent they lose their capacity to act, whereas the other professionals, who have decided, on the contrary to "lay down the law" on occupational mental health, find the means of deploying legal arguments capable of inviting the other stakeholders into the process of constructing health at work, for which everyone is calling. Better protected by their status they reassert, they take part in a redistribution of resources and contribute to exercising a particular form of social justice.

RC34-629.8LAPRESTA-REY, CECILIO* (*Universidad de Lleida*)JANÉS, JUDIT (*University of Lleida*)SANSÓ, CLARA (*University of Lleida*)*Acculturation and Wellbeing. the Case of the Descendants of Immigrants in Catalonia (Spain)*

The Acculturation theory proposes that, depending on the maintenance of the cultural elements of the descendants of migrants and the adoption of those of the destination society, four profiles are drawn which strongly influence their incorporation into society in conditions of: integration (a high degree of cultural maintenance and high adoption of the destination culture), assimilation (low maintenance and high adoption), separation (high maintenance and low adoption) and exclusion (low level of both maintenance and adoption) (Berry, 2005; Bourhis, 2001).

Focused on Catalonia, a bilingual territory in Spain, and on the case of the descendants of migrants who are in the final stage of compulsory secondary education (14-16 years of age), the objective of this communication is to analyze the influence on the construction of these profiles of two processes related to symbolic violence: experienced discrimination and perceived prejudice.

Methodologically, a questionnaire has been applied to a total of 572 Catalan schoolchildren.

The main results confirm that higher experiences of discrimination and perceived prejudice play a determining role in the construction of the profiles of acculturation. Additionally, the different groups according to their origin are discriminated against and prejudiced to a different degree.

The conclusions point to the importance of promoting policies and initiatives to avoid current and future conflicts.

RC25-473.1LAPRESTA-REY, CECILIO* (*Universidad de Lleida*)HUGUET, ÀNGEL (*University of Lleida*)IANOS, ADELINA (*University of Lleida*)PETRENAS, CRISTINA (*University of Lleida*)CABALLÉ, ESTER (*University of Lleida*)TORRES, MARIA (*University of Lleida*)OLOUME, FRANCIS (*University of Lleida*)*Aculturación Lingüística e Integración Lingüística. El Caso De Los Descendientes De Migrantes En Cataluña (España)*

La teoría de la Aculturación, en su vertiente lingüística, propone que en función del mantenimiento de la/s lengua/s propias de los descendientes de migrantes y de la adopción de la/s de la sociedad de destino, se dibujan cuatro perfiles que influyen poderosamente en su integración: integración (alto grado de mantenimiento lingüístico y de adopción de la/s de la sociedad de destino), asimilación (bajo mantenimiento y alta adopción), separación (alto mantenimiento y baja adopción) y exclusión (bajo grado tanto de mantenimiento como de adopción) (Bourhis, 2001).

Situados en Cataluña, territorio bilingüe de España, y en el caso de los descendientes de migrantes que se encuentran cursando la última etapa de la Educación Secundaria Obligatoria (14-16 años), el objetivo de esta comunicación es analizar la influencia de los diferentes perfiles de aculturación en tres dimensiones fundamentales de la integración lingüística: el conocimiento lingüístico, las actitudes lingüísticas y las identidades lingüísticas.

Metodológicamente, se ha aplicado un cuestionario a un total de 572 escolares catalanes.

Los principales resultados confirman que el desarrollo de un perfil u otro de aculturación se encuentra interrelacionado con unas más altas competencias lingüísticas, unas actitudes lingüísticas más equilibradas y unas identidades lingüísticas múltiples. Aún así, y aunque los outputs entre los que construyen perfiles de integración y asimilación son en gran medida similares, se deben diferenciar sus implicaciones.

Las conclusiones teóricas y contextuales son discutidas.

RC14-273.4LAROCHELLE, LAURENCE* (*University Sorbonne Nouvelle - Paris III*)*Violence and Justice in Popular Culture: The Case of Turkish Television Series in Greece.*

Since 2000, the production of Turkish television serials is in constant development. These serials that have indisputably a great success at a local level are also exported abroad. More precisely, they were first diffused in countries that were in the sphere of cultural influence of the ancient Ottoman Empire (which means the Balkans and the Middle East). Later they were also exported

even far, in Latin America, in China, in Pakistan, in Bangladesh etc. Among these countries, Greece has become a great consumer of Turkish television serials. This consumption has considerably augmented since the economic crisis in Greece. During this period, the local production has been practically diminished. Consequently, Turkish television serials had an ideal context of diffusion, in this country in a state of lack. The themes of these serials are not original. They remind the practically standardized themes of the classic "soap-operas" or of the "telenovelas" of the Hispanic speaking world of the period 1990 - 2000. The most frequent subjects concern the sentimental relations and more precisely the stories of forbidden love between two persons with different social status or between lovers that are in an ambiguous situation because of a third person that is implicated in the relation. These problems are always accompanied by intrigues, passions and rivalries in order to attract the public. Violence and justice are omnipresent throughout these stories and determine the beginning and the end of each serial. We propose to present the results of our empirical research concerning the analysis of the representations projected by these serials and their reception by the public in Greece.

RC19-369.4LARSEN, JØRGEN* (*University of Copenhagen*)ANDERSEN, JOHN (*Roskilde University*)MØLLER, IVER HORNE MANN (*Copenhagen Business School*)*Elderly Immigrants Living Conditions in Denmark***The purpose of the paper**

The paper analyzes the problems of redistribution and recognition that elderly immigrants face in Denmark since elderly immigrants are among the most marginalized Danish citizens.

Methodology approach

Living conditions for elderly Danes and for elderly immigrants are compared and analyzed with the help of different theoretical concepts of recognition and distribution applying, among others, the works of Amartya Sen and Nancy Fraser. The empirical data consist of documents on the political and discursive climate around legislation on ethnic minority matters (for example pensions and care services), and data on living conditions. The paper also analyzes recent municipality policies (for example in the Copenhagen) that are trying to address the challenges that elderly immigrants are facing with regard to socioeconomic inequality and social services.

Findings

As in other Western countries, the Danish political discourse since the 1990s have taken a strong right wing turn with the emergence of anti-immigration populism seriously affecting immigrants' and refugees' rights and their possibilities for socio-cultural and socio-economic inclusion. These changes have been driven by a dominating liberalistic ideology including an almost unlimited focus on a "work first" discourse followed by a "fraction old-age pension" (where level of pension depends on years in Denmark) and reductions in the duration of levels of other social benefits. Poverty, in particular among old age immigrants, has increased significantly and underlines that a focus on minority ethnic issues provides a reminder of the complexity of the life course trajectory, and of the diversity of aging as a cultural, political and social construction.

The value of the paper is that it integrates different theoretical perspectives on inclusion and exclusion of elderly immigrants and employs different empirical material (quantitative and qualitative) to underpin, discuss and challenge these theoretical perspectives.

RC15-281.6LARSEN, KRISTIAN* (*University of Aalborg, Campus Copenhagen, Denmark*)HARSLØF, IVAN* (*HIOA University College*)HØJBJERG, KARIN* (*Aalborg University, Denmark*)HINDHEDE, ANETTE* (*Aalborg University, Denmark*)*Health Capital: An Empirical Study of Danish Healthcare Professionals' Bodily Investments*

The work with and on the body to improve performance and appearance may be conceived of as investments in 'health capital' that can maintain or optimize social position in general or in specific social fields. The work is directed towards the body or specific body parts and can articulate itself in the surgery body, the chemical body, the nutritional body, the physical body, and the mental body. As such, health capital may represent an extra card in the social game, as being played out in the labour market, in the educational system, and other arenas of social interaction.

In the health care field itself, such bodily investments may be of particular importance. The agents that occupy the field will be expected to 'perform' health in accordance with established knowledge regiments and practices. Arguably, their own bodies are at play in the interprofessional and professional-patient inter-

action. Yet, we may also expect endowments of health capital among different actors in the health care field to be differentiated along different social strata.

The paper presents results from a study of the possessions of health capital among healthcare professionals – nurses, physiotherapists, occupational therapists, nurse assistants and health consultants. By use of quantitative (survey with 1,000 respondents) and qualitative data (30 individual interviews), we explore similarities and differences among and within the professions. In physiotherapy the physical body is significant and articulated in textbooks and verbally by physiotherapist (strong/weak, slim/fat), but concrete occupational positions strongly determine exactly how these are practiced, for example in opposition between private physiotherapeutic clinics opposed to public institutions. Discussing the empirical data we elaborate on theoretical implications concerning habitus, capital and field, as well as primary, secondary and tertiary socialization.

The Impact of Non-Standard Employment on the Financial Well-Being of Australian Families

In OECD comparison, Australia stands out as a country with a particularly high share of non-standard employment, including casual work, fixed-term contracts and temporary agency work. While the literature so far has focused on the immediate consequences of these employment types on wages, little is known about whether and in which cases non-standard employment translates into financially precarious household conditions. Yet this question is of crucial importance considering the large impact of income (and poverty) on various life chances of both workers and their families. From a theoretical perspective, the household context is a mediator which can both attenuate or aggravate the impact of low or unreliable individual earnings on financial well-being, depending e.g. on other sources of income and the number of dependents. Considering the dominance of the modified male breadwinner model in Australia, non-standard employment might have a larger impact on the financial situation if taken over by men (as designated primary earners) than women (as secondary earners). On this background, the paper analyses the financial situation of non-standard workers' families. To what extent are non-standard workers sole, primary or secondary earners in their families? Do most non-standard workers live with standard workers or does non-standard employment accumulate in the family context? How does it affect family financial well-being, i.e., overall family income, poverty risk and satisfaction with the financial situation? To what extent do the results differ by employment type and by gender? The paper applies longitudinal analyses to data from the Household, Income and Labour Dynamics in Australia (HILDA) Survey (2001-2015). Despite the mediating impact of the household context, the study finds a negative effect of non-standard employment on family financial well-being compared to standard employment, both for male and female workers. The results thus call for policy conclusions improving the financial situation of non-standard workers.

The Mutual Emergence of Technological Innovations, Older Users, and Active Ageing: An Inquiry into Ontology

Inquiry into ontology has become a prominent topic within Science and Technology Studies (STS). One general characteristic of ontological STS is an interest in how *things* (objects, facts, policy concepts, technologies and so on) participate in the emergence of socio-material worlds. This interest in *emergence* is often coupled with the wish to interfere in common sense perceptions of the world as being stable, singular and thus the foundation for technological development. Opposed to this view, ontological approaches see 'worlds' as effects of collective social and material practices. Bringing the ontological turn into the study of geron-technology implies acknowledging the inseparability of things such as technology, older users, and policies on ageing, and open up to analyses of multiple and entangled 'worlds' in which specific normativities, values and versions of old age emerge.

Social studies of geron-technology often explore the relations between technology and its users epistemologically and thus tend to remain within the analytical realm of the subjective experiences of individual actors. While this is certainly important, it has some problematic implications such as analyzing 'technology', 'user', and indeed 'the researcher' as singular and detached entities, thus closing down possibilities to explore mutual emergence.

We wish to explore the implications and potentials of turning the study of socio-gerontechnology towards ontology. We look back on our own ethnographic studies of - and in - an innovation project aiming to develop welfare technologies for older people in Denmark. Re-working our empirical-analytical material through the conceptual lens of ontology, we analyze the worlds performed in the innovation project, and discuss the implications of this kind of analysis for design, policies on ageing, and the older people. As such, we explore what an ontological

approach to socio-gerontechnology may be, and what kinds of questions emerge in the encounter between social gerontology and ontological STS.

Military Education and an Emerging Transnational Profession of Arms

Have changing patterns of professional military education (PME) helped military forces to evolve from a competitive tool of states towards a transnational asset to pursue common security? The answer is maybe. Noise from the biggest states obscures important developments in the global middle class of states. This paper reports historically widening and deepening PME, and a growth of university-like higher-PME institutions worldwide since the end of the Cold War. The nation-state has been the locus of this development and is the unit of analysis for our data, but many states are committed to collaboration, and their higher institutions for PME are increasingly committed to critical thinking and professional standards. Epistemic communities and networks of learning amongst smaller states are often **not** dominated by big powers, although regional powers and alliances play an important role in the generation and diffusion of knowledge. The security discourse amongst small states is generally more collaborative than that emanating from major powers. There are global patterns of officer education, particularly at mid-career level. PME curricula fall into two broad categories: subjects for sharing; and national secrets. Peace support operations, civil military cooperation, and disaster assistance are examples of the former, while war-fighting, counter-insurgency, and counter-terrorism include the latter, even when some materials are shared. Institutional patterns in entry level and mid-career military education suggest that there are internationally accepted standards of professionalism to which NATO has contributed, but that these standards are not dominated or promulgated by any one centre, and have been widely adopted or sought outside NATO. If PME is helping military forces focus on tasks other than war fighting, this has both advantages and disadvantages for states, regional security complexes, and global society.

Domestic Violence in Transnational Diasporic Consanguineous Marriages: Narratives of Marriage-Related Abuse Among British Azad Kashmiri Women of Pakistani Origin.

British Azad Kashmiri women of Pakistani origin experiencing violence and abuse in consanguineous marriages are adversely affected by a patriarchy that has a greater impact on women from lower socio-economic backgrounds. Living in Western pluralistic societies, adds further complexity to the experiences of marriage-related abuse among Azad Kashmiri women. Ethnic communities place an emphasis on cultural retention, envisioning women as boundary markers between ethnic and host cultures. Responding to host society hostilities, minority communities can become inwardly focused, heightening patriarchal practices, which have deleterious implications for women. However, there is little empirical research exploring the interplay between patriarchal ideology and abusive consanguineous marriages in host societies. This paper presents findings based on eleven months of focused ethnographic research conducted with five older first-generation British Azad Kashmiri women who stayed in abusive consanguineous marriages and ten semi-structured interviews with younger, second-generation, and recently arrived spousal migrants who left their marriages. The findings indicate that transnational families expect abused Azad Kashmiri wives to make consanguineous marriages work. Families perceive these marriages as symbols of their honour and expect women to strengthen existing kinship ties. This is line with migrant network theory, which posits that migration from the subcontinent is primarily motivated by migrant aspirations to improve their familial honour. In the light of such expectations, and with few viable alternatives, women are co-opted into processes to advance transnational family honour and, thereby, personal honour. Women who stay adopt strategies to advance family honour. Those who leave attempt to reclaim lost honour. The former seek influence and bargaining power in family spaces and with abusers, while the latter are driven by attempts to regain diminished influence and prevent further stigmatisation. However, advancing ideology provides women with few opportunities to ameliorate their positions among abusers, families and communities, leaving women vulnerable and unprotected.

LATRECHE, ABDELKADER* (Social Sciences Forum)

For New Approach of Future Studies: Case of Future of Arab Countries

The study of the future of Arabs required the adoption of a new approach concerning the elaboration of the possible, alternative and desired future for the new generation of Arabs, away from classical methods. For that our vision to forecast the *desire future* will integrate both the effect of long-term dynamics and rupture but also with and abandon of classical outdated conceptions of the past and present, because the future is not necessary the extension of actual crisis. This approach will break up with traditional way to forecast the future and give up to develop an articulating project around a *desirable future* for new generation of Arabs.

The *desire future* for Arab countries is not limited only to the announcement of descriptive scenarios but essentially to design the pathways leading the future of Arab countries and contributing to move toward a *New Future*. This will not prevent us from reporting all determinants that will reinforce and ensure the realization of the *desire future* such as increase all forms of exchanges between Arab countries, strengthening legal frameworks that promote real rapprochement between Arab states and populations, reinforcement of the role of different local actors, civil societies, trade unions, political parties, professional association beyond the traditional channel.

This approach is based on the idea that *futures* are in large part shaped by choices and thought creatively and collectively.

Forecast the future of Arab countries have the singularity to be design as project with vision based on the realization of common strategies goal which all, or the majority of Arab State, adhere, in particular put an end to all the conflicts in the region. Our vision of the *desirable future* combine different level of changes.

LAUBE, HEATHER* (*University of Michigan-Flint*)

Sociologists, Feminists, and Work in the Corporatized University

In 2002, I interviewed 50 US-based sociologists, all women, who self-identified as feminist. I explored their experiences as professors at various career stages and located in various types of institutions of higher education. I asked if and how their feminism shaped their professional work, how the type of institution in which they were situated influenced how they practiced their feminism, the relationship of their feminism to their scholarship and teaching, the importance of intersections of gender and race, and how they thought about professional success and activism. I examined how the structure of academia, definitions of science, and expectations about the production of knowledge shaped their work, careers, and feminist identities.

Fifteen years later, it is reasonable to expect that the assistant professors I interviewed then are now associate (or perhaps even full), and the associate professors are now full professors. Some will have changed universities and others may have left academia. Some of the full professors will have retired or moved into leadership positions. In an effort to understand how their careers have progressed and their feminist practice has evolved, I return to the two-thirds of the original participants who were assistant or associate professors in 2002, to ask them to share their experiences and reflections since our 2002 interviews.

The institution of higher education has changed somewhat dramatically over the last fifteen years. In this paper, I focus on my participants' reflections on the ways the corporatization of higher education has impacted their work over the past 15 years. I explore how, as feminists and sociologists, they have grasped opportunities to challenge and disrupt this institutional shift, while confronting structural constraints and attempted to maintain and advance their careers.

Young Australians and the Future of Work: Insights from the Our Lives Project

There is a growing body of literature devoted to predicting how jobs will change in the 21st century. Suggestions have also been posed regarding the types of knowledge and skills that young people will require. The literature, however, does not tell us if young adults of today feel adequately prepared for the future of work.

The 'Our Lives' project is an ongoing longitudinal study of a single-aged cohort of more than 2000 young people from Queensland, Australia. Currently aged approximately 25 years old, many participants in this project have already embarked on a career pathway. We have undertaken in-depth interviews with a subset of 50 Our Lives participants on their expectations and plans regarding work and working in the 21st century.

In this paper we report our participants' views regarding the extent to which their chosen careers are likely to change in the future and the various strategies they will use to ensure that they remain employable over the decades to come. Our participants are well aware that their careers will likely undergo some dramatic transformations, but are confident in their ability to adapt should the need demand. They have also articulated the types of skills they believe will be

necessary in order to 'future proof' their career trajectories. These skills include flexibility, entrepreneurialism, innovation, and imagination.

LAUSTER, NATHANAL* (*University of British Columbia*)

Is Home Really Just Attachment?

The literature on Home as a sociologically meaningful concept could use some tidying. Attachment theory seems like a promising framework for assisting in reorganizing home, having gained wide currency in Family Studies, Child Development, and Social Psychology. Nevertheless, attachment theory's examinations of relationships between parents and children and romantic couples have also been subject to a variety of theoretical and methodological critiques in both Psychology and Sociology. Place attachment is less developed as a concept, though more associated with home, and both have also been subject to critique. Attachment to things has received comparatively little discussion outside of hoarding research. In this paper, I draw together theories of home with theories of attachment (to person, place, and thing) and seek to clarify the connections and divergences between the two concepts. I draw upon data from a multi-method study of home in Vancouver and Nunavut, Canada and from a similar study of hoarding to illustrate theoretical overlap and points of disjuncture.

Feminization of the Primary Care Medical Workforce: A Systematic Review and Case Study of Implications for Pay-for-Performance for Chronic Disease Management in Context of Universal Health Coverage

The prevalence of chronic non-communicable diseases is increasing rapidly worldwide. To address the growing challenge of chronic disease prevention and management, performance incentives for patient-centred care are increasingly common in many health organizations. While studies suggest feminization of the primary care physician workforce contributes to changes in practice patterns, there has been no comprehensive investigation of its impacts on the effectiveness of pay-for-performance (P4P) for patients with chronic disease. This research aims to address the knowledge gap from global to local perspectives. First, we perform a systematic review of the literature on impacts of P4P for chronic disease management in systems of universal health coverage – and the extent to which physicians' gender is considered or influential in the results. Second, we conduct quantitative analysis of the gender-specific effects of P4P by physician uptake of a diabetes practice incentive in New Brunswick (Canada), a context of single-payer universal health insurance. The review aligns with Preferred Reporting Items for Systematic Reviews and Meta-analyses guidelines, with the preliminary search yielding 2090 records from 10 databases and other sources. After applying inclusion and exclusion criteria to focus on studies measuring outcomes most relevant to patients and policymakers, none of the record titles highlight the effects of workforce feminization. Full-text articles will be screened for the variable of interest. For further insights from a local perspective, we present a case study from New Brunswick, where the proportion of female family physicians increased from 38% to 45% over the decade 2006-2015. We use a quasi-experimental study design drawing on linked population-based health administrative datasets, with propensity score matching for physician's gender and other characteristics. Results are expected to enhance the evidence base on the effectiveness of "one-size-fits-all" P4P schemes to improve population health and sustainability of health system investments with feminization of the physician workforce.

LAW, ALAN* (*Trent University*)

Racing to Entitled Leisure: Older Workers and Fractured Futures

Drawing on 37 semi-structured interviews with male and female workers in manufacturing and health care sectors located in the Peterborough Ontario region, the paper explores trajectories of "works end". For some these trajectories are assured and match the promise of a modernity that delivered the promise of a secure, balanced and stable life. However, for most, unstable labour markets, major industrial shifts, breaking bodies and location in the 'sandwich generation' (caught between ageing parents, unemployed offspring and extreme work pressure in senior positions) means that the post-retirement life of leisure is indeed a cruel lie made worse by failing public pension funds pushing the age of public pension eligibility, beyond what could possibly mean an 'end' to work.

RC02-65.5LAWSON, JAMES (JAMIE)* (*University of Victoria*)*On Strategic Comparison of Fossil-Fuel Production Chains: Drawing Lessons from North American LNG and Bitumen Cases*

This paper examines the work-process and infrastructural foundations of power relationships and strategic possibilities that surround the material work processes of fossil-fuel extraction, refinement, and export. Drawing on the diverse literatures for analyzing commodity/production chains or networks, it contributes to the development of an analytical framework for its own power-oriented analysis. It draws on early mixed-methods research into three distinct export-oriented production networks (bitumen SAGD, strip-mined bitumen, and liquefied natural gas by hydraulic fracturation) that derive specific fossil fuels from extraction sites in the interior of Western Canada. Transportation and communications infrastructure are crucial in shaping and channeling the various flows necessary to project extractive capacity into resource frontier sites. They are also central in the degree to which concentration of flow control, quantitative flow asymmetries, and flow disproportion can give rise both to technical problems of production and power asymmetries in conflicts that target the network itself. Examples of this are evident in the degree to which different networks see conflict emerge over stages in routine extraction, upgrading and transport of the resource, or alternatively over disruption or delay in staged construction of new extractive, upgrade, transport, storage capacity. This comparative project is intended to generate a framework for explaining the particular sites of socio-political contestation that emerge regarding network impacts, and particularly those sites that correspond to particular nodes and corridors of the network itself.

RC20-380.2LAXER, EMILY* (*University of Michigan*)REITZ, JEFFREY (*University of Toronto*)*Do National Integration Discourses Affect Muslims' Political and Civic Incorporation? a Comparison of France, Canada, and Québec*

This article seeks to determine whether and how national integration 'models' affect immigrants' – particularly Muslims' – political and civic incorporation, focusing on three dimensions: acquiring citizenship, participating in associations and voting. The study compares outcomes in three settings: France, where republican values orient integration discourses and policies; Canada, where immigrant integration has for decades been conceived as part of a multicultural citizenship project; and – within Canada – Québec, where an intercultural approach echoing aspects of republicanism and multiculturalism has recently emerged. Based on analysis of two national surveys – the Trajectories and Origins Survey (2008) in France and the Ethnic Diversity Survey (2002) in Canada – we find that national integration discourses have limited capacity to explain political and civic incorporation among Muslims and other minorities. Though dissimilar across settings, these populations' patterns in citizenship acquisition are readily explained by their divergent histories of migration. Meanwhile, Muslim-non-Muslim differences in association membership and voting are strikingly similar in France, Québec, and the rest of Canada. We conclude that national discourses of integration in some ways obscure, rather than illuminate, on-the-ground patterns in minorities' political and civic incorporation.

RC48-801.1LAY, TONATIUH* (*Universidad de Guadalajara*)*Community Networks and Alternative Communication Processes*

The exclusion of access to the broadcasting, telecommunications and Internet media to which various communities and indigenous peoples have been marginalized has led to community organization in some parts of the states of Oaxaca, Chiapas and Quintana Roo, in order to achieve the rights and the services stipulated in the Telecommunications Constitutional Reform of 2013. This paper aims to describe and analyze those processes of community organization for the management and self-management of technological devices and their operation, as well as the impact of its use in the community itself and the surrounding areas, in a context where commercial broadcasting and telecommunications seek to cover all areas without allowing not only competition but also preventing the development of peoples and communities. Also, analyze these processes from the concepts of autonomy, Internet governance and communitarianism.

RC52-859.2LAZAR, FLORIN* (*University of Bucharest*)MARINESCU, VALENTINA (*University of Bucharest*)BRANEA, SILVIA (*University of Bucharest*)*Media Representation of Social Work Profession in Romania*

Social work in Romania was re-established after the fall of communism in 1989, being a relatively young profession with a sometimes contested identity within the general public/audience. Thus, how social work profession is represented in media is important for professionals and service users alike. Guided by the media framing theory (Entman, 1991; Gamson, 1989), which considers that repeated discourses and phrases on a subject shapes the representation formation of a domain/topic within the media audience (Sieff, 2003), we investigate how Romanian online media framed the social work profession over the last seven years. Using ten relevant keywords, a quantitative content analysis was made of online articles (n= 1,300) retrieved in the first 15 Google.com pages. Social work is not the main topic of the article (69%), persons or events being the focus of the article. The personal stories are preferred (38%), over analyses of the policies (21%) or legislation (20%). Social workers are not presented in the articles (86%) and are less likely to be cited within the articles than other professionals. The main topics covered are child abuse and neglect, poor people and the functioning of the welfare system. The articles are about social work system in general, not focusing on an issue, or making recommendations to social problems (65%). The articles are usually informative (87%) and generally social work is presented in a neutral manner (44%) and sometimes positively (19%). Social workers are not the primary definers of their work or/and of the social issues covered in the articles about social work. The social work as profession and social workers are schematically presented since articles lack the personalization of social worker and the general context. The main frame used in the sample was the problem frame - the cause frame and the solution frame missing from Romanian media.

RC15-289.1LAZAREVIC, PATRICK* (*TU Dortmund University*)*Biological Influences on Health-Ratings: The Relationship of Biomarkers and Self-Rated Health and How It Differs across Groups*

Self-ratings of health are the most widely used single-indicator of health in many scientific disciplines. Accordingly, many researchers rely on these self-ratings in the description and explanation of social inequalities in health. How these ratings come about, however, is still partly unknown and self-rated health is treated like a valid measurement of 'true health' when it is actually a black box. This would prove especially problematic if there were differences in how respondents from different social groups (e.g., age-groups, men and women, socio-economic groups, or ethnicities) rate their health because this would mean that self-rated health measures a different concept in each group. In order to investigate these possible group differences, researchers need to have a wide array of health-related information which respondents might use to base their appraisal on. Physical measurements and biomarkers play a rather interesting role in this regard since they potentially give objective and highly relevant health information beyond what a respondent is willing - or even able - to tell. Their relevance for rating ones' health, though, is still basically unknown.

This paper contributes to the state of research by analyzing data from the Canadian Health Measures Survey (CHMS). Additionally to a health questionnaire the CHMS comprises, among others, physical measures like grip strength, blood measures like infection markers, and urine measures like creatinine levels. With these data cross-sectional analyses are conducted in order to determine the relative contribution of different types of health information for several groups in explaining self-rated health and whether physical measures and biomarkers can contribute to this explanation beyond information typically collected in questionnaire-only health surveys. All in all, this research evaluates the relevance of collecting this information in explaining self-rated health and whether self-rated health is invariantly measured in different groups.

RC23-434.9LAZNJAK, JASMINKA* (*University of Zagreb*)ŠVARC, JADRANKA (*Institute of Social Sciences 'Ivo Pilar'*)*Coping Strategies of Croatian Researchers in the New Development Paradigm of Entrepreneurial Economy. The Shift of Power?*

The paper reflects on the changes in the role and position of the scientific-research caused by the shift in development paradigm and related public policies. The shift from industrial society and managed economy towards postindustrial entrepreneurial economy moved the public policies' focus from national innovation system to the "national entrepreneurial system" focused on

business innovation, small companies and regional development. The changes in paradigms and public policies has weakened the role of scientific research especially in economically less developed countries where research systems are weak and vulnerable like Croatia.

Drawing on the concept of coping strategy we use this concept to explore the strategies that researchers use for the sustainability of research system in the situation of significantly weakened public funding of science. The analysis is based on data from on-line survey and focus groups dealing with the impact of the reform of scientific sector in funding and organization of scientific work in order to foster scientific excellence.

Producing the Scales of Food Sovereignty

One of the central pillars of food sovereignty is the promotion of local food systems (Robbins, 2015; Nyéléni report 2007; Schiavoni, 2015). The local discourse can be conceived as a way to "subvert, the various types of "distancing" that the current industrial food system has created" (Alonso-Frajedas et al. 2015: 442). But the Food Sovereignty vision of local food systems is still partly unarticulated because it has to deal with complex realities and issues (Borras and al. 2008). The difference between spatial and organizational proximity is related to the ambiguity as to what constitutes "the local" and calls for an interdisciplinary social and geographical approach.

Far from aiming to define what is local in Local Food Systems, we contend that food sovereignty scales have to be investigated. We do not agree with scholars who, as Marston (2005), call for discarding the notion of scale. Since the politics of Food Sovereignty interact with the state, the nested scales of the state are central to food sovereignty project. Conversely, local actors do employ scalar strategies of their own to expand their power bypassing the state.

Our aim is to analyze how Food Sovereignty as a process of territorial development is shaping up new scales of action for all participating actors. To do so, we base ourselves on food projects being implemented in tree French municipalities: Clermont-Ferrand, Albi and Cusset. These projects considerably reshape the patterns of relationships and power between the multiple actors of local food systems. Our paper explores geography's use of the concept of scale and uses the case studies as opportunities to contribute to this scholarship. Inversely, we contend that more attention given to scale production in Food Sovereignty projects has the potential to open new windows of opportunity both for scholars and Food Sovereignty practitioners.

LE CLAIR, JILL* (*Centre for Business in Society, Coventry University*)

WONG, DONNA (*Centre for Business in Society, Coventry University*)

Contested Global Mega-Events, Para-Sport and Social Values: London, Toronto and Singapore

This paper examines attitudes towards para-athletes and their mega-sport events, in the context of UN and national Disability Rights legislation (Parent & Chappelet 2015). Mega-sport events both reflect and influence national values, and are inevitably the site of contestation within global capitalism. Results from a two-year study of attitudes after the London 2012 Paralympic Games and the Toronto 2015 Pan Am-Parapan American Games are presented, and an analysis of the heated public debates linked to Singapore's policies and governance of the Olympic and Paralympic Games.

Research showed that in the UK some Paralympians were already celebrities because of mainstream and social media coverage, but at the same time there was conflict between those who objected to social welfare cutbacks for the disabled and those who supported the global corporate 'economic development' of London's East End and billions of pounds spent on the Games themselves (Jackson et al 2015). The legal and social framework for the Toronto Parapan Am Games was the passage of the *Accessibility for Ontarians with Disabilities Act* (AODA 2005), and a commitment to greater accessibility, socially, and in the built environment, despite additional costs. There was less media coverage of all kinds for this second-tier event, but most participants 'admired' and were 'inspired' by para-athletes (Le Clair 2016).

Provision for disabled sport in Asia has not been as comprehensive as in the global north, so there are fewer participants from the global south in para-sport (Brittain 2017). Multi-medalist Paralympian swimmer Yip Pin Siew became the centre of national discourse over the difference in the treatment and recognition of disabled athletes in Singapore. This led to changes in para-sport policies and governance (*Disability Sports Master Plan* 2016).

RC27-490.5

LE CLAIR, JILL* (*Centre for Business in Society, Coventry University*)

Sport, Nationalism and Global Multi-Identity Tension in Two Para-Sport Cities: London and Toronto

This paper presents results from a two-year study of the complex, sometimes contradictory identities of residents after the mega-sport events of the London 2012 Paralympic Games, and the Toronto 2015 Pan Am/Parapan American Games. Results from questionnaires illustrated tensions and intersections of bodily identities based on family origins and/or place of birth (nationality), citizenship, gender, disability, and race/ethnicity. How the body is perceived and framed varied according to the context; unique government typologies such as Black British and Canadian Métis, historical factors, national discourses, and local political tensions impacted on perceptions of the self, and of para-athletes in mega-events (Beacom & Brittain 2017). Initially para-sport was focused on rehabilitation and disability-based, but after 1989 it increasingly shifted to sport-based competition with the emphasis on high performance as disabled athletes were renamed para-athletes and Paralympians (Le Clair 2016). Increasing size of the Games and media coverage led to celebrity, and their training and skills were described as 'inspirational' in both cities.

In a global world people 'choose,' or are given, elements that make up their multi-identities; race/colour and the separate 'national' identities of England, Scotland, Wales, and Northern Ireland (Bond 2016; Simpson et al 2016) made up Team GB (Great Britain) in the Paralympic Games. However, 36.7% of London's population was foreign-born (2011 UK Census), and 76.5% of participants identified as British. In Canada, hyphenated identity is an expected part of daily life (eg. Chinese-Canadian), and of the federal government's official multicultural policy (Jedwab 2016). 48.6% of the population in Toronto is foreign-born (Statistics Canada 2011) and 76.4% of participants identified as Canadian, with 76% supporting Canadian teams. Other Canadian identities are those of Quebec, the majority French-speaking province, and the Indigenous First Nations (arguing for full autonomy), but all compete in para-sport as part of Team Canada.

From the "Best Interests" of the Child to the Expertise on Pupils: An Analysis of the Uses of Pupils' Well-Being in French Secondary Education

Since the end of the 1990's, promoting pupils' wellbeing is one the schools' missions in France. It is part of a broader extension of the social function of schools that requires, among other things, to "personalise" education and take account of pupils as "whole-persons".

In this context, I started out a PhD research on the uses of pupil's wellbeing and mental suffering in French secondary education. Early fieldwork analysis revealed that those categories (wellbeing, mental suffering) did not constitute everyday categories to the staff. They were redefining pupils who challenged the school norms (behaviour, attendance, work) under the prism of "mental suffering" situations. In the organisation's everyday life, those deviant pupils are qualified by school staff as "pupil's cases". "Pupil's cases" require relational work (with pupils, their family, school staff and sometimes other professionals outside of the school) in order to find solutions to the problem(s) the pupils bring in school.

Managing pupil's cases is often seen by school staff as a way to defend and protect the "best interests" of the child. To that extent, this work fits in the frame of pupils' wellbeing. But how are those "best interests" defined?

This communication is based on qualitative investigation (ethnographic observations and interviews) lead in three French public high schools between 2014 and 2016 as part of an ongoing PhD research. It demonstrates the ways in which the "best interests" of the child are most of the time qualified by the school staff themselves, it can be analysed as a form of expertise on pupils more than a way to give voice to the pupils. It sheds a light on the power relationships between professional territories that are at stake behind the defence of pupils' wellbeing.

LE TRIVIDIC HARRACHE, LILA* (*University of Rennes 1 - Arènes - EHESP*)

Managing "Pupil's Cases"? an Ethnography of Professional and Institutional Tensions in a French High School

The French secondary school system has been built over the idea of "indifference to differences" of pupils, in line with the justice principle of equality (of treatment). However, numerous sociological investigations as well as public reports have pointed out the strong contribution of that system to social reproduction.

Since the 1980's, French education policies have intended to tackle the issues of school failure and early school leaving. Framed in terms of fairness, they require, among other things, to "personalise" public education and take account of

pupils as "whole-persons". For examples, because they have "personal issues", school staff can allow a pupil not to attend some assignments on a regular basis while the rest of the class has to.

This sometimes generates tensions between fairness and equality, tensions that are managed by school staff. Indeed, the public demand for both equality and fairness leans more and more on school institutions and staff's ability to frame the situations they are confronted to. How can school staff manage individuals when they are embedded in an institution that was built for groups?

This communication is based on an ethnographic investigation (observations and interviews) lead in a French public high school ("Lavoisier") between 2014 and 2016 as part of an ongoing PhD research. It demonstrates the ways in which school staff deal with the tensions they are confronted to in the organisation's everyday life. It shows the institutional cobbling-together in the management of "pupils' cases", that is to say pupils (often with "personal issues") who challenge the school order. Although Lavoisier's management staff intend to build and spread a fairness-inspired frame of action, the ethnographic observations have revealed the importance of informal relational clusters in the ways that staff manage the tensions when dealing with "pupils' cases".

LEAHY, TERRY* (University of Newcastle. Australia)

A New Framework for Evaluation in the Social Sciences

Social scientists tend to believe that evaluative statements express a personal and socially constructed set of values. They struggle to reconcile this with the equally forceful belief that they should intervene politically to make a difference through their social analysis. Ultimately, this conundrum comes out of the writings of Weber on values and, before this, the Scottish philosopher, David Hume. Weber's program is to purge social science of evaluative statements, which he takes to be statements of preference and not part of the empirical description of society. I will show why this program is completely impossible to carry out in practice. I will go on to explain how sociologists routinely convey ethical judgments through their factual descriptions. A humanist conception of ethics and evaluative statements can make more sense of what sociologists actually do.

Discourses of Exclusion: Analysis of Compensation for Degrading Situation in the Brazilian Penal System

According to the national survey of penitentiary information (infopen), produced by the Ministry of Justice and released in 2016, there are 622,202 prisoners in Brazil. However, the number of places available did not match the demand. There are 371,884 vacancies and a deficit of 250,318, with an occupancy rate of prisoners that exceeds 167%.

In addition to overcrowding, Brazilian prison areas are known for their poor maintenance conditions. They are fetid places, with sanitation, hygiene and structure problems, making the scenario more complex. In bad conditions, are added the reports of prisoners on mistreatment, torture, and compliance with rules stipulated by criminal factions, true 'owners' of the prisons.

It is in this complex scenario that the Supreme Court of Justice (STF), in February 2017, gave cause to an inmate who applied for financial compensation for moral damages because his incarceration situation was considered degrading.

Therefore, this article - as a result of a postdoctoral project - intends, through the Critical Discourse Analysis (Fairclough 2001, 2005), to examine the first sentences handed down in favor of the prisoners, identifying the juridical, social and moral elements present in the stipulation of indemnities. Another objective of the article is to observe how the actors, especially judges and adjudicators, relate to the categories of human dignity and degrading situation, dialoguing with the theoretical contribution of authors such as Boaventura de Sousa Santos (1999) and David Garland (1998).

LEÃO, ANDRÉA* (Universidade Federal do Ceará)

Littérature De Jeunesse, Circulation Et Médiations Techniques De La Culture

Depuis la fin du XIX^{ème} siècle, la culture brésilienne de large diffusion qui atteint l'ensemble de l'espace national n'est pas celle de l'écrit, mais de l'oralité liée au cinéma, à la radio, à la chanson populaire et à la télévision. En prenant en compte qu'aujourd'hui nous sommes confrontés à une nouvelle modalité de production, de transmission et d'appropriation de la culture, ce texte organise une discussion sur la cohabitation entre l'imprimé et le digital dans les stratégies et les résultats de la transnationalisation de la littérature brésilienne de jeunesse. Nous prenons en considération la circulation des œuvres, la morphologie des espaces de mobilité du livre dans les traductions du portugais (Brésil) vers le français et l'espagnol, ainsi que les actions de classification des professionnels qui interviennent entre la création littéraire et le public de lecteurs, les médiateurs : éditeurs, traducteurs,

agents littéraires et critiques. À ces fins, nous avons choisi les trajectoires et les œuvres de José Mauro Vasconcelos et d'Ana Maria Machado. Le cheminement de cette présentation se base sur la problématique spécifique de la polarisation qui structure l'espace étudié : celle qui oppose le livre national au livre traduit et qui se prolonge dans l'antagonisme qui sépare la littérature érudite, régie par la logique intellectuelle et diffusée, d'une certaine manière, par une culture d'élite, des best-sellers, régie par la logique de la médiation technique et de la production à grande échelle. Dans le cas brésilien, cette polarisation est aussi structurante du passage de la culture de masse vers la culture médiatique. La culture médiatique et la culture de masse sont des concepts qui aiguillent un dilemme structurant de plus dans notre formation nationale : celui du synchronisme du temps entre un moment culturel brésilien et un moment culturel européen.

Morbidity with Temporary Work Incapacity in Russian Regions: Do Macrosocial Determinants Explain the Difference?

Morbidity with temporary work incapacity has a wide use in Russia and other East Europe countries for characterization of health of working population. The indicators of morbidity (number of cases, days and the length of one case) have a steady downward trend from 2005 to 2015 in all 85 Russian regions. But the significant difference between regions still exists. Average number of days of morbidity with temporary work incapacity (2005–2015) was 884.2 days per 100 workers in Ural Federal district, 805.6 days – in North-West Federal district and 618.2 days – in North Caucasus Federal district. Average length of one case of morbidity (2014) was 1.2–1.3 times higher than on average in Russia in 5 regions of Far East Federal district, 3 regions of Siberia Federal district and 3 – of North Caucasus Federal district. To explain the difference we used 3 indicators of environmental determinants of health, 9 macrosocial indicators (gross regional product, fixed capital investment per capita, average income of households, average wage and several others) and the percentage of workplaces with harmful working conditions (2005–2015). The correlation and regression analysis were used. None of chosen indicators have a significant effect on level of morbidity with temporary work incapacity. For example, the average income of households effects on number of cases of morbidity ($r=(-)0.18$; $R^2=0.03$, $p<0.05$) as well as an average wage does ($r=(-)0.15$; $R^2=0.02$, $p<0.05$). The level of unemployment correlates with the number of days of morbidity ($r=(-)0.28$; $R^2=0.03$, $p<0.05$). The same correlation was found for the percentage of high qualified workers ($r=(-)0.25$; $R^2=0.06$, $p=0.000$). The explanation of the difference between regions may be connected with 1) lifestyle factors (that can be proved by the data of national survey in all regions) and/or 2) presenteeism (that requires using another indicators of health of working population).

LECCARDI, CARMEN* (University of Milano-Bicocca)

Looking at Young People through the Temporal Lens

Andy Furlong's work was mainly dedicated to the analysis of the connections between processes of social change and the transformation of the ways and the meanings of the transition to adulthood. Among other things, he shed light on the close connection between the sociology of youth and general sociology. This contribution intends to reflect on this aspect through an analysis of the relationship between young people and temporality. In particular, through time it is possible to think about a series of strategic questions for understanding youth experience today. I am referring, for example, to the representation of the social world, trust in institutions, and the processes of identity construction – all of which are aspects that youth cultures incorporate and re-elaborate. In other terms, by examining young people's temporal visions, we can explore youth subjectivities and the forms of agency that they deploy to regain control over their lives.

All of this happens, in particular in southern Europe, in a period marked by the recent dramatic recession that has not only accentuated young people's vulnerability in terms of the labour market, the risk of social exclusion and poverty. It has also had a direct influence on their self-representation and their capacity for agency, both of which are also connected with their relationship with time.

On a more general level, a specific contradiction in contemporary young people's lives has to be underlined: the increasing gap between the well-known issue of delayed and non-linear transition to adulthood and the acceleration of social life through the affirmation of a culture of immediacy, widespread in institutions and society. In this scenario, young people try to build forms of active and creative relations with the present to deal effectively and profitably with the evanescence of the future (and the past).

Capitalism, Welfare Regime and Intimate Sphere: Towards a New Theoretical Framework

The goal of this theoretical paper is to integrate three frameworks that are formally separated in different disciplines: studies on the diversity of capitalism, on welfare regimes, and on the intimate sphere as a site for carework. The latter two frameworks aim at clarifying the mechanisms of human reproduction and their cost(s), a domain, which has been often ignored by research on the diversity of capitalism.

More precisely, the starting point of our effort is offered by the Régulation theory, a form of historical institutionalism that explain the diversity in time and in space of socio-economic dynamics through the concepts of institutional complementarities and hierarchy. However, as explained in previous works (see for example Arai & Lechevalier, 2005), a weakness of this framework is the lack of understanding of human reproduction, mainly because of difficulty in dealing with gender and family issues. This is why our major intention is to employ some key concepts from the work of Ochiai (see for example Ochiai et al., 2014) that shares with the Régulation theory a historical perspective.

Our strategy is to consider gender as an institution - at the same level than the wage labor nexus, the state or forms of competition - that determines both the regulation mode and the conditions of reproduction, mainly the demographic dynamics. Moreover, as Régulation theory is eminently situated and never proposes a theory that would be true in any point of the time and the space, we aim at explaining post-fordist and post-familialist dynamics in Europe and in Asia. We thus explain the formation of new political-social blocks has led to the reform of social protection schemes, with the objective to cover new emerging risks that the family or the firm are no more able/willing to cover.

How Do Medical Apps Form Healthcare Practices? a Case Study from Diabetes Care in Denmark

Healthcare organisations increasingly use medical apps operated on smart phones and tablets in service delivery. These technologies influence healthcare practices: both, the way lay people engage in their own health and the working practices of healthcare professionals. Digital technologies often come to be presented as neutral and objective problem solving tools; however, material actors such as medical apps interact with human actors and may change the meaning and forms of participation in healthcare. The aim of this paper is to explore how the use of medical apps by lay people and health professionals in healthcare consultations forms healthcare practices and how this changes the delivery of healthcare.

Our analysis is based on a qualitative in-depth case study of the development and use of a medical app. The app 'Diapplo' was developed in collaboration with users, health professionals and IT designers in Denmark to support teenagers with type 1 diabetes to manage daily life and facilitate contact with health professionals. The app is currently tested by users and health professionals at two outpatient clinics. Data comprise transcripts from meetings and workshops, interviews, observations and material products to be included in the application. Data collection is ongoing throughout 2017.

The preliminary analysis highlights the fact that healthcare professionals take on a leading role in defining the contents of the app and the practical procedures for using the app. This potentially conflicts with the preference of teenager to have a private space as part of the app, which neither healthcare professionals nor parents can access. Inspired by the theory of material participation we critically discuss possible consequences of using medical apps for healthcare practices involving lay people and healthcare professionals.

How Intersectoral Health Promotion Changes Professional Work: A Case Study from Denmark

Healthcare organisations increasingly focus on intersectoral health promotion; this challenges traditional (vertical) ways of working with health promotion, which the work of health professions has been molded into. Intersectoral health promotion emerges a critical case for studying what is new in professional work; the new tasks professions take on and the new relations professions enter. Our specific aim is to examine how professions engage in intersectoral health promotion and how this changes their work.

Our analysis is based on a qualitative case study of a cookery project for school children and nursing home residents in Denmark ('Cool Beans') that involved school teachers and care assistants. Our data consisted of documents (project descriptions, teaching material, and website information), participant observation and informal in-situ interviews, and interviews with individual professionals. We used a sociological institutional framework to analyse the professional work practices emerging in joint care and teaching situations.

We found that interorganisational health promotion to some extent challenges the existing institutional roles of care assistants and teachers; the cookery sessions push the two professional groups to engage in interprofessional collaboration. Both groups adopt a strategy of 'collaboration by proxy': they not only continue with their respective professional work practice, but also engage as 'assistants' for the other professional group. The new organisation of health promotion emerges as a key lever for changing the professional work of teachers and school assistants. This suggests that changes in organisations and the new tasks that follow may offer an important stepping stone for making professionalism more interprofessional in nature.

'Making Sense' of Baby: Parenting, Technology, and the Politics of Touch

This paper investigates the politics and ideologies of touch technologies in the emerging field of parent-baby/infant communication. While tactile engagement between (predominantly) mother and child is constructed in the western parenting literature as harbouring psychological benefits for both, it is also subject of considerable ideological debate, with a significant history (O'Malley Halley, 2009). Within this context, technological advances promise to enable new, or to reshape traditional, forms of tactile interaction between parent-baby/infant. 'FeTouch' (Prattichizzo et al. 2004) allows expectant parents to touch 3D models of their unborn child, smart maternity clothing visualises fetal movement (Jeon et al 2015), and 'Bumpe' (Guz, 2017) communicates baby's heart rate and movements via the bump and, later, via the baby's body suit to parents' smart phones. These technologies are part of a wider 'quantifying babies' bio-sensing trend (e.g. Bonafide et al. 2017, Noh et al. 2014) of measuring and analysing babies' health and behavioural patterns in relation to environmental factors.

Drawing on an in-depth literature review, multimodal semiotic analysis of technological devices, and sensory interviews (Pink 2009) with designers and parent users, this paper explores what types and functions of touch are imagined and designed for in parent-baby/infant interaction, with analytical attention to the social and political discourses and stakes for communication. More specifically, we will address the following questions: how does the use of these technologies co-constitute and reimagine babies' and parental bodies, their boundaries and (biological and/or physical, cultural and social) connections? How does this technological engagement with 'bodies' (e.g. 'fetal bodies') intersect with the ethics and politics of 'start of life'? How are parent-baby/infant relationships disciplined through these technologies? How does technological design maintain, interpret, disrupt or generate new touch and sensory-affective practices and routines within parenthood?

RC02-61.2

LEDOUX, CLÉMENCE* (Université de Nantes)

The Mobilisations of Private Organizations Providing Domestic Work and Home Based Care. the Case of France.

In several European countries, the number of for-profit providers for domestic and home based care has increased in the last thirty years, highlighting the shift from family-based system of care and domestic work to a market-based economy of welfare services.

The structure of these welfare markets can be very different between countries and the type of public regulation involved play a key part in their development and shaping. But little is known on the exact role of different actors involved in the construction of the diverse public regulations. Based on a qualitative survey, this paper will analyse how employers' organisations can contribute to this policy making in France, a country where several employers' organisations of domestic and home based care workers are now well established. Also, France has been a forerunner in the development of "new" instruments regulating the domestic and homes based care market, with the introduction of a check, generous tax credits and the extension of collective agreements applying to different employers, may they be families, non profit or for-profit organisations.

While the industry sector has been central in the structuration of French employer's organisations, we will show how organisations representing the employers have emerged in the sector of home based care and domestic work, have perceived market options, defined collective interests related to them and finally, how they have developed repertoires of contention in order to influence the dynamics of this welfare market.

RC44-754.2LEE, CHUN-YI* (*University of Nottingham*)WANG, JING (*School of Sociology, University of Nottingham*)*Who to Decide 'Good Job' or 'Bad Job'? a Bargaining Game of Production: Case Study from Pearl River Delta*

By definition, precarious work means employment that is uncertain, unpredictable, and risky from the point of view of the worker. Workers therefore are reluctant to take precarious work because of those drawbacks. However, empirical fieldwork informed us that skilled workers (here the skilled workers refer to those workers who are familiar with assembling/processing jobs) in China, especially in Pearl River Delta, often choose to do precarious work (outside of the factories) willingly. From our preliminary interviews in Guangzhou and Shenzhen, workers reflected that they have good reasons to take precarious work rather than regular factory jobs.

This preliminary empirical observation challenged our pre-understanding of precarious work. We assumed workers were forced to take precarious work; our empirical data informed us the opposite reflection from workers in the Pearl River Delta. This observation triggered us to ask this paper's question: Who decides if a job is a 'good job' or a 'bad job'? In order to answer this question, this paper will start from reviewing existing literature in relation to informal work and map out different understandings of precarious work. Conventionally, 'good job' refers to permanent position and high pay, most of workers when they face the choices to choose stability of work or higher payment, they would opt for the stability because the implication of stability includes pension and social security provided by the permanent position. Nevertheless, our empirical findings pointed us an opposite direction. Skilled workers in the Pearl River Delta would choose higher wages than permanent position, which begs the questions of China's social welfare system as a whole, and also the imbalanced state-society relationship, that without a trade union or workers' organisational support, workers chose to have short-term material interests in order to insure their own bargaining power in the production.

RC04-103.5LEE, FENG-JIHU* (*National Chung Cheng University*)*Shaping of Teacher Professionalism in Taiwan: A Critical Review of Policies from Evaluating to Supporting Teacher Professional Development*

Since 1990, the global political economy has undergone a dramatic change. National education policies and reforms are immersed in empowerment, efficiency, the market, competition, accountability, performance management, parental choices, and knowledge-based economy. Teaching profession has been influenced by this progression. Teachers' professional development and quality assurance is seen as the core impact for the achievement of schooling, and has become the central focus of educational reform and the making of educational policies. Therefore, evaluating the professional development of teachers is an inevitable global trend. This paper aims to examine the development of school teachers' professional evaluation/support systems in Taiwan, by means of document analysis, historical research, and theoretical analysis. First of all, this paper analyzes the different perspectives of teacher professionalism. Secondly, this paper critically examines the policies changed from evaluation of teachers' professional development to support their professional growth in Taiwan. Finally, according to the discussion of teacher professionalism and the new system of teacher professional support, this paper analyzes this professionalism's strengths and shortness, with a view to improve the practices of teachers' support system in Taiwan.

RC15-282.5LEE, HEEYOUNG* (*Sociology, Chung-Ang Univ.*)LEE, NA-YOUNG (*Sociology, Chung-Ang Univ.*)*Contested Medical Practices and Women's Body : Situating Precocious Puberty in South Korea*

This paper aims to analyze the processes and conditions of medicalization of precocious puberty, one of the so called 'Western disease' from the perspective of transnational feminists. At this time, transnational feminist perspective is a criticism of the process of re-colonization of the women's body as sexualized, racialized, and classified in the process of the (neo)imperialist globalization. (Mohanty, 2003). Medical knowledge requires stricter reliability and validity than other knowledge. Yet, medical practices as a process are performed differently according to the social arrangements such as race, culture, institutions, etc. based on the border. That is, the localized medicalization occurs. The precocious puberty became a public health issue when the Korean government implemented intensive birth control policies between 1960s and 1980s. Since then, woman's precociousness has become a subject that the state should manage to control the fertility rate in the context of economization of woman's life. However, since

2000, precociousness has been laid into a new paradigm of (over)medicalization. Precociousness, which had previously been the subject of education and discipline for a population agenda of a certain age, has now become a personal disease that must be prevented from discovering. Furthermore, the fear of precocious puberty has increased dramatically. From 2006 to 2015, the number of consultation personnel increased by 11.8 times, 75,945. Unlike the Western, yet, South Korea has distinguished conditions such as ①the coexistence of oriental medicine and western medicine ②single race ③the absence of independent studies or standards for Korean. Therefore, the medicalization in Korea is a contradictory mechanism of 'the fear of westernization of the body' and 'embodying the Western child's body in the Korean child's body.' We will especially focus on the process within distinct conditions, which leads to parent's self-diagnosis, hospital selection, diagnosis, treatments and the underlying logic to make a reproductive body.

RC13-254.1LEE, KANGJAE (JERRY)* (*North Carolina State University*)FLOYD, MYRON (*North Carolina State University*)SCOTT, DAVID (*Texas A&M University*)*Social Inequality and Symbolic Violence in the History of Public Parks in the U.S.*

Using the concept of symbolic violence, this paper attempts to illustrate the oppression toward people of color, immigrants, and working class in the history of American public parks. Symbolic violence denotes a situation in which dominant groups usurp valuable resources through arbitrary cultural and political systems which impose certain social practices as more legitimate, sophisticated, and superior than others (Bourdieu, 1991). Three parallels between symbolic violence and the history of American public parks are drawn.

First, public parks in the U.S. were founded upon White middle- and upper-class sensibilities (Byrne & Wolch, 2009). Many public parks were built by evicting racial and ethnic minorities and working-class immigrants from their residences (Taylor, 1999). Moreover, park managers established rules and dress codes to inculcate cultural norms of middle-class within working-class and immigrants visitors (Byrne & Wolch, 2009). Until the 1960s, public parks were built, in part, as a means of social control toward people of color, immigrants, and the poor (Scott, 2013).

Second, despite social and health benefits of public parks, African Americans were not allowed to visit them freely until the Civil Rights era. The institutionalized slavery and Jim Crow laws forced Blacks to use segregated parks called 'Negro Area' that were inferior in quality and extremely rare (O'Brien, 2016). Lee and Scott (2016) argued that today many Blacks are not interested in visiting parks because the centuries of racial discrimination have prevented them from developing a cultural disposition that appreciates parks.

Finally, diversity and inclusion programs of many park and recreation agencies are symbolic rather than substantive (Allison, 1999). What is often missing in their programs is an acknowledgment of the history of exclusion and oppression pertained in public parks. The omission perpetuates symbolic violence by implying that the problem resides among the oppressed rather than the oppressors.

RC13-248.4LEE, KOFAN* (*University of Mississippi*)*Indoorisation 2.0: Home Climbing Wall As a Case*

The establishment of indoor climbing facilities redefines the sport of rock climbing (Kulczycki & Hinch, 2014). Indoor spaces are built to simulate rock surfaces with various angles and features, which not only provide accessibility to publics, but enables climbers to improve their techniques (Thomas, 2016, April). Nonetheless, indoorisation not only take place in public spaces, climbers also build home climbing spaces. By search the term "home climbing wall" on Google, approximately 25,500,000 results are found. This search result implies the presence of a subworld in a broader rock climbing community. Online contents also reveal the discourses, activity, practices, technology and organizations involved in this subworld (Strauss, 1978). Further, while climbers have a long-history to craft their own training devices and spaces, a preliminary look into those online contents also suggests the hints of commercialization (e.g., instruction of building a home climbing wall are provided on the website of manufacturers, outdoor gear retailers, media and individuals). In lifestyle sports, including rock climbing, commercialization is seen as a changing force to modify the practices, identity and even the culture of a sport (Wheaton, 2004). As a result, the general research direction of this preliminary study is to explore the social world of home climbing wall through online contents, its position in broader climbing world, and the influences of commercialization on this social world.

