Children and Violence - a Childhood Sociological Perspective

Childhood Sociology's main concern are childhood as a life phase, children as a social group in their own right, and ultimately the well-being of children. In contrast, child protection aims at the best interest of the child, rendering childhood as a state of preparation and child abuse and neglect as respective threats – this is the common approach of the law, whereas child protection practice performs further constrictions by addressing the mothers as housewives and homemakers. Instead of just bearing the mark of familism, as it is often argued, child protection centers predominantly on a traditional female gender role, complemented by the professionals via beneficial and controlling strategies of “taking the mother by the hand” and “gaining the mother's trust”. These two institutional steps protect violence against children against its full recognition and processing: the legal codification is dedicated to the reproduction of the generational order of society, while the professional approach is oriented towards a routine-based and frictionless operation in accordance with the law.

The social recognition of violence against children is located outside of its professional processing: cases of reporting by kindergarten teachers or neighbors are filtered and regularly invalidated by professional interventions. Unrightfully, as studies show. However, this is not an argument against professional child protection system, but for its fundamental reshaping and a legal foundation that aims for the voice and state of the child to be heard. The presentation is based on an interview-study with professionals of Germany's child protection system, complemented by a comprehensive comparative analysis of child protection legislation in several countries.

Access to Justice in Contexts of Precarious State Institutions

This presentation will be based in my work on Access to Justice in Latin America, where there are contesting ideas of what is “fair” and what “justice institutions” are better to fit the requirements to build a Democratic Rule of Law. Among several challenges to Justice are structural inequalities, social exclusion, and discrimination along ethnic, racial, and gender lines. All of them contribute to the erosion or violations of basic human rights, committed both by state institutions and by other non-state powerful actors, like informal powers, criminal networks or other organizations. Although political liberties associated with democracy have been secured in many countries (i.e., the rights to suffrage, association, and freedom of speech) several indicators of the Rule of Law are still lacking. Also the systematic violation of human rights still poses a major challenge to democracy across the region. As a reaction several forms and resistance actions have been introduced by civil society organizations making the region a territory of dispute between progressive and other traditional conservative actors.

Spaces of/in Transition: Epistemic Chances and Methodological Challenges

Urbanization entails several material and immaterial changes and triggers multiple transitions. These might conflict with each other and lead to consequences stretching this immanent process of becoming over time and space, and dramatically challenging the ontology and epistemology of flows.

Which dynamics are (re)producing natural and built environment? How people make sense of changes and emergent properties of these complex living systems? And what methodologies can we develop to conduct research on them?

The presentation will address the above issues, considering in particular the notions of boundaries and fringes, since they are constitutive of urbanization process and of the ripple effects it encompasses – such as the dramatic transformation occurring on rural areas and natural ecosystems located on the urban fringe, or rural-urban migrations and the shaping of urban fantasies and aspirations – which, at the same time, continuously challenge the positionality of the researcher. For The paper will raise questions and advance proposals to fuel sociological imagination and build more “live methods” – that encompass the visual and the sensory – and that can both expand our capacity to address these complex issues and engage multiple publics, in multiple ways.

Examples of uncertainties produced by the urbanization pathways of China and Europe together with the perceptions, knowledges and actions – individual and collective – that they (can) generate, will enrich the discussion.

The Iron Bars Get Closer: Anormative Regulatory Coercion

Violence' is polysemic denoting 'compulsion' 'abuse', 'punishment', 'duress', 'force', and 'manipulation' *inter alia*. These denotations are not interchangeable and often co-exist. I will discuss 'coercion' as the use of power to enforce compliance; accentuating techniques whose intensification is employed to get other agents to do or to refrain from certain actions. Such anormative regulation increases significantly with the intensification of social morphogenesis – unbound from countervailing forms of morphostasis. Circa 1980, Bureaucratic regulation predominates over normatively based legislative control as the law cannot run fast enough to keep up with simultaneous social transformations. Increasingly legal provisions lag behind innovative malfeasance as morphogenetic variety stimulates more variety, outdistancing juridical control. In turn, there is a severance from past legal concern with *legitimacy* without any new preoccupation with social *legitimation*. An 8 point Ideal Type encapsulates the regulatory quest for social coordination and unconcern with cooperation and re-distribution. Administrative regulation highlights the 'moral disconnect' (Porpora) between norms and values in the context of low social solidarity, multiculturalism and the muting of normative differences through political correctness. Political centrism promotes it; political populism contests it. This regulatory boom results because the generative mechanism fuelling intensive morphogenesis becomes systematically skewed towards market competition, intrinsically producing winners and losers, and augmenting the gap between them. The potential for the same mechanism to diffuse win-win contexts promotive of an integrative Commons is overshadowed by the digital proponents of the situational logic of competition having made common cause with the political and corporate promoters of anormative social regulation.

Powerlessness of Marginalised Women in the Dialectics of Violence in Pakistan

SouthAsia is encumbered by cultural conflicts and violence in the countries it has and the size of their populations. Four of the ten South Asian nations have the highest rate of violent cultural conflicts. Around the entire South Asian countries, Pakistan gives an impression of unsure growth towards women empowerment and gender discrimination, and remains lower in ranking than others The reason is clear that Pakistani society has patriarchal setup that little recognizes the capabilities of marginalized women, rather make persistent problems in their way towards liberation. Marginalized women often face physical and mental violence as a result of numerous innate psychological and behavioral encounters and appear powerless. Powerlessness of marginalized women dwindles in a synthesis of opposing terms of 'violence' and 'non-violence', and as Bataille thinks about the same type of two antagonistic concepts, these are 'mutually constitutive and

there is synthesis of opposing terms each lending its power of signification to the other'. In Sadean dialectic, 'opposing terms are united in synthesis which structures their initial emergence into the discursive arena'. The emphasis on violence as a synthesizing force is just one of the ways in which Sade's dialectical system differs from Hegelian dialectic which is essentially historical and operates chronologically through times. The binary oppositions become supportive and constitutive. The dialectics of violence is the central theme in this paper. Keeping this viewpoint, this paper will be based on an empirical research conducted by different government agencies in Pakistan with a sample of 3,687 women about domestic violence that revealed that marginalized women suffered from physical abuse as "hitting, kicking, biting, shoving, restraining, slapping, or throwing objects" and other "sexual and emotional abuse, controlling or domineering behaviours, intimidation, stalking, and passive or covert abuse."

ATZMUELLER, ROLAND* (Johannes Kepler University)

Confronting the Destruction of Social Rights through Considerations on the Crisis of the European Social Model and Options to Tackle It

The financial and economic crisis of 2008, which was subsequently transformed into a sovereign debt crisis and subsequent austerity policies have (further) polarised the European Social Models. Young people are among those who have been affected hardest. In Southern and Eastern European countries high levels of unemployment of up to 60% and poverty and social exclusion linked to austerity related cutbacks of social support and educational and VET (vocational education and training) systems transformed youth into a social problem. Also in the dominant European countries, young people were affected more strongly by economic crisis and permanent austerity. As even neoliberals have to admit that young people are not yet full market individuals and human capital they are still seen as a legitimate target of social policies. Notwithstanding far-reaching differences, a converging neoliberal governmental rationality concerning the problems of young people as well as the best strategies to tackle them is emerging. Thus, the situation of young people is ascribed to a lack of adequate human capital (i.e. low educational levels and skills) which is said to result from the social deficits of their respective family background, ethnic origin, non-conformist lifestyles etc. Tackling the crisis and transformation of capitalism is therefore shifted to the adaptability of young people and their willingness to transform their abilities into human capital policed by an expanding set of disciplinary social policies. Only when the individualised and human capital centred understanding of welfare and justice is replaced by a renewed conceptualisation of freedom and individual autonomy which runs counter not only to market-processes but also gendered and ethnicised structures it will be possible to confront the crisis of the European social models and to upend the emergence of centrifugal tendencies (right wing populism) which threaten to tear apart the EU.

BALFOUR, GILLIAN* (Trent University)

Carceral Feminism As Colonial Violence

Despite decades of liberal feminist gender-responsive reforms to the confinement and treatment of women prisoners, Indigenous women are the fastest growing prisoner population in Canada. Within the walls of these "feminist fortresses" (Hannah Moffat 1995) Indigenous women are more likely to be held in maximum security, solitary confinement, be subject use of force, and be denied parole. How do feminist criminologists account for the deepening of carceral violence against Indigenous women prisoners who are most likely to be victims of gender-based violence? Have women-centered prisons contributed to a carceral femicide of Indigenous women? This paper considers the works of scholar Elizabeth Bernstein (2012) on the carceral turn within feminist penal reform in the U.S., and Kelly Hannah Moffat's (2010) call for an intersectional critique of gender-responsive correctional policies, and locates incarceration as a gendered and racialized form of endangerment for Indigenous women.

BAUR, NINA* (Technische Universität Berlin)

Methodologically Grasping Social Processes in Urban Environments. Mixing Visual Methods with Other Methods in Process-Oriented Micro-Macro-Analysis

Urbanization and related social processes – such as climate change, massive migration of people, economic and geo-political crises and changes in the capacity to sustain ecosystem services – as well as the related increasing uncertainty are long-term social processes which often take place on the macro-level. These processes both change and are driven by micro-level interactions of humans with their urban environments. In order to fully grasp these complex interactions, a process-oriented micro-macro-analysis is needed. The paper discusses how various types of visual methods can contribute to grasp those micro-level interactions. At the same time, the paper shows that in order to fully understand the interaction between the macro- and micro-level in urban research, it is necessary to mix visual methods with other methods such as quantitative methods and historical methods. The paper concludes with methodological issues that need to be resolved in future research.

BELLO, WALDON* (University of Philippines)

State and Counterrevolution

The paper will focus on the relationship between counterrevolution, capitalist transformation, the state, and the middle class. It looks at how the dialectic of revolution and counterrevolution operated in five societies: Italy, Indonesia, Chile, Thailand and the Philippines. It seeks to understand the motion of different classes in periods of great political fluidity. It explores the relationship between state elites and counterrevolutionary mass movements. Finally, it probes the relationship between domestic counterrevolution and global geopolitics.

Inte-27.1**BENSKI, TOVA*** (College of Management Studies)*Emotions and Social Movements Activism*

Throughout history, social movements and mobilizations have played crucial roles in fostering or resisting economic, political, social and cultural changes. Since the 1960s, there has been a growing academic interest in social movements that has generated different approaches, starting with the earlier Collective Behavior concerns with mobs, to structural strain models, to Resource Mobilization (RM), Political Process, Political Opportunity Structure theories, and Framing theories in the US, and the various New Social Movements (NSM) theories in Europe. In a sense, these theoretical formulations reflected both the changing theoretical and empirical fashion and knowledge that has accumulated since the 1960s, and the changing character of the social movements of the time. History and knowledge. These theories have explored various aspects of social movements starting with explaining their mobilization, to their organizational dilemmas, identities and culture. Despite the "cultural turn" in social sciences in the 1990s, social movements theories retain a "cognitive" focus and did not look at emotional processes or gave salience to emotions within their analyses. More recently, there has been a renewed interest in the emotional aspect of social movements mobilizations and activity. In this presentation, I would like to further enhance this direction of research and will focus on "Human Dignity" or more specifically on the violations of human dignity as the main situational factor stimulating the emergence of clusters of emotions that lead to mobilization. I will demonstrate this on the most recent progressive movements of Arab Spring, Southern Europe and OWS.

Plen-4.1**BHAMBRA, GURMINDER*** (University of Sussex)*Dispossession, Justice, and Social Science: 'In the beginning all the world was America'*

In this talk I propose that justice in the present requires taking into account the historical processes of exclusion and domination that have come to configure our contemporary time. This also requires us to understand how our social scientific categories and frameworks are bound up in equivalent processes. I argue that the possessive individualism that underlies modern claims to justice is not formed in capitalist relations of production, but in processes of dispossession and settler colonialism. The dispossession associated with the enclosure movement in Europe generated migration to the 'New World' that established new forms of domination there. European social thought – normative and explanatory – had to confront how rights claimed for one group (Europeans) involved the dispossession of another (indigenous peoples). For Europeans in the early modern period, this was done by representing travelling across space as travelling back in time. Dispossession was thus incorporated into a stadial theory of progress that would eventually reincorporate those initially excluded, while continuing to deny their agency and understanding of rights differently grounded. This exclusionary logic continues to inform contemporary social scientific understandings and is in urgent need of transformation.

Plen-5.1**BONILLA-SILVA, EDUARDO*** (Duke University)*"Feeling Race": The Field Of Racialized Emotions In Trump America*

Emotions such as fear, joy, sadness, and anger may be universal, but racialization has produced race-specific "feelings." Unfortunately, most of our analysis on race has reduced race-induced emotions to just "negative" ones (e.g., hate, anger, etc.) or ignored them altogether by focusing on the material aspects of racial domination. In this talk I will theorize racialized emotions and argue that they are as material, and thus, as consequential, as other structures and practices of racial domination. Cognitions matter, but emotions matter too! Albeit my goal is to provide a general argument about the significance of racialized emotions, I will highlight how they play out in Trump America. I will conclude by making a case for an "emotional politics" to fight Trumpism and help energize social movements to build the "new society."

Inte-23.4**BRINGEL, BRENO*** (State University of Rio de Janeiro)*Movements and Scholars As Knowledge Producers in the Global South*

Social and intellectual movements have coexisted during the last decades in a cognitive and geopolitical critique that has questioned the classic Western narratives of sociology and the forms of knowledge production. The labels used (Southern theories; alternative epistemologies; peripheral sociology; post-colonial theories, etc.) are diverse and take on distinct epistemological, theoretical and methodological assumptions and local/national/regional traditions, projecting also different interpretations of modernity, the legacy of colonialism and the role of sociology and social movements.

ISA -1033.2**BURAWOY, MICHAEL*** (University of California, Berkeley)*Power, Violence and Justice: Re-envisioning The Great Transformation*

How shall we rethink *The Great Transformation* and its understanding of capitalism to incorporate the three themes of the ISA's Congress in Toronto?

Plen-7.3**BYFIELD, NATALIE*** (St. John's University)*Surveilling Blackness in the 21st Century U.S.A.: Modernity/Coloniality, Objectivity and Contemporary Forms of Injustice*

The contemporary constructions of blackness in the digital age, in which the emergent era of policing in the U.S. focuses on security and risk management and incorporates a variety of surveillance tools and technologies, such as data analytics and algorithms, compels us to think about the lessons of U.S. history concerning the role of science—particularly the social sciences—in creating associations between blackness and criminality. All these are or have been part of the state's or empire's strategies for survival and "development." The incorporation of all these considerations in an assessment of the increasingly digitally-based approach to policing New York City neighborhoods reveals ways in which the forces of modernity/coloniality create new approaches to objectivity and develop new types of injustice.

CASTAÑEDA SABIDO, FERNANDO* (Universidad Nacional Autónoma de México)

Popular Protest and Repression in the 21st Century: The Indigenous Movements in Defense of the Earth, Territory and Human Rights in Mexico

The relationship between repression and social protest is an issue that has been studied from various angles, both in its visible and direct dimension based on the exercise of violence that "legitimately" is carried out by the State, as in that which is not necessarily visible but which is exercised in order to nullify the threat to the status quo represented by contentious collective actions.

The paper proposes the study of social movements that are organized around the objective of the defense of land, territory and human rights, constituted in Mexico to face the implementation of "mega projects" of investment in extractive industries, energy and infrastructure, that are settled on indigenous territories. These projects are rejected by the affected communities, which are organized for the defense of rights acquired in the international and national level.

In Mexico, as elsewhere in the world, indigenous demands for recognition of their collective political, social, cultural and economic rights have been expressed through new forms of organization and social movements whose forms of protest are developed at local, national and international. The dynamics of its action usually combines fights and diverse repertoires of collective action, linking through networks with other collective actions that also defend human rights and participation in decision making, systematically confronting existing power structures.

In this context, this paper aims to analyze the use of prior consultation, free and informed, to obtain the consent of indigenous peoples regarding government actions, legislative measures and / or of individuals that affect their interests, as a defense mechanism, but at the same time as a containment of indigenous demands.

Plen-5.3

CASTRO, JOSE ESTEBAN* (National Scientific and Technical Research Council)

Socio-ecological Violences, Resistances, and Orders

Social struggles against different forms of socio-ecological violence have a long history. These range from struggles against the impacts of soil, air or water pollution on human well-being, against the mass displacements of entire populations to build infrastructure works or against the appropriation of land, water and other natural goods including life itself (e.g. through biopiracy or similar tactics) by powerful private and corporate actors, among many other forms of violence. However, in recent decades these forms of violence have been exacerbated, among other issues because of the unrelenting global expansion of capitalist commodification and related processes and mechanisms, which continue to prompt widespread and multiple forms of social resistance. The aim is to discuss, from a sociology-grounded political ecological approach, the interplay between socio-ecological violences and resistances as structuring forces, driving the destruction, the transformation or even the emergence of new socio-ecological orders.

CHEN, CHIH-JOU JAY* (Academia Sinica)

The Suppression of Popular Protest in China

This paper examines state responses to social protests in contemporary China, thereby demonstrating the institutional logic of governance. The data source for this research is a database of more than 10,000 news events on mass protests from 2000 to 2015. Empirically, the main findings of this study include the following: (1) Between 2000 and 2015, the percentage of police responding to collective protests by force increased steadily; the police were more and more inclined to crack down on social protests. (2) The police's suppression of protests in rural areas was the most serious, followed by those in second-tier cities, and last, by those in large cities. Police in large cities were the most tolerant of collective protests. (3) Erupting violence was one of the main factors leading to police attendance at protest scenes, as well as the arrest of protesters. (4) The larger the scale of a protest, the more likely the police were to appear on the scene. By contrast, the police were more inclined to arrest protesters at small protests. (5) Police responses were influenced first and foremost by who was protesting and not necessarily by the protest issues or targets. When protests targeted local governments (rather than central or provincial governments), or when protesters' claims were administration issues or cadre-related, police were more likely to attend the protests and arrest protesters. The underlying reason for police attendance, however, was that the protesters were members of

disadvantaged groups. The suppression of social protests by local governments varied for different people, issues, and areas. To pursue effective governance and protect the authority of the central government, local governments faced with collective protests habitually resort to modes of reaction that enable them quell protests quickly, while sacrificing the interests of disadvantaged groups, making the institutionalization of social conflicts impossible.

Asso-1021.2

CHERNYSH, MIKHAIL* (Institute of Sociology of the Russian Academy of Sciences)

Social Justice in National Contexts: Neoliberalism and Youth Fortunes in the Brics Countries

The agenda of social justice is often regarded through the prism of basic principles. John Rawls following in the footsteps of Kant proposed three basic "laws" of social justice – freedom, equality of life chances and social insurance for the underdog. The laws are deducted from the motivations of an average person totally amnesic of his or her past and unaware of his or her cultural or social background. The Kantian logic has been criticized by Amartya Sen who emphasized practical aspects of justice embedded in local social and cultural environments. To understand what is just and what is not in a concrete social environment it is important to address the past.

The specific issues of justice that pertain to each country's conditions poses an important question of whether justice can be understood in universal terms. Contemporary sociology is quite positive that such an agenda exists.

The policies of commercialization affect most countries that are integral parts of the global system. These policies encroach on reproduction. The more commercialized is the system of education, the more inequality it generates in each society.

The agenda of justice is the highest in the youth cohorts. Education undergoes dramatic change with a rising gap between elite and average credentials. Careers that young people often dream of are frequently thwarted by precarity that plagues modern labor markets. Inequality is often regarded by young people as a societal challenge and is universally treated as a violation of the justice principles. It is not accidental that in Russia in 2011 or 2017 it is the young people that came out into the streets demanding a more just system and a change in policies. The agenda of justice acquires new relevance as the new generation meets with opportunities and limitations, both local and global.

CIELO, MARIA CRISTINA* (FLACSO)

Extractivism, dispossession and gendered transformations of territoriality

The primary commodity boom of the last decade – driven by global transformations of emerging and speculative economies – has clearly generated new forms of unequal development and dispossession. Anti-extractive and indigenous movements continue to challenge the expropriation of resource-rich lands, but their resistance is complicated by subjective transformations in these territories. In Latin American countries where redistributive projects benefitted from high oil, gas and mineral prices, "neo-extractive" policies were established at the overlap of social democratic rights and neoliberal appropriation. Dispossession in these contexts does not always mean the direct loss of land, but rather, the transformation of inhabitant's relationships with their surroundings, and the incorporation of these relations into capital accumulation processes.

In the Ecuadorian Amazon, for example, as developmental and extractive projects further intervene in indigenous communities' daily activities, their territories increasingly separate the human from the natural world, the productive from the reproductive sphere. Gendered territories are reconfigured, with women's care work and activities bounded not only to the human, but also to the family and the household. Activities that sustain social and natural reproduction – including participation in cycles of fertility, growth and waste interdependent with nature – are thus progressively gendered, domesticated and devalued. These redefinitions of the situated territories of care differentiate and increase men and women's dependence on commodity and labor markets. New subjectivities – more social than ecological – are shaped through affective, political economic processes, in which the institutionalized violence that structures inequalities is anchored in gendered transformations of territoriality.

CLÉMENT, DOMINIQUE* (University of Alberta)

State Funding for Social Movements: Channeling Dissent?

Channeling theory posits that external funding for social movements, rather than coopting activism, channels activism into more structured and less militant forms. Studies on channeling, however, focus on private funding. The following paper examines whether or not public funding has a comparable effect on social

movements. It examines several issues relating to channeling: why funders support activism; funding as social control or altruism; how funding is related to consolidating movement gains; and the impact of funding on mobilization, activism and internal movement dynamics. To address these questions, this article draws on an innovative new dataset that includes lists of grants extracted from over fifty years of government budgets in Canada. In addition to demonstrating that public funding has a comparable channeling effect as private funding, this article provides the first comprehensive survey of the extent of state funding for the social movement sector in Canada.

Plen-5.4

COLLINS, RANDALL* (University of Pennsylvania)

Symbiosis of Terrorist Tactics and High Tech

The increasing power of military weapons, combined with aerial surveillance, satellites, sensors and long-distance global communications, has dispersed the military battlefield. Resource-poor forces have responded, first with guerrilla tactics against isolated bases and supply lines; and then with terrorist tactics, hiding in the civilian population and attacking civilians as softer targets. Terrorism grows in symbiosis with high tech weapons and communications because the weaker side cannot win on conventional battlefields. Insurgents also use the global internet and GPS for their own battle communications, targeting IEDs by mobile phones via distant Internet cafes. Cyber-war grows as a cheap resource for insurgents, because they operate within the same global communications as their resource-rich enemies. Western militaries now anticipate that GPS and the Internet will be shut down during a major war, either by enemy cyber attack, or by Great Power initiative to pre-empt insurgents from using it. The next move may be away from relying on global networks in war, returning to low-tech backup systems: high-tech stalemate driving a return to earlier forms of warfare.

CONNELL, RAEWYN* (University of Sydney)

Imperial Race, Master Science: On the Whiteness of Sociology

When Lester Ward (the first president of the American Sociological Society) announced that sociology should become the leading science of the 20th century, he understood sociology as the science of progress - an idea founded on a deep-seated concept of colonial difference commonly understood as "race". Metropolitan sociology produced two further treatments of race: its effective erasure through ahistorical models of the social, from Parsons to Bourdieu; and the assertion of race as a social identity or a dimension of stratification within the metropole (now usually conceived as intersectionality). Meanwhile, the colonized world saw a changing reality of violence, power, exclusion and exploitation. Early empires in search of loot and labour forces were not scrupulous about colour - or human lives. Later administrative empire, plus settler colonialism, became more systematic about race, and merged gender with colonial difference to produce the racial barriers, and contempt for the colonized, which first-generation sociology assumed. Independence struggles were sometimes led by creole elites, sometimes but not always contested racial exclusions. The postcolonial periphery has seen both anti-racist politics and a growing array of recovery and revaluation projects, ranging from Aboriginality and Afrocentrism to Hindutva and the PRC's Confucius Institutes. The postcolonial metropole has produced multiculturalism, border protection and Trump. A vigorous re-thinking of race is needed to de-colonize sociology; but we can only do that by coming to terms with the world-wide historical dynamic.

CORRIGALL-BROWN, CATHERINE* (University of British Columbia)

An Examination of the Relationship between Prominence in Federal Debates and Federal Funding Indigenous, Environmental, and Women's Groups in Canada, 1960-2014

In this paper, we use two innovative datasets to examine debates within the Canadian Parliament to determine the relationship between the amount of discussion an issue area receives and the later funding it receives. First, we bring together information on all grants to groups in three issue areas (Indigenous, Women's and Environmental) given by the federal government from Federal Public Accounts. Second, we count all mentions of Indigenous, Women's, and Environmental issues in the Hansard, a record of all debate and discussion in the Canadian Parliament. Through this research, we highlight the connection between government debate and actions and the complex relationships between the discussion of elected officials and the policy outcomes across issue areas.

Labor Movements: Whither Industrial Democracy and International Solidarity?

The debate about what kind of voice, democracy or participation workers should have at the workplace and as citizens in the political arena, has been on-going ever since Sidney and Beatrice Webb coined the term "Industrial Democracy" over a century ago. A variety of alternative visions upheld by different social movements emerged, intended on bringing democracy to the workplace and the political arena. Their struggles spanned the 20th century across the globe.

Unlike a century ago, when the Webbs addressed alliances between unions and the Labour Party, in this era of disaffiliation from labor unions and distrust of political elites, distressed workers and citizens are increasingly attracted to modern day Populist and totalitarian rhetorics that promise divisive, nationalist and sometimes violent solutions to their problems. Besides labor unions and political parties, modern day debates and theories about democratic participation include a variety of civil society groups and activists. What kinds of alternative visions and strategies have emerged? How are labor movements coping with the current capitalist crises and changing power relations? Are labor movements responding to the changes and challenges brought about by the by increased globalization with strategies meant to renationalize labor or rather with transnational strategies fostering international solidarity? I will address these issues with a particular focus on transnational labor issues such as international framework agreements and labor clauses in trade agreements.

(Dis)Counting Victims: Indigenous Femicide/Feminicide and the Courts

In addition to the ongoing legacy of colonization, the high risk of indigenous women and girls to violence, including femicide/feminicide, is believed to stem from the perceived impunity of their perpetrators and inadequate state responses, similar to other world regions where rates of these crimes are high. For example, some research shows that about one half of Canadian Indigenous femicides remain unsolved. No charges are laid in many other cases. However, the continued absence of systematic data that can link case characteristics to investigation, prosecution and punishment processes and outcomes has largely prevented a systematic examination into criminal justice responses to violence against Indigenous women. This dearth of data is common internationally despite the fact that understanding how the law's symbolic - and real - response might be contributing to risk for these women and girls is paramount. Drawing from data that documents four decades of femicide/feminicide in Canada's most populous province of Ontario, this paper examines court responses to cases involving Indigenous women and girls, compared to cases involving non-indigenous victims, demonstrating some significant patterns while underscoring the need for better data that document law's real response to these killings.

This talk will focus on knowledges born in social struggles and the ways they can integrate academic knowledge with the objective of constructing ecologies of knowledges and strengthening the struggles.

Plen-4.4**DERANGER, ERIEL TCHEKWIE*** (Indigenous Climate Action)*Indigenous Climate Action: Indigenous Peoples, Climate Change, and Climate Justice in the Canadian Context*

It is becoming increasingly known that those who contribute the least to climate change are often those that feel its impacts the greatest. This couldn't be more true than what we are witnessing within Indigenous communities the world over. Yet, Indigenous peoples remain underrepresented in the climate change discourse or included in the development of climate change solutions and strategies. Indigenous Climate Action is a coalition of individuals from a range of organizations, communities and regions across Canada. Our goal is to fill the gap between lived experiences of Indigenous Peoples and the policies and strategies that are currently being developed to address climate change. Many Indigenous communities are actively challenging the expansion of high intensity GHG projects in an attempt to protect Indigenous land rights and culture. Indigenous peoples represent 5% of the global population but house more than 80% of the world biodiversity within their recognized lands and territories. Now more than ever we need to work to find meaningful ways to include Indigenous communities, rights, and culture into the development of climate change strategies and practices. I will discuss how ICA works to collectively amplify our Indigenous worldviews into the climate discussion and share Indigenous knowledge towards evolving climate solutions that are sustainable, equitable and effective. I will share examples of how we work to obtain true climate justice, in the hopes of identifying solutions, honouring our past, and ensuring that legal and cultural foundations of Indigenous peoples' rights will be upheld for generations to come.

Pres-1.3**DESJARLAIS, AMY*** (Knowledge Keeper, Beaver Clan, Wasauksing First Nation)*OPENING***Asso-1017.4****DIEZ GARCIA, RUBEN*** (Spanish Federation of Sociodology)*Collective Action and Citizenship: Between the Social Democratic Order and Social Change*

Academic literature on social movements has traditionally emphasized their *agency capacity*, as collective actors urging social transformations and changes. However, the outcomes of these processes are difficult to observe. In contemporary societies, these changes also take place in a context in which social movements tend to achieve limited and particular objectives and institutional reforms destined to expand systems of representation in the defense of collective interests and reinforce civil society; instead of radical changes in the social order.

An alternative (and complementary) view emphasizes that *sociology of action* shouldn't conform as a different field of the *sociology of social organization*. From this point of view, citizen's collective action takes place in the framework of civil societies, in which social movements' organizations work as *collective persuasion agencies* inspiring and sustaining in time collective definitions on different public issues, guided to the generation of reforms on these issues, but also sometimes in resistance to them. Social movements, and organizations participating in public life, have the capacity to produce public controversies and debates that have an impact on citizenship collective definition and social institutions, both in symbolic and organizational terms, and in the selection of new political elites; playing an important role in democratization and cultural change.

An active, open and plural civil society is a pillar in shaping democratic life. Hence, citizen's collective action and social movements are also linked to the democratic social order, given that they enable society's adaptation and (always) complex cohesion. Approaching these dynamics offers a valuable perspective to understand social change since those encouraged by citizens' collective action usually should be understood as the result of progressive processes of transformation from subsequent reforms. Likewise, this perspective allows approaching the counterbalances that civil society groups and organizations with different values and interests mean in plural and open societies.

Inte-25.3**DOBRUSIN, BRUNO*** (CEIL-CONICET)*Labour, Extractive Neoliberalism and an Unattainable Just Transition: Trade Unions and Argentina's Energy Paths*

With recent experiences by left-of-the-centre governments in many Latin American countries a debate erupted within social justice movements, including trade unions: does the more equalitarian redistribution of resources justify the socio-environmental impacts of the extractive energy path? For the most part, the trade union movement in Latin America answered positively to this question, arguing that in order to overcome poverty and inequality development was a necessary 'evil'. Unions that had allied themselves with social, and environmental, movements during the struggles against the Free Trade Area of the Americas were now at odds with many of those same movements. Argentina provides a case example of these challenges when the energy model remains extractive in nature, but the distribution moves from developmentalism to neoliberalism.