Young People & Sexting: Risks, Gifts, and Shame.

This paper explores sexting by young people discussing motivations, regulation, and outcomes both social and legal. It draws on an Australian based study of over 1000 young people and theorises this in the context of Marcel Mauss' work on the gift and the historically problematic nature of childhood sexuality. It also outlines the relationship of sexting to various frameworks of risk arguing that many studies of sexting are informed by a public health models of risk that often marginalise the voices of young people involved while emphasising the negative risk outcomes of the practice. The paper concludes by discussing the problematic gendered nature of much sexting while emphasising that many participants themselves highlight positive experiences.

"Just Because I Am a Woman?" Gangnam Femicide, Misogyny, and a New Wave of Feminism in South Korea

"I did it because women have always ignored me." This quote by a man who brutally murdered a woman in her twenties in the middle of Seoul's busy Gangnam neighborhood has triggered a furious responses by Korean young women. Against the official announce by the Police indicating the incident as a random murder, Korean young women calling it *"femicide based on misogyny"* started a SNS hashtag movement #survived. Boosted by the strong blast of wind, countless numbers of mourners came to leave post-it messages in order to express their sorrow over her death and had collective memorial gatherings in front of the exit 10 Gangnam Station. Behind the wave of commemoration, there was a public concern about intense hostility between women and men, so-called "gender war." The purpose of this paper is to analyze the misogynous killing and women's collective reaction in South Korea. As examining the meanings of misogyny, gender based violence, and femicide from feminist perspectives, this paper explore issues surrounding the 'the exit 10 Gangnam Station' and socio-political meanings of the seemingly unexpected emergence of women's visible resistance and mourning fervor. Reading the incident as a symbolic signifier, I argue that the 'the exit 10 Gangnam Station' should be understood as a new wave of Korean feminism having similarities and differences with the Second Wave in the U.S., because of women's efforts not only to challenge androcentric laws and institutions, but also to deconstruct both cultural perceptions of gender violence in specific and social practices of gender inequality in general. This current feminism as a feminist social justice project, is now to reconstruct the Korean society toward more egalitarian, democratic, and sustainable one.

LEE, PO-HAN* (University of Sussex)

Between Representation and Overexposure: Queer Ambivalence Towards Global Healthification

In an era that the enjoyment of the highest attainable standard of health is considered as a human right, fundamental to the fashioned path of global health governance, this paper explores how the institutional and epistemological apparatuses regarding global health have portrayed sexual and gender minorities and ignored/silenced their health disparities 'scientifically' in international fora. This paper begins with an analysis of the WHO Secretariat's report regarding health-related issues of LGBT persons, which cited an emergent body of literature in both health and social studies, and the relevant meetings held in the Executive Board since 2013. However, there was a disappointing deadlock for many LGBT rights advocates as a result.

Simultaneously, the state-centred LGBT health politics has re-pathologised the precariousness and vulnerability of this population, which is reflected on in this paper through the observations of interactions between intergovernmental organisations and queer activists in East Asia. Some activists from this region are deeply concerned about the representation of LGBT health issues – by means of garbled or biased 'overexposure' – on mainstream media and national policies. Meanwhile, for those who do not possess a fixed sexual and gender identity or who are not 'figured' for their neglected existence, they are however further excluded by the identity-based narratives, which predominate contemporary LGBT human rights discourses and strategies.

By identifying the ambivalence towards 'global healthification' of social problems since 1990s, such an input of queer social health concerns into the realm of global health manifests a form of *homointernationalism* that potentially harm queer population in local communities by disavowing their right to health equity. In this paper, I thus argue that global health policies should recognise the multiplicity

of lifestyles without a predetermined judgement, which has limited the understanding of health professionals and policy makers regarding queer population.

The Ethics and Politics of Breastfeeding: Power, Pleasure, Poetics

Robyn Lee, University of Alberta, Sociology

The Ethics and Politics of Breastfeeding: Power, Pleasure, Poetics

Date of Publication: July 2017

Publisher: University of Toronto Press

This book interrogates the foundation of debates over breastfeeding, going beyond understanding breastfeeding in terms of choice, towards a model of reproductive justice and expanded understandings of kinship and care. The work challenges biopolitical conceptions of breastfeeding dominant under neoliberalism, developing an alternative conception of breastfeeding as an ethical, embodied practice of the self. Responding to the most widely read breastfeeding manual, La Leche League's *The Womanly Art of Breastfeeding*, It explores breastfeeding as an art, a practice that must be developed through skillful application of effort, rather than a natural or merely physiological process. It explores how induced lactation enables individuals other than cisgendered women to breastfeed and chestfeed, challenging straightforward associations between breastfeeding and "womanliness". Drawing on the work of Michel Foucault, Emmanuel Levinas and Luce Irigaray, this book develops a poststructuralist ethics and politics of breastfeeding in which breastfeeding is understood as an "art of living", involving creative practices of self-transformation.

This book is relevant to RC32 because it explores how breastfeeding is important to how sexual difference is produced and understood and examines ways of transforming the practice of breastfeeding to address ongoing obstacles to combining parenthood and paid employment. The book investigates why debates over breastfeeding continue to provoke controversy, even as breastfeeding is increasingly encouraged by public health campaigns.

Suspicious motherhood: marriage migration, borders, and precarity

In the event of a divorce, marriage migrants in South Korea are able to extend their stay on the same visa if they have South Korean children who are minors. The visa, however, is temporary and local immigration authorities grant visa extensions based on evidence of maintaining a connection between the migrant-mother and the citizen-child. As such, migrant-mothers present compelling stories regarding the boundaries of citizenship, gendered geographies, and stratified forms of motherhood in their struggle to maintain their legal status and exercise their right to parenthood after divorce. This paper examines the patterns of mobilities and immobilities of migrant-mothers, which is decided by the immigration regime on the basis of the migrant mothers' ability to prove their existing care ties with their citizen-child. By paying attention to the 'legal grey area' produced at the intersection of family and immigration mechanisms during, and in preparation for, the scrutinization by immigration authorities, the paper analyses how the immigration institutions affect the family justice system. While the family court and immigration offices are two separate bodies of the state with dissimilar mandates and mechanisms, the immigration authorities have adopted the language and instrument of the family court to used them to enforce immigration measures. The stories in this paper map the margins of discretionary power that the immigration authorities utilize to manage migrants' motherhood practices and their effect on the everyday lives of marriage migrants.

ECEC Discourses in England, Germany, Japan and Korea: Framing the Departure from the Male-Breadwinner Ideology

ECEC Discourses in England, Germany, Japan and Korea: Framing the Departure from the Male-Breadwinner Ideology

Childcare and early education (ECEC) policies, along with other 'work-family' measures, have been widely seen to signify a departure from assumptions based on male-breadwinner model families that had underpinned social policy since welfare states' origins. Against this background of shifting assumptions about what policies for families and children are supposed to achieve, policymakers in many countries have framed ECEC expansion as 'social investment'. Yet there is large variation in the way that ECEC policies have been expanded and different outcomes in terms of sufficient availability of ECEC, the weight of public and private provision, the adequacy of state subsidies of costs and the educational quality of ECEC institutions. This paper examines this expansion in four countries

spanning different welfare regimes in Europe and East Asia, and in which the ideological shifts away from assumptions based on male-breadwinner model families have been particularly stark: England, Germany, Japan and South Korea. Given that this was a period of shifting assumptions about families and family policies, we argue that both the content and the success of social investment discourses were important factors. More specifically, in the two countries whose reforms were less comprehensive, England and Japan, social investment framing was primarily located in one policy area: child development. On the other hand, in the two countries which saw wider reforms, Germany and South Korea, the concept of social investment was considered more broadly, and explicitly included female employment and demographic aims. In the latter two countries, the social investment discourse helped achieve a consensus on raising social expenditure as part of the national agenda, whereas in England and Japan, social investment framing was not able to subsume more pressing policy concerns into a coherent and dominant social investment discourse.

From Precarity to Worker Power: Through the Case of South Korean Tenant Shopkeepers' Organizing

Can new sources of worker precarity become venues for organizing and introduce novel ways to leverage worker power? I examine the case of South Korea's tenant shopkeepers who have recently established a national profile for their organizing efforts against the displacement of their shops. When scarce urban space itself becomes a speculative commodity in high demand, it is not only the urban poor residents who suffer. I analyze how the false conception of the relationship between landowners and tenant-shopkeepers as a contract between equal parties, upheld by the propertied citizenship regime, has become a source of dispossession, exploitation, and enduring inequality. However, the intensifying space-based urban precarity has also emboldened tenant shopkeepers to develop a collective identity as precarious workers. In South Korea, as in other late-industrialized countries, the self-employed sector remains a high proportion of the working population—one out of four workers are self-employed—and especially commercial tenancy occupies a symbolic place as a fallback source of employment. When the protected wage jobs moves out of one's reach—due to a low level of education and skill—or when access to the such jobs are constrained by one's age, many turn to commercial tenancy to make a living. This trend has boosted tenant shopkeepers' symbolic power as workers. I examine how this symbolic position of commercial tenancy has heightened awareness of urban space-based precarity and facilitated alternative alliances and visions for redistributing rights to the city. This case study contributes to the literature that rethinks the category of precarious work by demonstrating how the shopkeepers' seemingly privileged position as autonomous and flexible workers turns into the basis of precarity and how their dispersed workplaces, which physically isolate these workers from each other, turn into a broad network of trenches that increase the visibility of the tenant shopkeepers' resistance.

LEE, YEWON* (*University of California at Los Angeles*)

Up-Scaling Resistance for Right to the City: Through the Case of South Korea's Tenant Shopkeepers' Organizing

Can an anti-gentrification movement avoid the local trap and grow beyond the scale of a particular place-based alliance? I analyze how the context of South Korea enabled an anti-displacement organization to form a trans-local identity and organizational presence based on the precarious urban citizenship of the property-less. I conduct ethnographic research on a particular anti-gentrification movement that has gained increasing national visibility by tapping into a new base of urban constituents: tenant shop-owners who are facing eviction from their shops. By focusing on urban spaces not only as places of living but also as places of making a livelihood, I cast the limelight on how hyper-urbanization creates a condition that brings together a wider set of socio-economic classes when the lack of ownership rights becomes a source of dispossession, exploitation, and enduring inequality. Conventionally, the tenant shop-owners as a group are considered privileged due to their autonomous, self-employed status and are thought to be shielded from the deteriorating conditions of low-skilled working-class wagedworkers. However, contrary to this perception, in the face of gentrification pressure, this apparent security is more tenuous. By analyzing the contested grounds on which the tenant shopkeepers frame their right to the city, I examine how the infusion of new movement subjects creates a space to experiment with and debate an alternative vision of a just distribution of rights to the city. I also critically examine how certain ways of framing urban citizenship and deservingness can inadvertently exclude urban dwellers and even member tenants with less social and cultural capital. By filling a theoretical and empirical gap in the gentrification literature on a certain overlooked urban space-based precarity, I contribute to identifying the multiple pathways to fulfilling the vision of the right to the city and explore and scrutinize the "actually existing" resistances along these paths.

WEKERLE, GERDA (*York University*)

Developers and the Development Industry As Active Institutional Agents in Urban Policy and Planning in the Toronto Region

This paper investigates strategies real estate developers and the development industry use to influence urban and regional land use policy and planning. While research on developers' influence on planning has been growing (e.g., Coiacetto, 2000; Leffers, 2017; Ruming, 2009), developers and the development industry have remained undertheorized in studies of urban and regional spatial restructuring. This paper puts developers in the spotlight by investigating both routine and more ad hoc mechanisms through which developers shape planning policy and land use decisions. The empirical evidence informing this paper derives from case study research on the development industry in the Toronto region, Canada, including land conflicts associated with major regional planning reforms between 2001 and 2005. The argument is that land use planning is not simply an objective system of regulations enacted by politicians and planning staff; it is a set of deeply political institutions influenced by the ideas and actions of diverse actors, including developers and development industry associations. Theoretically, we draw on interpretive institutionalism to examine actors and ideas that influence planning and policy outcomes. Institutional approaches focus on the role of key actors, ideas, and strategies in influencing the trajectories of political institutions, and the confrontation of political and strategic maneuvering in the face of existing institutions and structures (Lowndes & Roberts, 2013; Olsson, 2015). This paper highlights absences in urban theory on the role of real estate developers as active institutional agents in the governance of land use.

MILLS, CHINA* (*University of Sheffield*)

Child As Metaphor: Colonialism, Psy-Governance, and Epistemicide

This paper explores the often-used framing of colonized people, and mad and intellectually disabled people, as being *like children*, and deconstructs the mutually reinforcing metaphors of the child, cognitive impairment, madness, and the 'primitive/savage'. To be *child-like* is a metaphor that is used to denigrate, to classify as irrational and incompetent, to dismiss as not being knowledge-holders, to justify action on others' behalf – in their 'best interests', to deem as un-developed or wrongly-developed, and, hence, to subjugate. For Ashis Nandy, (2007) the Western worldview of childhood as an imperfect transitional state on the way to adulthood is embedded in ideologies of colonialism and modernity, meaning 'the use of the metaphor of childhood [is] a major justification of all exploitation' (p. 59). The ways in which this metaphor contributes to the shaping of the material and discursive realities of racialized and colonized others, what Erica Burman (2008) calls the 'infantilization' of the global South, as well as those deemed mad, will be detailed. Furthermore, the paper will explore the material and discursive impact of this metaphor on children's lives, and particularly children who are racialized, colonized, and/or deemed mad. We argue that complex adult-child relations, sane-mad relations and Western-majority world relations within global psychiatry, situated firmly within pejorative notions of what it means to be *child-like*, and reproduce multi-systemic forms of oppression that silence children and all those deemed child-like.

LEGANTKE, KATHARINA* (*Georg-August-Universität Göttingen*)

Social Movements and Corporate Personhood in the US

Not only have corporations learned to deal with world cultural expectations, in a certain way they are made by world cultural expectations (Bromley/Sharkey forthcoming). I assume, that the development of the actorhood of corporations is reflected in the realm of law in the legal construction of the corporate person. Therefore, I am analyzing the conflicts about the accumulation of fundamental rights of the corporate person in the US. It is the discursive arena of the law which is constitutive to a specific form of the corporate person and there is a line of Supreme Court Cases which form the center of a critical discourse around the personhood of corporations. I will present first findings from the analysis of judgments, decisions, opinions and other documents relating to those cases, above all the infamous cases *Citizens United* and *Hobby Lobby*. I will conduct a content analysis – hopefully enhanced by automated text analysis – and I am mainly interested in the conceptions of corporations which are employed in the documents. But law is not made in a vacuum: It seems to me, that social movements are instrumental to this development in the US and internationally in three ways. First, there is a movement in the US which wants to abolish corporate personhood in general, which is directly opposing the attribution of fundamental rights to corporations. Second, the conservative movement in the US seems at least to condone this development in their fight for religious liberty and other

rights. And third, by demanding of firms to act as moral actors, the CSR and the human rights movement may involuntarily fuel this development by contributing to the consolidation of the actorhood of corporations which might be the base for the attribution of fundamental rights to corporations.

LEGETT, WILL* (University of Birmingham)

From Reflexive to Fractured Modernity: Macro Social Theory in the Crisis Era

Since the 1990s macro social theory has been dominated by theories of reflexive modernity. Associated particularly with the works of Beck and Giddens, reflexive modernization offered a reconfigured account of the modern project amidst rapid social transformation. The theory highlighted the centrality of economic and cultural globalisation; de-traditionalising pressures upon various dimensions of what was labelled simple modernity; and increasing individualisation. It was optimistic about the prospects for modernity, with Giddens developing a related, widely adopted Third Way political programme. However, twenty years on from Giddens' *Third Way* and following the 2008 Global Financial Crisis, attention is now on spiralling inequality and related conflict; a global migration crisis; and the emergence of new populist and authoritarian movements. Some fear we are witnessing threats to progressive modernity and Enlightenment itself. Resisting the temptation to condemn reflexive modernity as a zombie category, this paper offers a recuperative critique under the sign of 'fractured modernity'. First, rather than linear de-traditionalisation, threats of *re-traditionalisation* need accounting for, in spheres such as civil rights and gender relations. Second are extensive forms of *pathological individualisation*, including an alleged narcissism epidemic and global mental health crisis. Third, whereas previously agential and institutional reflexivity was posited as given, reflexivity itself is in fact contingent and under threat. Thus, behavioural economic and neuroscientific disciplines, and their deployment by corporate actors, challenge the reflexive capacities of individuals. At the same time, widespread institutional failures (finance, politics), coupled with explicit 'post-truth' assaults on expertise, problematize reflexive institutional learning. An account of fractured modernity does not abandon the insights of reflexive modernization. But in updating them, it recognises that key features of modernity are not a functional *fait accompli*. Instead, they are precarious and politically contested, with a continuing role for macro social theory in understanding and shaping them.

LEGETT, WILL* (University of Birmingham)

Weber, Post-Truth Politics and the Complicity of Social Science

The tumultuous politics of 2016 saw 'post-truth' designated as the Oxford Dictionary's word of the year. Post-truth political practices are typically counterposed to academic and expert narratives. This is broadly consistent with Max Weber's account of ethical neutrality, and the appropriate relationship between the social sciences and politics. However, using Weber's broader legacy, this paper suggests that social science is in fact deeply – if unintentionally – implicated in the emergence of the post-truth era, and in ways that extend well beyond the usual suspects of 'postmodern relativism'. Three features of Weber's work are highlighted. The first is his politico-centrism – notably regarding the analysis of the state. This marginalises the role of societal institutions and structures, as well the content of norms and values. It instead presents social life as a boundless field of 'purely' political struggle between power-seeking actors, likely to impose their own truths. The second area is Weber's more structuralist analysis of societal rationalisation. While the rise of modern bureaucracies such as an impartial civil service arguably institutionalise the fact-value distinction, they have also given rise – as Weber intimated with the concept disenchantment – to the technocratic centrism that contemporary populist movements react against. Thirdly, Weber's own preoccupation with charismatic leadership as an antidote to a disenchanted, rationalised politics is of obvious appeal when explaining the rise of populist figureheads such as Donald Trump. However, Weber's account – underpinned also by his focus on intersubjective understanding – has additionally given rise to what we might call 'leaderism' in social scientific analysis. This increasingly fetishizes the dispositions and *performance* of individual leaders, in a way that further blurs the fact-value distinction. The result of these tendencies is that social science does not just describe – but also reinforces – a post-truth political climate.

Citizen Literacy of Participatory Democracy

If "participative democracy" is a well known concept among scholars, do citizens understand and use it? In everyday life what are the main options lay people consider when discussion public engagement in public action and decisions? We will build upon a quantitative study that took place in France to investigate

what, and how lay citizens express their visions of democracy and of what can be their role in public policies. We will analyse the gap between scholars' and citizens' representations of a "good citizen". Our results also show a link between previous voluntary work and willingness to contribute to engage in public matters.

LEGRIS REVEL, MARTINE* (CERAPS CNRS Lille University)

Engaged Citizens : Par As a Bridge between Science and Society

Our society is nowadays facing major crises (climate change, biodiversity loss, economic crises, epidemic...) which can only be solved through inclusion of a diversity of citizens, and on the same time being open, transparent, anticipative and flexible enough for adaptive change (RRI process requirements). Engaging alongside researchers to reflect together on social questions and imagine solutions is crucial to become part of the decision-making process and this way take action. In this respect, a new ethic of relations between science and society is emerging and the expression "Participatory science", as well as the several attributes that can be related to it, takes on its full meaning: it is no longer about only extracting observations or knowledge from the citizen, but about co-constructing/building together research and innovation projects that are appropriate and include the citizen in each step, leading to a better understanding of phenomena and to the joint production of solutions, which is crucial to a greater social acceptance and commitment.

Nevertheless, still many stumbling blocks remain, to name some: CSO or public participation is not on the radar of many researchers, public authorities and businesses, research is not the main activity of CSOs, organizational shortcomings within CSOs, the limits of funding schemes for participatory research or the limits of trust between relevant actors. Furthermore, despite the upsurge of interests in participatory research, and public engagement, significant scientific, innovative, and socio-ecological outcomes are not sufficiently recognised and identified. This paper will discuss those issues and provide a systemic model.

LEGUSOV, OLEG* (University of Toronto)

Using Bourdieu's Theory of Practice to Investigate the Experience of International Ontario College Graduates Seeking Career Employment and Permanent Residency in Canada

With an aging population and a looming shortage of skilled labor, the Canadian government has been trying to attract more skilled immigrants to the country. International students represent a potential source of such immigrants. For many international graduates, however, the path to Canadian citizenship involves securing employment in Canada. But, even with educational credentials, many of them have difficulty obtaining jobs that suit their qualifications and can lead to permanent-resident status. This qualitative study uses an interpretivist paradigm to explore the experience of Ontario college graduates from three Russian-speaking former Soviet republics: Russia, Ukraine, and Belorussia as they attempt to transition from school to work and integrate into Canadian society. Pierre Bourdieu's theory of practice is used as the theoretical framework to analyze participants' work and integration experience. The study examines the relationship between structure and agency, as well as the interplay of three elements of Bourdieu's theory *field*, *capital*, and *habitus*. According to Bourdieu's theory, the job market can be considered a field that job seekers try to enter and establish themselves in. To do so, they need to use their cultural and social capital as well as to enhance it. They enter a complex game, which they may be ill equipped to navigate effectively because they are new to Canada. Thus the main focus of this research is to determine the degree to which international college graduates succeed in using their capital to learn the rules of the game.

Effect of Objective Well-Being Factors and Satisfaction in Different Domains on Subjective Well-Being

The great amount of academic and political interest towards subjective well-being has caused also a demand for understanding it, hence I have conducted a longitudinal data analysis about factors that predict one's subjective well-being. The analysis is focusing also on the correlations of different types of both subjective and objective well-being indicators.

The indicators for subjective well-being in my study are happiness and life satisfaction. Further, the indicators for objective well-being are operationalized from two theories. The one is Richard Layard's (2011) construction of happiness: "Seven Causes for Happiness", and the other one is the capability approach by Amartya Sen (1993). The Seven Causes for Happiness are family relation- ships, financial situation, work, community and friends, health, personal freedom and personal values; and the capabilities are mostly about satisfaction in different domains in life (satisfaction with partner, job, household income, social life, neighborhood,

and leisure time), and also financial manageability, health limitations, ability to vote, voluntary group and political group membership. The capabilities help paying attention to the relationship between the outcomes and the opportunities on one's subjective well-being.

The data is drawn from the British Household Panel Survey (BHPS), which is a nationally representative longitudinal survey of nearly 10 000 individuals over 16 years of age in the United Kingdom. The analysis based on 12 waves of the BHPS, which enables to explore whether the objective well-being factors, that might have changed in the life of an individual, have an impact in one's subjective well-being and moreover, the difference between happiness and life satisfaction. Analyses were performed using a linear mixed-effects model to analyse the correlation between objective well-being indicators and life satisfaction and happiness at different points in time.

Service Learning: Planting the Seeds of Personal Investment in Social Change

There are many ways to address social injustice. This presentation addresses one way which is to create learning environments in which students recognize that as social actors they can influence social life. Service learning, a common pedagogical tool used to link students to their communities, creates such an environment. In addition, the service learning experience fulfills several pedagogical goals: 1) it gives students the opportunity to do sociology; 2) it meets a genuine community need; and, 3) it allows for a structured reflection on the service learning experience.

Reflection is more than thinking about the service learning experience; it is about linking the experience to the insights of sociological theory and method. Reflection aids students in recognizing their civic responsibilities to those whom they provide services. Most importantly it places students in a position to recognize, and in a small way, address social injustice at a micro level of experience. At this level of experience, the seeds of personal investment in social change are planted.

The Representation of the "Brazilian Woman" (1966-1985)

The Brazilian Tourism Company (Embratur) was created in 1966, during the military regime. In this context, the Brazilian government, through Embratur, encouraged the development of a tourism infrastructure by systematizing Brazil's participation in international events, organizing international events in the country and promoting Brazil as a tourist destination abroad and aimed to build a "Brazilian tourism industry". This institutional-policy was structured from a reductionist perspective of tourism as social phenomenon. Thus, this investigation aimed to reveal if Embratur sold the "Brazilian woman" as a "product of tourism". Our objective was to analyze the representation of the "Brazilian woman" contained in Brazil's marketing materials as a touristic destination for foreigners, which were produced and promoted by Embratur between 1966 and 1985. Through a descriptive-interpretative approach, we have analyzed Embratur's official documents, its related legislation and marketing materials. Brazil's marketing materials for foreigners promoted mostly natural landscapes, historical-artistic heritage, religious festivals and rituals. However, the highlights stood in the "Carnaval" and the "Brazilian woman". White women were socially represented in beauty contests and fashion events. Non-white women were represented as: "mulatas", hypersexualized and worshiped during "Carnaval" or in the summer season advertisements, mostly portrayed half-naked in bikinis at beaches or natural landscapes; or as exotic black women related to religious rituals or gastronomy. The study investigated how the "Brazilian woman" was apprehended as a modern subject by Embratur, locating women's identities in fixed categories of Latin-American/Brazilian, female and racialized, which consequently (re)produced the stereotypes of sexualized, exotic, submissive, sexually available and domesticated. Embratur turned the "Brazilian woman" subjectivity into an object, a touristic product, through representations of localized identities, and has offered it - body and beauty - to the foreign tourist / colonizer / oppressor, in a process of fixing the "Other's" stereotype - (re) produced by Embratur.

The Origin of the Durkheimian Sociology of Religion (1886-1899)

The work analyzes the approach developed by Durkheim for the investigation of religion and religious phenomena between 1886 and 1899, a period which ranged from his first review of religion in Spencer's work to the publication of the article on the definition of religious phenomena in the *Année sociologique's* second volume. Contrary to most bibliography on the topic, we intend to uphold

the unity of Durkheim's approach to religion in this period, namely, that of the narrow parallel established between the religious and the moral in the different strata of his analysis. As we intend to demonstrate, even when Durkheim introduces relevant modifications, they do not go against his dominant ideas and are rather conceived as an improvement on the same approach. In this sense, when analyzing the texts of the period, we find that the theme of religion appears, initially, in a subordinate manner to the analysis of moral phenomena. Gradually, however, the religious becomes the focus of Durkheim's analysis and culminates, in the foundation of the *Année*, with the emergence of a relatively autonomous sub-area, *sociologie religieuse*. In this light, the refinement of his approach to the religious is manifest, while being discrepant with the general view of his earlier writings. Thus, the years 1898 and 1899 mark, inextricably, both the *apogee* of his reflections on the religious and the *prelude* to a new research agenda.

African Cities and Climate Change: Planning and Implementing Strategies for Low-Carbon Transitions

African cities face apparently intractable challenges. Populations of African countries are now increasingly concentrated in ever-growing cities, while the financial and human resources of African municipalities remain scarce. Municipal departments are furthermore heavily constrained in their action by the fragmented nature of African cities: the difficulty to elaborate integrated strategies comes not only from the usual compartmentalisation of knowledge between administrations, but also for urban planners to acknowledge the diversity of local communities' trajectories.

This paper relies on observations made during a 4-years UK funded action-research project on low-carbon transitions with medium-size municipalities in Ghana, Uganda and South Africa. The interdisciplinary research team included academics and consulting companies working closely with officers from municipalities. The research focused on having an impact on the practices of urban planners, helping to identify and prioritise actions that could reduce energy use in different sectors while promoting inclusiveness and energy access.

To establish low-carbon strategies implies that stakeholders in the local political arena are able to build a community of practices and develop a common understanding of the challenges faced by their city in implementing energy transition. This can be built by bringing stakeholders around modelling and the construction of energy scenarios in relation with contrasted future possible development paths for their municipality. But institutional changes are also needed to capitalise knowledge in the long-term and to reduce the silo effect, and also channel and allocate adequate funding on identified priorities. Furthermore, permanent organisational interface to favour a dialogue between planners and local communities has to be established and this dialogue structured, especially with inhabitants of informal settlements.

Testing the Universalism of Bourdieu's Homology Thesis: A Challenge for Comparative Analysis.

The so-called homology thesis contends that a strong relationship exists between social position and cultural practices. This idea is at the centre of Pierre Bourdieu's work *La Distinction* (1984) and all of the studies in the sociology of culture that follow this seminal opus. Bourdieu wondered whether his analysis of French society could be generalized to other cases such as the United States, Germany or even other countries as distant as Japan (Bourdieu, 1991). However, he never attempted to do such analysis. Moreover, the bulk of contributions within the context of the sociology of culture have focused on particular national cases, usually within Western Countries. The availability of the ISSP *Leisure and Sport* module (2007) offers a unique opportunity to assess the bourdieusian thesis in a context of more than twenty countries from all around the world.

The challenge that we will face is to find a methodology that respects as well a comparative perspective and the constraints of the homology perspective. In this context, a canonical analysis of ordinal variables in the frame proposed by the Gifi group appears very appropriate. This baseline methodology will be compared with other possibilities. In particular, the analysis of the measurement level in the context of this ISSP module is a way to think about the question of comparability in international surveys more generally by looking at the question of scaling and equivalence of response categories in international or intercultural surveys

To Show or Not to Show, That Is a Concern!

Dans *Daech, le cinéma et la mort* (2016), Jean-Louis Comolli nous amène à questionner les images d'exécution produites par l'autoproclamé État islamique (EI), ainsi que notre rapport à celles-ci et l'impact qu'elles peuvent avoir sur la terreur. À l'instar de cet auteur, il m'importe de réfléchir à ce qui est montré mais surtout à ce qui demeure caché, puisque le « monstre imaginé sera toujours plus effrayant que le monstre dessiné, peint ou filmé » (p.51). Ceci dit, est-ce que les bonzes des communications de l'EI puisant dans l'imagerie hollywoodienne en deviennent les pervers rouages? Est-ce que leurs mises en scène sorties des studios Al-Hayat visent à les mimer ou à les miner? Est-ce que ces dernières ne suggèrent pas plutôt que le danger est ailleurs, dans ce que l'EI « s'évertue » à ne pas montrer et/ou dans l'angle-mort de des spectateurs? Si les vidéos de propagande « supposément naïve, car trop directe » (p.17) peuvent nous convaincre de la puissance de ceux qui s'y laissent entr'apercevoir et de l'impuissance de ceux qui les voient, ne peuvent-elles pas aussi être des opportunités de se rappeler de la puissance désormais trop souvent obliérée contenue autant dans le choix de montrer et de ne pas montrer que dans celui de regarder et de ne pas regarder? Pourquoi cette guerre globale des images s'infiltrant plus massivement et intimement dans nos vies que les attentats terroristes et leurs contre-attaques demeurant dans le local ne pourrait-elle pas s'avérer une opportunité de savoir si nous sommes encore plus naïfs que ceux faisant « sauter » leur propre interdit de la représentation et, en quelque sorte, perdants, parce que, ni Hamlet ni Caïn, nous refusons de paraphraser nos questions existentielles : faut-il montrer/regarder ou ne pas montrer/regarder et qui est le gardien de mon frère ?

History As Process: How Youth Can Make New Tools

Young people today face a more uncertain and difficult future than any generation in a century. The challenges include under-/unemployment, crippling debt, poor social mobility, increasing education demands, and a lack of capital, all in the context of climate change, conflict and a distracting digital world. Young people urgently need insight into today's world as well as the intellectual tools to flourish or even survive in it. This paper looks at the world and young people's place in it through a critique of globally pervasive frames of reference (here called global cosmopolitanism) that include progress, individuality, objective knowledge, capitalism and justice. It argues that it is precisely these frames that hinder insight into the problems facing young people today and moreover inhibit action; in other words, that part of the problem for young people today are these old "tools" themselves. The paper argues, drawing mostly on Gilles Deleuze, that the challenges facing young people are historical-structural and that a processual approach to history and change as well as subjectivity and action will make this visible. At the same time such an approach undermines and deligitimizes the dominant frames of reference and points to other frames (for example, freedom as knowing the forces that act on us) as well as the possibility of heterogeneous (transnational) social structures.

LENCO, PETER* (*Aion Research Insight*)

Mapping the Limits of Relational Sociology. an Ontological Approach.

Although relational sociology as a distinct approach is becoming more of a household name in academia, it remains indistinct because its theoretical net is cast rather broadly. This is nowhere more so the case than at the very heart of its theory when we think of precisely what a relation is in the first place. The spectrum runs between relations basically as *any* sort of connection between units on the one side, to the units themselves being the product of ephemeral relations on the other; and there may be other axes besides. This paper argues that this is

a stumbling block for relational sociology, for at present we have ontologically incompatible approaches under the same rubric. Thus it seems urgent that we sort out these divides. The paper proposes to do just that by using process philosophy (Whitehead and Deleuze) to compare the more humanist approach of Archer and Donati with the so-called transactional approach of Emirbayer. It argues that the transactional approach is more ontologically robust, but that at the same time it need not totally reject the notion of actors and can even accommodate (with caveats) a humanist agenda. Furthermore, we need not break up the relational sociology fold, so long as we are clear as to what precisely is on offer among its various voices. The paper argues that this should be done on ontological grounds.

The Failed Welfare State and Its Gendered Effects in Urban America

This ethnographic research explores gendered mechanisms operating in the context of urban America, specifically in one neighborhood in Detroit, Michigan. As state cuts and the retrenchment of the welfare state continue in the United States, availability of resources is abysmal. As a result, women, especially mothers and those in primary carework roles are disproportionately affected. Two decades ago, more resources including healthcare and cash support for child care and elderly care assistance were more often funded and more easily garnered. Today, the time and responsibilities required in both paid and unpaid carework hinders opportunities for additional or better paid work. In some cases, women are leaving full-time jobs or education paths to conduct carework, largely done in the home. The burden and precarity of carework upholds intergenerational poverty and reproduces intersectional inequalities, including long-term negative health outcomes related to stressors stemming from care duties and lack of resources. Findings reveal gendered processes in examples including: 1. men in male-headed households often find themselves relieved of care work which is then handed over to women outside of the household. 2. the brunt of the care work of grandchildren falling on grandmothers 3. women volunteering at community organizations to help secure supplies such as diapers, pads, and over-the-counter medications for the household. 4. less time to earn money in formal or informal economies. Informal care activities and gendered strategies include self-provisioning and cultivating support from communities and, when available, kin. These strategies put a strain on economic, social, and emotional resources of households and communities; thus depleting their ability to mitigate the effects of poverty.

The New Spirit of Academic Capitalism: A Sociological View on the Unintended Consequences of Ratings, Rankings and Scientometric Indicators

The presentation will outline the major findings on the consequences the new public management and academic capitalism has on knowledge production in capitalistic societies. Starting with the observation that society faces a "new spirit of capitalism" (Boltanski/Chiapello) the specific consequences of the emergence of "academic capitalism" (Slaughter/Rhoades) and the implementation of a "new public management" (Horton) in German universities are analyzed. To catch the process of economization and marketization thirty biographical interviews with German professors from various subjects have been conducted to reveal the underlying processes of academic lifestyles and knowledge production. In particular, the intended and unintended consequences of ratings, rankings, and scientometric indicators on the academic profession will be analyzed.

The interviews show that a significant personality shift within the academic profession takes place giving rise to professors with an entrepreneurial spirit and managerial skills. Moreover, the findings reveal a structural change in the *illusio* of the field away from an intrinsic driven motivation to produce knowledge and innovations into science as an ordinary career path. The findings highlight the long term issues that arise if sciences are transformed in accordance with new public management, output orientation, acceleration and the measurement of research grants, journal publications using scientometric indicators. In short I demonstrate a transformation of the *academic habitus* aligned on the innovative production on knowledge into a managerial habitus aligned on the successful positioning in the academic field and therefore strategically interested in the reproduction of existing knowledge. The talk is devoted to the analysis of the social dimension of science-metrics and the unintended consequences for the academic profession.

Patterns of Same-Sex Partner Choice in Germany

Whereas acceptance of same-sex partnerships has been increasing in Western societies, research on same-sex partner choice is still scarce. Due to the small number of same-sex couples, large datasets are needed to identify patterns. Our empirical study is based on German Microcensus data – an annually official household survey representing 1% of the population in Germany – from 1996 to 2013. This database allows us on the one hand – and for the first time – to trace trends of same-sex partnerships for a period of almost twenty years and on the other hand to analyze their patterns of partner choice.

Our empirical analysis focuses on assortative mating behavior. We compare same-sex and different-sex couples with respect to age and educational homogeneity. Moreover, the large dataset allows us to differentiate between female and male same-sex partnerships as well as to account for changes in assortative mating over time.

We assume that same-sex partnerships are less homogenous than different-sex partnerships. One reason is that social norms about partner choice do not or only to a lesser extent apply to same-sex couples. More importantly, the pool of potential partners is much smaller for homosexuals than for heterosexuals, so that existing preferences (for homogamy) will be harder to realize. However, over time, we expect an increase in age and educational homogamy of same-sex couples – mainly as a result of increasing opportunities.

JECHT, TANJA* (*University of Bielefeld*)

Hegemony – Stabilizing Supremacy

In the theory of power by Max Weber "hegemony" is introduced as a form of power through constellations of interest – if only to distinguish his own concept from it. Almost at the same time Antonio Gramsci put the concept of "hegemony" in the centre of his research marking it to be the central form of power in early Fordist societies. He was especially interested in how supremacy could be maintained through the continuous production of approval and consent – not being imposed through violence and force. Since this early development there is a vital discussion about "hegemony" in diverse disciplines. In sociology the term is particularly connected with the concept of hegemonic masculinity. It is instructive to notice that within these sociological debates the political philosophical tradition of the concept of hegemony is not problematized, although it is a (methodological) challenge for research.

After starting our talk with a brief introduction and problematization of the concept of "hegemony" from a sociological point of view (1.) we will focus on the question of (2.) how hegemony is stabilized in every day practices and (3.) in which contexts hegemonic practices and discourses are questioned and/or reconfigured by bringing in data from group discussions that we conducted in our ongoing DFG-funded project "Reconfigurations of Masculinities". We will show that the construction of hegemonic masculinity (still) is a dominant pattern for men's every day life experiences and practices, particularly in connection with the "paradigm of work" ("Erwerbsarbeitsparadigma"). Our material also enlightens the fact that "standard work" ("Normalarbeit") is getting brittle and that the fissures that arise from this confront our interview partners with the challenge to gain new knowledge and to create new action strategies. Within also lies the potential for change and for questioning and contesting established power structures.

Processes of Unification in Germany: (Re-)Configuring Religious, National and Gender Identities

It is not at least Stuart Hall's merit to highlight that there is no pre-given identity. Therefore, it is to ask how elements of identity come together and become (relative) stable. With theory of hegemony we can stress that these processes of unification – in particular of collective identities as national or religious identity – go hand in hand with social struggle. Within these struggles opposed interests, adversarial needs and different views of life are connected to a "reasonable" compromise, a consensus that is supported by "civil society".

In my talk I will focus on a struggle that takes place in Germany recently: a revival of a religious based antagonism. In a different way to a long period of the antagonistic relation between two Christian denominations – Catholic vs. Protestant – there can be observed the rise of an antagonism between Christian and Islamic religion. What is instructive is that this antagonism is interrelated to national identities ("foreign nationals"; "Arabs", "North Africans" vs. "Germans") and gender. Based on material conducted in an ongoing project funded by the German Research Foundation I will argue that the figure of the *Muslim patriarch* is a pattern that members of our group discussions use to stabilise their (masculine) identities via demarcation. Therefore the rise of a "new" religious identity is not threaten the identity of hegemonic social positions but stabilizing it.

My talk will start with a brief theoretical discussion on the interrelation of identity and hegemony, followed by an introduction of the observed phenomenon of connecting gender, national and religious identities in Germany and finally bring-

ing in data from group discussion to show how this connection is used for stabilizing identities: the "own" identity becomes more distinct.

LENKA, PAPESH K.* (*Pondicherry University*)

Farmer Suicides in Odisha, Eastern India

Since the last two and half decades there is a growing literature on farmer suicides in India. While one group of scholars holds the view that these suicides are mostly due to rising cost of cultivation and decline of farm income the other group attributes them to the changes in government policies on agriculture and rural development following neoliberal reform measures. Yet another group views these suicides as the combined effects of a set of complex socio-economic reasons. On the other hand, the government appointed committees and commissions attribute these suicides to erratic monsoons and adverse climatic conditions. However, the studies on farmer suicides are mostly confined to the advanced states like Maharashtra, Karnataka, Punjab and Andhra Pradesh which reported a wave of suicides immediately following the economic reforms in early 1990s. The backward states like Odisha which experienced suicides in the recent years are yet to receive due attention. Hence, the present paper makes an attempt to analyse the farmer suicides in Odisha with reference to agriculturally advanced Bargarh district that has reported highest number of farmer suicides.

The paper is divided into four parts. While the first part reviews the major discourses on agrarian change and farmer suicides, the second section provides a broad macro background on nature of agrarian change in the state with a special focus on Bargarh district. The third part examines the causes of suicides at the micro level based on information collected from family members of the sampled deceased farmers. The last section draws conclusion.

The paper attributes farmer suicides to the rising trend of exploitative tenancy practices, the absence of a farmer-friendly marketing mechanism and the emerging values of individualism and consumerism in the rural society.

LENZ, ILSE* (*Ruhr University*)

Gender Transformation, Care Work and Organising in Flexibilised Global Capitalism

The ongoing transformation of gender relations and capitalism implies new chances and new barriers for gender and labour organising. In postfordism, the Fordist breadwinner/housewife model has been replaced by flexibilisation and precarisation of large groups of women and men. Flexibilised global capitalism has propelled the commodification of women's labour power in various flexibilised forms for example as informal workers, home workers or on irregular and precarious arrangements. New combinations between unpaid, low paid and informal and wage work are emerging calling for intersectional analysis looking at gender, class and migration. One example is the combination of work by family members, irregular migrants and public kindergartens in childcare.

Feminist and grass roots labour movements have been another force transforming gender relations by struggling for women's rights to independent and decent work. Women have entered the global labour force on a large scale. In paid care work, they have organised in various forms from engaging in trade unions in the service sector to networks of irregular migrant domestic workers. Nancy Fraser's critique of elective affinity between feminism and neoliberalism focuses on upper class feminism in the US and neglects these worldwide contentions.

I will argue that the transformation in gender relations generates new tensions as well as new chances for labour movements and organising in care work. In childcare, for example, several labour struggles have developed cross mobilisations involving mothers/ parents, kindergarten teachers, feminists and local civil society. Thus, they provided new approaches to the issues of care, work and human and social life. Labour organisations also could strengthen the networks with other movements, as parents and feminist networks. Summing up research on these struggles, I will analyse their potentials as well as their limits.

LENZ, ILSE* (*Ruhr University*)

Processual and Reflexive Universalism from a Transnational Social Movement and Gender Perspective

Presently, approaches of *processual and reflexive universalism* are emerging in social movements. First I will draw on critiques of eurocentric and androcentric 'thin universalism' by gender and social movement perspectives. Then I will analyse the understanding of universalism and difference in two feminist core debates: care work and developmental feminism from the South.

From a social movement and gender perspective, the decline of universalism has been linked to the critiques of eurocentric and androcentric ideologies. Some of them conceived universal subjects as (implicitly male) homogenous persons like 'the citizen/political subject' in the welfare state oder 'the worker/breadwinner' in capitalism without envisioning differences. Women, Black or colonised

persons were relegated outside and framed as 'others'. This 'thin universalism' was seen as legitimating deep inequalities by setting a hegemonic homogenous standard and excluding the 'otherised' as different.

Therefore, feminism and antiracist movements insisted on social difference by gender and 'race' decentering the homogenous subject. Some currents maximised difference and joined postmodernism with its general distancing from universalism. While insisting on gender and racialised differences, other currents attacked inequalities resulting from these hierarchies and thus in effect referred to inclusion and participation of all persons as universal standard. I will analyse two transnational feminist debates for their explicit and implicit understandings of universalism and differences: 1) the care work movement 2) the Development Awareness of women Network (DAWN) from the south.

From these debates, approaches of reflexive 'thick universalism' which include differences based on symmetric relations and inclusion can be developed. They negotiate universalism/ difference in processes of deliberation around social movement issues, aims and subjectivities. For example the importance of diverse men for changing care work has been negotiated in diverse ways. These approaches of *reflexive and processual universalism* can provide new concepts for universal social policies.

The Broken Promise of Meritocracy? German Middle-Class Perceptions of Upward Social Mobility in the Era of Rising Inequality

In our paper, we study German upper- and lower middle-class perceptions of upward social mobility in the current era of rising inequality. Germany is a particularly interesting case because its traditional self-image as a "levelled middle-class" society has recently been challenged by increasing economic inequalities affecting the social fluidity of Germany's social structure (e.g. polarized income distribution, income inequality, and risen poverty rates). Nevertheless, surveys show that there is still strong support for the idea that the prospects for upward social mobility are primarily based on achievement-related factors.

We try to elucidate this contradiction by using a mixed methods design. Based on representative survey data from the German General Social Survey (ALLBUS, 1976-2014), we ask how perceptions of upward social mobility have developed during the last forty years. Our findings show that while people attribute increasing importance to ascribed characteristics, achievement-based factors are rated as consistently more important. To understand this ambivalence, we analyze qualitative data of four focus group discussions with upper- and lower-middle class members, paying particular attention to the transformation of the effects of ascriptive- and achievement-characteristics in everyday practices.

These qualitative findings show that upward mobility in the era of rising inequality is a central topic in all group discussions. In line with the quantitative results, both ascribed and achieved characteristics are seen as important for working one's way up the social hierarchy. This ambivalence, however, is solved through different moral interpretations which vary across social classes. While upper-middle class members formulate an *individualized interpretation* of upward mobility, members of the lower-middle class put forward an *agonistic interpretation* in which upward social mobility is reinterpreted as a "test". Thereby, achievement and ascription both figure prominently in people's everyday perceptions of social mobility, while the increasing importance of ascribed characteristics does not challenge the idea of meritocracy.

The Symbolic Order of Social Inequalities: Strategies of Justification in the German Upper Middle Classes

Our paper aims to provide a better understanding of the symbolic order of social inequality in Germany by analyzing how it is perceived and justified among upper middle-class members. Since the early 1990s, social inequality in Germany is rising. Currently, especially right-wing populists' interpretations of the subject are gaining popularity. Against this backdrop, we consider it crucial to investigate, how influential social groups understand social inequality and its possible political consequences. Thus, we focus on these elitist groups, who are equipped with cultural, social, and economic capital and have a significant influence on public discourses and political decisions.

By following the theory of justification as it was described by Luc Boltanski and Laurent Thévenot, we assume that societal orders can only exist on a normatively legitimized basis. In what is called "orders of worth", different orientations towards a "greater good" create guidelines for a justifiable implementation of principles of fairness. We therefore examine, how upper middle-class members relate to the issue of social inequality by mainly analyzing what they consider as

serving the common good. Our findings derive from three group discussions with upper middle-class members. To identify characteristics of the symbolic order of inequality our analysis is based on the Documentary Method of interpretation which pays attention to the underlying normative orientations of everyday practices.

Our findings show that social inequality is a central topic in the perceptions of upper middle-class members. Nevertheless, they tend to legitimate these inequalities functionally as inducing productivity. Furthermore, they justify inequalities through a cultural and moral devaluation of lower classes, claiming that differences in chances of social advancement are due to a lack of individual motivation and merit as well as "deficits of socialization". Paradoxically, the way inequalities are criticized here leads to a reproduction of these inequalities.

LENZ, THOMAS* (University of Luxembourg)

School Curricula between Global Isomorphism and Local Idiosyncrasies: The Example of Luxembourg

Today, educational questions are discussed on an international level, and, indeed, the different national school systems are adjusting to each other on a formal level. This isomorphism has led to a neglect of the cultural idiosyncrasies of the different school systems and thus to marginalization of the question of how the successful process of institutionalization of the modern school system came about in different nation states. However, dominant theories about the process of globalization in education argue that the global affinities are on a formal level only, and that the inner activities of education are hardly affected by these global developments. Other theories try to explain why encompassing reforms fail as soon as they change the inner logic of the school.

Against that background the desideratum of a sound cultural reconstruction of the institutionalization process of the national school systems becomes evident. The general hypotheses of my paper is that when educational policy successfully transfers formal structures of one system to another, it will first be in tension with the idiosyncratic convictions of the local culture and then it will affect primarily the formal structures, with little effects on the inner activities of the organization.

I will try to support these theoretical considerations with a historical reconstruction of the development of the Luxembourgish school curriculum. I will argue that while Luxembourg has tried to keep track with the "scientification" and rationalization of the curriculum as promoted by supranational policy agents (like the OECD), this attempt to follow international reform patterns was contradicted by national and local traditions inscribed into the curriculum and classroom practices prevalent at least since the founding of the Luxembourgish nation state. The case of the Luxembourgish curriculum will demonstrate how international curricular discussions shift and change when they are applied on a national level.

LEONARD, MADELEINE* (Queen's University Belfast)

The Teenage Gaze: Teens and Tourism in Post-Conflict Belfast

Childhood studies is increasingly seen as a multi/inter-disciplinary subject drawing on and contributing to debates in sociology, anthropology, psychology, geography and other ever growing disciplines. However, the contribution of childhood studies to tourism studies remains underdeveloped with children marred by their absence rather than their presence with Small (2008: 772) noting 'a review of the literature highlights that most of the research on age has been undertaken within a positivism paradigm with the emphasis on description rather than social understanding'. Hence, where children are included, it is often in a passive way as members of families going on holidays. While there is some reflection on children's impact on adults' decision making over location (Wang et al, 2004; Nickerson and Jurowski, 2001), for the most part, the adult gaze dominates tourism research involving children and young people. The purpose of this paper is to address the absence of children in tourism studies by outlining a novel methodological approach concerning a case study of involving teenagers in tourism by enabling them to co-construct a tour of Belfast. The presentation first outlines the absence of children in tourism studies which is dominated by the adult gaze. This is followed by a review of the pivotal role of tour guides in leading the tourism experience and the subsequent neglect of the audience, particularly children and young people and their potential role as co-creators of tours. The case study involving teenagers in Belfast planning and organising a tour of the city is then introduced and the value of seeing the city through their eyes is evaluated.

Degradation Ceremonies Revisited: Organizational and Biographical Ways of Coming to Terms with the Military Past of the GDR

When the German Democratic Republic (GDR) acceded to the Federal Republic of Germany (FRG) on 3 October 1990, the National People's Army of the GDR (*Nationale Volksarmee*, NVA) as well ceased to exist. Full command authority over the GDR armed forces passed to the Federal Minister of Defense of the now unified Germany, and the Bundeswehr, the military organization of the Federal Republic of Germany, was called to dissolve the East German armed forces and to integrate parts of its personnel. The paper analyses this politics of integration and its impact on East German soldiers' biographies. For this, it draws on the findings of a research project based on biographical interviews with former officers of the East German National People's Army.

The aim of the paper is twofold: On the one hand, by taking up the concept of degradation ceremonies first introduced by Harold Garfinkel (1956), it will explain the logic by which the Bundeswehr organized (and legitimated) the admission of former "enemies" amongst its ranks. On the other hand, the effects of this politics of integration on the individual level are discussed. They show that organizational degradation ceremonies imply the assignment of new social identities by devaluating the past, which also has to be dealt with biographically and thus affects (and alters) biographical narratives.

LESCHZINER, VANINA* (*Department of Sociology, University of Toronto*)

Thinking Relationally between and Beyond Fields

One of the major relational approaches in sociology, theories of fields (including Bourdieu's and organizational theories, among others) have been mostly concerned with the internal dynamics of fields. This follows from the premise that fields are relatively independent from the larger social space, and shaped by their own internal dynamics (Bourdieu, 1993), a conceptualization that has led to great progress, but also limitations. For one thing, it has given rise to a myopic view, one that has little to say about the boundaries of fields, and even less about the relationship between fields. For another thing, it has led to a limited view of social space, unable to account for variance in the scope of fields. I will use the example of culinary fields, for they make a particularly good case to examine the pitfalls of extant approaches, and propose a more thoroughly relational framework. Research on culinary fields has blossomed in recent years, with studies conceptualizing culinary fields to be as localized as a city, bounded by national borders, and global in scope. Rather than adjudicate upon extant conceptualization of culinary fields, I will suggest that fields of different scope co-exist. If fields are social spaces whose boundaries and internal morphology are constituted by relational processes, it follows that, even within the same area of activity, actors may be embedded in fields of different scope, because these are formed around different stakes (e.g., chefs orient their actions to local peers to survive on the market, but to global peers in the competition for rankings). I will thus propose a conceptualization of cuisine as nested fields. Through this framework, I seek to contribute to theories of fields by complementing their focus on internal dynamics (see Fligstein and McAdam (2012) for an exception) with attention to the vertical relationship between fields.

Sustainable Development Goal 3 and Tackling the Public Challenge of Suicide in Jamaica

Positive mental health plays a critical role in shaping the human development landscape of any country. Persons who are mentally well are better able to lead productive and dignified lives, recover from shock, realise their full potential and transition out of poverty. Goal 3 of the 17 United Nations Sustainable Development Goals (SDGs) was developed based on this recognition and the need to 'promote mental health and well-being for all, at every stage of the life course' (United Nations Economic and Social Council 2016). However, the inadequate policy attention given to the risk factors and warning signs of suicide in Jamaica might delay realisation of this SDG. Previous research has shown that majority of people who attempt or die by suicide have one or more mental health conditions which in some cases may go untreated and unrecognised (National Health Service 2015). Jamaica has had a similar experience, but there is a paucity of research on the extent to which relevant public policies have changed in seeking to address the needs of persons at-risk of committing suicide. By largely drawing on secondary data and international good practices, the paper argues that Jamaica may not realise SDG 3 Target 3.4 within the specified timeframe if persons with known mental health disorders and psychosocial disabilities continue to suffer exclusion, and mental health services and care remain neglected.

LESSENICH, STEPHAN* (*Ludwig Maximilians University Munich, Department of Sociology*)

Externalization: The Hidden Side of Capitalism's Success

The thread which had once held Critical Theory and Political Economy together has been loosened, if not largely undone, in neo- and post-Marxist theorizing since the 1970s. What has dominated the scene in the last two decades has been the detection of a "new spirit of capitalism" inspiring and fueling the current stage of capitalist development. Questions of the material and physical reproduction of so-called post-Fordist or post-industrial capitalism, however, are being debated only in specialized circles at the margins of Critical Theory. Karl Marx' 200th birth anniversary seems to be the adequate occasion to go "back to basics" – from the reconstruction of ideological superstructures to the analysis of the material basis of contemporary capitalist dynamics. Critical feminist theorizing on Marx' analysis of the process of capital accumulation proves to be an excellent starting point for such a "materialist" re-orientation, as this strand of theory aimed at taking Marx seriously when he was postulating not to take the "bourgeois" narrative of equivalent exchange at face value. It is this strand of theorizing that from early on pointed to physical reproduction and reproductive labor as the functional, yet hidden precondition for the accumulation of capital and the social distribution of wealth in capitalist societies. By matching this theoretical position with conceptual developments in International Political Economy and Ecological Economics, we can gain a more substantial – and substantive – understanding of the reproduction of contemporary capitalism: It is the "externalization" of reproductive functions into the realm of the invisible and unacknowledged "Other" of capitalism which has shown to be central to modern capitalist development. Most importantly, only by taking into account this "dark side" of the capitalist success story, the reproductive mechanisms of capitalism as a definitely global entity and enterprise can be elucidated.

Locative Media: Adoption and Use of Mobile Apps in Public Spaces

The focus of our presentation lies on implications of locative media for urban social life. Locative media is an umbrella term for a new form of mobile apps, providing users with digital information about their social and material surroundings. Commonly known examples are Foursquare, Pokémon Go, or Tinder. These apps change the ways that actors sense and interact in public spaces. For instance, the diffusion of locative media strongly affected navigation practices of travellers, moving through unknown or unfamiliar areas. Some apps extend the perception of material spaces by including virtual creatures and objects; others serve as a social radar in everyday life to locate nearby friends or to look for potential flirt partners. We investigate new practices arising from the adoption of locative media, asking whether using these apps opens up opportunities for social inclusion by creating new spaces of encounters, or rather establishes spaces of retreat leading to social exclusion. This broader question has to be examined differently for specific apps. Whether new opportunities for inclusion or exclusion are emerging depends on the functionalities enrolled in the apps as well as on the cultural frames of usage practices. Although locative media is a recent phenomenon, the number of corresponding apps is already too large to examine the field as a whole. We will present first results of exemplary case studies, designed to investigate typical forms and consequences of the use of locative media. The case studies examine adolescents and young adults in three cities, which are known as cultural breeding grounds for locative media practices: Berlin, New York, and Tokyo.

Critically Examining the Norwegian Sport for Development and Peace Context: Partnerships and Policies

The Sport for Development and Peace (SDP) movement has gained international recognition from governmental, intergovernmental and non-governmental organizations (NGOs), sport federations and corporate sponsors. Participation in sport has been promoted as a medium to attain development goals (Kidd, 2008), and a plethora of entities have emerged since the United Nations adopted SDP as a part of its development agenda. Norway has been a leading donor country in the SDP movement (Right to Play, 2008), and has funded Norwegian actors including the national Olympic Committee, various sport federations and NGOs.