The limitations and contradictions of what has been deemed a 'commodity consensus' became evident with the slow-down of economic growth, the growing protest of social movements and communities directly affected by those movements, as well as the dependant nature of the development model which reinforced the role of multinational corporations and finance over State-led strategies.

This paper provides an overview of trade union standpoints in Argentina on energy and environmental justice issues at different points in the recent decade. The paper explores the changes in the narrative of the trade union movement as political changes took place and a right-wing government came to power from 2015 onwards. The 'green agenda' presented in Argentina by the current government represents a central debate for trade unions as they reposition themselves in the face of new adversities.

Genealogies of the Concept of Karama (dignity) in Egypt, from Independence to the Arab Uprisings

The concept of *karama* in the Arab world has gone through several phases of semantic change. *Karama* means now dignity, and the concept was crucial in the Arab uprisings as a cry for social justice and as an expression of moral outrage. In this paper, I will trace, selectively, paths of semantic change of the concept of *karama* from the post-independence era in the 1950s, with nationalist agendas of self-determination, to the Arab uprisings starting in late 2010, with increased demands for human rights. The point is to investigate how the concept has been described by local authors, and the implications of possibly enduring ancient meanings of *karama* as they confront current meanings of the concept. This helps understand the multiplicity of meanings of *karama* witnessed during the Arab uprisings in Egypt, as a case study. I will argue that one major trend is a departure from a collective meaning of *karama* to an individual one, in the context of globalizing societies and identity crises.

Youth Protests and Space Reconstruction: The Case of Mohamed V Avenue in Rabat

Mohamed V Avenue is a discontinued public space. It represents the space of political expression to reject mainstream politics and policies in Morocco. A fact that converted it into a **nucleus** of a larger political and civic public space. Its strategic location and over-policing makes it ideal to make claims heard and to defend rights.

The transition of this avenue from a space that was almost exclusively under the State's authority, to a space of multifaceted political and civic activism has been successfully achieved. Deploying diversity of profiles, opinions and affiliations while protesting has become apparent in this location more than anywhere. The march's course is sub-divided into several sit-in spatial points. How its space has been reconstructed by youth protesting practices? What kind of political, cultural and social meanings have been attributed to this Avenue? How historical militancy and actual practices have mingled to reconstruct this Avenue?

The space itself is not homogeneous or composed of equal parts. On the contrary, the elements that compose this space have different value in terms of expected political outcome, and different impact on the surrounding public. What are the multiple sub-spaces that compose the avenue's space? How do the protesting practices differ while crossing the multiple sub-spaces?

Youth are using challenging ways of demonstration (theater performances, black comedy, songs, dancing, etc.). The groups of protesting youth seem to be constituted according to ideological, institutional and regional criteria. Protests are also the scene of veiled and unveiled women, young and older, women from diverse political tendencies participating in the march, yet separated according to Islamist or modernist affiliation.

In face of the State who emphasizes the Avenue coherence and homogeneous order, civic actors are displaying diversity, difference and tolerance. A new political order is emerging through this kind of space reconstruction.

How Do We Speak about Migration and Labour? the Vocabulary Which Articulate Migration and Work in a Critical Perspective of Analyses of Migration in the Context of Globalization and Resurgence of Racial Boundaries.

Interests in migration issues have increased considerably over the last decade with three impetuses. The first is linked to the economic and labour market globalization of the last few years and to the intensification of people circulation. The second is linked to the transnational circulation of knowledge on these issues, to the confrontation between various national traditions and approaches, and to the disciplinary and transdisciplinary institutionalization of migration research. And the third is the involvement of researchers in the area of migrations or of minorities, who provide critical insight into the theories of intersectionality.

This lead to a fragmentation of the field of migration study. It is sometimes difficult to link together different disciplinary approaches. The demanding connections between language issues, concepts, and methods may be at the risk of emptying them of their primary contents.

This communication focuses on how a seminar participates to scientific knowledge circulation about the language issues that arise while researching migration and labour. We deal with two imbricated levels: the language used to delimit the research object; and how language helps scholars to share and rearrange their way to analyse the link between migration and work.

By re-examining the links between migration and work, we favoured the study at the related interstices and intersectional logics that characterize them and their inclusion in multi-location and multi-level contexts. This contributes to the acceptance of the fact that migration is characterized by its own logic, which cannot be limited to the effect of constraints and / or economic utilitarianism. This encounter cannot be analysed without thinking about the forms of globalization of labour and of workers, and of the tensions they raise in terms of the reactivation of geographical, racial, economic, and social boundaries, and while enriching the language to describe this complexity.

*Representations of Colonial Violence in Palestinian Society***Representations of colonial violence in Palestinian Society**

In this article I am interested specifically in colonial violence, not in other fabrics of violence in society as other scholars have explored the notion that colonial violence breeds social violence in different forms that are reproduced by Palestinians themselves in their daily life. This focus, however, does not mean that all other modes of violence are attributed to colonial violence, as there are clearly other instigators of violence, be it gender-based, socio-economic, or the violence generated by traditional structures. What I mean by colonial violence, in the present context, is the "original violence" that is structurally connected to colonial power present on the ground. Such violence is meant to impose dominance and maintaining hegemony to suppress the colonized and imprison them within a persistent state of conformity to the colonizers and their ethnic hierarchies. Besides keeping the colonized people as subjects, this violence secures control over their actual resources (i.e. land, water, energy, etc.). I am rather interested in the colonized than in the colonizer as I employ the Subaltern Study Group's conceptions that prioritize the narrative(s) of the indigenous people themselves to give voice to them as a scholarly means to exit the dominant colonial framework.

Resisting Nostalgic Developmentalism: (Re)Generative Commons As a New Nexus for Sustainability and Restorative Environmental Justice in Post-Disaster Japan

This presentation contributes to ongoing efforts in environmental sociology to theorize environmental justice in social settings of disaster restoration and rehabilitation. In particular, this presentation explores the notion of a (re) generative commons as a progressive nexus system linking social justice and environmental well-being. Amidst our efforts for recovery from the aftermath of a disaster, localized and structured systems of injustices begin to emerge. These injustices rise through a hiddenness and complexity, which mask or subsume the efforts of localities to shift out of disempowerment and deterioration in their own efforts at re-generating community and environmental well-being.

We firstly clarify that a political-economic framing of recovery underpinned by 'nostalgic developmentalism' engenders and exacerbates such negative cycles, which we most clearly encountered in the post 3.11 disaster sites in Japan. 'Nostalgic developmentalism' consists of collective and often selective memories embedded with successful infrastructure modernization experiences, especially in periods of economic boom and regarding improvements in living standards. This presentation offers ethnographic and archival methods, linked with discourse analysis in a case study of disputes over reconstructing tsunami prevention levees. It enables us to analyze historical reproduction processes of 'nostalgic developmentalism,' while inducing both structured injustices systems and deterioration of local biophysical, infrastructural, and socio-cultural environments.

Finally, this paper contributes to a growing body of research that engages how local community members encounter and counteract systems and narratives of developmentalist interventions. In particular, this paper engages human and ecosystem landscape functions as (re)generative commons, which offer people discursive spaces where they can acquire historical and multi-cognitive perspectives, which in turn engender positive dialogues that fertilize and cultivate forms of socio-cultural capital and reciprocity networks among local social actors. Most importantly, a (re)generative commons can engender restorative environmental justice, which can produce practices as a nexus for achieving just and sustainable local communities.

Femicide in Canada? Framing the Responsibility of the Canadian State for the Murders and Disappearances of Indigenous Women and Girls

In this paper, I explore the possibility of framing the murders of Indigenous women and girls as femicide. The term femicide (*feminicidio*) represents an adaptation of the radical feminist concept of femicide. Femicide emerged as a powerful frame in the context of feminist activism against the killing of women in the Mexican state of Chihuahua that borders the United States. What makes femicidio different from femicide is that it draws attention to the complicity of the state with violence against women by tolerating its impunity, as well as by sustaining systemic gender inequality. Given that the Native Women's Association of Canada has consistently drawn parallels between the failed response of the Mexican state to gender violence in Chihuahua and that of the Canadian state to the murders and disappearances of Indigenous women and girls in Canada, I suggest that femicidio has the potential to serve as a frame in their struggles.

Topologies of Epistemic Change: Zoological Gardens As Harbingers of Future Lives?

Many zoos that were founded in the late 19th or the early 20th century have over time quite unexpectedly become part of urbanization processes. Today, zoological gardens find themselves situated in the center or at the close periphery of urban environments. Often this has led to a shortage of space and prohibits expansion plans. Zoological gardens have become participants in the urban race for space and life quality.

If we turn to historical maps and zoo plans we become aware of how in earlier times zoos were depicted as sites of new, systematically oriented buildings, coined by rectangular streets of houses, deserted from any human being or animals. In recent times, green areas have started to prevail, pointing to the imaginary wilderness of the animals' habitats, and building a stark contrast to the imagined grey urban outside. Hence, zoos have come to resemble the 'other space' that Foucault drafted with his concept of the Heterotopia. At least on such plans, zoological gardens do look like garden cities. However: a look onto the genealogy of the maps reveals that we are confronted with a history of colonization. The many drawn animals show that zoological gardens have - in recent times and according these plans - become densely populated areas.

On the background of these charts, the paper will discuss how it comes then, that contemporary zoos advertise their spaces with "more room for less animals", and point to the increased quality of life of their inhabitants and the pleasure of looking for the visitors, while, in fact, they have started to decrease the number of animals, that are allowed to live in zoos.

How the Turkish Press Is Covering Syrian Refugee Education: A Critical Discourse Analysis

Dire conditions caused by the ongoing civil war in Syria have forced millions of people to flee to neighbouring countries. In this context, the way Syrian refugees and irregular migrants are represented in the media carries great importance to understand the nature of public debates on the issue. Out of this need in large part, media representations of Syrians in question have become a key field of academic study in recent years. Coverage styles and discourses employed by news stories on Syrians have an important effect in increasing or reducing the public support mentioned above. It is clear that one of the most important areas in terms of problems encountered by the Syrians and their mutual interaction with Turkey's society and adaptation processes is education. Various educational services are carried out for the Syrians in Turkey, especially for children. The Ministry of National Education has developed various practices to solve the educational problems of the Syrians. It is known that children living in the refugee camps benefit more from these services. As a result of this, studies on Syrians and their educational problems have increased in recent years. This study is aimed at contributing to the field and policy makers by delving into educational and social problems faced by Syrians putting the highlight on media coverage. The main aim of this research which is designed as a qualitative study is to determine the basic perspectives of the newspapers in the context of Syrians and education and to make a general evaluation by examining the news in this sense. The news about the Syrians and education published in the national newspapers were included in the scope of the review, and the analysis of the news was based on critical discourse analysis.

: On Contested Ground: The Australian Workplace As Site of Climate Change Mitigation and Adaptation

Continuous and alarming scientific research tells us that the world is failing to mitigate and adequately prepare for climate change. To limit or reverse these planetary ecological shifts we need to reimagine the socio-economic and political structures of contemporary society. A central, yet often overlooked, aspect of this reimagining is the contemporary workplace. Climate change is and will increasingly impact work, workplaces and workplace relations. The varying responses of business, policymakers, community, environment groups and organised labour within the Australian context suggests climate change as a workplace issue is not well understood and is highly contested. This paper asks why and in what ways climate change has failed to move from the periphery to be embedded in Australian workplace relations, labour legislation and business practice. This assessment is built upon semi-structured interviews with Australian based employer associations, unions, environmental organisations, human resources managers and sustainability managers. The paper concludes by considering climate change and work as at the core of the various actors' positions around climate change and yet very much at the periphery of the wider climate debate. The workplace as site of climate change mitigation remains on contested ground.

GOODWIN, JEFF* (New York University)

The irrepressible anticapitalism of movements for social justice, or why every struggle has a Left Wing.

Political conflict almost always involves struggles at the intersection of two or more forms of oppression or injustice. Social movements of many types and constituencies, for example, must necessarily contend with capitalists, including not just labor movements but also democracy movements, women's movements, environmental movements, and movements against racial, ethnic, or national oppression. They do so either because capitalists directly exploit and oppress their constituents (or a large proportion of them) or because capitalists strongly support, if only indirectly, other forms of oppression and exclusion which afflict their constituents. Movements for justice also often seek and even require a fundamental redistribution of resources in society, which invariably pits these movements against the capitalist class, among others. The result of these factors is that movements for social justice invariably give rise to an anticapitalist wing of greater or lesser influence and autonomy, a wing which is sometimes capable, under certain conditions, of leading a particular movement as a whole. At the same time, there are systemic factors which tend to favor strongly the position of opponents of anticapitalists within social movements, especially the resources made available to them by capitalists inside or outside of movements. This talk will attempt to specify the kind of circumstances which favor the position of anticapitalists within movements.

The Challenge of Higher Education Transformation in South Africa

The South African higher education landscape has been undergoing structural, institutional and curriculum transformation for two decades. New policies, legislation and national higher educational bodies coordinate and guide the transformation process. Government has set particular economic and social priorities for the higher education sector. However, transformation must be normatively framed against academic freedom and institutional independence. Accordingly, the South African contribution will analyse the contradictions that derive from these divergent priorities.

The South African contribution will focus specifically on the changing patterns of student access to higher education; commensurate curriculum change; and graduate attributes for the roles in society and the economy. Accordingly, the aim of the contribution is to highlight the realigned foci of South African higher education from the previous apartheid bias of supporting a minority population and limited economic sectoral base to that of opening up to the majority population and the broader national economy. The contribution will also highlight the challenges of the relationship between South African education and the national economy.

Risk Culture, Risk Framing and Nuclear Energy Dispute in Japan before and after the Fukushima Nuclear Accident

The author will discuss nuclear energy dispute in Japan before and after the Fukushima Nuclear Accident with focusing on changing risk culture and risk framing. The accident revealed the failure of Japan's risk culture and risk framing on nuclear energy, a chain of underestimations, no defense against tsunamis and the station blackout, the narrow evacuation zone, and ineffectiveness of safety regulations. Why the majority of people accepted the nuclear energy before the accident? What kind of social mechanism supported the proliferation of nuclear energy? The function of 'nuclear village' and the nuclear budget, limit of courts, and weak social watchdogs. After the accident, how the situation changed? Analyzing news clippings, documents and participant observations, we can find some continuities and discontinuities before and after the accident. The accident has clearly shown that there is no absolute safety and nuclear risks remain very high. The majority of people came to support decreasing of the plant and regard the central government unreliable. Citizens' protests became drastically frequent. The focusing points of the dispute were shifted from risk of electricity shortage to risks of severe accidents in a quake-prone country, financial risk, the issues of handling spent nuclear fuel and potential nuclear deterrent. However, in Japan protesters did not yet succeed to find the effective political route of energy transition to a denuclearization. Growing political influences is still tough challenge due to the limits of organizational backgrounds and the narrow political opportunity structure. How anti-nuclear movements should be organized toward new directions, what the next step should be, and who should be their political partners? This is unclear. Upheavals of activism failed to bring the victory of national elections. Under the political backlash led by ethno-centrism and populism, Japan's civil activism is facing at cross roads, still forwarding or declining.

What's It Like After Fifty Years: Multiculturalism in Canada at the Crossroads

This keynote presentation will address issues of race and racism, xenophobia and 'diversity' after nearly 50 years of official multiculturalism in Canada. I will review some of the positive changes that have taken place but will indicate that racism in several major institutions such as policing (carding), education (Black students experience) lack of representation at higher decision making levels in corporate structures (including University administrations) and other arenas of society are still taking place. Xenophobia against Syrian newcomers and the rise of anti-Muslim sentiments are noticeable as are strained relations with Indigenous communities. I will conclude that Canadian society today requires new societal models as 'multiculturalism' and 'diversity management' are outdated and cannot explain contemporary socio-political realities.

Education, Identity Formation and Persisting Ethno-Religious Tensions in Post-Conflict Sri Lanka

Sri Lanka's ethnic conflict involving the majority Sinhalese community and the Tamil minority came to an end in 2009. The not only ravaged the north and eastern part of Sri Lanka where the Tamil minority is largely concentrated but also adversely affected the rest of the country in many ways. So, many people not only felt relieved when the war came to an end but looked forward to sustainable peace as well. On the other hand, bringing about sustainable peace and reconciliation necessitated addressing long standing causes of the conflict through policies and interventions based on evidence. Since such a plan of state action did not materialize in the years following the war, political parties and civil society groups representing the interests of the minority Tamil became agitated and articulated their demand for policy measures to address the issue of national reconciliation. It is against this background that the Presidential and Parliamentary elections in 2015 resulted in a regime change actively supported by minority political parties. While the newly elected government explicitly recognized the need for a major policy change in the above regard, certain initial steps were taken to pursue national reconciliation as a major program of the government. On the other hand, the same moves also made the nationalist forces associated with the majority community resulting in renewed ethno-religious tensions in some parts of the country, this time also involving the country's Muslim community. These developments cast doubts regarding the prospects for peace and reconciliation.

In this paper, I argue that the ethno-religious conflicts in the country are the result of a state policies pursued by successive post-independence regimes that continue to influence the formation of ethnic identities and perceived inequities between ethnic groups

Principles for Collaborative Governance: Based on Experiences of Forest Management in Asian Countries

The commitment of various stakeholders in forest policy in the tropics and Japan was brought into the mainstream. The objective of the study was to demonstrate the principles of collaborative governance applicable to both developed and developing countries as an inevitable consequence of logically-proposed strategies, in order to tackle the enduring problems confronting the people.

In Japan *iriai forests*, or communal forests, were noticed by many scholars of Common-Pool Resource management because of the particularity of *iriai rights*. Beginning in the mid 1980s, city dwellers started visiting rural areas to help manage forests as forest volunteers for recreational purposes as well as for social justice. *De facto iriai forest* owners and forest volunteers, however, potentially conflict over the purposes and recognition of the forests. In the tropics, participatory forest management systems, such as social forestry, community forestry, community-based forest management, and others, were introduced from the late 1970s as a consequence of the failure of autocratic forest governance. The participation of various stakeholders, however, causes anxiety about being controlled by outsiders as well as facing difficulties in consensus building.

Under these circumstances, the people could take three options of social movements/strategies in terms of the response to globalization: resistance, adjustment, and eclectic strategies. Collaborative governance is embodied under the eclectic strategy. To tackle the barriers of the eclectic strategy, two important guidelines are proposed: (1) "graduated membership" of executive management bodies, and (2) "commitment principle" for decision-making, or a principle in which the authority of stakeholders is recognized to an extent that corresponds to their degree of commitment to relevant activities. "Commitment principle" functions effectively in the areas where local autonomy is granted by the government. An adoption of the principle brings about a phenomenon of relativizing the ownership. Social movements hold the keys to these trends.

Career Mobility and International Activities: an Analysis of the ISA World Congress Participants in Yokohama

Globalization has motivated the exchange in sociological research and education throughout the world. Our analysis of the survey at XVIII ISA World Congress of Sociology in Yokohama (2014) reveals sociologist career mobility and its effects in globalization. Sociologists show specific trends in their global research exchange. Which world regions have stronger ties with which other regions? Does their research travels and international activities center on Europe and America? We explore these questions focusing on the mobility patterns of scholars who have studied abroad. Subsequently, such macro level trends suggest explanations for the career mobility and formation of individual sociologists. What social conditions lead them to study abroad and conduct research away from their home countries? What consequences do such global experiences produce in their research career as professional sociologists? We investigate the global mobility and career development patterns of sociologists, elaborating gender and generation gaps. This research provides macro and micro sociological perspectives on the career outcomes, particularly, of female sociologists.

Energy Democratization in Taiwan: Current Problems and the Civil Society's Advocacy

As a result of the 2011 Fukushima nuclear disaster, there has been greater public awareness of possible catastrophe from nuclear power disasters in Taiwan. In addition to the strong civic questioning of current energy policy, issues such as the urgency of global carbon-reduction and the emphasis on sustainable energy worldwide are pushing the Taiwanese government towards new and more significant energy policies. Although the government has launched several nationwide conferences on energy issues, in an attempt to reach social agreement on "energy transition," public participation, action guidelines and consensus have been largely insufficient thus far, due to the lack of deliberative discussion and articulation of a national vision in relation to current energy policies and problems. The authors utilize a qualitative methodology, through in-depth interviews with major stakeholders, such as local activists, NGO members, and governmental officials, as well as content analysis of documentary data related to the energy options debate, local energy-saving programs and advocacy for community-based energy, in order to analyze how the state-centered legacy of the developmental state hinders the process of energy democratization. In addition, the authors also investigate the ways that civil society advocate for renewable energy development in Taiwan. Based on the findings, the authors provide suggestions for strategic actions to accelerate energy transition in Taiwan.

Discursive Opportunities and Demobilization of War Veterans' Movement in Croatia

Research findings on social movement demobilization promote different explanations for the role of repression in killing a movement. While coercive actions employed by political authorities can result in termination of dissent, repression can also often breathe new life into a movement and lead to an increase in membership and public support (Davenport, 2015). In this paper we explore dynamics of war veterans' protests in Croatia and strategies undertaken by political authorities aiming to the demobilization of veterans and reduction of public support for their cause. We analyze veterans' understanding of politics as a field of particularistic battles and framing of their own position as national moral authority whose main concern is national interest. Starting from traditional understanding that put emphasis on direct interaction and use of force, we draw on the approach to repression as "an act of strategic communication" (Koopmans, 2005) in order to show how the political authorities strategically used non-violence and avoidance of direct confrontation as means for gaining legitimacy, exposing veterans as a violent group and subverting the veterans' movement. In developing our arguments we use examples from two massive war veterans' mobilizations in Croatia in 2013 and 2015 and an analysis of 26 interviews with representatives of Croatian war veterans' organizations.

The First Decade of the New Life: The Income Trajectories of Canada's Immigrants and Refugees, 2001-2012

Previous research has shown that economic integration of immigrants and refugees is a crucial indicator for their integration into their new countries, as it is a strong predictor of the strength of their sense of belonging to their new homes. Against this background, this study examines the incomes of different categories of immigrants to Canada – i.e., refugees, family-class, business-class, and skilled workers – for a cohort of immigrants who landed in Canada in 2001. Through the Longitudinal Survey of Immigrants to Canada (LSIC), those immigrants were surveyed three times – six months, two years, and four years after arrival – between 2001 and 2005. Recently, through a unique pilot project by Statistics Canada, the authors have managed to link the LSIC data with the taxation data for those immigrants for the subsequent years till 2012. This allowed for an examination of the longitudinal trends in the earnings of this cohort of immigrants during the first decade after their arrival in Canada. A regression model is developed, with the logarithm of income as the dependent variable, and six groups of predictors as independent variables, including: a) the demographic traits, b) immigrant category, c) employment, d) source region, e) social capital, and f) religious background. The results show a very interesting pattern of change over time, but also some consistent features for the whole decade. The policy and research implications of these findings are discussed.

Violence, Inequalities and Exclusion in Latin American Sociology

The relationship between violence, discrimination, racism and exclusion has been a major concern for Latin American social sciences over the last 30 years. The aim of this presentation is to give an overview of the main ideas, concepts and findings of Latin American Sociology on these issues, organized around three distinctive phases. The first one is defined by a series of studies which focused the political violence linked to the dictatorships that devastated most of the region in the 70s. The second phase is characterized by studies that addressed urban violence in a region with very high rates of homicide and theft. These studies

spread across the region, even in countries with comparatively low levels of violence. In these investigations the relationship between violence, racism and exclusion is very strong: violence affects mainly the most excluded social groups which also tend to be the victims of racism, such as Afro-Latin Americans. A third phase gained momentum in the last decade, linked to the so-called "pink tide's" political changes, new views on violence and an attempt to produce local theories. One of the main questions has been why in a period of decreasing inequality there was not a drop in crime. There has been also a renovated reflection about exclusion and discrimination. Many studies have highlighted the question of race and, above all, the centrality of gender violence, in particular femicides. There was also a new look at different types of violence and their interrelations, as well as an interest in understanding the likely influence of the political authoritarian past in the current manifestations of violence. These questions, as well as other that will be addressed in the presentation, pose new challenges for Latin American Sociology in order to comprehend, to explain and to contribute to transform reality.

KHOSROKHAVAR, FARHARD* (EHEES)

Western Jihadism in Sociological Perspective: The Urban and National Dimensions

Jihadists have been mostly analyzed with respect to their "radicalization" process, their networks, their individual and social characteristics and their ideology. They almost set aside the following dimensions:

- the urban sociological aspects (in Europe, the so-called "poor suburbs" or "poor inner cities" and the first, second, third generation people of migrant origin)
- the differences between different nations in Europe, their political culture and their ways of dealing with immigration. To give but an example: the French laïcité and the English multicultural approach have major differences and their attitude towards Islamic mores (particularly the hijab) antagonizes in a differential manner Muslims: French Muslims of traditional background feel more deeply hurt than their English counterparts.

- the differences between different communities in Europe: Moroccans, Turks, Pakistanis, Somalis.... One example: the Turks (that is European citizens of Turkish origin) are underrepresented in Jihadist acts whereas Moroccans (that is the European citizens of Moroccan origin) are rather overrepresented for social, cultural and historical reasons;

- The interaction of these communities with the cultural and social settings in each country: for historical and cultural reasons Algerians who have suffered most from decolonization are less present in Jihadist circles in France than Moroccans in the last decade. In the same fashion, those Jihadists who have returned home are "less dangerous" in Denmark than in France or Great Britain for institutional and cultural reasons.

- The urban setting can play a major role in many cases, particularly in the "banlieues" in France, "poor districts" in many European countries, or simply due to the original attraction of a city (Minnesota in the US for the Somalis (citizens of Somali origin)).

This paper intends to give their full weight to these dimensions and explore their relationship with the Jihadist agency.

The Violence of Erasure and the Significance of Excavating the Histories of the Oppressed

The paper will present different theories of violence to illustrate how structural violence sustains itself through cultural practices that erase bodies deemed insignificant. The paper centers its argument on the stories and histories of especially Black women. The central argument of the paper is that erasure denies the oppressed agency and that to reclaim this agency these narratives need to be excavated and shared in ways that restores the agency and humanness of the oppressed.

When Repression Fails

Repression aims to increase the costs of participation in contentious politics. Such repression needs not necessarily be real to be effective. Expected or feared repression might have the same effect. In this presentation I will present data on the impact of expected repression. Citizens of nine countries varying in democraticness were asked whether they expected repression in response to participation in contentious action. Theoretically, four possible configurations can be conceived: {expect repression/intent to participate} {expect repression/no-intention to participate}{no-repression expected/intent to participate}{no repression expected/no intention to participate}. In this paper I am especially interested in citizens who expect repression but who nonetheless are prepared to

participate in collective action re issues they care about. As it appears, repression is not always effective. Substantial proportions of a population previews to participate in collective action despite the repression expected. We try to understand what the perceived socio-political context looks like of citizens who participate in collective action despite the expected repression.

Class, Identity and Place in the Tensions between Environmental Conservation and Resource Extraction: The Politics of Copper Mining Development in Minnesota

New sites and forms of resource extraction projects and infrastructure such as mountain-top removal mining and oil pipelines have sparked conflicts between, and within, the labor and environmental movements in the U.S., and created fissures in alliances around climate change and green jobs. Through a case study of controversial proposed copper mining projects in Minnesota using interviews and ethnography, I explore how and why conflicts emerge between workers and environmentalists, particularly over resource extraction and environmental conservation. I draw on theories from cultural sociology and political ecology to explore the place-based identities and class differences in how people relate to nature and perceive risks and benefits of development in order to advance scholarship on labor-environment relations by addressing understudied cultural, ideological, and discursive dynamics. I find that material interests alone do not account for union, worker, and local resident support for mining that is motivated by place-based identities, nostalgia, and feelings of resentment. While support for mining is not simply the product of corporate public relations and manipulation, industry and politicians use dominant cultural narratives to mobilize support and frame environmentalists as elite outsiders and companies as part of the community. On the other hand, environmentalists contest development that they see as a threat to pristine and sacred wilderness – emotionally and culturally important places of recreation. Conflicts over mining have broader political ramifications as the issue contributes to growing support for right-wing populism – indicative of shifts in the U.S. Bridging these divides will in part require that environmentalists recognize the emotional, cultural, and social connections of workers and communities to histories of mining that shape people's collective identities.

The Anti-Nuclear Movement and Ecological Democracy in South Korea

This paper analyzes the characteristics of the South Korean anti-nuclear movement in terms of ecological democracy. Campaigns against nuclear waste disposal sites were successful from the 1990s to 2004. However, the local anti-nuclear movement was weakened after the Roh Moo-hyun administration changed the policies. The Roh administration increased economic compensation and adopted residential referendums for nuclear waste disposal sites. On the other hand, the alternative energy transition movement has flourished since the 2000s. The Lee Myung-bak administration has implemented a nuclear power plant enlargement policy. However, the Fukushima accident provided an opportunity to revitalize the anti-nuclear movement and change the political alignment of nuclear issues. Anti-nuclear movement began to get support of the people again on the basis of public concern about the safety of nuclear power. The Moon Jae-in administration declared nuclear phasing out policy in 2017.

The authoritarian developmentalism (1961-1997) was changed to democratic developmentalism under the 'democratic' administration (1998-2007). However, 'the democratic government' could not change developmentalism to ecological democracy. The regime was retreated to authoritarian developmentalism from 2008 to 2017 May. 'The candle light revolution' of 2016-2017 gave an opportunity for anti-nuclear movement to proliferate ecological democracy in South Korea.

Right Ressentiment As Reaction: Whither Democracy?

The first decade of the 21st C, marked by a variety of progressive, democratic protests and movements, the EZLN in Chiapas, the anti-globalization protests of Seattle, Geneva etc. the World Social Forum, or the "Pink Tide" in South America, was seen as a harbinger of growing democratic movements throughout the world. This is especially the case after Arab Spring/Southern Europe/OWS. But this was not to last, the next decade witnessed right-wing reactionary movements and mobilizations in Poland, Hungary, Austria, France, England (Brexit) India, Turkey, Brazil, and even the ascent of Donald Trump – supported by among the most reactionary elements of the society. How can we explain this shift? While there is no simple explanation, many journalists as well as social scientists have attributed this to the consequences of globalization especially after the 2008 implosion of the American economy. And to be sure, growing economic hardships and mushrooming inequality played a significant role, the question remains, why did these movements shift to the right and not the left in so far as both agendas promised ameliorative social change. A number of studies have suggested that much of the shift was tied to alienation rooted in various aspects of cultural changes, not the least of which included growing precariat classes including many college graduates that become unemployed or underemployed, growing migrations of people in the global economy, and the rapidity of social change. In many cases, the combination of these economic factors, together with demographic and cultural changes were experienced as assaults upon collective identities and values that undermined the status of many groups- this in turn fostered *ressentiment* to existing and often progressive elites and the embrace of reactionary leaders and movements the promised restoration the now lost world. Nevertheless, it seems as if these movements have rekindled progressive mobilizations.