The participation of a diverse range of actors in SDP has exhibited a vast assortment of organizational values and approaches to foreign aid. The current body of SDP scholarship has highlighted the tension between elite-performance athletics (i.e., sport development) and mass participation sport (i.e., sport for development), as well as among top-down and bottom-up approaches to development

(e.g., Black, 2010; Houlihan & White, 2002). Partnerships have often been formed between actors that have possessed ideological differences in values, which has routinely led to the submission of 'weaker' partners to the realization of priorities set by more well-established actors (cf. Black, 2017; Hayhurst & Frisby, 2010). In so doing, the unbalanced set of power relations between partners has frequently upheld the hegemonic practices of neoliberal and neocolonial agendas in SDP (cf. Guest, 2009; Kidd 2008).

While there has been growing scholarship that has critically examined partnerships in SDP (e.g., Black, 2017; Hayhurst & Frisby, 2010), few studies have investigated partnerships in the Norwegian context, despite Norway's position as a vital actor in the international SDP movement. This study will therefore examine the nature of the relationships among the variety of Norwegian SDP actors in addition to the ways in which Norwegian SDP policies have been influenced by partnerships among these actors.

Experiential Knowledge As the Basis of Power in Organizational Democracy

Since the end of the last century, strengthening the user perspective has become a policy initiative in many countries, including the Chinese community of Hong Kong. In the name of ensuring service quality, the Hong Kong Social Welfare Department requires subvented welfare service organizations to incorporate the users' perspective in service planning and management as a condition for continual funding support. This regulatory measure encourages welfare service organizations in Hong Kong to develop user participation initiatives, which promises to transform the welfare service users from passive recipients of service to equal partners of the service providers in the organizational decision-making.

Notwithstanding popularity of the user participation rhetoric, formal and elite knowledge continues to outshine lived experience of the service users as the knowledge premise to guide practice and service decisions. Believing that technical or expert knowledge alone is insufficient for resolving service problems, proponents of participatory practices have been advocating for recognizing the personal and lived experience of the service users as a major source of truth in the mandate of knowledge. Nonetheless, how personal experiences can be inscribed as a new form of authority in the knowledge mandate is under-researched.

The presentation is based on a qualitative study that set out to understand how the welfare service practitioners processed the particularistic and substantially detailed experiences of the service users, and the extent that users' experiences were accepted as a legitimate body of knowledge to influence decision-making. The study identified an uneasy compromise when the users' experiences did not align with the normative understanding of the service practitioners. It uncovered the ways that experiential narratives of the service users were employed to confirm the expert knowledge system. Based on the findings, the presentation will discuss how knowledge power can be reconstituted to realize organizational democracy in the welfare service context.

Discriminatory Media Reports Against Mainland Chinese New Immigrants in Hong Kong

Since the transfer of sovereignty in 1997, the connection between Hong Kong and mainland China has become increasingly close. Mainland-Hong Kong marriage is prevalent since the 90s; it accounted for 38.0% of the total marriages registered in Hong Kong in 2013. The "One-way Permit" scheme (OWP), which is mainly for family reunification, has a quota of 150 new residents from mainland China per day. The number of landed immigrants under this scheme reached a new high in 2016 (over 57,000 individuals), stimulating controversy over immigration restrictions and integration issues specifically directed toward the mainland Chinese immigrant population. This study aims at unfolding the public discourse and the media representation of this immigrant group in Hong Kong.

The study adheres to the analytic paradigm of Critical Discourse Analysis employed by Fairclough (2010) and van Dijk (2008). News articles and columns from major newspapers in Hong Kong were analyzed. The ideological underpinning and taken-for-granted assumptions in the language of media reports were unpacked. Using the analytical tools suggested by van Dijk (2008), we found that the reports contain indirect forms of "racism" even though the discriminated population is racially, ethnically and culturally similar to the Hong Kong local majority. Moreover, the reports emphasized the "cultural" differences between the local and immigrant populations, but the term "culture" often embodied the situated meaning of political attitudes such as support to the Chinese Communist Party. The new immigrants were portrayed to be "culturally" deviant and "threatening" (e.g. on housing and welfare) in order to support the journalists' proposition to decrease OWP quota. Even though the controversy implied the political resistance by the local society under "one country, two systems", the discriminatory discourse affected the integration of immigrants, which has already hindered the justice, diversity and harmony within the society.

Family v.s. Career: Negotiating Experience and Mobility of Chinese Immigrant Mothers in Toronto

Marxist feminists suggested that women's engagement in the domestic sphere widens the inequality between genders. Power of fulltime mothers is diminished through unpaid family caretaking and their full citizenship participation is covertly denied in the capitalist welfare society. Although previous studies has already discussed how childcare burden discourages mothers from embarking on career development and engaging in the community, the intersectionality of gender and early immigrant experiences is still missing in the literature.

This study aims to explore the lived experiences of Chinese mothers in Toronto regarding to their child care, transition and support network. In the larger project, we interviewed 61 immigrant participants from Mainland China, Hong Kong and Taiwan, as well as some Canadianborn Chinese participants. Seven of the overall participants were immigrant mothers who had gone through child care at their early immigration stage. From these interviews, we found that most of the interviewed immigrant mothers had completed college or above and had a full-time job in their place of origin. However, after immigration, they changed their career plan due to the challenges such as child care, employment gap, language barrier and family concerns. Some participants reported that they used to have abundant support to parenthood back home, but immigration impacted their support network, which in turn changed their career decisions. Findings provide better understanding on the intersectionality among child care, employment and immigration of Chinese immigrant mothers. Strategies they employed to negotiate between child care and employment also revealed their agency and mobility during the transition process.

LEVAOT, Yael* (*Israel Trauma Coalition*)

LEVANON, TALIA LEVANON (*Israel Trauma Coalition*)

Building Regional Resilience in Muslim Minority Community in Southern Israel

Ethnic minority status has been found to be a major risk factor that can explain the variable responses to trauma within many of the world's sub-populations. In Southern Israel, missile attacks, sirens warning of imminent attack and the threat of attack are all part of the landscape. The feeling of insecurity is even more acute for the Bedouin community due to a lack of bomb shelters. In some of their communities, there is also a dangerous tendency not to adhere to instructions of the Home Front Command in times of emergency. The Bedouin communities also experience exaggerated levels of trauma in their everyday lives. Sources of such trauma includes high poverty, food insecurity, as well as intra-community violence.

As a direct result of Israel Trauma Coalition's ongoing perception of partnership with regional leadership, and in collaboration with the Ministry of Health, the ITC recently established a Regional Resilience Center for the Bedouin population. The Center not only serves the local population, it is serviced by the local population, staffed by local service providers and ultimately establishing a system in which the Bedouin community becomes self-reliant.

Over the past two years the ITC has successfully developed and implemented this model for regional training disaster preparedness. The advantage of such centers is the ability to enhance emergency preparedness and at the same time to create a strong regional professional preparedness network.

The center's model works on four levels: Local Municipality Emergency Protocol Development, Educational System Preparedness Training, Trauma Response and Treatment Training for Professionals and Community Resilience Workshops and Training in the community. The model allows for the accommodation of specific needs whilst concentrating resources to provide regional training for both Jewish and Arab professionals. By coming together, a regional vision can be formed and implemented alongside individual council needs for disaster preparedness.

Transnational Higher Education: Means for Social Mobility or Echo of "Persistent Inequalities"?

Transnational higher education (TNHE) is a key facet of the internationalization of higher education. Its main characteristic is that students can get a foreign degree without having to move to the country "in which the awarding institution is based" (Council of Europe, 2002). TNHE is often presented as a means to achieve a win-win situation beneficial for all the stakeholders involved. It allows students to benefit of a larger range of educational opportunities. For countries where it is implemented, TNHE is considered as a tool to improve their higher

education system and to expand enrollment. For higher education institutions exporting education, TNHE is a way to reach “new markets”, enhance international reputation and competitiveness. From a geopolitical point of view, TNHE seems to occupy a special place between “cooperation” and “competition”, which is worthy of attention.

Little is known on the characteristics and motivations of students enrolled in these kinds of programs and a lot of questions remains unanswered: Is TNHE an integral part of socially stratified higher education systems? Does TNHE broaden access to higher education? How does it intersect with the global “axes of power”, i.e. gender, ethnicity and class?

By using original data generated by a survey conducted in eleven German TNHE in ten countries, this paper explores these kinds of issues. On the one hand, the results show how TNHE is often perceived by a nascent middle classes to pursue distinction and status. On the other hand, they also reveal an enabling potential of sort. Indeed, TNHE allows some people to access higher education. Furthermore, it also seems to contribute to the acquisition of “mobility capital” and of the “capacity to aspire” (Appadurai).

LEVENSON, ZACHARY* (*University of California, Berkeley*)

Race, Class, and Immorality in a Land Occupation: Struggles over Housing Stigmatization in Post-Apartheid Cape Town

In post-apartheid South African cities, informal housing frequently exists amid the interstices of formal homes. Nowhere is this truer than in Cape Town, where shacks in the backyards of formal homes is the prevailing informal housing type, and where land occupations are often launched in spaces adjacent to existing neighborhoods. Based on an ethnographic study of one such occupation called Sigalo since its inception in 2012, I demonstrate how its more than 18,000 residents' legal struggle over the right to stay put has fueled their stigmatization by the municipal government in moral and class terms. In addition to this moralizing stigma as improper citizens, this government framing has reignited a second major source of stigmatization: middle class residents in formal homes across the road, who stigmatize squatters in race (as “African,” as opposed to “Colored”) and class (as lumpen as opposed to workers) terms. Drawing on accounts of meetings of the formal housing association (“ratepayers”), including violent conflicts with Sigalo residents and visits from municipal government officials and the Mayor, I argue that the City's framing and ratepayers' complaints reinforce one another, creating a generalized discourse of land occupiers not as homeless people in need, but as threats to the healthy functioning of the city. I conclude with an analysis of how Sigalo residents have contested these discourses, sometimes successfully, and how this speaks to struggles over the stigmatization of informal housing more broadly.

A Homogenising 'We-Discourse' and the Social Positioning of Syrian Refugee Entrepreneurs in Jordan: The Business of Hope and the Politics of Misery

Just as Palestinian refugees have been radicalized in camps in Lebanon and Jordan in recent decades, so the arrival of 650,000 Syrians in Jordanian camps over the last few years has led to concerns about radicalization. In this figurational context, a lot depends on how long refugees stay in the camps, as well as the opportunities they have to move forward in their lives. Refugees need to have hope that their situation will one day improve, or they will soon come to express dissatisfaction with their situation. Drawing on recent work on the experiences of aspiring Syrian entrepreneurs in Jordan, we explore the refugee ‘we-discourse’ (Worm et al. 2016) that has emerged as a result of the torturous emotional ordeal of losing possessions, family and friends, as well as not knowing what the future holds. Although the ‘we-discourse’ of the refugees highlights the problems the community has to deal with collectively, restrictions on work and self-employment mean that the community suffers from a distinct lack of social cohesion, with refugees being forced to survive as individuals rather than as a group. Young men are particularly vulnerable in this context. As their efforts to find work or earn a living through entrepreneurship in the informal economy are restricted, so their plans to emigrate west also flounder. As anxiety grows and feelings of discrimination increase, frustration and dissatisfaction flourish, conditions that have been associated with radicalisation.

The 'Halal Meat Controversy': Animal Welfare Concerns or a Sign of the Times?

As the UK Muslim population expanded in the decade to 2011 the availability of halal meat in shops, restaurants and public institutions became a reoccurring feature of public debate and political controversy. Muslims as well as Jews are exempt from the legal requirement to stun animals prior to slaughter and it is thus widely assumed that all halal meat in the UK is produced without stunning animals, when over 80% comes from pre-stunned animals (FSA 2011). In this paper I compare the ‘halal meat controversy’ with developments that occurred as the Jewish population expanded in the late nineteenth century. Anxieties about animal welfare, immigration and the increasing presence of minorities are consistent across both historical periods and I explore the extent to which these issues are connected to wider processes of socioeconomic change. Drawing on the work of Elias (2012) and Warde (2016), I argue that when animal slaughter occasionally comes into view the food practices of *outsiders* are shown to be more barbaric than hegemonic preferences, thus legitimizing the established order and warding off perceived threats to national values and identity.

The Social Nature of Occupational Distress. Francophone Social Workers in a Minority Setting Faced with Structural and Institutional Changes in Healthcare in Ontario, Manitoba and New-Brunswick.

Occupational distress constitutes a major issue within the field of social work. Multiple studies have sought to explain the manifestations of occupational distress in social workers, but mostly through psychological factors and specific characteristics of the clinical practice. In contrast, we seek to explore the social workers' experience of their contexts of work following recent reforms of the healthcare system in Ontario, Manitoba and New-Brunswick in relationship with their social representations of social work itself. With this inquiry, we seek to better understand how this relationship shapes the extent and manifestation of occupational distress in a professional setting. Our study aimed more specifically to document the specificity of this reality in a francophone minority setting. 30 semi-directed were conducted on a non-probabilistic sample of social workers from three provinces who declare having experienced symptoms of occupational distress within the last 12 months. The integrated content analysis combined with a lexicographic analysis of the interviews allowed to 1. Bring to light the complex relationships between the structural and organizational dimensions of their work and their occupational distress 2. Analyze the social representation of social work of social workers to better understand how this representation influences or is influenced by the experience of their work 3. Propose a model for the role of the representational and experiential dimensions of work in the occupational distress of social workers 4. Explore how particular social standings (the feminine majority within the profession and the clinical practice of Francophones in a minority setting) further influences the experience of occupational distress of the participating social workers.

When the Margins Make Noise: Urban Poor Women's Participation in the Reproductive Health Policy Debate and Advocacy Process in the Philippines

Local and international media depict the passage of the Responsible Parenthood and Reproductive Health Act of 2012 in the Philippines as a significant legislative milestone. Apart from its purportedly positive ramifications on the economy, they view this 14-year quest as a victory for women's rights. They also argue that the active involvement of women's groups in the reproductive health (RH) debate and advocacy process bodes well for women empowerment because it signals the opening up of avenues for women to engage and interrogate institutions of power which they historically have limited access to. Unsurprisingly, renowned members of the local press, political pundits to some extent, hail its passage as both a triumph for the women's health and rights lobby, and an important step towards deepening democracy in the country.

Despite this development, the nature [and extent] of women's participation begs further scrutiny. For instance, little attention is afforded urban poor women and their ideas as if to suggest that the RH lobby is monolithic. Their perspectives on RH issues remain muted and marginalized, hence the urgency of providing conducive environments for these perspectives to take root. Furthermore, wheth-

er the involvement of urban poor women equates to a genuine recognition of their important contribution to the RH discourse, and represents a counter-hegemonic shift in power relations necessitates a more nuanced analysis.

Drawing insight from sociologist Asef Bayat and political scientist James C. Scott, this paper focuses on how unorganized urban poor women interrogate and resist enduring structures of injustice and inequality via their informal, albeit important, involvement in RH advocacy work. It also aims to shed light on their understandings of RH and experiences grappling with prevailing cultural and institutional obstacles to the crafting and implementation of RH initiatives.

Move over, Mona Lisa. Move over, Jane Eyre

Cultural inequality is part and parcel of global political and economic inequality. Until we even the cultural playing field by making it more diverse, we won't do better at addressing other pressing socioeconomic challenges. My project explores the social, political, and economic conditions and institutions that allow artists and writers from what have been culturally peripheral regions to gain greater global prominence in the English speaking Global North. Using qualitative methods, including participant observation (at galleries, book fairs, museums, cultural events), document reviews, and interviews with cultural creators and codifiers (i.e. critics, publishers, collectors, patrons, curators) in Lebanon, Argentina, and South Korea, I will examine what factors expand the global literary and artistic canons and how they vary across regions, time, and genre. In what ways are the art and literary worlds rethinking categories such as canons, literacy, and national culture that might lead to greater cultural inclusiveness?

Transnational Social Protection: Framing the Agenda

Social welfare has long been considered something which states provide to their citizens. Yet today, 220 million people live in a country in which they do not hold citizenship. Many are forced into permanent impermanence and others chose long-term residence without citizenship. How are people on the move protected and provided for in the contemporary global context? Have institutional sources of social welfare begun to cross borders to meet the needs of individuals who live transnational lives? How do these compare across sectors, such as health, elder care, education, and labor rights? Who are the new winners and losers in these emerging institutional arrangements? This introductory paper proposes a transnational social protection (TSP) research agenda designed to map the kinds of protections which exist for people on the move, determine how these protections travel across borders, and analyze variations in access. I define TSP; introduce the heuristic tool of a "resource environment" to map and analyze variations in TSP over time, through space, and across individuals; and provide empirical examples demonstrating the centrality of TSP for scholars of states, social welfare, development, and migration.

LEVY, YAGIL* (Open University of Israel)

Conceptualizing the Legitimacy of Using Force

The question of what constitutes the legitimacy of using force targeting an external adversary, has become especially relevant since the wars that followed the 9/11 events and the post-Cold War's interventions in human crises. However, international relations is the main field in which this issue is discussed while political scientists tend to mix legitimacy with supportive public opinion. This paper is conceptually motivated. It begins by defining the concept of the legitimacy of using force. It then analyzes the two components of this legitimacy: the first represents the constant, socially constructed component, and the second is a dynamic component, on which the paper focuses. It is constituted by several mutually related variables which are critical for increasing or decreasing the constant component of this legitimacy and can be circumstantially and contextually used by leaders to mobilize support. The variables are grouped into three categories (with mixtures among them): 1) legal and policy variables, 2) cultural and discursive variables and 3) structural variables.

Military Gender Integration: The Unasked Question of Female Patriotism/ Eyal Lewin

Most of the discussions around the participation of women in the military have been framed in terms of tensions between democratic citizenship and military effectiveness. Democratic values of equality and non-discrimination are weighed against those of military necessity and readiness. The tendency to eliminate gender discrimination and equalize status between male and female service members prevails, although occupational restrictions still exist and women are still excluded from combat-related areas and functions. This article seeks to add to the discussion about military gender integration an understanding of the issue in a field that scholars, until now, did not cover: the question of whether women are more patriotic or less patriotic than men. Several steps are taken in this study: (1) Patriotism is briefly defined. (2) The case study of Israeli society is introduced. (3) Quantitative results of a large database from a national survey are presented. (4) The results of a qualitative inquiry are brought. The conclusive analysis of both quantitative and qualitative data shows that women are at least as patriotic as men, if not more so than men, and raises evidence that patriotism leads female warriors, at times, to outstanding military achievements.

Ageing in Risk: The Economic Consequences of the Transition to Retirement

Ageing in Risk: The Economic Consequences of the Transition to Retirement

Retirement is a "life course risk" that affects the economic well-being of many households. This life course transition is usually associated with economic "risk outcomes" such as decrease in income and increase in medical expenses which, despite an anticipated drop in consumption, lead to growing difficulty in making ends meet. With the growing tendency to transfer risk from the state to individuals and democratization of credit in most OECD countries, financial indebtedness became a legitimate solution for maintaining the standard of living among households of the elderly.

While past studies have suggested that household debt has a considerable effect on retirement decisions, limited attention has been given to the economic consequences of retirement in social settings that differ in their management of social risks. The goal of this study, therefore, is to examine the dynamic relationship between retirement and short term debt, over time, in Germany and Israel. These countries were chosen as two case studies that represent varying degrees of welfare support and privatization of risk in their pension systems. For the empirical analysis we utilize panel data from the Survey of Health, Ageing and Retirement in Europe (SHARE).

Initial findings reveal that there are cross-country differences in the extent to which the transition to retirement affects the likelihood of financial indebtedness, and the extent to which the relationship is mediated by household wealth, health status and demographic attributes. In this regard, the current study furthers our understanding of socioeconomic inequality in late-life. More generally it contributes to the understanding of the extent to which cross-national differences in the management of social risks, shape the sensitivity of late life course transitions to economic risk outcomes among elderly households with diverse characteristics.

Rights and Rescue: Morals and Secularization in Faith-Based Anti-Trafficking Practice in the UK

This paper will explore emerging postsecular partnerships in the global 'fight' against 'modern slavery' and human trafficking. Faith-based organisations (FBOs) and actors have an increasingly visible role in responses to human trafficking, in awareness raising among faith congregations, in providing services to trafficked persons, and increasingly, as policy advisors. Human trafficking emerges amid complex intersections of migration regimes, global inequalities, precarious labour, and the criminalization of certain activities, peoples and mobilities. Abolishing modern slavery has achieved global policy consensus, arguably by relying on simplistic tropes of 'evil' traffickers and deserving 'victims'.

The paper will report on early findings of a UK Economic and Social Research Council project that aims to better understand the roles of faith-based organisations in three terrains: anti-trafficking service provision, public representations, and governmental discourse and policy making. The methodology of the project explicitly aims to tie together the three analytical levels of political party, faith based organisations, and individuals operating in the realm of anti-trafficking in England. The paper will consider these multi-level lenses to unpick the direction of influence between religion and social policy in the realm of modern slavery. Against a background of the UK's changing religious landscape and growing welfare pluralism in times of austerity, a congruence emerges between neo-abolitionist and state positioning of human trafficking as a particular 'evil' unrelated to

wider state and social structures. This paper will consider the particular assemblages and affective atmospheres created for trafficked persons in faith-based and secular anti-trafficking settings. Processes of secularization among anti-trafficking FBOs taking up key roles as government-funded service providers or statutory partners demonstrate a variety of positions in managing religious discourses of 'rescue' or 'saving' trafficked persons while operating within international legal rights-based frameworks.

Human Trafficking, the Role of the State, and the Crisis of Rule of Law: A Recent Study on Human Trafficking from Eastern Part of Indonesia

Indonesian government, like those in the other post-authoritarian states, after two decades of experiencing transactional democracy is still struggling to anticipate the impact of heavy market penetration on labour migration in the post New Order regime. While, the centralistic state has been replaced by giving autonomy to the districts, the problem of human trafficking is one of the most extraordinary crimes that are yet to be anticipated by the state institutions in terms of design, coordination, and attitude toward human trafficking. Today there is no institution at the higher level that could match the power of the crime network in order to prevent human trafficking in Indonesia. This paper is a combination of my work as a researcher and an activist of anti-trafficking in the last four years in the Eastern part of Indonesia. Additional research on newspaper mapping is also done to build data base of human trafficking in NTT Province. A significant point from historical investigation is that human trafficking today resembles the colonial slavery during the Dutch occupation period. This paper aims to describe how state institutions are unable to prevent its citizens from the risk of human trafficking today.

Negotiating the Boundary between Risk and Pleasure of Psychoactive Drug Consumption: A Qualitative Study on Young Drug Users in Hong Kong

In the past 20 years, researchers have used a "normalisation" thesis to explain the popularity and the changing image of adolescent drug use in the context of the "post-modern and risk-laden society". In the original normalisation thesis, Parker assumed that drug use was no longer stigmatised and had gradually moved from youth subcultures into the mainstream youth lifestyles. Some researchers have criticised the normalisation thesis for not reflecting the dynamic nature of drug from the drug users' experiential point of view. Stemming from this on-going debate, this paper argues that Lyng's model of "edgework" provides us with an appropriate theoretical tool to discern how drug users understand their drug consumption behaviour in the late modern context. Through the theoretical lens of "edgework," psychoactive drug use is seen as a form of voluntary risk taking in which drug users – the "edgeworkers" – are consistently negotiating the boundary between risk and pleasure during their course of drug consumption. From the early 2000s until recently, ketamine was the most popular psychoactive drug among young drug users in Hong Kong, however, methamphetamine has become increasingly popular in the recent years. This paper will examine these latest changes in the drug scene through probing into the socio-psychological meanings of psychoactive drug consumption from the young drug users' perspective. Based on qualitative data analysis of about 40 in-depth interviews

conducted in 2017 and 2018 with Hong Kong's young psychoactive drug users, the ultimate goal of this study is to decipher the reasons for the increased popularity of methamphetamine among this group of "edgeworkers" in Hong Kong.

Everyday Citizenship Practices and Counter-Hegemony in China

Rather than a granted status of political identity from above, citizenship in transitional China is still a process of bottom-up struggle and acquired through critical citizenship practices against the state hegemony. It is thus imperative to explore everyday experience of critical citizenship in China and its complicated relations to the Party state. Among various Chinese publics, liberal-oriented journalists stand out for being critical of the government and speaking out for the vulnerable, thanks to their exclusive advantages of being armed with professional knowledge, taking regular sites to express, and having significant allies of activists and other intellectuals. This paper focuses on the practice of critical citizenship through media and traces changes in the "right talk" of Chinese liberal journalists' surrounding a major food safety crisis of 2008. In particular, it systematically examines the making and development of civic claims about public rights, government accountability, and legitimacy of the current political system in the outspoken newspapers, which demonstrates their understanding and expectation of citizenship in contemporary China. I also find that making counter-hegemonic claims in the tightly censored media relies on necessary discursive tactics: (a) taking advantage of central-local divisions within the state to attack the easy targets, e.g. the local officials, (b) strategically speaking the official language, i.e., selective quoting and creative twisting of official statements and policies to appear compliant, (c) making use of openings to say the unsayable, but tempering it with a heavy dose of praise and optimism. Although being strategic, the liberal journalists have demonstrated their willingness to question authority and readiness to advocate civic appeals and been able to do so with effective skills, especially the ability of re-interpreting official accounts to advance civic claims, which suggests that Chinese citizenship practices are capable of exerting counter-hegemonic effect.

LI, HAOYUE* (*SUNY, UNIVERSITY AT ALBANY*)

State Legitimation and Environmental Crisis in China

State legitimation is contested in the Party-States. The authoritarian China also struggles for state legitimation especially in face of environmental and public health crises. Among many contentious environmental issues, China's air pollution problems have repetitively made Chinese state a direct target both nationally and internationally. The controversies over China's air quality in the lead-up to the 2008 Beijing Olympics and the smog crises in 2010 are the most debated media events up to date. The paper explores how state legitimacy claims concerning crisis response, environmental treatment, and government accountability in the Chinese Party press have been made, challenged and tuned during these environmental and legitimacy crises, and what kinds of discursive tactics are employed in order to seek and preserve state legitimacy during the controversies. I find that the Party press initially tried to downplay the significance of the environmental crisis caused by air pollution, but it gradually modified its approach by developing two narratives about Chinese modernity and the environment. The first narrative emphasized the challenging modernization context that China is going through. It celebrated the environmental changes and innovations that had been initiated, while also recognizing the structural challenges that would take decades to overcome. The second narrative emphasized the need for a partnership with an emergent Chinese civil society, as an important way to respond effectively to environmental challenges. In developing its new environmental discourse, the Chinese Party press disputes the dominant accounts in the mainstream U.S. newspapers, which consistently interpreted China's actions as evidence of corruption, dishonesty, and a general hostility toward democracy and civil society. Instead, it aligned with civil society actors, drawing on similar public narratives that were circulating in Chinese ENGO press releases, to amplify its plausibility and legitimacy.

A Hospital for Our Kind of People: Segregated Inclusion and Reproductive Citizenship of Internal Migrants in Shanghai

This article takes up a critical reading to two bodies of literature. The first critique is of the concept biological citizenship. Most scholarly discussions situate biological citizenship in a modern democratic political environment where the biological citizenship connotes some power to act, to represent, and to be recognized. It ignores the situations where people have little space to achieve it or make a claim for it. The second critique is of the scholarly discussion of rural-urban migrant labors in China. A dominant perspective in the literature on China's

internal migrants focuses on the concept "farmer worker" (*nongmin gong*) who is working in the city but is deprived of basic welfare that only urban residents are entitled to due to the household registration (*hukou*). These discussion fails to give close attention to the reproductive labor of the large number of female migrants. By focusing on the birthing experience of a group of rural-urban migrant women in a government subsidized maternity hospital, I demonstrate that the unresolvable tension between large number of rural-urban migrants and the strict state policy offered the migrant women temporary access to their "biological citizenship", but it nevertheless imposes a gendered burden on rural-urban migrant women's reproductive bodies and uncertainty on their reproductive experience. Their experience can be described as "segregated inclusion" meaning that rural-urban migrant women are included by the government subsidized childbirth services but nevertheless are treated in a segregated manner that is deeply influenced by dominant urban culture.

Association between Parental Socioeconomic Status and Children's School Grades: The Importance of Parenting and Child Behaviour Problems

Abstract

The strong link between parental socioeconomic status (SES) and children's success in school is well-established. However, mechanisms that underpin this association remain a major issue in current research on social inequality. Using nationally representative data from the Families in Germany Study (FID) and structural equation modelling, this study demonstrates that parenting styles and child behavioural problems explain in part the association between parental SES and child school grades for mathematics and German at ages 9 to 10. We found that low SES parents tend to use an inconsistent parenting style or psychological control, which are linked to more child behavioural problems. This in turn is associated with low school grades. Our findings also show that parents with low SES are more likely than their high SES counterparts to have children with behaviour problems, which in turn is associated with lower school grades. These findings suggest that parenting styles and child behavioural problems and their interplay may be potential pathways that underpin the influence of parental SES on offspring's school achievement.

From News Delivery to Social Interaction: New Form of Sports Programs Live Broadcast Via Internet and Its New Effect

From News Delivery to Social Interaction: New form of Sports Programs Live Broadcast via Internet and Its New Effect

Internet Live Broadcast is a new form of media communication, which transcends conventional media platforms due to its larger and more extensive coverage. Sports matches and programs with its competitiveness, fierceness and entertaining elements, can be delivered quicker, opener and more freely through new media platforms. Internet live broadcast featuring pictures, videos, scripts, 3D, VR interprets sports matches in a panoramic and multidimensional ways by maintaining visibility of conventional media and varying the original ways of staging programs. In a platform combining virtual and real worlds, it also change what once to be mere link between anchors and audiences into host and users, and it creates a social interactive environment where host and users, users and users interact with each other via comments, dialogues and giving awards. Live broadcast becomes a whole new social platform on internet and it strengthens initiative of users and expands social communication.

Impacts of the Sichuan Earthquake in China on Generations and Gender across

This paper looks at various impacts on across generations and gender in the longer-term, taking the case of Sichuan Earthquake in China at the occasion of 10 years anniversary. It looks at three generations, from children, parenting age,

and older people. For children, we looked at how school education has changed, especially disaster preparedness education, after experiencing the 2008 5.12 Sichuan Earthquake. This paper addresses the influence of the collaboration of agencies, such as academic institutions, NGOs and international organizations engaged in disaster risk reduction education. For parenting age, we looked at how job and living arrangement have changed in general. We also look into a particular NGO, the house of mother. The organization was set up on May 19, 2008. The scope of its work is in the area of "mental health and life safety". Public welfare mission is to provide help for poor, childless, unmarried, and disabled mothers, and to provide a training to raise literacy of rural mothers. To urban mothers, more communication opportunity was provide in order to nurture love, happiness and dignity for mothers. It especially worked for those mothers who lost their only child by the school building collapse when the state had, what is so-called, "one-child policy". For older people, we looked at the older people who live in the aged-care home built in Dujiangyan Sichuan as a post-earthquake support through pairing support system of China by Shanghai city. In conclusion, looking at various activities targeting various generations and gender, issues in the society can be highlighted. It is also where a new NGO rises. The year of 2008 has been said the first year of volunteerism and of NGO because of the rise of NGOs following the 2008. 5.12 Wenchuan earthquake in Sichuan, P.R. China.

Evolution of Agrifood System in China Since the 1980s: A Food Regime Perspective

This research adopts the 'food regime' concept to analyse the evolution of agrifood system in China since the 1980s, in order to justify different trajectories for potential transitions. Driven by internal and external pressures, China has experienced the farming land reforms, the privatization of agrifood sectors since the mid-1990s, and the agricultural structural adjustments and associated institutional arrangements (such as intellectual property laws) in accordance with the Agreement on Agriculture of the WTO since 2001; and all these changes have consistently led to an agro-industrial regime. Meanwhile, evidence also shows that, in the last two decades the role of corporate in China has become increasingly important in food trade and food retail sectors, which means that to a certain degree a neo-liberal, corporate food regime has come into being. Given the fact that, recently exposed food scandals and the pollution from agriculture have caused the erosion of consumers' trust on food industries and the industrial farming patterns, the 'quality turn' of the society indicates an emerging 'hybrid' value systems and new dimensions of food regimes. The new dimensions have different emphasis, such as environment, nutrition and public health. As contradictory relations and conflicting values within food regimes might produce crisis, transformation, and transition to successor regimes (McMichael 2009), these divergent and sometimes competing claims on agrifood system bring the opportunities for change. However, the direction of regime change depend largely on the power relations among interest groups. To further explore the trajectories for potential transitions, the analysis thus focuses on the changing narratives on agrifood in China and the dialogues/negotiations with international communities, and the consistency and contestation among those narratives and dialogues.

Expanding Wealth Inequality and Changing Class Identification: A Temporal Trend Analysis on Shanghai, China (1991-2013)

Research on Chinese class identification, or subjective social status, has been a hot topic in recent years, but long-term trend analysis is scarce. Using a unique data set collected in Shanghai through 1991 to 2013, this research shows the periodical change in determinants of class identification. In mid-1990s people evaluated their status only by income, while the other two indicators of stratification, education and occupation, also played the significant role at the beginning of 21st century. However, the recent period witnessed a new era in which subjective status is mainly determined by one's wealth, such as income and housing. Meanwhile, the average of citizens' subjective status declined in the examined two decades.

Migrants Threat, Economic Deprivation or Governance Failure? Social Cohesion Comparison across 60 Communities in Shanghai, China

Theoretical and empirical research on social cohesion, especially its relation to racial/ethnic/immigration diversity, has been a hot issue since the 21st century. The inquiry is also applicable to today's urban China, however, relevant study is very scarce and descriptive. Using a unique survey data including individual

and administrative variables across 60 communities in Shanghai, this paper first examines whether and how social cohesion is affected by three theoretically important community factors in Chinese socio-institutional context. It finds that economic deprivation, rather than the influx of migrants, significantly weakens social cohesion, while governance performance compensates this negative effect and plays the most important role in all determining factors. The empirical results are robust and consistent in aggregate-level and multi-level data analysis.

ICT, Online Weak Ties and Female Entrepreneurship -- a Case Study of a Chamber of Commerce in Guangxi, China

Information and Communication Technology (ICT) has been viewed as a crucial vehicle that shapes a networked society. Studies on social networks and Guanxi have illustrated important and complicated interactions of career development and social connections. But limited attention has been paid to social network in the online context and with a gender perspective. This study of Chinese female entrepreneurship focuses on a chamber of commerce that has more than 500 members in Guangxi province in China. Based on virtual ethnography in a Wechat group and in-depth interviews with members in this chamber, we find that (1) weak ties in online community benefit its members greatly in doing business by building useful information channels and offline social networks, and (2) the utilization of weak ties that are derived from online communities helps female entrepreneurs to overcome difficulties that may be gender-specific, such as extending networks in a male dominated sphere of commerce and promoting projects in cost-effective ways. To summarize, the development of the information communication technology, especially instant messaging, and weak ties built in this context provide more opportunities for female entrepreneurship and women's agency in the business world.

What Drives Chinese Welfare State in the Globalizing Era?

Most research on welfare state in developing countries find that economic globalization has a negative effect on governmental welfare spending while ignoring the rapid expansion of welfare system in China. Ranked as the largest host of foreign trade and the largest host of foreign direct investment in the world, China has established and expanded its welfare system since 1978 when it initiated market reforms. This research is one of the first attempts to understand the driving force of Chinese welfare state based upon panel data from 25 cities in the coastal, more developed regions spanning from 2000 to 2014, for over 90 percent of governmental welfare spending is paid by local governments. Focusing on social security spending, I find that economic development and labor disputes significantly encourage social security spending when facing the downward pressure of trade openness and FDI inflows. In particular, the negative effect of economic globalization can be offset and then turn positive when the level of labor disputes reaches high. This finding challenges existing literature which maintains that welfare spending in non-democratic regimes are more vulnerable to economic globalization. On the contrary, the authoritarian regime, such as Chinese government, which pays close attention to political legitimacy and social stability, tends to encourage individualized, institutionalized labor dispute arrangements, which pushes governments to expand welfare spending.

Social Assistance As a Counter-Insurgency Strategy in Contemporary China

By providing social assistance to about 60 million poor people, the Urban and Rural Minimum Livelihood Guarantee Scheme (*Dibao*) of the People's Republic of China is one of the largest social assistance programs in modern history. This article provides substantive support for our argument that Chinese government uses *Dibao* program as a containment strategy against protest movements. The argument is based on a quantitative analysis of two large datasets: a protest events dataset that we have created based on the news reports of the Boxun website (boxun.com) and a social assistance dataset based on the figures of the *Dibao* provision reported by the PRC Ministry of Civil Affairs. Using these datasets and various control variables in multivariate regression, we identify a statistically significant spatial relationship between protests and the *Dibao* provision. The paper then examines why and how the Chinese government has devised and implemented the *Dibao* as a way of containment of social unrest. The article

concludes with a discussion of the use and limitations of social assistance in Chinese government's effort to maintain social and political stability.

Heterogeneous Corporate Responses to Climate Change: Empirical Evidence from China

The largest greenhouse gas emitter with a fast-growing economy, China plays a vital role in low-carbon transition. Beijing has imposed regulations that require its industry achieving carbon emission reduction targets. Facing tougher environmental regulations, how did Chinese manufacturers respond to climate change? This communication seeks to offer empirical analyses of corporate responses through exploring the institutional capacity for mitigation with organizational and regional perspectives.

The conceptual framework integrates management and sociological theories, more particularly the Porter hypothesis and the ecological modernization theory. We apply the combined framework to analyze organizational shifts at the firm-level and at the meso-level by identifying efforts to curb climate change on the ground. A two-year survey (2013-2014) was conducted in over 100 firms in 15 industry sectors, including all key industries in the Pearl River Delta region, known as the "world factory". In addition, our study used supplementary primary and secondary sources such as participant observation, interview and environmental audit report. By mixing quantitative and qualitative data, we gained corroboration and a more comprehensive understanding of climate-induced institutional changes.

Chinese businesses responded heterogeneously to climate change under similar socio-political-economic context. Their capacities for mitigation vary depending on organizational characteristics such as size, sector and served market. The majority of the surveyed firms took various eco-efficiency measures. Larger energy-intensive companies and export-oriented firms tend to make more efforts to reduce their carbon emissions. Some of the participating companies introduced climate-friendly technologies through voluntary agreements. But very few of them undertook low-carbon innovation. Our findings supported to some extent the theoretical claims. Stringent environmental regulations may induce innovation to improve both economic and environmental performance. However, the win-win situation is most likely to occur in firms with strong environmental commitments, advanced innovative capacities and substantial financial resources.

Driving Forces of Employee Creativity in the Chinese Innovative Organizations: The Role of Organization Support and Calling

Recently, China is establishing innovation-oriented country and innovative enterprises, and vigorously supporting the organization innovation to cultivate an innovation-driven economy. At the same time, the spirit of the craftsman which is rooted in vocation calling is advocated to promote the development of Chinese independent innovation. The feasibility of this innovative strategy has become the focus of the study.

According to the social exchange theory, when employees perceive the organization support, they will have their own sense of obligation to the organization, subsequently they make the commitment to work and are engaged in accomplishing organizational goals actively. That means the organization support has a role of emotional arousal. In other words, it can arouse vocation calling which proved to be relevant to many positive outcomes in the working context. Componential model of creativity considers that the impacts of social environments on the individual creativity are mainly mediated by task motivation. Thus it can be inferred that organization support as an environmental factor will influence employee creativity through calling.

On the basis of the theories and literature review, a mediation model was constructed among organization support, vocation calling and creativity.

The model was investigated using a sample of 298 employees from Chinese innovative organizations using Survey of Perceived Organizational Support-8, Calling and Vocation Questionnaire and Person-Environment Fit Scale for Creativity.

Correlation and regression were adopted to analyze whether the external force (organization support) and the internal force (calling) are driving forces of employee creativity. The findings revealed that positive and significant correlations were observed among perceived organizational support, calling and creativity. Perceived organizational support and calling were statistically significant predictors of employee creativity. Analysis of mediating effect indicated the mediating role of calling between perceived organizational support with creativity, which showed the influence mechanism on employee creativity.

"S/He Is Sick": The Discourse of Dementia and Its Influences on Daily Care Practices

In 2012, the World Health Organization (WHO) declared that dementia has become a vital global disease in its report, *Dementia: a Public Health Priority*. The report not only signifies the propaganda of WHO but also has its influences on local practices widely around the world.

In contrast to the medical term, dementia, which diagnoses the certain symptoms of elderly as disease, the local Taiwanese culture used to treat them as the natural processes of aging. However, the diagnoses of dementia have increased in the medical practices in past years. In addition, the language use of dementia has become common in daily settings and results in the unexpected consequences.

The institutional ethnographic investigation is anchored in the standpoint of elderly who are diagnosed as dementia patients. Relying upon interviews and participant observation, this study explores how the diagnosis of dementia and the relevant discourses affects the elderly's experiences of being cared for. Through describing the embodied work of the elderly and their care givers, I aim to demonstrate that dementia is not only a medical diagnosis. The specific moment of being diagnosed activates a series of trans-local activities, which are coordinated through the ruling discourse of dementia. In this proposed study, I focus on the care arrangements, care practices and care relationships, and how they are shaped by the discourse of dementia.

Social Desirability Bias in on-Line Surveys: A Comparison Among Different Sources of Respondents

On-line surveys have been commonly used due to its advantages of lower cost and higher efficiency. It also has a higher possibility to reach hidden population that are less contacted by in-person or telephone interviews. However, lack of sampling frame, non-probability samples, and coverage issues often result in lower data quality and skewed response distributions. Researchers have suggested to increase sample size or use various channels for recruitment to improve heterogeneity of the respondents. Recent studies have collected emails from probability samples as an alternative for recruiting on-line survey respondents. However, it remains unclear whether the data quality of the latter is better than that of the former.

Concerning for data quality, social desirability bias is found to be an important issue. Social desirability (SD) bias is related to how survey questions are measured, whether an interviewer is involved, pace of cognition process during interviews, sensitivity of survey questions, etc. The results of SD measures can be an indicator of data quality.

This study aims to compare data quality from different resources of respondents in an on-line survey. These sources include probability samples using previously collected emails from cross-sectional surveys and from a large-scale panel survey. The third sample was recruited using both on-line and off-line advertisement and flyers. Given the different levels of rapport developed between respondents and the survey institute, it is expected that probability sample from the panel survey has the highest level of SD bias, while the non-probability sample has the lowest. However, the distributions show the opposite findings. Social-demographic characteristics, as well as life style, are also compared to understand the dis/similarity among different sources of samples of on-line surveys. The findings are expected to contribute to the field of survey methodology for further understand on-line samples.

"One Is Too Few, Two Are Just Right": The Discursive Battle Around China's Shifting Population Policies

Starting in early 2010s, Chinese government gradually relaxed its almost 40-year old one-child policy for urban couples. In 2015, not only all restrictions on the eligibility for a second birth were removed, but the state also started openly encouraging married couples to have more than one child. This is likely a response to the increasing aging population and gender imbalance, both resulting from stringent population control. Many predict that such change will further disadvantage Chinese women as primary caregivers in the family. Using official documents published by both provincial and central governments and articles from popular feminist media accounts, this paper answers the following questions: How do the central and local governments in China legitimate this change that not only reverse one of its long-standing core policies but also potentially undermines the official socialist gender ideology? How do the public,

especially those concerned with increasing gender inequality, respond to this new policy? How do the various cultural traditions coexisting in China feature in either the official discourses or the popular ones? Preliminary analyses suggest that the state capitalizes on the anxiety of the "new middle class" and attempts to transfer social responsibilities of child and elderly care onto individual families, combining the traditional kinship culture with the neoliberal logic of individualism. Meanwhile, it responds to concerns over gender inequality mainly by framing it as an issue of women's employment opportunity, ignoring feminist critiques of the institutionalized sexism not only in the market but also in all important social realms, including the family and legal institutions.

Ideological Constructions of Disability in Higher Education Health Related Programmes: Human Rights or What?

As the percentage of people with disabilities of all ages globally increases issues of social justice and equality in HE become multidimensional, including more pronounced emphases on the promotion of disability rights across all academic disciplines. According to the United Nation's Convention on the Rights of People with Disabilities, disability is an 'evolving concept' that is largely contingent on social conditions and exigencies. The Convention highlights the necessity of promoting a disability rights discourse in the education of doctors and other health professionals, and to enable them to reflect upon their own role in creating and perpetuating disabling barriers. This study explored the extent to which the programmes and curriculum outlines in health-related academic disciplines in Cyprus are informed by a disability rights discourse.

The study used textual data derived from 32 medical and other health related higher-education programmes outlines available on five Cypriot universities websites. The analysis brought to the surface a number of 'discursive absences' that manifest the scarcity of disability-related considerations. In general, the language used or not-used indicates the prevalence of an individual and deficit oriented approach to disability. Terminology and the context in which disability is presented, seem to be relevant to the approach adopted based on the field of study and related scientific discipline, the majority of which lie under the individual model of disability. Findings suggest the inadequacy of these programmes to conceptualise disability as an issue of 'cultural politics'. Hence, it is argued that HE programmes should primarily concentrate on reconceptualising and redefining disability as a political and human rights issue. This can be partly achieved by changing negative and discriminatory attitudes towards disability and by enabling health professionals to problematise their own assumptions and misconceptions about disability while nurturing their social and ethical responsibility to view their patients as rights bearing subjects.

How to Show an Invisible Man: An Experiment in Filmic Representation of Illegalized Sub-Saharan Migrants

The political status of sub-Saharan migrants residing in nation-states around the world without work or residence permits affects the migrants' public representation: while compelled to conceal their identity in mass media out of cautionary measures, the migrants become "hyper-visible" in public discourse through their repetitive representation as masses of victims or dangerous invaders.

The "invisibility" of the migrants' subjective identity led to a filmic experiment in which the main participant – a West African refugee living in Berlin without a work permit – is never seen on camera. Named in this film Mr. X, to protect his identity, the refugee joins the filmmaker/researcher behind the camera as cinematographer and storyteller. His voice recites memories from his life in Africa, Italy and Berlin, constructing a fragmentary narrative conceived through his collaboration with the filmmaker. Mr. X uses the camera to illustrate these memories with images of German landscapes, and to engage in a self-reflexive dialogue with the filmmaker who appears on screen.

Contextualizing the migrant's cultural invisibility, the research addresses the centrality of vision in modern thought as a means of understanding and capturing reality. It presents an experimental visual approach that criticizes the observational tradition's search of cultural "sameness" through the corporeal, and celebrates cultural diversity expressed through the visually absent. The methods used – participatory research, "third voice" dialogue, montage, self-reflexivity, reversing of the cinematic/scientific gaze – are evaluated for their ability to both bypass and confront the migrant's forced invisibility, and the underlying political, socio-cultural and epistemological order. Private link to the film Napps - Memoire of an Invisible Man: <https://vimeo.com/96679622> password: storyofmrX Film Trailer: <https://vimeo.com/128956736>

RC24-444.17LIDSKOG, ROLF* (*Environmental Sociology Section*)SUNDQVIST, GÖRAN (*University of Gothenburg*)*Big Science, Big Players: The Constitution of Global Environmental Expertise*

Numerous expert bodies and expert panels at national and international levels have evolved around environmental issues. Their aim is to review and assess scientific research and make it relevant for policy makers, but sometimes also to facilitate and shape societal transformations towards sustainability. Without doubt, these bodies are important players in the discourse on global environmental sustainability, and currently there is probably no environmental issue that is not populated by scientific expertise. But what counts as expertise and how is it shaped? What is needed to claim epistemic authority for an environmental issue? These questions are guiding the paper, which aims to contribute to a theory on global environmental expertise.

By drawing on findings from Science and Technology Studies (STS), environmental sociology and general social theory, this paper stresses that in order to give robust and relevant expert advice in environmental matters, the expertise needs to include at least two dimensions; an understanding of how society works (analysis of social dynamics) and an identification of the character of a particular environmental problem (diagnosis of pathologies). Since long time back, however, there has also been raised claims that expertise also needs to include a third dimension; proposals for how to solve the problem at stake (therapy). By reviewing current forms of global environmental expertise – not least those contributing to the narrative of Anthropocene – the paper investigates to what extent and in what ways it includes the three dimensions mentioned above. It is found that relatively often, natural scientists speak about how society should be designed in order to solve a particular environmental problem, whereas social scientists are rather silent concerning solutions. The paper ends by discussing risks and benefits of including all three dimensions in the making of global environmental expertise

RC56-920.1LIDZ, VICTOR* (*Drexel University College of Medicine*)*Comparing Karl Jaspers' Concept of Paradigmatic Individuals with Max Weber's Concept of Charisma*

Comparing Karl Jaspers' Concept of Paradigmatic Individuals with Max Weber's Concept of Charisma

Victor Lidz

Drexel University College of Medicine

In *The Origin and Goal of History*, where he developed the concept of the Axial Age, Jaspers cited, as his key source for the idea, Hegel's discussion of Jesus' life and teachings as the axis of history. Yet, sociologists have long understood that Jaspers' esteem for his friend and colleague Max Weber's comparative studies in the sociology of religion, attested to in several of Jaspers' writings, provided the scholarly substance underpinning the concept of the Axial Age. Jaspers noted Weber's research on the Hebrew prophets, Confucian thought, Hinduism and Buddhism, the Greek *poleis*, and, with qualifications, Islam in presenting his notion of axial religio-philosophical movements. He also discussed Weber's conception of charisma and charismatic authority in a brief treatment of modern political institutions. However, in the first volume of *The Great Philosophers*, Jaspers discusses the lives of Socrates, Buddha, Confucius, and Jesus as "paradigmatic individuals" who "have exerted a historical influence of incomparable scope and depth." He does not use the term charisma nor that of Axial Age, but he makes clear that the cultural frameworks of great civilizations were shaped by the legacies of these key figures – all charismatics to Weber – in respects that cannot be claimed for any other historical persons. The presentation will compare the concepts of charismatic leaders and paradigmatic individuals, calling attention in particular to differences that Jaspers seems to have deliberately emphasized.

RC08-163.1LIDZ, VICTOR* (*Department of Psychiatry, Drexel College of Medicine*)STAUBMANN, HELMUT (*University of Innsbruck*)*It's Not What You Think: Talcott Parsons' Conception of Functional Subsystems of Society*

As early as 1939, Talcott Parsons proposed that two institutional mechanisms, allocation of resources and social integration, made essential contributions to the functioning of society. The "functionalism" of *The Social System* (1951) elaborated the same ideas. In *Working Papers in the Theory of Action* (1953) Parsons proposed, with Robert F. Bales and Edward Shils, the first versions of the four-function paradigm, based on abstractly defined functions of adaptation, goal attainment, integration, and pattern maintenance. Four-function theory was presented as a more efficient method than Bales' interaction process analysis for small groups, which included 16 process categories. *Working Papers* then extended the four functions to analysis of major institutional complexes, each contributing

differently to societal operations. In *Economy and Society* (with Neil Smelser, 1956) the four functions were treated with greater specificity and detail as a closed conceptual set. Analysis focused on the economy as adaptive subsystem of society, but the four functions also provided the basis for a theory of the structural differentiation of society into four complex subsystems, each itself analyzable into functionally defined subsystems. Parsons later extended four-function analysis: to political institutions and processes as goal attainment subsystem of society; to institutions of the integrative and pattern maintenance subsystems; to functional differentiation of American society; and, beyond social systems, to cultural and personality systems. In *Societies: Evolutionary and Comparative Perspectives* and *The System of Modern Societies*, he used the four functions to analyze societies and civilizations very different from American and even Western civilization. We argue that, given the later formulations of the four functions as abstractly defined dimensions of action systems, the theory did not privilege states of equilibrium, favor order over conditions of stress and conflict, align with capitalism over other ideologies, or privilege American society, allegations that have predominated in the literature.

RC04-89.4LIEBHART, CHRISTINA* (*University of Vienna*)HAINDORFER, RAIMUND (*University of Vienna*)VERWIEBE, ROLAND (*University of Vienna*)*Labor Market Integration of Refugees: Determinants of Labor Market Entry Among Syrian, Afghan, Iranian and Iraqi Refugees in Austria*

In 2015 and 2016 Austria belonged to a group of EU countries (including Germany, Hungary and Sweden) which received the largest number of refugees in relation to its population size. One urgent concern is the facilitation of these refugees' economic self-sufficiency by integrating them into the labor market. This paper investigates the theoretical assumption (e.g. Alba, Esser, Faist, Castles) that labor market integration is affected by various social, cultural, and symbolical factors. All of these factors are assumed to influence labor market chances in the receiving society, by taking into account the respective institutional conditions. Empirically, this presentation is based on field research conducted in 2017 in Austria. Our research utilizes a mixed-method approach comprising a quantitative survey with refugees from Syria, Afghanistan, Iraq and Iran (N=1,200), 25 problem-centered interviews with refugees and 10 expert interviews.

Preliminary findings show that labor market entry in Austria is mainly affected by refugees' cultural capital (e.g. educational background, language proficiency), social capital (specific forms of personal contacts), occupational experiences as well as factors like age, gender and national background. The qualitative data give insight into the specific processes of looking for and finding work, hence disclosing a number of challenges regarding employability (e.g. recognition of qualifications) but also in the everyday reality of refugees (e.g. supporting NGOs), that can positively or negatively affect their chances of finding a job. Better prospects of labor market integration are found for young males with access to ethnic and Austrian social networks and the willingness to work their way up from nothing, mainly in the service and manual crafts industries, while women with young children and little formal education can be especially vulnerable. Often the restraint of seeking employment during the long asylum seeking process is deemed to be a negative constant in economic integration.

RC42-JS-49.3LIEBIG, STEFAN* (*German Institute for Economic Research*)MAY, MEIKE* (*Okanagan College*)*Justice As a Precondition for Cooperation in Modern Societies*

Within evolutionary psychology human's sense of justice plays a key role in the explanation of cooperative behavior. Justice – i.e. norms of justice – is seen as a means to identify situations of exploitation and to avoid losses in cooperative relationships. This paper aims to test these assumptions. First, we suppose that individuals bound in close cooperative relationships at the workplace will view justice as more important. Second, we assume that individuals react on perceived injustice with a termination of cooperation, i.e. they will be less motivated to obey to formal and informal norms at the workplace. We test these hypotheses using survey data from a representative dataset of the German workforce (LINOS-1 doi:10.4119/unibi/sfb882.2014.9, N=3.565). We use subjective measures of perceived procedural and interactional justice as well as norm following behavior at the workplace, and apply structural equation modeling. The results support our hypotheses: Employees who work in highly cooperative environments value justice more than employees in less cooperative workplaces, and employees who perceive injustice at their workplace trust their employers less and report less motivation for work-related efforts. We also test if there are any spill-over effects from injustice experiences at the workplace and find that those who perceive more injustice at the workplace show also less trust in societal institutions and comply less towards social norms. Our study adds to the research from empirical

justice research that justice is a precondition of cooperation on different societal levels.

Why Is Justice Regarded As Important? Theoretical Considerations and an Empirical Test

The paper investigates why justice is regarded as important in human groups and societies. Using the theory of social production functions (SPF) as a general model of action, the theoretical analysis focuses in a first step on the question of why individuals regard justice as valuable in social life. The theory of social production functions defines two fundamental human goals—physical and social well-being. The integration of justice concepts into a general model of human behavior demands to explain how justice enters an individual's social production functions. We predict a direct effect by just procedures that increases social well-being and an indirect effect by stability of auxiliary assumptions given by justice for the production of physical and social well-being. In a second step, the theoretical predictions are tested empirically. The analysis is based on a large dataset that contains 2,926 employees surveyed all over Germany. Using structural equation modeling, the empirical results support our hypotheses: Justice is more important for people who have deficits in physical and social well-being. Moreover, these deficits are more important for justice in the public context than in the private context. It can also be shown that people who work in cooperative situations in which they have to rely on others rate the importance of justice higher. In conclusion, the importance of justice depends on the personal situation and the fulfillment of individual goals. Justice can be seen as a means for increasing subjective utility (well-being) in cooperative interactions and is, hence, rational on the individual level.

Persistence of Unemployment and Welfare Receipt in Germany: Determinants and Duration Dependence

Although getting comparatively well through the last great recession, the German economy suffers from a high and stagnating incidence of long-term unemployment and benefit dependency and solutions for this problem are urgently needed. We are the first to study duration of benefit receipt and its determinants in the German basic income support for needy individuals capable of working ("unemployment benefit II, UBII") as a whole and pay special attention to duration dependence.

Rich administrative data on welfare recipients became only available after the introduction of the UBII in 2005. Administrative data have several advantages over survey data: First, the large number of observations enables us to study effect heterogeneity. In particular, merging regional information allows us to consider regional heterogeneity. Moreover, administrative data on benefit receipt are based on actual payments of the welfare agencies to the recipients and thus can be regarded as highly reliable. This is not necessarily true for survey data, where individuals tend to underreport their benefit receipt.

As the welfare benefit is a means-tested household benefit, not all recipients are registered unemployed, but some are e.g. employed with insufficient earnings, participating in training or are economically inactive (e.g. due to child care obligations). This makes it necessary to study welfare receipt and unemployment separately.

Using exceptionally rich administrative data from the German Federal Employment Agency on individuals who received welfare benefit between 2006 and 2012, we estimate discrete-time hazard rate models that control for unobserved heterogeneity. Our results indicate that the chances of leaving welfare are determined by welfare duration, household composition and labour market resources. The chances of leaving unemployment are generally higher than those of leaving benefit receipt. They are also affected by duration dependence and labour market resources, but to a lesser extent by household composition.