An Empirical Study on the Job Satisfaction of Chinese College Graduates

Since Chinese college expanded enrollment in 1999, the number of college graduates has increased year by year. With more and more serious employment situation, the employment rate of college graduates has become the social focus. However, the quantity problem of the graduate employment is the surface of employment issue, the problem of quality is under the surface.

Based on the survey data of Panel Study of Chinese University Students (PSCUS) 2015, which is a research project on Chinese university students conducted by institute of sociology of Chinese Academy of Social Sciences, this paper described the overall job satisfaction of Chinese college graduates, and examined the major factors influencing the job satisfaction of Chinese college graduates.

The result found that the overall job satisfaction of Chinese college graduates is relatively high. External job satisfaction is higher than internal job satisfaction. Both external and internal job satisfactions have a significant effect on job satisfaction. Although some non-job factors have no significant direct impact on overall job satisfaction, they can indirectly influence overall job satisfaction by influencing external and internal job satisfaction factor.

Friends or Foes? Labor Unions and Anti-Pollution Activism in Taiwan

From the data of Taiwan's environmental protests between 1961 and 1987, we observe four different responses of labor unions when their companies faced pollution disputes. Sometimes unions engaged in physical fights with environmentalists to defend their "right to work," sometimes they sided with pollution victims by openly denouncing the polluting practices of their own companies. In some other cases unionists played the intermediary role between the management and pollution-stricken protesters, by either brokering a deal to pollution victims or covertly sending classified documents to environmental groups. Yet in the majority of cases, labor unions stayed on the sidelines and remained silent, either out of indifference or out of survival instinct to stay safe.

It has been rather clear that "pollution" is never an event taking place exclusively outside the factory fence; ample evidence also attest to the horrendous records that the management of polluting corporations manifested in basic labor rights and workplace health and safety. Even if the system of enterprise unionism in Taiwan institutionally tied workers' interest with their employers, it simply could not explain away the fact that labor unions responded differently in the face of pollution disputes.

Hence, this paper uses the data of environmental protests and union survey to specify the conditions under which labor unions responded differently to anti-pollution protests. Besides the usual culprits that one might attribute to unions' favorable or unfavorable responses to environmental protests (unions' historical relations with the management, unions' personnel overlapped with other social movements, the democratic practices inside unions), the paper pays particular attention to unions' ties to the pollution-inflicted communities filtered through the polluting corporations' residential arrangements and personnel recruitment policy, a factor that the author believes might be of great importance.

MARTINELLI, ALBERTO* (University of Milan)

The Rise of National Populism in Western Democracies.

The electoral success of Donald Trump in the USA and of national populist parties in several European countries, from Poland and Hungary (where they are in government) to France, Italy, Germany, Austria (where they have significant minorities), call for a reappraisal of the ideological bases and political strategies of both populism and nationalism. Populism is both an ideology and a strategy of consensus organization, its ideological core is thin but very strong, since it consists in the fundamental opposition between the people as undifferentiated whole which is by definition good, and the elites which are by definition corrupted and ineffective. The vagueness and plasticity of this ideological core, thin and strong at the same time, allows the populist rhetoric to be combined with a 'thick' and highly structured ideology, such as nationalism, that divides the world between 'us' and 'them' and holds that national interests and values have absolute priority. In European countries national populism takes a strong anti-EU attitude and demands the closure of the frontiers and the renationalization of policies against the EU 'superstate'. In the US Trump's national populism is blended with protectionism and nativism and aims at reaffirming a unipolar, US-dominated world. The paper will analyse the main causes of the rise of national populism on both sides of the Atlantic (such as the crisis of representative democracy and its key institution, i.e. traditional, mainstream parties; the global financial crisis and the long economic stagnation which have aggravated inequalities and nationalist tensions; the role of the new media which widely use the web for naming and shaming adversaries, looking for scapegoats, expressing personal frustrations and prejudices).

MARTINS, CARLOS* (University of Brasilia)

Recent Changes of Higher Education in Brazil

In the last decades, Brazil has been established as a new emerging world power. This process is marked by the pace of growth of its economy, especially in the first decade of the twenty-first century and by the country's greater international insertion in the scenario of globalization. Several phenomena have contributed to this condition, such as the consolidation of democratic political institutions, the existence of social movements that pushes for greater social insertion, the introduction of social inclusion and the incorporation of large contingents of the population to the consumer market. The work to be presented has the objective of highlighting certain changes that have been occurring in higher education in Brazil in the last four decades.

In this direction, certain aspects regarding the current structure of Brazilian higher education will be approached, such as: (i) late emergence of higher education in Brazil; (ii) expansion and institutional heterogeneity of the system; (iii) aspects of higher education financing in Brazil; (v) development of the national graduate system; (vi) policies of inclusion and social justice; (vii) challenges to be faced.

The *paper* aims to highlight that despite the recent expansion of institutions and enrollment in undergraduate courses, the higher education system remains exclusive to a significant part of the Brazilian population. It also wishes to point out that the lack of financial and administrative autonomy of federal universities constitutes a serious obstacle to enhancing higher education in the country. The work will seek to provide data on tertiary education in Brazil, in order to compare to the structure and challenges of higher education systems in other BRIC countries, with the aim of creating a BRICS Network University.

MISHEVA, VESSELA* (Uppsala University)

Social Entrepreneurship, Sociological Engagement, and Social Change

The debate about capitalism in question intersects the sociological debate in which sociology, in a self-reflexive turn, has begun examining its own foundations. One challenge in this regard concerns the lack of sociological interest and engagement in social entrepreneurship research, which is dominated by economics and psychology. This reveals that sociology has been alienated from its own foundations insofar as the history and institutionalization of sociology are closely associated with social entrepreneurship and the encouragement of social reform. The wealth of sociological knowledge about social entrepreneurship from a participant-observer position, which could have been applied to illustrating the basic mechanisms involved, are now forgotten and unused. Clearly, the growing number of unresolved social problems and unsatisfied social needs that have been accumulated for more than a century – in spite of the expansion of wealth production and the general prosperity of capitalist enterprises – is a primary reason for the emergence and spread of social enterprise today. However, the origins of the social entrepreneur, or agent of social change, as well as that of the unusual not-for-profit quality of her entrepreneurship, remain unclear. Against this background, I argue that social entrepreneurship begins neither with entrepreneurship, to which the social is somehow added, nor with seeing an opportunity to provide a new solution to a social problem and acting upon it, as is often claimed. It is instead conditioned by righteous indignation at injustice, which is based upon moral guilt. Social entrepreneurship will consequently be discussed in terms of an awakened social consciousness that strives to repair the damage done by the individualistic consciousness of the modern entrepreneur, who is committed to an individualistic ethics. Social entrepreneurship thus comprises a moral criticism of society that signals an emerging ethical revolution.

Interjection of 'History' in Struggles for Democracy: A Case of South Asia

The contemporary South Asia has been undergoing socio-political struggles and concomitant upheavals, ranging from local to national levels, which transform the nature of political systems, sometimes ingeniously and sometimes randomly. The last three decades are particularly marked by a range of collective initiatives and people's struggles in making and unmaking polity, economy and society. At the substantive level, three momentous collective initiatives may be underlined – the corporate capital's efforts to integrate economies at the global level, the rise and expansion of collective consciousness and concomitant actions among the vulnerable sections of society for social equality, and the people's struggles to broaden their space vis-à-vis the state. In India, the processes of democratization and contestation for identity with equality entail all-encompassing shared history, and at the same time, comprise multiple and diverse narratives. This ostensive contradiction is called for a conceptual and theoretic explanation offering insight to the unfoldment of uniformities and divergences in various forms of people's awakening and the nature of intensification of the state power. To explain the interplay between people and the state the three basic issues are addressed (i) the interconnections among the assortment of people's struggles vis-à-vis the state in different phases of history revealing trends of commonality in addition to distinctions, (ii) the analysis in terms of both contextual narratives and the intervening elements of political economy, and (iii) the construction and reconstruction of history (democracy) either by people as collective agencies enlarging the public sphere or by the state limiting democratic struggles.

Rural Community Sustainability and the Commons: A Post-Disaster Experience

In-depth field research in the field of Japanese environmental sociology has been conducted on the commons or collective natural resources management. These studies have clarified the diversity and dynamism of the commons. This paper investigates contemporary roles of the commons for community sustainability through an ethnographical case study of a Japanese rural area that was heavily affected by the tsunami that occurred on March 11, 2011.

The area had enjoyed successful collective management of various natural resources such as forest products, fish, seaweed, and river reeds. Community organizations had governed the natural resources, culture, and residents' lives. However, since the tsunami in 2011, the area has undergone community reconstruction and reorganization. Communities were dissolved, divided, depopulated, or merged in this process. This situation, naturally, led to reformation in natural resource management and the related social systems.

From the post-disaster experience of this area, this study reveals the diversified aspects and their dynamism of the commons as well as how they function, in both a positive and negative way, for the post-disaster recovery process. Furthermore, I will present the key factors for the sustainability of the local socio-ecological system such as embedded collective social systems, trust of collectiveness, and policies that enable social adaptability.

Patriarchal Authoritarianism in MENA – What Explains Its Durability?

In the early part of the new century, Turkey appeared to be on course toward an "Islamic democracy" characterized by citizen participation through fair and free elections, and legal and policy reforms for women's rights and human rights. A decade later, that course was derailed, with a form of patriarchal authoritarianism now entrenched. In Egypt, aspirations for a robust and women-friendly democratic transition following its January 2011 political revolution were similarly dashed, first by the policies of the Morsi government and then the post-2013 Sisi government. In the Islamic Republic of Iran, patriarchal authoritarianism remains in place since 1979, despite regular elections and certain socio-political changes over time. What explains the durability of such (gendered) regimes? What blocks effective democratization? The paper will examine international factors and forces, and the nature and capacity of both political society and civil society. Some references to the more successful democratic transition in Tunisia will highlight the salience of these explanatory factors. At the same time, it appears that a strong role for religion in politics and in society does seem to go hand-in-hand with the persistence of authoritarian tendencies, especially in MENA.

Plen-5.2

MOHAMAD, MAZNAH* (National University of Singapore)

Everyday Violence and the Privatization of Coercion

Globalization as exemplified through the use of social media is creating private citizens able to engage in self and communal policing. Everyday acts of violence done in the name of religion have now become normalized as a form of privatized policing. In Muslim Southeast Asia incidents of women without head veils being physically abused in public and one's 'sex' identity be administratively verified by religious authority are but two of the numerous and growing extent of violence imposed on the dignity of self. Rapid and virulent exchange and circulation of images and messages through social media may be contributing towards this privatization of coercion.

Inte-26.5**MORRIS, ALDON*** (Northwestern University)*W. E. B. Du Bois' Scholarship and the Case for Canonization*

Aldon Morris's study, *The Scholar Denied*, significantly rewrites the history of modern sociology by revealing the primacy of W. E. B. Du Bois' work in the founding of the discipline. Calling into question the prevailing narrative of how American scientific sociology developed, Morris probes the ways in which the history of the discipline has traditionally given credit for the founding of scientific sociology to Robert E. Park, who worked with the conservative black leader Booker T. Washington and to the Chicago School of Sociology. However, by using power and racial privilege, these forces rendered Du Bois' groundbreaking scientific sociology and his Atlantic School invisible. Morris uncovers the seminal theoretical work of Du Bois in developing a "scientific" sociology through his pioneering of a variety of innovative empirical methodologies and examines how the leading scholars of the day disparaged and ignored Du Bois' work. Morris' presentation will be based on *The Scholar Denied* which is anchored in extensive, rigorous primary source research. In so doing, Morris sheds new light on the role that power, economics, and ideology play in the production and transmission of knowledge. By placing Du Bois' work at the center of sociology over a century ago, Morris' presentation will make a powerful argument that Du Bois' body of sociology works need to be canonized. Only through such canonization can contemporary scholars discover and reclaim the intellectual bounty embedded in Du Bois' wide ranging scholarship.

Cana-18.2**MURDOCCA, CARMELA*** (York University)*The Politics of Redress and Racial Gendered Violence: The Case of Val-d'or*

In 2015, Indigenous women in Val-d'Or came forward through Radio-Canada's investigative program *Enquête* with experiences of physical and sexual abuse and other forms of racial violence at the hands of police officers from Sûreté du Québec. Indigenous community members, advocates and some government officials responded with demands for an inquiry and commission to redress relations between Indigenous people and the police in Quebec. Although a number of officers were placed under investigation, none of the 37 complaints turned over to the police resulted in charges against police officers. This paper will explore the representational conditions of racialized, gendered violence that gives rise to a politics of redress. I will address the following question: How do representations of racial and gendered violence provide content to political calls for redress? I am especially interested in how specific legal and ethical obligations are articulated in the presence of ongoing racialized and gendered violence.

N**Plen-7.2****NEOCOSMOS, MICHAEL*** (Rhodes University)*Resisting Xenophobic Violence in South Africa: thinking the character of popular politics*

As is well known South Africa has experienced on-going xenophobic violence since achieving democracy. Violent outbursts in 2008 and 2015 were simply extreme examples of a xenophobic culture that is endemic in the population as a whole. I have argued elsewhere that in essence, xenophobia must first and foremost be understood as a particular form of (state) politics, i.e. it is characterised by discourses and practices embodied in state thinking (indigeneity, autochthony, national entitlements, exclusion, etc.). These discourses and practices are accompanied by a (state) produced culture that legitimates the deployment of violence for the resolving of contradictions and differences within the context of a specific mode of rule in what I term a domain of 'uncivil society'. Most research has focussed on analysing xenophobia and xenophobic violence and not on explicit organised opposition to it among ordinary people within uncivil society. This presentation focuses rather on much less well-known political subjectivities: the alternative politics of resisting xenophobic violence and their related attempts at confronting the dominant state politics of exclusion. I will comment on such experiences in order to elucidate what I believe to be indications, in some instances, of a politics of universal humanity emanating from such resistance.

Ad H-1034.3**NGUYEN, NHI HA*** (Queen's University)*Our Elusive Neighbours: Imagining and Negotiating Natures with Urban Coyotes*

The history of human-wildlife relationships in urban spaces is a socio-historical account of multiple "natures" in the context of environmentalism and city development. Taken for granted in everyday life, urban wildlife appears as an ongoing pragmatic lesson on eco-social coexistence at best, and at its most unruly, a sobering, embodied reminder of a sublime nature, as awe-ful as it is an escapist spectacle for upper-class recreation. A liminal social imaginary that increasingly transgresses modern nature-culture boundaries, the urbanized, non-domesticated nonhumans colloquially known as urban wildlife thus provide a unique lens, through which the complexities of governing human-animal relations can be examined. Situated at the crossroads of public imagination, popular media and narratives of "nature" encounters, this project investigates environmental hermeneutics and the construction of "risk" as a determinant of accountability in urban wildlife interactions.

This research centers on urban coyotes, which belong to a category of non-domesticated nonhumans I define as "urbanized animals". The designation refers to those highly versatile species that have become habituated to, yet not completely dependent on human livelihood (e.g. urban red foxes, pigeons). Partly an effect of their characteristic elusiveness, and partly because of the dynamics of modern nature-culture dichotomies, the presence of urban coyotes is largely inconspicuous unless a risk element makes them visible. The proposed research is an ethnographic inquiry into the discursive framing of urban, nonhuman Others as risks, as entangled as this process is with a triangulation of governance practices, public opinion and popular media. It will contribute to the social sciences through exploring the following questions: In what way is our perspective of elements of the cityscape influenced by and influences governance of humans and nonhumans' behaviours? How are human encounters with urban wildlife coproduced through different imaginations of "nature"?

Ad H-1036.3**NISHIHARA, KAZUHISA*** (Seijo University)*Colonialism and Globalism: On Modern Japan and Internationalization of Japanese Sociology*

In my presentation, I will talk about problems of colonialism and criticize the internationalization of sociology in the Okinawan context. To begin, I present a short historical overview of the Okinawa's political climate.

Prior to 1879, Okinawa was an independent country called the 'Ryukyu Kingdom'. In 1879, Japan annexed the Ryukyu Kingdom and governed the former kingdom until 1945. In 1945, battles between Japan and the US occurred in Okinawa. Following these battles, the US occupied Okinawa for 27 years. In 1972, Okinawa was returned to the 'homeland' (Japan). Okinawa's return to Japan marked the birth of 'Anti-Return Movements'.

Although the exact growth of Anti-Return Movements is unknown, the rape of a schoolgirl by American Marines in 1995 is known to have activated current interest in Anti-Return Movements. Interest in these movements involve the following

orientations 1) pursuing Okinawan autonomy, 2) moving US bases to mainland Japan, 3) declaring Ryukyuan independence, 4) drafting Ryukyuan transnational constitutions, and 5) developing the cosmopolitan Anti-Globalism movement.

For this presentation, I will discuss orientations 3), 4), and 5) from a 'methodological transnationalism' view. This view represents an extension of U. Beck, who showed that Japanese sociology fits the framework of methodological nationalism. This extension and discussion involve a paradigm shift from 'internationalism', based on modern nation-states' presence to 'transnationalism' toward cosmopolitan social design.

Recently, Sociological Review, the official journal of the Japanese Sociological Society, put together its first special issue on Okinawa. If this issue deals only with sociological problems within a narrow perspective of the nation-state, then Okinawan problems will not be resolved. Consequently, peace keeping efforts in the northeast will be adversely affected. Finally, to resolve Okinawa's problems, I advocate for the transnationalization of sociology as opposed to its internationalization.

A Politics of Hospitality towards a Politics of Inclusion: migration, displacement and belonging -the role of participatory arts based research

In this paper I want to discuss what a politics of hospitality and a politics of inclusion looks like. Theoretically and methodologically, important approaches that help us to make sense of the violence, racism, humiliation and lack of recognition experienced by migrants, are participatory, arts based and performative research (that are relational, dialogic and embodied). Participatory action research facilitates a loosening of the power/knowledge axis involved in 'expertness' and values the knowledge experience of people and foregrounds a commitment to facilitating spaces for dialogue. This for me is constituted by a combination of creativity, critical theory and critical praxis, is interpretive and action oriented (I have called this ethno-mimesis) can reach a wider audience, challenge myths and stereotypes and be inclusive.

Participatory research and feminist understanding and theorising can take us 'beyond white man's justice' in facilitating recognition and (in my research) the cultural citizenship of women who are marginalised and 'othered'. I will share some examples of art and research with migrant women that might foster a more radically democratic imaginary that challenges exclusionary discourses and practices, produces space for dialogue and action and critical and reflective texts that may facilitate a politics of inclusion through a politics of hospitality.

"I Am Living like a Hetero:" Homonormativity Among Upper-Middle Class Turkish Gay Men

This paper examines a group of middle and upper-middle class gay men in Istanbul, Turkey, in their prolonged political, spatial, cultural and social journey from the fringes to the center—the normal. This new normality that they actively attempt for being a part of has been largely shaped by neoliberal principles and increasing authoritarianism that underscore (hetero-)normative ideals as well as homogenizing and assimilating policies. "I am living like a hetero," was something I kept hearing from gay men, aged 28 to 60-somethings, during the interviews I have conducted and the ethnographic "home visits," I made between 2013 and 2015. By saying that, they explicitly state that their work life, career and financial situation are their priority; they are oriented towards "serious", long-term, marriage-like intimate relations; homeownership—in both investment and place making senses, is significant; and they are nationalist, secular, anti-Kurdish, and republicanist with a loyal tone of European enlightenment and democracy. In this sense, their political homonormativity simultaneously overlap and contradict with the authoritarian regime in Turkey. Furthermore, they tacitly position themselves against two kinds of public representations of sexual dissidents: Politically engaged, radical leftist queer activists who enact subversive performances in public and stand against the state hegemony by using their bodies as well as the promiscuous, "crazy," gender-bending, and the performatively effeminate individuals who can go wild on social media. This group of men, their predilections and life choices, and their symbolic yet articulate oppositions give us a chance to observe and probe into the dynamics of privilege and norm formation, the everyday and multifaceted impacts of hegemonic masculinity, and the intimate relation between heteronormativity and homonormativity.

Women's Empowerment Policies of NGOs in Istanbul: Experiences of Syrian Female Migrants

Migration has come to the forefront of global event in the last century. The number of migrants all over the world has reached to the highest rate since World War II. Women and children are the groups feeling deeply the effects of wars and migrations. By focusing on especially the problems of women, many non-governmental organizations (NGOs) tend to address the problems of migrants. Turkey faced the greatest mass migration movement as a result of civil war in Syria started in 2011. Due to the increasing conflict and war conditions, the number of female migrant is increasing swiftly and local, national and international NGOs in Turkey carry out relief works and projects for food, housing, medical, legal and psycho-social support for Syrian migrants including women. Although there are some studies conducted for analyzing the impacts of migration on Syrian females in Turkey by looking at their experiences, there is no study on the discourses and activities of NGOs on Syrian females from a gender sensitive approach. This study aims to fill this gap by responding to the questions of what are gender-based discriminations faced by Syrian females, which target NGOs set for struggling with these discriminations, what kind of activities are carried out to support empowerment of women and to what extent they are effective by focusing on the voices of both 10 Syrian females and 10 NGO representatives in Istanbul, Turkey through conducting in-depth interviews and collecting NGO documentation. Key argument of this study is that discourses and activities of NGOs are determinant on empowerment of women. Herein, while NGOs can support empowerment of women, in some instances they may hinder their empowerment sufficiently.

Expulsion of Patriarchy from Gender Theory

Over the last decades, patriarchy has lost its prominence among Northern feminist theorists as a conceptual tool for theorizing and describing gender. "Out-sourced" to the global South, in the words of Inderpal Grewal, "patriarchy" circulates to explain violence to women done "elsewhere" while remaining undertheorized and devoid of temporal and cultural specificity in our literature. Yet patriarchy remains a critical and named prism through which women and men negotiate their self-making in a variety of contexts. Our failure to adequately theorize patriarchy thus limits our ability to richly voice the lived experiences of these subjects and their movements against patriarchy. With the rise of the intersectionality paradigm, the analytical power of investigating how gender domination comes to be constituted, maintained and transformed in particular ways was diminished. In this paper I advocate a conceptual framework to address this missing domain of domination in gender theory and suggest that we must open a thread via gender domination that can provide the analytical template to link theories produced in different locations that contextualize and particularize gender domination spatially and epistemologically. Empirical material for this paper comes from Turkey where melding neoliberalism with neoconservatism is remaking patriarchy under an authoritarian political regime and resistance to it by feminist and LGBTQ movements. The Turkish case raises particular questions and new analytical openings for the concept of patriarchy in gender theory.

Global Social Theory: Towards Inclusivity

This paper examines the way the social movement for global social theory is being reframed in contemporary social sciences. It suggests that both colonialism and nationalism played a major part in theory building. Today contemporary globalisation processes have inaugurated a new phase. In this context how do global social theory not repeat the journey taken in late 18th and 19th centuries?

It assesses this argument by examining the sociological traditions of India wherein social theory was articulated in context of colonialism. Social theory in India remained embedded in anthropological theory and methods because colonialism divided the disciplines of sociology and anthropology into two-one studied the modern world (Europe, North America) and the other the pre-modern traditional world (Colonial countries). While there was an effort to confront this divide in order to constitute an interdisciplinary perspective, in India, as in other ex-colonial countries, the nationalist interrogation of colonialism did not completely erase the episteme that organised social theory; rather it allowed for the continuity of colonialist positions within methodological nationalism.

Contemporary globalisation has raised theoretical challenges to this legacy and questioned various nationalist positions in practise both in the Global North and Global South. However because the globe remains unipolar dominated by the countries and regions characterised by the Global North as it did in late 18th and 19th centuries, it is possible that there might be a trend towards reconstituting the late 18th and 19th century episteme of social theory in the 21st century.

In this circumstances, it is imperative to ask how global social theory can be both universal and particular expressing concerns for the entire world and yet engaging with local, regional and national issues. The paper suggests the need for creating a new inclusive language of diversity built on relational ontological differences.

PATEL, SUJATA* (Indian Institute of Advanced Studies, Shimla)

Race and Caste: The Story of Its Intertwining, Its Erasure and Its Re-Connections in the Last 200 Years.

Contemporary literature on the caste system has discussed its antiquity and has mapped the varied contradictory ways it evolved in the different regions of South Asia. As a consequence, current studies on caste have decentered the standardised understanding of this system as being unique and frozen in time. Instead historians and sociologists have suggested that the caste system has evolved as a consequence of the changing economic and political processes occurring in the region. How did the idea of caste as a unique system of practising graded inequality emerge? The paper focuses on the way the caste system and hierarchy were conceived in the discourse promoted by colonial administrators and the native elites in colonial India. Using archaeological, archival sources and secondary literature, this paper maps the way the discourses of race and caste became imbricated through the Orientalist episteme from the mid-18th to mid-19th centuries. It also records the way the consciousness of this imbrication was erased in discursive memories in the context of formalisation of social science literature in India from mid-19th century onwards, initially in the discipline of anthropology and later sociology. By the early 20th century sociological literature had started asserting that caste was a uniquely Indian system of practising hierarchy and that it articulated the civilizational attributes of the region. Today this understanding is gradually erased as the system's present origin in 19th century colonial South Asia is being acknowledged. In this context, can we argue that contemporary caste system is racist and that caste-ism is a form of racism? Or does one seek to comprehend the specificity of articulation in the region's histories and social and cultural practices? Can race be used as a universal category to assess and comprehend graded inequalities? The paper concludes by positing some dilemmas facing social scientists in the region.

Patterns of Illicit Entry: Raccoon Encounters in People's Homes in Toronto

The raccoon has been a focus of attention in the City of Toronto. Raccoons feed from Toronto's green bins and make their dens in the attics of Toronto residents. This study seeks to understand how raccoons use residential space across the city, and into which neighbourhoods they prefer to make their abode. Treated as eternal interlopers, raccoons repurpose urban spaces for their own use. Using data from AAA Gates Wildlife on raccoon entries into homes in the City of Toronto, maps of the spatial pattern of the entries were generated. Toronto neighbourhoods were used as the spatial polygon layer to create a regression model of raccoon density (per ha) explained by elevation, building density, and whether or not the neighbourhood is on the subway line.

The Arc of Justice in the Era of Routinized Violence

How is justice configured in an era of routinized violence? How do the dynamics of changing institutions of justice and segments of civil society intersect to shape the arc of justice? This plenary will focus on questions of power, violence, and justice by foregrounding the case of documented, partially documented, and undocumented immigrants in the United States. I will argue that states are increasing using routine violence-institutionalized violence as well as facilitation of vigilante action—to shape the human in/securities of all those who are deemed immigrants. I will conclude by pointing out that this nexus of justice and treatment of 'immigrants' reveals a state's commitment to principles of democracy—freedom, rights—as well as the gap between rhetoric and practice.

From Monarch to Republic: Power, Representation and Marginalised Communities in Nepal

Nepal is the youngest republic in the world. One could see a very tempting and radical political transformation in the Himalayan country within a decade. In fact, Nepal's new identity as Federal Democratic Republic has been achieved in a very difficult way. On the one hand Maoists which launched their "people's war" in 1996 were saying that they were fighting for republic in Nepal. On the other hand, the same Maoist party leadership was having a tacit understanding with the Monarchy to abandon other parliamentary political forces. Many Nepalese were suspicious about Maoist party about its transformation from the rebellion to a peaceful democratic party before the party accepted the result of the second constituent assembly elections in 2013. People used to argue saying Maoists still wanted to capture the power by destroying all the existing apparatus. However, Nepal's journey from Monarchy to a Republic has been a reality today even though the process was a bit lengthy and tiring one. Federalism, secularism and inclusiveness are considered as major achievements of "new Nepal" as mechanisms to address the problems faced by minorities and marginalized groups of the country.

This paper discusses how Nepal could deal both the authoritarian monarchy and the rebellion Maoists at a time, and introduced a widely acceptable political system within a democratic framework. Major concerns i.e. power, social exclusion, representation etc. of the minorities and the marginalized groups of contemporary Nepal will be the major focus of the analysis.

Dynamics of Subnational Funding of Advocacy Groups

The social movement literature has long recognized the importance of resource mobilization. In many countries this is tied to political opportunities linked to the nation-state. A growing literature has examined the importance of that funding on social movement and advocacy groups. What is less clear is how subnational politics affect funding and whether they too play a role in sustaining advocacy and social justice groups when national politics turns to neoliberalism and austerity. Looking at Indigenous, Environmental and Women's advocacy groups this paper explores how critical events and political opportunities affect subnational funding and whether it fills the void created by declining national support of social justice and advocacy groups.

Redefining Masculinities in Anti Gender Based Violence Initiatives Under Authoritarian Conditions

Notions of responsibility are intimately tied to conceptions of masculinities and femininities in both collective and individual practices. Projects for gender justice and women's empowerment imply masculine responsibility in formulating the problem and suggestions for reform, but men, while deemed responsible, are often not directly targeted by women's-rights organizations in their awareness and conscious-raising campaigns and projects to promote gender equality, particularly in the area of gender based violence (GBV). This project examines Cairo-based initiatives and groups working to end public space sexual harassment and GBV to see if it is necessary to invoke "traditional masculinist modes of responsibility..." in order to change men's perceptions, behavior and public opinion. The implications of not directly addressing the role of men and masculinities in projects for gender justice need to be examined especially in authoritarian contexts where the space for civil society has been severely curtailed, especially in Egypt since 2013. Until gender (masculinities and femininities) is fully addressed, particularly in the area of gender-based violence (GBV), such projects will most likely not be successful in the long term. This research discusses how and if various groups working to end GBV in Egypt, particularly public space sexual harassment, deal with masculinities and engage men in an authoritarian political context based on field work (in depth interviews with staff and volunteers, content analysis of reports and other written materials and observations) with independent initiatives, non-governmental organizations (NGOs), national and international organizations based in Cairo. More specifically, the findings will explain why men have been active participants as staff members and volunteers in anti-sexual harassment campaigns particularly and how some of these groups are trying to reconceptualize masculinity and masculine responsibility in ways that are not traditionalist nor patriarchal.

Feminism, Motherhood, and the Globalization of Reproduction: What is Justice?