Migration and a Care Conundrum? Factors Affecting Care Penalties across Four Welfare Regimes

Existing literature on social policy is divided as to the ongoing relevance of welfare regime typologies given considerable heterogeneity within as well as between categories (Brennenstuhl, Quesnel-Vallee and McDonough 2012, Reibling 2010). However, many cross-national analyses of care work continue to

rely on grouping countries into "clusters" based on the quality of social rights, the extent of social stratification and the relation of state, market and family (e.g. Mahone et al. 2012, Michel and Peng 2012). This study quantifies any "care penalty" in both high and low status care work across four welfare regimes and within thirteen countries using data from the Luxembourg Income Study. Using cumulative logit models, I explore the impact of pertinent national-level conditions – welfare regime, immigrant composition, and income inequality – on individual-level factors affecting wages in care work – e.g. family structure and demographic characteristics, human capital and job characteristics – as well as quantifying the moderating effect of immigrant status. The data demonstrates that across numerous welfare regimes, individuals born outside of the country are more likely to work in low wage, low status care and incur additional wage penalties compared to native-born care workers with equivalent human capital. However, I also find that national-level conditions play a pertinent role. I find that rising levels of income inequality lead to wage polarization in care between migrant and non-migrant populations, and that welfare regimes continue to play a significant role, with wage penalties highest in Liberal and Central and Eastern European countries. I outline some possible explanations for these findings, as well as discussing areas that require further inquiry to improve understanding of the relationship between migration, paid care work, and welfare regime theory.

Artists in Offices, Cultural Institutions and Compromise

This paper advances 'theoretical interjection' as a way to cultivate stronger dialogues between contemporary theoretical strands from two fairly different disciplines: sociology and art history. Specifically, I am interested in how each struggles to frame and interpret the cultural dimensions of critique, using the example of the role of artistic critique within cultural institutions. Specifically, my case study centres on 'artists in offices' (Adler 1979)—professional visual artists who work in critical, conceptual traditions and hold tenure-track jobs at universities. While working through how both disciplines grapple with how to assess the critical content of the work of art, this paper weaves together an understanding of critique as more resilient than field theory can account for, but more tempered than aesthetic theory dreams. This paper pursues this wider problematic in three parts. First, this paper modifies Boltanski and Chiapello's (2006) version of artistic critique by tracing its current life within public cultural institutions and addressing contemporary contexts of creativity. Second, drawing on interviews with artists, policy documents, and art works, I construct artistic critique as a compromise-relation within circuits of production, circulation and consumption. Third, I develop three dimensions of artistic critique as compromise: mutual concession, recombination and vulnerability. These features can act in concert effectively, but the sustainability of critique becomes severely limited when the first two dimensions are jeopardized.

The Strength of Weak Expertise: Understanding the Times Higher Education Rankings' Influence

In this contribution, I show how university rankers are weak yet influential experts in higher education. Using insights from a long field study, interviews with key respondents, and an analysis of hundreds of related documents, I explain how rankers build up their expertise with respect to targeted audiences by carrying out a careful, continued, and negotiated balance of objectives in the production of their ranking tables and other products. Because of their varied operating models and organizational histories, ranking makers face difficult choices. They often have different target audiences (Lim, 2017); although these often overlap with other rankers. Furthermore they need to produce better instruments that are (1) reliable and comparable through time, (2) based on robust data and (3) relevant to their main target audiences. No ranking is able to convincingly achieve these goals. Despite their efforts, there is widespread scepticism regarding the validity and even value of ranking products (see Kehm, 2013, among others). Rankings are regularly critiqued by academics and university managers, even though they are among the primary consumers and users of rankings. Despite this pushback, I show how one organization – the Times Higher Education (THE) – uses this apparent weakness to build up the network of advisers and consultants through a 'sustained dialogue' with its target community of 'higher education thought leaders'. This, in turn, reinforces its position as an agenda-setter and qualified expert in the field.

Social Justice, Recognition and Integration of Disabled Workers in the Public Service through the Legal Reservation of Job Vacancies in Public Tenders

Brazil is one of the countries that apply legal reserve lists of job vacancies as a strategy to promote access of workers with disabilities into the labor market. In the public service legislation ensures the reservation of at least 5% of the available vacancies in calls for public tenders, to be filled preferably by disabled workers. Although the reservation of vacancies in public tenders in Brazil is regulated, little is known about the implementation of this policy. This work aims to discuss the legal reservation of vacancies for people with disabilities in public tenders, in the context of the Universidade Federal de Santa Catarina (UFSC). At first, the Brazilian regulations that establish the legal reservation of vacancies for people with disabilities in the public service are presented, as well as the international mechanisms that reinforce access to work as a fundamental factor to promote human dignity. The recognition theory is emphasized as a possible approach to understand the achievement path in this field. The analysis of calls for public tenders for admission of professionals in the careers of Higher Education Teaching; Middle School and Certificate Program Teaching, and Administrative Technician are presented in order to verify the offer of vacancies to be filled preferably by workers with disabilities, and the actual filling of these job positions. Subsequently, the integration of people with disabilities in the researched institution was discussed, based on reports and documents issued by the Equipe Multiprofissional de Acompanhamento aos Servidores da UFSC com Deficiência e em Estágio Probatório (EMAPCD). Although the reservation of vacancies for people with disabilities in public tenders presents a positive course, it reflects professional integration that is still distant from the percentages expected by the Brazilian legislation, as well as great inequality in the access to work, taking into account the different disabilities.

LIMONCELLI, STEPHANIE* (*Loyola Marymount University*)

INGOs, Neoliberalism, and the Global Movement to Combat Labor Trafficking

Among scholars and activists who study transnational social problems, INGOs have often been posited as important social actors fighting the ill effects of neoliberalism. In the global movement to combat human trafficking, for example, INGOs are key actors fighting labor exploitation exacerbated by the movement away from governments as regulators of market forces. Despite their best efforts, I argue that INGOs are part and parcel of increasingly market-based approaches to addressing social problems and that they function to reinforce rather than challenge neoliberalism. Drawing from interviews with 20 anti-trafficking INGOs headquartered in European countries and the United States, as well as an analysis of their organizational materials, I find that INGOs are supporting neoliberalism in four major ways: (1) through the construction of trafficking as problem of individualized violence; (2) by promoting awareness and consumption-oriented anti-trafficking strategies more often than changes to standard business and/or migration policies and practice; (3) through the commodification of trafficked persons as marketing objects and workers to create goods to sell; and (4) by embracing (or acquiescing to) corporatization in organizational structures and operations.

Perception of Risk and Online Practices: An Inductive Approach to Understanding the Information Behaviour Paradox

People's concerns about risks online and how they actually behave online do not always match up, this is often referred to as a personal information behaviour paradox. We look to a dataset of 101 people in East York, Toronto to identify factors that influence perceptions of online risk and behavioural responses to those perceptions in order to better understand this paradox. Our findings suggest that: 1) self-reported internet skills do not seem to be related to whether our respondents are concerned with online risks; 2) perception of online risk, self-reported internet skills, as well as hearing about other people's negative online experiences are related to how our respondents are protecting themselves online; 3) although having concerns about online risks or hearing about someone else's negative online experiences do not seem to be related to whether they prefer to store certain information online, self-reported internet skills do play a

role. Furthermore, we use latent class analysis to identify three distinct classes of internet users in our sample who differ in their perception of online risks, self-reported internet skills, as well as their behavioural responses to third party negative online experiences.

LIN, IJUNG* (*Osaka University of Economics*)

A Normative Theory of Mass Media That Contributes to Social Communication

In the information we have, that which we directly experience and obtain is limited. Other people and the mass media provide information exceeding this scope. How people imagine society and the world varies according to differences in the information they possess. From this perspective, the images of society and the world depicted by people were surprisingly different in the past, when the mass media provided information characterized by a certain degree of homogeneity compared to that provided in the Internet era. Likely, this significantly impacts the current democratic society, which is premised on people engaging in discussion and taking action based on information. This is vividly illustrated in the recent Brexit vote in the UK and presidential election process in the US.

It has long been argued that the mass media has a social responsibility. Much research on how this social responsibility should be fulfilled and its nature has been conducted, and there has been some practical action in this regard. The most well known is the social responsibility theory encompassed within the four theories of the press by Siebert et al. Based on this theory, a range of subsequent research has been conducted on the roles and norms of the mass media. However, societal transformations due to conditions in the mass media and globalization were outside the scope of the assumptions in traditional mass media normative theory.

First, this research points out the problematic nature of such preconditions. Next, we consider the emerging position and role of the mass media by taking alternatives for these from theories on the freedom of expression and political thought to construct a mass media normative theory that contributes to social communication and is aligned to modern society.

Open Science As Foundation of Overcoming Replicability Issues in Social Sciences: The Case of Taiwan Indigenous Peoples Open Research Data (TIPD)

There have been growing concerns in academic communities about scientific replicability and thus research credibility issues in the past decade. Such situation leads to the call for open science to cope with replicability issues. The calls for "Open Science" emerge due to the flaws of "Closed Science", e.g., issues of scientific replicability and reproducibility, and barriers of accessing data and knowledge systems. One important feature of open science is it allows us to examine research "replicability" given the same method and data. By definition, open science is the movement to make scientific research methods, data, results being accessible to all communities. Open science consists of six principles: open data, open source, open methods, open peer review, open access, and open educational research (see https://en.wikipedia.org/wiki/Open_science). To enhance research transparency, the most important elements of open science are open data, open source, open method, and open access. Open data refer to the data that can be available to everyone to use and republish without restrictions of any forms, including copyright, patents, and/or other mechanism controls. With open data and open source serving as enhancing transparency, open methods and open access enable us to examine research replicability and thus credibility. This research uses Taiwan Indigenous Peoples Open Research Data (TIPD) as Example to manifest how open science can serve as a foundation of overcoming replicability issues in social sciences. The ongoing research project of TIPD starts since 2013 (see TIPD web at <http://TIPD.sinica.edu.tw>; TIPD open data repository at <https://osf.io/e4rvz/>). TIPD is constructed by strictly following the principles of open science. The contributions of TIPD based on open science principles are as follows: changes in research from "close" to "open"; from "the elite" to "the ordinary"; from "local" to "global"; from "macro and static" to "micro and dynamic".

LIN, LEFENG* (*University of Wisconsin-Madison*)

Insurgent Representation: Labor NGO-Led Collective Bargaining Campaign in Southern China

In this article, I draw ethnographic data to examine the response of Chinese civil society to worker insurgency since early 2010s, asking how independent labor NGOs in China have managed to organize and sustain workers' collective contention in an oppressive political regime. I found that, domestic labor activists' strategic choice and initiative, with support from overseas labor advocacy network,

played a key role in experimenting with innovative approach to address precarious workers' collective grievances. Allying themselves with the state-led collective bargaining campaign, labor activists adapted the western concept of collective bargaining to the China's context. Avoid being illegal to organize independent unionism, they took civil representation from Chinese Civil Law and applied it to worker representation in their grassroots collective bargaining campaign: Workers authorized worker leaders and labor activists as civil agents to represent them in negotiation with employers and government officials, which produced a committed worker leadership – worker representative committee – who actively engaged organizing and mobilizing fellow workers to confront employers and local officials. By exploiting legal and political space created by the state, labor NGOs have turned collective bargaining as a stabilizing mechanism for setting up labor-capital compromise to a grassroots organizing/mobilizing mechanism among rural migrant workers. They have formed a viable strategy to organize workers to contend with employer and government officials and help workers gain health care, pensions, job security, and compensation. However, when the new model of labor organizing became an alternative to the state-controlled trade unions, China's trade unions mobilized state power to restrain the growth of grassroots worker organizing. Compared to trade union, this labor NGO-led organizing is case-issue-based, indiscriminate to all workers, no bureaucracy, low running cost, and very flexible and mobile. I argue it stands as a viable organizing model to confront both capital mobility and authoritarian regime.

Unequal Pathways to Adulthood in China

Rapid economic and social changes coupled with constantly changing policies have had impacts on the way young adults structure their pathways to adulthood in China. In contrast to previous studies on demographic markers of Chinese young adults where the focus is limited to specific life events, this paper applies a holistic method to describe and explore transition trajectories. This requires that we pay attention not only to the timing of events, but also to the relative duration and sequence of transition states. Drawing on the detailed retrospective information on individuals' educational, occupational, cohabitation and marital histories collected by the 2010 China Family Panel Studies, this paper (1) builds a typology of transition pathways using the optimal matching technique and a cluster algorithm, and (2) investigates the ways in which historical and structural factors influence these pathways by estimating the effects of cohorts, gender, and household registration status (*hukou* status - rural vs. urban status) on pathway membership. We conclude that the holistic approach adopted in this study proved to be a useful tool to show a distinctive typology of demographic transition trajectories in China; and to understand how the transition process varies between cohorts and how the interaction between gender and *hukou* status matters in predicting the risk of belonging to a pathway membership.

Did the Critical Care Patterns of Dialysis Changed during Hurricane Sandy in NYS?

Introduction: Flooding and consequent power outage during Hurricane Sandy not only affected people with chronic diseases, but also had significant impact on electricity-dependent diseases, such as dialysis. However, few research evaluated the critical care use patterns of dialysis after Sandy. This study assessed and compared the changes of emergency department (ED) visits and hospital admissions due to dialysis after Hurricane Sandy and also if sociodemographic interacted with Hurricane Sandy on dialysis.

Methods: Immediate Hurricane Sandy period was defined by FEMA as 10/28/2012 – 11/9/2012. The affected areas included the areas categorized as evacuation zones or Hurricane storm surge zones in five borough NYC counties, Nassau, Suffolk, and Westchester. The rests of the areas in these eight counties were the control areas. Additionally, pre-Sandy period (2001-2011) was also used as a control for pre-/post-Sandy comparison to control county-level socio-demographics. Poisson Negative Binomial model was used to compare service utilization during the storm year with prior years among affected and non-affected areas.

Results: Overall, there were large and significantly increased risks in dialysis ED visits (RR: 2.90, 95% CI 2.24-3.75) and hospitalization for dialysis (RR: 1.29, 95% CI 1.15-1.46) in the storm zone during Hurricane Sandy. The ED visits of dialysis also

increased in the non-storm zone (RR: 2.34, 95% CI 1.83-2.98) after Sandy. The peak of dialysis ED visits occurred one day after the extensive power outage in all affected counties. Almost all sociodemographic groups had significantly increased risks of dialysis. People with Medicare and other insurance had significantly increased risks of dialysis ED visits after Hurricane Sandy compared to Medicaid and private insurance. Other race than white and black had the highest risk.

Conclusion: Both Dialysis ED visits and hospital admissions after Hurricane Sandy significantly increased. Generally, the effects of Hurricane Sandy impacted all sociodemographic groups.

Exploring the Risk Discourse of Nuclear Waste: Media Coverage of Nuclear Waste Debates in Taiwan

There is an increasing media coverage and visibility on nuclear waste issues in Taiwan. Solving nuclear waste siting controversy will require not only technological methods but also take into account social, political and cultural dimensions as in our values of cooperation, respect for science and gender-equality. Few studies, however, have been done with regard to how siting issues of nuclear waste have been reported in the newspapers. Taking a discourse analysis approach, this paper intends to examine Taiwan's major newspapers after Japan's Fukushima nuclear accident in 2011. The paper attempts to examine how the risk of nuclear waste has been framed and represented, and how they interact or reflect national energy and nuclear power policies. It is to draw out some of the key lessons emerged from the experience in Taiwan and to identify barriers and opportunities in dealing with nuclear waste. It concludes with a discussion of how these findings help us understand the dimensions of power, science and ethics that affect national nuclear waste governance.

Using Paradata to Monitor Interviewers' Instrument Navigation Behavior and Inform Instrument Technical Design: Case Studies from a National Household Surveys in Ghana and Thailand

Many computer-assisted personal interview software captures paradata (i.e., empirical measurements about the process of creating survey data themselves), computer user actions, including times spent on questions and in sections of a survey (i.e., timestamps) and interviewer or respondent actions while proceeding through a survey. In these cases, the paradata file contains a record of keystrokes and function keys pressed, as well as mouse actions. These paradata files can be used for quality assurance checks and reporting, particularly when interviews are not audio recorded.

This presentation uses data from (1) the Ghana Socioeconomic Panel Study a collaboration between the by Economic Growth Center at Yale University, the Institute for Statistical, Social and Economic Research at University of Ghana, and the Survey Research Center at University of Michigan; and (2) the Evolution of Health, Aging, and Retirement in Thailand in collaboration with the National Institute of Development Administration and the Survey Research Center at University of Michigan. Both studies utilize unique team management and travel structures, and have a complex instrument design. In addition, interviewers are allowed to interview respondents within the same sample unit without any particular order and to switch among varied interviewing components in a flexible fashion. Paradata is heavily relied upon to monitor interviewers' behaviors.

We first categorize interviewer navigation patterns such as mid-section break-offs through varied interviewing components. These navigation patterns are then inspected for predictive power against data quality indicators such as response changes and non-response. Subsequently, we analyze interviewer, household, and geographic characteristics and identify quality control metrics (e.g., interview length) to determine if interviewer behaviors and interview efficiency can be predicted by interviewer's team behavior or household characteristics, among all other information available. Finally, we will present how analyses can be practically applied to improve interview efficiency and data quality of interviewer administered surveys.

Comparing Impacts of Hurricane Sandy on Multiple Health Outcomes between Medicaid and Medicare Enrolled

Introduction: Emerging evidence has shown natural disasters have a devastating impact on health. However, limited studies assessed the health impacts among elderly, Medicaid, and Medicare populations. This study investigated the effects after Hurricane Sandy on cardiovascular disease (CVD) and injury in Medicaid and Medicare elderly enrolled in New York State (NYS).

Methods: An ecological study was conducted among elderly aged Medicaid and Medicare enrollees residing in NYS. We aggregated daily counts of claims for four service types (outpatient, emergency department, inpatient, and pharmacy) over immediate, three-month and twelve-month periods following the storm. We performed Poisson regression to compare service utilization during the storm year with prior years among affected and non-affected areas.

Results: We observed immediately after Hurricane Sandy period, the greatest risk of CVD was among Medicaid (RR 2.65; 95% confidence interval [95%CI] 2.64-2.66), while injury was among Medicare enrolled (RR 1.21; 95%CI 1.21,1.22). The high risk of CVD and injury remained consistent three-months and twelve-months after the storm period. However, women enrolled in Medicaid and Medicare were most vulnerable to CVD and injury risk after Hurricane Sandy, with the strongest association twelve-months after storm (RR 2.63 and 1.73, respectively).

Conclusion: Our findings revealed gender-specific differences for the effects of Hurricane Sandy on health outcomes. We also found that the effect was observable one year after storm period. This study points to a greater need for public health emergency preparedness and response to include the impact of long-term effects as a priority.

Assessing the Influence of Cultural Variables, Perceptions, and Earthquake Hazard Information on Household Emergency Preparedness

This project is assessing the effect of earthquake hazard information on household emergency preparedness, and includes an assessment of the influence of local and cultural variables on perceptions and preparedness actions. Our research is based in the Protective Action Decision Model (PADM), which integrates approaches in social influence, persuasion, behavioral decision making, attitude-behavior relationships, and innovation adoption to identify the phases through which people typically pass in the process of taking protective action. We are exploring the relationships between PADM variables and information seeking behavior through a random sampled, geocoded questionnaire (Comparison Group) that addresses the principal constructs of PADM (threat perception and attitudes toward pre-earthquake protective actions). Our approach is unique in that we provide participants the opportunity to seek additional information, and respond to the information through follow-up post-tests. Second, we are testing the efficacy of Interventions, developed using active-learning techniques and goal-setting strategies, to engage participants in a way that facilitates personalization of risk, positive attitudes toward protective action, and a plan to take action on promoting hazard adjustment intentions and actual adoption (Intervention Group). The Intervention also allows us to collect qualitative data on the influences (and misconceptions) that most strongly influence intentions to take pre-earthquake protective action. Pre- and post-test questionnaires, identical to the comparison group questionnaires, allow us to compare the two groups, and assess the efficacy of the Intervention. Finally, we are investigating the influence of cultural factors on protective action attitudes and behavior by working with the Portland Metro Latino population, the largest minority group in our target area, using the same materials and approach listed above, but provided in Spanish.

LINDGREN, LENA* (*Lund University*)

Political Legitimacy: Old and New - a Conceptual Itinerary 1968-2018

Following the conceptual itinerary of legitimacy as it has developed over the last 50 years means being close to important changes both in society generally and in the social sciences. The classical term of legitimacy, denoting a more or less precise criterion for political authority, has been transformed to a broader all-inclusive concept – still normative, but arguably less constructive in terms of analytic social theory. The increasing use of legitimacy as a code-word in political rhetoric and the possible consequences of this for New theorizing in relation to the concept will be discussed in my presentation. A statement from President George W Bush in the UN General Assembly prior to the US-led invasion of Iraq illustrates a politically militant rhetoric: “[A] regime that has lost its legitimacy will also lose its power.” President Bush later declared that the invasion was not legal, yet he assured the public that there was no doubt regarding its legitimacy. This raises the persisting question of the relation between legality and legitimacy in analysing a democratic system. It will be argued in my paper that making legitimacy the most important factor to be considered will promote moralism rather than realism in political and social analysis. Continuing in this vein, a typology of how people react to claims of legitimacy is suggested. This includes ‘active acceptance’ (politically supportive action, manifesting conformative actions, moral condemnation of those violating the norms of the system, etc.); ‘passive acceptance’ (no political action being taken, neutrality regarding violations, etc.); ‘non-acceptance’ (political attacks, open violation of various principles, taking actions in support of alternative systems, etc.). Such a typology represents another dimension of the relation between rulers and the people they rule over than the Weberian classification into traditional, legal-rational and charismatic legitimacy.

LINDHULT, ERIK* (*Design and Engineering Mälardalen University*)

Systemic Innovation - Critical Rethinking of Boundaries

Innovation is often understood within relatively narrow boundaries, where single-issue financial, social or environmental gains can be made, but impacts on other areas of concern are marginalized. Stakeholder engagement tends to be similarly narrow, involving customers or service users and maybe suppliers and close business partners, but not those who have wider concerns. A fundamental dimension of recent systems thinking paradigms is critical reflection on how boundaries are constructed based on available knowledge and value judgements of stakeholders (Churchman 1970; Ulrich, 1983; Midgley, 2000). The role of boundary construction and boundary reflection is a largely unexplored issue in research on and management of innovation practices. The purpose of this paper is to employ boundary reflection for rethinking the landscape of innovation approaches, like open innovation (Chesbrough, 2003) and democratized innovation (von Hippel, 2005), and clarify systemic innovation as a concept and approach. Systemic innovation as concept emerged in the end of 1980s as a recognition of the interconnected, networked dimensions of innovations (Teece, 1986; Laet, 1999; Takey and Carvalho, 2016) as a forerunner to open innovation and other interactive, collaborative and participatory perspectives and approaches to innovation (Rothwell, 1992). The stream of research on systemic innovation has a main focus on innovations that is dependent on its innovation context for its development. The paper shows how the concept and practice of systemic innovation enables critical rethinking of boundary setting in innovation practices (Ison, 2016), e.g. how actors and issues are prioritized or marginalized having significant effects on innovation processes and outcomes. Such constructionist framing opens up for reflection on the role of power, conflict, value judgments and ethics in innovation, and conditions and methods for participation and dialogue among stakeholder in investigating synergies in value co-creation and sharing.

Corporate mining in the Philippines

The Philippine Mining Act of 1995 liberalized corporate mining in the Philippines. The most affected are the indigenous communities since about 60% of mining operations are in ancestral lands. Although there are national and international laws that stipulate the rights of indigenous population to their ancestral lands, often these are violated. Corporate security defense forces and the state military and paramilitary forces have been used to suppress and repress resistance to large scale corporate mining resulting in many human rights violations. The militarization of extractive capitalism embodied in the liberalized corporate mining in the Philippines is clearly illustrated here. The tremendous economic, environmental, cultural, political, and social impacts of corporate mining have spurred collective resistance from the indigenous communities and other sectors and human rights advocates in solidarity with them.. This paper analyzes the forms of resistance of the indigenous people using data from personal interviews, participant observation and relevant literature that I have conducted during my Fulbright scholarship in the Philippines (Fall 2017), and I draw their implications towards an integrated framing of human rights, social movements, and sustainability. The conceptualization of human rights and sustainability still largely see these dimensions as separate, but reality suggests that the social construction of sustainable societies must be anchored on a

human rights regime, and social movement organizations that offer alternatives must be legitimized not repressed, suppressed and oppressed.

Good Mothering and the Provision of Family Meals: Public Health Discourse Vs Contemporary Realities

The family has long been recognised as a crucial site for public intervention particularly with child obesity. This paper analyses the promotion of family meals as a panacea for obesity and emotional dysfunction. We argue that this public health discourse has emotional and nostalgic power but cannot easily be put into practice under the structural conditions shaping contemporary family life. Family diversity, changed gender roles, changed employment patterns and increasing commute times mean that frequent family mealtimes are not possible to enact for many families. We draw on qualitative research with 50 families with at least one child under 12 from Victoria Australia to illustrate the diversity and challenges of everyday meal provision. We argue the disconnect between the public health message promoted and the reality where it cannot be put into practice is likely to cause more harm, in the form of maternal guilt, than good outcomes as intended.

Killing Companions: Emotion and Struggle within the Contemporary Animal Shelter Field

Through a synthesis of Pierre Bourdieu's work on fields and capital, Sigmund Freud's psychoanalytic theory of the superego (both individual and collective), and Arlie Russell Hochschild's theory of internal, individual emotion work, emotion management, and transmutation, this paper focuses on shelters as fields and the complex emotional inter-/intraspecies labour within them. It is imperative that sociologists look deeper into these places, with the aim of illuminating the internal and external struggles in the shelter field; moral, psychological, and practical problems such as euthanasia, secondary traumatic stress disorder (STSD), and insufficient space and funding are frequently hidden from the public's view. This paper aims to join up theory while practically addressing the oft-ignored (or unidentified) social psychological complexity of the internal and external "shelterer", linking the morality and regulation of the superego, emotional struggle, and exchanges within the field, this laying the foundation for further analysis and more empirical study.

LINDWALL, JOHAN* (*University of Gothenburg*)

Caught between Choice and Control: Institutional Talk and Power in Swedish Statutory Drug Treatment Services.

Swedish drug policy insists that a consistent rejection of illicit drugs is needed from a preventive perspective. Hence, all use of narcotics without a medical prescription is illegal. Within municipal social services, this implies a requirement for social workers to *actively* promote change for drug using clients. Simultaneously, they are bound by law to respect their clients' integrity and will. Departing from social workers contradictory obligations, the focus of this paper is on meaning making processes between drug using clients and social workers in authoritative institutional settings. This ongoing ethnomethodologically infused PhD-study is conducted at three social service agencies in Sweden. The data of the study in qualitative: field notes and transcribed audio recordings from observations carried out in professional team meetings and encounters between clients and social workers.

Using different DA- and CA-tools, in dialogue with Foucauldian concepts of power, this study explores how institutional tasks related to Swedish drug policy are carried out, how tensions are handled, and how power is exercised through language use in institutional interaction at the micro-level. Special attention is given to how different social worker positions are accounted for, how agency and responsibility is distributed, and how clients' and social workers' identities are constructed and negotiated through everyday institutional talk at the studied agencies. Furthermore, I discuss how language and power is intertwined and constitutes a foundation for institutional action and counter-action. Early findings suggest that a number of positions, for social workers and clients, are being talked into being and negotiated in the institutional interaction. Each position is

linked to a specific way of exercising power or counter conduct. The social worker positions gain legitimacy by drawing on institutionally available discourses and "truths" including specific constructions of the clients with implicit judgements regarding issues related to moral, risk and change potential.

Gendered Finance? Comparing Insurance Organizations

Sociological studies of insurance interpret the actuarial practice of classifying risk according to people's gender as an implementation of economic ideology. Their research is based on empirical material that relates to commercial insurance providers while neglecting other types of insurance – mutual societies, government annuity plans, social insurance. Historical studies, however, alert us to the fact that these forms of collective risk sharing traditionally also make actuarial use of gender categories – albeit in ways that so far have not been accounted for as part of a financial service. This contribution explores the relevance of gender distinctions for different forms of insurance. It does so by examining the problems that insurance offices attempt to solve when they apply gender categories.

Conceptually, I understand all types of modern insurance relations as organizations. Nevertheless, these organizations operate under different social conditions. Instead of focusing on one form of insurance (commercial offices) and seeing its use of gender categories in the light of one highly specific organizational problem (price differentiation) and its accompanying set of institutional rules (economic ideology), I compare three types of insurance organizations (mutual, social and commercial insurance). This allows for more general statements about how the financial service of insurance organizationally relates to broader social institutions.

Using examples from various insurance schemes in Europe, I demonstrate that gender categories serve – or in some cases: served – to A) predict costs (commercial, mutual and social insurance); B) determine who could be selected as members and who would categorically be excluded (commercial and mutual insurance); and to C) construct and justify price differentials between members (commercial and mutual insurance). To grasp insurance in its social dimension, we need to explore the organizational problems that insurance offices need to solve as well as compare the solutions they come up with.

Intimate Partner Violence, Mental Distress and HIV Prevention and Treatment Adherence in Southern Africa

The World Health Organization defines violence as the use of physical force, power, and threats against a person, group or community resulting in suffering, death, psychological damage or limited development (WHO, 1996). A typology of violence proposed by the World Health Organization includes self-inflicted, interpersonal and collective categories. Interpersonal violence principally refers to violence among family members and/or intimate partners. In Southern Africa (and elsewhere) women are far more likely to be affected by intimate partner violence, which often produces psychological and physical trauma and death. There is an increasing amount of data suggesting that intimate partner violence (IPV) which is gender based (GBV) and the mental stress and trauma associated with it, is both a cause and an outcome of HIV infection (CDC, 2014). Recent studies in Kenya confirm that IPV limits women's ability to distribute self HIV tests to males (Shaeffer et al., 2017) and adherence to PrEP (Roberts et al., 2017). A third investigation concluded that IPV was an important problem of HIV infected women in Kenya, but we can not expect that reductions in intimate partner violence will be associated with improved ART adherence (Wilson et al., 2017). This presentation will present an overview of the recent findings on intimate partner violence, mental distress and HIV prevention and treatment adherence with a focus on Southern Africa. Further, it will present a proposal for a multi-national study of the same topics in Malawi, Botswana and South Africa discussing issues of sampling and the use of quantitative and qualitative research methods. RC05-110.7LISIAK, AGATA* (*Bard College Berlin*)*Reflections on a Mixed Methods Approach to Researching Immigrant Mothering*

This presentation provides a reflexive account of the methods applied in my research project *Immigrant Mothers As Agents of Change* (2013-2017). As they play a central role in transmitting cultural capital on a transnational and transgenerational scale (Erel 2010, 2012), immigrant mothers' regular participation in and exposure to urban diversity – especially to diverse mothering practices and discourses – leads, through social and material remittances, to a transformation of the understandings and performances of motherhood in the sending country. In my project, I inquired specifically into how migrant mothers, coming from Polish cities that are largely homogenous in terms of ethnicity and religion, make sense of and come to terms with the much greater diversity they encounter in the British and German cities, in which they now live (Lisiak 2017; Lisiak and Nowicka 2017). Recognizing the many complexities inherent to immigrants' encounters with diversity in urban and transnational space and the meanings migrants assign to them, I chose a mixed method approach in order to generate not more, but various kinds of data. The methods I worked with included semi-structured and narrative interviews, participant observation, diaries, as well as creative methods. In my ISA presentation I would like to briefly discuss the advantages and challenges related to each of these methods in the context of my research and focus on the use of drawings in participant-driven image elicitation. I will also present the website <https://immigrantmothers.net>, which showcases the visual and narrative materials produced through creative collaborations with research participants and demonstrates how their contributions foster research questions and research methods.

RC20-380.1LISITSYN, PAVEL* (*Saint-Petersburg State University of Economics*)
STEPANOV, ALEXANDER (*TANDEM, St. Petersburg State University*)*Models of Social Inclusion and Social Exclusion of the First and Second Generations of Transnational Migrants in Russia, France, and the USA: Comparative Sociological Analysis*

Our proposed presentation at the XIX Congress of ISA is developed in a context of issues relating to the processes of socio-economic and political transformation in our time that can be called as the 'Age of Transnational Migration'. It will be focused on a comparative analysis of the activities and practices that organize everyday life of transnational labor migrants in Paris, New York, and St. Petersburg, Russia.

The goal of the paper is a comparative sociological analysis of social foundations for radicalization and the involvement mechanisms of transnational migrants into the practices of terrorism.

The point of departure for analysis is Charles Tilly's distinction of the certain types of terror and diversity of forces of terrorism as the strategy.

The basic hypothesis of the paper can be formulated as follows: the models and practices of social inclusion and social exclusion of transnational migrants serve as the major factors for developing ideological extremism and precondition terrorist activities.

The research is organized along with the structural chain: the state - the employer - the employee. The cases for analysis were chosen according to the different types of social welfare for newcomers to the country and the availability of welfare to the first and second generations of immigrants.

The paper will be based on the specific data and examples that come from the on-going longitudinal research, 2017-2020.

RC15-293.10LISSITSA, SABINA* (*Ariel University*)
MADAR, GALIT (*ARIEL UNIVERSITY*)*ICT Adoption By People with Disabilities – Findings of a Repeated Cross-Sectional Study – 2003-2015*

In highly developed health care systems most aspects of health care and the consumer health experience are supported and mediated by a wide array of technological platforms. Research has continually shown that lower e-Health literacy rates are associated with a range of negative health outcomes. It is obvious that in order to benefit from e-Health opportunities or avoid injury due to its non-use, internet adoption and use constitute a necessary condition. The main purpose of the current study is to follow the trends in ICT adoption among the population of Israelis with disabilities (compared to the population without disabilities) from 2003 to 2015 and to identify variations in the socio-demographic characteristics that may predict internet access and digital uses over time. The current research is based on a repeated cross-sectional study. Study data were collected by means of Annual Social Surveys conducted by Israel's Central Bureau of Statistics in the period between 2003 and 2015. The

total sample included 95,145 respondents, among them 22,290 respondents with disabilities. Our findings show that the rate of internet access and digital uses increased continuously among disabled people; however the gap between them and the healthier population was preserved. The more prominent differences between these groups were found in the first level of the digital divide (internet use vs non-use), whereas between-group differences in the second-level digital divide (digital uses) among internet users were moderate. Our findings make it possible to identify disadvantaged groups in which groups with disabilities intersect with additional risk factors: Arabs, religious people, elderly, respondents from low socio-economic backgrounds. The effects of most of these variables did not change in the period under study. The findings of this study have important implications for researchers, educators, practitioners and policy makers who attempt to promote internet use among people with disabilities.

RC44-739.4LITTIG, BEATE* (*Institute for Advanced Studies Vienna*)
BARTH, THOMAS* (*Ludwig-Maximilians-University Munich*)*More Than Business As Usual? the Socio-Ecological Activities of Austrian and German Trade Unions*

In our contribution we discuss, how the current environmental engagement of Austrian and German trade unions meet the challenges of two concepts linked to socio-ecological transformation, namely the imperial mode of living and the logic of externalization.

In this discursive context we detect a rising attention for sustainable work: Sustainable development is increasingly framed as socio-ecological transformation towards sustainable working societies. This relates to issues which have been fostered by trade unions for a long time. At the same time interrelated social, economic and environmental inequalities enlarge. Historically an imperial mode of living has been established in the global North, which due to the logic of externalization passes on the costs of the good life on the global South. This divide results in problems of transnational solidarity for trade unions of the global North.

Based on this diagnosis we want to put forward the theses that firstly, sustainable positions and strategies of trade unions regarding climate change and environmental protection have to overcome the logic of externalization. Secondly, trade unions need to address issues of the workplace and business as interconnected with everyday practices of the employees.

This approach comprises big challenges for the trade unions of the global North. Contrary to the social movement oriented trade unions of the global South their Northern counterparts are bound to corporatist structures. Thus, they are a structural part of the environmentally destructive capitalist growth regime, which intensifies global inequality. At the same time they are in a privileged position, since they are the only democratic and global institutions that act at the interface of work-ecology, work-life. But how about trade unionist concepts of sustainable work or related approaches which question the imperial mode of living and working? Based on recent case studies we want to discuss this question.

DA, SHUYANG (*Zhejiang University*)*The Relationship between Leisure and Happiness*

Abstract: Few studies have made qualitative analysis on the intrinsic relationship between leisure and happiness, though extant quantitative studies have explored their relationships. Based on grounded theory, a photo elicitation approach is employed to visualize people's conceptualization of happiness and the relationship between leisure and happiness. Visual data are collected among college students from 2013 to 2017 in an eastern key university of China. More than fifty participants were asked to draw three pictures depicting their happiest moments and make a narration of them. When, where, why and with whom do people feel happiest, and what activities make them feel happiest shown in the pictures were analyzed. Then, the leisure elements are dissected from the pictures and the implied psychological factors in leisure which bring happiness are also interpreted. The study reveals that the happiest moments are closely related to leisure time, such as festivals and vacations, silent nights or afternoons, which is disposable and away from work. Moreover, a majority of those happiest moments happen in leisure spaces, like parks, malls, beaches, resorts, etc. In addition, most of the participants feel the happiest when they are participating in leisure activities, including traveling, playing sports, listening to music, etc. Relaxation, tranquility, achievement, affection and enjoyment are significant mechanisms bringing happiness. Leisure functions as a core ingredient for happiness. Practical suggestions were made to improve people's leisure participation and happiness.

Key words: leisure, happiness, photo elicitation

Between Social Spaces

For more than a century, sociologists have imagined society as spaces. By the early 21st century, field theory seems to have become the dominant approach for studying social spaces. Yet Bourdieu's field theory has a curious blind spot, namely, the relationship between social spaces. This paper takes the Simmelian approach of formal sociology and outlines the basic social forms by which two or more social spaces relate to one another. I argue that social spaces have life histories like individuals and institutions. They evolve in mutually contingent and constitutive ways. Each space has a unique history of its own, yet all life histories of social spaces are shaped by interactions with other spaces over time. In order to study these interactions, the paper examines two dimensions of the relationship between social spaces: (1) heterogeneity; (2) social distance. In terms of heterogeneity, social spaces can be kindred, symbiotic, or estranged. In terms of social distance, they can be linked, overlapping, or nested. These social forms of spatial relations are constituted by the individual and collective actions of a variety of actors, including guardians, brokers, and space travelers. The main objective of the paper is to outline the social forms that structure and delimit the substantive aspects (e.g., power dynamics, patterns of inequality, or modes of production) of spatial thinking in sociology and beyond.

Boundaries and Professions: Towards a Processual Theory of Action

This article outlines a processual theory of action for the sociology of professions. It argues that existing theories of the professions focus primarily on the questions of social order and social change in professional life but overlook the basic question of social action, namely, what do professionals do? Individual professionals, their clients and regulators are all purposive actors, and the professions are the outcomes of their collective action in the system of work. These actors in professional life fight for jurisdictions with boundary work, define expertise by diagnostic struggle and coproduction, and build social networks through exchange. Following the interactionalist tradition of the Chicago School of work and occupations, the processual theory of professional action examines the interactions of professionals and other actors over, within, and across boundaries and uses this theory of action to complement existing theories of order and change.

Lineage Networks and Chinese Rural Entrepreneurship

Since Max Weber, it has been a long-held debate about whether lineage networks promote or hinder the development of modern private enterprises. We argue that lineage networks, functioning as community-level social capital, can either facilitate or impede the development of private economy, depending on formal institutions they embedded in. When the private property and market exchange are not effectively protected by formal institutions, the dualism ethics entailed in lineage networks facilitate the growth of private enterprises by reducing transaction costs and protecting the property rights of private entrepreneurs. When private property and market exchange are legally protected, the dualism ethics of lineage networks contract the universal ethics required by market exchange. Lineage networks cannot escape the problems of free-riding and exclusion of others. In this context, lineage networks hinder the growth of private enterprises. The privatization and marketization of the Chinese economy provides a great opportunity to examine this argument. Using the village-level data from 2005 Chinese General Social Survey when Chinese formal property law was effective, we find that the strength of lineage networks – measured as the proportion of largest surname group, lineage temple, and genealogy books – are negatively associated with the number of rural private enterprises at village level. This finding is in sharp contrast with the protective effect of lineage networks on rural private enterprises found in rural China in the 1990s, a period where private property was not legally protected. Taken together, these results support that the role of lineage networks on private entrepreneurship depends on their interactions with formal institutions, clarifying the institutional basis for the Weber thesis.

The Effect of Neighbourhood Social Ties on Migrants' Mental Wellbeing in Chinese Cities

Existing literature on migrants' mental wellbeing in Chinese cities has highlighted the crucial role of social ties, yet the pathways by which social ties

influence their mental wellbeing remain poorly understood. Using Guangzhou survey data and multilevel linear regressions, this paper examines the extent to and ways in which migrants' social ties with neighbours enhance their mental wellbeing, with a particular focus on the distinction between the main effects and buffering effects of their neighbourhood ties. Results from multilevel models reveal that neighbourhood ties enhance migrants' mental wellbeing in a direct manner, but no evidence shows that neighbourhood ties lessen the negative impacts of neighbourhood deprivation. Results also illustrate that the association between neighbourhood ties and mental wellbeing is stronger for locals than for migrants. This paper contributes to our understanding of migrants' mental wellbeing by disentangling the positive effects of their social ties with neighbours and investigating the role of migrants' neighbourhood ties in relation to stress arising from neighbourhood deprivation.

A Study on the Educational Policies on Teacher Education and Social Justice in Alberta: Focused on the Results of Talis 2013

Alberta, a western province of Canada, for the first time in 2013, participated in the Teaching and Learning International Survey (TALIS) as a single and only province. Alberta has always been very active in education reform and participation in international competitions, with a view to the pursuit of excellence in education. Especially in the PISA, TIMSS and PIRLS competitions, the performance of primary and secondary school students in Alberta is not only excellent in the Canadian provinces, but also internationally comparable to other advanced countries. Thus, Alberta's school system and the teaching situation of teachers which cultivate such outstanding students deserve to be explored in depth. Therefore, the purpose of this study is to analyze the quantitative results of TALIS 2013 in Alberta from the perspective of social justice to summarize its important characteristics and challenges of teachers' working conditions and school learning environment. At the same time, through the qualitative results of the interview survey, this paper explores the important implications of the TALIS 2013 survey results and relative reforms on teacher education in Alberta.

LIVINGSTONE, D.* (*University of Toronto*)

The Growth of Professional Classes and the Polarization of Authority Relations in an Advanced Capitalist Economy

Authority is central to professions, but much previous research has treated professions as internally homogenous and not examined important internal differences in authority relations. Professionals make up growing proportions of the employed labour force in advanced capitalist economies (Livingstone and Scholtz 2016). But professionals are found in four distinct class positions: those who employ others; the self-employed; managers; and non-managerial employees (Livingstone 2014). This paper documents changes in the distribution of these classes of professionals both in the general class structure and among professional occupations. Two dimensions of professional authority are identified: the extent of participation in organizational decision-making and discretionary control of planning their own work. The changing exercise of authority among these professional classes is estimated in these terms. Empirical analysis is based on a distinctive series of national surveys conducted in Canada in 1982, 1998, 2004, 2010 and 2016. Findings suggest that non-managerial professional employees have diminishing authority in relation to employers and managers, becoming more similar to traditional working-class industrial and service employees. The differing negotiating power and economic attitudes of these professional classes are also assessed and implications discussed. In particular, it is argued that further studies of professional authority should distinguish rather than conflate professional classes.

Intermédiaires Du Travail Artistique, Carrière Des Musiciens Et Inégalités Au Sein Du Champ Musical

Les fortes inégalités qui structurent les champs de production artistique sont liées aux ressources initiales des artistes mais aussi à leurs capacités à en mobiliser de nouvelles durant leur carrière. Le processus d'accumulation du capital symbolique qui permet à certains artistes d'accéder à la reconnaissance

passé notamment par la collaboration avec des intermédiaires culturels, eux-mêmes inégalement dotés en capital social, économique et symbolique. C'est ce que je tenterai de montrer en m'intéressant au rôle des agents, des tourneurs et des managers d'artistes dans la carrière des musiciens français. De plus en plus nombreux, ces intermédiaires interviennent dans l'appariement de l'offre et de la demande de travail artistique. Dénoncés par certains comme « parasites », perçus par d'autres comme « faiseurs de stars », ils se désignent souvent eux-mêmes comme « développeurs d'artistes ». Quel rôle jouent aujourd'hui ces intermédiaires dans la production de la valeur symbolique et économique des artistes ? Pour répondre à cette question, je m'appuierai d'abord sur une série de données quantitatives qui montre que le capital symbolique des musiciens augmente avec la présence d'intermédiaires. Plus un artiste s'élève dans la hiérarchie du succès, plus les intermédiaires qui l'entourent sont différenciés et professionnalisés, et plus le réseau qui participe à la valorisation de l'artiste est étendu. Des données plus qualitatives seront ensuite mobilisées pour montrer comment et avec quelles ressources ces intermédiaires agissent en faveur de l'accès des artistes au succès. En plus du travail de promotion et de placement des artistes sur le marché du travail, ces intermédiaires développent constamment leur réseau social pour créer des opportunités. Ils agissent également sur les dispositions des artistes à l'égard de leur travail et de leur carrière et développent des stratégies qui s'inscrivent dans la montée des logiques marchandes au sein du champ musical.

State Secularism from the Classroom up: Examining the Role of French Teachers in Carrying out Laïcité Policies

France's long-held principle of state secularism, *laïcité*, is expressed through multiple areas of social service provision, but perhaps nowhere most intensely as in public education. Within this core institution of French society, multiple attempts have been made over decades to emphasize a common national secular identity. I examine the latest major iteration of this phenomenon, a package of pedagogical and administrative reforms called the *Grande Mobilisation pour les Valeurs de la République*. Focusing on core French values including *laïcité*, these were enacted following the January 2015 attacks in and around Paris, most notably directed at the offices of the satirical publication *Charlie Hebdo*.

What is most notable about these reforms is that it is primarily ground-level educators – teachers, principals, and others – who are responsible for monitoring students' adherence to French principles of secular society as they are defined by the national-level Ministry of Education. As a result, there is a distinctly individualized and localized form of personal experience and discretion that plays a key role in the implementation of the *Grande Mobilisation*. Despite this, the role played by this local level in carrying out state education priorities remains somewhat undertheorized.

I draw on work in critical education and critical policy studies, as well as recent work in critical geopolitics that calls attention to the exercise of state power at an intimate level, to present a framework for how we can understand the role occupied by ground-level educators in the realization of national educational priorities. This is an especially important in the context of governments across Europe that are facing an erosion of their authority from populist nationalism on the one hand, and increasing flows of migrants on the other, and so are responding by doubling down on their insistence on traditional civic values as a marker of belonging.

The Consequences of the 2008 Financial Crisis on Household Wealth Inequality: A Comparison between the United States and Canada.

The history of the Great Depression has shown that credit must be both loaned and borrowed responsibly, but the 2008 subprime crisis made manifest that this lesson has not been learned. While the 1930s crisis was overwhelmingly caused by careless lending in the form of margin accounts for stock trading, the 2008 financial crisis originated in mortgage lending to a category of households that represented high financial risk. Through the financial innovation of securitization, the high-risk category that had previously been called the *uncreditworthy* was relabelled *subprime* and integrated to the credit market. Ultimately, this category proved unable to continue their payments and their massive defaults and bankruptcies lead to a global financial crisis characterized by collapsing real estate markets, insolvent banks and a prolonged recession. As to be expected, however, the consequences of this crisis differed significantly between countries. The goal of this paper is to compare the consequences of the 2008 financial crisis on wealth inequality in Canada and the United States. The statistical analyses were performed on the Luxembourg Wealth Study (LWS), which is currently the most comprehensive database available to study wealth inequality in a comparative approach. In order to properly show the effects of the financial crisis, it was necessary to analyse wealth inequality with both absolute and relative measures.

The often-remarked observation that the Canadian economy was largely spared the financial crisis is confirmed empirically in detail when examining household wealth distributions. The results highlight the fundamental importance of financial regulation, the economic and democratic stakes of homeownership policy, the risk compromise between growth and financial innovation and the importance of financial security as both a concept of sociological analysis and a policy objective.

The Problem of Non-Congruence between Income and Wealth Distributions in the Study of Economic Inequality: Towards a New Classification of Economic Elites in OECD Countries

Important research on top income and top wealth distributions has shown that the current drivers of economic inequality are located in the top percentiles and, to a lesser degree, the top deciles. This paper proposes to address the continuing relevance of top deciles and percentiles as concepts of analysis in economic inequality. While recognizing their important contributions in the study of inequality, it will be argued that this field would greatly benefit from drawing upon the theoretically grounded literature of class analysis and elite studies in order to take further advantage of the new possibilities in empirical research – namely, the growing availability of household wealth data. Specifically, as concepts of analysis, top income and wealth percentiles highlight the classic problem of non-congruence in Weberian class analysis. Households may not only hold different positions in terms of class, status and power, but also, in the context of class, they hold different positions in the respective income and wealth distributions. While this is already known, the literature has yet to explore this in depth. How can this we make sense of this non-congruence? To what extent do income elites overlap with the wealth elites and how might these different categories be distinguished? Is there cross-country heterogeneity in the overlap of top income and wealth? To answer these questions, a comparative analysis was performed on the eleven OECD countries participating in the Luxembourg Wealth Study (LWS). The LWS is currently the most comprehensive database to study both income and wealth inequality conjointly in a comparative approach. By using a principal component analysis on income sources (i.e. labour income, capital income, self-employment income, etc.) and wealth, a classification of economic elites will be proposed. The results highlight a promising way that the income/wealth non-congruence may be analysed in the study of economic inequality.

Caring in the Midst Exclusion/Inclusion: Care Provision and Survival Among Haitian Migrant Domestic Workers in the DR

Since 2007 laws and regulations that govern citizenship and nationality in the Dominican Republic (DR) have gone through an intense period of transformation. These recent changes are part of a historical process of inclusion/exclusion (de Genova, 2013) in which migrants are known to live and partake in Dominican society in ways that are conditioned by the constant interrogation of their legal status in the country. As a result, Haitian migrants and their Dominican-born descendants find themselves often formally or informally excluded from social, economic, and political rights that among others, limit their access to health, education, and social policy. Based on recent fieldwork in the Dominican Republic, I argue that migrant Haitian women and women of Haitian descent find themselves at the centre of the process of exclusion/inclusion. First, in the past,

Haitian women were more likely to enter the DR with insufficient documentation due to the DR's specific pursuance of male Haitian agricultural labourers. Second, Dominican law requires mothers to be the ones who register their children's birth, which often leads to passing the condition of legal liminality from one generation to the next. Third, limited access to social services of migrant women and their descendants increases their reliance on women's unpaid social reproductive labour and informal care arrangements. In this context, I argue that state-led inclusion/exclusion is central to a *de facto* informal security regime that relies in important ways on the unpaid and paid care labour of women who are structurally at risk due to the intersections of their citizenship status, gender, race, and class.

Intimate Labour As Cross-Border Survival: Narratives of Arrival Among Haitian Migrant Domestic Workers in the Dominican Republic

Together with sex work and petit trade, domestic work is one of the three main sources of income for Haitian migrant women in the Dominican Republic (Petrozziello and Wooding, 2013). I argue that care work and other forms of intimate labour (Boris and Parreñas, 2010), paid and unpaid, are at the heart of Haitian migrant women's migration experience as a strategy for survival. In other words: they provide intimate labour in order to survive. My argument draws on extensive qualitative data collected through interviews and focus groups held in Haitian and Dominican border towns, *bateyes* (sugar plantation communities) in south-west DR, and Santo Domingo, the Dominican capital, with Haitian women who work as domestic workers in the DR. Their testimonies frequently refer to the provision of unpaid care work to distant relatives that host them when newly-arrived (often as children or youth) as well as the provision of similar work for adult men who they meet upon arrival and who provide shelter and limited social protection in exchange for unpaid care and other forms of intimate labour, including sex. Informants narrate these arrival arrangements as a matter of survival, and often portray them as foundational to the formation of their families and as training for their future incursions in the labour market. In this context, the boundaries between paid and unpaid care work, transactional sex, and other forms of intimate labour are often blurred in the quest for survival that permeates their migration experiences.

Injustice within and Beyond Families: The Conception and Formation of Families Among Queer Women in China

The present study examined the experiences of injustice faced by Chinese queer women in the processes of forming queer families in Beijing, the capital of China. It revealed the ways in which different institutions, including the heteronormative power structure of Chinese families, the government, and the market, shaped Chinese queer women's conception and formation of families. While a substantial number of Western research on family patterns and relations of lesbian, gay, bisexual, transgender, and queer (LGBTQ) individuals has emerged since the first decade of the 21st century, less attention has been paid to LGBTQ family formation in Asian contexts. In China, since non-heterosexuality remains heavily stigmatized and discussions about homosexuality have been censored by the government, families formed by LGBTQ individuals are largely invisible and suppressed. Through semi-structured interviews with 30 Chinese queer women, who identified themselves as "*lalas*" (queer women in Chinese term) and lived in Beijing, this study illuminated their different patterns of making sense of and forming families, ranging from staying single, cohabiting with a same-sex partner, performing "contract marriage" with a gay man, to having a child through assisted reproductive technology. Informants' diverse meanings attached to the idea of "family" were attributable to their experiences of empowerment and/or disempowerment in relation to their social locations, including gender, sexuality, class, and age, as well as within different life spheres, including within families of origin and the workplace. Meanwhile, by creating different forms of families, informants resisted and/or surrendered to the violence of heteronormative beliefs and rules in China to varying extent. This research has provided new empirical knowledge about the needs, wants, and challenges of families formed by queer women as well as the power dynamics behind queer family formation in China. It also has important implications for transnational theoretical dialogues concerning families, sexuality, and social justice.

Leisure for Well-Being: The Z Generation's Mood

This paper is going to present the results of a research carried out among young Italians born between 1998 and 2000 attending high school. The research aimed at comparing their idea of well-being with that of older generations by looking at leisure practices (traditionalists: born between 1922-1943; baby boomers: 1945-1964; Generation X: 1965-1980; Generation Y: 1981-1994; Hamilton 2016). The empirical base of the study is made of:

a) 500 questionnaires administered to a non-probabilistic sample of high school students living in a city in the South of Italy. Respondents were asked to describe their idea of well-being and also whether leisure time and the way they practice is a relevant part of it or not;

b) 50 in-depth interviews with subjects from other generations in order to investigate their concepts of well-being and leisure time and how the two intersect each other;

c) a series of analyses of cultural products (movies, books, song lyrics, kinds of issues treated in youth magazines, etc.) taken as "icons" (i.e. milestones) in the cultural and value systems of the different generations with regards to the concept of well-being and its relationship with leisure practices in the past.

Framed within a sociological-generationalist perspective (Mannheim, 1928), this comparison is going to see how the definition itself of well-being changes significantly not only historically with regards to the different life experiences and leisure practices of different generations, but also with regards to the way in which the meaning of well-being in leisure time changes according to the different level of sharing and "sociality" that is attached to it, i.e. a public or private dimension differently experienced as "essential" by different generations.

Exploring the Experiences of Young Adult Women Growing up with Non-Resident Fathers in Tlokwe Local Municipality

South Africa has the second highest rate of non-resident fathers in Africa after Namibia. Studies indicate that one father out of two is absent in a child's life and 50% of all fathers between the ages 15-49 do not have daily contact with their children. This study examines the experiences of young adult women raised in non-resident father households in Tlokwe Local Municipality, North West. Focus groups and face-to-face interviews were conducted with 34 young women between the ages 18-25. Five important, nuanced themes emerged, these are: a) fathers who are physically present but emotionally absent, b) fathers who are physically present but uninvolved, c) fathers who are physically absent but involved, d) fathers who are physically present and involved and e) fathers who are absent and uninvolved. Non-resident fatherhood remains a challenge in the Tlokwe Municipality, most of the participants had never met their biological fathers. The study revealed the frustration young women feel towards their mothers and maternal grandparents for caring more about maintenance than they do about a healthy father-daughter relationship. The study further revealed a deep-seated need for close proximity and an involved type of fathering among the young women.

Happiness and Development of the Elderly: Leisure As an Enhancing Agency

Quality of Life and Life Satisfaction are phrases used to evaluate the wellbeing of individuals and societies. Much documented evidence exists that children and those in the workforce are active and occupied in their ways of life. However, activity and busyness are not evident in later life, especially after the cessation of work. After retirement, common knowledge indicates a contraction of the range of activities leading to boredom and loneliness. This paper advocates that contraction of activities need not occur. It uses leisure to increase the repertoire through learning new activities, substituting for those one was accustomed to and adapting to those and individual once enjoyed. Advancements that enhance the extension of life and new technologies, combined with focused attitudes will enable people in late age to be fully occupied and happy.