The following presentation interrogates this erasure of immigrant women from our vision of who we are as US citizens. I analyze the process and function of placing immigrant domestics and nannies in the shadows and avoiding issues surrounding employee rights, safety and health problems, and childcare needs. Examining the nexus of immigration, nationality, and markets is central to the social reproduction of the "American" family, communities and country. Immigrant women provide affluent families with "assisted reproduction" in the US (and internationally); and vital to conceiving a new just world order.

ROMERO-LANKAO, PATRICIA* (Climate Science and Applications Program)

Uncertainty in Climate Vulnerability and Risk. Lessons from Interdisciplinary Sociological Research

Many different approaches exist in the theoretical and practical literature on the analytic ("is") and normative ("ought") dimensions of urban sustainability and resilience. This presentation draws on prior sociological and interdisciplinary work in cities from the Americas and Southeast Asia, to reflect on the policy implications of one dimension of uncertainty: ambiguity. What we know depends fundamentally on what questions we ask and how we go about answering those questions, based on the kinds of methods and data we decide to use or have available to us. For instance, many studies on health risks in cities, apply an epidemiological approach that, while important to examining health outcomes, tends to ignore the influence of behavioral and institutional factors, and produces a set of explanatory variables that are tightly constrained by the availability of data, particularly in developing countries. These studies omit any attempt to gain ethnographic knowledge of behavioral norms, social networks and risk perceptions that are equally relevant to understanding both inequality in urban populations' vulnerability and populations' agency. Policy makers often pick up on this dominant thread, resulting in policies that ignore behavior and other social factors that can influence the success or failure of their policies.

Migrating Beyond Borders and States among informal South Asian Migrant Workers in South Africa

South Africa provides an interesting case study for unravelling the reasons for the increase in South to South migration. An Egyptian migrant in South Africa claims his right by stating "Egypt is still in Africa, not like Pakistan. It is still our home you know". The dichotomy of inclusion and exclusion raises questions into how migrants claim a space, a sense of belonging and demarcate territory. Even though South African cities are marked by rising discontent and unemployment, emanating in violence and crime against specific immigrant groups, for many migrants in South Africa's informal sector, out-migration is seen as a form of upward mobility. South Africa's attractiveness as an alternative site for migration is growing, given the potential for entrepreneurial activity, access to new labour markets, freedom to practise their religion of choice, ease of movement and relative peace in the country. Based on empirical research among South Asian migrant workers in the informal sector, this paper examines the extent to which community, space, and belonging impact overtly and covertly on the relationship between migrants and informal work in terms of occupational choices and networks available to migrants under conditions of urban diversity. Even in the creation of ethnic enclaves there is a move towards a politics of inclusion that requires all parties to transcend 'local-foreign' divides that privilege other identities. The narratives show the complex interplay of multiple identities as migrants, workers, and South Asians, sometimes with ambivalent implications for social cohesion.

SAGOT, MONTSERRAT* (Universidad de Costa Rica)

What is Justice for a Victim of Femicide? Challenging the Concepts of Rights and Justice from a Context of Disposability of Female Bodies

Central America is one of the most violent regions in the world, outside of an open war zone, with countries like El Salvador, Honduras and Guatemala, presenting some of the highest homicide rates. As a regional tendency, female homicides have increased at a much higher rate than male homicides. Violence against women is an extreme manifestation of gender discrimination and a deadly tool to perpetuate women's subordination. While femicide is a universal phenomenon, there are certain contexts, generated by histories of coloniality, exclusion, racism, sexist norms and the presence of organized crime that propel the conditions for an increased rate of femicides.

In those contexts, femicides are not social anomalies. They play a role in a climate of increasing authoritarianism and become a form of "pedagogy of cruelty" with a punitive and disciplining discourse. Because of this femicides usually take place under conditions of indifference and impunity. The dead body becomes a signifier of multiple systems of inequality that produce a context of "disposability" of women. In a context of disposability of female bodies, I question the rights paradigm and its supposed challenge to unequal relations of power. I also question the concept of justice as it is used in liberal democracies because of its instrumental logic and objectifying nature.

If we would like to envision a world without the misogynist killing of women, the rights paradigm and the pursuit of justice will fail, unless they guarantee women's access to full lives, not only in terms of recognition or representation, but in terms of the social, economic and political conditions required for the female bodies to exist, beyond just survival.

SAIDANI, MOUNIR* (El Manar University)

Social Change Challenging Social Sciences: The Case of Tunisia

The Arab uprisings were not simply a speedy process of social change but rather a new phenomenon that challenged assumptions common in the social sciences. For the case of Tunisia, and especially for sociology, the uprising call for a broad and deep mode of observing social actions, a careful classification and analysis of social actors and social facts. My point of view is that it has been a challenging situation for knowledge because of a tendency among Tunisian sociologists to expect change only from above, undertaken by large social structures and at a slow pace.

I will attempt to point out that the explanatory paradigms implemented by Tunisian sociologists are problematic, given the realities of the uprising. I will argue that the mainstream of Tunisian sociology was built upon a profound belief that the State was efficient, and that society was not able to produce contestation and protest forces, let alone force change. The paper will illustrate the inadequacy of that way of thinking by exploring Tunisian youth connections and networks that made themselves known during the Tunisian revolution and over the two to three following years.

SAIDANI, MOUNIR* (Universite Tunis El Manar)

Social Justice Claims and Power Violence in Tunisia. the Cases of 2008 and 2011 Uprisings

To the question to which extent can the State exercise power using violence without paying attention to justice as social demand, one can provide different answers from a sociologist point of view. The Tunisian 2008 uprising in the southern west mining area known as the mining basin; then the 2010 continuous uprising until the fall of Ben Ali on January 14th, 2011, seem very appropriate in the attempt to provide an answer to the above-mentioned question. In both cases, social justice was the very central knot in the relationship between a power less and less able to meet the expectations of the sweeping majority of the impoverished middle and lower social classes and a more and more battle-hardened social movement that learned how to enter into social clashes. By putting again in the social justice claims from outside the customary traditional political unionist and associative means and practices in the agenda, the social movement has given another alternative to the usually failing protests and contests under the violent power practices. Comparative analysis of the failure of 2008 uprising in becoming a substantive threat to the established power with the success of the Tunisian 2011 Revolution in beheading Ben Ali's rule in the first hand, and with other Maghrebian (North African) social movements can provide insights into the issue of the relationship between Power, Violence and Justice.

Ad H-1035.1**SANTOS, HERMILIO* (PUCRS)***Life-World: The Sociology of Alfred Schutz. Screening and Discussion of the Documentary Film*

The documentary film "Life-world: The Sociology of Alfred Schutz" (directed by Hermilio Santos, 60', Brazil, 2018), with interviews on different aspects of the work of Alfred Schutz is divided in four parts: some notes on his biography; the main theoretical influences on his work, as Edmund Husserl, Max Weber and Ludwig von Mises; the main concepts of his sociological theory and how his sociology have been used currently in theoretical and empirical researches. Among the interviewees are Claudia Schutz Gahagan, Michael Barber, Lester Embree (USA), Hisashi Nasu, Mototaka Mori, Masato Kimura (Japan), Ilia Srubar, Martin Endress, Jochen Dreher, Andreas Göttlich, Joachim Renn (Germany), Thomas Eberle (Switzerland), Michel Maffesoli (France), Carlos Belvedere, Silvana Figueroa-Dreher, Daniela Lopez, Mercedes Krause (Argentina), Luigi Muzzetto (Italy) and Tomas da Costa (Brazil). The interviews were conducted in English, German, Spanish, Japanese, Italian, French and Portuguese with English subtitles, with locations in Vienna, New York, Tokyo and Buenos Aires. After the screening the director of the film will discuss some topics explored in the film. The proposal of this *ad hoc* film session is based on the increasing worldwide interest on the sociology of Alfred Schutz, showed by the publication of his complete work in twelve volumes in German, by the creation of the *Journal Schutzian Research*, initiated in 2009, by the establishment of the *Alfred Schutz International Circle for Phenomenology and Interpretive Social Science* (created in 2012), besides the publication of recent books and articles exploring different aspects of his sociology.

Inte-27.3**SCHULZ, MARKUS S.* (New School for Social Research)***Crisis, Contention, and the Possibilities of the Political*

The rise of a new rhetoric of "crisis" signals a re-opening of the political horizon. How could or should sociology respond to the crisis of the present? What are the competing options, resources, and obstacles? This paper explores the social construction of selected types of recent "crises" in the context of a broader global crisis and a shifting zeitgeist. It contrasts the spectacles of corporate media and the technocratic narratives of political and economic elites with challenges to austerity and emerging alternative visions. On a theoretical level, it argues for the need to connect economic approaches to crises with studies of contentious politics and futures research. Studying stories of crises is studying futures in the making. This entails the forging of decisions points and narrative devices that broaden or narrow the choices considered to be within "reason". The widely diagnosed decline of utopian visions had left a void. The resentments of disenchantment that seep into this void threaten institutional stability, yet without altering more fundamental power differentials. Deconstructing the enclosures of expectation can help to democratize the imagination of alternative scenarios. In this sense, a sociology of possibilities offers practical relevance for the democratization of the political.

Asso-1018.4**SEIYAMA, KAZUO* (Japan Society for the Promotion of Science)***Pluralization and Fluidization in Japanese Stratification Structure Under Globalization: A Transformation of Academic Background-Oriented Society*

Recent research on social stratification and inequality has focused on income and asset inequality, as typified by Piketty. But sociological tradition of this field has been much more broader, including strata composition, social mobility, inequality of opportunity, and status consciousness. However, the impact of globalization on stratification structure has not been sufficiently studied.

This presentation analyze the impact of globalization, focusing on cases in Japan, and make clear that pluralization and fluidization are the basic changes induced by globalization. To be exact, an important change in the stratification structure among advanced societies had begun with the individualization of the second modernity (Beck 1986), bringing the "decay of class society", which had been conceived as the one where each class based on occupational status has its own specific living level, culture, life-style, and political orientation which are to be carried on through generations. However, due to various factors, such class society characteristics had declined significantly before entering the 1990s.

The impact of globalization comes after the 1990s, which brought about pluralization and fluidization of stratification structure. Pluralization is apparent in the fact that stratification status has become not determined solely by occupational status but increasingly affected by other factors such as academic background, ethnicity, and gender. Fluidization can be seen in the increase of non-regular employment. And also a representative example is the "less assuredness of higher educational background": that is, carrier instability and increased internal disparity among highly educated youth.

These structural changes suggest that a stratification structure should be investigated as, not merely an occupational composition, but a socially meaningful construction of reality concerning social status, life chance, life-style and inequality. In the presentation more detailed examples and analyses of pluralization and fluidization of Japanese stratification structure will be shown.

Asso-1016.3**ŞENTÜRK, BURCU* (EGE UNIVERSITY)***Loss of Status and the Masculinities: The Case of the Professional Syrian Male Migrants in Turkey*

Discussions on the capitalist reorganization of the work and class relations marked the analysis of the concept of precarity as can be mainly seen in the works of Bourdieu (1998) and Standing (2011). The connotation of the concept has gone beyond the position in the labor market with the feminist researchers' suggestions for gender lens for the concept. Moreover, the inextricable link between work and masculinities result in emerging literature on masculinities and precarity. Starting from this theoretical intersection of masculinities and precarity, this study focuses on the masculinities of the Syrian men who used to work in professional occupations before migrating to Turkey. Most of the Syrian men who used to hold professional occupations, are not able to continue on their professions and have to work in/search for lower status jobs in which they are neither supposed to use nor have the chance of using their skills and full professional capacity. They, as the new precariat of Turkey, become the targets and the beneficiaries of the social assistance programs conducted by the government and the NGOs. Besides, due to the social stigmatization about Syrian migrants, they are exposed to the fear of violence. The inability of preserving advantageous position in labor market and their social and legal status pushed them into a new negotiation between their masculinities and conditions of new social setting. Drawing upon the narratives of the Syrian men who used to be occupied in professional jobs, this study aims at exploring the effect of changing social/legal/economic status on masculinities, gender roles within family and Syrian men's coping strategy with loss of status in their new social setting.

Ad H-1036.2**SHIN, KWANG-YEONG* (Department of sociology, Chung-Ang University)***Internationalization of the Social Sciences in South Korea: The Current Status and Challenges*

The social sciences in South Korea have been affected by both democratization and globalization. Democratization in South Korea has transformed university system in significant ways. The Kim Young-sam government claimed as 'the civilian government,' transformed the orientation of social sciences research by emphasizing area studies and comparative research as a part of the government's globalization policy. As democratization proceeded, the rules for social sciences research were also altered. The newly introduced sabbatical leave system in the 1990s allowed scholars to be exposed to the burgeoning international research. The competitive allocation rule of research fund by the National Science Foundation has contributed to the internationalization of the social sciences in South Korea, by emphasizing meritocracy rather than seniority. The education of graduate students was also changed by an introduction of the Brain Korea 21 program in 1999, which purported to enhance the quality of graduate education. Internationalization of graduate education has been a core part of the Brain Korea 21 programs by emphasizing publication at international journals and participation in international academic activities such as conferences or workshops. In sum, the simultaneous process of democratization and globalization has generated a unique feature of internationalization of the social sciences in South Korea. It also generates academic challenges about the autonomy of researchers and publication of national or local experiences in international journals.

Reconfiguration of Social Class and Work in the Globalizing World

This paper explores the reconfiguration of the relationship among class, gender, and nationality in determining inequality in South Korea in the 21st century. Production and work go beyond the boundary of the nation-state due to globalization. Discussing the limitation of the classical approaches to social class and inequality, this paper suggests a new sociological approach by emphasizing the shift of temporal and spatial bases of social stratification and inequality in the globalizing world. Globalization has transformed the temporal basis of social class, undermining the employment system. Scientific and technological innovation have threatened the long-term contract between employers and employees, changing the structure of labor contract and diversifying workers' status by the type of contract. It has also transformed the spatial basis of social class, weakening the boundary of capital and labor embedded in the nation-state. The massive mobility of capital and labor across national boundary has transformed social stratification and inequality with the formation of foreign manual workers as the lowest social strata and at the same time the rise of the high strata professionals working in the transnational corporations in each country. In South Korea, however, those changes have been accelerated by the financial crisis in 1997, generating larger class inequality and poverty.

Moving Beyond Policies: Unions and Nature

Having led in the development of innovative policies on climate change, the definition of constitutive elements of just transitions and concrete plans to build a socially-owned renewable energy sector in South Africa; the National Union of Metalworkers of South Africa (NUMSA) has been unable to move beyond the creative resolutions that the union adopted to link shopfloor issues with broader ecological questions. The inability to move beyond agreed policies to implementation fundamentally raises questions about the ability of labour movements and unions in energy intensive sectors to lead on their own thoroughgoing and just transitions. By looking at both endogenous and exogenous factors that led to a stalled implementation of agreed policies, the paper will look at sources of inertia that act as stumbling blocks to labour movements fulfilling their role as active participants in environmental justice movements. Through an examination of these challenges and impediments, the paper will identify strategies inside and outside of unions that potentially can allow organised labour to take practically and with conviction its place in broad red-green coalitions

Globalization and Transformation of Higher Education in India: A Paradigm Shift in the Policies of Development and Social Justice

Globalization is a process of change affecting simultaneously both the developing and developed societies in a variety of ways from 'the cultural to the criminal, the financial to the spiritual.' Globalization refers to 'the increasing interdependence of the people across the world, it refers to the increasing impact of living and working in a single, global market place, but more fundamentally, it refers to a basic shift in the institutions of our lives'. As a result we can see a process of transformation in different institutions of the society. India has adopted the policy of 'globalization, privatization and liberalization' in 1991 in order to improve its economy. However, the process of globalization gradually extended to other institutions of Indian society. In the field of higher education a number of structural changes have been made in order to facilitate the process of globalization. In pre-globalization period, the higher education was mainly supported by the state, but in last two decades the number of self-financed educational institutions and private universities has been increased and these institutions are now in a competition with the state and central universities. Apart from these structural changes digitalization of the educational sector and success of software industry has not only transformed the structure of the technical and professional education but also changed the gender ratio in these sectors of higher education. The present paper is aimed to analyze the dynamics of the globalization in transformation of higher education in context of development and social justice.

Sociology's late colonial roots in France, Britain, Belgium, and their former colonies

This article develops a revisionist history of postwar European sociology through the mid-1960s, arguing that colonial research represented a crucial part of the renascent academic discipline after 1945, especially in Britain, France, and Belgium. Colonies became a privileged object and terrain of investigation and a key employment site for sociologists, engaging 33-55% of the British and French sociology professions between 1945 and 1960. Colonial developmentalism contributed to the rising demand for new forms of social scientific expertise, including sociology. The article begins by showing that sociologists became favored scientific partners of colonial governments, and that this fueled new forms of applied sociology focused on urbanization, detribalization, labor migration, industrialization, poverty, and resettlement of subject populations. The article then establishes the existence of networks of colonial sociologists, charts their size and composition, and reconstructs their relations to neighboring academic disciplines, especially anthropology, and to the metrocentric majorities in their own national disciplinary fields. While some colonial sociologists served colonial powerholders, others pursued more autonomous intellectual agendas, even when they were located in heteronomous conditions and marginal institutions. Colonial sociologists made theoretical, methodological, and empirical contributions that shaped the subsequent discipline, though usually in unacknowledged ways, foreshadowing transnational and global history, historical anthropology, and postcolonial studies.

Breakin' up Is Hard to Do? the Effects of Assortative Mating on Relationship Dissolution in Taiwan

Research has documented a recent decline in education homogamy in Taiwan, but the explanations for this trend are not clear. On the one hand, greater urbanization, increased geography migration, the rise of individualism, and decrease in educational institutions and workplaces segregations should increase contacts between people from different classes and lead to a decrease in sorting on family origin and decreasing influence of parents over partner selection. On the other hand, economic theory posits that economic downturn will reduce intermarriage because whom one married matters more in times of high uncertainty and inequality. In fact, rapid education expansion, growing economic inequality and job insecurity, and stagnation of low wage, together with strong preference of status homogamy or female hypergamy have been linked to delayed transition to marriage and gender differential of marriage rates in Taiwan.

This study examines how inequality within and between generations affects dating, mate selection and marital stability. Although sociologists has long interested in the role of assortative mating on relationship interruptions, their research rarely extends beyond the equivalence of qualifications within the couple. We examine how homogamy at both the individual and family levels affect rates of relationship dissolution in Taiwan. The case of Taiwan is especially interesting because the Chinese family norms that feature frequent intergenerational interactions throughout the life course make the equivalence in status between a couple's families of origin particularly important in shaping the couple's romantic relationship and marital relation. Using data from Taiwan Educational Panel Survey and Beyond, our analysis indicates that, although dating between individual with dissimilar traits are common among today's youth, courtship and marital stability are still highly governed by preferences for status homogamy or hypergamy. Moreover, homogamy in individual characteristics does not make a relationship more stable than similarity in class origin.

Pres-2.3**SUNDAR, NANDINI*** (Delhi School of Economics)*Universities as Sites of Power, Violence (and Justice?)*

This paper looks at the question of academic freedom, which is increasingly under assault from authoritarian governments worldwide, supported by right wing student groups who act as provocateurs and disruptors within. However, this issue needs to be located more broadly. As critical nodes in the process of elite formation (both nationally and within imperial formations) universities are intrinsically connected to the establishment, and thus sustain ruling power, even if the self-image is one of critical distance. While the assumed disinterestedness of knowledge production, and the way in which this constitutes an educated personhood functions as an important source of hegemony, universities are also sites of work and exploitation (especially of contract faculty) and vehicles for different kinds of agonistic relations (e.g. between student expectations and what the university actually offers), all of which limit the concept of academic freedom in important ways.

ISA -1033.4**SZTOMPKA, PIOTR*** (Jagiellonian University)*The Moral Capital: Much Needed Resource*

Society is nothing else but what happens between and among individuals in the interhuman space. One of the crucial missing resources of societies pervaded with abuses of power, violence and poverty is social capital, the network of good relations among the citizens. The core of social capital is moral capital which consists of six fundamental relations: trust, loyalty, reciprocity, solidarity, respect and justice. Trust is the bet on good intentions and actions of others, loyalty is the obligation not to harm those who trust you, reciprocity requires returning received favors, solidarity asks for disinterested contributions to the welfare of the whole community, respect recognizes dignity of others, and justice demands distribution of rewards proportional to the merits and achievements. Those relations constitute a syndrome; they are logically and empirically interconnected and none can be realized alone. Together they create important prerequisites for the functional efficiency of the social wholes of all sizes, from the family to the nation, and in perspective even the global community. And at the same time they make life of societal members more satisfying, fulfilling and happy. Alas the realities of many societies are witnessing the opposite syndrome. The levels of distrust, both horizontal toward other people and vertical toward the institutions are alarmingly high. The citizens' loyalty toward the state is very low. In place of reciprocity there is widespread exploitation. The idea of a common good is treated as an abstraction replaced by rampant egoism. Abuse, hostility and violence replace respect. Injustice of all sorts prevails. It is a big mistake to treat these as intangibles and imponderables, as "soft" irrelevant factors, putting all emphasis on "hard" material and financial meaning of capital. Without moral capital social development is not to be achieved.

T**Asso-1018.1****TAKENOSHITA, HIROHISA*** (Keio University)*Dynamics of Transition into Managerial Positions in Japan: Combining the Approaches of Intergenerational and Intragenerational Mobility*

This paper investigates what shapes transitions into managerial positions from the perspectives of intergenerational and intragenerational mobility. We focus on attaining managerial jobs because across industrialized countries, those jobs are highly desirable and managers can earn higher wage. Stratification research has had greater interests in how those advantaged status are inherited across generations. Previous studies have predominantly deployed mobility tables to detect patterns and changes of intergenerational reproduction of social class. Nevertheless, this line of research has neglected the process through which people climb up corporate ladders. Conversely, stratification research has shifted their concerns from intergenerational mobility to intragenerational one, mobility from the first job to the current job. This research explores the mechanism by which workers attain managerial positions after they start working, while it ignores how privileges in family background shape transition into desirable positions in corporate hierarchy. We, therefore, need to combine those separate perspectives of intergenerational and intragenerational social mobility. Furthermore, it is important to consider that the process of attaining managerial jobs depend on institutional arrangement of education and labor market. For instance, it is assumed that the institutional contexts of employment practices shape conditions of promotion among employees. In Japan, given the long-term employment practices and seniority earnings, employees are more likely to be promoted if they remain in the same company for longer years. Conversely, in other countries, people can become managers even if they change employers. Moreover, Japanese educational system differs significantly from that of other Asian and European countries. We need to identify how those institutional arrangements mediate the intergenerational inheritance of those desirable positions in the labor market. The case of Japanese society is very suitable to demonstrating how inequality depends on institutional arrangements because of different institutional arrangements of schooling and labor market.

Pres-2.1**TALLBEAR, KIM*** (University of Alberta)*Caretaking Relations, Not American Dreaming: #IdleNoMore, #BlackLivesMatter, and #NoDAPL*

I examine the caretaking of relations that I see embodied in several recent social movements led by women, two-spirit, and queer people. #IdleNoMore, #NoDAPL, and #BlackLivesMatter are commonly understood as environmental and/or social justice/anti-racist movements that call settler-colonial states, including the US and Canada, to make good on their treaty promises or civil and human rights law, to live up to their supposed dreams of liberty and inclusion. Since 2012, I have watched these movements unfold. Looming large in my vision fed by the 24-hour news cycle and more importantly by friends and colleagues on the ground of those movements and on social media, is Indigenous and black women and queer people caretaking their peoples. In the case of Indigenous-led movements, I also see a caretaking of other-than-human kin, the land and water—all our relations. In this moment of crisis—new to some but ongoing for many—is an opportunity to unsettle the American Dream that brings violence to so many at home and abroad. Turning our redemptive attention away from empire to instead focus on caretaking relations defies a foundational settler-colonial narrative—that nature/culture binary that puts humans at the top of a hierarchy of life, and white men and the top of that. American dreaming is rooted in a vision that cannot see bodies in mutually sustaining relation. It objectifies black and brown bodies, women's bodies, land and water bodies, and many bodies on down its hierarchy. The usually white men at the top—be they clergy, statesmen, or scientists—have long viewed it as their civilized prerogative to alternately exploit or steward life according to their animacy hierarchy. Their narratives script a particular structure of violence. This talk proposes instead another productive script.

TASTSOGLU, EVANGELIA* (Saint Mary's University)

Gender, Violence and Precarity in Displacement

This paper focuses on gender, violence and precarity in various stages of the forced migration process. I argue that the historically contingent, stage-specific, jurisdiction-distinct, intersectional, institutional and interpersonal forms of patriarchal violence experienced by women and families fleeing from conflict and devastation interact with their context-specific forms of precarity in a matrix of mutually reinforcing processes. I draw upon and discuss the sexual enslavement and genocidal violence against Yazidi women and girls under the Islamic state in the Middle East; the predatory, and at the same time systemic, sexual assault and gender based violence by smugglers, traffickers, government actors, community members and fellow refugees against women and families "irregularly" crossing land and sea borders seeking "safe haven" in Europe; and the institutional and every day forms of violence faced by asylum seekers in a permanent "suspension", in camps and at various stages of the asylum process in Greece and "Fortress Europe".

TAVARES-DOS-SANTOS, JOSE-VICENTE* (Federal University of Rio Grande do Sul)

Violence: Theory, Phenomenology and Public Policies

Violence has become a new social issue around the world: it's social roots are the processes of social fragmentation, inequality, stigmatisation and social exclusion. Changes are taking place in social institutions, and the processes of socialisation are in crisis. Late modern societies also produce transformations in crime and in forms of diffuse violence, such as violent crime, gender violence, acts of racism, and school violence. A worldwide landscape of insecurity emerges.

The Sociology of Violence and Conflictiveness is particularly notable in France, the United States, United Kingdom and, strongly, in Latin America. The main concept is the microphysics of violence which points to a theoretical discussion about the civilising process in contemporary societies. This sociological tradition combines empirical research, theoretical explanations, and social commitment. But this new global social issue is provoking changes in the state: the social control is accompanied by repressive measures, a penal social control state who is accompanied by the use of illegal and illegitimate violence. The main themes are political violence, police brutality and urban violence. And the microphysics of violence also implies domestic violence, gender violence, and corporal punishment at children and seniors. We observe a lot of analysis concerning symbolic violence and the reproduction - by media, television series, movies and by literature - of a culture of violence.

Although, we note the emergence of collective action and institutional initiatives for preventing violence and reducing violent crime: there are new alternatives for public safety policies capable of guaranteeing the citizens' rights, like the human security and citizenship safety models. Peace after violence would become a new social possibility for the new generations.

TAVERA FENOLLOSA, LIGIA* (Facultad Latinoamericana de Ciencias Sociales)

Fighting for social justice in Guerrero, Mexico: Creating alternatives to the state's failure to provide security and justice.

Since the nineties, social movements in Latin America have been very successful: they have overthrown presidents in Ecuador, Argentina, Paraguay, Peru, and Brazil, they have stopped or slowed down privatizing processes and have forced elites to negotiate and take into consideration their demands. However, questions remain as to whether the resistance can survive if it does not put forward a coherent alternative to the neoliberal state. In this paper, I address the experience of constructing an autonomous, indigenous-based system of security and justice in Guerrero, Mexico, that along with the Zapatistas' Juntas de Buen Gobierno in Chiapas and the Rondas Campesinas in Peru has become an important example of the creative and innovative potential of social movements across Latin America. Based on in-depth interviews with leaders and members of the Coordinadora Regional de Autoridades Comunitarias (CRAC-PC) and from the Unión de Pueblos y Organizaciones del Estado de Guerrero (UPOEG) the paper looks at the rise of the community police force or policía comunitaria in the ultra-violent state of Guerrero, and critically examines in what sense are they succeeding in creating alternatives to the state's political hegemony and for building social peace.

"We Can't Fight What We Can't See: Grading Top Sociology Graduate Programs' Training on Race"

As can be gleaned from a cursory perusal of undergraduate textbooks used currently in introductory sociology courses, it is quite normal to engage students in these classes in discussions about the three major stratifying divisions in US society: race, class, and gender. The professors who write these texts as well as those who ask students to purchase them may believe in the primacy of teaching young North American college students about these divisions. However, perhaps the more appropriate measure of the importance of this knowledge to the discipline is the preparedness we instill in our doctoral students as they train to take on jobs to teach, as well as create and disseminate new research on these key stratifying divisions. Students in US sociology doctoral programs surely cannot graduate without knowing Marx's theories and most often taking qualifying examinations that ask about that very topic. However, attention to theories of race and gender are optional, if courses in the material are offered at all. One might argue that the status quo training we offer doctoral students actively ensures an uneven knowledge base in our professoriate in areas we signal to undergraduates are crucial to understanding how society works, and perpetuates these holes in our collective knowledge base. This paper presents research from a study of US doctoral training programs in sociology, on their engagement with the basic sociological divisions of race, class, and gender, and discusses the implications for the discipline and our society as a whole of this unevenness in doctoral student training.

Claves críticas para comprender las tensiones entre transformación y conservación de la tierra comunal: parentesco, uso y propiedad de la tierra.

¿Cómo conservar la herencia comunal de la tierra?, ¿Cómo se conserva la tierra comunal y al mismo tiempo alteramos las jerarquías en un sistema patrilineal?, ¿Cómo transformamos sin perder lo que tenemos? Estas son preguntas que pueden orientar tanto el hacer político pragmático, así como la incesante discusión de las mujeres indígenas en los momentos álgidos de defensa de tierra frente al cercamiento que producen la economía extractiva. La construcción de la respuesta de las interrogantes me permitirá exhibir una clave en el que las mujeres indígenas piensan la transformación y conservación de los medios concretos para la reproducción de la vida, justamente porque son ellas las principales defensoras y agentes. Ensayaré una explicación de cómo las mujeres indígenas en tramas comunales y en un territorio concreto se inscriben en relaciones sociales que dan cuerpo y forma a la política comunal indígena. Así pues dentro de una amalgama de estrategias para regular las formas de uso y las jerarquías que inaugura el parentesco como una forma de auto regulación social, que sin embargo, ha sido producido como estrategia defensiva de la tierras comunales. Las mujeres en tramas comunales representaría pues una estructura que impide la totalización del capital y la finalización de desmembrar tierras comunales, para dar paso a una sociedad de pequeños propietarios.

*Developing Environmental Labour Studies***Developing Environmental Labour Studies**

Over the past ten years, the scholarly as well as the activist interest in 'labour environmentalism', 'just transition', 'environmental justice' to name but a few key concepts has been rising. Academic research has aimed to analyse environmental policies of unions in the global north and the global south. This has included the conflicts of power and resources that often characterise north-south relationships between unions. Amongst other this research has analysed the meaning and application of the term 'just transition', finding that there are many interpretations and thus ways of formulating environmental politics around it. Some writers prefer the term 'environmental justice' indicating that issues such as class, 'race', gender relations, work and workplaces, nature, and spatial relations need to be integrated into our analysis of the politics of labour and environment. Environmental labour studies, some argue, cannot limit itself to trade union policies alone, but has to be taken further into the struggles of workers (unionised or not) and their communities against all environmental degradation. Moreover, it has to address the political economy as a whole.