Leisure, Happiness and Development: Reflections on China

Linking concepts of leisure, happiness and development have been generally well accepted. In reality however, increased wealth does not correlate with increased happiness. Although increased development may enable greater leisure experiences, they may not arise from leisure activities that promote health and wellbeing. China is selected as the nation for discussion. Data are drawn from contemporary literature dealing with world happiness (Helliwell, Layard & Sachs, 2017) and literature on *Finding Leisure in China* (Godbey & Rui, 2015). As a country, China is ranked 79 out of 155 countries on happiness. Over the past quarter of a century the Gross National Product (GDP) in China has multiplied five-fold. But the

Subjective Well-Being (SWB) in the last 15 years has diminished before showing a gradual rise. GDP relates to the economic side of life; SWB is a comprehensive measure of individual well-being and takes account of economic and noneconomic measures. The social scene in urban China has leaped as a consequence of: the two-child policy; increase in gross national income; and expansion of pastimes and leisure activities in the home and out-of-home. Consumer culture has started to take hold with the advent of increased discretionary time and increased income. The countryside is different – still work dominated and limited in leisure. The paper attempts to describe the status of leisure in modern China and link the concepts of leisure, happiness and development in shaping a future.

Rehabilitating Neoliberalism? Market Instruments and the Sustainability Transition

To proponents, market-based policy instruments offer elegant solutions to sustainability crises – substituting political decision-making with the technical deployment of expertise, optimizing the efficiency of public resource allocation, mobilizing private finance and innovation, and acting on the root causes of social and environmental externalities. All the while avoiding the inflexibility and non-responsiveness of command-and-control regulation.

Such instruments have long been the cornerstone of global governance frameworks such as the Kyoto Protocol. But the failure of market instruments, and the neoliberal logics that inform them, to resolve or to evade what seems an increasingly fractured and polarized environmental politics is telling. On the one hand, this failure confirms sociological critiques. From the destructive potential of speculative capitalism to the mundanity of social practice, there is more going on in the exploitation of people and ecosystems than 'the production of externalities'. On the other, it does not follow that market instruments have no potential role in supporting meaningful reform.

This paper offers an analysis of the conditions under which a variety of market instruments may support lasting and transformative change in the management of (in this case) agricultural landscapes. It argues that all environmental policy (whether market-based or not) makes assumptions about the distribution of benefits that arise from sustainable resource management, about the rights and responsibilities that inhere in access to natural resources, and about policy-efficacy.

Conditions that support effective outcomes across a variety of market instruments include clarity and acceptability of property rights, clarity of resource access-related duties, institutional capacity, temporal security and flexibility, two-way accountability, stability and consistency in state policy, and regulatory legitimacy. Contrary, therefore, to the neoliberal promise of de-politicized policy, market instruments to support the sustainability transition demands explicit recognition of their social embeddedness.

Challenging Mafia's Territorial Power. Operating Among Market and Culture to Sanction Cosa Nostra, a Case Study on Addiopizzo

Addiopizzo is an anti-mafia movement established in Palermo (2004) to struggle extortion racket. It aims to sustain, spread and consolidate a culture based on legality, as well as an economic development free from mafia constraints. *Addiopizzo* association have fostered the creation of a community composed by entrepreneurs who refuse Mafia protection system. We argue that refuse to pay pizzo and above all the willing to denunciate any extortion attempt, question the legitimacy of mafia's territorial power. Consequently these attitudes can be conceptualized as a sanction against Cosa nostra.

For a shopkeeper, joining *Addiopizzo* network assumes the meaning of sharing the aforementioned attitudes and entails to signal it out. This implies an increasing perception of a possible change, namely a market field where is possible to avoid relationship with the mafia realm and to remain consistent with an ethical orientation founded on anti-mafia values and a culture of legality.

Our paper intends to inquire the dynamics that make *Addiopizzo*'s experience so effective and lasting. In particular, how a community can organize a sanction system, jointly at economical and cultural level, to challenge territorial power of crime organizations. One crucial point concern the role played by values and culture in this process. The aim is to contribute understanding the possibilities of change in a context marked by a rooted presence of organised crime through the use of a post-heroic approach, that is an incremental transformation driven by a collective action of actors otherwise weak and powerless.

Multigenerational Households in Italy. How Demographic Changes and Economic Crises Are Affecting Individual Trajectories and Family Forms

This work aims to understand how significant demographic changes and the economic crisis have affected generational interdependence, family structures and solidarity networks in Italy. It takes in consideration major changes in family living arrangements, focusing on the multi-generational household types, both from a structural and a relational perspective.

Specifically, the subject of my research are reconstructed households where young adults moved back to parental home as consequence of vulnerabilities, mainly entailed by economic crises and conjugal instability.

Avoiding a straight bourgeois positioning, I'm intending families in terms of *practical kinship*: as a field of relationships that are constantly used and reinforced in everyday practices and exchanges. Individual trajectories can play a big role, not just for shifting relative power of each member, but also impacting the family field as a whole, such as death, separation, re-partnering and reconstitution. Generational gap can produce conflicts of different kind. Multigenerational households resulting from a reconstruction, can be understood as a privileged field to observe negotiation processes and ambivalences of members living together while coping stressful situation of vulnerabilities.

What I propose is a mixed-method designs. Quantitative methods are used to understand the changes in family structures and define the most effective factors affecting the choice of returning parental homes. Qualitative methods are used to understand relational specificity of members involved in the management of multigenerational family field, focusing on challenges and ambivalences.

My analyses are intended to take a longitudinal perspective, confronting changes attributable to economic crises of 2008. I'm using the ISTAT Multipurpose survey on households. It is a repeated cross-sectional survey which provide detailed longitudinal data on daily life of individuals and families. I'm going to present results elaborated from descriptive analysis and regression models. Results of the qualitative inquiry will not be included in the eventual discussion.

'No Borders' Whilst Maintaining 'Safe Spaces': Boundary Management in Feminist and Queer DIY Punk

This paper investigates relationships between identity, belonging and the creation of cultural community 'safe' spaces, through a case study analysis of contemporary queer/feminist do-it-yourself (DIY) punk scene(s) in the UK. These draw on the aesthetics of Riot Grrrl punk that emerged in the USA in the early 1990s, but this new generation are also influenced by contemporary queer, anarchist, feminist and trans politics.

The scenes operate in a way that enables performers, organisers, and its wider community to play with the borders of genre, particularly in terms of deconstructing spatial, cultural, and identity boundaries. Politically, this approach allows an 'opening up' of possibilities, countering the cultural hierarchies and oppressions extant in wider cultural and social life.

Simultaneously, however, the scenes rely on the creation of 'safe spaces' at events. These allow otherwise marginalised people to perform, to experiment, or simply to exist, at events without fear of attack. Such 'safe spaces' rely on the creation and policing of boundaries, of ensuring that attendees adhere to sets of guidelines around behaviour at events.

By analysing these two seemingly contradictory approaches to boundary-management, this paper will examine the complexity of scene participants' political work in terms of identity, belonging, and community.

This paper brings together findings from two research projects, 'Trans Music Communities' (2012-3) and 'Punk, Politics and Gender in the UK' (2016-), while also reflecting analytically on the author's own involvement with the scenes in question (2011-). Data includes interviews, participant observation, and content analysis of creative outputs by performers and scene organisers.

LOHMANN, HENNING* (*University of Hamburg*)

Non-Standard Work, Low Pay and Poverty in Europe: Patterns of Redistribution within and across Households

In recent decades European welfare states have undergone massive change, were facing increased global competition as well as economic and financial crisis. As a result, many countries saw a deterioration of labour market positions with a widening of the segment of non-standard and low-paid employment relationships. The paper addresses how these developments have contributed to changes in the distribution of labour market earnings and in the patterns of redistribution within and across households.

The relationship between non-standard work, low wages and poverty is an aspect of the more general distributional question how an individual labour market position translates into well-being at the household level. A direct link is to be expected when single earnership is the rule and no other sources of income but the earnings of the 'household head' are available. But these conditions differ across countries and are subject to social change, in particular to transformations affecting the patterns of family living, the gendered division of labour and the tax/transfer system. In the welfare states of the late 20th and early 21st century a complex link between work and poverty has evolved as not only earnings of a 'household head' contribute to a household's income package, but also a partner's or other household members' earnings, public or private transfers and other incomes.

The paper takes a multilevel perspective to identify the impact of macro-level characteristics on micro-level outcomes. Based on the EU Statistics on Income and Living Conditions (EU-SILC 2004-2015; two-way fixed effects and random coefficient models) it provides an analysis of three types of incomes (individual earnings, pre- and post-tax/transfer household income) which show how structural and institutional factors shape the distribution of labour market earnings and patterns of redistribution within and across households.

Hyper-Governed Young People's Resistance to the Crushing Ubiquity of Neoliberal Violence.

The ongoing debate about youth and violence within sociology is beginning to integrate the significance of non-physical violence. Using data drawn from young people directly, I argue there is a need to further develop existing frameworks to conceptualise violence in structural, cultural (Galtung) and symbolic (Bourdieu) forms. These frameworks from the emerging sociology of violence facilitate two insights. Firstly, it recognises *hyper-governed* young people's experiences of violation as resulting from "neoliberal violence" (Giroux, 2014, p. 224). Secondly, it facilitates a conceptualisation of the diversity of their techniques of resistance as ultimately discursive. Theirs is a search for the language through which to speak into existence new realities free from violence. The project this paper is based on involved 28 semi-structured interviews with hyper-governed young people predominantly from South Australia. Interviews were audio record and transcribed. Persistent motifs were identified through thematic analysis.

These young people, 15 – 25 years of age, were identified in this project as *hyper-governed* because they are subject to increased regulation and surveillance from the state. This governing is in addition to the already highly regulated period of youth. The hyper-governing of these young people is the result of their association with political action, child protection or juvenile justice systems. However, they do not passively accept the violence imposed on them. Rather, they experiment with resistance techniques that challenge the hegemony of neoliberal violence. This paper focusses on three such techniques: Democratised Surveillance, Voluntary Occupation, and Self Governmentalisation. My analysis of these stories draws on Bourdieu's (2001) concept "symbolic violence", Galtung's (1969, 1990) "structural" and "cultural violence", as well as Giroux's (2014) "neoliberal violence". I will demonstrate that hyper-governed young people actively resist conformity to sanctioned forms of neoliberal violence through discursive resistance.

LOMBAARD, CHRISTO* (*University of South Africa*)

The Murderous God of Genesis 22 (the Akedah) in Three Recent Public Discourses: A British Popular Anti-Religious Book, a US TV Series and a South African Poem. (- Or: Criteria for God-Hood and Faith in Secular Media)

Genesis 22 (known within Judaism as the *Akedah*) relates the psychologically disturbing account of how God instructs Abraham to sacrifice his son Isaac as a token of devotion. Apart from almost two and a half millennia of interpretative wrangling with this text and two centuries of academic scholarship on it, this account keeps recurring in various ways in modern media too. Three such publications are here taken into review: a section of the popular 2006 book *The God delusion* by British biologist Richard Dawkins; an interchange between two of the main characters in the US TV crime series *Bones* (series 2, episode 2); and a 2016-published poem called "Sacrificium" by South African poet Lina Spies in her most recent poetry volume, *Sulamiet*. In these three public fora, which may be placed variously on a continuum between religion-positive and religion-negative views, the problem of the murderous God of the Genesis 22 account is in each instance treated differently, and creatively so. Interestingly, and unintentionally, in these treatments (as in many others) implicit criteria on the part of the authors are revealed of what would in secular discourse be acceptable for acknowledgeable God-hood and/or for legitimate faith. Identifying these and other implicit criteria are of importance in placing on a clearer footing the often binary religion-positive / religion-negative discourse within publicly secular societies. In turn, such greater clarity tends to indicate that the rhetorics employed in this debate frequently stem not from the oppositioning of "religious" and "non-religious" points of view,

but from two equally religious orientations, though of opposing perspective regarding the phenomenon of faith.

Richard Sennett and the Jewish Ghetto in Venice: For a Socio-Literary Interpretation of Cultural Displacement

This proposal aims to further investigate the relationship between power, conflict and displacement developed by Richard Sennett in the first part of his volume *The Foreigner: Two Essays on Exile* (2011). The purpose is to focus on the literary references (Shakespeare and Castiglione among others) chosen by Sennett to snapshot the instable balances determining the cohabitation with the Jewish community in Renaissance Venice. The particular social and cultural scenario marking life in Venice allows Sennett to dwell on the contingent tensions begot by the presence of the Jewish community. To the fore is a clever reflection on the condition of exiled people in a foreign land, to the extent that this issue implies a reflection on the rights of citizenship and principle of tolerance at the dawn of our modernity. The practice of power may foster the confliction between justice and violence, as Sennett emphasizes in reference to the pogrom which afflicted the Jewish in 1627. As a result, the sociologist actualizes the social dynamics marking the Jewish Ghetto in Venice, in compliance with the dialectic between "placeless rights" and "the very mobility of spoken word". This means the precariousness of the exile people, subdued to the unfathomable action of justice and the sudden manifestations of violence. Hence follows the reference to Shakespeare's play *The Merchant of Venice* that Sennett viewed as representing the centrality of the unwritten word in commercial affairs at the time of old Dukes. The role of trust among people and the communicative dimension highlighted by Sennett in reference to "the legitimation and protection of words in themselves" preludes to the social learning of Shakespearean work, so much needed in the quest for understanding of our post-modern complexity: "the connection between freedom of speech and sanctity of contract. This economic freedom derives from freedom of speech".

LOMBARDINILO, ANDREA* (*University "Gabriele d'Annunzio" of Chieti-Pescara*)

The Risks of Academic Mobility: The Media Theatricalization of Violence

This proposal focuses on the journalistic take on the death of two young Italian researchers named Valeria Solesin and Giulio Regeni who died in Paris and Cairo in November 2015 and February 2016 respectively and both – to some extent – fell victim of terrorism. In particular, the aim is to further investigate the process of theatricalization of violence involving young researchers, starting from the journalistic strategies fostered by some important European newspapers (*El Pais*, *Le Figaro*, *The Guardian*, *Corriere della Sera*). Hence the opportunity to analyze not only the communicative representation of their sudden death, but also the political and civil reaction to their murderers. Their sacrifice inevitably symbolizes the difficult conditions in which young university researchers abroad find themselves sometimes. To the fore are the risks stemming from university mobility, in particular for young researchers involved in scientific and academic endeavor. There is no doubt that their death underwent a process of media theatricalization because of the emotive impact of the event as well as the cultural and scientific determination that led the two Italian researchers to attend their PhD courses abroad (in Paris and Cairo, respectively). Unfortunately, the social effects of the brain drain and international mobility of young scholars and researchers, strongly supported by governments and higher education systems, has been reconsidered and therefore weakened by the increasing insecurity that afflicts our globalized world, within and without Europe. Fifty years after the murder of the young German student Benno Ohnesorg (gunned down by a policeman during a demonstration in West Berlin), the prophecy of "university in democracy" claimed by Habermas as a sign of protest against the murder of the young student is far from being fulfilled today in spite of the advent of the connected society and the construction of reticular communities.

Gendered Encounters with the State: An Analytical Proposal

This paper argues that by analyzing women's experiences of military service we can rearticulate the meaning of gendered citizenship as a lived experience that occurs in the "contact zones" between the citizen and the state's institutions.

Based on interviews with 120 Israeli women soldiers, we propose three key concepts that analyze the meaning of gendered encounters with the state: 1) 'Multi-Layered Contracts' (civic, intersectional group, and individual), which contain both formal and non-formal aspects in regulating the relations with the state; 2) 'Contrasting Gendered Experiences' signifies the various experiences of doing and undoing gender in diverse military roles from the perspective of body, sexuality, and emotion management, which affect women's gender consciousness and their critical-political voice; and 3) 'Dis/Acknowledging Violence', which discusses how the women soldiers understand and react to the military's violence in war and occupation and in terms of sexual harassment. These three concepts expose the concrete meaning of women's participatory citizenship. Reading the women's narratives through the lens of these three concepts, we argue that women's mandatory military service at such a formative age, during an active ongoing violent conflict, becomes an initiation process into gendered citizenship, where the women discover their marginality vis-à-vis the state.

Rural Laboratories of Social Entrepreneurship: A Sociocybernetics Approach

The Rural Laboratories of Social Entrepreneurship, of the Colombian NGO Future for Children, is an educational program directed to rural inhabitants or suburban areas of small and medium municipalities who have not suffered directly from the armed conflict and have low human development indices. The objective is to strengthen personal and technical skills that allow them to identify the problems, wealth and opportunities of their environments; recognize their potential and define their life project; and partner to self-manage initiatives that promote a relevant and sustainable development for their communities. In 2017, four laboratories were held at Colombian Antioquia department with young peasants, mostly out of school. The experience has led to a research that seeks to understand, from systems theory, how laboratories confront young people with their limits of knowledge about themselves and their environment, and how in collective they construct new knowledge and make social decisions that trigger emerging processes that influence their personal and community development. The paper presents and explains the model of this system, which includes the process of observation of the participants, and makes a reflection from a Sociocybernetics perspective that seeks to understand how Laboratories can facilitate that young people understand their environment and act upon it to co-create a new rurality.

LONG, AMY* (*University of Fort Hare*)

A Sociological Appraisal of Police Crimes and Disciplinary Measures in Buffalo City Metropolitan Municipality - South Africa

Policing as a global concept, involves an exchange of trust between the public and a given police service. The underlying basis of this exchange is the premise that police services exist to protect citizens and their property, and to ensure that order is maintained in societies. The police services by virtue of the nature of their role in society can therefore be regarded as 'protectors'. The South African Police Services are guided by the same philosophies as policing services globally. Recently in South Africa though, there has been an increase in reports accusing policemen of becoming involved in criminal activities themselves. With a focus on the Buffalo City Metropolitan Area of South Africa, this paper presents the incidences of undocumented police crimes; the perceived causes thereof; and the perceived role of disciplinary procedures (both internally and legally) in preventing such incidences of crime. Findings from this study reveal that policemen are involved in undocumented incidences of white collar, and violent crimes in the Buffalo City Metropolitan Area of South Africa. Most white collar crimes include bribery and corruption; whilst most violent crimes include assault, assault GBH (Grievous Bodily Harm), torture and interrogation techniques with a violent element. Reasons stated for such crimes include inadequate remuneration, frustration at the poor efficacy of the criminal justice system, and general deviance due to criminal elements. Most policemen surveyed in this study stated that they know of policemen who have been involved in unethical and illegal behaviours, and that they do not believe the internal and legal disciplinary measures to be effective in eradicating these incidences. The result of such incidences is that enforcers of the law become the perpetrators of crimes whose nature they are tasked with investigating.

Beauty Practices As Harmful Cultural Practices? a Study of Female University Students in Iran

This research, drawing on a conceptual framework including notions such as harmful cultural/traditional practices (HCP) and beauty, and based on semi-structured interviews with young female university students in Iran, investigates the perceptions and experiences on beauty practices and cosmetic surgery. We explore how these notions are perceived, articulated, practiced and potentially resisted. The data suggests that despite existing criticism of the gendered aspects of beauty practices among women who practice them, they are still practiced on a large scale. In Iran, the female body as a contested space for expression of identity and social capital, is under influence by the globalized beauty ideals that rely on predominantly Western beauty ideals, and local accounts of appropriate and optimal appearance. Despite the popularity of particular forms of beauty practices in Iran, especially facial surgeries, beauty is not perceived as a common good but as a necessary evil by young university students targeted by this research. We discuss the harmful aspects of beauty and how it could be defined as HCP, as well as agentic aspects of performing beauty and body management practices.

Relationship and Financial Uncertainty during Emerging Adulthood

In the U.S., emerging adulthood is the stage in the life course in which individuals are expected to traverse the landscape of adulthood, without having to necessarily commit to adult roles. It is a pivotal age period (18 to 29 years) characterized by role exploration. Yet there are societal expectations that individuals will establish stable intimate relationships and gain financial independence from parents. Furthermore, there is always the possibility of role failure. Young adults may lose their jobs, fail to pay bills, and easily make missteps in intimate relationships. Likewise, an economic recession like that of 2008 can cause young adults to experience an uncertain financial terrain (Van Horn, Zukin, Szeltnér, & Stone, 2012). This combination of exploration and expectations can lead to subjective feelings of uncertainty. Broadly defined, uncertainty is a state or situation in which an individual is unable to readily define an outcome. Moreover, compared to the recent past, establishing conventional markers of adulthood, such as establishing financial independence and stable relationships can be difficult, and as a result, can leave emerging adults distressed. Using the Toledo Adolescent Relationships Study (n= 928) we explored the mental health outcomes associated with economic uncertainty and relationship uncertainty. Examining anxiety, depressive symptoms and low self-esteem, among an emerging adult sample (ages 22-29) using ordinary least squares regression, we found that relationship and economic uncertainty were both moderately common experiences. In multivariate analyses, relationship uncertainty was related positively to anxiety and depression, and negatively related to self-esteem. Likewise, economic uncertainty was related positively to depression and anxiety, and negatively related to self-esteem. Additionally, modeled together, relationship uncertainty and economic uncertainty remained positively associated with anxiety and depression, and negatively related to self-esteem. This research added to an understanding of unexplored areas of mental health vulnerability in emerging adulthood.

Precarious Employment, Social Norms and Youth Policies: Priorities and Rights in Canada, France and Argentina

Despite developing skills and making efforts to adapt themselves to new work standards, young people are one of the age groups who have struggled the most in the labour market for the last decades, constituting a deliberated and credible target for State policies in many countries. However shared and "explicit goals" of social inclusion, skills expansion, development of experience, access to employment, and increase of job standards, rights and security are dominated by "implicit social norms" of each context, defining different policies effects. The paper analyses the ways in which public policies address solutions to young people employment difficulties such as precariousness, instability, vulnerability, low wages, and lack of access or training. It focuses on recipient's programs priorities and "forgotten" groups to identify different: a) state functions among youth, b) criteria to generate rights, and c) individual efforts required to benefit a public action. These points will be illustrated by results from a qualitative research on youth employment policies in three countries: Canada, Argentina, France. Under this project we realized a documentary analysis of more than a hundred of policies and programs and we interviewed responsible and designers of these policies and programs in each context.

RC15-291.3LOODIN, HENRIK* (*Lund University*)*The Organisation of Welfare Services on Quasi-Markets - a Study of Elderly Care in Sweden*

This paper examines how a Scandinavian country organises elderly care as a welfare service on a quasi-market. More specifically, it deals with how public officers work with meeting citizens' need and demand, while at the same time struggle with political decrees, changes in the political climate, as well as the whims of the market. Swedish elderly care is used as an example of how a welfare service is organised on a market in which care needs and state financed subsidies intersect with private and public actors. The Swedish welfare regime traditionally seeks to de-familiarise welfare services and de-commodify citizens. The aim is to unburden families of unpaid welfare service work and secure individual welfare from market failures. Since the end of 1900, however, the model has been reformed in terms of opening up the market for private actors to organise and deliver elderly care.

The study is based on three different empirical sources. First, a survey was conducted on elderly people living in a mid-sized Swedish city and who applied for a retirement home in 2014. Second, qualitative interviews were conducted with public officers responsible for the placement of elderly. Third, a text analysis was made on significant policy documents that frame the practice of the public officers.

The findings suggests that the conditions for the organisation of elderly care have changed, the welfare regime's original aims are contested, and that family relationships is the main determinant for explaining differences in elderly people's attitudes to living in a retirement home in the future. In addition, the findings reveal the complex tactics that the public officers developed in order to handle the needs and demands of elderly citizens in relation to new ways of governing elderly care.

RC19-353.4LOPES, ALEXANDRA* (*University of Porto*)POSKUTE, VIRGINIJA* (*ISM University of Management and Economics*)*Social Investment in LTC - Findings from the Sprint Project*

SPRINT is a 3 years research project funded under the European Union Horizon 2020 Program and aims to apply a social policy analysis to a specific domain of policy design and implementation - that of long-term care (LTC)- from a social investment perspective. Social investment applied to LTC involves the identification of good value investments in LTC that create the conditions for the realization of policies that contribute to the most efficient use and allocation of resources over the life course in support of high levels of participation in the labour market, while enhancing and maintaining capacities and independent living of older people and simultaneously promoting efficiency, equity and quality of life. In this presentation we will be outlining the dimensions to consider when looking at LTC from a SI perspective in European countries. The aspiration is to disentangle the impact mechanisms of LTC provision with a view to identifying good value investments in that field, developing innovative assessment tools that can genuinely bring a fresh approach to the consideration of the social value of LTC and help in comparing options in terms of their expected returns. The contents of the presentation are the result of research work carried out in 11 European countries involving the analysis of legal frameworks, administrative data, secondary data as well as qualitative data from interviews and focus groups with a diverse array of stakeholders.

RC15-296.5LOPES, NOÉMIA* (*Instituto Universitário de Lisboa (ISCTE-IUL) - Egas Moniz, Centro de Investigação Interdisciplinar (CiEIM)*)*Ageing and Performance: From Medicalization to Pharmaceuticalization*

The decline of individuals' ability to perform at the same level, on various domains, associated with old age, has become, since the 1970's, a particular target for medicalization processes. More recently, the medicalization of old age expanded the range of its intervention, shifting its focus from treatment to enhancement/rejuvenation. This new pattern of medicalization of old age cannot be separated from the expansion of pharmaceuticalization. Its vast therapeutic offer is geared not only towards treating pathologies of old age, but also towards responding to modern expectations of old age rejuvenation (and expanding them), giving rise to a flourishing anti-ageing industry as Higgs & Jones coined it. Within this frame of pharmaceuticalization, countering physical and cognitive decline, a new market for natural products (such as food supplements, nutraceuticals or natural medicines) has also been developing. This constitutes another pattern of consumption - where these products are generally used in tandem with pharmaceuticals. In this presentation we aim to discuss ageing, increasingly defined as a social problem and constituted as a site for the

expansion of medicalization and pharmaceuticalization, largely driven by market dynamics. This discussion will be set in the context of the consumption of memory medication - as a modern icon of rejuvenated old age - and its impacts on identities, when used for the management of performance, or the management of disease. This approach is empirically based on a study conducted with a sample of 414 elders (aged 65 +), physically and cognitively autonomous, living alone in their homes or in institutional settings, in the city of Almada, in Portugal. A mixed methods approach was used, comprising, firstly, a survey (n=414) and, secondly, life history interviews (n=30) to the people previously inquired.

RC37-666.5LOPES, PAUL* (*Colgate University*)*Competing Visions of Race Music: The Aesthetics of the Black Jazz Avant-Garde, Black Jazz Neo-Conservative, and the Black Jazz Popular Vernacular*

This paper looks at three competing visions of jazz as *race-music*. I argue that since the early twentieth century professional black musicians have articulated a race-conscious, black nationalist agenda in promoting black race-music as a distinct practice of music-making expressive of African American culture, politics, and self-empowerment. While the 1960s avant-garde Black Music movement in jazz has been recognized as a black nationalist race-music, I argue that two other strains of black nationalism emerged since this period. Using my research on Miles Davis, I show how Davis and electronic-jazz musicians positioned a *vernacular* aesthetic against the *formalist* aesthetic adopted by the Black Music community. Davis argued for a populist form of jazz incorporating elements of mainstream and avant-garde jazz as well as popular black music genres as seen in his 1969 album *Bitches Brew*. I show how in response to the black jazz avant-garde and popular vernacular, Wynton Marsalis and other neo-conservative musicians and critics adopted a black nationalism of conservation of the jazz tradition against the formalism of the avant-garde and the populism of the electronic-jazz movement. Following Robin D. G. Kelly, I show how these three-aesthetics represented distinct forms of *infra-politics* - cultural politics in everyday life and ritual - among black jazz musicians. I argue that these *infra-politics* expressed Bourdieuan *distinctions of opposition*, where Davis and other electronic-jazz musicians were accused of "selling-out" by the jazz avant-garde and neo-conservatives who rejected popular expressions of electronic-jazz as well as black popular music of the period. In rejecting these popular expressions, they failed to see the emerging *infra-politics* of hip-hop. Davis, however, recognized this *infra-politics* and incorporated hip-hop into his last album, *Do-Bop*, before his death in 1991.

RC37-664.1LOPES, PAUL* (*Colgate University*)*Miles Davis: The Unreconstructed Black Man in Modern Jazz*

This paper looks at the *infra-politics* of Miles Davis - his everyday demeanor, actions, and words of resistance. It is based on the *public story* of Davis found in magazines, newspapers, books, television, radio, and film. This story reflects the personal and artistic journey of Davis and the collective rendition of this journey by Davis, critics, journalists, and others. It shows the intersection of the personal life, public biography, creative work, and critical reception of a public intellectual negotiating his racial and gender identity for over four decades. Davis was an *unreconstructed race-man provocateur* who elicited among white critics and journalists such epithets as Public Enigma No. 1 and Prince of Darkness because he challenged prevailing expectations of *racial etiquette* in Jim Crow America. The public story reveals how in his professional persona and interviews Davis challenged the *deference-behavior* expected from African Americans by White Americas. Davis became the "angry" and "racist" race-man by stridently reminding those around him of the racial social distance that pervaded the jazz art world and American society. He also challenged the *deference-silence* expected of African Americans by his angry, no-holds-bared criticism of racism in American music and society. I also look at how his self-hood and persona of race-man was intimately wrapped up in a hypermasculinity that prevailed in jazz and American music. I argue how this hypermasculinity with its misogynistic objectification of, and violence towards, women was normalized in jazz and American music so that this aspect was not part of Davis's "angry" black man narrative. I end by looking at Davis's complicity in this image of black masculinity and his eventual fall from grace with the publication of his 1989 autobiography. This autobiography forever changed his legacy as one of the most important African American intellectuals and artists of the twentieth century.

RC22-409.14LOPES JR, ORIVALDO* (*Universidade Federal do Rio Grande do Norte - UFRN, Social Sciences Department*)*The Cognitive Partnership: Intersubjective Religious Research Methodology*

In a research setting, researcher and researched are usually in different regimes of enunciation (Deleuze, Becker, Latour), and share diverse interests. This is a methodological proposal of cooperation agreement, where, in a construction partnership, participants of a specific research can produce a knowledge useful for both of them. Departing from applied studies in sociology of religion, this methodology had been constructed and tested in several years, in researches did by the author and others investigators in social sciences linked to his research group in Brazil. With the good results gained, it was possible to do the systematization here presented. The starting point was the studies in complexity proposed by Edgar Morin, but after, with its application in religious studies, G. van der Leeuw and Bruno Latour came to complete the theoretical foundation. Several researches discussed in the paper, demonstrate the results of this methodological proposal, its applicability, forces and weaknesses. The Cognitive Partnership is a way of relationship between researchers and researched, in which both actors share their specific abilities and resources to achieve goals previously established. Although their objectives are diverse, they can work in partnership, since they trust in the validity of the final product of the research. The implication of this methodology for the sociology of religion, and for others fields of antroppo-sociological investigation is significant. That's a way of work with the human subjectivity that take advantage of it.

The Latin American's Concentration Land: Several Answers and Solutions for Strengthen Peasant Agriculture. 2017

In the countries of Latin America the problem of the unfair concentration of the land is part of social conflict, social inequality and politician instability. While this problem continues all aspiration of peace are impossible unless we have a real society of pace in Latin America. So, one point of party for analysis is about Latin American's land concentration.

The other hand, the American's land concentration has different interests of national and international companies and owners with historical roots in the social structure of Latin American. These owners have big land. They also have also power of politicians and they have alliance with companies and bad people they take territories of peasant, to increment their possessions. So, the grabbing of land in Latin America has been an unfair process, a process of accumulation of blood and fire, historic injustice that now is shown in the century as the base of global companies, news national constitutions and process of peace, but, the truth is the same problem in the twenty first century: the concentration of land.

In reason for conflict and the taking of land and concentration of earth has a few answers: The first answer is The Peasant Zone of Reserve. It is as basic Law 160 from 1994 in Colombia this is support to peasant agriculture; In Brazil the best the Movement of the Without Earth by the peasant agriculture; in Bolivia the Movement of without Earth, and others regionals movements; in Ecuador the movement against the mining-plan for the government, by the rights of the nature.

However, all the answers have essentially one condition: the earth for peasants and the earth for indigenous, two traditional people, however, each of them have several thinks and ideas and only the final solution of the economical democracy strengthens the politic democracy

Elites and Distribution: A Cultural Approach

What motivates elites to endorse redistribution in contexts of high inequality? While former theories generally assume elites to be utility-maximizing rational actors with perfect information, we contend that elites' decisions regarding distribution are informed by the cultural tools they use when addressing inequality, particularly how they draw symbolic boundaries between themselves and the poor. We conducted a multi methods design that combines speech analysis with regression models, using in-depth interviews and closed questionnaires in targeted and randomized samples of elites in congress, government, and business between 1994 and 2015 in Brazil. We asked elites about their understanding of poverty and inequality and found that the main boundary that Brazilian elites draw between themselves and the poor relates not to wealth, power, or deservingness, but to cognitive resources and agency. In elites' eyes, the poor are ignorant, irrational, and thus incapable to pursue (or understand) self-interest. Because elites disregard the poor as irrational and immobile, they become skeptical about the efficacy of social policy and less inclined to endorse it. This mechanism translates into a substantial and robust negative effect of symbolic boundaries in elites' support for social policies. To test our argument outside Brazil, we replicated the questionnaire in South Africa and Uruguay and observed similar responses regarding the alleged ignorance of the poor, especially among business elites, as well as a strong negative effect of this symbolic boundary in

the endorsement of social policies. Results add complexity to previous theoretical models, which account elites' decision to expand or contain distribution as a well-informed rational response to the externalities of inequality. While it is fair to assume that elites can use distribution to prevent externalities, we find that their attitudes toward social policy are more directly informed by the meaning attributed to poverty and inequality.

Trafficking and Forced Labor of Indigenous Women Employed in Domestic Work in Mexico

Trafficking in persons for the means of forced labor is a serious problem that not only violates the labor rights of individuals, but also violates their most basic human rights, especially freedom. In Mexico, forced labor is reflected mainly in the agricultural sector, mostly in the corn and tomato fields, as well as in the coal and silver mining industry (Walk Free Foundation, 2016). Such is the case of day laborers in San Quintín, Baja California where on 16 March they mutinied in a great strike because of the poor working conditions in which they had them. "We all saw it as normal that people were suspended for three or four days or that they dismissed them without compensation for demanding that our rights shall be respected, or for trying to force the bosses to pay for overtime in the days that we had to rest," said Jose Ignacio Garcia, 19 years old and who has been working since he was 12 years old in the fields of the valley of San Quentin" (Animal Politico, 2015). The population sometimes ignores this form of exploitation and in Mexico it has not been recognized as a recurrent problem, much less in domestic work. However, some cases are beginning to draw attention, confirming the existence of forced labor in Mexico and not only in the agricultural and mining sector, but also in domestic work, where victims suffer physical torture, different types of exploitation and the violation of their human rights. Taking into accounts the above discussion, this research explores the modalities and forms of exploitation that indigenous female victims suffer in their employment as domestic workers.

El Problema de la Fiabilidad de las Fuentes en las Campañas de Sensibilización Social

Este estudio pretende conocer cómo las fuentes políticas afectan en la opinión de los ciudadanos respecto a determinadas propuestas sobre la violencia en las edades escolares.

A través de dos mensajes persuasivos, asignados ambos a dos fuentes políticas de distinto signo, determinaremos si la población otorga más relevancia a los mensajes y las propuestas, o a las fuentes que los divulgan. Además añadiremos un mensaje sin contenido persuasivo ni fuente que ejercerá de grupo de control.

Considerando la implicación y el interés de los ciudadanos en la política nacional, veremos qué grupos son los que prestan atención a los mensajes que se emiten por parte de los actores políticos, y por tanto sobre los que hay que ejercer un mayor esfuerzo para lograr su apoyo. De la misma forma podremos analizar si es necesario destinar recursos y esfuerzos a determinados grupos que solo puedan verse afectados por la fuente política, ya que el contenido no es para ellos lo más relevante.

Mechanisms to Increase Social Fluidity over Cohorts and across Age. the Case of Spain

This paper presents the results of an analysis of intergenerational social mobility in Spain taking into account the role of education in social fluidity over cohorts and across age. We follow the work of Breen (2010) and Vallet (2017) addressed to determine the contribution of the different mechanisms to the increase in social fluidity over cohorts, adding age effect. Drawing data from pooled cross-sectional data (INE, 1991; 2005; 2011), both men (50,804 cases) and women (38,688 cases) reaching occupational maturity between 1956 and 2011 (born between 1926 to 1981) are analyzed, a period of profound economic, political and social transformations. We analyze change in the fundamental statistical associations: origin-destination, origin-education and education-destination, and the interaction OED, over cohorts and age, as an indicator of labor experience. As well as we apply a simulation or counterfactual analysis to test the relative role of education in shaping social fluidity. For the case of Spain, we conclude that social fluidity is explained by two fundamental mechanisms: first and mainly by the educational expansion, and to a lesser extent by a reduction of the direct effect. In turn, there is a slight effect of the age in social fluidity.

This analysis is part of a research developed in the context of INCASI Project (*International Network for Comparative Analysis of Social Inequalities*, Horizon 2020. Marie Skłodowska-Curie Actions. Research and Innovation Staff Exchange, GA-691004, <http://incasi.uab.es>).

Immigrant Labor and Migratory Regulation in Europe's Agricultural Enclaves. the Case of Moroccan Workers in Spain, Italy and France's Agricultural Sectors.

Since the mid-1980s the restructuring of the intensive production of horticultural products has transformed the economic, labor and demographic dynamics of many agricultural enclaves. Their technological and productive transformation, their orientation towards external markets and their intensive use of workforce have converted the territories where this type of agroindustry is implanted in laboratories of new forms of labor and migratory regulation. Unlike the processes of complementarity and competition observed in other economic sectors, in these agrarian communities the national labor force has been gradually substituted by immigrant workers. The formal and informal recruitment of migrant workers into the agricultural sector has been the result of both spontaneous migration and labor incorporation dynamics as well as proactive recruitment mechanisms through temporary workers programs and new migratory laws and policies.

The objective of this presentation, focused on the case study of Moroccan workers, is to analyze the reconfigurations and interrelations between new forms of labor relations and migratory regulation in the agricultural enclaves of southern European countries, using the concepts of temporality and precariousness. This analysis is based on more than 60 in-depth interviews conducted with Moroccan workers throughout 2015 and 2016 in some of the main agricultural enclaves of these three southern European countries: Huelva and Lleida (Spain), Salerno/Piana del Sele and Cuneo (Italy) and Bouches-du-Rhône (France), carried out under the TEMPER project.

The Invisible Shift. Outsourcing, Private Actors, and the Markets of Migration Control. Insights from Spain.

In the last decades practices of delegation and outsourcing of functions of migration control have experienced an expansion across Western Europe, North America and Australia. In this context an increasing number of private actors, including companies and service providers, have acquired a prominent role in the implementation of migration control policies. Restrictions on the freedom of movement have generated a market for migration control with growing business opportunities, increasing transaction costs and the appearance of intermediaries who modulate the dynamics and management of the migration flows. This market covers various functions of border and internal control, including, for instance: a) the selection, filtering and registration of entries; b) the surveillance, detection, interception and rescue; c) the retention and immobilization; and d) the transportation (expulsion) of irregular immigrants.

The objective of this paper is to describe and analyze these migration control markets (and the dynamics and practices of outsourcing) in the Spanish case. Inspired by the migration industry literature (Hernández-León, 2013) and the concept of migration markets (Gammeltoft-Hansen and Nyberg-Sorensen, 2013) the paper introduces a typology and characterization of the markets of migration control. The migration control market can be considered an analytic instrument to characterize and explain the logics -and scope- of the involvement of private actors in this area of the migration policy.

The Spanish case analysis is based in primary sources and in-depth interviews with public and private actors in the framework of MIND Project, revealing how complex and dynamic migration control governance has become.

Between Merit and Politics. Evaluation and Careers Among Diplomats and Officers of the Armed Forces in Argentina

This paper analyzes the evaluation procedures that organize the progression of careers in two professional bodies whose activities are directly linked to the main

functions of the State: officers of the armed forces and diplomats. In both cases, during the twentieth century there has been an autonomization of these groups, which have managed to control their recruitment and the type of knowledge and skills that are valued in their members. However, the evaluation of these knowledges and capacities, and therefore the access to prominent positions in each of these bodies, is not exempt from the influence of politics in at least two different ways: one internal, such as military and diplomatic cliques; another external, such as the Senate or the concerned areas of the Executive branch of the government. To address these issues, we primarily rely on interviews with senior officers in military and diplomatic organizations, to explore how certain qualities are appreciated, and how individuals are ranked in order to promote them. Our hypothesis is that in the early stages of the careers there is an idea of merit that, although negotiable and contingent, points to certain technical-professional abilities that are considered to belong to the profession, while in the later stages of the careers are also appreciated and above all political capacities, which do not only include professional knowledge but also trust and loyalty.

The Judiciary As an Object of Political Dispute. Organizational Networks, Judicial Agents, and Policy Coalitions in Recent Judicial Reforms in Argentina

The judiciary is an independent power in the Argentine constitutional system. In formal terms, it serves as a counterbalance to the two other branches of government. Implicitly, although we are not always aware, it is a political domain of government of society. In turn, the other powers of the State have interference in its organization and functioning. Laws that are dictated and promulgated, institutions that are created and modified, judges who are selected, evaluated and eventually removed by agents external to the judiciary. In Argentina, the judiciary has recently been placed at the center of the political scene. Many voices raised to point out the inefficiency of the system as slow or soft when dwelling with everyday crime or cases of corruption that sprout from the political arena and echo in the media. In this context, two administrations with opposing political signs have in recent years promoted integral plans of justice reforms, each with their own tools, their own social and political supports, and their own justifications. In this paper, I propose to analyze these two governmental justice reform initiatives, one presented as "democratization" and the other as "modernization", concentrating on the actors that promote or block these reforms, the specific nature of the innovations proposed and the ways in which it was tried to give legitimacy to the changes invoking principles, values and aims related to an idea of common good. To achieve these objectives, I analyze official documents, parliamentary debates, press materials and interviews with key informants involved in these processes.

Western Questions and Devout Silence – on Researching Disasters in Highly Religious Settings

In June 2013, a major flash flood due to early monsoon and a bursting glacial lake destroyed the livelihood of thousands of people in the remote areas of the Himalayas in the Indian state of Uttarakhand. Thousands of people lost their lives and hundreds of bodies have never been recovered. The whole region is a sacred space full of holy places where Hindu people from all over India come to worship and visit ancient temples on a multi-day pilgrimage. Thus, the loss of life, especially in the most holy place Kedarnath, is seen as sacred not as a tragedy or disaster.

Three years after the disastrous events, we conducted research in this area centered around the vulnerability of the people in the face the disaster and their explanations of the events. Accompanying pilgrims on their way up the mountains to remote temples, we were confronted with highly religious people praying and performing religious rituals, who were undeterred by the recent disaster and the permanent dangerous high altitude environment. This situation evoked questions whether it is possible and/or appropriate to ask pilgrims "rational" scientific questions about vulnerability and disasters while they were experiencing the whole situation as devout. This led to deeper reflections on contradicting epistemological foundations of Western scientific rationality and religious worldviews as well as experiences.

Based on the case study we will elaborate on general (research) ethical questions and the implications for disaster research in terms of difficulties and challenges of researching disasters in highly religious contexts where common research methodologies and approaches are not applicable (or appropriate). This also implies reflecting on our own (self-)identity and positionality as Western and non-Hindu researchers and the implicit expectations of the research field.

RC16-322.1LORENZ, STEPHAN* (*Friedrich Schiller University Jena*)*A Procedural Methodology*

Thinking in relations and processes means not to have ultimate points of reference or a solid foundation for tightly anchoring knowledge. How can empirical research prove its findings within such a fluidity and indeterminacy? The answer is similar to other fields of modern society such as positive law or democratic politics. There are procedures that are used to find political decisions or legal judgement. In research, we call such procedures methods, of course. Thus, the basic idea of any kind of method is being a procedure. What I call a 'procedural methodology', therefore, means to reflect on methods as procedures. What are the basic characteristics of procedures? How do they actually proceed in general? What are necessary steps in any kind of procedure? And how can the results be justified? Procedures are structures and have a structuring effect. They need to be open for indeterminacy but have to be able to come to results, too. While they have to provide guidance, they must not determine specific outcomes. The paper will present a general model of procedures. This includes the four most important tasks of procedures (openness, negotiation/ selection, determination, re-opening/ reflexive learning). One of the advantages of procedures is the chance to re-open them again and again. This is essential because relational and processual thinking does not allow ultimate outcomes. A procedural methodology also lays the foundations for a reconstructive methodology. This offers critical potential because it enables consideration of the observance or non-observance of the necessary procedural steps, e.g. are there processes hindered or incomplete; are there relations excluded from consideration? A procedural methodology provides an integrative framework for methods and research approaches within the relational-processual paradigm. Main theoretical references for this conception are drawn from Habermas, Latour, Luhmann and pragmatism.

RC47-JS-76.6LORENZ, STEPHAN* (*Friedrich Schiller University Jena*)*Food Banks As Transnational Actors of a Charitable Future*

Food banks arose as a local initiative in the USA 50 years ago. Beside a strong increase in North America over the 1980s they also spread to and within Europe, e.g. with the foundation of the *European Federation of Food Banks* in 1986. In 2006 the movement reached the global level by launching the *Global Foodbanking Network*. Thus, food banks have expanded transnationally and have become an established part of the social systems all over the world – or strongly work on their establishment at least as it is the case in India, for example. The core practice of food banks and similar initiatives aims at the collection of excess food from trade, industry and consumption for distributing it to poor and excluded people. It operates based on voluntary work and on being sponsored by businesses. Food banks originated in the affluent societies where food excess has easily been available as a resource for charity. Appearing in welfare states with (different levels of) social security provided by state-based social rights they still found their recipients. Although this is less self-evident regarding the availability of excess food the conception also works in poorer countries. Furthermore, it proves to be compatible to every kind of social system. In contrast to the success of food banks in terms of quantity the establishment of food banks indicates a consolidation of poverty and exclusion much more than helping to overcome it. The paper argues that this is a result of the structural problems of this kind of charitable assistance itself.

RC46-774.3LORRAIN, MARIE-JOSÉE* (*UQAM*)NICOLAS, CÉCILE (*UQAM*)*Lorsque La Recherche-Action Favorise La Place De La Subjectivité Dans La Pratique Sociale: Une Recherche Réalisée À Partir D'Une Clinique Narrative Et De Récits De L'Expérience Syndicale De Travailleurs Issus De L'Immigration*

Après avoir situé l'approche narrative et le récit d'expériences dans le champ plus global de l'approche du récit de vie, dans cette communication nous examinons les principaux enjeux méthodologiques et épistémologiques de l'approche à partir d'un exemple de recherche récente s'appuyant sur les récits de l'expérience syndicale de travailleurs issus de l'immigration. Dans le cas présenté, l'approche est considérée comme indissociable du contexte de pratique sociale dans lequel elle s'inscrit. Nous terminons en revisitant l'intérêt grandissant, de l'approche des récits d'expériences, notamment sur des enjeux de recherche, de formation et d'élaboration de savoir pour et sur soi. Celle-ci soulève par ailleurs des enjeux épistémologiques spécifiques, pour ce qui a trait en particulier à la place de la subjectivité dans la pratique sociale.

RC07-JS-33.2LOSEKANN, CRISTIANA* (*Universidade Federal do Espírito Santo*)*We Are Here to Say NO! Emotional Dynamics in the Legal Strategies of Social Movements Against the Mining in Latin America*

It is our objective to investigate cultural aspects and emotional dynamics involved in the interactions between the social movements and the judicial institutions in mobilization lawsuits against vast resource-extractive ventures in Brazil. Deny the mining is the first step for a new world in the perspective of social movement and they are doing this across the law. Judicial strategies are constituted by the interactions between activists and legal practitioners in judicial arenas, involving dynamics which embrace not only an expectation of concrete gains, but also, overall, mobilize a series of symbolic elements that constitute the experiences of the actors over the juridical dimension (the law in its moral and factual dimension, and the interactions with the judges, prosecutors etc.). Such interactions may be also seen by the light of the emotional mechanisms, which maintain or interrupt this specific type of repertoire. Preliminarily, we consider that the judicial arenas operate generating this dynamics between resiliency and melancholy, where these will act as emotional elements which are crucial to understand why activists invest or not in judicial strategies.

RC11-216.5LOTTMANN, RALF* (*University of Surrey*)KING, ANDREW (*University of Surrey*)*Ageing Diversity: LGBT* People, Housing and Long-Term Care*

This presentation discuss findings of the AGEDLGBT* project, which is funded by the European Commission. AGEDLGBT* is the first European study of its kind to compare and synthesize data from three research projects conducted in Germany and UK regarding older lesbian, gay, bisexual and trans* (LGBT*) people, housing and care, later in life. This presentation focuses on two main questions from the project that have been examined so far. Firstly, what similarities and differences exist between older LGBT* people, in terms of gender, sexuality and other identifiable sources of social division, such as social class, ethnicity and age, in the data of the three projects involved? Secondly, in what ways, if at all, do older LGBT* people's life course experiences, such as their experiences of discrimination, prejudice and/or resilience appear in their choices and expectations regarding housing and long-term care facilities later in life?

The specific projects used to answer these questions are: *GLESA*, which examined the challenges and risks of LGBT* housing projects, based on interviews with experts and older LGBT* tenants in Berlin, Germany; *GLEPA*, which investigated the needs of older LGBT* people in long-term care facilities, using narrative interviews with older LGBT* people in need of care and interviews and focus groups with experts in the field; and *SAFE*, which used a mixed methods design of focus groups and a survey to produce the largest study of older LGBT* housing experiences, preferences and concerns in the UK.

The presentation ends by explaining how these current findings will be used to undertake the next stage of the AGEDLGBT* project: an agent-based, social simulation model of older LGBT* housing and care to contribute to future research and policy debates.

RC08-164.3LOUCKX, KAAT* (*University of Chicago*)*Early Transnational Networks, the "Rise of Statistical Thinking", and the Construction and Diffusion of Social Indicators*

In recent scholarly literature, the role of national actors in the "rise of statistical thinking" has received ample attention. However, the impact of early transnational political and scientific networks has hitherto been largely overlooked. In this paper, I attempt to explore this neglected aspect by studying a preeminent example of such a network, viz. the *Congrès International de Statistique*. The *Congrès* (1853-1876) was established in the margins of the Great Exhibition (1851) on the initiative of the renowned Belgian statistician Adolphe Quetelet. Via its sessions, the *Congrès* organized the international transfer of knowledge; it became the first setting for professionalizing statisticians worldwide and one of the first models of international scholarly collaboration. This paper focuses on the mediating role of this early international transfer of knowledge in managing domestic social problems, such as indigence, pauperism, and delinquency. It examines, more particularly, the decision-making rationales behind the construction and standardization of social indicators and the tensions within the *Congrès* between different understandings of what constitutes 'national welfare'.

RC15-282.28LOUIE, PATRICIA* (*University of Toronto*)*Revisiting the Cost of Skin Color in African American Adolescents*

Recent research on skin tone and health have found that African Americans with darker skin have worse physical and mental health than African Americans with lighter skin. Does skin tone have the same impact on the health of African American adolescents? If skin tone is an embodied social status, with darker skinned African American adults experiencing greater inequality relative to lighter skinned African American adults, then we should observe similar patterns of health in adolescent populations. Using data from the National Survey of American Life: Adolescent Supplement, this paper investigates whether the impact of skin tone on health for African American adolescents mirror the results previously observed in adult populations. Findings indicate that skin tone is not significantly related to CESD depression, self-rated health, and self-rated mental health, a challenge to the skin tone patterning of health in the NSAL adult sample. These results are cautiously interpreted as suggesting that exposure time matters and that the impact of discrimination accumulates throughout the life course, perhaps gaining salience at different points in the life course. Results are discussed in terms of the life course patterning of health that are tied to larger cumulative disadvantages.

RC38-675.3LOVE, GILLIAN* (*University of Sussex*)*"That Makes Me Feel a Bit Better:" the Ethical Limits and Opportunities of the Biographical Interview As a Therapeutic Encounter*

In this paper, I reflect on my experiences of conducting biographical interviews with women who have had abortions. In particular, I explore the idea of the biographical interview as a 'therapeutic encounter,' and the ethical dilemmas and opportunities this presents to social researchers and participants.

Maxine Birch and Tina Miller define a 'therapeutic encounter' as 'a process by which an individual reflects on, and comes to understand previous experiences in different—sometimes more positive—ways that promote a changed sense of self,' noting that qualitative interviews often involve processes similar to those employed by professionals in therapeutic work (2000, p. 190). In this paper I analyse examples of moments like these from my interviews, reflecting on the fact that biographical research often features sensitive and intimate disclosures. Opportunities to disclose an experience like abortion to 'someone who understands' can be scarce, and take on great importance. At the same time, social researchers are rarely also trained therapists, meaning these types of interactions with participants require careful boundaries.

I argue that the ethical responsibility in biographical research is to acknowledge how far one can offer a therapeutic encounter, and to take seriously the weight and importance of the intimate, emotional moments that occur during sensitive interviewing rather than to avoid therapeutic moments entirely. There were many moments, in discussing their abortions as well as other aspects of their life stories, when my participants talked through something difficult with me, or told me their interview had helped them see something in a new way. These moments are valuable to both researcher and interviewee, and, if guided with an appropriate ethical sensibility, can result in positive experiences for both parties.

Birch, M., Miller, T., 2000. Inviting intimacy: The interview as therapeutic opportunity. *International Journal of Social Research Methodology* 3, 189–202

RC39-680.3LOVEKAMP, WILLIAM* (*Eastern Illinois University*)*Community and School-Based Applications of an Historic Disaster Event*

On May 26th, 1917, the third deadliest tornado disaster on record swept across Illinois, United States. In Mattoon, the tornado killed 53 and injured 409, destroyed 496 houses and partially destroyed 124, leaving 2,500 homeless. The path of destruction was 2 ½ miles long by 2.5 blocks wide, and damage estimates near \$1.2 million (1917 dollars). In Charleston, the tornado killed 38 and injured 182, destroyed 221 homes and partially destroyed another 265. The path of destruction, which passed a mile north of the State Normal School (now EIU) and was 1 ½ miles long by 600 yards wide, and damage estimates of \$781,000 (1917 dollars).

This presentation will discuss the research and other related community work that led to the production of a documentary film *Nature's Fury and the Human Spirit*, and museum exhibit. It will also discuss the collaboration with local teachers and schools in creating a partnership whereby we share the documentary in their classes, develop of curriculum used by the teachers to facilitate student learning of the disciplines of sociology and meteorology, teach students how to conduct oral histories and learn more about the research process with hands on training and relevant examples, and enhance their general understanding of disasters and discuss the importance of preparedness.

RC06-125.10LOVELL, RACHEL* (*Case Western Reserve University*)FLANNERY, DANIEL (*Case Western Reserve University*)*Helping Mothers Helps Mothers and Children: Familial Power Dynamics in Abusive Households*

This paper is based upon an evaluation of an intervention provided to (primarily) mothers (n=287) who are or have been in an abusive relationship(s). The intervention consisted of three informational sessions detailing how intimate partner violence impacts children's behavior for the purposes of reducing the risk factors for child abuse and maltreatment. Data collected on the intervention included satisfaction survey with participants, attendance records, and a focus group with session facilitators. The overwhelming majority of participants (~95%) viewed the intervention favorably or very favorably.

Additional findings from this study speak to the hierarchy of power within the family. In households where mothers are the primary targets of abuse, mothers often possess less power than fathers but more power than children. This familial hierarchy of power implies that mothers often are in the middle—possessing both shielding and wielding power. Mothers in this study reported that they attempted to shield their children from seeing and experiencing violence but also reported "lashing out" at their children at times. Some mothers reported feeling significant guilt as a result. Based on participants' feedback, the intervention proved successful at helping mothers better understand how exposure to trauma impacted their children's behavior, potentially lessening their "wielding" power. Additionally, mothers reported that the sessions helped them better understand how their exposure impacted their own behavior. By the end, many mothers said they felt empowered and more confident, potentially increasing their "shielding" power, and for one woman, lead her to leave the abuser.

This research has important public health implications for reducing familial violence and speaks to the need for interventions to account for power dynamics in the family, mothers' "shielding" and "wielding" power, and how information provided to mothers on the impact of exposure to trauma can improve the lives of children and mothers in abusive households.

RC08-163.2LOW, JACQUELINE* (*University New Brunswick*)*Symbolic Interactionism in Canada: Shared Meaning and the Perpetuation of Ideas*

In this paper I discuss differing theoretical explanations of the status of symbolic interactionist theory in Canada. In particular I address Helmes-Hayes and Milne's (2017) institutional perspective on the health of this theoretical tradition in Canada and Neil McLaughlin's (2017) emphasis on scientific intellectual movements and Coserian intellectual sects in explaining the emergence of symbolic interactionism in Canada and its potential future. In doing so I also critique the claim that the perspective is on the verge of disappearing, consumed by its own subjectivist assumptions on the one hand and overwhelmed by a rising tide of postmodernist and stand point theory on the other. Instead I offer an explanation grounded in symbolic interactionist insights about shared meaning and how it shapes the activities of individuals. I conclude that it is ironic that debates over the presumed demise of symbolic interaction in Canada may well contribute to a renewed interest in the perspective, raising its profile among students and researchers and thus contributing to its continued existence within the canon of Canadian Sociology.