While industrial unions are especially challenged to engage in the environmentally sustainable transformation of their industries, farmers, agricultural workers and indigenous peoples have not been prominent enough in research on labour environmentalism, even though the agricultural sector is a significant source of pollution and carbon emissions. Nor have we paid systematic attention to the service economy, a major component of the political economy employing also the largest number of vulnerable people.

We take a critical overview of the developing field of environmental labour studies, identifying its principal theoretical and methodological perspectives. What has been achieved so far? What have been the consequences of red-green alliances? Where are the gaps, what should be the priorities?

Continuities and Discontinuities in Security Deliberations in Contemporary South Africa: Archival Reflections

This paper reflects on continuities and changes in the constructions of security in contemporary South Africa. It does so from a historical vantage point and by drawing on archival sources such as Commissions of Inquiry in which the police feature in one or other critical way. The archival record reveals no less than 44 Commissions of Inquiry for the period 1910 and 2012.

Public Commissions of Inquiries into police and policing constitute a rich resource for reflecting on the form, content and impact of security paradigms. An interpretative reading of the findings of a select number of Commissions allow us to examine the *social context* within which security paradigms are constructed. Commissions reveal the *normative assumptions* embedded within security deliberations at any particular point in time. Commissions also reveal the *political imperatives* at play and the contestations between competing interest groups over the shape and content of security. A longitudinal historical approach allow us to identify patterns in security debates.

Using South Africa as a case study, the historical enquiry brings to light the fluidity, contestations and complexities of security deliberations. Questions about *What kind of security* we have in mind and *Whose security* should be prioritised are integral to such deliberations. The answers provided to those questions across time reveal both discontinuities and continuities in policies pursued in Apartheid and post-Apartheid South Africa.

VIETEN, ULRIKE M* (Queen's University)

Translating Complexity, Intersectionality and Doing Research in a Context of Migration and 'Race': Don't Mind the Gap

This presentation reflects on some of the conceptual and discursive dilemmas when working on race, migration and ethnic relations issues in different languages (English and German). I focus on two levels regarding these research objects.

First, I reflect on my native German upbringing to explain how the turn to English (since 2002, and with my immigration to the United Kingdom of Great Britain and Northern Ireland) eased communicating group differences that include race relations (e.g. outcome of racisms), ethnic relations and talking about nationalism, on the one hand, and complicated layers of how to name ethnicity and race, on the other.

Second, I take into account the fact that the gap between what can be said, what can be asked, what can be understood is embedded in the different Continental European history of the Holocaust and the un-possibility to speak 'race' across Europe. This dilemma continues, as it is also linked to varied histories of totalitarianism and colonialism that shape the contemporary use of 'ethnicity' categories in Great Britain, Northern Ireland, and other European countries, distinctively. On the basis of different research projects (qualitative research) I conducted in Europe (Germany and the Netherlands) and the United Kingdom (England and Northern Ireland) with different groups of visible minorities and refugees, I conclude that any attempt to translate social complexity and intersectionality in the context of migration and race, necessarily has to accept our limits in comprehension, and thus to cope with the gap.

Inte-22.2

VILLALON, ROBERTA* (St. John's University)

Breaking through Knowledge Dissemination Barriers: An Activist Transnational Feminist Approach

As a representative of RC 32: Women in Society, I will articulate how we can build a critique about the dissemination of knowledge and take action towards dismantling its unequal dynamics from an activist transnational feminist perspective. Reflecting on two different action research projects that I developed, I will discuss how to navigate through and beyond the main channels of research circulation (scientific publication, conference presentations, civil society addresses, teaching, and research consultancy) and their dominant languages and styles with the purpose of breaking through the barriers that tend to reproduce social inequalities. A focus on ideology, discourse, language and praxis will exemplify that while intersecting inequalities abound, opportunities to resist and challenge are also plentiful. The application of an activist transnational feminist framework allows not only to uncover overlapping gender, sexual, racial, ethnic, class and

other inequalities, but also to develop strategies for resistance across social, cultural, geographic, disciplinary, language and style boundaries. By bringing in examples from my studies about violence against Latina immigrants in the United States, and health histories of Ecuadorian migrants, I will share the multiple strategies utilized to close the gap between knowledge creation, knowledge dissemination and its conversion or translation into action for equality and justice.

Plen-10.2

VOLKOV, VADIM* (European University at Saint-Petersburg)

The Sociology of Law as Public Sociology: How Can Empirical Research Enhance Justice

In any country the system of justice is subject to external or extralegal influences that threaten to undermine it. Judges may be subject to racial or class bias, legal procedures, even when properly applied, may produce socially unequal outcomes. The application of managerial and bureaucratic approach to the judicial system tends to increase its efficiency at the expense of the quality of justice. The legal profession is subject to organizational capture whereby values of profession are eclipsed by the goals of the organization and its KPIs. I argue that the empirical sociology of law is in the position and, indeed, should have it as its mission to diagnose such problems, explicate them and engage legal professionals in solving them. When sociological research articulates issues of public relevance and maintains critical dialogue with professional groups about research outcomes we refer to this practice as 'public sociology'. In this talk I will draw upon the best cases whereby the sociology of law / empirical-legal studies stimulated legal changes or inspired reforms of the justice system. I will argue that the sociology of law has a tremendous potential to affect the justice system, a chance that it should not miss, especially as massive new legal data is becoming available.

Surveying the Refugee Population in Germany – Challenges and First Answers

Since 2014 1.4 million refugees arrived in Germany and one third of these immigrants are under age. The integration of these newcomers into society represents one of the most urgent issues in Germany today.

The conditions for a successful integration of refugees and factors hindering that integration remain without scientific evidence at the moment due to a lack of appropriate data. To close this gap the Leibniz Institute for Educational Trajectories (LIfBi) in Bamberg, Germany, conducts a longitudinal refugee study which examines the process of integration into the German education system. The study "ReGES (Refugees in the German Educational System)" concentrates on two key stages of education: (1) early childhood education, and (2) the transition from lower secondary level into the vocational training system.

The proposed contribution will briefly describe the migration situation in Germany and the concept of integration, as far as the social integration of immigrants into the host society is concerned. It will be demonstrated that, for several reasons, a successful integration into the education system of the host country in childhood and youth is an integral part of the social integration of individuals with a migration background. In this context we will also discuss which aspects of existent migration research are transferable to studies on refugees and which specific aspects have to be considered additionally.

We will present our unique research design in detail as an example of an extensive study (starting cohorts, longitudinal design, interviews with important context persons, modes). Particular attention will be paid to challenges based on surveying this specific target group, e.g. cultural heterogeneity, illiteracy and many more. Solutions are discussed and their implementation in the field work is reported. For our presentation we will have results from the first wave of the study available, allowing us to show first descriptive results.

WALBY, SYLVIA* (Lancaster University)

Theorizing Violence: Neoliberalism, Gender, and the Increase in Violence

Is violence increasing or decreasing? According to Pinker, drawing on Elias, violence is decreasing. But, when gender-based violence is made visible by recent developments in measurement and data collection, violence can be seen to be increasing not decreasing. As the neoliberal project restructures societies, increasing inequalities and shrinking welfare, the resilience of potential victims is reduced, and the rate of violence increases. Too often, violence has been dispersed or fragmented in social theory, and treated as less important than other forms of power. When considered, it has traditionally been more often considered as deviant behaviour from the disadvantaged, rather than the deployment of power by the more powerful. The new scholarship from women and the global south has challenged this traditional account of the direction of violence; documenting the scale of the violence from the powerful. It is time the analysis of violence was moved from the margin to the centre of contemporary sociology, as proposed in this conference, and its significance for society developed in social theory. This requires rethinking the concept of violence, redefining it as an institution parallel in significance to those of economy, polity and civil society. This would facilitate the inclusion of violence in analyses of societal transformation, including the contradictory implications of neoliberal forms of securitisation for power and justice.

Plen-4.2

WALTER, MARGARET* (University of Tasmania)

Australian Indigenous Dispossession: The Link between Land and Social Justice

Relationship with land is the foundation of Indigenous social order. Yet in 1788 the mere raising of the British Flag at Possession Island in North Queensland claimed the entire Australian continent. Aboriginal and Torres Strait Islander peoples were deemed without a sovereign or system of land tenure (distinguishable to British eyes) making the country un-owned (terra nullius). This legal fiction supported, despite the protracted frontier wars, the Euro-Australian myth that Australia was settled, not invaded. Terra Nullius was formally overturned in 1993 but the quest for Indigenous re-possession has been slow and resisted with the Australian nation state colluding to invalidate Aboriginal control of lands. Within this terrain of continued dispossession it is not coincidental that Indigenous people in Australia remain deeply socio-economically, political and culturally marginalised within their own lands. Past and present, Indigenous land justice and societal justice are co-dependent. This presentation uses national data to empirically link Aboriginal and Torres Strait Islander socio-economic and political disenfranchisement with historical and contemporary dispossessions. Framed within Australian socio-cultural discursive realities, inclusive of the *Uluru Statement from the Heart*, the 2017 Indigenous message to Australian political leaders, the strong relationship between 'country' and Indigenous well-being across multiple dimensions is established.

Plen-10.3

WEMMERS, JO-ANNE* (Universite de Montreal)

Justice for Victims of Crime

Justice is important for victims of crime. Some authors even consider victims' need for justice to be a fundamental human need, like the need for safety and the need for a love and positive relations with others. Yet, victims often complain of the injustice of the criminal justice system and many do not report their victimization to police. Victims tell us that justice can provide them with a sense of closure and satisfaction, and, therefore, is important with respect to their healing process. But what is justice? In this presentation, I will consider research on the meaning of justice for victims. Victims take a broad view of justice, deriving a sense of justice from different sources such as how they are treated by authorities (interactional justice), their role in the criminal justice process (procedural justice) and the principles and values underlying the distribution of outcomes (distributive justice). Examining the many possible sources of justice and injustice for victims with respect to state-based victim services, including the justice system, we will consider how we might enhance justice and promote healing for victims, while respecting the rights of the accused.

Preventing and Exiting Violence: A Domain for Sociology?

La prévention et la sortie de la violence constituent un problème crucial pour les sciences sociales. Les connaissances ici proviennent surtout de spécialistes, experts, juristes, diplomates, responsables d'ONGs, psychiatres, diplomates, etc. Il est temps d'en faire un véritable domaine de la sociologie, couvrant un espace allant de questions individuelles (traumatisme des victimes, que faire des coupables par exemple) jusqu'à de grands enjeux géopolitiques (que peut devenir le Moyen Orient après Daech?) en passant par les niveaux des communautés et groupes concernés et celui de l'Etat (construction de la démocratie, justice transitionnelle par exemple). Une idée centrale sera au coeur de la présentation: l'essentiel n'est-il pas de transformer la violence et les logiques de crise et de rupture en débats et en conflits institutionnalisés?

Cana-15.4

WINTER, ELKE* (University of Ottawa)

Perceiving and Receiving (Syrian) Refugees in Germany and Canada: Exploring Small n Comparisons

Canada's Governor General David Johnston called the arrival of roughly 40,000 Syrian refugees since November 2015 a "defining moment" for Canada. Chancellor Angela Merkel's "Wir schaffen das" ("we will make it"), which allowed about 800,000 refugees to enter Germany will mark her legacy. In both countries, the initial reaction to the – very differently arriving – refugees from the Syrian civil war was overwhelmingly sympathetic. Increasingly, however, concerns about refugees' apparent unwillingness to integrate and their seemingly privileged access to social benefits and jobs are getting louder.

There is usually two ways in which the members of the mainstream society learn about refugees. In Canada, roughly 35% of Syrian refugees came through private sponsorship arrangements (not the state). In Germany, volunteering and civil engagement, usually stable at 36% of the population, have increased dramatically since 2015 and many new groupings and associations have come to exist next to established service provider organizations. While this rise in volunteers befriending (Syrian) refugees is impressive, the overwhelming majority of Germans and Canadians do not have the chance to directly meet asylum seekers and refugees. Rather, they form their opinion about "them" by the ways in which immigrants and refugees are represented in the mainstream media: are they portrayed as innocent, pitiful and deserving? Or do seem to be illegals, cue-jumpers, profiteers, and rapists? As such, media portrayals have a huge influence on the success of immigrant and refugee integration.

I first present preliminary results of two recent studies using qualitative analysis to study a limited amount of data, one studying civil society and refugee reception, the other analyzing mainstream media perceptions of refugees. Against this backdrop, I then address the question of how sociology and sociologists can contribute to the successful resettlement and integration of refugees.

YOSHIDA, YOKO* (Dalhousie University)

AMOYAW, JONATHAN (University of Western Ontario)

Trajectories of economic outcomes and adulthood transition of refugee youth and children in Canada

Since the arrival of Syrian refugees in late 2015, several research projects were rapidly deployed to examine the experiences of refugees as well as investigating the responses of host societies. Such rapid research provides valuable insights on the short-term experiences of refugees; however, a longer window of research is required to fully understand the mechanisms of integration. Against this backdrop, we examine how the children of refugee immigrants transition to adulthood and whether their experiences differ from the children of other immigrants. Specifically, we examine whether long-term labour market trajectories and well-being of refugee children and youth converge or diverge from children of other immigrants. We do this by using the Longitudinal Immigration Database (IMDB). The IMDB includes records of individuals who became permanent residents since 1980 and filed tax in Canada at least once since their arrival. Because it can track children into adulthood, the IMDB offers much insight into the life course of newcomers. Focusing on refugees and immigrants who arrived in Canada as children or youths, aged 0 to 17 years old, we examine the trajectories of labour market outcomes and other indicators of adulthood transition up to 35 years later accounting for the 1980 to 2015 period to offer a portrait of people's integration. Our results serve as a baseline of information for other studies on refugee children and youth in Canada and to compare across refugee and immigrant cohorts.

Citizen Participation-Based Energy Transition Experiments in a Megacity: The Case of the One Less Nuclear Power Plant in Seoul, South Korea

Seoul, one of the world's megacities, has been working since April 26, 2012, towards building an energy self-sufficient and climate-protective city through conservation of energy, improvement of energy efficiency, and expansion of renewable energy use in face of climate change and energy crises under the name of the One Less Nuclear Power Plant. This study examines how citizens in Seoul were involved in the OLNPP initiative and what factors have led to the involvement of citizens, resulting in the successful performance of the OLNPP, based on concepts of emancipatory catastrophism and metamorphosis proposed by Ulrich Beck and energy citizenship. This study finds out deliberative governance, political leadership, transparent information sharing and interactive communication with citizens, experts and NGO activist as policy advisors and facilitators, educational programs are major factors contributing successful performance of the OLNPP. The grand experiment Seoul has conducted is still on-going.

ZAKARIA, KHEDER* (Syrian Association for the Social Sciences)

The Syrian Revolution As Seen By Arab Social Scientists

The paper compares and evaluates different approaches Arab researchers--Syrians in particular--adopted towards the background of the Syrian revolution and its determinant factors:

- The socio-economic approach, which explains the Syrian uprising with expansion of poverty and unemployment, caused by corruption and mismanagement. The argument here is that capital productivity declined, there were no incentives for investment, and the countryside did not receive enough attention. As a result, rural migration to cities increased. This resulted in increasing unemployment and disguised unemployment, as well as large disparities between rural and urban areas, governorates and regions, on the other.

- The religious-sectarian approach, which focuses on the supremacy of the Alawite minority, particularly their control of sensitive positions in the army and the security apparatus, giving them control over the state and society, in which a Sunni community was the majority. This situation led to the rebellion of the Sunnis, and the spread of the various Islamic propositions—both moderate and extreme, thereby turning the revolution into a sectarian conflict.

- The tyranny vs. democracy approach, which argues that the essence of the Syrian revolution lies in the people's rejection of the Syrian regime's tyranny, represented in highly-authoritarian structures, leaders' personality cult, and a security apparatus in control of all aspects of social, economic, cultural, and political life. The people's aspiration to freedom led them to struggle for a pluralistic democratic regime, built on the rule of law and equality of all Syrians, regardless of their ethnic, religious, sectarian or other affiliations.

- The approach of international conspiracy, which is adopted by the regime and its supporters. Those adopting this approach frame the uprising as a result of a global conspiracy, led by the United States and Western countries, to topple a "progressive" regime that resists "Zionist and imperialist ambitions".

Political Attitudes of the New Social Class in China: A Measurement and Comparison Based on Survey Data of Six Provinces

The rise and growth of a new social class in China has gradually seized the attention of the public, and has also become one of the hot topics in the academic world. Based on survey data, this paper discusses how to evaluate political attitudes of the new social class, and then compares differences in political attitudes between this new class and other social classes, and differences within this class. Five indicators, i.e. trust in government, perception of social security, consciousness of rights, identification with authority, and awareness of inequality, are adopted to measure political attitudes of this new class. The results show that compared with the middle class "inside the system," this class has significantly lower trust in government. It shows no obvious preference for liberalism or conservatism compared with the lower middle class. And within this class, freelancing intellectuals tend to be more liberal than private employees and employers.

Israeli State Security and the Palestine Issue

State security figures out predominantly in discussions involving privacy, citizenship rights and human rights in general. We have come across the debate surrounding state security in the use of the internet, social media and various legislations intended to maintain a balance between national security and individual rights. But the use of state security to justify state intrusiveness and violence as forms of defense is seen most glaringly in the clash between the rights of a subject population and military occupation in conflict zones, as in Israel/Palestine. "In the name of security" Israel has launched preemptive wars against the Palestinians in the West Bank and Gaza and abrogated the rights of a subject population under the Geneva Conventions. Many researchers have labeled Israel's violence against the Palestinian population as disproportional. Others have viewed Israel's attitudes to security as a form of "theology" in which the state preaches and practices absolute adherence to its unilateral security declarations. The presentation in this session explores the various mechanisms that distinguish a colonial state in its uses of national security arguments.

Towards a Financialised Capitalism?: Evidences from Spain in the Context of Comparative Political Economy

The concept of financialisation is being widely used to describe certain structural changes in advanced capitalist economies. This paper proposes a conceptualisation of financialisation combining concepts of comparative political economy and economic sociology. Scholars on the fields of comparative political economy consider financialization as a new regime of accumulation that emerges in response to declining productivity in the late 1960s. While in the US and the UK, financialisation has reached the stage of a finance-led capitalism (Boyer, 2000), coordinated market economies in Europe and Asia follow a different trajectory (Kalinowski, 2013; Yamamura & Streeck, 2003). This project aims to analyse the varieties of financialisation outside Anglo-American capitalism, giving special attention to the European southern area, and the varieties of financialisation in Europe.

Studies on financialization have analysed the relationship between the fall of profitability in the productive system and the search for new business opportunities of non-financial firms in financial markets. However, these approaches don't offer a successful system of indicators in order to compare different countries with different variants of capitalism. This paper offers an analytical model based on three dimensions:

The first called "financial development", refers to the development of financial markets and intermediaries, the financial economic structure, and the financial integration.

The second dimension called "Political economy" refers to governments' economic decisions on stable exchange rates, sovereign macroeconomic policies and open capital accounts (Kalinowski, 2013; Obstfeld et al, 2005)

The third dimension called "actors" has to do with the structural characteristics of non-financial firms.

These dimensions are analysed for the Spanish case. Provisional results are showing a convergent trend consistent with all capitalist economies, in which financial capital gains increase not only when the net profits of companies rise, but also when they collapse in a context of severe economic crisis and high unemployment.

ABAZIE-HUMPHREY, MARGARET* (*Office of the Special Adviser to Nigeria President on Niger Delta / Presidential Amnesty Programme*)

Demobilizing the 30,000 Amnesty Beneficiaries – Entrepreneurship The New Gateway for Its Sustainability in the Niger Delta, Nigeria

The article focuses on the oil-rich Niger Delta and analyzes how the 30,000 beneficiaries of the Presidential Amnesty Programme are both demobilized from the post-amnesty conflict re-mobilization and the role of entrepreneurial reintegration packages in sustaining the security stability. In the post-demobilization era, sustainable reintegration programme of the Niger Delta Amnesty DDR programme focus more on the engagement/empowerment of these beneficiaries as entrepreneurs. There is an increasing body of evidence which indicates that entrepreneurship can halt conflict process and mobilization, and this article explores the implications. These novel explanations are useful to understand empirical literature in the emerging economies of entrepreneurs and a benchmark for future studies on post conflict demobilization and re-mobilization.

KEY WORDS: Demobilization, Entrepreneurship, Niger Delta, Amnesty-beneficiaries

The Contested Terrain of Islamophobia: Performances of Anti-Muslim Hatred and Muslims' Experiences As Bodies 'out of Place'

The shift in focus from 'race' to religion requires attention to discontinuities and continuities in Muslims' experiences of hostility that requires a nuanced understanding of Islamophobia that is attentive to intersections of 'race,' religion, gender and age. Drawing from research conducted in Bradford and Leeds in the UK with British Muslims, this paper explores how stereotypes of the 'dangerous

Muslim male' and what I term the 'imperialised Muslim' woman that is increasingly featured as both subject and object of terror, legitimates anti-Muslim hatred, which re-works everyday spaces as spaces of insecurity. I show that Muslims' association with terror post-9/11 creates conditions in which they are terrorised within everyday spaces by the white non-Muslim nationalist who takes up the position of 'protector' of the nation and its values. The paper thus challenges stereotypes of Muslims as hostile subjects by explicating their experiences of terror involved in the management of national space symbolically, materially, and affectively through interrogation, spitting, and ripping off the veil. In particular, I show that the treatment of Muslims as objects of disgust to be expunged from national space emanates not from fear, but functions as a strategy of dominance that is connected to power relations which separate subjects from those not quite subjects. These exclusionary practices are significant for understanding the contested terrain in which Islamophobia operates. Whilst providing a language for Muslims to articulate the particular terrors they face qua Muslims, representations of Muslims as a threat to the nation work to entrench Islamophobia within the national consciousness.

RC05-121.3

ABBAS, MADELINE-SOPHIE* (*University of Manchester, United Kingdom*)

The Terror of Voice(lessness): Hate Speech, Silencing and the Culture of Fear Experienced By British Muslims

The attacks on Charlie Hebdo called attention to the racialising practices that designate what is (un)sayable for certain bodies, where the ability to occupy the position of 'civilised' can transcend restrictions of what constitutes injurious speech for racialised Others. This paper is concerned with examining the politics of representation involved in setting the terms of Islamophobia for British Muslims within the 'war on terror' context and the challenges they face to name practices of terrorisation experienced by them following from the precarious position in which they find themselves within two interconnected sets of circumstances relating to freedom of speech: firstly, the increased threat from hate speech, particularly Islamophobia; and secondly, developments to statutory offences in the 2006 UK Terrorism Act on communications that indirectly encourage terrorism. Significantly, these legislative developments contribute to the conditions under which perpetrators of hate speech are afforded greater freedom to espouse Islamophobia unchallenged. This is because this legislation not only in part contributes to the legitimization of Islamophobia by re-iterating Muslims as potential terrorists that require greater securitisation than the rest of the populace, but it places restrictions on Muslims to be able to challenge the speaker of hate due to fear that their actions will be interpreted as evidence of extremist behaviours. This has meant that words come to mean different things when uttered by Muslims which has encouraged practices of self-surveillance to be undertaken by them. These practices provide evidence of the reproductive effects of racial terror which comprise not only self-silencing, but decisions not to present a 'visibly' Muslim identity through Islamic dress or the beard. These strategies suggest that voice must be understood as bodily and relational that is mediated not only by the body that speaks, but by the body that interprets what has been said.

ABBASI, PARVEZ AHMAD* (*DEPARTMENT OF SOCIOLOGY AND SOCIAL WORK*)

Social Media: An Exploratory Study of Patterns of Interaction

Social media can be described as a set of technologies and services that make self-publishing online very easy and allow the consumers of a particular medium to interact, most commonly through comments of some sort. Facebook, Twitter, YouTube etc. are common examples of social media. The reach of these tools is global but in usage they are not universal as access is restricted by the availability and viability of communications, infrastructure, and personal device (i.e. phones, computers/laptops, i-pods), skills and most importantly the interest to actually participate in social media activity. Moreover, participation in certain networks and activities in a social media differs from country to country. It has been observed that Facebook is one among the most popular social networking sites for the people of all age groups. It not only connects a person with his friends, colleagues, virtual friends but also with members of his/her family. The patterns of interaction among the family members vary in terms of age, sex, sharing contents, comments, posting messages on timeline and tagging etc. The review of the existing literature indicates that: the teenagers send more friend request to their parents; Married daughters post more on timeline of their parents; Mothers are more concerned about the safety of their son. The present explores the types and interaction patterns on social media through some case studies.

RC13-258.7ABDE AHAD, NARGES* (*University of Waterloo*)MOCK, STEVEN (*University of Waterloo*)HAVITZ, MARK (*University of Waterloo*)***Achievement Goal Orientation and Leisure Satisfaction Among Canadian Backpackers: Does Level of Skills Matter?***

Among outdoor adventure activities, backpacking has grown in popularity among travelers, marketers, and academia in recent years. However, to date research focusing on Canadian backpackers' satisfaction and motivations is very limited. To address this knowledge gap, this study aims to explore how different patterns of goals (validation-seeking and growth-seeking goals) are associated with leisure satisfaction. The study will also investigate the moderating role of perceived skills on the association between validation-seeking and growth-seeking goals with leisure satisfaction. Data were drawn from a self-administrated online questionnaire during the spring 2015 in Canada and 185 valid questionnaires were completed. Both univariate and multivariate analyses were conducted to analyze this quantitative data. The data indicated that Canadian backpackers are mostly growth seeker individuals who travel to learn new experiences as well as to self-improve their backpacking skills. It also revealed that growth-seeking backpackers are more satisfied with their backpacking activity compared to their validation-seeking counterparts. An analysis of the interactions show that growth-seeking had a bigger impact on satisfaction for low vs. high-skilled backpackers. Results also suggest that limited level of skill is not associated with leisure dissatisfaction if individuals consider backpacking as a chance to practice and improve their skills rather than judging themselves on how good they are at their activity. For lower skilled backpackers, having a growth-seeking orientation, it may help them to maintain a sense of self-consistency and positive regard toward themselves which may provide them to acquire more skills for a better performance at some later time. Promoting non-competitive activities may help individuals to value learning over winning, to face challenges and efforts as routes to mastery which may help them to augment their level of emotional well-being.

RC14-278.6ABDUL-AZIZ, DEMBÉLÉ* (*Ecole des hautes études en sciences sociales*)***Information and Communication Technologies (ICT) and Development of Agriculture: The Case of a Information System on Rice Seed in Côte D'Ivoire***

The purpose of this Communication is to analyze the role and impact of information and communication technologies (ICT) in the development of agriculture. We will try to see the social, economic and cultural dynamics implemented following the adoption of ICT by rice farmers in Côte d'Ivoire. In other words, what is the relationship between ICT and traditional forms of communication (including interpersonal communication) in the rice production process in Côte d'Ivoire? A case study (base on my PhD fieldwork) on the implementation of a project of information system on rice seeds via Smartphone in Côte d'Ivoire will allow us to discuss this issue. In a country which covers only 42 percent of its needs in rice, the establishment under the leadership of FAO Rome of an information system by SMS for the commercialization of rice seed seems to be a good initiative to achieve self-sufficiency. Faced with the seed producers difficulties in finding profitable markets to sell their productions and the inability of buyers (farmers, traders and distributors) to access on time of certified seed varieties adapted to their needs, development and implementation of an information system adapted to this context was expected to raise some of the constraints. The information system on seeds by SMS aimed therefore to provide buyers with updated information on the availability and quality of certified seed on the one hand, on the other hand making information available on seed producers and the varieties volumes requested by buyers. Unfortunately, the project was not renewed after its pilot phase. Starting from the local context, we will try to analyze the main causes of project failures by highlighting the producers' different forms of organization, the existing relationship between the different actors, and local form of exchange and communication channel.

RC31-571.3ABDUL-KARIM, ABDUL-BARI* (*University of Manitoba*)***Deskillings of Internationally-Educated Immigrants: Critical Evaluation of the Processes in the Foreign Credential Recognition in Canada***

Immigration has always played crucial role in the development and sustainability of the Canadian workforce and economy. Estimates suggest that between 60-100% of the growth in the Canadian economy is the result of the labour, taxes and investments that immigrants make (The Ontario Ministry of Finance, 2014). It has been well documented that the majority of those migrating since the 1980s are more highly educated than other Canadians but experience long-term

downward social and economic mobility. Immigrants receive comparatively lower rates of return with respect to labour market earnings to foreign educational credentials, despite their higher educational background (Sweetman, McDonald & Hawthorne 2015, Shirkpak et al., 2011). Many recently arrived immigrants express disappointment at local employers' failure to recognize their educational credentials, credit their overseas work experience or accept their English accents, and find it difficult to negotiate the everyday obstacles they encounter. This research examines the job-skills match rates among immigrants working in one of the 31 self-regulated professions in Manitoba, by addressing the questions: *what are the processes of recognizing foreign credentials in Canada?, what are the barriers to immigrants' foreign credential recognition and access to regulated professions in Manitoba?, do immigrants' labour market outcomes differ by occupation? And, how do immigrants working in self-regulated professions in Manitoba fare in comparison to those working in other provinces?*

This research uses Critical Race Theory which provides the most comprehensive arguments in identifying immigrants' challenges in the foreign credential evaluation processes. CRT explains the role of institutionalized racism in immigrants' labour market outcomes. This poster uses the most recent censuses of Canada to investigate the processes of foreign credential recognition. This research is necessary because it helps direct policy aimed at addressing inequities in the labour market, and creating evidence-base of knowing if highly skilled workers are in their appropriate professions.

TG07-999.1ABDULLAH, NOORMAN* (*National University of Singapore*)***Sensory Politics in a Multicultural City-State: Foodways, Religion and the Everyday***

In the context of urban and cosmopolitan cities with diverse, intensified migrant flows, questions pertaining to religious freedom have been circulated and debated. The potential for religious tension and conflict has often been pitched as a source of anxiety, given that diversity cannot in itself guarantee racial and religious harmony. This paper unpacks the repressive character of 'harmony' in multicultural and multi-religious societies through the lens of foodways, senses and everyday life. The cases presented empirically examines Singapore's colonial and postcolonial conditions in relation to a range of religious and food practices, and how such logics and discourses have been politically appropriated to institutionalise and legitimise repressive armatures.

What happens when everyday religiosity expressed through food practices and rituals that involve sound, smell and other sensory modalities infringe on the sensory "rights" of other groups in such multicultural, multi-religious contexts? How does this infringement reconfigure talk about racial and religious harmony? The paper therefore draws attention to the sensory micropolitics of friction in the everyday that ostensibly appears less dramatic, less serious and less pressing than the spectacle afforded to religious violence, but which nevertheless remains real and challenging. At a broader level, the cases are connected to the processes involving the bureaucratisation of senses in modern, urban Singapore – invoking the discourse of the greater good by the state vis-à-vis the project of hegemonic consensus.

RC25-479.3ABE, SATOSHI* (*Nagasaki University*)***Islamic Debates and Hermeneutics: Examination of Environmental Ethics in Iran***

Islam is long known to have provided the faithful with a language or conceptual framework through which their ethical attitudes and dispositions are organized. The interpretation of its foundational texts on various matters – from mundane practices at home to state management by caliphate leaders – has crucially shaped the ways ethical practices are configured among the faithful. Contrary to the claim that Islam since its inception has not undergone any changes, this reveals a force of historical contingency that has entailed changes in Islamic tradition at different times and places.

In recent years, Iran, an Islamic Republic that upholds Islam as a guiding principle in state management, has problematized a matter that was previously considered less significant and that now draws greater attentions from its religious establishment; that is the matter concerning the environment. While increasing efforts to bolstering industrial sectors, Iran has recently been experiencing severe environmental problems, especially those pertinent to the air, water, and soil. What was used to be "outside" of Islamic concerns are now contentions of heated debates among religious leaders as well as environmental scientists. These debates freshly give rise to diverse interpretations of Islam and thereby contribute to an Islamic tradition that is distinctively reflective of historical conditions of Iran.

This paper highlights ongoing debates concerning the environment among religious leaders in Iran and relevant practices, and examines how Islam as a conceptual framework is drawn upon to address environmental problems. In doing so, it also investigates emerging ethical attitudes and dispositions generated through such discourses and practices. The paper is making a scholarly contribution to the

hermeneutics of Islam, demonstrating a changing Islamic tradition in contemporary Iran in which the environment is increasingly problematized as such.

Hip Children, Good Mothers – Constructing Proper Parenthood By Means of Appearance

A growing body of sociological literature conceptualises physical appearance as a form of capital; a convertible resource in contemporary societies (e.g. Holla & Kuipers, 2015; Sarpila, 2013). This so called "aesthetic capital" (Anderson et al., 2010) refers to a combination of resources related to physical appearance. In the sociology of consumption, children have been considered as an embodiment of the parents' lifestyle choices, values and positions, maintained with the vicarious consumption (c.f. Weblen, 1899(2002)) on children. In more recent consumer culture research, children are often referred to as part of their mothers "extended self" (Belk, 1998). In this study, we utilise a sample of 10 interviews with Finnish mothers who were recruited from a popular Facebook group, which could be considered as a modern tribe (Maffesoli, 1996) focusing on children's fashion.

We examine whether the appearance of children is important only as a part of the new appearance-related consumer culture, or if the children are portrayed as "a sign-bearing capital" for their parents (Bourdieu, 1984; Skeggs, 2004; Mears, 2014). We also ask if the investment in the aesthetic capital of children can also be seen as a construction of a contemporary understanding of proper parenthood in the middle-class context. It has been suggested that clothing brands have taken the place of symbolic markers of class, and the well-dressed child represents the middle-class appearance: performing respectability, dignity and control (Skeggs, 1997; Vänskä, 2009: 222). Although extensive research has been carried out in consuming on children, this is the first study combining research on parenting in consumer culture with the theory of capitals to explore the materially based construction of parenting in the Finnish context.

The Experiences of Healthcare Workers Following the Fukushima Disaster

The 2011 Fukushima Triple Disaster of earthquake, tsunami and radiation exposure presented an extraordinary public health emergency with persistent effects on the local community. This paper focuses upon the social and professional disruption experienced by medical professionals, allied health professionals, and support staff in the city of Minamisoma, the nearest sizeable city to the Fukushima power plant. Drawing upon semi-structured interviews, the research shows the way in which the exogenous shock of the disaster has resulted in fundamental short-term impacts in the structuring of healthcare work, but also in longer-term changes in professional roles both at the institutional level and as managed and experienced by individuals.

Individual impacts include disruptions in professional trajectory, both during the immediate crisis and longer-term (for example, through unexpectedly moving between institutions). For doctors, in particular, long-term impacts also include conscious shifts in professional focus, for example through a shift in speciality (e.g. interest in disaster medicine, or increasing focus on home care). At the institutional level, the destabilisation of the disaster has led to a reorganisation of work, for example in the rise of new work categories (e.g. around radiation testing) and in the restricting of work-roles to account for the loss of particular categories of staff.

Overall, the paper draws upon both medical sociology and the sociology of work to reflect upon the effect of the disaster on the health workers and institutions of Minamisoma, demonstrating the persistent and wide-ranging impact of the disaster on the practice of healthcare.

Multilingual Practices and the Transmission of the Mother Tongue in Families of Moroccan Origin in Germany and France – a Biographical Evaluation of Language Learning Policies

This presentation is part of the collective research project "Migreur" conducted at the Universities of Strasbourg and Frankfurt am Main on the "Biographical evaluation of social policies towards migrants in France and Germany". The method of evaluation of public policies (Apitzsch et al. 2008) departs from the biographical experiences of persons who have benefited from institutional

support; it allows to analyze the way policies concerning languages implemented in different fields such as the health, the educational or the employment sectors intertwine in the daily life of migrants and how the latter develop strategies to react and to contribute to shaping these policies. Thereby, not only the learning of the language of the country of arrival, but also policies favoring the transmission of the mother tongue as well as multilingualism are taken into account.

Departing from a case study of a family of Moroccan origin in Germany, this presentation will depict the different experiences the family members have made concerning language learning from the 1960's until today. It will address the following questions: How did Morocco's colonial past shape the family's experience of multilingualism even before their migration? Which strategies did the family develop in order to learn and pass on both the German and their mother tongue to their children and grandchildren? Are these strategies themselves an object of intergenerational transmission, i.e. are they repeated by the younger generation? What relevance did their mother tongue have during different stages in their individual life courses in Germany: In preschool, the education system or the employment sectors? We will discuss these questions from a gender-centered as well as a transnational perspective. Furthermore, this presentation will base on interviews collected in France among families of Moroccan origin, thereby opening a French-German comparative perspective regarding the place of multilingualism in different European countries.

RC38-677.5

ABID, YOUSSEF* (*Goethe University*)

Multilingualism Among Young Adults of Moroccan Descent in Germany and France.

With policy emphasis on the acquisition and competence of the national language in Germany and France, multilingualism among the descendants of immigrants has been discouraged in educational settings and neglected in research. In my ongoing PhD research, I study the biographical and social meaning and importance of growing up with a variety of languages in one's own family and the consequences of monolingual educational settings for young adults.

So far, there has not been much research on language use and its meaning for the younger generation in immigrant families or on multilingualism as a social practice. Also, little is known about the perception of the devaluation of the family language(s) and about social processes of exclusion related to speaking "immigrant languages".

My research interest focuses on biographical narratives of young adults in Moroccan immigrant families in Germany and France about their experiences of multilingualism. My objective is to understand more about their experiences and the challenges they are confronted with, in their families, in educational settings and in the public sphere, as well as about the discrimination and exclusion experiences they are confronted with.

Based on comparing cases in Germany and France, I would like to present a first analysis to illustrate the concept of multilingualism among descendants of immigrants as a "normal" social practice, with all spoken languages as part of their biography and identity. Then, I would discuss the challenge of dealing with multilingualism in monolingual societies. The immigrants' descendants are aware of the necessity to learn their family languages, relating them to their historical and political contexts. Moreover, they consider the languages as competences that open up international possibilities and transnational options. But at the same time, the social devaluation of the family languages is painful and confusing, which leads to question the actual language policies.

Is the Merton Concept of Scientific Ethos Relevant Today: The Case of Post-Soviet Science

The history of post-Soviet science gives us a lot of important information for thinking about how vital the concept of the value framework of science, described by R. Merton. In a sense, the imperatives of scientific ethos, described by Merton, such as communism or unselfishness, coincided with the officially declared model of Soviet science. On the other hand, a rapid transition to market relations, a radical transformation of the economy, social life, interpersonal relations could not but affect the life of science. Hence the question: how have people of science changed, their professional and interpersonal relationships, ideas about the ideal structure of science as a social institution? Our report will be devoted to the search for a response to it. An empirical basis for analysis will be the results of sociological monitoring of academic and university science in Siberia, which has been held since 1992. The hypothesis of our study is that the traditional professional values of science described by R. Merton in the form of ethical categories are relevant for science in Russia and today. Another thing is that under the influence of external conditions they have changed significantly, being an important element of the mentality of a professional scientist. The report will also place great emphasis on

comparative analysis (in the context of Merton's concept) the professional values of different generations of Russian scientists.

ABOIM, SOFIA* (*University of Lisbon, Institute of Social Sciences*)

A Name of One's Own: Formations of Difference and the Semiotics of Liminality

The expansion of plural gender identities is one of the most challenging forms of resistance to the limits of binary systems. However, even if gendered in-betweenness can be conceptualized, in the Foucaultian sense (1969), as a discursive formation, that is, as systems of dispersion or units of discourse not linearly connected and thereby, as plural statements that, ultimately, fit into a single system of formation, such plurality of discourses cannot be reduced to a textual signifier stripped from bodies and embodiments. The difference affirmed as a gender singularity against the dominant must not only be viewed through its materiality (whether bodies, institutions and historical processes), but also as a 'one's own' that summons, often, hidden meanings, which, as in Derrida's, can only be understood through additional words, from which they differ and gain meaning. Hence, the words and bodies of 'one's own' can be seen as an inversion of the slogan 'the personal is political' as new words and performances challenge the Cartesian division between mind and body. In opposition to the truths of the body or subjective self-authentication, processes of naming are grounded in political programmes for the affirmation of an identity that accommodates the self. Against a rhetoric of authenticity (as in Taylor, such entanglements will be discussed by examining three contrasting narratives: trans as transition (a journey between poles of normalcy), trans as confirmation (pre-existence of an identity before performative becoming), trans as transgression (exaggeration of difference to create the possibilities of difference itself). On the basis of this reflection drawn from the discourses of a wide diversity of trans people in the global north and south, I address the onto-performative character of language as the basis of liminality, both as semiotic and material spaces for the multiple, and often contradictory, naming of gendered personhood(s).

RC35-642.4

ABOIM, SOFIA* (*University of Lisbon, Institute of Social Sciences*)

The Coloniality of Trans-Gender: The Contradictions between the Exotic and the Citizen in Times of Transnational Neoliberalism

Addressing the paradoxes of present-day imaginaries and movements for gender diversity implies deconstructing the coloniality of gender as proposed by feminist philosopher María Lugones and an engagement with the 'analysis of racialized, capitalist, gender oppression'. Drawing on ethnographic work and qualitative interviews with trans/gender sex workers carried out in Lisbon and London, I focus on the reconstruction of their transnational trajectories of multiple displacements and how these journeys serve to reproduce colonial subalternity and neo-colonial capitalist political economies. In these existences of bodily reification and commodification, we find important challenges and negotiations to localized discourses of western modernity. While Latin American Travestis and Asian Kathoey serve to reinvent the images of the exotic subaltern in western contexts, a transnational transgender rights movement, at times sited in the global south, has also taken shape over the last decade. The coloniality of marketized bodies, quite often displaced from south to north, expands rapidly alongside the equal rapid development of a rights-based discourse on gender diversity and a politics of Transgender inclusion. Together, these contradictory flows form a transnational transgender imaginary. Addressing the contradictions anchored in neoliberal capitalist transnational flows of bodies and rights, we explore the disconnections between the exotic and the citizen while bringing the lens of coloniality to discuss what is at stake in such representational struggles. While addressing trans sex workers lives and discourses, I argue that the current transnational economy of gender diversity is being erected upon paradoxical flows of knowledge and practice that circulate from north to south (or otherwise) while contributing to reproduce the contradiction between exoticization and assimilation, even if in more nuanced colours.

Domestic Homicide in Nigeria: Sociopsychological Profiles of Men Who Killed Their Wives

Without gainsaying, there has been a marked increase in the incidences of domestic homicide in Nigeria in recent times. Meanwhile, research on family violence has vigorously focused on spousal abuse, trends and prevalence of domestic violence, and risk factors, while the most severe of violence—the killing of a spouse, has not received an equal amount of attention. Available statistics

show that men are more culpable in abusing their wives to the point of death. Leaning on eclectic adoption of social learning, personality, and marital power theories, this present study examined the psychological factors and sociological background of men who have been charged and convicted of killing their wives as a result of domestic conflict. Qualitative analysis of official demographic and offence history data, and in-depth interviews of 21 purposively selected male offenders of spousal homicide in celled housing units in Kirikiri Maximum, Kirikiri Female and Ikoyi Prisons, Lagos State, revealed that childhood experience of violence and abuse is strongly connected with perception and perpetration of violence in marital life. The events leading to the death of spouses suggested that the killings were accidental rather than premeditated, however, the use of dangerous weapons were prevalent. There is a clear empirical evidence to suggest that qualitatively, men who kill their spouses do not differ greatly from those who use nonlethal violence. It is suggested that parents, religious leaders and significant others should be more attentive to situations between couples and base their interventions on the wellbeing of the couples rather than religious dictates and social desirability alone. It is essential that an understanding of spousal homicide is continuously pursued and that steps are taken to reduce the likelihood of spousal homicide—the final abuse.

Which Risk? Which Trust? Cognitive Determinants of Participation in Collective Action.

According to the theory of rational choice a decision to engage in a collective action can be viewed as a special case of decision under risk (e.g. Coleman 1994). This implies a cognitive process in which two individual traits play an important role. Trust determines how the decision maker perceives probabilities of various outcomes of the collective action at hand. Risk attitude determines how these probabilities influence the final decision to cooperate (or not). Hence the choice should be related to both risk attitudes and propensity to trust.

We are presenting results of an exploratory study aiming at establishing whether these postulated relationships exist. The crux of the study is the fact that both risk attitude and propensity to trust can be measured in many different ways. For example risk attitudes in economic research are measured via series of choices between lotteries, while psychologists and sociologists prefer various questionnaire items. Trust on the other hand can be measured using the traditional general trust items or more specific questions. Not all these measures are equally adequate in the context of collective action. For instance inquiring about subjects' risky behaviors such as substance abuse, unprotected sex or parachute jumping is not necessarily relevant here. We are therefore raising a question of how to assess trust and risk attitude to predict choices made in public goods dilemma.

Our research is based on a study in which participants were taking part in a PGG and filled in a questionnaire. We find that making decisions is different from thinking about one's attitudes when it comes to risk and that trust can be estimated surprisingly well using very simple tools. Furthermore, both trust and risk attitude are important determinants of contributions in the experimental game.

A Power Capability Approach of Gendering Europe: The Five Worlds of Gendered Welfare Regimes in Europe and Their Connection with Domestic Labour

How do power structures and empowerment determine the division of household tasks within couples in the context of different gendered European welfare regimes?

Over recent decades, processes towards gender equality are raising in most European countries. Implementations of gender-egalitarian family policies are increasingly en vogue. Nevertheless, comparing European welfare regimes also includes the dimension of unpaid work – especially since this aspect has not been taken into account for a long time in the welfare state research. The relationship between unpaid work and welfare is important for a "gendered Europe". Despite the "Scandinavian dream" of absolutist gender equality, we observe a striking discrepancy between egalitarian attitudes and traditional behaviors, when comparing the division of housework in Europe. In all European countries the division of unpaid work is more or less traditional, however differences can be observed for five regimes: social democratic, post-socialist, liberal, conservative and latin rim regimes.

Rethinking the concept of Europe as a pluralistic "gendered Europe", including the dimension of unpaid work and offering a new theoretical typology of power

is the aim, this paper seeks to address. The assumption is that the division of household tasks is influenced by power relations, whereby power is regarded as a latent, dispositive, complex and social phenomenon, which makes a multidimensional approach in the sense of Amartya Sen's "functionings and capabilities" and in the context of gendered European welfare regimes unavoidable.

Using data from the first wave of the Generations and Gender Survey and comparing European countries, the 'Task-Participation-Index' reveals little country-specific differences (the ICC suggests that about 6.1% of the total variability in TPI lies between countries); however, in all countries women do more housework than men. According to the results from a two-level multilevel regression, especially non-traditional domestic labour is more accepted, the higher the political empowerment for women.

Bringing a Gender Lens to the Production of Science and Technology: The Impact on the Sustainable Development Goals.

The discussion on the presence of women in science, technology and innovation is not a new one. For the last three decades, the need to include women in the scientific arena was the subject of a large body of research and analysis, both in academia and in the international organizations. The recent approval by the UN of the Sustainable Development Goals brings, however, this discussion to a new level. Although more gender aware than the previous Millennium Development Goals, with SDG 5 and its nine targets dedicated to achieving greater gender equality and empowerment of women, the other SDGs and their more than 100 targets do not recognize the special needs of women and girls and the essential science based knowledge needed for their implementation. Recent evidence, however, clearly indicates that gender inequality issues cannot be separated from actions to tackle poverty, hunger, poor health and well-being, maternal health, climate change adaptation, energy and environmental burdens, economic hardships, and societal insecurity, and that a gender lens on science and science education can enhance the success of the implementation measures. This paper will look at the latest research findings on how central it is to bring a gender lens to research and what are the elements on this process that influence the positions of men and women in the science and technology system. Its main argument is that a greater diversity of perspectives and insights in science innovation technology and engineering (SITE) will make the processes and products of SITE more equitable overall, and that greater equity in the products of science (knowledge, technologies and the ways they are applied) will in turn lead to more sustainable solutions to development challenges.

"No Hay Lugar Para Los Negros": Manteros En Barcelona

Esta comunicación pretende explorar el fenómeno de los manteros en Barcelona partiendo del concepto de "ensamblaje" (Deleuze and Guattari, 1980) para evidenciar y "actuar" las relaciones, componentes, procesos de codificación, estratificación y territorialización/ desterritorialización, entre otros (DeLanda, 2006) que podemos tomar como agentes constituyentes de dicho fenómeno. Los manteros son vendedores ambulantes -hombres negros, principalmente inmigrantes ilegales de origen subsahariano - que venden en la calle copias ilegales de productos de lujo (gafas, monederos, bolsos).

El fenómeno de los manteros es global y se pueden encontrar en las principales ciudades del mundo occidental. Este colectivo que señala que "no hay lugar para los negros en Barcelona" se visibiliza y ocupa masivamente algunos espacios de la ciudad para vender sus productos sobre todo a partir de 2015 cuando se "relaja" la presión policial contra ellos con la llegada del gobierno de izquierdas de *En Comú Podem* al Ayuntamiento.

Desde una perspectiva de "descenramiento" aspiramos a analizar de un modo relacional y complejo las cotidianidades de estos "hombres", "pobres", "negros" e "ilegales" en tanto hombres pobres negros ilegales cuyos "afectos" incluyen el espacio, las mercancías, la opinión, la represión, la emoción, los sindicatos, la policía, el racismo.

Nos interesan especialmente los procesos de incorporación/intersección del sistema etnia/cuerpo/masculinidad/emoción que se materializan en esos ensamblajes, así como las formas de violencia, exclusión/inclusión, estigmatización, expulsión y racialización que generan esos ensamblajes. La comunicación está basada en un análisis etnográfico que incluye observación, entrevistas y análisis de noticias en los medios de comunicación.

Sahrawi Diaspora in Canary Islands: Intergenerational Change

Esta comunicación se basa en un trabajo de campo realizado para mi tesis doctoral sobre la diáspora saharaui en Canarias a finales del año 2014 y principios del año 2015.

La irresolución de la cuestión del Sahara Occidental ha contribuido al asentamiento de esta comunidad fuera de su territorio de origen y, por consiguiente, a la conformación de una diáspora donde el grupo hace un esfuerzo por mantener sus señas de identidad. Canarias se considera una de las regiones que mayor número de población saharaui acoge debido a su cercanía geográfica y al vínculo histórico.

El marco teórico se inserta en los estudios diaspóricos y en el concepto de identidad social de Richard Jenkins (2008), desde donde se analiza el caso de la comunidad saharaui en Canarias y los cambios intergeneracionales que se dan en su seno.

En concreto, se centra en el surgimiento de múltiples identidades entre la segunda generación, que oscilan entre la identificación con la comunidad de origen hasta una total asimilación en la sociedad de asentamiento. Cambios que tienen que ver con los distintos tipos de familia existentes donde los niños y niñas saharauis experimentan sus procesos de socialización. Entre estos cambios, se observa una redefinición de la identidad saharaui, la transformación de los roles de género, así como una mayor integración de la segunda generación con respecto a la primera. Así mismo, también se estudia la intersección entre la etnia y el género y cómo estos factores condicionan el proceso de integración social en la sociedad canaria.

The Biopolitics of Declassing Professional Women in a Settler-Colonial Context

In this paper, I argue that the biopolitics of declassing Palestinian professional women, as part of the logic of *eliminating the native*, is mediated by colonial violence as part of securing the class sovereignty of the settler in the labor market. By declassing, I refer to women's class subordination and transparency in the labor market- a group of middle class professional Palestinian women from the southern Naqab/Negev, who account for no more than 4.1% (Ghara, 2015: 73) of Bedouin society yet represent its greatest financial, educational and cultural capital.

This study aims at unpacking the logic of elimination through the racialized, everyday lived experience of the highest female class in Bedouin society that succeeded in entering the Jewish workplace. Nevertheless, in this case, they face sophisticated *erasure* tactics, paralleling various manifestations of the *direct* politics of fear that disciplines the body, will and mind, as well as *indirect* opposition reflected in the reinforcement of patriarchal power against women in the labour market.

This paper's purpose is to reveal concealed violent forms of power practiced by the colonialists to declass Palestinian women and preserve colonialist's class superiority in the labor market. It contributes to the field of bodily class stratification/subordination, that is not carried out primarily through economic (Scott, 2002) or symbolic (Anthias, 2001) means, but rather through everyday embodied practices involving violent mechanisms.

ACHARD, MARGOT* (*Université Catholique de Louvain*)

After Ayotzinapa: Personal and Self-Construction Impacts of the Mobilization

My investigation focuses on the "post-mobilization" periods. I am particularly interested in those following the student mobilization in support of the Ayotzinapa rural school in Mexico at the end of 2014, in reaction to the forced disappearance of 43 students. In this presentation I would like to focus on the impact that such a mobilization can have on participating students, on a personal and self-construction level.

How the different subjectivation processes experienced by students affect the way they look at politics many years after the main mobilization? Does it have an incidence in the student organization?

The Ayotzinapa mobilization was highly charged emotionally. The encounter with the victims' families and Ayotzinapa students had a really strong impact on the Mexico City students. This experience will remain present and ease a future mobilization as well as the union with rural organizations. It has also changed their way to see the world, to think of themselves and their relation with others.

As a result, some students involved in the Ayotzinapa mobilization see themselves as "militants": their personal life is not separate from their political life. It implies also some changes in their personal network: the people they met in the student assembly are now their friends, but not any kind of friend: people with whom they can think about a new world. This new network of friendship turns out to be really important for the student organization during the period following the newsworthy phase of mobilization.

However the subjectivation process is different for every student and it can also lead to some divisions in the organization. For example the repression they

lived in their flesh can radicalize some students, or lead others to stay away from those kinds of protest and try to change the world in others ways.

ACHATZ, JULIANE* (IAB Institute for Employment Research)

Affordability, Availability or Desirability? An Empirical Analysis of Children's Opportunities to Attend Guided Leisure Activities.

Leisure activities with peers are supposed to play an important role in the social development of children and adolescents and may therefore contribute to their social wellbeing. Particularly participation in guided activities like extra-curricular music or art education, sports or club activities has taken an increased interest in the last years. Recent research points to the existence of a social bias in the extent to which children and youth participate in guided activities. Empirical studies show disadvantages of poor children regarding opportunities to take part. However, some studies also point out that a number of low-income parents nevertheless manage it to make ends meet and to enable their children to attend to courses or similar organised meetings.

This leads to the question if participation is mainly related to financial conditions irrespective of other factors like family structure and educational background of parents. To disentangle effects of financial constraints from other factors is an important policy concern. In 2011, the German government introduced education and inclusion subsidies for children of low-income families. This policy approach implies the assumption that risks of social exclusion are mainly due to financial hardship that can be effectively counteracted against by providing financial support.

This study aims to test the impact of three main factors - financial resources of the family, perceived quality of the living environment and parental background regarding education and leisure preferences - on participation opportunities of children and adolescents. The empirical analysis is based on representative micro-level data from the German Panel Survey "Labour Market and Social Security" (PASS). Findings from a hybrid random effects regression model suggest that a stimulating home environment seems to be a key factor of children's participation opportunities, irrespective of the economic status of the family.

Community Re-Building: Labor Pains for the Birth of a New Community in a Renewed or Privatized Kibbutz

In the late 80's of the 20th century the Israeli kibbutz movement was hit by a serious and multi-dimensional crisis: economic, ideologic, and demographic. Young people left and population aged since there was no absorption of new members for nearly 20 years. So, kibbutz communities were dying.

During the early 21st century, and similarly to 80% of the 270 kibbutzim today, my kibbutz has undergone a process of privatization of expenses, first, then incomes and assets. Later, new population was integrated as residents or non-full members (members without ownership/shareholding on the economic assets of the kibbutz). So, the settlement was saved but the unified community split into diverse groups with diverging interests and beliefs. Pluralization of status (and class) in the kibbutz now threatens the community and undermines solidarity.

The aim of this paper is to describe how people in a privatized kibbutz, despite their diversity, socialize (in institutional and non-institutional ways) to rebuild the community as a sense of place, a community sharing common perspectives, and how social practices attempt to forge a common identity.

Kibbutz Industry Experience and Organizational Democracy

there is a problem i can't copy and paste my whole abstract. the last stance only was pasted

Despite this incentive to sell, Naaleh industry and its owner, kibbutz Nadiv, provide a counter-example to the normative behavior in the kibbutz sector. Kibbutz Nadiv refuses to sell and conform to the M&A's wave in the kibbutz industry, in spite of its privatized structure adopted in 2007 and its economic success. Instead, Nadiv chooses to strongly invest, develop, and extend its factory into the kibbutz yard. What can explain this paradoxical behavior and Nadiv opposition to a neo-liberal trend? What are the conditions in Naaleh which allow keeping at least a much more humanist and democratic work organization-if not an organizational democracy- than that in numerous other kibbutz plants? Focusing on a comparison between Naaleh and other kibbutz plants, the purpose of this paper is to sketch a theory on kibbutz industry today in terms of ownership, governance, management and succession. Such theory could contribute to a better understanding of the necessary resources for organizational democracy.

L'islamophobie Au Québec: Quel Impact Sur La Communauté Musulmane?

En 1971, une politique de multiculturalisme établie par Pierre Trudeau a été mise en œuvre pour promouvoir le respect de la diversité culturelle et le droit des groupes ethniques à préserver et développer leur propre culture au sein de la société canadienne. À cet effet, la question du vivre ensemble ou de l'identité collective au Canada est caractérisée par une diversité de cultures. Cette valeur de pluralité ethnique, permettant à toutes les communautés de préserver leurs caractéristiques culturelles, s'est cependant avérée hétérogène. Elle a très vite été associée à un problème majeur mêlant terrorisme et religion ou origine ethnique. Le multiculturalisme inquiète et l'islamophobie prend de plus en plus d'ampleur, particulièrement depuis les attentats du 11 septembre. L'islam en tant que religion engendre un sentiment de crainte et de peur au sein de la société canadienne. La communauté musulmane, principalement minoritaire au Québec, souffre d'injustice et le traitement médiatique des événements mettant en cause ce groupe minoritaire et religieux alimente de plus en plus les stéréotypes et les préjugés dans la société et propage un sentiment d'insécurité chez les Québécois. Nous cherchons à connaître la façon de décrire la communauté musulmane dans les quotidiens québécois. Cet article repose sur une recension de la presse québécoise, particulièrement de 2001 à 2016.

Quelle analyse a fait la presse québécoise de la communauté musulmane du Québec? Est-elle traversée par des courants intégristes ou bien est-elle bien intégrée dans la société? Est-ce que la presse québécoise a mis un lien entre les attentats du 11 septembre et la communauté musulmane du Québec? A-t-elle propagé un sentiment de crainte et d'insécurité dans la société? Est-ce que ces articles ont favorisé les relations intercommunautaires? Ce sont à ces questions que nous tenterons de répondre en nous intéressant de plus près à la société québécoise.

ACHTERBERG, PETER* (Tilburg University)

Post-Fact, Post-Scientific Inquiry? Belief in Conspiracy Theories and Public Attitudes Towards Science in the U.S.

Scholarly attention for conspiracism as a form of public opinion is rising. Based on mainly qualitative studies, many times it is argued that conspiracism is associated with a highly critical view pertaining to science. The research suggests that conspiracists tend to distrust scientific experts, tend to view scientific outcomes as corrupted, and tend to see the scientific enterprise as basically flawed. Yet, this same literature suggests that conspiracists typically embrace (their own) scientific methods as the only way of finding out the truth. This paper investigates the consequences of conspiracism for the legitimacy of science, and tries to explain them. Based on representative survey data gathered in 2014 in the US, in this paper, I find distinct two distinct types of trust in science. One pertaining to the trust in scientific institutions. And one pertaining to trust in scientific inquiry as the only way of obtaining the truth. I furthermore show that whereas support for conspiracy theories indeed detracts from institutional trust in science, it simultaneously boosts trust in scientific methods. In the paper, I test two theories explaining these patterns. The first focuses on reflexive modern motivations for conspiracists to embrace scientific methods and distrust scientific institutions. The second theory, which is empirically corroborated, argues that it is feelings of cultural discontents that explain this typical constellation of scientific attitudes among conspiracists. At the end of our paper, I elaborate on the theoretical relevance of these findings.

Globalising Social Science in Indonesia: Problems of Interrelations of Institutions, Networks, and Social Skills

The globalisation of social science in developing societies and its trajectories have attracted scholars across the continents. At least two perspectives dominate these studies namely, academic capitalism and academic dependency. While these perspectives are useful to assess the current position of national social science in the global sphere, they seem to pay less attention on the level of development of social science in a country. This paper tries to fill this void, using Indonesia - a country still in the infant stage of social scientific development - as a case study. It aims at explaining the impacts of globalisation-directed state in scientific works upon production of social science in Indonesia. It is argued that publishing social scientific works in reputable international journals is considered as a corner stone for the rise of academic social science and in turn policy social science in Indonesia. Rather than competing for a place in global academic ranking, the rise of both types of social sciences contributes to the modifications of Western social theories and public policies appropriate for a national context. By assuming production

of social science as a field and by employing a perspective of interrelations of institutions, networks, and social skills, this paper raises the following question. Under what circumstances globalisation of academic works directed by the state change the field of production of social science in Indonesian universities. The results of this study reveal that typologies of networks among actors inside and outside universities play a pivotal role in bringing about successful and failure of globalising social scientific works. Resilience and robust networks indicated by the present of academic leaders and characterised by wide ranging relations involving scientific producers, private and public sectors contribute significantly to globalisation of academic works.