RC09-191.1LÖWE, PAUL* (*University of Bamberg*)*Is It Still a Lifetime Relationship? the Job Stability of Public Sector Labor Markets Entrants in Germany in Times of Reforms, Privatization, and New Public Management. – a Cohort Perspective*

The public sector is associated with a reduction in social inequality. It offers stable, well paid jobs for risk groups, reduces economic inequalities, and provides protection of market powers. This paper answers the question if also the risk group of labor market entrants can benefit in terms of stable starting positions for their career. Labor market entrants face a greater risk of insecure employment, are typical outsiders, and not a part of the internal labor market. On the other hand, the public sector is associated with stable employment, internal labor markets, and an insider labor market. So far it is unclear as to what extent the public sector offers also stable starting positions for entrants as well as if and how the stability of the entry position has changed over the cohorts due to major transformations that took place in the German public sector. Huge state-owned enterprises were privatized and new public management challenged the bureaucratic paradigm. This paper identifies the characteristics of public sector employment that should increase the stability of entry positions and tests them empirically in a mediation analyses with six mechanisms. It allows the differentiation between the supply of high occupational status jobs and the institutional setting to answer the question

which mechanism drives the effect of public sector stability. Stepwise multivariate discrete event history analyses with a piece-wise-constant specification for the labor market entry cohorts 1960-2009 are calculated, based on the German National Educational Panel Study (NEPS). NEPS offers rich retrospective spell data which allows controlling for several important influences and reducing selection bias. Initial findings show, over the cohorts, the composition of the public sector experienced an increase of high occupational status jobs that balance the weakening of the institutional setting advantages. Overall, the public sector still provides stable entry positions for entrants.

RC06-145.5

LÖWE, PAUL* (*University of Bamberg*)

What Can We Learn from the Public Sector in Germany Regarding Fertility? Is It Really the Workplace or Just Selection?

In Germany, as in many other European countries, low fertility rates are a persistent problem for, last but not least, the funding of the welfare state. The difference between the desired and the actual number of children is high and female labor force participation is lower than that of males. For several European countries, it has been shown that women working in the public sector possess higher fertility rates compared to the private sector. Until now it is unclear if this holds true for Germany and the jobs provided by the welfare state in a phase of major transitions, what the concrete mechanisms are, and to what extent selection accounts for the public sector effect. This paper enhances our understanding and gives new insight into what characteristics of public sector jobs drive increased fertility. First, based on a wide range of theories and explanations regarding fertility rates (family economics, human capital theory, compensating wage differentials, occupational sex segregation, labor legislation), job and working place characteristics that enhance or decrease fertility are identified. Second, it is argued why and how public sector jobs should feature these characteristics and allow for a better work-family-balance. Third, the mechanisms that should influence fertility positively or negatively are tested empirically. A stepwise multivariate discrete event history data analysis with a piece-wise-constant specification is implemented. The transition to the first child conditional on a job in the public or private sector is calculated. The longitudinal data set Panel Analysis of Intimate Relationships and Family Dynamics (Pairfam) is used, which offers rich information on the motives and planning for family formation. This allows to especially address the problem of selection and to ensure that public sector characteristics drives higher fertility and not self-selection. The results can expand our knowledge of how fertility rates can be increased.

LOZOWY, ANDRIKO* (*University of Lethbridge*)

Collaborating with Cameras in Canada

In my 2013 doctoral thesis I argue for an embodied practice of The Photographer-Researcher who encourages youth participants to emerge as empowered participant-researchers, collaborators. Through collaboration what would otherwise be thought of as a kind of participatory action ethnography - uplifting the formation to the level of a collaboration meant that instead of observing and participating in a group, I asked youth to challenge themselves by learning new skills like photography, ethics, design, critique, and group work, to actively produce material objects that could represent moments of life in relation to the underlying socio-economic phenomenon of regional petro-capital production that is entwined with global markets.

In 2018 I am challenged by ethical considerations that appear when I consider the prospect of transforming a thesis that is already mostly published as articles into a monograph. The tension emerges when I consider how to proceed? For example; I could generalize all aspects of the findings; focus on the methods and produce a hand-book without focusing on 'the what;' or, produce a text that is largely visual as a means of giving the visual 'evidence' its own space that documents a group of, then youth, who participated in an activity that they would of had no way of knowing that I would still be thinking about some years later.

This paper will provide a very brief overview of the research conducted, point to the already published work, and then ask, what are the ethical considerations that also need to be brought to light in order to mitigate harm, and for their to be some benefit through wider dissemination. The author, Andriko Lozowy, humbly asks those in attendance, given what you know, what makes the most sense, what provides the greatest benefit, and what should the next steps be?

LUBANOV, CARMIT* (*The Association of Environmental Justice in Israel (AEJI)*)

Mitigation of Climate Risk and Adaptation to Climate Security in Israel and the Middle East: Low Carbon Policy Measures Toward Regional Transformation

The linkages between climate change and National security are discussed vis-à-vis the current geopolitical landscape and associated transboundary challenges in Israel and the Middle-East region. Current climate-security challenges include migratory pressures, climate refugees, water stress and food insecurity. Recent research by AEJI on Climate Mitigation and Adaptation in the perspective of regional economic cooperation, aimed to assess prospects for climate-security in the region and evaluate measure to low carbon economy on regional scale. Preliminary findings correlate Israel's potential role in climate-security politics to positive economic benefits. Climate Change Leadership offers an alternative pathway for regional cooperation and geopolitical stability through the promotion of Middle Eastern-Mediterranean Alliances. The research suggests policy recommendations to promote geopolitical cooperation and regional transformation in response to the socio-economic and environmental pressures of the climate change. Climate-security is framed in the research by four key directions: Multi-level governance, New energy pathways, IDF Climate-stress Operations, and Climate stewardship.

The article will present the Climate stewardship as reflected the power of the people, seeking to elevate the role of the individual citizen towards carbon-reduction, part of transforming into low carbon economy. Environmental education can facilitate empowerment across local scales, as citizens come to internalize the reality of climate change vis-à-vis their own carbon footprint. The article will outline that Climate stewardship is one of the first lines of defense against climate change and sets the path towards reaching climate justice in a climate-protected society.

Progress towards this goal also means that a better socio-economic balance and sustainable future draw closer. Taking steps toward strengthening long-term security, within Israel's borders, and consolidating positive regional transformation, across the Middle East, holds the key to neutralizing the impacts of climate change and provide economic prospect for new low carbon climate regional regime.

LUBANOV, CARMIT* (*The Association of Environmental Justice in Israel (AEJI)*)

The Role of Environmental Justice in Addressing Sustainable Development Policy

In recent years the prominence of 'social justice' and 'environmental protection' has increased in the public discourse in Israel. Environmental Justice combines these two principles in order to ensure that all population groups, identified by gender, socio-economic, ethnic and or peripheral identity, benefit equally clean environment and free of environmental and health risks. The new research of AEJI empirically examined the inequality and the state of environmental justice in different parameters towards the development of comprehensive national policy for sustainable development.

The 5 parameters are: sewage, water, air pollution, availability of public transportation and open spaces. The 'Environmental justice' has examined by constructing a database for all municipalities and local and regional councils in the country. The findings clearly indicate that:

1. Environmental *injustice* is identified with Arab towns and villages, noticeable in socio-economic clusters that particularly lower (1-4 of 10).
2. The economically vulnerable communities are often the most subject to environmental risks. Those communities lag behind in empirical data and scientific literacy, legal and advocacy capacity, and access to information.

The presentation will share AEJI experience in the field of addressing environmental justice policy indicates for the centrality of creating research based data and approaching it to decision makers, in the ability to generate comprehensive policy.

LUCA, NADINA* (*University of York*)

From Hunger to Well-Being. Exploring the Role of Community-Based Food Initiatives

Background: The rise of household food insecurity, increased rates of obesity, food waste and food distribution inequalities pose significant questions to the current food system. In England, the rise of community-based initiatives such as kitchens and cafés and 'social restaurants' are proposed as a potential solution for recovering and using the surplus food, respectively localising food and providing spaces of interaction that can support well-being, social capital and sustainable consumption. However, more research is required to assess the impact of such initiatives on social change, nutritional health, well-being and sustainability.

Aims: This paper builds upon the sociology of food and transformative consumer research to investigate how community-based food projects emerge and their role within the food system in England. **Methods:** The paper adopts an action research approach and builds upon interviews with participants in community-based food initiatives as producers, coordinators, consumers, volunteers, local authorities and other organisations such as supermarkets and food charities.

Findings: Emerging findings suggest that community kitchens, and cafés

operate as participatory spaces which recognise the social dimension of eating and foster the creation of social networks. Such initiatives may act as spaces for the redistribution of food surplus. However, they enable alternative food spaces where surplus food is 'upcycled' to contribute to well-being outcomes including nutrition, food availability, food literacy and food socialisation (Block et al. 2011). Power dynamics and negotiation processes mark the interactions of various actors participating in these initiatives. The lines between producers and consumers are blurred as members of the community take active part in setting up social spaces for cooking and eating together. **Conclusions:** The study highlights the potential of community-based food initiatives for social innovation. It pinpoints the creativity of consumers to resist to the failures of the traditional food systems but also the limitations and challenges facing such initiatives.

LUCA, NADINA* (*University of York*)

Understanding Behaviour Change in Context. the Role of Sociology in Social Marketing Health Programmes

Background: Social marketing health approaches centred on behaviour change, choice and self-management have been criticised for limited power to effectively engage the populations most affected by inequalities and understanding and altering the structural barriers to health. One of the criticisms of current practices in behaviour change interventions is the focus on individual beliefs and attitudes which poses the danger of neglecting peoples' practices and strategies in the wider social context. **Objectives:** The paper examines how interactions with a collaborative service-driven social marketing programme may lead to change in both the practices of the individual service user (smoke outside) and of staff. In doing so, this research explores sociology theory as an alternative perspective to the traditional psychology lens used in social marketing health programmes to understand the social and institutional processes underlying behaviour and social change. **Methods:** The paper builds upon Bourdieu's treatment of habitus, capital and field and Hays (1994) concept of transformative agency, qualitative data collected through observation notes and interviews with members of the public and community services workers engaged in a Smokefree homes and cars initiative in a city in England. **Findings:** The findings indicate that despite structural barriers, transformative agency leading to incremental change of practices and habits emerges from conflicts between the habitus associated with the community work and the home field and resource interactions between staff and members of the public. Conflicts between the habitus and the field driven by the changes to health professions and public services challenge both staff and service user to be creative and may lead to reflexivity, transformation of capital to adjust to the new field and change of rules, practices and habits. **Conclusions:** The study highlights the value of sociological frameworks for understanding how change occurs in open-systems and individuals' embeddedness to inform customised health programmes.

Agent-Based Modelling of Conventions in Microfinance Groups

The focus of this research abstract is the agent-based modelling of conventional social behaviour adopted by individual microfinance clients regarding their collective decision-making for maintaining microcredit groups. Data has been gathered from surveying and observing microcredit clients meetings in the southernmost state of Mexico, Chiapas. The microfinance institution (henceforth MFI) sets out of how and when groups should repay quotas, yet individual credit defaulters are handled independently by the members of each microcredit group on whether these should be cooperated with or penalised. Both social and financial mechanisms are employed, which generate emergent properties and these are shown to be important components in the MFI regulatory framework. For that, an analysis has been made on the interplay occurring in the management of the collective credit scheme, which involves both the creditors formal, institutional rules and the clients' informal, group-level conventions. As a result of this analysis, a policy change has been made on how microcredit groups are financed, so that both group structure and its social conventions are taken into consideration when credit is being applied for. The development of this agent-based model allowed for a more detailed understanding of the mechanisms at play for maintaining microcredit groups in adversity with regards to the dynamics of credit repayments. This research illustrates an approach to agent-based modelling process that emphasises the collection of localised evidence and stakeholder participation.

Dynamics of Primary Health Care Teams

The focus of this research abstract is a subset of data emerging from a complex knowledge-to-practice study developing geriatric service capabilities in two innovative formats for delivering primary care in Ontario, Canada – Family Health Teams and Community Health Centers. Data from 32 such teams situated in six geographic locations across the province included (a) exchange and referral network data between different health professionals, (b) contextual attributes, such as co-location status and primary care format, plus (c) data from the Dimensions of Teamwork survey (DTEAM), a validated measure for understanding the dynamics of health care teams. In this abstract the results arising from the network and contextual data sources are examined. The analysis provides insights into the diversity of network characteristics across and within the two primary care formats. The potential relationships between network characteristics and team measurement are anticipated and the benefits of combining the aforementioned three sources of data (i.e. networks, team attributes and survey) to facilitate a cross-disciplinary analysis on how these primary care teams function and inform the generation of team-specific recommendations. This is proposed through a combination of a network model and an agent-based model for testing process improvement.

Addressing Crime Prevention through Social Policy in Mexico City

Cities in both the global north and the global south have experimented with municipal policies that creatively combine social service provision with urban re-design policies in an effort to address some of the root causes of poverty, violence and insecurity. We trace how international ideas about neighbourhood improvement have been adapted in Mexico City under recent left-wing Partido Revolucionario Democrática (PRD) administrations. This presentation explores the intersection between municipal social policies and new forms of crime prevention in Mexico City (including Tepito, Copilco el Bajo and various neighbourhoods in Iztapalapa). We draw on interviews with government bureaucrats and grassroots community actors conducted during the summers of 2016 and 2017. The interviews reveal how communities in high-risk neighbourhoods are creatively adapting municipal policies to target both poverty and insecurity. We focus on the effects of these initiatives on poverty reduction, urban safety, urban gentrification and the implications for gender, youth and seniors. We also examine the political implications of the emergence of a new left-wing party, Morena, with strong links to urban popular movements.

Un Nuevo "Compromiso Público": Managers De Empresas y Clase Alta En El Gobierno De Mauricio Macri En Argentina

La victoria de la alianza Cambiemos en Argentina (2015) y el visible avance de fuerzas de derecha en América Latina reinstalaron con vigor, en la región, un campo de exploración clásico de las ciencias sociales: el estudio de los grupos de poder. En nuestro país, desde la asunción de Mauricio Macri una novedosa ingeniería ministerial ubicó a destacados *managers* de grandes empresas en la alta función pública. Así conocimos, según la definición de las nuevas autoridades, al "mejor equipo de los últimos 50 años". A la virtud de la meritocracia empresarial se suma otro elemento dentro de este cuadro: la composición fuertemente clasista del nuevo gobierno. Muchas de las caras visibles del ejecutivo -el propio presidente, pero también segundas líneas- forman parte del entramado de familias que se reconoce como "la clase alta argentina". Cómo interpretar esta relación entre exitosos hombres de empresa, herederos de apellidos patricios y participación en la más alta función pública?

Esta ponencia ensaya una primera respuesta a esta pregunta a partir de los avances de una investigación reciente sobre altos funcionarios del gobierno nacional. Sobre la base de un trabajo de entrevistas con secretarios, subsecretarios y directores nacionales, así como fuentes documentales, nos proponemos describir las experiencias formativas y de socialización de estos actores con el objeto de

comprender cómo se construyen sentidos sobre este nuevo “compromiso público” que han asumido. Al documentar las formas de categorización y justificación a partir de las cuales entienden la política, el Estado, la relación público-privado, el rol del mercado, etc., se busca analizar los modos en que las disputas en torno a estas definiciones ponen en juego procesos de jerarquización social que expresan luchas con otros grupos de poder.

Hope in the Debris of Capitalist Utopia?: Exploring Manifestations of Hope and Utopianism in the Everyday Lives of Workers and Communities in Lephalale, Limpopo

Throughout history there have been dreams, visions and hopes for a utopian world. Hope is understood as an ontological reality, emergent from the unfinishedness of the world. Bloch's seminal work uncovers a mass of material containing dreams and wishes for a better life, in the search for emancipatory-utopian elements in all living ideologies. In this way, his work brings to the fore contradictions, ambiguities and potentialities, as well as the possibilities of the capture/co-option of hope (Kellner, 1997). As such, we are forced to finely comb through the detail of everyday life; to look towards practices of the here and now, with all their contradictions and potentialities. Through ethnographic research methods, this paper seeks to explore manifestations of hope in the everyday lives of metalworkers and the communities in which they live in Lephalale, Limpopo. Lephalale is described as the “first post-apartheid town” and “the future mining and energy generation hub in South Africa” through the construction of the mega-project, Medupi coal power station as well as new coal mines. These resource extractivist mega-projects are firmly situated within the framework of the utopia of capitalist development and its concomitant practices of progress, growth and permanent accumulation. Mieville describes the utopia of corporations as a time of apocalypse too, in which the poor are dispensable. It is a utopia that will destroy its living foundations and leave fields of rubble behind in a modernist march of progress and thus the starting point of any counter utopia must be with dismantling the progress based on ‘empire’. In this context, how do the utopias of those in power get traced through the lives of people and the lands that they flatten, leaving rubble behind? In the debris, is there space for hope and possibility for the visioning of alternative collective utopias?

Digitalisation and Gender: Can Digital Technologies Help to Overcome Gender Inequalities at the Workplace?

Based on recent research funded by the Hans Boeckler Foundation and in preparation of a research programme on “Digitalization and workplace democracy” this paper develops a theoretical framework to analyse the impact of digital technologies on gender inequality at the workplace. Starting point is the concept of social construction of technologies. The development and the use of digital technologies are shaped by interests, social stereotypes and antagonisms. It's part of a multitude of social conflicts, including the struggle for gender equality. How are digital technologies shaped and used to reproduce traditional gender roles and stereotypes? How can they be used to overcome them?

The paper will discuss these questions with regard to two topics: work life balance and talent analytics. The flexibility provided by mobile devices such as smart phones, tablets or laptops is praised for its potential to enhance work life balance by dissolving the spatial and temporal frontiers between work, home life and leisure.. However in many cases such a dissolution of frontiers only leads to increased work pressure and has a clear gender bias not only resulting from inequalities at the workplace but also from an unequal sexual division of housework. In Germany many company agreements already try to address these issues. A deeper theoretical reflection may help to improve such efforts. Talent Analytics is a growing market for enterprise software. It is aimed at improving decisions about hiring, management and promotion of “human resources” via bid data analysis. Its promise is provide “objective” data in order to overcome discrimination based on prejudices or affinities with regard to gender, race, age, etc. However bad algorithm may only reproduce existing discrimination. How to avoid such effects? How to enable employees and their representatives to critically assess the impact of algorithms for Talent Analytics?

LUDWIG, SUSANN* (*University of Basel*)

Accomplishing Multipurpose Futures

This presentation explores the relationship between the future and infrastructure. The future carries the idea of potential; infrastructures are materialized potential „they create the grounds on which other objects operate, and when they do so they operate as systems” (Larkin 2013). Multipurpose halls

are such systems. They were constructed based on a past vision of multiple future purposes; in their default nature they need to be maintained in the present and transformed for future purposes, namely events. In other words, multipurpose halls are ground for the future to operate. Events are a rupture to the everyday maintenance of the hall.

Based on ethnographic fieldwork, constitution of multipurpose halls is explored in terms of how they are embedded in their environment, in the people who maintain the hall on an everyday basis as well as the ways in which people use the possibilities and constraints set by the hall. The central question here is: what constitutes the multipurpose hall? Thereby, I focus on grasping present practices accomplishing both the infrastructure of the hall and the infrastructure of the event in order to be able to approach the relationship between them and the future.

Exploring the Potential of Membership Categorization Analysis for Researching Uncertainty

In Mali, more than 70 percent of young academics are searching for employment. They encounter severe difficulties finding a job that corresponds to their qualification or entering the labor market in general. University graduates find themselves in situations characterized by uncertainty, which impacts both their actions in the present and their imagination and planning of their futures.

Against this background, the question is: How university graduates deal with their present situation and how they relate to the future? One answer lies in what graduates refer to as “la chance”, which is part of their common sense knowledge and accomplished by graduates making sense of everyday uncertainties.

In order to describe the phenomenon of *la chance*, accounts from more than ninety biographical, narrative interviews with university graduates were analyzed according to Membership Categorisation Analysis (MCA) was conducted. Originating in Ethnomethodology, MCA examines “common-sense knowledge in terms of the categories members employ in accomplishing their activities in and through talk” (Francis and Hester 2004, 21). This presentation explores and discusses the potential of ethnomethodology's ideas in general and MCA in specific, when researching everyday uncertainties.

Feeding Urbanization: Perceptions of Urban Agriculture in Nanjing, China

Rapid population growth and urbanization in China are creating profound social, economic, and environmental challenges. Since open-reform in the late 1970s, China has largely remained focused on economic growth, national-scale food security policies, and transitioning to a modern agri-food system. These largely economic focused strategies have resulted in criticisms of China's food systems and concerns, particularly surrounding food safety and food scandals, have created a level of mistrust among consumers and producers. Therefore, there is a need to re-examine how urban spaces in China are not only being developed but how urban inhabitants are being fed. One promising avenue may be the expansion of urban agriculture, a practice that is seen by many as beneficial to social, economic, and environmental issues in both post-industrial and developing cities. However, China's urbanization plans have excluded planning policies for agriculture within urban areas. The purpose of this research is to better understand the motivations of residents practicing urban agriculture in the case study city of Nanjing, China. While studies have shown the existence of urban agriculture in China, empirical research on the perceptions and benefits of it is greatly lacking. Using a mixed methodology, this research aims to (1) assess the demographics of those practicing urban agriculture within Nanjing and where it is taking place, (2) identify the types and methods of urban agriculture being used, (3) understand why populations are engaging in small-scale urban agriculture and the perceived benefits of it, and (4) critique the extent to which current, future and past policies have impacted the practice of urban agriculture. Drawing on interview data from farmers, government officials and practitioners, this presentation will discuss the apparent social benefits and the potential future of urban agriculture in Nanjing.

ZACCAI, EDWIN (*Université Libre de Bruxelles*)

(Climate)-Smart Agriculture: From and for Whom?

For more than a century, a series of sociopolitical processes have led to thinking of agriculture in a vision of progress involving an increasingly high level of modernization of the activities. Recently, the development of internet-based technologies led to the emergence of a “digital revolution” of agriculture, also

known as **smart agriculture**. A parallel and more recent development is what the Food and Agriculture Organization (FAO) has introduced as **climate-smart agriculture** (CSA), an approach that integrates concerns for mitigation and adaptation to climate change in this technology-driven agriculture.

Behind the seductive 'smart' term, what do those notions cover and how do they frame current agricultural policies in global arenas, as well as practices in local ones?

Our contribution aims to answer those questions by investigating the contents of smart agriculture and CSA as framed by major actors, such as the FAO, international research groups and relevant NGOs. The existence of controversies between actors with divergent interests, using buzz concepts for their own agenda, are particularly explored. Logics inherent to the 'smart' model, in the valorization of productivity and progress, responding to a perceived food security threat, are studied in the light of the expansion of neoliberal policies since 1990. Furthermore, concrete study cases are presented to identify the repercussions of 'smart' practices on food production and farmers' conditions. In the absence of any agreed definition of what (climate)-smart agriculture means and covers, the diversity of cases labeled as such lead to divergent results in terms of productivity and impacts, be it environmental, social or sanitarian. The technological development of agriculture increases the divide between farmers who have the means to follow and the others. It may even be that adaptation to climate change reinforces a process of (capitalistic) concentration of farms capable of using such tools.

¿Ecología De Saberes?: Una Aproximación Desde El Proceso Constitutivo De Inveval.

INVEVAL S.A. (Industria Venezolana Endógena de Válvulas) es una Empresa orientada a la producción, mantenimiento y comercialización de válvulas industriales. Fue recuperada por trabajadores y trabajadoras de la antigua empresa Constructora Nacional de Válvulas, la cual cesó sus operaciones en el contexto del paro petrolero llevado a cabo en Venezuela en el año 2002. En el devenir de este proceso las y los trabajadores, mayoritariamente obreros y obreras, emprendieron encuentros con diferentes instituciones: representantes del Estado, académicas y otras vinculadas a movimientos sociales de base. Entre todas apalancaron el proceso constitutivo del naciente entramado organizacional, que tuvo como punto de partida la formación de una cooperativa. Así, se producen diálogos, encuentros y desencuentros entre las representaciones del mundo del trabajo encarnadas por el saber-hacer del colectivo laboral y otros saberes más formalizados y articulados en aquellas instituciones. Con el análisis aquí presentado, se aspira un acercamiento al abordaje que enfatiza la importancia de hacer próximos los conocimientos tecno-científicos y el conocimiento popular no formalizado, contenido, en este caso, en la experiencia de trabajadores y trabajadoras. Sostenemos que el saber también implica, además del conjunto de prácticas experimentales y reflexivas que han caracterizado al conocimiento en la comprensión eurooccidental, un conjunto de fenómenos que responden a otras sistematizaciones pero que son posibles porque contienen, al igual que el conocimiento científico en sus etapas preconstitutivas (en términos Foucaultianos), discursos e imaginarios que delimitan particulares modos de ser y hacer en sociedad.

Estos análisis parten de una investigación más amplia que tuvo como objetivo examinar experiencias vinculadas con lo que se dio en llamar cooperativas tecnológicas. Para la recolección de la información se hizo trabajo etnográfico y se realizaron entrevistas a profundidad a actores claves del entramado laboral abordado y de las instituciones que coadyuvaron en la conformación de la empresa.

Class Mobility, Migration, and Social Processes: Hong Kong Middle Classes in Canada

Migration involves a change of social field, in which the rules of games in achieving social status vary. Past studies find that immigrants face deprofessionalization as they move to a more developed country. Yet others argue that as migration is a highly selective process in that migrants are positively selected in terms of quality, they are likely to climb up socially. Based on in-depth interviews with 30 Hong Kong professionals/managers/administrators who have moved to Canada since 1990s, this study takes the Bourdieusian perspective to examine mobility processes. We found two pathways for movers who do not return to Hong Kong despite institutional exclusions in Canada from entering their original professions: 1) Some experienced initial downward mobility in terms of occupation, but they conformed with the tacit rules by accumulating sufficient cultural resources espoused by the host country, which buffers the fall; 2) Some sought alternative paths by creatively utilizing their ethnic cultural capital and social capital they have from Hong Kong to regenerate their middle class status. While these two pathways sustain their middle-class status occupationally,

Hong Kong movers, facilitated by migration intermediaries, reconstruct a new definition of middle class status by devaluing "work" and upholding "quality of life" as a superior distinction of themselves from "middle class" stayers in Hong Kong. Such construction, however, is constantly contested because of the middle-class Hong Kongers' habitat to compete in order to achieve upward mobility; and partly because of their indecisiveness to actually settle in Canada. Their struggles have unintentionally and partially modified some immanent rules of class formation in Canada. This study contributes to the understanding of the transnational nature of social mobility and class-in-struggles as the field changes.

Making It in the Land of Opportunities. Labor Market Integration of Skilled Refugees in New York City Area.

Despite the increased public interest in the situation of refugees, little is known about how skilled refugees integrate in the labor market and how this process is affected by social policies. In the United States, refugees are eligible to participate in federally funded programs which aim "to achieve economic self-sufficiency as quickly as possible after arrival in the United States" (The Refugee Act of 1980). Tools such as: case management, employment services, language trainings, cultural orientation classes and direct cash allowances are used to reach this goal. What is known is that although the overall median employment rate among refugees is higher than among the native population (Capps, Newland, Fix, McHugh, 2015), the self-sufficiency paradigm itself is criticized for forcing refugees to take entry level jobs at the bottom of the labor market structure without offering time to learn the English language and increase long term opportunities (Brick, Cushing-Savvi, Elshafie, Krill, McGlynn Scanlon, Stone, 2010). Using the case of the New York City area, this presentation aims to explore the main opportunities and obstacles that skilled refugees face in their attempts to reconstruct their labor market position. It also aims to answer how federally funded programs and other interventions delivered by non-profit organizations affect the integration of skilled refugees into the labor market. The presentation is based on 20 in-depth interviews (IDI) with refugees, 10 IDI with case workers and participant observations in three non-profit organizations assisting refugees. Refugees were sampled based on their legal status, income, residing in the NYC area and receiving assistance. Interviews were audio recorded, transcribed verbatim, and Dedoose software was used for data analysis. Thematic analysis using inductive approach was next utilized. The principle investigator analyzed the data, developed Memos and used peer debriefing to further ensure the rigor of the study.

LUMIER, JACOB J.* (*OHCHR Civil Society Section*)

Difference and Complementary Issues between Legal Studies and Sociological Orientation in Teaching Human Rights.

The teaching of human rights is often practiced as a legal discipline. It allows imperative morality based on tradition or duty, recurrent in legal circles, and places as unfavorable position the knowledge that rights reach effectiveness in the multiple social frameworks. It is an understanding that implies negation of conceptual thought, described as the problem of distance between assignment of rights and the real situation.

Facing such concern, legal studies on human rights highlight the numerous collisions of rights and value that it would not be enough to announce a right in order that duty of protection starts acting.

Although their frame of reference is, certainly, the statement of rights to coexist, the reason for it is the activity of weighting, that they mainly contemplate the rights that are confirmed in the courts of the country, without direct application of the International pacts.

The contribution of the sociologist, in the other hand, is that he understands the coexistence of rights, not in terms of judicial hierarchy, but according to human sociability, especially a peculiar partial fusion of the prerogatives of some and the obligations of others. This social fact anticipates the said activity of weighing, as unique for courts.

Sociology values the well-known propagation of constitutional amendments that, in the 1990s, together with globalization of economy, occurred in a hundred countries, with human rights incorporations.

It has been a formidable collective effort to demonstrate, itself, the undeniable tendency for universalization of these rights and that it meant an undeniable refutation of a position that do not consider human rights as a system of effective checks and balances of globalization.

WG05-JS-62.1LUMIER, JACOB J.* (*OHCHR Civil Society Section*)*Los Obstáculos Ideológicos Para Una Aproximación De Sociología y Derechos Humanos*

El estudio de los obstáculos ideológicos al compromiso de la sociología con la mentalidad de los derechos humanos pone de relieve la influencia del hegelianismo, como fuente de la doctrina de soberanía nacional exclusiva.

El hegelianismo pasa una verdad llamada a afirmarse fuera de cualquier marco de referencia, como ausencia de límite de una misteriosa voluntad universal, cuya influencia los sociólogos que se adhieren a la filosofía de la historia aceptan, al aproximarse teodicea e ideología revolucionaria.

1) Max Weber lo repercute en la medida en que coloca la teodicea en la base real de los movimientos mesiánicos, tomando su estructura mental como el conjunto de las respuestas "razonablemente satisfactorias" para explicar la incongruencia entre el destino y el mérito.

A la necesidad racional de una teodicea, Weber atribuye los rasgos de religiones como el hinduismo, el zoroastrismo y el judaísmo y el cristianismo Paulino.

Como ejemplos de esa necesidad, Weber cita datos de 1906, mostrando que, entre un número bastante considerable de proletarios, sólo una simple minoría mencionó como razones para dejar de creer en el cristianismo las teorías de las modernas ciencias naturales, mientras que la mayoría se refirió a la injusticia del orden del mundo.

2) La ideología proletaria para Marx es un conocimiento liberado de sus relaciones con los cuadros sociales, una concepción de "verdad absoluta", fuera de cualquier marco de referencia. No sería sólo desalienada: sería un poderoso estimulante de la desalienación.

Se nota una paradoja ocultándose bajo la ideología de la clase proletaria, a fin de hacer triunfar esa verdad en la historia transformada en teodicea, como incongruencia de destino y mérito. Y permanece negativa como en el hegelianismo, apuntando hacia una eticidad mística, en el caso, una verdad llamada a afirmarse fuera de cualquier marco de referencia.

RC48-JS-25.6LUMINAIS, MISTY* (*Case Western Reserve University*)LOVELL, RACHEL (*Case Western Reserve University*)KARAKURT, GUNNUR (*Case Western Reserve University*)*When the Hand That Feeds You Becomes the Hand That Guides You: Governmental Funding of Local Rape Crisis Centers*

Recently in the United States, federal and local governments have increased funding for community-based rape crisis centers, a potential boon which does not come without strings. Some of the funding is funneled through the Victims of Crime Act (VOCA), which essentializes sexual violence as, first and foremost, a crime. Government funding has allowed many rape crisis centers to remain open, or in this particular case study, expand. By accepting these funds, centers have to be responsive to the priorities of the agency providing funds - by expanding their engagement with the criminal justice system. Speaking with both survivors who have used the services of a Midwestern rape crisis center and victim advocates who provide some of those services, we discovered some tension between what survivors found valuable in their experience with the rape crisis center and how advocates defined success for survivors. Specifically, we noted several instances where the advocates identified a criminal justice resolution as one of the most important outcomes for a survivor over their course of interaction with the center. In this paper, we explore how State funding, however well-intentioned, shifts the focus of community based rape crisis centers towards the only remedies provided by the State - legal ones. Sexual violence disrupts a person's life in many ways, not all of which can be framed in terms of the crime committed or punishing an offender. Offering support to those people willing to participate in the criminal justice system is an important service but it is possible that funding streams are placing an overemphasis on this aspect of a rape crisis center when survivors define other services as of equal or greater value.

RC06-141.6LUMINARI, DILETTA* (*BIGSSS - Bremen International Graduate School of Social Sciences*)*Journeys to Parenthood: The Challenges and Strategies of Italians Becoming Parents through Surrogacy.*

The last decades have seen an increase in the use of Assisted Reproductive Technologies (ARTs), which opened the doors of parenthood to people who could have not reached their parental goals in "natural" ways. Surrogacy, arguably the most controversial among ARTs, has raised relevant ethical questions and social scrutiny especially with respect to its moral implications. This study expands the empirical and theoretical knowledge on the experiences of surrogacy by talking the often-overlooked position of intended parents and including people of different sexual orientations. By exploring their journeys to parenthood, the

research aims to understand parents' reproductive narratives, with specific attention to the social, emotional, administrative, and legal challenges they face, and their interactions with the state's apparatus (i.e. health care system, adoption and registration offices, consulates and embassies, etc.). The research identifies the obstacles faced and strategies developed in people's attempts to accomplish their procreative projects, and further informs the debate on how concepts of parenthood, reproductive vulnerabilities, and bio-medical mobilities relate to each other in a context of non-heteronormative reproduction. The study takes Italy as a most extreme case of restrictive legislations around surrogacy, and is designed around a focus group with people who have already reached a parental status through surrogacy, and longitudinal interviews in two points in time (before and after the baby is born) with people on their path to parenthood through surrogacy.

RC18-JS-35.4LUNA, MATILDE* (*UNAM*)VELASCO, JOSE (*UNAM*)*The Claim to Representation in Associative Systems*

This paper should contribute to answering one general question: how political representation is constructed outside of the institutions that are formally acknowledged as representative.

This extra-institutional representation is abundant and variegated. It can be found in social movements, social organizations, neighborhoods, NGO's and many other political arrangements.

Our analysis centers on one variant: representation that exists within complex associative systems. These systems are characterized by voluntary cooperation among diverse actors, both official and private, who try to solve a perceived public problem that public institutions, by themselves, cannot or will not solve.

This sort of representation is largely self-constructed: representatives have to earn the right to portray themselves, and to be recognized, as such. Hence, it shows, in stark terms, something that is normally neglected or underestimated: that political representation is, above all, a claim—always contestable—according to which some people are said to act, speak or decide in the name of others.

The question that this paper seeks to answer is the following: how is the claim to representation formulated and validated in these associative systems? More specifically: Who formulates this claim—all members of the associative system or some individual participants? To whom is it addressed? How is it tailored to the different identities of these addressees (for example, official representatives, the intended constituency, the other claimants to representation)? What principles and meanings of representation are invoked to back it? What duties, tasks and rights are attributed to the representatives and the people they claim to represent?

To answer these questions, we focus on two cases that are different enough to give us a reasonable idea of how the claim to representation varies in this context. Our data comes from the review of relevant documents and some interviews with key participants.

RC44-748.7LUNDEMARK, MAI* (*Uppsala university*)*Rescuing 'the Danish Model': Immigrant Representation in Union Revitalisation Efforts*

Danish unionism is amongst the strongest in the world in terms of union density, collective agreement coverage and influence on labour market regulations. Nonetheless, decline in union membership and influence make scholars question the perseverance of the Danish collective agreement system and the broader notion of the 'Danish model', which are considered fundamental for the Danish welfare system. To remedy the downturn in union memberships, several unions have imported ideas from the American and British 'organizing turn' as means to revitalisation. Previous research has shown that revitalisation strategies, such as organizing, emphasise rank-and-file empowerment and the inclusion of migrant and ethnic minority workers' needs. Such research has mainly been conducted in union hostile environments and in countries with long histories of net-immigration. In contrast, little is known about whether and how union revitalisation is inclusive of migration-driven diversity in countries new to net-immigration, with high labour standards and with collective agreement systems based on consensus. Taking Denmark as an empirical example of the latter, this paper aims to fill the gap and asks: *how do union officials and organizers make sense of immigrant workers' (lack of) representation in union revitalisation efforts?* To answer this question, the meaning and construction of representation will be scrutinized as well as intersections of race, nation and citizenship and class. The empirical material will consist of union policy documents, descriptive statistics of shop stewards, and interviews with union officials and organizers from two major unions in Denmark. By combining industrial relations research with theory on race and representation, the paper aspires to contribute theoretically to the research fields of labour union revitalization, integration and welfare state studies.

RC15-JS-86.2LUNEAU, AYMERIC* (*Muséum National d'Histoire Naturel, Paris*)*Disputes about the Reality of a Health Trouble*

On the 19th of October 2010, an article of Chemical Sensitivity Network reported that a child "with MCS" had said: "I wish I had a cancer because at least my condition would be recognized." This quote in itself illustrates the question which my paper deals with: why people who suffer from "multiple chemical sensitivity" have difficulties to draw the attention of others on their condition.

Relying on my PhD research, I will show that the lack of attention to MCS stems from a "collective inquiry" which does not progress. Since, there is not scientific agreement that the MCS syndrome is a chemical-induced disorders, the sincerity of MCS people and the reality of their troubles are questioned by their relatives, their friends or their physicians. Therefore, discussions with MCS people turn into dispute (Dascal 2010), since actors are not able to reach a common definition of the situation. In this way, I will assume that we need to pay attention to the feelings of "victims", but also the feelings of those who listen their "testimony" in order to understand why MCS people have difficulties to keep a "space of expression" related to their condition open.

RC23-434.4LUNEAU, AYMERIC* (*Muséum National d'Histoire Naturel, Paris*)*Epistemic and Axiological Stakes of the Public Involvement in Science*

The issue which my paper deals with concerns the involvement of "laypeople" in science. While amateurs have contributed to collect data in astronomy or ecology since a long time, the "participatory turn" of science has reached a new step. Participatory and community-based projects arise such as "open street map" or the "popular epidemiology surveys", meanwhile scientific institutions carry out "citizen science" projects, and science policy-makers see the involvement of non-scientists as a new magic formula for enhancing the public confidence in science and innovation.

Relying on my current postdoctoral research, which focuses on the career of participatory projects related to biodiversity issues, I will explore epistemic and axiological controversies arising from debates about public involvement in scientific research. The aim is to understand the impacts that the critics of scientists, non-scientists or policy-makers have on the way of making "Citizen Science. It will be an opportunity to analyze how this opening up of science may reshape the borders between science and society.

RC19-368.3LUPPI, MATTEO* (*Collegio Carlo Alberto*)NAZIO, TIZIANA* (*WZB Berlin Social Science Center*)*Intergenerational Care and Welfare State Evolution: A Matthew Effect?*

Demographic and societal changes are fuelling change in intergenerational relations. Ageing population, increased female labor market participation and shirking family size contribute to shift growing care loads on the shoulders of the middle-aged population. Providing care to older (parents) and younger (children and grandchildren) generations interests a growing share of European population. Using SHARE data we show how the "potential risk of intergenerational care", i.e. the risk to be caring for both upper and lower generations at once, varies across European countries. Given a shorter duration to childbirth onset, the Nordic European countries display a larger share of middle-age population who can be potentially involved in bidirectional care relations compared to Southern ones. However, the latter are those in which family care is left to play a more substantial role. We address this paradox looking at how welfare state expenditure has been distributed among old and new social risks in the last decades. We show that differences in the "potential risk of intergenerational care" reflect how public expenditures have been distributed, horizontally, between welfare pillars, and vertically, between generations. We combine SHARE data and national macro data on welfare expenditures and demographic structures, investigating nineteen European countries grouped in different care regimes (Saraceno and Keck, 2010). Different targets of welfare state expenditure, across age-groups and welfare pillars, in the context of a progressive intergenerational inequality, have resulted, in some countries, in a cumulative (dis)advantage. One the one hand, relatively generous welfare provisions in times of better economic circumstances to those with fewer bidirectional intergenerational responsibilities; on the other hand, leaner provisions towards generations suffering worst economic prospects under a higher risk of growing intergenerational responsibilities.

RC52-858.3LUSOLI, ALBERTO* (*Simon Fraser University*)*'teaching Business As Business'. the Role of Harvard's Case Method in the Construction of the Modern Manager*

This paper explores the early days of business education with the aim of understanding how an uncoordinated and rather heterogeneous network of practitioners, practices and knowledge was institutionalized as an academic discipline and as a profession. Adopting a critical constructivist approach, this inquiry questions the managerialist ideology by exploring the material circumstances which led to its establishment in early XX Century. In particular, it focuses on the role that the Harvard Business School's (HBS) pedagogy, the *case method*, had in the institutionalization of management knowledge. It is argued that HBS' pedagogy, working at the boundary between academia and industry, was capable to translate the values of post-WWI industrial capitalism into the HBS' curriculum. The consequences of this translation were two: 1) the *neutralization* of capitalist's rationality, achieved through the constitution of a new academic field, business management; 2) the birth of a new class of experts, the managers, endowed with the exclusive control over the use of managerial rationality. Methodologically, the research relies on an historical analysis of the first twenty-two years of operation of the Harvard Business School. A qualitative content analysis of the School's Annals reconstructs the diffusion of the case method between 1908 (HBS' inaugural year) and 1930. The analysis is complemented with an historical inquiry into HBS' organizational transformations which supported the production of business cases and their use as pedagogical artifacts. The results show a rapid diffusion of the case-method, especially in the aftermath of WWI. The institution of the Bureau of Business Research, the creation of the Harvard Business Review and the standardization of the pedagogy marked the birth of business education, consecrated HBS as the behemoth of this new discipline and legitimized *the managers* as a new class of experts.

RC10-212.3LUSOLI, ALBERTO* (*Simon Fraser University*)*The Role of Occupational Communities in the Democratization of Labour in Startup Companies. a Data-Driven Ethnographic Approach*

Occupational communities are semi-formal grassroots organizations connecting workers with similar competences and professional interests. Blending elements of leisure and work, occupational communities have proved to be an effective means for fostering collaboration and mutual support amongst workers, thus helping them to navigate the uncertainties of flexible capitalism. Building on this definition of occupational communities, this paper investigates to which extent informal meetings of startup workers can promote collective actions, lead to political mobilization and overcome the limits of flexible capitalism, such as lack of social security, individualization of risk, precarious employment. Occupational communities are therefore investigated as sites of tactical resistance, in opposition to the strategic organization of labour informed by the 'Agile ideology' which permeates the startup economy. The research was conducted in Vancouver. Home to three out of five companies comprising the Canada Narwhal Club (companies established after the dot-com bubble burst that have reached a market value of at least \$1B CAD), the city hit the 18th position in the global chart of the best cities for startups in 2015 and was rated the most attractive city in Canada for new software ventures. The research protocol is composed of two main components: online data analysis and ethnographic exploration. Through the analysis of publicly available metadata collected from Meetup.com, the research identified and mapped formal and informal communities of tech-professionals operating in the Metro Vancouver area. The outcomes informed the subsequent ethnographic investigation of startup workers' community. The results collected through interviews with web-developers, computer scientists, marketers and digital practitioners, emphasize the ambivalent nature of occupational communities. If on the one hand they counteract the losses that workers experienced in the passage from industrial to flexible capitalism, on the other hand they promote individualistic approaches to social problem and reinforce current hegemonic forms of managerial power and control.

RC02-JS-53.3LUTZ, HELMA* (*Goethe University Frankfurt*)*Masculinity, Care and Stay-behind Fathers from a Post Socialist Perspective*

This paper reveals the constant and messy entanglements of individual, intimate and micro practices with the larger global political economy of care by focusing attention on stay-behind fathers in post-socialist Eastern Europe. As a consequence of the political system transformation, many women and men in Eastern Europe lost their employment and found themselves without adequate means for care and living. Women migrate in large numbers in order to support

their families. While over the last 15 years a variety of studies have focused on the repercussions of single female migration for their families, the gendered experiences and practices of stay-behind fathers have rarely been investigated. I will a) discuss the particularities of fatherhood, masculinities and gender regimes in socialist and post-socialist Europe; b) present two opposing cases on fathering partners of female migrant care workers, the involved working father and the authoritarian head of family from the analysis of interviews from the research project 'Landscapes of Care Drain. Care Provision and Care Chains from the Ukraine to Poland and from Poland to'; and c) finish by focusing on the difficult situation of 'mothering fathers' in a post-socialist situation where breadwinner masculinity is considered the cultural norm.

KORECKOVA, JANA* (*Palacký University Olomouc*)

Religion and National Identity in the Live of Czechs in Chicago

Many migration studies point to the fact, that the religion is for many immigrants' tool for successful integration into the new environment. At the same time, religious communities can function as some surroundings, which helps successful internment. Our contribution summarizes the results of the empirical survey of the Czech community in Chicago, which began in 2014 and continues to the present. Our empirical research (based on ethnography, participate observations, interviews and document analysis) is combined with a historical approach. This combination helps us to compare the findings from the research of the contemporary life of the Czechs in Chicago with information above the life of the Czechs in this region in the past. Chicago was the third "largest Czech city" (after Prague and Vienna) at the beginning of the 20th century. There was a Czech neighborhood where Czechs dominated culturally, socially, economically and politically. Today, the situation is different - the Czechs are largely assimilated and there are currently only small Czech communities. Our research question is: What role did religion or the Czech religious community in the process of integration or assimilation of Czech immigrants into the American surroundings? The results of our research show that Czech religious communities (mainly Catholic) have functioned and still working as surroundings where, on the one hand, the Czech cultural memory and collective identity are maintained, on the other hand, leads to the ghettoization of a part of the Czech immigrant community.

Deep Learning in Urban Research; Exploring Local Issues By Mapping Semantic Themes and Sentiment

Deep learning in urban research; exploring local issues by mapping semantic themes and sentiment

In line with the development in other sciences, the study of large, varied and continuously growing data (i.e. Big data) has resulted in an increased adaption of data driven methods in social science research. Big data analysis has become increasingly topical in the study of spatial issues in the urban context. Municipalities around the world are opening up location based public data for researchers to utilize, and the software tools for analyzing large quantities of data becomes increasingly advanced and attainable. However, as new computational methods are constantly developed, the evaluation of their potential in research lags behind. Deep machine learning based on neural networks is quickly becoming mainstream in the analysis of everything from images to audio. The method has also proven successful in semantic analysis and predicting contextual themes from large corpora of text data. Combined with location based data the analysis can leap from semantic space to spatial space. In this case study of 34 000 citizen feedback messages in Turku, deep machine learning is combined with location based data analysis. Preliminary results of the case study show the prevalence of semantics relating safety and danger in citizen feedback relating to the urban environment. This article further addresses the problems relating to the use of deep machine learning for semantic text analysis and issues relating to the study spatially bound phenomenon in this way. The methodological concerns relating to this type of explorative data-driven analysis are highly topical in contemporary data-rich urban environment.

Participative Media Practices in Ukrainian Social Media: Constructors of Personal Values and New Identities Versus Ways of Political Manipulations

The main purpose is to analyse the ambiguity role of social media in today's Ukrainian context: as the creators of new communicative environment, new sociality that favour finding of personal and national authenticity and as the social field of information wars, political games and realization of economic interests of

great Internet corporations. From here we can examine 3 major advantages of such participative practices. The first, social media are de-institutionalized that gives to users multidimensional features to create and modify voluntarily content, and also to share it with other users. At the same time de-institutionalization is always partial thereby main Internet resources are concentrated in hands of several big political players. The second, the consumer is considered as the producer of content and as his distributor, the term of "produser" emphasizes such a hybrid position. The third, communication in social media is always interactive and networking that causes both positive and negative consequences. We reveal the specific character of numerous types of communicative practices in contemporary Ukrainian virtual sphere subjected to "simultaneous/ non-simultaneous" character and number of interlocutors. Thus, we divide the audience of Internet users relative to their creation of personally significant meanings, values and purposes of communication. So, it is possible to allocate extremely active users or "insiders", "newbie" who are in process of training and searching and certain "lurkers" – followers of social networks without active participation and creation of own content. The other criteria of differentiation are formed by the axes "information dependence/ addiction versus information discretion", "tool orientation versus communicative orientation versus orientation to joining and belonging". We have observed some different configurations of political and information technologies which have been operating in the course of Ukrainian revolution of 2013-2014 and hybrid war continuing during 2014-2017

Negotiation and Medicalization of Transgender Identities at a Thai NGO

In this article, I examine how Thai kathoey – who are variously labeled "second-kind-of-woman," "third gender," or "male-to-female transgender" – embrace or resist medicalization of their identities in the context of Thailand's medical tourist boom for gender reassignment surgery (GRS). Though Thai kathoey are often described as male-to-female transgender because they experience incongruence between their birth sex as males and gender identity as females, their identity has historically not been understood to be a medical/psychiatric condition. In contrast, Western concepts of transgender identity are heavily medicalized, beginning with the diagnosis of "gender dysphoria" defined in the Diagnostic and Statistical Manual of Mental Disorders (DSM-5) and extending to the notion that dysphoria can be alleviated through mental health counseling, hormone therapy, and/or surgical interventions. Here, I interrogate how the medical therapies outlined in the "Standards of Care," a set of guidelines published by the World Professional Association for Transgender Health (WPATH), have influenced the perception of kathoey identity as a psychiatric/medical condition, a perception that has been formalized through the 2009 Thai Medical Council ruling that patients seeking GRS must provide letters from two psychiatrists confirming a gender dysphoria diagnosis. Through participant observation at a kathoey-led Thai NGO that works to guarantee legal rights for their community and in-depth interviews with 12 Thai kathoey, I demonstrate how the influence of a "globalized" transgender identity in Thailand has created multiple valences of transgender as a medical identity, both reframing the medical decision-making processes for Thai kathoey and introducing new struggles with stigma that bleed into domains such as family relationships and careers.

LYSAK, ELENA* (*School for Advanced Studies in the Social Sciences*)

Military Family Industry. The Role of the Family in the Construction and the Development of Military Profession in the Contemporary Army

A soldier's marital status merits concerted reflection when considering the interweaving of work and family in the army. In France, for example, *marriage control* was exercised in every army corps until 1972. An officer had to pledge in writing that his wife would refrain from any salaried work. Despite the liberalization of military status, it is still not a rarity to encounter wives that also "marry the army". Taking into account working conditions that feature frequent transfers, the presence of women becomes essential to organizing daily life. Even though the role of the wife is relegated to the private sphere, it becomes recognized as essential for the functioning of the army.

Moreover, according to studies conducted on American and British armies, the "military family industry" aims to foster a "happy family life" in the eyes of society. This phenomenon, observed in the American army since 1930, implies an involvement on the part of wives for the care of every regiment officer, single or married.

It is obvious that women provide a "free service", favored by army leaders and explained away by the "female nature" of the tasks. Recognizing this reality may help bring about a shift from the private sphere to the professional domain within army workforces.

Our investigations, carried out in France and Russia between 2014 and 2017, show that wifely duties, visible at a family and institutional level, remain socially depreciated in the army, whereas this activity should be considered a real job.

Our thinking is thus aimed at understanding in what measure the military family can contribute to the construction and development of the military profession in the contemporary army.

A Perfect Partnership... or Is It? Taiwanese Firms in Malaysia and Taiwan-Educated Malaysian Chinese Returnees

Recent research has noted the geographical unevenness of cultural capital, arguing that the portability and recognition of overseas credentials are not automatic but contingent upon social, economic, and political connections and limitations. Since foreign direct investments generally create local employment opportunities and boost the demand for more diversified human capitals, it is worth examining whether and how investments of foreign firms influence the appraisal mechanism of overseas credentials in the host labor market, and how this in turn shapes overseas graduates' opportunities for social mobility at home. By taking Taiwanese firms in Malaysia and Taiwan-educated Malaysian Chinese returnees into a case study, the paper investigated the relationship between foreign investments and the portability of overseas education. Initial assumptions were that Taiwan-acquired credentials, skills, and cultural knowledge would be better recognized and rewarded in Taiwanese firms, thus Taiwan-educated Malaysian Chinese would be more likely to be attracted to work in Taiwanese firms and preferred by Taiwanese entrepreneurs in the hiring process. Moreover, the establishment of Taiwanese firms in Malaysia may increase the value of Taiwanese-acquired education that had long been disparaged in Malaysia, thus facilitating upward social mobility of Malaysian Chinese holding Taiwanese degrees. The analysis was based on the interview data collected between August of 2016 and July of 2017 from 58 Taiwanese business owners and managers, Taiwan-educated Malaysian Chinese returnees, and related organizational leaders in northern, central and southern regions (Penang, Greater Kuala Lumpur, and Johor) in Malaysia. The results demonstrate that the partnership between Taiwanese firms in Malaysia and Taiwan-educated Malaysian Chinese returnees existed only in a very limited sense. This disjoint can be attributed to the replacability and instrumental values of experiences and cultural capital accumulated overseas, the organizational scale and the significance of foreign firms in the host labor market, market competitions, and regional economies.

Taiwanese Business Migrants in Malaysia: Translocal Networks and Entrepreneurship

Taiwanese investments in Malaysia surged after the Malaysian government opened the gate to welcome foreign investments in 1986 and reached the peak in the 1990s, bringing along flows of Taiwanese business migrants. Although Taiwan gradually withdrew its investments from Malaysia after the 2000s, it still stands as the one of top investor countries in Malaysia with its accumulated investments. By taking Taiwanese entrepreneurs and their businesses in Malaysia into study, this paper investigated how transnational and local networks were established and operated to facilitate business migration and corporate operation, and to what extent the characteristics of Taiwanese entrepreneurship were maintained, challenged, and adjusted in the host context. The analysis was based on the interview data collected between August of 2016 and July of 2017 from 24 Taiwanese business owners and top managers in northern, central and southern regions (Penang, Greater Kuala Lumpur, and Johor) in Malaysia as well as participant observation of Taiwanese firms in these regions. The findings showed that Taiwanese corporate management in Malaysia was culturally and structurally embedded in transnational and local contexts connected socially, economically, and politically through institutional linkages and mobility of people. Faced with changing national, regional, and global milieus, Taiwanese entrepreneurs, while preserving their outward and network-based features as "typical Taiwanese businessmen," adjusted their business orientation from limited localization to adaptable translocalization in pursuing their business aspirations in a foreign land.

Family and Parental Influence on Family Formation Among Taiwanese Young Adults

Previous literature has well documented significant determinants of family formation, namely marriage and childbearing. However, most studies mainly examine the variations between individuals with respect to their gender, socioeconomic status, and gender role attitudes. Much less attention is given to the influence of earlier family experiences on young adults' family behavior. The only exception is perhaps the effect of parental divorce on adult children's intimate

relations and family formation, especially in the West. This study will examine family formation in the transition to adulthood with special focus on effects of earlier family experiences between parents and children. Using the longitudinal panel data from Taiwan Youth Project (TYP) since the year 2000, we will analyze potential influence of parent-child relations during adolescence, parents' educational expectation since adolescence and the actual fertility behavior of parents on young adults' marriage and childbearing. Gender ideologies as well as traditional norms will also be explored of its possible impact in the process of young adults' family formation.

Judging from the perspective of intergenerational transmission, it is hypothesized that positive parent-child relationship during adolescence is likely to result in positive attitudes toward family formation. But the actual marital and child-bearing behavior will depend on other contingencies such as family resources and normative expectation. Specifically, parents with less traditional gender role attitudes and higher educational expectations tend to delay adult children's age of first marriage and first childbirth. Growing up with more siblings at home and the endorsement of traditional norms may contribute to the timing of family formation. In addition, the association is expected to be stronger for daughters than sons, for working-class families than upper-class families, and weaker for young adults experiencing parental divorce during adolescence. The implication of different timing of family formation in the transition to adulthood in Taiwan will be discussed.

The Inequality of Digital Learning Among Students in Rich and Poor Countries

This paper sheds light on an increasingly important new form of inequality, popularly known as digital learning inequality (or the digital divide), by examining the socioeconomic differentials in Internet/online search skills for educating adolescents. Using data from the 2009 wave of the Programme for International Student Assessment (PISA) across 42 countries, I examine how macro-structural forces like economic development, national investment in human capital, and income inequality affect inequalities in digital learning between students attending poor schools and those attending elite schools. Using three-level multilevel models, I estimate school-level and country-level determinants of the digital learning inequality among students from various socioeconomic backgrounds. To capture national-level indicators, I geocode a set of country-level factors from various publicly available sources, including the World Bank's World Development Indicators database, the UNESCO Institute for Statistics database, and the World Income Inequality database.

Despite the fact that digital access in schools has been greatly improved in a wide range of countries, my research finds persistent between-school digital inequalities that are more pronounced in low-income countries. In affluent countries, however, digital technology in schools produces greater benefits when students attend resource-rich, elite schools rather than schools with a majority of low-income and disadvantaged students. I connect these findings with discussing the importance of school cultural processes and institutional settings (e.g., teacher expectations, administrative actions) from research on social stratification and inequality in explaining inequalities between poor schools and elite schools. I also discuss how globalization as well as the emergence of knowledge society may generate inequality in schools differently between rich versus poor countries.