ACIK, NECLA* (*Manchester University, UK*)

Between Security and Liberty: The Effect of Preventive Counter-Terrorism Policies and Practices on Young British Muslims.

The threat of 'home-grown terrorism' since the 2005 July bombing in London and the wider 'war on terror' has led to counter-terrorism strategies being expanded in the UK with a focus on prevention. The most controversial counter-terrorism measure has been the Prevent strategy, which has been criticized widely for disproportionately subjecting Muslim communities to surveillance and invoking narratives of 'suspect communities'.

Failing to get the voluntary support of the Muslim communities, a subsequent revision to the Prevent strategy in July 2015 made it a statutory duty for schools, universities, health, and social services bodies to implement the Prevent programme. Under this duty, public sector frontline practitioners including teachers are required to identify and refer people at risk of radicalisation and extremism to the government's Channel programme, which delivers early intervention and support to vulnerable individuals.

This paper draws on two empirical studies carried out from 2016 to 2017 in the North-West of England. It examines the effect of Prevent on students and teachers as well as on young Muslim activists' sense of social and political engagement. This research will address the potentially stigmatising and isolating effects of the current counter-terrorism policy and practice in schools and the effect it has on young Muslims in the UK.

Race, Religion and the Contested Convivial: A Pittsburgh Case Study

This paper focuses on the role of community and religious organisations in urban regeneration initiatives in two neighbourhoods in the city of Pittsburgh. Drawing on fieldwork data gathered during the first year of the Trump presidency the paper focuses on the struggle of African American communities to engage in regeneration whilst attempting to resist gentrification and largescale displacement in their communities. At the same time that local communities are engaged in struggles for their neighbourhoods, developers, politicians, entrepreneurs, local and federal policy makers also have plans for these urban landscapes, hoping to transform them into mixed income, multicultural spaces of conviviality. Relations of power, of trust, of local democracy and accountability come to the fore in these contexts and the paper reflects on the implications of these relations for convivial and equitable community development in the city and beyond.

Grant Hunting in Corporatized Universities: Experiences from Canada and Finland

Across the globe, contemporary universities are subject to forces of neoliberalism, including corporatization. These macro influences trickle down to find expression at meso (institutional) and micro (experiential) levels. It is increasingly becoming imperative that academics apply for and obtain external research funding. The two authors have independently done extensive research on changing academic work practices. Recently, each of us found herself involved in making a funding bid to the main social science research council in Canada and Finland respectively. We began to compare notes about our latest efforts at "grant hunting." This paper draws on our individual experiences, our knowledge of Canadian and Finnish universities, relevant literature, and insights from our prior research on academic work. We sense that much of the literature on the corporatized university, especially some of the more dramatic accounts, fails to recognize important divergences as well as convergences from country to country. We believe that it is important to bring into the discussion countries outside of the UK, US, and Australia. Canada and Finland provide interesting variations on the overall theme.

The paper begins by sketching the research funding and institutional landscapes typical of each country. It then focuses on the detail of the application process each of us recently experienced, including peer review, collaboration, budget constraints, institutional support, communication of results, and the subjective impact of "success" or "failure." In general, this alteration of academic reward practices means investing extensive unpaid time and energy into the invisible work required to prepare applications; intensifies the tiering and stratification between have and have-not groups; and heightens the emotional politics of academic work, including pride, shame, and envy. We consider whether exposing these experiences to the light of day might lead to ideas for reform.

Voces, Silencios y Verdades De Las Mujeres Indígenas En Colombia (2005-2016)

En las últimas décadas en las sociedades postconflictos, además de reconocerse la importancia de los tribunales, fueron establecidas las Comisiones de Verdad (CV). Un instrumento valioso y complementario para fomentar la reconciliación, el perdón y la restauración de la dignidad de las víctimas. Colombia no escapa de dicha lógica. Recientemente el gobierno y las FARC acordaron establecer la "Comisión para esclarecimiento de la verdad". Además de contemplar una participación amplia de las víctimas individuales y colectivas, da un carácter particular a la victimización sufrida por las mujeres, y a las formas diferenciadas en las que el conflicto ha afectado a los pueblos indígenas. Sin embargo, en este escenario es escasa la participación y la inclusión de las demandas de las mujeres indígenas (MI). Más allá de la regulación normativa no han existido mayores intentos por parte de las organizaciones indígenas miembros de la MPC por incluir a sus mujeres, su interés ha estado en la restitución de tierras y en la reparación colectiva. De esta manera, el objetivo es analizar cuáles son los retos y limitaciones de las MI en el marco de la implementación de la JT, particularmente la CV. El punto de partida es que la perspectiva de género en las CV contribuye a recoger las perspectivas de los roles desempeñados por hombres y mujeres antes y durante el conflicto. Así, serán visibles las violencias a las que se han enfrentado las mujeres indígenas, que además de ser de carácter sexual, también son espirituales, económicas y territoriales. La CV para asegurar los derechos de los MI, deberá centrarse no sólo en violaciones individuales y recientes, sino también en las afectaciones pasadas, colectivas e internas. El análisis con base en una "etnografía multisituada", tomará como referencia el trabajo de campo con la EIDI, entrevistas etnográficas y observación no participante.

Islam As "Everyday Lived Religion": A Case Study of Japanese Muslim Women Converts

This presentation aims to describe how Japanese Muslim women converts practice Islam and manage overt and covert conflicts on their identities and social relations with non-Muslims as well as with their foreign Muslim husbands. In the analysis, I adopt a theoretical framework of "everyday lived religion," which focuses on the "thinking and doing of lay men and women," rather than on religious leaders and religious normative statements. This approach helps understand Japanese Muslim women converts who lack religious support from communities and are forced to manage their religious lives by themselves. Based on data from in-depth interviews with 21 Japanese Muslim women converts, I found that they deal with daily issues, both in their workplace and at home, in an imaginative and original manner. In some cases, they make use of the stereotypes associated with Islam to convince their colleagues about their religious duties in the workplace. In other cases, they keep from their husbands information that may cause conflicts between them, especially when related to *halam* (things not permitted in Islam), or even make use of Islamic teachings in order to avoid their husbands' control on them. This result shows that Japanese Muslim women converts struggle to maintain a balance between being Japanese and being Muslim, thus mobilizing various resources and tactics in order to do so. For these women, Islam is neither what is indoctrinated by religious authorities and their husbands nor learned systematically in study circles or mosques, but rather like *bricolage*, i.e., created according to their needs in daily life. These findings suggest that Islam, in the globalized age, can survive as everyday lived religion which is practiced and produced daily in different ways by common believers, including these converts.

People with Visual Impairment "Watching" Television? Leisure Pursuits of People with Visual Impairment in Ghana.

Leisure pursuits of people with visual impairment is one of the under researched concepts in disability discourse. Employing focus group discussions, this study explored the leisure pursuits of people with visual impairment in the Kumasi Metropolis of Ghana. The study revealed that leisure pursuits among people with visual impairment is underlined by their socio-cultural, economic and political milieu. Their leisure pursuits include chatting, sleeping, listening to radio, meditation and watching television. Some activities such as watching of television is traditionally considered to be beyond the ability of people with visual impairment, however, this was pursued for multiple reasons including as a form of resistance to traditional stereotypes on visual impairment as well as its educational and informative values. Reasons underlying their leisure pursuits include availability and accessibility, desire to obtain information and relaxation.

Changes in Professional Power: The Experiences of Canadian Engineers

In recent years, researchers have explored the changing nature of professional power on a societal level, documenting declines in self-regulation, professional authority, and autonomy (Saks 2015; Abel 2003; Evetts 2002). Challenges to professional power at the societal level appear to be accompanied by changes in professional practice. New public management practices, corporatization, and demands for greater accountability, may restrict professionals' discretionary power, although there is evidence that professionals resist such encroachments, with some degree of success (Evetts 2002; Coburn 1994; Waring and Currie 2009). Nonetheless, trends in professional power at the level of practice are still unclear and under-examined. This paper explores the changing nature of professional power through a case study of the practice experiences of professional engineers working in Ontario Canada, drawing on data from a survey of 750 engineers, and follow-up in-depth interviews with 53 practitioners. First, I explore the extent of engineers' power to shape their own work: do engineers have the ability to determine their work content, and participate in meaningful decision-making? Second, I explore whether professionals are able to use their power to protect the public. Study findings indicate that engineers report a considerable degree of decision-making authority and discretion. At the same time, many engineers report increased workloads, and pressure from employers, clients, and competitors to underbid on contracts, or do their work more quickly and cheaply. This creates ethical dilemmas: many engineers feel pressured to make decisions that could have negative implications for public safety, as their clients push for short-term economic savings, over social protections. Faced with these dilemmas, some engineers question whether they have sufficient power to protect the public. The paper concludes with some reflections on the distribution of professional power, and implications for theory and practice.

ADAMS, TRACEY* (Sociology - University of Western Ontario)

The Changing Nature of Profession-State Relations in Canada

Research on professions and professional regulation in Anglo-American contexts has highlighted the importance of the state to profession creation, but has seldom documented state actors' activity. Researchers have focused on what professions do to 'win' the approval of legislators and, more recently, what state actors have done to restrict professional powers. Our understanding of why and when state actors choose to regulate professions remains limited. This paper will address this gap in the literature by focusing on profession-state relations and professional regulation in Canada historically. Focusing on the creation of scores of regulated professions between the 1860s and the 1930s, the paper examines state discourse, debates, and rationales. Legislators actively debated, contested, and ultimately endorsed professional regulation, and we have much to learn by considering who they regulated, who they did not, and what explanations they gave for the decisions they made. The implications of the empirical evidence for our theoretical understanding of professions and their regulation will also be explored.

The Gendered and Economic Impacts of Land Reform in Zimbabwe

What are the economic and gendered consequences of land reform in Zimbabwe? Zimbabwe's land reform represents the most extensive redistribution of land to smallholders in the 21st century. Initiated in 2000 when the state decided to support black occupiers on white-owned commercial estates, this land reform program has transferred 4,500 formerly white owned estates – representing 20 percent of the total land area in Zimbabwe – to around 170,000 black smallholder households. Despite the fact that women are crucial stakeholders in rural development processes, and are central to food production, the impact of land

reform on women has been overlooked in favour of political-economic outcomes. Based on ethnographic research with twenty households in Sovelele – a post land reform settlement located in southeastern Zimbabwe – my paper focuses on how the roles and responsibilities of women may be shifting among land recipients. My research suggests that land reform in Sovelele has given rise to a new group of medium-scale farmers able to produce significant surpluses of maize, small grains and groundnuts. Yet, this expansion of agricultural production has also entailed an intensification of unpaid female and child labour. For some women – namely married women – the demand for their labour translates into increased control over land and household income, while for others (such as unmarried daughters), the increased work load expected of young women and men encourages them to seek opportunities outside of the resettlement area.

'Everywhere Is Home': Paradox of Homing and Child Upbringing Among Nigerian-Chinese Families in China

The rise of China in Africa has facilitated flows of diverse nature, including the movement of people. As with Chinese in Africa, Africans are settling in Chinese cities and establishing families through unions with local women. As part of an ongoing study on the settlement experiences of Nigerians in China, this article explored how Nigerian-Chinese couples construct and embrace contradictory notions of home through practices of child upbringing. Using data from several hours of life history interviews and repeated home and office visits and social hangouts with families, the article analysed the delicate nature of China as a home to mixed-families and their children, and highlighted the socioeconomic and political uncertainties that foreclosed Nigeria homeland as a possible alternative. The study showed how parents in this form of union mould their children to become more Chinese through increased involvement in school activities while simultaneously rejecting the notion of China as home with decisions around children schooling choices and everyday lessons on mundane social behaviours like walking and management of personal space. This contradiction was explored within the context of social and institutional arrangements that exclude not only foreigners but also internal Chinese women migrants in Guangzhou city. In conclusion, whereas mixed-parents anticipated that China's rising global profile would have positive sociocultural ramifications, their parenting styles, hope and aspirations for their children suggest a tension in expressed optimism about China as a home.

From the Fringe to the Mainstream: Integrating Women into Trade Union Activities in Nigeria. Issues and Challenges

Abstract

Nigerian women's involvement in the socio-economic development of their various societies over the years has been well documented. These activities had been located mainly within their families and communities. However their foray into wage employment has necessitated their participation in other activities within industry. One of such activities is trade unionism whose objectives include clamouring for social justice and equity in the workplace. Trade Unions strive to enable improvement on existing working conditions of members through mass actions. By providing several benefits for their members, particularly a platform for participation in managerial functions in the work place, Unions have become a veritable force within the relationship between workers and management. However, in spite of their agitations for industrial democracy and social justice, women participation in unionism is still limited. Nigerian women are still marginalized in the leadership and decision making processes of their unions despite various official policies supporting participatory democracy. This paper therefore explores the internal workings of trade unions in Nigeria with specific reference to the location and activities of women in these organizations. Using a multi-stage random sampling technique, six hundred and forty workers were involved in this study. Both questionnaire and in-depth interviews were used to elicit information. Specifically, the study looks at activities of women within the administrative structures of the unions. Findings reveal that women are grossly under-represented in the governance of trade unions in Nigeria. Many reasons have been adduced for this state of affairs with the most strident being the patriarchal attitudes of the society. The paper concludes that efforts to move women from the fringe to the mainstream of trade union activities are constrained by some socio-cultural factors. Suggestions on the necessary steps required to ameliorate the situation are proffered.

RC56-JS-32.5ADEFOLAJU, TOYIN* (*Ekiti State University*)*Unemployment, Poverty and the Erosion of Family Values in Nigeria*

As work is vital for human development, gainful employment remains a veritable source of human needs. People therefore make efforts to secure employment with a view to improving their quality of life. However given the state of affairs in Nigeria with an unemployment rate of about 25% and four million people entering the labour market annually, securing employment has become a daunting task. As a consequence of the dwindling economy, many people are out of job, just as many school leavers are unable to get work either. The immediate consequence of this is that poverty sets in as the people who are out of employment are unable to meet their immediate and future needs. This situation which now makes the country one of the poorest in the world, with a per capita income of about \$2700 has had devastating social consequences and direct effect on the Nigerian family. Today as a result of general lack in many families, those values of integrity, mutual respect and justice that are cherished and responsible for the integration of their members have given way to some aberrant behaviours leading to dire consequences on the general society. Using available literature, this paper therefore examines how the poor state of the Nigerian economy has impoverished the citizens and diminished the long-standing values that have held the family together. The paper ends with recommendations that could improve the economy, create jobs and restore and secure the family as an institution.

RC36-651.6ADELMAN, MIRIAM* (*Federal University of Paraná*)*Human-Animal Relations, Feminist Eco-Criticism and the Struggle to Recreate Subjects & Subjectivities*

Although sometimes trivialized by those who see concerns for humans and for non-human animals in an oppositional light, the field of Human-Animal Studies has, over the course of the last two decades, produced rich and innovative work showing that an epistemology of *connectedness* may be much more fruitful. Based on over a decade of empirical and ethnographic study on the gendered and classed reconstruction of popular (rural-based) equestrian cultures in Brazil and recent study of literature that discusses the significance of human-animal relations in terms of theoretical paradigm changes in the social sciences, I offer considerations on the *why* and *how* of particular forms of bringing animals into current struggles to recreate subjects and subjectivities. I argue that such efforts may be constituted as emotional and reflexive responses to the impasse of contemporary societies and as attempts to overcome alienation and carve a path out of current environmental and social crises.

RC27-495.4ADELMAN, MIRIAM* (*Federal University of Paraná*)BERNAVA, CRISTIAN CARLA (*Universidade de São Paulo*)*The Many Faces of Rodeo Sport: Intersectional, International and Cross-Cultural Comparison.*

Rodeo sport has a long and complicated history. Often explained as "the only sport descending directly from work routines" - in this case, those of the American 'cowboy' and the Latin American 'vaquero' (vaqueiro) - its popularity does not cease to grow the world over, precisely as the context of its birth recedes in time (albeit not in the popular imagination). Furthermore, it is a sport that engages animal and human bodies in complex, diverse and much-mythologized interaction, whether in conflict (as in bull and bronc riding) or partnership' (i.e. the 'horse-human team' in barrel racing and calf roping). This paper is based on comparative work on contemporary Brazilian and North American rodeo and the apparent counterpoint of two of its current tendencies: on the one hand, its expansion as part of what Maguire has referred to as the Global Sport Media complex - as exemplified by the multi-million dollar North American PBR (Professional Bull Riders) events - and on the other, the often less business-oriented and even community-driven construction by participants who reclaim new visibility and opportunity for their historic but less recognized presence in rodeo and equestrian cultures, often mobilizing around racial-ethnic or gender/sexuality axes. As part of a broader comparative project, we focus here on two regional Brazilian rodeo cultures - the southern Brazilian Gaucho (campeiro) and the central Brazilian country rodeo circuits. We examine similarities and differences in the social origin of participants and within the sporting practices and the discursive strategies used to justify or gain support for their particular rodeo circuits; key issues that come to the forefront include constructions of masculinity/femininity, the re-signifying of rural and national/regional identity & 'heritage' and recent conflicts over uses of animal bodies in rodeo sport.

RC15-288.1ADEOYE, BEATRICE* (*Federal University, Oye Ekiti, Ekiti State, Nigeria*)ORIOLO, BOLANLE (*Federal University, Oye Ekiti*)FELE, MODUPE (*Federal University, Oye Ekiti*)*Demographic Variables and the Incidence of Hypertension in Ado-Ekiti, Ekiti State, Nigeria***Abstract**

Men's and women's health care experiences differ as they age. While increasing attention has been focused on gender differences in health status, prevalence of illness, and access to quality care among older adults, little is known about differences in their health care in the last years of their lives. To assess age and gender differences among Medicare-eligible adults in their utilization of health care services in the last year of life, gender is much more important as age in explaining most of the variations in the health outcome among people of different statuses. This study utilized structured questionnaire administered on 290 randomly selected respondents. About 86.9 % had prior knowledge about hypertension through different means such as social media, friends, healthcare delivery campaigns etc. However, their knowledge of the cause(s) of hypertension is quite low. Forty-two percent (42.7%) believed that when think or get worry only can cause hypertension. Majority (92.4%) of the respondents in their opinion says people from 50year above are liable to hypertension than people below the same age. Above forty-six percent (46.9%) of the respondents answered "yes" that gender have a role to play in the health outcome of hypertensive patients. Majority of the respondents (53.1%) in the study believe that men are liable to hypertension than women but hold on to the fact that men can survive hypertension than women. Statistically, according to Chi square test it was only age that shown a strong relationship to the health outcome people with hypertension. The study recommends more enlightenment programmes on causes and risk of hypertension and adequate, accessible and affordable health care for all hypertensive patients.

RC01-50.4ADERINTO, ADEYINKA* (*University of Ibadan*)OJEDOKUN, USMAN (*University of Ibadan*)*Trends and Patterns of Deaths Arising from Ethnic Conflicts in Nigeria, 2006-2016*

Ethnic conflict remains an intractable problem that has been confronting Nigeria since it gained independence in 1960. Despite successive governments' drives towards peace-building and the attainment of a united Nigeria, ethnic conflict remains a recurring problem frequently resulting in loss of lives and properties. Although many studies have been conducted on ethnic conflict, however, little scholarly attention has been directed at deaths arising from such conflicts. The major concern of this ongoing study is to fill this gap by providing information on trends and patterns of deaths arising from ethnic conflicts in Nigeria between 2006 and 2016. Data collection is currently being undertaken through a content review of some Nigerian newspapers on cases of ethnic conflicts. The study is expected to provide detailed data on the number of deaths arising from ethnic conflicts across Nigeria within the specified timeline, the socio-demographic profile of victims, the socio-economic and environmental factors sustaining ethnic conflict, the patterns of its occurrence across the six geo-political zones, as well as the actors perpetrating it.

RC08-170.3ADESINA, ADEWALE* (*EKITI STATE UNIVERSITY, ADO-EKITI*)*Akinsola Akiwowo: Born to Rebel; His Autobiography As the Pathways to Indigenization Debate in Sociology*

For Sociology to be meaningful to us all, it must be able to encourage, rather than discourage the values, maturation of indigenous discourse, norms, beliefs social systems and social processes. . There is no universal solution that will promote the benefits of sociology to all people and culture. Giving the same theory and method to every society did not and will not work. Akinsola Akiwowo Sociology represents a unique opportunity to the debate. This paper looks at the ways in which the socio-cultural background of Akinsola Akiwowo influenced his interest of indigenous knowledge to formulate theories and methodologies in his quest for an emic sociological paradigm of society. There is a great need to decolonize sociology so as to allow for more particularistic perspectives without compromising world sociology which is to be nourished/nurtured by progressive and revolutionary ideas derived from other socio-cultural environments. At present, sociology does not represent or reflect hopes, ideas and challenges of other continents apart from Europe. Little is known about how his autobiography and his socio-background influence his derivation from the Universal paradox. This paper attempts to re-assess Akinsola Akiwowo's personal life histories as well as his deep attachment to "Orunmila divination and Ifogbon Taiyese" perspectives of man and society, throughout his life as the basis for his theoretical formulations.

RC19-367.2ADESINA, JIMI* (*College of Graduate Studies, University of South Africa*)*The Idea of Transformative Social Policy: Securing Well-Being in an African Context*

If the general idea of social policy embraces an expansive approach to the diversity of instruments for securing well-being, its translation into an academic discipline has narrowed the vision of the questions we ask of social policy and the instruments that are privileged. The focus on social services in the Titmuss formulation of the discipline tempered the mutual embeddedness of economic and social policies. The instruments selected in Esping-Andersen's typology privileged social protection. The casting of the 'East Asian' social policy as 'productivist' attenuates the multiple tasking of social policy in the Nordic context, for instance—including the 'production' tasking; the same applies to the search for a "social investment" welfare state. The idea that, in the non-OECD context, employing other instruments not privileged in the European social policy scholarship involved doing "social policy by other means" attenuates the expansive vision of social policy pioneers—as public policy (Adesina 2015). The current hegemony of the "social protection paradigm," privileging social assistance, in 'developing countries' further narrows the vision and tasking of social policy.

In a development context such as Africa, a wider vision of social policy, with broader instruments, is required in securing well-being. We return to the idea of *Transformative Social Policy* (Mkandawire and UNRISD 2006; Mkandawire 2007, 2011; Adesina 2007, 2009, 2011, 2015)—both as a heuristic and an evaluative device. We enunciate the five tasks of social policy; the interconnection of economic and social policies; and the transformation of economy, social institutions, and social relations. Drawing on data from a three-year study of "the social policy dimension of land reform", we employ the *transformative social policy* in assessing the effectiveness of land and agrarian reform—an instrument that hardly features in OECD-centric social policy scholarship—in securing well-being and enhancing human capability.

RC36-651.1ADHAMI-DORRANI, LADAN* (*York University*)*Engulfed Apathy: A Systemic Crisis*

Engulfed Apathy: A Systemic Crisis

The xenophobic discourses and practices post 9/11 have led to the proliferation of other-making through fear at the local, national and international levels. The role of emotions cannot be underestimated in the current western cultural politics. Where fear spreads in the political and social landscape, it reaches into the individual body, in a complex interaction, danger, anxiety and love of one's nation (patriotism) lead into engulfed apathy, which is part of a tripartite of alienation in Thomas Scheff's articulation. Through an interdisciplinary approach, the aim of this paper is to explore how this phase of modernity is saturated by certain primary emotions such as fear, anger and hatred that testify to systemic crisis whether economic, political or cultural within the system which breathes apathy, triggering violence. This paper not only relies on Eric Fromm's concept of alienation as developed in his text, *The Sane Society*, Zigmunt Bauman's *Liquid Love*, and Hannah Arendt's *The Human Condition*, but also looks into the effect of the value-neutrality methodology and the expansion of alienation in the realm of knowledge making. Perhaps Hans Gadamer's *Truth and Method* is a text which sheds light into the myth of value neutrality that can be interpreted as a form of concurrent systemic alienation within the modern world of knowledge-making. This paper is an interpretive and genealogical cultural analysis which relies on a post-modern qualitative critical examination.

RC17-333.1ADKINS, LISA* (*University of Newcastle*)YLÖSTALO, HANNA (*University of Helsinki*)*Experimenting with Wellbeing: Ubi, Immaterial Labour and the Production of Uncertainty*

This paper is concerned with UBI (Universal Basic Income) and especially with the ongoing UBI experiment in Finland. This trial has gleaned praise from progressives around the world, not least because of its apparent break from the compulsions of workfarism. In this paper we stress, however, that the Finnish UBI experiment must be understood as part of a broad programme of government reform and especially as part of strategies aimed at the restructuring of labour. We elaborate how the UBI experiment is a behaviourist intervention designed to enhance the wellbeing of unemployed populations at a time in which productivity increasingly turns around wellbeing, that is, at a time in which wellbeing is increasingly defined as a productive, value producing, capacity. In this context we suggest UBI must be understood as a policy intervention which forms part of a broader strategy of the restructuring of labour and the emergence of new notions of productivity.

RC02-56.3ADNAN, ZAIRA* (*Western Sydney University*)MALLIK, GIRIJASANKAR (*western sydney university*)CHOWDHURY, MAMTA (*western sydney university*)*The IMPACT of Human Capital and Foreign Direct Investment on Productivity in Pakistan*

Human capital is a major driving force for better productivity of an economy. Human capital development refers to improvement in skills and efficiency of individuals that leads to higher productivity. This study examines the effect of human capital and foreign direct investment (FDI) on the total factor productivity (TFP) for Pakistan in presence of trade openness, government expenditure and inflation using annual data over the period of 1970 to 2014. The study uses Johansen co-integration technique and error correction method to examine the long run and short run relationship among the above mentioned variables. The results indicate that the variables are co-integrated and therefore exists a long run relationship among the variables. Moreover, a positive long run relationship exists between FDI and TFP in Pakistan. FDI inflows bring in new ideas and technologies in the host country exposing the labor to better methods and skills hence increasing the efficiency of the domestic factors of production and the results of this study are consistent with this theory. Human capital represented by education expenditure is found to have a positive significant effect on TFP in Pakistan. The results also suggest that government expenditure has negative but insignificant impact on TFP. The trade openness however has a significant positive impact on productivity. Pakistan is a labor intensive developing economy and in order to fully utilize its economic resources it needs to improve the quality of human capital to be able to increase productivity growth. An increase in education expenditure, better healthcare facilities and betterment of school conditions is a prerequisite to increase the productive capabilities of people. Government needs to particularly focus on diverting its expenditure on education to create an efficient workforce that would result in an increase in factor productivity which would eventually contribute to long run growth of the economy.

RC22-414.4ADOGAME, AFE* (*Princeton Theological Seminary*)TAYLOR-ABDULAI, HANNAH (*Accra Technical University*)*I Am a Witch for Jesus! Ritual, Symbolic Violence and Trauma in African Pentecostalism*

Scholarly and public attention has been drawn, particularly in the last few decades, to the dynamism, mobility and public visibility of Pentecostal and charismatic churches within the African and African diaspora religious landscapes. However, little focus has been paid to aspects of the ritualistic dimension, that in many cases have become associated with incidences of ritual abuse, verbal terror and symbolic violence, often unleashed by some religious entrepreneurs on unsuspecting adherents/clientele; acts that could infringe on their human and individual rights, and pose dire health consequences and challenges. This paper analyses the ritual dimension of some Pentecostal/charismatic churches, focusing on the ritual acts and idioms with criminal dimensions and a proclivity for abuse; the attendant trauma faced by adherents and clientele and their personal narratives (testimonies); the public discourses of approval/disapproval that have accompanied such ritual actions and verbal expressions. Using specific case studies from different African contexts, such ritualism will be critically analysed against the backdrop of the social/spiritual capital theory.

RC32-582.4ADOMAKO AMPOFO, AKOSUA* (*University of Ghana*)*Who Is an African Woman? Towards a New Paradigm of Feminist Knowledge Production and Activism*

We have a responsibility to use our knowledge and research to serve as advocates for the continent. As we reflect on Cynthia Joseph's commitment to gender justice broadly and "minority" women's access to justice today in particular, the voices of a new generation of women and feminist scholars is important. Also important are our relationships to the stories we encounter in our work, and the people who inhabit those stories—for our humanity is inextricably linked with that of others. She who knows she is because others are: Ubuntu! Millennial women are almost accused of preferring high heels and lipstick to the hard trenches work of their older 'second' and even 'third wave' sisters. And yet many are taking on issues that some of this "older" generation have not had to confront in our world today where heightened militarization coincides with academic arguments supporting white supremacy. This paper will discuss conversations with young African women about what it means to be a woman and a feminist today, the new challenges that confront them, and their own feminist work.

RC29-537.3ADORNO, SERGIO* (*University of Sao Paulo*)*Linked Stories: Circuits and Flow of Operations of Organized Crime in Contemporary Brazil.*

This proposal is based on partial results from a research in progress whose object is the chain and the flow of operations that move illicit drug trafficking from the production operations in the Andean countries to the distribution operations to the Brazilian consumer market. It aims to identify its main stages, the scope of its expansion, the local and scale social processes that they trigger, their social consequences (the institutional dislocations that these processes provoke) and their political consequences (the conflicts they establish and the corresponding power relations). The main focus, therefore, is the emerging crime economy with drug trafficking. The empirical sources of information include reports from government organizations (national, regional and local) as well as from international and nongovernmental organizations and national press reports. The analysis plan foresees to reconstruct the chain of operations in a temporal perspective (synchronic and diachronic). In empirical terms, the paper will focus on trafficking routes in Latin America towards Brazil and its local effects, such as the flourishing or decay of cities, impacts on public security policies, evolution of crime rates, especially homicides, drug and armaments seizures.