Research on the Change of Birth Cohort Size and Its Social Effect in Metropolis : the Case of Beijing

Using birth data of Beijing from 1981 to 2016, this paper discusses the characteristics and trends of birth cohort size in metropolis like Beijing. Result shows the change of birth cohort size in Beijing is totally different from the whole country. Family planning policies, age structure and traditional fertility culture collectively lead to these results. Planning and allocation of public resource doesn't match the change of birth cohort size in Beijing, birth cohort size imposes squeezing effect on public resource, and this effect transfers to members of birth cohort. So the public policies should respond to the change of birth cohort size to make sure people born in different birth cohort can enjoy the equal outcomes of social development.

Systemic Vision to Plan an Old Age with Health and Quality of Life

Aging process is complex and multifactorial. It refers to the continuous physical, mental, emotional and social changes in the time that we naturally and gradually experience all of us. These changes are determined by our way of life, food, history, culture and socio-economic conditions. The systemic interaction

between all these factors has the result that aging of each person is different. On the other hand, it is a reality that in Mexico, there is no culture of health and prevention. In addition, 16% of older people have a poor quality of life. This paper presents a complex self-management project, for health prevention, from a balanced nutrition with the support of natural nutritional supplements, to have a good level of physical, mental and social health.

This project is designed, but also is built and operated by older adults. How to plan an aging with health and well-being, so as not to reach old age in disease?

We conducted a study with adults, over than 55 years, middle class in Mexico. Few of them occupy some of their time in preview and planning a long life with a healthy aging process, with well-being and quality of life.

We worked with focus groups guided, at the same time, with basic diagnostic questions, in order to know not only levels of physical, social and mental activities, but also quality of daily nutrition.

Some results: Poor diets are present continually. There is a regular overweight in participants. People do not have sufficient information about balanced nutrition. All this factors produce low levels of physical, mental, emotional and social health.

We propose a systemic method of integral health and well-being, based on a daily balanced diet, enriched with natural nutritional supplements, and supported by an active, creative and shared aging.

MACALUSO, MARILENA* (*Palermo University*)

A Mother-to-Mother Self-Help Group in Palermo: From Breastfeeding Promotion to Daily Web-Support

Citizens in individualized societies experience *life-politics* or *lifestyle politics* and their daily relationships pass through the Net. On one side, there are the weakening of the Welfare State in the Western countries, the economic crisis, the precariousness of work; on the other, there are the *post-politics* and the *cyber-transformation of the public sphere*. In this scenario new forms of collective mobilization are spreading, they have not the features of social movements, but they form simpler realities that can take different shapes and changing dynamically, becoming *interest coalitions* when there are social and political opportunities. This paper analyzes in particular the case study of a collective social actor born out of the action of a group of mothers and professionals promoting breastfeeding and mother-to-mother support in Palermo (Italy) observing its origin, evolution, organizational structure, inner and outer communication and Internet use, protest repertoires (flash mob, social campaigns, etc.), networks with other local, national and international groups (the network around breastfeeding support is global, the bigger hub in Italy there is Italian Mother Breastfeeding Movement and globally the Leche League International). Starting from the analysis of public policies in Italy on breastfeeding and moving from local reactions to global processes, this paper illustrates the case through participant observation and ethnography (5 years), collection of interviews, analysis of the press echo. They develop in their everyday life a work of mutual support, listening, tackling against fallacy and preconceptions, spreading of lifestyles and sustainable consumption, making strong virtual ties using the social network (WhatsApp group, Facebook), peer learning and social empowerment that from the private sphere assumes from time to time the form of pressure group, protest movement, virtuous civic experience, social engagement, becoming a driving force for social and political change.

Separated Young Migrants: Political Socialization and Narratives of Conflict and Cooperation in Palermo

There is many literature on the definition of "childhood", the conceptual frame of this expression has changed during the time and it is going on changing across the borders. Moreover, when children migrate alone or remain alone on the way toward a new country they institutionally become "separated children" (UNHCR) or "unaccompanied foreign minors" (Council of Europe). At an international level, there is no unique definition of the minor immigrant. In Italy, the expression unaccompanied foreign minor concerns "a minor who does not have Italian or other EU citizenship, has not applied for asylum and is, for any reason, within the territory of the State without care or representation by their parents or other adults who are legally responsible for them under existing Italian laws" (Decree of the President of the Council of Ministers No 535/1999, Art. 1). From one hand, there are the legal and bureaucratic procedure, the issues linked to social policy choices at national and local level, the social reaction to migrants and their representation on the Internet and mass media; on the other hand, there are the people, their story, their dreams and wishes, their emotions, their new daily experience and political socialization processes. This paper wonders about violence, power and injustices moving from the point of views collected in the narratives by some youths arrived alone in Palermo (Italy) with the aim of analyzing their political socialization and comparing and intertwining different

perspectives, other- and selves-definitions, in order to find areas of conflict and cooperation between social actors and public institutions.

MACCORMAC, KATHERINE* (*Western University*)

At the Crossroads of a New Frontier: Youth, Identity, and the Negotiation of Multiple Belongings within Canada's Bilingual Framework

For over forty years, the dominant vision shaping Canada's official language policies and French as a second language (FSL) programs has remained in a bilingual, bicultural state despite the rapid linguistic and cultural transformation of Canadian society from increased waves of transnational migration. Recently, Byrd Clark (2007, 2008b, 2010) and Mady (2012) have each discovered that the reproduction of this vision is especially problematic for multilingual Canadian FSL students because it limits the possibilities of negotiating multiple forms of belonging by failing to reflect the complex globalised ethnoscape across which these students negotiate their identities. What remains to be investigated, however, is how the reproduction of this vision specifically affects the identity negotiation experiences of multilingual Canadian youth born abroad and raised in Canada who have chosen to invest in official bilingualism. For this population of Canadian youth, the process of multilingual identity negotiation not only involves negotiating their identities both *across* and *in between* their multiple social worlds (i.e. home/ school, home country/host country), but it also requires doing so within a bilingual framework that fails to fully account for the rapidly evolving nature of Canadian society. While applying a critical postmodern narrative approach, this paper adds to the conversation by sharing preliminary findings of the narrative experiences of Canadian multilingual former FSL students negotiating a space for the expression of their identities while investing in official bilingualism. Although focused on the Canadian case, this paper has important implications for the broader international community by demonstrating the heightened need in today's globalized world to ensure that language policies and educational practices adequately respond to the challenges faced by today's multilingual youth negotiating their identities and multiple belongings across increasingly complex globalised ethnoscaes.

MACCORMAC, KATHERINE* (*Western University*)

Negotiating Multiple Identities and Linguistic Capital within Canada's Bilingual Framework: A Narrative Analysis of the Past Experiences of Canadian Multilingual Youth

Since the adoption of official bilingualism in Canada over forty years ago, Canadian language policies and French as a second language (FSL) education programs have continued to promote a homogenous bilingual and bicultural vision of the nation despite the evolution of Canadian society from increased waves of immigration. From a social justice standpoint, Canadian language and education researchers have discovered that the continued reproduction of this vision not only limits the possibilities for multilingual FSL students to negotiate multiple forms of belonging, but it also enacts symbolic violence on them by undervaluing their linguistic capital (Byrd Clark, 2007, 2008b, 2010; Mady, 2012). Although highlighting the tensions involved in the Canadian language situation, previous studies have mainly focused on the experiences of adult newly arrived and second generation Canadian born multilingual FSL students. Remaining unexplored, however, is the long term effects of these tensions on the experiences of multilingual FSL students born abroad and raised in Canada whose immigration status often involves negotiating a space for their multiple identities and linguistic capital both *across* and *in between* their multiple social worlds. While employing a critical postmodern narrative approach, this paper adds to the conversation by presenting preliminary findings drawn from narratives of the lived experiences of a group of Canadian multilingual former FSL students. Although focused on the Canadian context, this paper has broader international implications because it highlights the importance of addressing issues of social inequality within national language policies and education programs to aid multilingual youth in maintaining their multiple identities and linguistic capital while integrating into the linguistic landscape of host societies.

I Get By with a Little Help from My Kin: The Advancement of Whole-Family Methodology for the Study of Multigenerational Mobility

Although the evolution of Western society has become increasingly individualistic, it is an inevitable fact of life that people are born into a family under conditions that they do not have the ability to change. The family, as an institution, therefore plays an important role in facilitating an individual's upward or downward trajectory of social mobility. Bertaux (1995) contends that although

the family dimension of social mobility is paramount for understanding the life decisions of individuals, studies have largely neglected the extent to which 'whole-families' face issues of mobility over time by relying heavily on dyadic and individual models of family relations (Cox & Paley, 1997; Handel, 1965, 1987, 1996). This 'artificial construction' of how the family is viewed limits our capacity to understand family processes throughout time because only a fragment of family relationships within a family unit are being accounted for. This paper advances Handel's 1989 work on 'whole-family methodology' to include extended kin relations for the study of multigenerational social mobility. Using data from pioneer settlers in Prince Edward Island Canada over four generations, I argue the methodological merits of utilizing a flexible framework combining historical data, the life course perspective, and whole-family methodology to observe interpersonal relations and processes of change that affect everyday family life. I demonstrate that conceptualizing processes of change from a 'whole-family' perspective over time can reveal important patterns of mobility variation of socially bonded individuals transitioning through different social structures over their life course. Including extended kin in the scope of observation for family mobility research expands our understanding of how families and individuals negotiate levels of autonomy and connectedness and aid one another towards upward social mobility.

MACCORMAC, MEGAN* (*The University of Western Ontario*)

The Shift to Three-Dimensional Thinking of the Family: Advancing Historical Multigenerational Mobility Research through the Use of Whole-Family Network Analysis

The study of families over time requires a multilayered understanding and conceptualization of individual lives embedded in family units that change throughout time, context, and processes of social change. Despite this understanding, research on the family has overemphasized individual and dyadic models of family relationships which merely illustrate one section of a relationship within the family and cannot explain multi-generational relationships or the multiple relationships that exist within one family unit. As a result, much is known about processes involving family relationships from an individualistic or dyadic point of view, however, our understanding of 'whole-family' processes, especially historic family life, remains limited. This paper advocates for the use of whole-family methodology to study families over time and addresses the methodological challenges of using historical multidimensional data that grapples with the tension of including observations that are continuous yet restricted to the boundaries of the family. In the paper, I argue that by applying a flexible framework encompassing whole-family methodology and the life course perspective, researchers are able to consider the interplay between individual and family mobility patterns by accounting for the influence of time (i.e. individual, collective, and historical), human agency, and linked lives on family mobility. Similarly, by reconstructing the historical social record for extended families over time in a whole-family manner, I contend that this type of research has the potential to add to our understanding of family life by viewing social mobility within the family from micro- (i.e. individual life patterns), meso- (i.e. whole-family networks) and macro- (i.e. community level affects on the family) level perspectives.

MACDONALD, KATIE* (*St. Francis Xavier*)

Intimacy and Pedagogies in Volunteer Tourism

Volunteer tourism is a rapidly increasing field. It is often either celebrated (for professional, pedagogical and developmental opportunities) or lamented (for neocolonial and oppressive structures). Both of these perspectives focus on the *outcomes* of volunteer tourism. In this presentation I take two sites of intimacy in volunteer tourism to consider the complex ways in which subject and meaning making happens in encounters between Western volunteers, particularly white women, and "locals", particularly host mothers. Through in-depth interviews and participant observation with volunteer programs in Nicaragua, I found that while both Nicaraguan hosts and volunteers imagined possibilities for transformative pedagogies in volunteer abroad, these transformations and thus their pedagogical logics, were different. In this presentation I examine these pedagogical logics through a focus on how moments of intimacy through the naming of "family" in the homestay and catcalling in the street were illustrative of the inequalities of volunteer abroad that are often obscured through a neoliberal frame. I argue host mother labour is conceptualized as a labour of love rather than a labour for which they are financially compensated, and that the danger imagined in the street resides in the bodies of Nicaraguan men. By outlining the ways safety is imagined as "at home" and danger as in the "public", I argue that pedagogical logics of volunteer abroad are underlined by a fantasy that the home space is particularly good for learning because of its conceptualization as safe and asexual. While volunteer abroad is rife with fantasies about intimacy, I demonstrate that when these fantasies are disrupted they often reveal the underlying power relations enabling these encounters. This presentation examines the experiences

of intimacy of both women who are volunteering and women who are host mothers to consider the complex negotiations of learning, inequity and power.

RC55-901.4

MACDONALD, KATIE* (*Capital Region Housing*)

Wellbeing and Housing Stability

There is an increasing call for more complex measures for understanding wellbeing – both objectively and subjectively. Researchers have moved into seeking other ways to capture how people are doing, for example the case of the Happiness Index in Bhutan, Gross National Happiness, the Canadian Index of Wellbeing, and so on. Each of these measures attempts to capture how well people are faring, and to present a more robust picture of the lives that people are living.

Capital Region Housing (CRH) is one of the largest housing management bodies in Canada. While it is known that housing vulnerability is a key indicator of wellbeing, what is less known is how housing stability – through the provision of subsidized housing – impacts other sub-dimensions of wellbeing. In 2017 CRH engaged tenants in an anonymous wellbeing survey designed to provide a clearer understanding of wellbeing of tenants, and to understand the interconnections between areas of wellbeing and housing stability.

The findings represent a baseline understanding of where current tenants are in their self-reported wellbeing (from finances to health to community). We discuss some preliminary findings that complicate the assumption that providing stable housing means other dimensions of wellbeing can and are addressed, as well as provide some preliminary connections between stabilizing housing and other sub-dimensions such as finances, family life, and safety. Finally, we examine these findings along identity lines including race, gender and immigration to consider how specific populations of people report wellbeing differently and the implications for future research, understanding of wellbeing analysis and service provision. CRH intends to use this data to develop new outcome paradigms for social housing that are consider more than simply putting a roof over someone's head as a meaningful measure.

Meaningful Participation or Tokenism? Individual and Advocacy Experiences of the Mental Health Tribunal in Scotland

The Mental Health (Care and Treatment) (Scotland) Act 2003 has earned Scotland an international reputation for progressive mental health policy. It diverges from other jurisdictions through its focus on rights and safeguards, as opposed to public protection, and is underpinned by key principles including participation, benefit, and reciprocity. Despite this, the Mental Welfare Commission, the regulatory body in Scotland, has raised concerns that individuals are not able to effectively claim their rights, suggesting that the legislation is incompatible with the United Nations Convention on the Rights of Persons with Disabilities.

This paper draws on doctoral research into experiences of community based compulsory treatment orders in Scotland. Based on qualitative, semi-structured interviews with mental health advocates and individuals subject to compulsory treatment, it examines the extent to which the mental health tribunal facilitates meaningful participation in legal decision making. Whilst individuals had the opportunity to share their views during tribunal proceedings, this was largely experienced as tokenistic, with informants feeling disempowered by the process. A lack of a successful outcome further reinforced feelings of powerlessness and caused some participants to disengage from the process altogether. This paper argues that the subordinated position of individuals subject to compulsory treatment, by virtue of their diagnosis, in comparison to the 'expert' status afforded to medical professionals, undermines the participatory potential of the mental health tribunal.

Transnational Biosurveillance and Criminalization across Borders

The expansion of transnational biosurveillance generated by continuous innovations in the field of databasing and genetics are becoming important pieces in security policies at a global scale. In this paper, we analyse the empirical case of the large-scale exchange of DNA data between different jurisdictions in the European Union. Our analysis is based on interviews conducted in different countries with professionals working in the field of the fight against organized

crime, terrorism and the so-called illegal migration. We focus in particular on the actual and expected uses of biotechnologies that allow searching for criminal suspects on the basis of DNA profiles, such as DNA databasing and forensic DNA phenotyping. Our aim is to understand the multiple forms of sense making deployed in the narratives of the experts involved in operations of police and judiciary cooperation among EU countries. We focus on processes of criminalization of mobility across borders by inquiring the narratives of these professionals of surveillance through the following questions: What makes data travel through different jurisdictions? Which particular territorial borders and specific social groups are considered "risky" and deserving more intensive and extensive forms of biosurveillance? Which hopes and concerns emerge towards different biotechnologies and their application in the fight against criminality? The paper concludes by pointing out how social boundaries and territorial borders are continuously re-created through particular forms of criminalisation of certain social groups and intersections between expectations towards different biotechnologies.

State Repression and Human Rights Mobilization in Contemporary Democracies: The Brazilian Case (2013-2016)

In the two last decades, after the Seattle Battle (1999) and the September 11 (2001), the state repression of political dissent in democracies became a central issue in the social movements literature. Especially in democratic regimes, harder state control strategies of street demonstrations can generate feelings of injustice, and diffuse the protest in defense of civil rights. Thus, the dispute between challengers and state agents by meanings of public and legal order is part of the contentious politics itself.

Two issues that still remain too little developed in the research field. The first is the use of repressive state strategies on an ambiguous continuum from informal or unlawful control (use of police force, surveillance, agents' infiltration) to lawful control (use of criminal prosecution in courts and legal changes in parliaments). The second is the emergence of human rights mobilizations against state repression and their impacts on the protest field. Human rights coalitions can change the protest field by spreading and connecting contentious episodes from the local space of streets to national and international spaces.

The paper focuses on this two issues based on preliminary results of the ongoing research on the recent Brazilian protest cycle (2013-2016). We analyze the connection and dynamics among three contentious episodes: 1) the stream of repressive state strategies from police control on the streets to legal control in courts and parliament; 2) the legal dispute between protesters' lawyers and state agents; 3) the human rights activists and lawyers' mobilization inside and between protest spaces (micromobilization process) and national state and international spaces (scale shift and repertoires diffusion processes).

RC53-874.5

MACHT, ALEXANDRA* (*Oxford Brookes University*)

Children's Agency and Father's Positive Health and Work-Related Benefits

Studies on the relationship between fathers and children often overlook the mutual beneficial influence both social actors have on their close relationship. Moreover, the literature on contemporary Scottish masculinity has been largely focused on the connection of 'hard' Scottish working-class masculinity and a range of subsequent health-risks and diseases. This negative view is supported by media depictions on the current vulnerable state of Scottish masculinity (Hassan, 2010), deemed 'problematic' as it is usually associated with cases of male suicide and social alienation. But looking at the positive and everyday interactions between Scottish fathers and their children, and by adopting a social-constructionist framework with an embodied focus (Burkitt, 2014), a different picture is revealed. Based on empirical findings from 27 qualitative interviews with Scottish involved fathers and 3 observations of interacting with their children, this paper argues that it is not only fathers that are transformed by having a child but also that children can have a beneficial influence on father's health benefits and positive engagement in work. Involved fatherhood offers the opportunity to resist practices of risk-taking and denial of treatment, which are harmful to men's health. Importantly, children were described as re-energising fathers for work and helping them let go of negative health habits (smoking, drugs, driving more carefully). Fathers in turn adopted a future-oriented and emotionally engaged perspective to spend more time with their children, which was essential in the transformation of their daily habits. Conclusively, it is argued that children play an important role in counteracting hegemonic masculinities, as they can help fathers shift from emotional stoicism which can be harmful to health, to increased nurturance and intimacy, which can increase the well-being of both family members.

RC06-129.8

MACHT, ALEXANDRA* (dr.)

Towards a Comparative Account of Scottish and Romanian Involved Fathering

Europe is a vast assembly of different cultures wherein family lives unfold according to a variety of classed practices. As representatives of the West and the East of Europe, Scottish and Romanian involved fathers practice fathering in slightly different ways even if they have similar conceptions of what constitutes intimate fathering. Drawing from empirical research based on 47 qualitative interviews with Scottish and Romanian resident and non-resident, working-class and middle-class fathers, I attempt to trace the differences and similarities in how involved fathers love their children and how in the process they re-create their masculine identity. As they shift between the provider role to the nurturing father, men also shift emotionally from stoicism to increased intimacy. However the varied socio-economic influences and relational pressures that exist in their cultural environment create different expectations. It has been argued that Scottish fathers are characterized by the cultural values of grit an autonomy and Romanian fathers by those of warmth and collectivism, but the findings of my research show that fathers believe that loving their children will help them develop into individuals which expound the reverse of such cultural prerogatives: that their Romanian children can become more confident and active in their social environment, and that their Scottish children can become more warm and sociable. Scottish fathers in their role as romantic partners also value individualism, while Romanian fathers prize a shared sense of collective identity. Therefore, using the incremental transformation of European fathering as a background, in this paper I will present the different construction of masculine emotionality according to a relatively neglected sample of European fathers: Scottish and Romanian ones. This serves to unmask the role of collectivism and individualism in reshaping the culture of parenthood, particularly in respect to (and following from Hochschild's conceptualization) the increasing commodification of intimate life.

MACIEL, DEBORA* (Brazilian Center of Analysis and Planning - Cebrap)

MACHADO, MARTA (Brazilian Center of Analysis and Planning - Cebrap)

Studying Dynamics of Repression and Mobilization in Protest Cycles: An Analytical Framework Proposal

The challenge of researching about the state's repression on protests has been to build theoretical and methodological models that capture the dynamic (temporality) and interactive (non-linearity) character of the phenomenon. The main analytical and empirical problem is to identify sociopolitical mechanisms and describe processes of repression and mobilization in their reciprocal effects. Two issues still remain too little developed in the social movements literature. The first is the stream of repressive state strategies on an ambiguous continuum from informal or unlawful control (use of police force, surveillance, agents' infiltration) to lawful control (use of criminal prosecution in courts and legal changes in parliaments). The second is the emergence of meta protests against state repression as backlash mechanism. Especially in democracies, the human rights mobilization can change the protest field, throughout cycles of protests, by spreading and connecting contentious episodes from the local space of streets to national and international spaces.

We propose a more integrated analytical framework for simultaneously observing streams of contentious interactions between activists and the State in a variety of arenas and throughout different phases of the recent Brazilian protest cycle (2013-2016). Based on recent methodological debates (state, law and social movements, theories of fields, arenas and repertoires), the paper shows how we are investigating dynamics of repression and mobilization in three contentious episodes through various methodologies: 1) the interaction strategic and symbolic between police and protesters (protest events analysis); 2) the dispute by juridical repertoires between protesters' lawyers and state agents in courts (socio-legal study of criminal prosecution and legal mobilization processes); 3) the human rights activists and lawyers' mobilization (network analysis) inside and between arenas and the sociopolitical mechanisms that they set in motion: in protest spaces (micromobilization processes) and in national state and international arenas (scale shift and repertoires diffusion processes).

Gender Patterns in Educational and Occupational Trajectories: Longitudinal Results

Based on findings from a longitudinal research, "EPITeen24: Reproducing or going against social destiny?", that analyzed a cohort of people born in 1990,

assessed at the ages of 13, 17, 21 and 24, we develop a paper about youngsters gender patterns', educational trajectories and the first years at the labor market.

Results from several waves show that women stand out in upward educational mobility and seem to present focused oriented practices to reach higher educational and social position. Young women are more likely to have lower rates of school failures and higher levels of schooling. However, it's early to tell whether this upward educational mobility is reflected in a social upward mobility, as girls already seem to demonstrate more difficulties entering the labor market. They have both higher part-time employment and unemployment rates than young men. Young men reveal higher social capital that seems to help them in the labor market. It is therefore visible a strong female agency (2/3 of youngsters with Upward Educational Mobility are women), but at the same time strong gender inequalities entering the labor market, with women presenting more precarious and unstable situations and men occupying more places in positions of authority, prestige and status.

Considering a theoretical framework that combines social class and educational mobility (Roberts, 2009), the role of the Welfare State and the educational system (Abrantes & Abrantes, 2014), gender inequalities and masculinities and femininities (Torres et al, 2014; Sikora e Pokropek, 2011; McDowell, 2009; Connell, 2009; Holland, 2009; Torres, 2006) we'll try to answer the following questions: Who is winning and where? Who is losing and where?

Work Stress Among Older Employees in Germany: Effects on Health and Retirement Age

Background: Policy makers in aging societies have aimed for the extension of work lives by increasing the official retirement age. Despite these efforts, many people stop working before reaching this retirement age. Previous research has shown that the main reason for early retirement is poor health. Health in turn is influenced by exposure to the job environment, in which the majority of people spends a comparatively high proportion of their lifetime. The increase in prevalence of psychological disorders indicates that work stress has become an ever more important risk for health and early retirement.

Objective: This study examines the relationship between work stress and retirement age. Moreover, it investigates whether this relationship is mediated by health.

Methods: A German subsample of the longitudinal Survey of Health, Aging and Retirement in Europe (SHARE) is linked with register data of the German Public Pension Scheme (SHARE-RV). The sample followed 304 individuals aged 50-65 at baseline from 2004 to 2015. The data contains information on self-rated health (SRH) and work stress, measured by the two dimensions of job strain and effort-reward-imbalance, and age of retirement. Structural equation modeling is applied to analyze the direct and indirect effects of work stress on retirement age via health. Work stress is lagged in a way that it temporally precedes SRH and retirement age.

Results: Only one dimension of job stress, that is higher job strain, relates to poorer SRH and lower retirement age. The other dimension, effort reward imbalance, has no effect. SRH does not operate as mediator in the relationship between work stress and retirement age.

Conclusions: Improving psychosocial working conditions related to stress can help to reduce earlier retirement beyond workers' health status. Lowering job strain potentially extends people's work life, as it made a direct contribution in explaining low retirement age.

Are You for Real? Authenticity in Youth Work Practice

The youth work sector in Scotland has become a diverse professional field with practitioners tasked increasingly to deliver key political and policy imperatives with outcomes gauged against pre-determined success criteria. Youth workers increasingly find themselves engaged in practice themes and discrete service delivery formerly the responsibility of other professionals. Progressively, practitioner boundaries are blurred and as such the changing demands on role and social purpose challenges their professional authenticity and the relationships they have with young people.

Over the past few years there has been a great deal of work exploring the notion of 'authenticity' in formal schooling with the role and practice of the teacher placed under critical scrutiny. It is our contention that the concept of authenticity is useful in helping explore the identity, practice and ethics of youth work in the current context. The interaction between adult practitioners and young people is commonly mediated by levels of trust, respect, sincerity and above all - authenticity. This relationship is built on notions of an informal learning partnership between the adult practitioners and participating young people. Such a partnership is often marked by an underlying commitment to enabling young people to take more control of their lives through learning critically about the issues and

challenges they face. In the current practice context characterised by increasing emphasis on measurement of predetermined outcomes and targeted provision can practitioners still remain authentic?

Through a comprehensive literature review we have developed a four dimensional theory of authenticity for youth work practice. We interviewed seven practitioners about the work they currently undertake with young people and analysed their responses through our model – asking the question, ‘to what extent are youth work practitioners encouraged to be/able to be authentic?’

Beyond the Body Camera: Wearables and Inwardly Expanding the Public Safety Toolkit

From body temperature sensors for firefighters and mine rescue workers, to body cameras for police officers and biomechanical monitoring systems for military personnel, wearable technologies are increasingly being marketed to the public safety sector. On the ground information about the conditions and context of work is no longer limited to verbal feedback or post hoc reports, but instead can stream directly and immediately from a sensor-enriched workforce. By tracking and recording a biometric and an audio-visual account of an event or incident, these devices promise the faster detection, prediction and analysis of events and employee performance. While tracking the productivity and health and safety of employees is not new, many are concerned about the potential for these devices to extend various powers of surveillance inside the body. By expanding the public safety “tool kit” – already outfitted with facial and optical recognition technologies, predictive algorithms, and data mining practices – wearables render our body and our surroundings as information. The body, the self, produced through monitoring is not only the *subject* of scientific measurement and interpretation, it is also the *product* – a resource to be managed, controlled, and optimized (Foucault, 1975; Lupton 2016; O’Neil, 2017). Given the hype and nascent stage of wearable adoption, this paper focuses on the supply side of 15 public safety wearable devices. Through a discursive analysis of the promotion of body cameras, exoskeletons and smart glasses, I argue the adoption by the public safety sector of sensor technologies and big data analytics reinforces a project of subjectification, as total information awareness and quantified-self logics align with institutional conceptions of bodies as instruments and resources.

Ruling Trans Health: Mapping How Clinical Documents Coordinate the Assessment Process for Transition-Related Medicine

RATIONALE

The Diagnostic and Statistical Manual of Mental Disorders (DSM) serves a powerful coordinating function in transition medical care for transgender people. Meanwhile, other standardizing clinical texts such as the World Professional Association of Transgender Health (WPATH) standards of care (SOC), also translocally regulate how trans people are approved for hormones and surgical interventions. We studied how the WPATH SOC constrained clinicians’ work of assessing suitability for transition, particularly for patients who experienced mental health challenges.

METHODS

Following the critical research tradition of institutional ethnography, we interviewed 25 key informants to elucidate how the actualities of transition care are shaped by the use of clinical texts in everyday clinical practice. Informants included trans patients, psychiatrists, clinician educators, residents, social workers, and policy experts. An iterative analysis of participant interviews and key texts allowed us to map the textually coordinated healthwork of transition medicine.

FINDINGS

The local interactions between trans patients and clinicians within transition care settings is ruled by the WPATH SOC. Although clinicians articulated skepticism of the DSM’s gender dysphoria diagnosis, the SOC requires clinicians to work with this diagnostic category to approve transition for patients. Clinicians evaluated patients’ overall mental health to rule out perceived contraindications to transition sexes for patients with complex mental health needs (e.g., acute suicidality). Trans patients provided accounts of the work of strategically withholding mental health concerns, including depression and suicidality, from providers during the mental health assessment period to help ensure their access to transition care.

CONCLUSIONS

The WPATH SOC shapes both clinicians’ and trans patients’ movement through the local transition care system. Clinicians are hooked into the SOC’s prescriptive requirements of diagnosing and gatekeeping transition care, while trans patients with complex mental health needs minimize or withhold current challenges, foreclosing opportunities to be referred to relevant mental health care services.

Sport Policy, Athletes' Rights and Citizenship

In a policy conversation with Olympian-advocate-scholars -- Dr. Bruce Kidd and Rosie Maclellan -- we explore the changing inter/national landscape of sport policy and the implications it holds for athletes’ rights from a social justice perspective and for the multiple notions of citizenry held by athletes. Policy engagement and social initiatives by present and former athletes are observed in order to scrutinize: (1) athletes’ rights and relationships with sports organizations, transnational media, and sponsors; (2) the meanings and forms of citizenship fostered in different kinds of political activity; and (3) how different approaches to policymaking help or hinder social justice. While competing internationally and serving as an athlete representative for the International Federation of Gymnastics and the Canadian Olympic Committee, Maclellan discusses how she investigates the roles and identities of high performance athletes, the complex regulations and contractual agreements imposed by governing bodies, and the myriad of pressures acting on athletes as they pursue ‘social responsibility’ initiatives in and around the realm of sport. For Kidd, “critical support” or ‘critical partisanship’ is the commitment to the rigorous scrutiny of and intervention into the ideas, institutions and practices to which one is committed, advocates and carries out” (2013, p.341). His wide range of emancipatory projects have contributed to policy changes, ranging from including athlete representation on sport governing bodies, the right to due process and arbitration as a basic human right and the dismantling of gender verification policies of international sport federations, to deploying sport as a vehicle to help end apartheid in South Africa. A critical appraisal of policy making models, assumptions of citizenry and ethical foundations of ‘best practices’ in sport policy and governance will be synthesized to advocate a number of ways forward to an intersectional and intersectoral approach to social justice in sport.

MACZKA, KRZYSZTOF* (*Adam Mickiewicz University*)

Citizens' Reception of Public Consultation

Background

The phenomenon of public participation has been the focus of global debate for the last 30 years. Analysis of participation often focuses on perspective of the initiators of participatory activities (e. g. public consultation on revitalization, participatory budgeting, spatial planning etc.). However there is a lack of knowledge on the citizens’ reception of participation.

Research aim

The main aim of the project is to provide insights in this respect by answering the question: How does the citizens’ reception of participation (understood as citizens’ opinion on public consultation conducted by local governments) look like taking into account: 1) quality of decision making, 2) level of trust to the local government, 3) sense of agency.

Methods

Qualitative, comparative, multiple-case study approach is applied in the research. The purposeful case study areas selection is based on typology of historical regions of Poland and administrative division of municipalities in Poland. The case study analysis will apply: 1) desk research of available data pertaining to a particular case in terms of participation: scientific literature, press releases, official documents and 2) in-depth interviews with local elites’ representatives (e.g. NGOs, business, media, local politicians, local leaders) who will be identified within desk research.

Results and conclusion

The research enables to assess reception of participation with respect to the quality of decision making, level of trust to local government and citizens’ sense of agency. Moreover the project provides verified methodological approach on how to assess the local elites’ reception of participation to be used in applied research concerning various topics at more detailed levels, e.g. local community revitalization, environment protection, culture etc. which may give an input for local government to improve public consultation or in particular circumstances even recommend not to conduct any.

MADERO, CRISTOBAL* (*University of California, Berkeley*)

The Changing Meaning of the Teaching Profession in Latin America.

In this qualitative exploratory and comparative research project, I shed light on whether secondary education teachers understand their profession as a calling and under what conditions such calling, if any, emerges and thrives.

The study of the association between work and having a calling to do it was first studied and conceptualized by Max Weber's (1904; 2011) pivotal study on the effects of the Reformation on Western society. Thirty years of research has resulted in important developments such as: conceptual distinction between callings and the concept of job and career (Bellah et al., 1985; Wrzesniewski, McCauley, Rozin, & Schwartz, 1997), how a calling develops in the worker (Dobrow, 2013), and how such calling is related to organizational dispositions (Neubert & Halbesleben, 2014).

Few studies have examined the specific association between callings and the teaching profession at an empirical level (Bullough Jr & Hall-Kenyon, 2012; Hansen, 1995, 2001; Serow, 1994). Such studies, with the exception of Hansen (1995), have delivered important, though limited, conceptual and theoretical understanding of this association. We learn from such studies neither what having a calling to teach means in the life of teachers nor about the necessary conditions for the emergence of that calling.

Using oral history as interviewing methods, and both thematic narrative analysis and comparative analysis, as analytical approaches, I study whether veteran and retired teachers (N=108) in a school network in Chile, Bolivia, and Peru, live their teaching profession (from 30 to 55 years) as a calling, and under what conditions such calling emerges and thrives.

Findings suggest that understanding teachings as a calling is widely spread in teachers who connect their work to a mission, sometimes in religious, that transcends the teaching and learning relationship. Those who understand their work as a calling, tend to show higher level of satisfaction.

MADERO, CRISTOBAL* (*University of California, Berkeley*)

The Professionalization of the Teacher Workforce in Catholic Schools between 1960 and 2010 in the Latin American Southern Cone and in the USA.

This article aims to answer what the teaching profession today can learn from the professionalization of the teaching workforce in Catholic schools in the last 50 years. I study Catholic schools in the USA and in the Latin American Southern Cone (Chile, Argentina, Bolivia, Paraguay, and Peru), because they show the shift, in a very defined span of time, of the professionals who taught in schools: that is, the shift from priests/ministers to professional lay teachers. In doing so, I consider the organizational/institutional context particularly of schools that belong to the Society of Jesus (Jesuits), a 400-hundred-year-old Catholic order dedicated mainly to providing education at the secondary and higher education level. I use two different bodies of theories to address the problem: Abbot's theory of professionalization (1988), and Fligstein & McAdam's theory of fields (2012). In addition to oral histories and in-depth interviews of 75 retired and in-service teachers from 25 high schools, I review archives from several collections (Jesuit Education Quarterly Archives, Jesuit archives in Rome, and archives in each of the schools). Findings indicate that the professionalization of the teaching workforce in Catholic schools occurred primarily during the 1960s and as a result of: (1) priests/ministers who found it difficult or impossible at an advanced age to go for a teaching credential and in that way remain in the system, (2) an accelerated process of secularization that decreases the number of men entering seminaries, and (3) an extension of the secondary education level enrollment that posed an organizational challenge to the Catholic schools.

A Comparative Perspective on Later-Life Employment and Health

Across the developed world, unprecedented population ageing has led governments to implement policies that encourage paid employment in later life to mitigate the strain on public pension systems. In practice, this has meant, among other measures, increases to the age at which individuals become eligible for a state pension. Despite common measures, there is considerable heterogeneity in the labour market experiences of older adults across and within countries, driven in part by the labour market and pension policies of diverse welfare states. However, to date, our understanding of how such policies influence the effects of labour market activity on non-monetary dimensions of late life, notably the health of older adults, is in its infancy. In this paper, we adopt a cross-national comparative perspective, assessing the labour market experiences of older adults in the years leading up to, and beyond the state pension age, and their association with health in the US, Europe and Chile.

We use data from the Health and Retirement Survey (for the US), the English Longitudinal Ageing Study of Ageing (for England), the Survey of Health, Ageing and Retirement in Europe (for Austria, Belgium, Denmark, France, Germany, Italy, Spain, Sweden, Switzerland), and the Chilean Social Protection Survey (for Chile), to first model labour market involvement in the 5 years pre- and post- country and gender specific state pension ages using optimal matching analysis. We then analyse the relationship of these patterns with self-rated health, and assess the extent to which the association between later life employment patterns and

health varies across clusters reflecting distinct welfare state types. Preliminary results indicate that early exits for men in liberal-oriented nations are the most damaging for health, while extending working life (both in full-time and part-time positions) leads to better health indicators in most of the countries analyzed.

LE FEUVRE, NICKY (*Université de Lausanne*)

Welfare Regimes, Education Levels and Women's Late Careers in Comparative Perspective

In western societies, understanding the labor-force participation determinants of seniors (i.e. workers aged 50+) or late careers is becoming increasingly important, notably due to different policy reforms aimed at reversing early retirement trends and delaying retirement age. To date, little is known about the determinants of women's extended working lives, which depend both on factors external to the labor market (partner's retirement age, family care needs, particularly with respect to grand-parenting) and on their personal employment history and current working conditions. Moreover, the proportion of women aged 50+ in employment varies significantly between countries with different welfare state regimes. In conservative-oriented countries, which often provide a low institutional support for mothers' paid employment, women are likely to exit the labor market more rapidly than their male counterparts. On the other hand, in liberal-oriented countries with a (modified) male-breadwinner culture, women may return to work (often part-time) at 50+ following a family-related career-break. However, we also know that, within a given macro-level welfare context, women's education levels determine to a large extent their later-life employment patterns, unemployment rates and working conditions.

Based on a harmonized pooled-country dataset from four exceptionally rich panel surveys (HRS, ELSA, SHARE, and EPS) we use sequence analyses to study the employment careers of women aged 50-60 years in the following 12 countries characterized by different welfare regimes: Austria, Belgium, Chile, Denmark, England, France, Germany, Italy, Spain, Sweden, Switzerland, and the United States. The main aim of this research is to analyze the combined influence of welfare regimes and women's education levels on their employment rates and patterns in later life. Preliminary results in some of the mentioned countries indicate that higher educated women show a strong attachment to the labor force during late careers regardless the welfare state context to which they belong.

MADHAVAN SARASAMMA, JAYAKUMAR* (*University of Kerala*)

Hard Relax after Hard Labour: The Situation of Elderly Return Emigrants in Kerala, India

The state of Kerala is well known for international migration, especially labour migration to the Gulf Cooperation Council (GCC) countries in the Persian Gulf, started in the early 1970s with oil boom. The majority of these 2.4 million expatriate workers are lesser educated and involved in construction and other manual jobs at the destinations. Return of these emigrants started in the 1980s and still continues. Their number was 1.25 million in 2014 against 1.15 million in 2011. The present study, based on empirical data, looks into the situation of the aged return emigrants in the state. The return emigrants too are mostly males like the emigrants. The distribution of return emigrants among religious groups shows sharp distinction with Muslim households having more representation. As most of their earnings is spent on building house, educating children, marrying off girl children, meeting everyday needs etc., they could not save much for their elderly life. They do not benefit from any emigrant welfare schemes for repatriates. Investment of their earnings and savings for purposes other than sustainable income generation caused loss of income. They also could not utilise the skill and expertise they gained abroad back at home after return, especially those returned due to health issues. The loss of income has brought about undesirable outcomes in their familial and social relations.

The Transnational Identities of Immigrants and Their Impact on the Sense of Belonging to the Host Society: The Case of Africans in Canada

In this paper, we will examine how Sub-Saharan African immigrants in Alberta, Canada, construct their transnational identities and whether these identities enhance and/or jeopardize their sense of belonging to Canada. To this end, we will analyze the connections these immigrants create and maintain with their countries of origin, the role that the global means of communication and transportation play in the enactment of these activities, and the reasons that

prompt the immigrants to develop these ties. We will also explore the meanings which the immigrants associate with their transnational and Canadian identities. Utilizing theories of transnational migration (Hugo, 2014; Vertovec, 2009) and identity (Korostelina, 2007), as well as a qualitative research methodology that employs content analysis of 20 semi-structured interviews, we will shed light on the dynamics of inclusion and exclusion in both the host society and the countries of origin that shape the identities being constructed. We will also ascertain that the transnational identity and the sense of belonging to the host society are not dichotomous; rather, immigrants negotiate these identities in a complementary manner to enhance their inclusion in both societies, and foster development in the countries of origin in Africa.

Modernization of "Tradition" Resumed after 150 Years of Vacuum: Normalization of Wearing "Traditional" Clothes in Japan

The modernization of "traditional" clothes is widely observed in Japan. This recent phenomenon should be construed from the perspective of the global modernization process that normalized the custom of wearing clothes from western civilization while it paused the modernization of "traditional" clothes of non-Western regions. Japan now seems to have entered a new era in which the modernization of what "tradition" originally warranted is finally being resumed. If this is a bounce-back from the compression of the rapid process of modernization (Kyung-Sup 2010 "Individualization without Individualism," *Journal of Intimate and Public Spheres*) in the 19th century, the implication is that similar phenomena may soon become observable around the world where compressed modernization has been implemented at the cost of pausing the development of "traditional" practices.

There are two questions that need to be answered. First, is this a phenomena unique to Japanese society but not other Asian nations, such as South Korea and China? Second, what are the undercurrent social sentiments of this seemingly gradual resilience from the distortion of compressed modernization 150 years ago? Is it a nationalistic conservative swing in reaction to the rise of surrounding nations? Or, is it perhaps simply a marketing strategy that commodifies ethnicity? If both are culprits, then which has more weight?

In order to answer these questions, this research first took a glimpse at the historical adaptations of western clothes in Japan, South Korea, and China, as well as the trend shift in dress codes throughout recent times and to date in these countries. Then, a survey was conducted to examine the possibility of a rise in conservative nationalism and the mere utility of the commodification of ethnicity as independent variables affecting this new trend. Finally, interviews were conducted on those who dress in Kimono/Yukata on a regular basis in Tokyo.

A Job on One's Own. Economic Insecurity and Women's Labour Market Participation in Six European Countries.

The need for a wider comprehension of economic insecurity dynamics has been widely assessed in academic and political debate in recent years. However, to keep gender as the main analytical frame is still up to now underdeveloped in this debate, as the analysis' focus mainly remains at household level despite the well-known phenomenon of feminisation of poverty. The main contribution of the proposed paper is to empirically address this theoretical gap and to propose an analysis of how the institutional context as well as individual characteristics in intersectional perspective affects women's risk of living in economic insecure households. By taking in account six European countries (United Kingdom, Italy, France, Spain, Czech Republic and Denmark) as representatives of the main welfare regimes in Europe, the article aims at better understanding causes and mechanisms behind economic insecurity. The main hypothesis behind the paper is that households' risk of economic insecurity is directly influenced by women's frailer labour market participation.

The paper will use the EU-SILC database and its additional module 2013 to analyse the risk of women's exposure to economic insecurity, using a set of logistic regressions by countries and comparing differences in national determinants of the risk, with a specific focus on women's contribution to paid work. The article will contribute to advance the contemporary feminist debate in two ways. First, it focuses on the grey area between well-being and full-blown social exclusion. A new understanding of economic insecurity might put in evidence what are causes and mechanisms that determine the descent from a condition of risks to poverty and social exclusion, giving new input to innovative social policies. Secondly, it offers new advancements to comparative analysis by putting in question the traditional clusterisation of welfare regimes stemming from new empirical results.

FIRINU, ANTONIO (*University of Cagliari*)

The Jobs (F)Act: Marginalisation Processes and Flexicurity in Italy

Inequalities in the Italian labour market persistently occur along age cleavages. This is due to a 20 years process of deregulation "on-margins", which exposed new entrants, in particular young workers, to worsened conditions in terms of rights and social protection compared to older generations. This approach is confirmed by the *Jobs Act* (L. 183/2014), the latest among labour market reforms, inspired by the European *flexicurity* framework.

Following an actor centered approach (Sharpf, 1997), central to the *institutional change theory* (Streeck and Thelen, 2005), the paper deals with the *institutional disjunction* between institutions enhancing flexibility and those enhancing security at meso level. The main consequence on the supply-side is what we call a *drifting effect towards marginal work*. Marginalisation implies the workers' progressive loss of rights and entitlements as far as we walk away from the centre and it occurs when labour market integration is so frail and intermittent that puts in question the capacity of the social protection to defend workers from economic insecurity.

Our empirical investigation, based on the Italian labour force survey, will show to what extent marginal work concentrates among the young entrants in the labour market and to what extent the magnitude of this phenomenon changes across different territorial contexts. In particular, we hypothesize a complementary relationship between economic performances and institutional settings at NUTS3 level that impacts on the outcomes of *flexicurity* reforms and on the drifting effect magnitude to young cohorts on the labour market. The final scope of the analysis is to present a new understanding on intergenerational inequalities in Italian labour market, which are particularly insidious for the long-term economic security of young generations given the occupational nature of the Italian welfare state.

Paradigm Shift to Urban Devolution (Machizukuri Kyogikai) Based on "Residents' Collective Action" in Aging and Shrinking Cities in Japan — Comparison with U.S. Neighborhood Councils

Many cities/ municipalities and localities are struggling against aging and shrinking in Japan. The number of "living-alone" elders' households is 11% among all households. In addition, many municipalities are suffering budget cuts.

Meanwhile, social experiments have been observed. More than 500 cities among 1,718 all Japanese cities, new system of residential organization named "Machizukuri Kyogikais" have been adopted since the year 2000. They have similar structure and legal settings (creation by ordinances) with Neighborhood Councils in US and Canada, umbrella-organization, comprised of many associations such as PTA, senior clubs, social workers etc. approximately in each elementary-school boundary. It is considered the "urban devolution", a paradigm shift in urban governance.

Compared to US Neighborhood Councils such as ones in Tacoma (Washington), Birmingham (Alabama) of which focuses are apprehend as "advocacy" to their cities, Japanese Machizukuri Kyogikais put focus on "urban service delivery" by residents. Most of them works for creating or maintaining grassroots-level urban services: collective activities for watching over isolated elders (special luncheon meetings: "Lively Saloon"), as well as for watching over "kids' walk to/ from schools" by residents).

Focus of this presentation is "how paradigm shift is closely combined with residents' collective action", and "on what kind of social basis the designs of approved neighborhood organizations are set. Comparison-study on Neighborhood Councils of Tacoma and Birmingham in US and Machizukuri Kyogikai of Hiroshima(Japan) will be explored by analyzing the institutional structures and social functions for grasping the coherent aspects and feathers of them. This presentation will be tried for questing ideas and ways for social functions of "neighborhoods", "communities" in aging societies.

Youth and Pentecostal Identity: A Case Study on the Periphery of Rio De Janeiro - Brazil

This paper aims to present a form of specific identification, which we call the "assembleiana youth identity," which invokes a "classical" Pentecostal symbology, tracing the centennial trajectory of its church Assembly of God. It is the second

oldest Pentecostal church in Brazil and the first in number of followers - if affirming as a kind of resistance to the so-called "postmodern" identities, marked by fluidity and multiplicity. The research originates from a case study with members of a Pentecostal Assembly of God (age 14-24) located in São João de Meriti, in the city of Baixada Fluminense, metropolitan region of Rio de Janeiro, Brazil. Such identity is visible by two main characteristics: the (negotiated) observance of so-called uses and customs - which come from a whole theological tradition, but are more visible in the clothing and habits of daily life - as well as resistance to values considered as "temporal (mundane)", which is a category constructed from the opposition of what is "God (sacred)". This identity encourages young people to establish their diverse forms of sociability among the believers separated from the "world" but together in the "body of Christ." However, it differs from what I called an "Assembleiana identity", since it intends to dialogue with the specific characteristics of the youth condition of the Brazilian popular social class, trying to deal with the difficulties and typical dilemmas of this group, but without marking its identity according to the precepts of the previously mentioned church. The methodology used in this paper was a combination of in-depth interviews, participant observation in religious cults and a survey of the church's youth members.

GRANT, JUDY (University of Toronto)

Gendered and Racialized Violence: Financialization, Primary Accumulation, and Global Consolidation of Illegal Economies

Part I of our analysis flows from grass roots community praxis with women/ women-identified involved in illegal economies (sex workers, youth exploited in the domestic sex industry, and drug traffickers). Following Bhattacharyya (2005), we argue that financialization has facilitated global consolidation of illegal economies, which in turn are constitutive of 'legal' economies. Materially, this occurs through the proliferation of unregulated trading venues, dark pools, and global laundromats. Laundered money is a source of primary accumulation organized through white supremacy (including the international banking systems), and like primary accumulation in earlier phases of capitalism, represent perniciously violent, gendered, and racialized forms of accumulation. Within the financialized economy, the city itself is a source of accumulation, the speculative real estate market requiring enclosures of public infrastructure, including public housing, and expulsions of the most marginalized communities from prime property that trade on the speculative real estate market (which is itself a site of money laundering). This is accomplished via militarized policing, racialized surveillance, imperialist borders and mass incarceration, inspiring the term militarized financialization (Magnusson, 2015).

Amidst the dystopic urban landscapes of militarized financialization springs hope. Part II of our paper outlines strategies that prefigure alternative futures organized through urban anarchist tactics that reclaim urban spaces from global financialized imaginaries. In times of crises, community self-defense programs are initiated by the very people against whom the capitalist state has waged a war. Our paper outlines key strategies of anarchist communities/social movements and how they negotiate access to health care, organize food sovereignty, negotiate police state violence, and actively dismantle hierarchies organizing subjugation. Our paper is grounded in our own grass roots work.

Black Middle Class Positionality in the Cohabiting Setting: Perceptions and Experiences of Intimate Relationships

Black Middle Classness and Intimacy: A Coloured Perspective

Existing literature on the Black middle class primarily emphasise the emergence and growth thereof; its relation to spending and affluent lifestyle; and the issues of consumption and debt. However, literature rarely reflects on the inter-sections of class, race, gender, and the notion of intimacy. The Coloured community is of particular interest here as the historical racial group drawback of this group of people is the focus of political efforts to transform post-apartheid society (Southall, 2013:2).

The research explored the perceptions and experiences of unmarried Coloured middle class women and men in heterosexual cohabiting relationships. It illustrated the daily lived experiences, gender role-functions, and intimate relationship dynamics of these women and men. Furthermore, the study focused on acquiring knowledge about what factors could contribute towards relationship success or failure, and how gender roles were determined and played out in these relationships. In order to achieve these aims, a qualitative methodology was used. A total of 20 semi-structured, in-depth interviews were conducted with 10 women

and 10 men living with their intimate partners. The data collected from these interviews were then analysed through thematic content analysis.

Central to the study was the perceived precarious nature of the Black middle class position and how this may affect the personal lives of couples. Thus, the anticipated result was that class position or socio-economic status would play a significant role in the upkeep of these intimate relationships. Moreover, unemployment would result in gender role interchangeability, in which the jobless and thus homebound partner is then forced to assume the domestic role. However, the results gathered revealed that job or financial precariousness was in fact not the most prominent relationship-threatening factor, and gender obligations remained unchanged regardless of circumstance.

Socio-Economic and Intimate Experiences of the South African Coloured Middle Class Community

A Closer Look at Couple Well-Being: The Link Between Socio-Economic Positionality and Relationship Success for Coloured People

A healthy relationship is synonymous with resiliency and longevity thus couple well-being plays a significant role in relationship sustainability and success. Intimate experiences in cohabiting spaces shape the emotional and cognitive wellness of couples and of individuals in relationships, which in turn influences their living situations. The research demonstrated the relationship dynamics and intimate experiences of 20 couples, exploring the impact that socio-economic positionality had on their personal well-being and the maintenance of their relationships. A qualitative methodology was utilised to accumulate this data from 10 women and 10 men in intimate cohabiting relationships. The data collected from these semi-structured, in-depth interviews were then analysed using thematic content analysis.

The study focused on Coloured women and men in heterosexual relationships who were unmarried and cohabiting in a Black middle class context. The objective was to investigate how many of these women and men reported successful relationship maintenance regardless of negative factors such as conflict and gender inequalities within the cohabiting setting. The research also aimed to gain an understanding of the ideologies that these couples had about factors that contributed towards relationship issues, socio-economic positionality being one of them.

The results provided insight into the lives of these couples, in order to establish how conflict and negative experiences can affect couple well-being and relationship success. Living situations based on socio-economic positionality influenced intimate and gendered experiences immensely. Finally, a list of relationship-sustaining factors was presented in the study as an intervention strategy to help promote couple wellness; these served as contributions towards the process of 'relationship healing' not only for the couples in the study, but for all couples alike.

Children's Agency and Vulnerability. Theoretical and Empirical Considerations Concerning Child Well-Being Research

With respect to the new children and childhood studies (CCS), this contribution deals with the relationship between the concepts of agency and vulnerability in child well-being research. In the sense of CCS, children are social actors of their own living environment and so subjects and not objects of research. Thereby, the key position of agency was intended «as a contribution to the social emancipation of children» (Esser et al. 2016, p. 3). In the contemporary works on and about the concept of agency, the anthropologization and ontologization of the children's status as actor is criticised – and the paper joins this criticism: It is problematic to take children genuinely as autonomous and independent subjects, equipped per se with the ability to act. In this view, social conditions of childhood and of the possibility of 'agency' would receive less attention (Wihstutz in Esser et al. 2016, p. 62). Accordingly, «the physical, material and emotional dependencies of children» and thus «a relational and dynamic connection between social actors and specific contexts» (Prout cit. in Wihstutz 2016, 62f) should be systematically taken into account. An exclusive orientation along subjective perspectives of children, who are considered as strong, cannot serve as sole criterion for research on child wellbeing. Therefore, the paper connects the strong term of actor with the concept of vulnerability and discusses the contribution of this approach to child well-being research. We will focus on the following questions: How do social conditions, emotional relations and the material and economic environment affect children's agency and bring up potential vulnerability? In which way are children able to act in vulnerable situations?

TG08-1009.3MAGYAR-HAAS, VERONIKA* (*University of Zürich*)*Fear – Rage – Indignation. Analysing Right-Wing Movements*

Sociological diagnoses formulated in the last decades, that even in economically powerful, prosperous Western societies the social inequality is continuously increasing. Through the constantly widening gap between rich and poor not just people from the underclass but even from the middleclass have the feeling of being disadvantaged. According to such scientific analyses and medial representations, they feel *fear*: they don't feel safe, they feel limited in their self-development and opportunities for social advancement (Bude 2014).

With this feeling the new right movements, like the 'identity movement' in Austria or 'Pegida' in Germany, as well as right-wing populist parties legitimate their rejection, rage and resentments against refugees and migrants. The German sociologist Ulrich Bröckling (2016) argues, that it is the affect of fear as well as of fear-communication, which immunises against facts. Rhetoric of fear works with several scenarios of threats.

With respect to approaches in sociology of emotions, the feelings of fear and rage, produced by populist talks, will be put in relation to each other. Then, the paper outlines conceptual differences between rage and indignation. Against this backdrop, strategies of medial and populist generation of fear will be analysed. It will be asked, which forms of social indignation and countermovements to populist trends can be observed. The emotionalised dealing with questions of identity serves as a core aspect while analysing left- and right-wing social movements: Which kinds of identities and belongings will be valued, adjoined, and rejected? In order to handle these questions, the contribution refers to findings about post-identity protests (Marchart 2004).

RC24-463.4MAH, ALICE* (*University of Warwick*)*The Fiction of Closed Systems: The Circular Economy Discourse of the Global Petrochemical Industry*

Despite efforts to improve its environmental reputation, the global petrochemical industry remains a significant source of toxic pollution. This research focuses on two global integrated petrochemical clusters: 1) Nanjing, China, the second largest in China, with weak regulations and high pollution levels; and 2) Antwerp, Belgium, the largest in Europe, with comparatively strong regulations and low pollution levels. The research draws on qualitative interviews with petrochemical representatives, site tours, and analysis of corporate documents conducted between 2016 and 2017. Despite stark differences in regulations and risks, multinational petrochemical companies in Nanjing and Antwerp share a common corporate discourse of the 'circular economy'. The 'circular economy' is a sustainable business model based on the concept of a cyclical closed-loop system. Since the model was adopted within China in 2006 as a basis for their economic development, it has also become a buzzword within European policy.

This paper argues that the petrochemical industry's adoption of the circular economy discourse does not represent a move towards greater corporate environmental responsibility. The petrochemical industry cannot claim to have fully closed systems, whether environmental, economic, social, or spatial. Nor can the industry claim that it produces no waste, including toxic pollution. However, through invoking the fiction of a closed system with no waste, the circular economy discourse draws an artificial boundary around each petrochemical site, displacing corporate responsibility for toxic leakage. The idea of the circular economy superficially resonates with the model of integrated petrochemical clusters, which concentrate petrochemical producers and related industries next to logistics networks, with the aim of more efficient production. Integrated petrochemical clusters operate like securitized city-states, with their own border controls, fire brigades, medical staff, contractor villages, technological infrastructure, and waste processing systems. Spatially, they appear closed off, yet they are deeply interconnected with their surrounding environments.

RC48-805.2MAHALI, ALUDE* (*Human Sciences Research Council*)*Burning Tyres and Rubber Bullets: The Dystopic Policing of University Students in South Africa's Fallist Movements of 2015-2016*

South Africa has a sordid history of institutionalized, legislated and racialized state-enforced violence, police brutality and militarization. Historically the national police functioned as agents of intimidation and guardians of white supremacy that had at the end, black targets and victims. Some 24 years after democracy,

permutations of this mentality persists. 2015 and 2016 were volatile and transformative years for South Africa's higher education institutions, catalysed in part by student protestor, Chumani Maxwele hurling faeces at the statue of Cecil John Rhodes that stood at the centre of the University of Cape Town. Maxwele's performative act, motivated by persistent concerns around systemic violence and structural inequalities in higher education and society, set in motion the #RhodesMustFall campaign culminating in the overarching #FeesMustFall movement. Universities nationwide experienced shutdowns and unprecedented mass protest action against imminent fee increases. The term "fallism" became a way to identify the shared aims in the movements' political philosophies, both as a literal description of the collapse of the statue and the whiteness it upholds, but also as a call to dismantle all the oppressive vestiges of colonialism that have no place in contemporary life. Worryingly, the student protesters were met by university mandated armed private security and police officers responding to protest action through uncalled-for and racialized violence. Indeed violence, vandalism, looting and hate speech were existent within the movements from its start but many of these tactics were strategic uses of violence that attempted to show how collective emancipatory civic action could fight injustice. Disturbingly both the university and the state's response to young people and, in particular, black young people protesting was violence, fear-mongering, taunting and other forms of intimidation. This paper examines the dystopic policing of young people's protest action and their tactical rejection of a history of policing inherited from a horrific past.

RC12-245.9MAHAN, MARGO* (*University of Michigan*)*The Racial Origins of U.S. Domestic Violence Law*

My research challenges conventional accounts about the historical origins of U.S. domestic violence legislation. Since the proliferation of early wife-beating laws (1870-1900) coincided with first wave feminism, scholarship assumes that they were the result of feminist agency and borne out of a desire to protect women. These assumptions have led to two important limitations in domestic violence scholarship. First, most scholarship focuses on the U.S. North, where first wave feminism flourished. Second, even when research considers the effects of other social factors, such as race and class, it foregrounds the effects of feminist agency. Both limitations are troubling because the first state to legally rescind a husband's right to chastise his wife was Alabama, whose 1871 *Fulgham v. State* ruling was also the country's first in which the litigants were black. In fact, anti-wife-beating laws proliferated throughout Southern U.S. states where, like Alabama, there was neither a feminist movement, nor female collective action against wife-beating. The key questions I investigate are thus: *What were the social conditions in which wife-beating laws emerged in the nineteenth-century South? What do these conditions reveal about the primary functions of these laws?* Based on analysis of 19th-century legal and government data, local and appellate case records, federal reports, Freedman's Bureau documents, periodical data, and family records, I argue that, in contrast to the feminist narrative, U.S. Southern wife-beating laws were a white supremacist post-Civil War response to the legalization of black family formation. They functioned to control black labor and degrade the status of blackness. Situated at the intersection of the sociology of law, political economy, criminalization, race, and gender, my research reveals how racial projects to symbolically and materially privilege Whiteness motivated the emergence of "feminist" laws that scholarship and social policy largely conceptualize as apart from race, class, and market forces.

TG04-975.1MAHER, JANEMAREE* (*School of Social Sciences, Monash University*)FITZ-GIBBON, KATE* (*School of Social Sciences, Monash University*)WALKLATE, SANDRA* (*Professor*)MCCULLOCH, JUDE* (*School of Social Sciences, Monash University*)*Gendering Risk and Responsibility: Mothering in Violence*

Family violence is globally recognised as a gendered issue with women the primary and predominant victims. There is increasing attention to the impacts on children as victims of such gendered violence and increasing knowledge about the undermining of mothering as key aspect of gendered family violence. In this paper, using data from a recent Australian project exploring adolescent to parent violence and child protection death reviews, we examine how concepts of gendered risk and responsibility intersect when mothers are caring through and in violence. We argue that such punitive responsibilisation should be understood as an extension of the gendered harms of family violence and of the risks that women may face when they disclose family violence. Mothers are more often blamed than supported to take up or carry out their caring when they themselves are experiencing violence. This paper seeks to contribute to contemporary challenges to pre-existing accounts of risk as unitary, by emphasising the centrality of gender in understanding risk.

RC22-424.1MAHIEDDIN, EMIR* (*Religion & Society Research Centre*)*Latin-American Charismatic Christians in Stockholm (Sweden)*

The Latin-American diaspora has been present in Sweden for almost 50 years now, starting with the arrival of thousands of Chilean refugees after the fall of Allende in 1973, and it is constantly renewed by new flows of immigrants. The stereotype goes this group would only consist in atheist leftists, and there are just a few studies focusing on their religiosity, usually limited to the Chileans (50% of the Latin-Americans in Sweden). However, in suburban Stockholm, this diaspora is living a vivid time of revival, counting more than 4000 "evangélicos" gathering in successful Pentecostal and charismatic migrant-churches that remain invisible in media in spite of their success. A new generation of Latin-american evangelicals has emerged, determined to radically change not only their city, Stockholm, but the global spiritual landscape at large.

This paper will present ethnographic data gathered in an on-going study of these Latin-american charismatic Christians in the urban landscape of Stockholm. It will focus on the ethical and spiritual life they develop in these congregations, as well as on the social work the latter implement in order to answer their specific needs.

This groups are interesting for they have to build their subjectivities at the cross-road of several minority conditions: they are evangelicals in a Latin-american diaspora mainly characterized by Catholicism and atheism; they are believers in one of the most secular countries in the world; they are immigrants from the South in one the most developed countries in the North. The author will try here to analyze the kind of subjectivities that results from this entanglement.

RC57-935.3MAHMOOD, QAISAR* (*International Islamic University, Islamabad, Pakistan*)ISHAQ, MUHAMMAD (*Sociological Association of Pakistan.*)*Facebook Use in Higher Education of Pakistan: Prospects and Challenges*

Facebook, a leading Social Networking Site (SNS), is considered as an established global platform for communication among students and teachers in higher education institutions. The students can develop social ties, sustain existing relationships and can utilize it for learning purpose as well. However, its use for formal academic purposes remains contested. The proponents of Information and Communication Technology for Education (ICT4E) recognize its potentials and argue about its effective integration in higher education environment for enhancing students' formal and informal learning. Primarily, this study outlines educational potentials of Facebook at higher education level that how it is being used by teachers and students for academic and learning purpose in the different parts of the world. Secondly, the current study discusses the challenges in implementing such uses of Facebook in Pakistani context.

RC09-182.9MAHMUD, HASAN* (*Northwestern University in Qatar*)*Local Ambition, Global Action: Qatari Foreign Aid*

Qatar has taken a lead in boasting foreign aid despite tremendous skepticism about aid nowadays. With the rapid growth in foreign aid over \$2 billions in 2015, Qatar has surpassed many of the traditional donor countries, and thereby, left its mark in the global field of international development and humanitarian activism. This study explores the structure and function of Qatari Foreign Aid. Focusing on two cases of Qatari foreign aid to Japan and Comoros, this study compares Qatari foreign aid with those of the traditional donor countries and recognizes its uniqueness. By focusing on Qatari foreign aid towards Developed countries like Japan and the US, it finds cultural exchange as well as humanitarianism to the list of motivations of the donor countries in sending foreign aid. It concludes by making comments on how Qatar approaches foreign aid as a way of enhancing its national image of a global actor while helping those in need of support regardless of their position in the world.

RC09-194.4MAHMUD, HASAN* (*Northwestern University in Qatar*)*Migrants' Remittances & Development: A Critical Appraisal*

Remittances- or the money international migrants send home- has been touted as an alternative source of development fund for many origin countries of migrants in the Third World. Over last three decades, the belief in 'developmentalism' gave way to 'globalization' with replacing the nation state by global free market as the most efficient driver of economic growth in the developing world. Moreover, the flows of Official Development Aid (ODA) and Foreign Direct Investment (FDI) in the developing countries consistently declined. In this circumstance, the World

Bank and other international organizations recognize migrants' remittances as an alternative to the ODA and FDI due to its sheer size, which is more than three folds of ODA and FDI and its continuous growth. After three decades of optimism about the developmental outcomes of migrants' remittances, success stories of economic growth by utilizing remittances in migrants' origin countries are extremely rare, if not nonexistent. By placing the migrants and their remittances in the larger context of 'Third World Development', this paper explores the relationship between development and migrants' remittances with a particular emphasis on remittances utilization. The main objective of this paper is to critically examine the developmental potentials of migrants' remittances and the role of the migrants in bringing about developmental outcomes. It also raises few theoretical questions regarding structure and agency to highlight plausible reasons of the absence of success cases of development by migrants' remittances. Finally, it concludes by calling for assessing the idea of development through migrants' remittances with sound theoretical frameworks and rigorous empirical analysis.

RC32-JS-61.1MAHON, RIANNE* (*Wilfrid Laurier University*)*The OECD, the World Bank and Transnational Care Chains*

Transnational care chains can be seen as a 'wicked problem', i.e. one that requires co-ordination across a range of jurisdictions. Yet IOs, like other bureaucracies, factor problems. Although this is designed to make issue more manageable, it can also inhibit the organisation's ability to grasp, and therefore to deal adequately with, wicked problems. My paper examines the way policy research conducted in different parts of the Organisation for Economic Cooperation and Development (OECD) and the World Bank manages to capture pieces of the chain but is unable to see the connections between them.

TG08-1012.3MAHROUSE, GADA* (*Concordia University*)*Examining Inspirational Narratives of Refugee Success*

In his address to the United Nations 2016 *Leaders' Summit on Refugees*, Canadian Prime Minister Justin Trudeau told the story of the Hadhads who established a successful business within a year of coming to Canada as Syrian refugees. The epitome of their success was demonstrated not only in the fact that they are now employing 30 Canadians. In his speech, Trudeau urged that "we have to recall stories like this one when we're trying to think of solutions to help the 65 million displaced persons worldwide". Trudeau's speech was a clearly an attempt to set Canada apart from the fear, panic, anxiety and insecurity with which many in the Western world have reacted to the "refugee crisis" (Bauman 2015). With the example of the Hadhads, Trudeau not only challenges the notion of refugees as threats, he presents their success as inspirational. Yet, as critical refugee scholars have argued, it is an uncomplicated variation on the "from rags to riches" stories constituted by notions of rescue and liberation (Nguyen 2013; Lê Espiritu, 2014). Sympathetic groups and individuals who see themselves as in solidarity with refugees, or who simply want to assist and welcome them, are increasingly putting forward similar narratives about refugee inspiration and success.

The focus of this essay is this type of humanitarian narrative of refugees as inspirational. The theoretical framework used emerges out of several overlapping bodies of literature. First and foremost are studies that have interrogated the notion of the "good", "freed", and "reformed" refugee showing that it becomes a substitute for the "war enemy" (Lê Espiritu, 2014) and is used to juxtapose the "bad" economic migrant (Szczepanik, 2016) and critical work that has made links between the figure of the good refugee alongside notions of success and gratitude (Nguyen 2012).

RC04-93.12MAIER, TOBIAS* (*Federal Institute for Vocational Education and Training*)*Advanced Vocational Education and Training or Higher Education Bachelor Degrees – What Is the Preferred Choice in Recruiting Project Leaders for Employers in Germany?*

Since the Bologna reforms, we see a strong increase of students in higher education and at the same time a reducing number of pupils in the highly standardized system of vocational education and training (VET) in Germany. Apprentices in the VET system receive to an equal part training in vocational schools and within an establishment with which they sign an apprenticeship contract. After the apprenticeship they can further participate in advanced educational training programs (ISCED 6) to gain a master-craftsmen- or technician degree (regulated on (federal) state or regional level) to fulfill higher skilled tasks or manage people in the production process.

Persons with a bachelor degree also have an ISCED 6 qualification level. However, the study content of a bachelor-program is solely decided by the corre-

sponding university (of applied science) and due to a missing practical focus and no employment contract with an establishment, students have less occupation specific work experience by the time they acquire their certificate and they also have no access to the internal labor market. An increasing amount of younger people therefore enroll in study programs in universities of applied science, which offer bachelor degrees organized by the principle of the VET-system, with a large amount of time spent in companies.

In my paper, I will present a choice experiment, conducted with managers in establishments, where they have to choose between three candidates to be leader of a larger project. In the experiment, I vary the degree (advanced VET, Bachelor degree with practical experience), location of training, grades, location of work experience and subject of specialization. I can show that establishments see a larger utility in choosing persons with advanced VET-degrees due to their clear signal, whereas they ascribe persons with bachelor degrees the same utility values only if they trained them within their company.

RC04-99.5

MAIER, TOBIAS* (*Federal Institute for Vocational Education and Training*)

MERGENER, ALEXANDRA* (*Federal Institute for Vocational Education and Training*)

Labour Market Transitions of Bachelor Graduates in Competition with Workers with VET Certificates

Both the reform of the European university system with the implementation of bachelor and master degrees (Bologna reform) and the general increased supply of academics are changing the structure of workforce entering the German labour market. Even though Germany is still known for its national vocational education and training (VET) system with common quality standards, university graduates could constitute an option for substituting workers with initial or further VET certificates. This is especially conceivable in occupations in which, due to the knowledge imparted, persons with a variety of formal qualification levels would be suitable.

Hence, this paper intends to analyse labour market chances of bachelor and master graduates in competition with workers with initial or further VET certificates in different occupations with varying requirements. Thereby, we focus on the recruitment behaviour of employers by complementing an establishment panel with a follow-up factorial survey. Stratified by eight occupational groups, personnel decision-makers evaluate for one occupation possible recruiting situations described in vignettes. By experimentally varying the requirements of the occupation specific vacancy, the characteristics of the applicants (such as certificate and experience) and recruiting situation in general (number of applicants), we are able to identify which training curricula's are preferred for certain tasks by employers.

The research project broadens the discussion about labour market transitions processes by adding a quantitative inter-occupational study on the company preferences regarding formal vocational certificates when performing external recruitment. By this, we are able to present new results in a previously sociologically unexplored field that can directly applicable to the German labour market (because of the specific national database). Furthermore, these results are also transferable to other labour markets with similar structures.

MAIR, HEATHER* (*University of Waterloo*)

Representations of Revitalization: Rural Tourism in Popular Media

Building on a growing body of critical scholarship seeking to investigate the relationship(s) between rural places, tourism, and popular media (e.g., Andersson & Jansson, 2010; Jonasson, 2012; Mordue, 2009), the paper extends the discussion into representations of rural revitalization by presenting the results of an assessment of "Still Standing", a popular Canadian reality television series now in its 3rd season. In particular, I consider the ways notions of rural development and revitalization are signified and symbolized in the show and explore the implications thereof. The show chronicles the experiences of Jonny Harris, a comedian/tourist who travels to rural communities that are "on the ropes" but have learned to "laugh in the face of adversity" (<http://www.cbc.ca/stillstanding>). After spending about a week in a pre-selected community, Harris writes and performs a stand-up comedy routine for community members. The television show features the stand-up routine as well as footage of the area and Jonny's interviews with select community members. Although much of the material is humorous, there is a clear narrative highlighting efforts undertaken by residents to overcome a variety of social and economic challenges faced by their communities. Relying on past research exploring tourism and imagery, I use a critical discourse analysis approach to highlight how the show represents and reinforces a (typically) services-led approach to rural revitalization, which includes tourism, and which has deep implications for power relationships and for considering alternatives. The presentation ends with a re-imagining, following Edensor (2006, p. 489) who notes, "dramatizing the rural on screen and in fiction involves the citation of a stock of rural characters and settings that can be mobilized in the imagining of

multiple ruralities". I ask whether popular media could be mobilized to present different imaginings about what rural development and revitalization through tourism might entail.

Horizontal gender-related segregation and the barriers that women face to access, maintain and promote in the occupation of mechanic in the sale, maintenance and repair of motor vehicles subsector in Spain

It is important to highlight the scarce presence of female workers over decades in most occupations of the industrial sector and the automotive subsector, among others. In Spain in 2016 only 25,6% of the workers were female in the industrial sector and only 11,6% in the sale, maintenance and repair of motor vehicles subsector, and most of them were in administrative posts or were saleswomen. Moreover, in the European Union in 2016 the female employment rate was a bit higher in the industrial sector, 29,3%, and in the sale, maintenance and repair of motor vehicles subsector, 15,6%. According to the EUROSTAT data there is an important underrepresentation of women in the sale, repair and motor vehicle subsector in all member states of the European Union. Therefore, it is important to identify the different factors and barriers that still reproduce horizontal gender segregation in the occupation of mechanic in the subsector. So this paper studies the characteristics of this subsector and its labour market in Spain and the European Union, and the different forms of resistance of male employers and workers to the access, maintenance and promotion of female workers to the analysed occupation. Sometimes these forms of resistance acquire the form of direct or indirect discrimination or sexual or gender-related harassment.

Los Acuerdos Marco Globales: Sentando las Bases de la Negociación Colectiva de Ámbito Supranacional

En la actualidad existen más de doscientos acuerdos marco globales (AMG) firmados entre empresas transnacionales y federaciones sindicales internacionales. Los AMG proliferaron de manera importante en los primeros años del siglo XXI, en los que se han realizado la mayor parte de ellos. En general, estos acuerdos suelen abordar el cumplimiento, por parte de las empresas transnacionales, en su cadena de valor, de las normas fundamentales del trabajo establecidas por la Organización Internacional del Trabajo. No obstante, hay que destacar que determinados AMG incluyen también disposiciones sobre el empleo, los salarios, la jornada laboral, la salud y la seguridad laboral o la formación, lo que los aproximan a un convenio colectivo. Sin embargo, no son convenios colectivos internacionales, puesto que no tienen un marco regulador. Las organizaciones sindicales han adoptado los AMG como formas imperfectas e incompletas de instrumentos de negociación colectiva y relaciones laborales transnacionales, como una pieza clave para allanar el camino y sentar las bases de la eventual institucionalización de éstas y de una mínima regulación del mercado laboral a escala internacional. Mientras, las empresas no los conciben como resultado de un ejercicio de relaciones laborales y los circunscriben al ámbito de la responsabilidad social empresarial, junto con los códigos éticos. Por otra parte, existe cierta polémica entre los juristas y los expertos al respecto, aunque la mayoría los etiquetan como normas de responsabilidad social empresarial. En esta comunicación analizaremos la emergencia y las potencialidades de los acuerdos marco internacionales, un instrumento que ha aparecido en el campo de la Responsabilidad Social Empresarial como consecuencia de las reivindicaciones y las presiones de los sindicatos. De esta forma, las organizaciones sindicales pretenden invertir las iniciativas de responsabilidad social de las empresas, que entienden como una estrategia empresarial en aras de debilitar a los sindicatos y la negociación colectiva.

Values, Rights and Power in Accessing Comprehensive Sexuality Education By Young Adolescents in South Africa

The UN Child Rights Convention identifies the right of children to survival, healthy development and information as key to children's health and wellbeing. The 1994 International Conference on Population Development gave new impetus to governments to develop strategies that protect the right of adolescents to information and access to sexual and reproductive health (SRH) services. Comprehensive sexuality education (CSE) for adolescents was identified as central to such strategies. Adolescents' SRH concerns in South Africa have increased

raising questions about the appropriateness of sexual education for adolescents. This paper reviews policy assumptions and cultural, rights and power-related factors influencing sexuality education.

A cross-sectional survey using a questionnaire (n=748) and focus group discussions among a sample of adolescent learners aged 10 to 14 years were used to collect data in eight rural schools in Mpumalanga province, South Africa. The topics covered were adolescents' living arrangements, puberty, sources of information about puberty and SRH needs. Survey data was captured and analysed using SPSS and STATA software. Qualitative data was analysed thematically. Critical literature review including of policy assumptions and implementation on sexuality education for adolescents was conducted.

About 54.1% of the sample were girls and about two-thirds (73.1%) were aged 10 to 12 years. Some of the respondents lacked knowledge about puberty. Mother was the most important source of information on puberty. Mother, school teacher, own sister, health facilities and personnel were identified as important sources of information on puberty and SRH. Those who visited health facilities reported that they saw communication materials on contraceptives, abortion, had a talk about contraception or requested contraceptive. Only 24% of the participants visiting health facilities reported that health personnel talked to them about puberty. Young adolescents' most important sources of sexual education are unlikely to provide them with CSE. Current information material do not cover puberty.

MAKSHANCHIKOV, KONSTANTIN* (*National Research University "Higher School of Economics"*)

Keep Calm and Do Sports: Demonstrative Consumption and the New Role of Sport Industry

According to polls, the share of the individuals who are regularly playing sports in 2017 has made 24%, in general play sports of 75% of the population (VCIOM). Statistical data illustrate trends to growth of number of the individuals involved in regular and periodic trainings by physical culture and sport, and to reduction of number not playing sports.

However, in the paper we note that the increasing popularity of the state programs connected with development of the infrastructure intended to sports activities change of formats and patterns of sport consumption.

Growth of the epidemics of obesity and diseases connected with insufficient physical activity belonging to the leading causes of death of adult population has drawn attention of researchers to health issues and welfare of citizens, and development of sport and creation of the conditions providing an opportunity for citizens of a message of healthy life style became one of important aspects of policy of the majority of the developed countries.

At the same time, considerable means leave on construction new and on modernization of the existing sporting venues, the state programs aimed at the development of physical culture and mass sport are developed.

We determine the model of making decision on sports, planning of expenses on occupations, the accompanying goods, such as uniform, stock and underline that people now consume not only a process of doing sports itself but also the phenomenon of demonstrative consumption take place: people purchase of a uniform, download photos in social networks, visit city sport open spaces and fulfill the space with new meanings, such as networking space.

The theoretical frame explaining motivation of individuals to sports activities and also communication between them is presented. The model of participation of people in sport on a fundamental basis is made.

MAKSHANCHIKOVA, ALYONA* (*National Research University "Higher School of Economics"*)

Migration of Urban Middle Class to Rural Areas: The Era of New Mobility

The paper is devoted to tendencies towards de-urbanization, migration of urban population outside the city and includes the consideration of a role of mobile technologies in development of process of a de-urbanization. The critical problem points of large cities, combined with technological progress, lead to the emergence of new formats of work, life, leisure. The communication and information exchange at great distances is simplified, and the spread of new forms of the life outside the city appear. The research attempt to reveal the phenomenon of migration of the urban middle class and shows the way to determine mobile technologies inside de-urbanisation trend. The theoretical framework of the research is based on the concepts of modern theorists: "mobility paradigm" by J. Urry, "hot and cold media" by Marshall McLuhan the concept of "cellular globalization" by N.E. Pokrovsky. The empirical basis of the work is the result of applied field research using qualitative interview methods and content analysis of materials from Internet sources and blogs, devoted to drawing the image of the phenomenon of "life at 2 houses" or "life out of the city" in Russian socio-political media. As a result, the typology of the attitude of settlers from the city to small settlements to the means of modern infocommunications is presented.

MAKSHANCHIKOVA, ALYONA* (*National Research University "Higher School of Economics"*)

Mobile Technology Consumption: The Lifestyle in the Era of New Mobility

The critical problem points of large cities, combined with technological progress, lead to the emergence of new formats of work, life, leisure. The paper is devoted to the new way of mobile technology consumption as a alternative lifestyle in rural area residents and includes the consideration of a role of mobile technologies in development of process of a de-urbanization.

The divergence between system and the vital world is counterbalanced with a certain humanization of a workplace of workers, does not erase sources of class, administrative, information inequalities.

Thus, we note that the person of the megalopolis is in a condition of systematic saturation by information and social communications. We underline the "colonization" of those spheres of the vital world which primordially were considered as exclusively private - family life, life, leisure, experiences. We see the trend of transferring of a part of life and work to rural areas.

We assume that the way of consumption of infocommunications become a certain track in making decision on formation of new lifestyle out of the urban environment. The key research question is raised as follows: what a role of modern infocommunication technologies in the organization of life and the leisure moving from the city to rural settlements?

As the key messages of the paper we select the following theses:

- technical progress promotes degradation of borders of personal and working hours and space;
- the new way of mobile technology consumption support the de-urbanisation trend;
- the transterritorial perception of a workplace and the residence.

Also, the typology of the consumption patterns of means of modern infocommunications by rural settler is presented.

Struggling with Stigma: LGBTQ+ Student Mental Health Service Use across American Post-Secondary Institutions

Colleges and universities across America are experiencing a spike in the number of students seeking mental health treatment. However, few studies have examined how stigma and academic stress influence differences in mental health service use between LGBTQ+ students and their heterosexual peers. LGBTQ+ students exhibit higher rates of mental health problems including anxiety, depression, suicidal ideation and attempts, when compared with their heterosexual peers. These disparities are understood to be a function of the excess stress, discrimination and victimization that LGBTQ+ individuals experience as a result of their potentially stigmatized identity. This research combines data from The Healthy Minds Network Survey with The Integrated Post-Secondary Education Data System to conduct covariance and multiple-regression analysis for student group mental health and treatment use. Utilizing 35,385 domestic and international student surveys from 56 schools, this research demonstrates that students who self-identify as a sexual minority are more likely to use on-campus mental health services than heterosexual students. A number of factors relating to attitudes, beliefs and knowledge of resources are also found to be strongly associated with different help seeking behaviors between these student groups, suggesting that the contextual perceptions of students have real consequences for their mental health service use. Findings from this research reveal critical barriers impeding the efficacy and accessibility of post-secondary mental health services for LGBTQ+ students in the United States.

The 'Dialectics of Liberation' in Herbert Marcuse and Joseph Gabel: Beyond One-Dimensionality and the Reification of Time.

In this paper I want to show the liberatory affinities between the dialectical thinking of Critical Theorist Herbert Marcuse and the forgotten French Marxist critical theorist Joseph Gabel. Both thinkers view of the 'dialectics of liberation' have roots in their implicit dialogue with Lukacs' notion of reification and the *spatialization of temporality* under capitalism – for Marcuse the world of one-dimensional thought. Marcuse's dialectical/critical thinking tries to re-connect and transform the 'fragments' of experience, *the personal catastrophe of subjectivity defined by instrumental/colonial 'reason' under capitalism, into a multi-dimensional subjectivity*. Joseph Gabel, who was trained as both a psychiatrist and a Marxist social/critical theorist, drew on Lukacs, Mannheim, and the psychiatrists Mikowski and Binswanger to draw parallels between the reified or frozen, a-historical temporality of those suffering from schizophrenia, and political ideologies - both

racist and capitalist - that reflected a deranged and reified view of the world. Gabel had discussed the deterioration of lived experience in the reified world. This is what we are experiencing now in the Trumpist phase of the neoliberal era. In the paper I look at how Gabel's work compliments Marcuse's dialectical thinking and how both contribute to the transformation of an alienated, one-dimensional subjectivity into a multi-dimensional subject still struggling to emerge, in the social movements and elsewhere, from amidst the socio-psychoic devastation of the reified, one-dimensional world of neoliberal capitalism.

Institutional Representations and Professional Aspirations of Cadets in Portuguese Military Academies

Institutional representations and professional aspirations of Cadets in Portuguese Military Academies

This presentation focuses on institutional representations and future career perspectives of on Portuguese military academies cadets. The study includes cadets from three branches of the Armed Forces (Army, Navy and Air-Force) and the National Gendarmerie. It draws on first results of an online survey conducted to all cadets in 2016 in the framework of a research project led by the Research Center of the Military University Institute (CIDIUM) and based on a civilian-military partnership.

It addresses the issues of cadet's perceptions about Armed Forces and its participation in the international missions as well as the perspectives about a future military career in a context of significant challenges to the military profession and the role of the Armed Forces in Portugal.

The Convention on the Rights of Persons with Disabilities: Possibilities and Perils

This paper will explore the possibilities and perils of using the Convention on the Rights of Persons with Disabilities (CRPD) to advance equality for people with disabilities. It will demonstrate how the CRPD has adopted unique language that has the potential to achieve more than earlier UN treaties such as CEDAW and the Convention on the Rights of the Child. At the same time, one has to be cognizant about the limitations of engaging with law, particularly international human rights law. The processes in place operate at a very slow pace and may not necessarily be the most effective tool for advancing social justice. I propose that social movements use the CRPD strategically in tandem with other grassroots approaches to raise awareness and transform domestic law of state parties in a direction that promotes the social model of disablement. I believe that the study will show that there is recursive relationship between domestic law and the embryonic development of international disability law. However, this relationship may vary from country to country, depending on the state of domestic disability rights. One goal of this research is to develop a typology of understanding international law in countries with differing development of disability rights law.

Expose It Yourself: Sex, Lies and Sarasu

Ethnographic depictions of music fan practices in Japan have tended to highlight collective forms of participation, consumer identity formation vis a vis subcultural styles and accompanying public displays of 'fan culture' (Stevens, Dunn, Tsuda, Yano, Inoue, Seibt). While these have generated insights into the ways in which audiences relate to one another and to materials, texts and their producers, the focus on such forms of collective cultural practices have obscured some under-explored elements present in all fandoms: critique, conflict and confrontation. In this paper I examine how anonymous internet textboards are utilized by fans of Visual Kei, a form of rock music in Japan, as a space for reconstructing the boundaries of communal participation, as well as one in which self-generated content potentially undermines the careers of recording and performing artists. I will focus on a particular action, *sarasu* (to expose), that takes place on these boards in which fans seek justice, play vigilante, and debate various self-leaked scandals surrounding bands.

I situate this within the larger debate of the rise of digital capitalism and the co-opting of consumers towards the service of capitalism in which fans are increasingly re-configured as co-creators of various products through the free labor and surplus value which they 'willingly' generate in the name of enjoyment, creativity and freedom. I will argue that *sarasu* further complicates ideas about exploitation and the very idea that has come to constitute the trope of what a fan

community is itself, for the scandals generated neither clearly challenge the power of the music industry nor are they able to be subsumed by corporations into the larger creation of profit and value. I will also consider the implications *sarasu* has on leisure in terms of the potential for the internet to remain as a space for free-discussion.

MALLETTE, CAROLINE* (University of Toronto)

Go Big or Go Home: The Impacts of Patrimonialism and Sultanism on the Revolutionary Trajectories of the 2011 "Arab Spring"

Out of the nineteen countries in the Middle East and North Africa (MENA), six experienced mass mobilizations in what has been called the "Arab Spring". Among these cases where similar regime threatening protests emerged, Tunisia and Egypt saw their regimes toppled with little violence, as the army sided with protestors, whereas in Libya and Syria, a large part of the military remained loyal to the regime and violently suppressed the uprisings, leading to civil war. How can we explain these different outcomes? The 2011 uprisings in the MENA have marked the resurgence of Weber's concept of "sultanism", which has been indiscriminately used to characterize Syria, Tunisia, Egypt, and Libya. Arguing that the concept of "sultanism" is unhelpful in explaining the Arab Spring, another branch of the comparative literature has focused on the role of the armed forces. The logic is the following: since we can identify various patterns of army behavior – defection, fracturing, loyalty – within a uniform profile of sultanistic regimes, regime-type-based explanations must be abandoned. I will argue that the opposition between those two segments of the comparative literature stems from a misconception of the "sultanistic" ideal-type, mostly from the confusion between (neo)patrimonialism and its extreme form, sultanism, and the ensuing misqualification of several cases. A better understanding of this specific regime type can help move away from proximate and near tautological causes – i.e., regimes broke down where the armed forces defected – and actually explain this variation in military behavior. Indeed, it will be argued that the varying outcomes can be traced back to the sultanistic or neo-patrimonial nature of the regimes, and that sultanism is a regime type that accurately characterizes Libya and Syria, but of which Tunisia and Egypt fall short of meeting the minimum criteria.

Coercion, Contestation and Consensus: Shifting Scientific Practices in Globalizing India

Two profoundly destabilizing changes – cognitive and political – in scientific practices in India are witnessed since the World Trade Organization (WTO) provisions on Intellectual Property Rights (IPR) in 1995. Changes at the cognitive level in globalizing India occur from monovalent to polyvalent knowledge (triple helix model supersedes both traditional disciplinary boundaries and mode 2 knowledge production created in the context of application). Changes at the political level are towards a fracturing of the authority of nation-states, with consequent pressures to rethink the forms of democratic governance. The advent of the customer-funder-policymaker as a prominent element in scientific practice since mid-1990s in India and intensifying thereafter seems to have coerced scientists to contest the IPR-regulated science initially, and then (re) negotiate scientific boundaries and to do some of the delicate boundary work. The challenge for scientists is to forge an alliance between science, politics and industry demonstrating social accountability, legitimacy and relevance, but to avoid either science or politics or industry overextending into the other's territory – a prospect that is evidently disorienting and poses serious threats to idealized identities of science and the scientific community. The objective of this paper is to examine the factors contributing to the shifts in scientific practices from being a public resource to intellectual property. Through the drastic changes in science funding and policy-orientation in India since mid-1990s, scientists seem to be robustly mapping out the contours of cultural spaces for science and its practitioners. In this context, scientists included in the study are not actually in the process of (re)classifying a satisfactory version of "science" and "policy" through their work. Instead, they are engaged in multiple versions of actively negotiated science – policy boundaries, many of which seem to have different qualities and make different demands on them as researchers or scientists.

MALTHANER, STEFAN* (Hamburg Institute for Social Research)

"the Ummah Calls for Us": Forms of Orientation Towards Armed Conflicts in the Muslim World in Processes of Mobilization Among Jihadi-Salafist Milieus in Europe

When examining Jihadi-Salafist milieus in Europe, it is striking to what extent their discourse and activities, and radicalization-trajectories of individual members, revolved around violent conflicts in the Middle East and Central Asia

even long before the rise of the phenomenon of Western foreign-fighters in Syria and Iraq. Identification with the “heroic” mujahedin and solidarity with Muslim brothers and sisters abroad who suffer at the hands of “crusader” or apostate armies becomes the driving force of mobilization and gives meaning to personal experiences and grievances.

Drawing on an in-depth case-study of a jihadi-Salafist network in southern Germany, this paper examines the role of radical Islamist milieus in the West as a particular kind of global audience and reference group, and the dynamics of perception and legitimacy – but also competition for attention and support – it entails. From the perspective of Islamist armed groups in the Middle East and elsewhere, appealing to this kind of global following requires not only to draw attention and project an image of strength, but also to develop a type of messaging and notions of identity that resonate with this audience.

Potential Games and the Tragedy of the Commons

The term tragedy of the commons is widely used to describe the overexploitation of open access common pool resources. Open access allows potential resource users to continue to enter the resource up to the point where rents are exhausted. The resulting level of resource use is higher than the socially optimal level. In extreme cases, unlimited entry can lead to the collapse of the resource and the communities that depend on it. In this paper we use potential games to analyze the relation between costs of entry, costs of production, and the equilibrium number of resource users in open access regimes. We find that costs of access and costs of production determine the equilibrium number of resource users. We also find a natural link between Cournot competition and the tragedy of the commons. We discuss the relation between common pool resource management regimes and cost structure and show that cost structures are sufficient to determine the number of resource users accessing the resource.

Transforming Uncertainty into Manageable Risks: Conventions in Financial Education

One of the crucial components of the neoliberal regime is the transfer of responsibility for individuals' financial wellbeing and security from the state and other public bodies to the individuals themselves, who are required to take responsibility for their own financial decisions and their current and future economic situation. This neoliberal project of responsabilization presumes a world in which calculative subjects can estimate and manage risks. Yet, compelled to participate in the financial sphere as a key means to assure their future economic security, individuals are exposed in fact to the fundamental uncertainty of financial markets. In this paper we examine common sense conventions formulated and disseminated by programs of financial education as discursive instruments intended to induce individuals to experience the financial sphere as a site of knowledgeable, calculable and manageable risks, rather than as a site of fundamental uncertainty. These simple and conventional causal assertions regarding the functioning of financial markets aim at providing individuals with the sense that the financial sphere is relatively predictable, and that it is possible to hedge from life risks by making choices according to accepted rules of responsible financial conduct. As they affect the mode in which laypersons experience the financial field, these conventions, and practices of financial education in general, contribute to the normalization of financial logics of risk management in everyday life and to the incorporation of the general population into the process of neoliberal financialization as responsible and calculative subjects.

Hosting Wildfire Evacuees: Response Generated Demands in Kamloops, British Columbia

The 2017 wildfires in interior British Columbia, Canada were unprecedented, burning more territory than any year since 1958. As a result of the fires and the ensuing smoke, over 40,000 persons were forced to evacuate from their homes. Almost 11,000 of these individuals evacuated to Kamloops, B.C., a primary location for receiving waves of wildfire evacuees from the Thompson-Nicola Regional District.

This presentation is based on a quick response project conducted in August 2017, during which time the principal investigators met with key public officials and pro-

fessional representatives from the City of Kamloops, the Thompson-Nicola Regional District, Emergency Management British Columbia, and Kamloops area social service providers and community organizations. The temporary population influx of evacuees along with the convergence of both materiel and personnel created unique opportunities and unintended challenges for the community of 90,000. The response-generated demands placed on Kamloops in its capacity as a host-city during the 2017 wildfire season are presented from physical, economic and social perspectives, both in short and long term.

Mass movement of people temporarily fleeing danger is likely to become more commonplace, especially given that key indicators of fire behavior in the Canadian west suggest that upcoming fire seasons will be very active. Lessons drawn from the 2017 Kamloops experience are therefore useful for future response planning and implementation of emergency procedures on local, regional and provincial levels.

Transmigrant Familial Practices and the Accomplishment of the Work of Social Reproduction

Immigrant families have been utilizing transnational practices to maintain family relationships, and to accomplish social reproduction. In the context of the current climate of globalization and neoliberalism, some immigrant families experience unemployment and underemployment, and downward mobility. The difficulties in procuring affordable childcare services and in juggling the contradictory demands of paid work and household work have prompted some immigrant families to resolve to transnational strategies to accomplish the work of social reproduction, such as sending children back to their home country to be cared for by family members.

Informed by theoretical debates on social reproduction, and transnational migration literature, this paper is based on data from an empirical research which examines the migration experience of highly educated Mainland Chinese immigrant women to Canada who were professionals in their home country.^[1] In particular, the paper investigates how these immigrant women navigate paid work and household work, and explores how they utilize transnational migration strategies to accomplish social reproduction in an era of economic restructuring and transnationalization.

The research begins with the Chinese immigrant women's individual experiences, employing the life history method by first focusing on their motivations for immigration and then exploring the transnational strategies and decisions the families utilized to meet their social reproductive needs. The analysis of the paper is centered on the myriad strategies of social reproduction employed by these families.

[1] The research project “Transnational Migration Trajectories of Immigrant Women Professionals in Canada: Strategies of Work and Family” was supported by a Social Sciences and Humanities Research Council of Canada Research Grant (SSHRC) no. 410-2009-2453 to Guida Man as the Principal Investigator, and Tania Das Gupta, Roxana Ng (deceased), and Kiran Mirchandani as co-investigators.

“I Think One Should Vaccinate Carefully:” Health Professionals Accounts of Medical Knowledge, Risk, and Misinformed Others

Over recent years, narratives about the influence of anti-vaccine discourses on vaccination rates have drawn attention to the contestation of medical science. This attention often accompanies assumptions that vaccine supportive discourses are uniform. Specifically, it assumes that health professionals' voices consistently support every vaccine recommended on their local vaccine schedule. Nonetheless, health professionals who are expected to support vaccines and communicate their support to patients hold expertise in diverse disciplines. Some health professionals express inconsistent understandings of vaccination that are rarely acknowledged, let alone investigated. Health professionals who specialize areas that are not vaccine focused (such as immunology) may fill gaps at the boundaries of their individual knowledge with lay information.

In this paper, I review how health professionals' present themselves as professional when encouraged to discuss such gaps in their medical knowledge. I report findings from thirty-four interviews with physicians (N=27) and nurses (N=7) who practiced in Alberta, Canada. Interviews address how physicians and nurses accounted for the boundaries of their knowledge and how they related those accounts to perceptions of others' knowledge. Every professional who I interviewed stated that they supported vaccination, but many identified specific vaccines that they questioned. I argue that my interviewees acknowledged the boundaries of their own professional knowledge as evidence of thoughtful awareness, but presented others' skepticism as irrational and based in misinformation.

TG04-985.6MANCA, TERRA* (*University of Alberta*)*"If You Look at the Impact That Jenny McCarthy Had:" Risk, Fear, and Vaccination*

motions, especially fear, are prevalent forces in perceptions of vaccine-related risks and likely vaccine uptake rates. In many parts of the world that were previously well-vaccinated, including the Canadian province of Alberta, vaccine uptake is well below what is necessary to protect populations from diseases. As such, health professionals in Alberta are tasked with allaying patient fears about the risks associated with vaccines in their efforts to promote vaccine uptake. In this paper, I address how thirty-four Albertan physicians (N=27) and nurses (N=7) accounted for patients and parents' beliefs, rationality, and fears about vaccination. The physicians and nurses who I interviewed critiqued the role of the media and prominent anti-vaccination advocates who they argued promoted the vaccine fears that their patients expressed. In fact, they talked about using personal stories to evoke parents' emotional understandings of the risks that vaccine refusal could pose. Health professionals' experiences with patients' vaccine fears offer a vantage point from which to observe the role of emotion in the communication of medical knowledge, interpretation of patients' anxieties, and the navigation of perceived risks.

TG04-976.1MANCINI, FIORELLA* (*Instituto de Investigaciones Sociales. UNAM*)*Incertidumbre y Desigualdad Social En México: Respuestas Empíricas a La Sociología Del Riesgo Desde América Latina*

Debates recientes entorno al cambio social indican que una fuerte sensación de incertidumbre recubre a las sociedades contemporáneas. Dos grandes procesos, a su vez, remitirían a este aumento generalizado de riesgos: el incremento de la individualización social por un lado; y las transformaciones provenientes de la globalización, por el otro. Ello habría derivado en cambios en los estilos de vida, en las relaciones familiares, en los mercados de trabajo y, en general, en una apertura de posibilidades y opciones habilitantes de una agencia más crítica, reflexiva y responsable de sí misma, que se aleja de la tradición, del paternalismo estatal y de la confianza en las instituciones clásicas de protección social. Estos debates sugieren, además, que las percepciones de riesgo son generalizadas y que no están ligadas a contingencias concretas sino a una suerte de homogeneización del cambio social.

Si bien estas tesis han sido ampliamente discutidas en los últimos años desde la sociología contemporánea, rara vez han sido puestas a prueba utilizando datos cuantitativos, especialmente en América Latina.

Bajo estas premisas, y utilizando datos de una encuesta sobre percepciones de inseguridad e incertidumbre en México, el objetivo del estudio es responder tres interrogantes de la sociología contemporánea del riesgo: 1. Hasta qué punto existe esta percepción de incertidumbre generalizada; 2. Hasta dónde la percepción de riesgos está relacionada con ciertos grados de reflexividad y; 3. Cómo se vinculan estas percepciones con desigualdades sociales.

Los resultados indicarían que -contrariamente a lo que sostienen algunos debates- los riesgos sociales están permeados por las características de los regímenes de bienestar; su percepción no necesariamente está ligada a cierto grado de reflexividad y su intensidad está modulada, al menos, por tres ejes de desigualdad social: la que imprime el género, la etapa del curso de vida y el sector social de pertenencia.

TG04-973.3MANCINI, FIORELLA* (*Instituto de Investigaciones Sociales. UNAM*)*Patterns of Risk in Life Course's Workers of Three Generations in Mexico: Social Change or Historical Inequalities?*

Contemporary societies attend a rupture of traditional certainties structured around age, gender and social class. The so called "flexibilization of the life course" would have resulted in a process of individualization that, in general terms, would increase social and individual uncertainty. This, together with the global transformations of the economic field, would explain the existence of labor trajectories not only less predictable and orderly but also less collectively determined. Labor biographies have become less continuous, where unemployment, part-time employment or self-employment are increasingly common events.

Under these premises, the main of the paper is to analyze the accumulation of social risks in the life course of workers of three generations in Mexico. For this purpose, a sequence analysis of the labor trajectories is proposed to identify risk patterns throughout the life course, using data from the Longitudinal Survey on Occupational Insecurity in Mexico (2011). Optimal Matching Analysis is applied to model time-related processes in order to identify labor trajectories typologies.

Findings would indicate that three major types of movement are observed along the trajectories: 1) what I call "structural recurrence of instability" (a permanent transit between unstable situations); 2) fluctuations between security and

risk (depending on the stage of the life course) and; (3) "entrapment of risk", which implies few transitions along the trajectories but marked by poor quality jobs and with no possibilities of upward labor mobility. In addition, risk patterns would have changed as the cohorts are younger toward an increase in trajectories with a greater number of transitions and labor states over the life course. Finally, it would also be expected that certain axes of social inequality (gender, social origin and stage of life course) significantly predict the probability of belonging to each of the various patterns found in the research.

RC32-591.3MANDELL, NANCY* (*York University*)*Eldercare in Transnational Immigrant Families*

Economics, migration patterns, gender and ethnicity shape intergenerational relations in senior immigrant families. Increased mobility, longevity and unpredictability in family forms disrupt traditional life courses and generate new challenges. The emergence of complex emotional relations, diverse family structures, interdependent family roles and unanticipated extensions of caregiving into old age represent issues both generated by, and constituting responses to, global structural patterns. These patterns get played out in informal and formal types of eldercare. Multiple forms of caregiving, for longer periods of time, result in different possibilities for more generations to both give and receive physical, emotional and financial care. While adult daughters remain the default person for family care, there are potentially diverse sources of care, including more family members, new technologies, community organizations, and state services. Using a social reproduction framework, we analyze data emerging from focus groups and interviews with over one hundred senior immigrants from a cross-section of ethno-racial groups in the Greater Toronto Area. By paying attention to the diversity of older transnational Canadians in terms of gender, ethno-racial, and economic categories, we can distinguish among different types of care and support available and required. Informal and formal caregiving for older persons is revealed as a reciprocal, interdependent, nuanced and complex experience.

RC57-925.1MANDRONA, APRIL* (*Nova Scotia College of Art & Design*)MILNE, EJ (*African Centre for Migration and Society, University of the Witwatersrand*)MITCHELL, CLAUDIA (*McGill University*)JAKALA, MICHAELINA (*Coventry University*)*Children's Picture Books to Promote Solidarity and Acceptance in the Age of Refugees: Thinking through a Framework of Evaluation*

This paper presents initial findings from the Social Sciences and Humanities Research Council of Canada funded project "For Us by Us": *Children's Picture Books to Promote Solidarity and Acceptance in the Age of Refugees*. The research connected children with refugee experiences and adult collaborators in Halifax, Nova Scotia and Coventry, England through the creation and sharing of picture books that reflect their perspectives. It also sought to better understand young refugees' social experience of, and engagement through, storytelling and art making, and interrogated the notion of children's art and literature as 'neutral' categories of cultural production, seeking to illuminate how children's picture books transmit loaded, didactic information.

Using the various forms of data generated (visual, reflective, and textual) we offer a sample framework to assess the relevance and meaning of picture book making as a visual methodology and the potential it has to create change in the lives of participants. Of particular interest is the enactment of an ethics of engagement, which includes relationships between participant produced art materials as items of cultural consumption beyond the research setting, such as use of the picture books by adult community members, libraries, and academic institutions.

RC47-JS-22.11MANEIRO, MARIA* (*CONICET-UBA*)*Representaciones sociales en torno a la asamblea en los movimientos de trabajadores desocupados*

Los estudios sobre los movimientos sociales han atendido a la importancia de la democracia participativa en los movimientos sociales. Este trabajo visita esta cuestión desde un anclaje empírico. ¿Cómo aparecen las remisiones a la asamblea en los miembros de base de una organización de trabajadores desocupados de la periferia de Buenos Aires? Para ello se analizará la relevancia de ésta en los relatos de los entrevistados y los sentidos a los que se la asocia. En esta presentación se explorará su emergencia como ámbito de socialización de información, de ampliación de las modalidades de socialización, de exposición de conflictos y de construcción de acuerdos. Asimismo se referirá a las dificultades que aparecen en los relatos en torno a estos mismos ejes, instando a construir elementos que expresen los límites de la asamblea para afrontar los disímiles y

complejos desafíos que se le imponen. Este trabajo se basa en una serie de veinte entrevistas en profundidad realizadas entre 2012 y 2015 en un movimiento de trabajadores desocupados perteneciente al Frente Popular Darío Santillán en la periferia de la Ciudad de Buenos Aires- Argentina.

MANNING, NICHOLAS* (*King's College London*)

Migration, Mental Health and the Mega-City - Mechanisms in Urban Mental Disorder

This paper arises from a large scale UK ESRC funded project on *Migration, Mental Health and the Mega-city* (M3), currently in the field in Shanghai. The project's background is in the Urban Brain research programme at King's College London, which directly addresses the theme of this workshop – sociological explorations of the connections between urban settings and mental disorder. In this paper I will draw on our initial literature review, our current ethnography of migrant workers in Shanghai, and our preparations for a new survey instrument for carefully capturing the social conditions of urban migrants, to lay out some of the possible mechanisms by which the urban social setting 'gets under the skin' and 'into the brain'.

The paper addresses ways in which sociological analysis and biological analysis might work together through the identification of 'mechanisms', imagined and confirmed through data, of the way in which the urban generates mental disorder. The argument moves from the use of mechanisms in scientific explanation, to the shortcomings of epidemiology, and the possibility of a new 'mechanism-rich' epidemiology. A wide range of papers, and actual and possible studies, are presented, including the Network Episode Model (NEM III R), SES as a 'fundamental cause', the social psychology of small groups, social capital, interaction ritual chains, stress (and the hypothalamic-pituitary-adrenal (HPA) axis), social support and its effect on the polyvagal parasympathetic part of the autonomic nervous system, trauma and its effect on the life-course, including childhood and PTSD, and gut biome and its effect on inflammation in the immune system.

MANNING, RYANN* (*University of Toronto Rotman School of Management*)

This Smile Brightens up Our Hearts: Emotional Modulation and Social Mobilization during the West African Ebola Outbreak

In this paper, I explore the emotional dynamics of networked activism by Sierra Leonean diaspora communities in response to the 2014-2015 Ebola outbreak. Emotions infused this transnational social movement and helped connect people around the world to the tragedy unfolding in West Africa. I focus especially on how diaspora activists used social media to orchestrate action-oriented *emotional chords*, combinations of emotions akin to musical chords, which they believed would help enlist and sustain participation in the fight against Ebola. Analyzing real-time and retrospective data from a variety of online and offline sources, I find that diaspora organizations and individuals produced and deployed digital cultural objects in order to collaboratively shape the emotional tone and rhythm of interactions among members of the Sierra Leonean diaspora. Activists repurposed familiar cultural material in creative ways to help their community make sense of the novel challenges posed by Ebola. For example, they adapted symbols and practices from traditional mourning rituals into virtual memorials to the victims of Ebola—especially Sierra Leonean doctors who died from the disease—which circulated widely on social media. Often, diaspora activists created emotionally polyvalent objects that expressed and elicited multiple emotions, such as images and stories of Sierra Leoneans at home and in the diaspora who were taking action to stop Ebola. Incorporating rich, in-depth qualitative data from social networking sites and other online forums, I explore the dynamic interplay between emotion and action as members of the diaspora interacted with these cultural objects while discussing the emerging crisis in Sierra Leone and mobilizing to respond. Based on these findings, I develop a theory of *emotional modulation* by social movement activists, and I suggest implications for our understanding of networked activism, transnational organizing, and the complex role of emotion in social movements.

'Land That We Love': Responses By Sierra Leonean Diaspora Communities to the West African Ebola Outbreak

The 2014-2015 outbreak of Ebola virus disease in Guinea, Liberia, and Sierra Leone killed over eleven thousand people and spurred substantial economic and social disruption. Among the thousands of individuals and organizations who mobilized to respond to this disaster were many members of Sierra Leone's global diaspora community. Despite occupying a liminal position from which they

could have minimized their exposure to the Ebola outbreak, Sierra Leoneans in the diaspora pursued a diverse array of actions intended to help stop the spread of Ebola, mitigate its consequences, and contribute to long-term recovery and rebuilding. In this paper, I use a range of real-time and retrospective data to examine how people of Sierra Leonean birth or ancestry who were living outside of Sierra Leone at the time of the Ebola outbreak made sense of the unfolding crisis, and how they formulated their role and obligation, if any, to their country of origin. Specifically, I combine data from interviews with diaspora activists; internal and external materials shared with me by diaspora organizations; online public conversations that took place among members of the diaspora during the Ebola outbreak; and autoethnographic data from my own experience observing and working on the response to Ebola. I explore how activists within the Sierra Leonean diaspora sought to activate or appeal to the identities and loyalties of people with ancestral ties to Sierra Leone, including by invoking collective memories and narratives of the country's earlier civil war. I find that even the most engaged members of Sierra Leone's diaspora community—those who led the diaspora's response to Ebola—sometimes grappled with ambivalence toward their identity as Sierra Leoneans. This ambivalence was in some ways exacerbated by the Ebola crisis, but also played a role in the activists' decision to get involved in the Ebola response.

Family Bargaining, Community (Re)Building & Becoming Professionals: Gendered Strategizing of Skilled Migration By Indian Women in the U.S.

This paper examines how middle-class Tamil-Indian women negotiate with gender to strategize skilled immigration and settlement in the U.S. by drawing upon life-history interviews with 33 Tamil women who immigrated between 1971 and the early 1990s. Using the concept of embedded agency, it finds that framed by the nexus of gender, caste/class and immigration policy, Tamil women engage in 'accommodative reconfiguring'—appropriating, reinforcing and (re)articulating hegemonic Tamil gender ideologies and practices in immigration.

Tamil women articulate immigration through visions of improved familial mobility and correspondingly, of enhanced professional opportunities, difficult to realise as upper-caste, middle-class women in post-colonial India. Appropriating gender practices that legitimize Tamil women's married migration, they strategize immigration by marrying US-based/bound men *choosing* to become family migrants. In settlement, where they are classified as "dependents", Tamil women (re)articulate those same practices to strategize settlement by emphasizing wife/motherhood – becoming responsible for their families' settlement through their carework, making dyadic compromises for husbands' earlier labor market entry – in order to (re)establish strong marriages and families. They resist their dependence by (re)constructing women's networks with other Indian wives like themselves who become a community within which they ground their immigrant families. While (re)articulating the salience of wife/motherhood to their immigrant lives, they retain their professional ambitions, successfully re-training in the US to become professionals, albeit with a delayed onset. Indeed, professional work becomes an important component of their mothering, facilitating their families' upward socio-economic mobility in America.

Rather than resisting subordinating gender relations within their households and immigration regimes, they accommodate them, using them to devise strategies for engaging in gender non-normative actions (becoming professionals) and/or to reframe normative ones (motherhood/wifehood as critical to family adaptation) to accommodate their interests and goals. Accommodative reconfiguring however, (re)produces discourses and practices of Tamil womanhood in migration, albeit in reconfigured ways.

Collective Individualism As a Path of Youth Transition: Youth Street Art in Yogyakarta

The majority of academic research on youth transitions is focused on the individual and their individual journey. Such a position does not encompass models of collectivity that are the norm in places such as Indonesia. In Indonesian culture the individual is most often incorporated into some collective identity. Therefore Indonesian modes of collectivity feature prominently in youth practices including arts practice.

This paper uses Deleuze and Guattari's concept of the assemblage and rhizo-analytic methodology to investigate creative practices and youth transition from the perspective of a group of street artists from Yogyakarta in Indonesia. Traditionally collective practice in the arts is common in Indonesia. However, these young artists are creating new models of intense collectivity that shape their communitarian sociality. These new modes of collective individualism allow a young person to be simultaneously an individual and part of a collective. Although a powerful communal solidarity has developed between the artists in the assemblage, a fluidity of affiliations and alliances allows space for individualism within

the collective. Collective individualism is a function of the interaction of embodied knowledges acquired through intense collectivity and tradition collective arts practice with individual modes of praxis, which dominate fine arts practice and Western cultures.

It is argued in this paper that collective individualism in Yogyakarta has become an aspect of the transition into adulthood undertaken by these young artists. In contrast to the transition to adulthood through individualisation commonly theorised in Western literature, in the Indonesian case a form of adulthood that includes communitarian practice may well be the ideal. A collective individualism that encompasses communitarian practices may be their objective and a marker of successful adulthood.

Movement Building Analysis As Method: The Case of the Wisconsin Uprising

The Wisconsin Uprising was not only the early riser of the U.S. protest wave of 2011, it was both militant and mass based, mobilizing hundreds of thousands of people in building occupations and labor and student strikes, and roving pickets. To most outside observers at the time, as well as some participants, the Uprising seemed spontaneous. To this day, the full meaning of Wisconsin continues to be lost to scholars and activists alike. I show that the Wisconsin Uprising provides an important case for studying the process and consequences of the activist process of *movement building*. I draw on semi-structured interviews and archival research as well as my personal history as a protagonist in the popular movements of Wisconsin over 25 years. I show how key elements of the Wisconsin Uprising were constructed in the greater period of struggle that began in the early 1990s, arguing that the wave of 2011 was a product of purposive actions in the course of that struggle. In so doing, I introduce a theoretical framework and a *method of movement building analysis* for explaining the trajectories and outcomes of movements in struggle. Uprisings and other significant events that become visible as waves of contention surface into public view are poorly described by theories that fail to account for the strategic choices activists make as they are engaged in struggle over time. Movement building activities are not always readily available to empirical analysis, yet they occur nonetheless, producing many of the forces that enter play in times of heightened conflict.