RC29-536.10ADORNO, SERGIO (*University of Sao Paulo*)SIMÕES GOMES, LETÍCIA* (*University of São Paulo*)*Racial Profiling in the Literature: A Comprehensive Review*

This article aims to present a comparative discussion regarding racial profiling in international as well as in Brazilian literature. The bibliographic review consisted in the scrutiny of the core international and Brazilian databases, with the entries of "racial profiling", "racial bias" and police "violence + racism". Firstly, we present the main perspectives that dictate the international debate over racial profiling; then, we discuss how these perspectives permeate Brazilian literature. We also analyze Brazilian specificities of racial profiling, as well as how the racial problem interacts with public security politics. Underlying the debate over racial profiling there is the concept of institutional racism as an expression of structural racism through the police, which origins mechanisms that reproduce and contribute to perpetuate racial inequalities. The Brazilian case, when compared to the international literature (which is mainly from the United States), presents its peculiarities inherited from Brazil's racial composition and its interaction with public security forces - promoters of an authoritarian and less transparent order - which generates consequences for measuring and formulating of theoretical-methodological perspectives. In Brazil, the chief way of indicating racial profiling in police activity is through the analysis of police lethality and arrest in flagrante delicto; meanwhile, in other countries, the object is ultimately related to traffic stops and search. Racial profiling, as an expression of institutional racism, relies on the social-historical frame of racial relations in a given society. Thus, we emphasize that in the Brazilian case the formation of its State and its security forces - decentralized and founded in authoritarianism and the criminalization of poverty - joined by the (non)integration of the black population to Brazilian society and citizenship (by the margins of the class structure and with reduced social mobility) generated a deadlier racial profiling, when compared to the U.S.¹.

RC42-726.2ADRIAENSSENS, STEF* (*KU Leuven*)*Class Foundations of Social Exclusion Toward Gay People*

The concepts of homonegativity and homophobia usually denote some sort of hostility or negative attitudes toward gay people. Most of the literature seems to focus on comparative differences between societies as a whole, and on the religious foundations of homophobia. These findings do suggest that the socializing institutions of society, for instance through religious teachings and practices, influence attitudes of social exclusion towards sexual minorities. However, within societies there are other significant sources of socialization. Social psychologists and sociologists have stressed that occupational and socioeconomic experiences and differences are a basis for socialization. This class dimension may also apply to differences in social exclusion and rejection of homosexuals. There is some evidence that homophobia indeed has a social class dimension: manual workers are the least accepting of homosexuality, while the service class is the most accepting. This evidence is pretty robust. In different countries, there is a similar order in homonegativity. However, social classes are quite broad categories of occupational groups. The existing evidence has not much to say about the more nuanced image of which more detailed occupational groups differ in their attitude toward homosexuality. A second open question is whether social class or occupation today remains as relevant as before for the social exclusion of gay people.

This contribution attempts to shed light on the historical and occupational structure of the social exclusion of gay people. We will do so by

1. testing whether these differences are systematic for all occupational groups, and
2. whether the class or occupational relevance for attitudes toward homosexuality eroded through time.

We document this problem by measuring differences in social distance and moral disapproval towards homosexuality in the European and World Values Surveys. These large-scale survey have been conducted since the 1980's in numerous countries.

RC09-197.3ADRIAENSSENS, STEF* (*KU Leuven*)*Diffuse Violence As a Road to Social Exclusion: The Recent African Experience*

The level of intentional infliction of bodily harm by human(s) on individuals or groups most probably affects the access to resources. This contribution fits into the call by recent scholarship that we should be less concerned with the securing of states, and more with the reduction of violence as a public good which primarily should benefit citizens.

Diffuse violence is a reality in many regions throughout the world, in particular in unstable political circumstances and weak states. It may be a result of the presence of powerful organizations producing and trading illegal commodities (such a drugs), multiple party civil war, warlords, and other contexts with multiple parties introducing violence to exert control. In sociology, the bearing upon the development of democratic institutions is oft debated and well-grounded in historical sociological theories of state development.

The detrimental effects of diffuse violence on human development seem less studied. Frequent violence by multiple actors incentivizes stronger parties to invest in violent means themselves, instead of using formally peaceful exchanges, which may create a 'vicious cycle'. The associated failure of states or other polities to enforce an effective violence monopoly, decreases the attractiveness for agents to engage oneself in peaceful exchanges and the formal economy (paying taxes, enjoying contract enforcement and other public goods). Finally, the investment of resources in protection and the use of violence diverts resources from more productive investments, e.g. in public goods. In short, the existence of war-like circumstances between multiple parties and systematic violence for direct gain, is expected to have serious detrimental effects on the access of people to human development and welfare.

We make use of the Afrobarometer, a particularly rich dataset of repeated cross-sections during two decades. We investigate whether human development and welfare levels are influenced by diffuse violence.

RC04-81.22ADROGUE, CECILIA* (*CONICET - Universidad de San Andres*)ORLICKI, EUGENIA (*CONICET - CENIT*)*Dropout at Secondary School in Argentina. a Dynamic View*

Scholarization rate in secondary school in Argentina is quite high, but graduation is not. During the last decade scholarization has risen considerably, but lots of those who now reach this level are not able to conclude it, many of them belong to poor households. Most empirical evidence on dropout for Latin American countries is based on information collected at one point in time through large scale surveys. Children who are in school are compared with those who were once but who at the time of the survey are not anymore. This approach has two shortcomings. First, most observable factors are measured after children have dropped out from school and are only able to provide post facto explanations of dropout. Second, this approach fails to recognize that dropout is often the complex process which may include sequences of inter related events. In this paper, we study the process of dropping out from school over time and relate it to a number of possible determinants in order to understand its dynamics. Using matched panel data from the Permanent Household Survey (EPH), we could capture the young people aged 13-19 in several surveys within two years (with a maximum of 4 surveys). Hence, we could identify students in the sample that were at school and the next time they were surveyed they declared not to be at school any more, even though they had not graduated. This information allows us to study the educational paths of young people in Argentina according to their socioeconomic background. Also, working with a dynamic panel allows us to see how the socioeconomic situation of the student changes after he drops-out from school. This work intends to contribute with valuable information for policy makers to define strategies to help poor students to conclude their studies.

GARCIA DE FANELLI, ANA MARIA (CEDES - CONICET)

Unequal Opportunities in an Open-Access and Tuition-Free Education System. the Case of Retention and Graduation from Higher Education in Argentina

In the past three decades, the massification of Argentine higher education intensified due to the growing number of high-school graduates in the context of open-access and tuition free public university policies. Although Argentina stands out in relation to enrollment in higher education, it faces serious problems in terms of retention and graduation. In 2015, the graduation rate within the theoretical duration of undergraduate programs was approximately 30 percent and it registered a 62 percent freshman (first-year) retention rate. In Argentina and in most Latin American countries, longitudinal surveys are unavailable. Therefore, an option to study the factors associated with dropout at a systemic level is to approach the measurement of these phenomena through National Household Surveys -the Permanent Household Survey or EPH for the case of Argentina-. The EPH is a quarterly national survey that represents Argentina's urban population. It systematically and permanently collects data referring to the population's demographic, educational, labor and socioeconomic characteristics. Based on EPH, we have calculated the global dropout and graduation rates by socioeconomic status and estimated the major demographic and socioeconomic factors affecting dropout probability using logistic regression models. Among the main findings we observed that the socioeconomic status and being a first-generation student matter. In particular, we detected that being a first-generation student, even after controlling for the socioeconomic status of the student's household, the gender, the type of studies (tertiary non-university or university programs) and having a scholarship, imply a higher probability of dropout from higher education. We concluded by pointing out the utility of these results in designing public policies and the possibility of replicating this methodology in other Latin American countries that apply similar national household surveys.

AEBI, JONAS* (Department of Cultural Anthropology, University of Basel)

FLACHMEYER, MALTE* (University of Basel)

What, If Your Pension Destroys Your Home? Right to the City Struggles Against the Pension Fund of the City of Basel

We depart from a case study in Basel where the Pension Fund of the City decided to renovate a tenancy house in a gentrifying neighborhood and therefore tried to displace the inhabitants, mainly elderly people living up to 40 years in their flats. As some of the inhabitants were former state employees, their own savings, invested in real estate markets, suddenly threatened their own home. In consequence, the tenants protested, a solidarity movement grew.

The case shows the conflicting goals between the increasingly financialized logic of investments of pension funds and the increasingly threatened rights of decent housing for elderly. More generally it demonstrates an absurdity of financial market capitalism: With their systemic "financial inclusion" parts of the middle class are prone to become rent seekers and victims of rent seeking at the same time. In our case, the pensioners are shareholders of the pension fund and tenants of its "asset".

In our paper we would like to trace the political formation underlying the process of financialization of the housing market and the rental system in Basel and Switzerland and the resulting actors-logics in the management of real estate, of pension funds as well as of the city government.

These interdependent processes of financialization equally influence the logics of housing provision producing a growing antagonism between a financial logic and one based on the right to housing as an existential good.

Our «rights» perspective shows the limits of a struggle for the right to the city based only on the everyday experiences of dwelling. We will argue that it is only possible to oppose the diffusion of the financial logic in housing if tenancy struggles are connected (or rescaled) to the political constitution of the housing market and to the financial «sources» of financialization such as the pension system.

At the Intersection of Gender and Family Type: Does Family Structure Matter for Gendered Educational Aspirations?

Whether or not family structure is a source of inequalities and a mechanism behind (dis)advantages in life chances is a subject of ongoing debate. On the one hand, previous research on family structures showed that single-parent households are more at risk in regard to economic resources (income). On the

other hand, further studies indicated some advantages, for example a higher degree of agency – in terms of the capacity to act independently and make decisions – among children raised in single-parent families. With respect to vocational aspirations and choices, it is still rather under-researched how two-parent families differ from single-parent families. This paper focuses on the intersection between gender and family structure regarding aspirations to participate in STEMM courses.

We conduct empirical analyses based on survey data of upper secondary school students (N = 2445) in their pre-final and final year at school in the German-speaking part of Switzerland. The data was gathered within a project of the Swiss National Foundation Research Programme on "Gender Equality" (NRP 60). Our empirical analysis of vocational aspirations towards STEMM professions involves two steps. First, the different types of families are compared with respect to the percentage of male and female offspring with a gender-typical vocational aspiration. Second, more complex mechanisms are investigated in light of multivariate analyses (controlling for socio-economic status). Results of the descriptive analyses show that gendered vocational aspirations do not vary by family structure, while multivariate analyses indicate a weak effect for girls: if they are raised by their mother only, they are more likely to aspire a gender-typical profession and less likely to aspire a STEMM profession.

Patriarchy and Defenseless Women: The Qualitative Study of Women's Mental Health in Khorramabad (Iran)

In Iranian society, patriarchal culture provides grounds for domestic violence against women. In addition, domestic violence affects women's mental health. However, many women are exposed to violence in Khorramabad, because in this city there is a patriarchal culture. Khorramabad is a city in Southwest of Iran with a traditional and tribal culture. However, this article study the mental illnesses of women exposed to domestic violence in a cultural and social context. The data were collected from a sample that was chosen both purposive and theoretically, through open-ended questions and in-depth interviews with 15 housewives who referred to a psychologist at one of Khorramabad's health centers. They were analyzed by the application of grounded theory method. Then, the findings of the research were classified into 11 main categories in a paradigmatic model; causal conditions (husbands' problems, such as addiction, suspicion, and bad financial condition), contextual conditions (such as family unfaithfulness by the family of a woman), intervening conditions (such as the lack of power of a woman, the patriarchal mentality of the husband towards the woman, and the badness of the couples' relationship). Finally, the category of the final core was conceptualized as "Violence of patriarchal culture against defenseless women". However, research shows that women are more vulnerable to violence through social and cultural structures. In fact, this research shows that society with patriarchal culture and lack of adequate social rights for women makes women vulnerable to domestic violence. In such a society, women suffer from many mental illnesses such as anxiety, stress, and depression.

Social Trust and Social Participation in Khvaf City

In order to realize a sustainable and comprehensive development, attention and emphasis on social participation is necessary. According to many researchers, one of the factors that play an important role in increasing social participation is social trust. The purpose of this study is to investigate the relationship between social trusts, as one of the main components of social capital, with different dimensions of social participation. This issue is more important in developing and traditional societies such as the Iranian society, especially in Khvaf city, which have a special status and 123 kilometers of common border with Afghanistan, and religiously with Sunni and Shia religions. Local and ethnic identities are active in it. In addition, the youth population, high percentage of rural population, low employment rate and migration from villages to cities are the main characteristics of this city. The method of this research was survey and the data were collected using a multi-stage cluster sampling method. The population of the active population in the city of Khvaf was 55405 people and 380 people were selected using the Cochran formula. To analyze the data and test the hypotheses using the spss and Lisrel software, Pearson correlation coefficient and structural equation

model have been used. According to research findings, the relationship between social trust and all types of social participation has been significant. In fact, the relationship of social trust with social participation is 0.52, which indicates the average relation between social trust and social participation. Therefore, there is a positive and direct correlation between social trust and social participation.

Talking about the Psychology of Globalization without Mention of "the Powerless"

This paper summarizes different approaches to globalization in the discipline of psychology and points out that it is very problematic to talk about globalization without mentioning power differentials. There is an intellectual ambivalence towards globalization that results in academics seeing it both as an opportunity for developing awareness of cultural diversity and as a sign of cultural colonization. Most psychologists believe that globalization leads to culturally benign conditions such as hybridization, cultural diversity and intercultural contact in a peaceful manner. If we "uncritically" accept these concepts, it may make us blind to power differentials. Although globalization has not drawn much attention from psychologists, the ones who are interested in this topic, especially social psychologists, appear to be more prone to naive optimism regarding the potential consequences of globalization. Therefore, in order to avoid being a naively optimistic psychologist, I offer to evaluate globalization as seen through power differentials and neo-liberalism.

Psychologists are now more open and sensitive including to different cultural approaches, creating a more culture-inclusive discipline compared with psychology thirty years ago. However, although we can simply define globalization as the increasing inter-cultural flow, psychologists should be aware that the direction of this intercultural flow is shaped by economic and political forces. The conflict of globalization is bearing witness to an age in which some people try to live a better life while some others try to survive. Psychologists have a responsibility to recognize this conflict and attempt to do their best to strive for social justice.

Post-Incarceration Experiences of Women Prisoners in South Africa

This study examines the experiences of women in South Africa after incarceration. Using in-depth interviews, the experiences of twelve women ex-prisoners who were incarcerated in South African prisons are examined. It emerged that some of the participants of this study experienced unemployment, stigma and discrimination, as well as the psychological effect of imprisonment after their incarceration. It was revealed that unemployment increased significantly among the participants after incarceration. It was also revealed that some of the participants were victims of stigma and discrimination from their families, in particular, and the society, in general. The psychological effect of imprisonment was reported by some of the participants; this was reflected in the inability of this category of women to make friends and the display of some of the habits that they learned in prison, such as staying in the dark even though they had no reason to after their incarceration. Feminist pathways approach was used to explain the criminal offending of the participants and how some of their experiences after prison may result in recidivism. Female headed households was found to be a pathway unique to the offending behaviour of South African women.

The Efficacy of Weight Loss Surgery: Insights from the Patients.

Obesity is a growing epidemic worldwide and South Africa is not exempt from it. People lose weight using various methods and one of these is weight loss surgery. Weight loss surgery, which is also known as bariatric surgery, is a fairly recent phenomenon in South Africa. The procedure started in South Africa around the mid '90s and it has slowly, but steadily, received more attention over the years; this is reflected in the increased number of obese people who resort to the procedure. The research question upon which this study is anchored is "Is weight loss surgery effective in combating obesity?" The narratives of this study's participants, who are people that have undergone the procedure, will serve as framework to answer the research question of this study.

SHAFATI, MASOUMEH (PHD Candidate of Sociology University of Tehran)

Cyberspace and Postmodernization of the Medical Arena (Case Study: Music Therapy)

With the advent of postmodernism in medicine arena, new interpretations of the concepts of health and its approaches emerged. Complementary and Alternative Medicine (CAM) is one of the treatment methods that is consistent with postmodernist interpretations. Due to the lack of different types of CAM, especially music therapy in universities and the lack of music therapy clinics in Iran's social space, cyberspace witnesses the emergence of sites and weblogs about music therapy. Given these limitations, the role of cyberspace in providing an opportunity for a discourse presence that has been marginalized should be considered. This possibility of presence in cyberspace under limited conditions of presence in the physical space is a reflection of postmodernization. Certainly, the actual space constraints affect the quality of the presence of music therapy in Iran's cyberspace. (So, the research questions are as follow: How music therapy is introduced in cyberspace? What dimensions are emphasized on cyberspace in the introduction of music therapy- as one of the types of complementary? How these dimensions are in contrast to modern medicine?

The research method in this study is qualitative content analysis. The target community of the research consists of the updated Iranian websites on music therapy. (Purposive) theoretical sampling was used for sampling and continued to reach the theoretical saturation. The analysis of the 11 sites showed that they emphasize on the seven major dimensions (categories) of music therapy to introduce it to the visitors, which are "scientific dimension", "historical dimension", "therapeutic function", "empowerment dimension", "health benefit", "application comprehensiveness" and "globalization of music therapy". Meanwhile, music therapy by focusing on some dimensions seek to increase its credibility by bringing it closer to modern medicine and, in contrast, by emphasizing on some other dimensions, challenges modern medicine.

"How Do Migrant Muslim Women Negotiate in Slums? Ethnographic Study of Muslim Women Migrants of Khora, Ghaziabad"

Does migration always bring opportunities to the migrants? How does it impact gender? This paper makes an ethnographic study on the Muslim Women in Khora Colony in Ghaziabad and deeply probes the dynamics that affect the conditions of women in urban slum. Khora Colony, which is situated near the national capital of Delhi, has a predominant migrant settlement and the condition of living is very poor. They migrated from the villages of the neighbouring states in search of better job opportunities, but now engaged in petty works such as street hawkers, construction workers, etc.. But, low income and migration impacts women more than men. Migration to new place creates new restrictions on women mobility and access to opportunity. In the survey, it was found that women are restricted to home and do household work. The restriction pervades in almost all aspects of economic and social life such as education of girls, overall conditions and vulnerability. It has also been observed that girls are treated as burden and marriage is more on priority. There is no provision of education for them due to their minority status. The conditions of poverty, structural constraints imposed due to caste and religion degrades their condition further. Ghettoisation, limited social mobility, poor health, poverty and Patriarchy is the major hurdles that affect the women's participation in social life. This paper will explore how this condition affect the status of women after migration and how education can improve their condition. It also discusses how government is doing in helping their condition.

The Impact of the Argentinean Pension System on Poverty and Income Inequality

This paper analyzes the impact of the reforms of the Argentinean Pension System (SIPA) on poverty and income distribution between 2003 and 2016. This exercise is firstly aimed to provide evidence about the efficiency of a universal pay-as-you-go system to secure seniors with a decent standard of living. Secondly, this analysis attempts to clarify the way the structure of households composed of seniors influence the conversion of pension benefits into social welfare. Thirdly, this research highlights some aspects of current developments of demographic ageing in Argentina in order to discuss prospective reforms to the SIPA. To assess these objectives, we draw on the Household Permanent Survey (EPH) microdata to calculate changes in relative poverty levels and estimate Gini and Theil decompositions of household per capita income.

RC20-JS-78.11AGUADO, EMPAR* (*Universitat de València*)*Women in Docks*

The study of the profession of port cargo handling has a particular interest for several reasons: a) It is located in a sector that still remains fully masculinized in any geographical point of the Spanish State, this indicates the level of resistance to the prevailing change in profession by men who compose and having power in such decisions; b) It is a profession or trade not regulated by the Statute of Workers (RDL 1/95) but by an employment relationship of a special nature (RD 2541/1994-RDLG 1/1995-RD 1424/2002-RDL 3 / 2005-RDL 2/2011). Unlike the domestic servants, where we find domestic workers, this sector offers a high level of protection and quality employment; and, c) it is a profession with severe entry barriers in access despite not require high levels of education or training which indicates the high level of existing bargaining power in the sector.

In this paper we present an investigation framed in a larger project which aims to inquire about gender labour segmentation. The object of study we place in a highly masculine occupation: women in docks.

RC20-JS-78.10AGUADO, EMPAR* (*Universitat de València*)IBÁÑEZ, MARTA (*Professor*)BALLESTEROS, ESMERALDA (*UCM*)NAROCKI, CLAUDIA (*ISTAS*)GARCÍA, ELISA (*CUV*)FERNÁNDEZ, ANA BELÉN (*UM*)KURIC KARDELIS, STIBOR (*Universidad Complutense*)*Women in Male Occupations. the Spanish Case.*

Women who work in occupations where there is a significant majority of men face challenges that differ from those built in occupations with greater statistical balance by sex workers. Understanding why occupational segregation persists in the labor market is a central issue when to intervene on gender inequality in wage labor. In this research a qualitative approach has prevailed, recovering work experience as an extreme minority workers employed by semi-structured interviews. This rich body of data allows, on the one hand, consider what obstacles to conquer heavily masculinized parity in posts and, secondly, to study how these women persevere and maintain their motivation despite the challenges they experience and affecting both their permanence in employment and their chances of promotion.

RC44-747.5AGUIAR, THIAGO TRINDADE DE* (*Dept.of Sociology, University of São Paulo*)MELLO E SILVA, LEONARDO* (*Universidade de São Paulo*)*A TNC from the South: The Case of the Brazilian Vale*

This contribution intends to discuss the connection between union and social movements, as well as the possibilities of global action by the workers and the population affected by the policy of a multinational company from the South, *Companhia Vale do Rio Doce* (CVRD). Until 1997, it was a state-owned company before privatization made it a bold global player. Due to its involvement in large mineral exploration projects in the country, it has been the target of social movements, among which the most prominent is *the Movement of the Affected by Vale*. In the configuration of today's global capitalism, transnational corporations in the South are increasingly playing a dynamic role, especially in sectors related to mineral and agricultural products. The CVRD had acquired a mining company in Canada, which generated bitter labor disputes in that country because of the new management's attempt to introduce a labor relations system in Canada characteristic of that used in Brazil (for example, bonus, pensions and anti-union policies). Between 2010 and 2012, the trade unions in Brazil organized an international union network, which did not succeed due to the fragmentation of the system of trade union representation in the country. Attempts at international solidarity were made, but they fell short of what could have been achieved: expectations were more optimistic than reality allowed. One of the aims of the paper is to carry out an impartial exploration of the reasons for the extensive disappointment within the international metalworkers union movement with regard to the unfolding of the CVRD strike in Canada. In the context of the field of Labor Studies on the global action of union networks in transnational corporations, the analysis of a concrete case can be of interest as a teaching point.

RC01-37.1AGUILAR, SERGIO* (*UNESP*)*The Role of Borders in the Regional Conflict System of the Great Lakes in Africa*

Conflicts are seen as a complex phenomenon. In Africa, some of them extend over long time and are considered intractable. Being complex, African conflicts cannot be understood in a simplifying and reductionist approach of a linear analysis, which is normally done when we turn to the various paradigms in the field of conflicts and peace studies. That is why the systemic conflict analysis and, in some cases, the regional conflict system analysis can be useful to better understand the dynamics involved in various armed quarrels in that continent. The Great Lakes region in Africa can be understood as a regional conflict system where the border dynamics play a crucial role in the formation and maintenance of the conflicts. The dynamics are related to actors (internal and external), issues (declared and barely visible) and practices (legal and illegal) that fuel violence and keep its intractable and complex characteristics. The paper uses documents, second hand sources and other methodological tools to present the role of borders in the conflicts of three countries of the Great Lakes - Central African Republic, Democratic Republic of the Congo and South Sudan - analysing the dynamics that operate under the approach of regional conflict system.

RC01-40.4AGUILAR, SERGIO* (*UNESP*)*The Use of Force in Peacekeeping Operations in South Sudan and Central African Republic*

Peacekeeping operations has evolved in the last decades, especially because of the changes occurred in the patterns of conflict, actors involved in violent processes and global and regional security structure that made both, the conflicts and peace operations more complex. One of the changes in the attempts to manage, resolve or transform conflicts is related to the use of force to protect civilians and/or to accomplish the mandates. From the *United Nations Mission in Sierra Leona* (UNAMSIL), in 1999, many operations have been authorized to use force to protect civilians under threat of violence. In 2016, eleven peacekeeping operations presented use of force to protect civilians in their mandates. The paper address the use of force by military component in two United Nations peacekeeping operations in Africa - South Sudan and Central African Republic. The work used documents, second hand sources and other methodological tools to present how the force was used in the operations and its results for the protection of civilians and the peace process. The discussion addresses actors, issues and dynamics of the conflicts, and try to establish patterns of actions and the relationship between the use of force and the progress of the peace process.

RC37-664.5AGUIRRE JARAMILLO, ANDRÉS* (*Universidad Central del Ecuador*)*Reparación Integral: Las Expresiones Artísticas Como Instrumento De Reparación Simbólica a Víctimas De Graves Violaciones De Derechos Humanos*

En comparación con otros países de América Latina, la macrocriminalidad política impulsada por el Estado, también llegó a Ecuador en la década de los ochentas. Este período se caracteriza por la violencia sistemática contra toda opinión contraria al gobierno y por la aplicación de la Doctrina de Seguridad Nacional. En el año 2008, el Estado creó la Comisión de la Verdad, con la finalidad de investigar, esclarecer e impedir la impunidad las graves violaciones de los derechos humanos cometidos en el Ecuador entre el 4 de octubre de 1983 y el 31 de diciembre de 2008. Así, el Estado asumió la responsabilidad objetiva por los delitos de lesa humanidad y las graves violaciones a los derechos humanos, con ello, el ejercicio del derecho a la reparación integral, y la aplicación de medidas simbólicas en favor de las víctimas y la sociedad. Ante tal escenario, la presente investigación, intenta analizar las expresiones artísticas como instrumento de reparación simbólica que contribuye a la reparación integral de las víctimas de violaciones de derechos humanos. El argumento expuesto, toma como referencia estudios en Colombia de la profesora Yolanda Sierra León. Para ello, la propuesta intenta posicionarse teóricamente desde la sociología del arte que pone especial interés en la estética de lo social, en las ideas de Benjamin y Adorno sobre este asunto. Asimismo, se busca establecer un dialogo con los estándares internacionales que regulan los parámetros en los que debe llevarse a cabo la reparación, desarrollado por los sistemas internacionales de protección de los derechos humanos.

RC32-595.2AHLAWAT, NEERJA* (*M.D University, Rohtak, Haryana, India*)*Changing Marriage Considerations, Notion of Honour and Choices in Haryana, India*

Over the past few years, the institution of marriage is undergoing tremendous change. Marriage remains universal and nearly compulsory both for boys and girls as this is an indicator of one's overall position in society. In case of women, marriage is considered important especially for protecting their sexuality and family honour. In case of men too, marriage is important as it is linked with reproduction, their masculinity and having control on their wives and children. The state of Haryana is fast urbanising, with extensive consumerist culture and individualism. In view of the emerging scenario in Haryana, there is serious crisis penetrating deep inside the rural society where forces of tradition and modernity are in sharp contrast defying each other.

The present paper is based on extensive ethnographic study to examine the marriage norms, restrictions and notion of honour associated to women/girls. How does the violation in the observance of the prescribed rules of marriage result into severe punishment sabotaging freedom of choice to enter into matrimony. The study concluded the need to create an environment of dialogue, freedom and gender space to protect individual interests. For this, civil society organizations, academia, activists and media together should take the lead.

RC11-232.4AHMAD, AISHA-NUSRAT* (*International Psychoanalytic University*)*Everyday Reality of Older HIV-Positive Migrants in Germany*

In Germany, as in most of the countries in the Global North HIV due to medical advancement has developed to a chronic disease. Now the average age of people living with HIV and AIDS is increasing and so is the proportion of older people among the HIV-infected population. In a couple of years, it is expected that more than half of the people living with HIV in Germany will be 50 years and older. At the same time, another phenomenon that has recently gained increasing significance in science and politics are older migrants in Germany. Until the early 2000s, older migrants were barely noticed in science and politics. However, due to their increase in number and proportion older migrants and their often-precarious situation in old age - which is considered a social problem - an augmented interest can be observed. The group of older migrants are the most growing population group among the elderly people in Germany. Concurrently however, the dominant aging discourse in Germany is neoliberal. The neoliberal aging discourse in Germany promotes active and healthy aging and demands from the older citizens to productively contribute to the prosperous development of the society.

The reality of life of older HIV-positive migrants living in Germany are examined with an intersectional approach. With narrative interviews and social network maps the complexity of biographical compositions of lives that are moulded by experiences of migration, the HIV-infection as a socially highly stigmatised disease and the subjective experience of aging as a significant phase in life are traced. The research's sociological and social-psychological focus is on the subjective dealings with the interactions of the HIV-infection, the experiences of migration and the process of aging against the backdrop of neoliberal aging discourses in Germany.

RC34-613.2AHMAD, AISHA-NUSRAT* (*International Psychoanalytic University*)LANGER, PHIL* (*International Psychoanalytic University Berlin*)*Notions of Hope in a Fragile Context – the Afghan Youth Project*

Afghanistan and its people have been wracked with more than three decades of war and conflict that have led Afghanistan to be amongst the poorest countries in the world. Lack of educational facilities and societal restrictions especially for girls and young women, corruption, nepotism, unemployment as well as gender and ethnic discrimination are common. The *Afghan Youth Project* aims to understand the impact of traumatic experiences of everyday violence have for identity formation, conceptions of society and the development of social agency for youths in Afghanistan. And as well as how these experiences shape their imaginations of a different peaceful Afghanistan? To what extent do they see themselves capable in contributing to a societal and political transformation? Children and adolescents amount together two third of the country's population, yet their experiences, are neglected in scientific debates, that primarily focus on political and military 'powerful' actors. But it is the young generation that shapes the country's future therefore we think that the experiences of the youth must be taken into account when thinking about the country's future. For this presentation, we would like to share some findings of the *Afghan Youth Project* that explores with a participatory research design the everyday experience on a micro level with qualitative methods such as narrative interviews and drawings as well projective essays and drawings considering the heterogeneous ethnicities and socioeconomic backgrounds. By now 45 narrative interviews, more than 170 projective essays and more than 200 drawings have been collected by the authors

together with the local co-researchers. For this presentation, the authors will focus by drawing on the empirical data the narratives of pain and suffering but also the notions of resistance and hope among young Afghans and highlighting gender differences in dealing and coping with the experiences of violence.

RC13-260.2AHMAD, JAVEED* (*Sher-e-Kashmir Institute of Medical Sciences(SKIMS)*)*Changing Technology and New Ways of Leisure: A Critical Perspective*

Science and technology has revolutionized each and every sphere of human life. As a result of this, there is hardly any aspect of life that has remained immune to its impact. Its total impact is well reflected in the manner, the people make the use of multiple technological devices in spending their leisure time. The multiple ways in which people make use of technology in order to recuperate from the heavy work pressure may vary from listening to music, watching television, playing games on computer, chatting with friends on social networking sites to going gyms, playing sports or visiting amusement parks etc. Therefore, the dependency of modern day man on technology for spending their leisure is ascertained beyond any fact.

While there is no denying the fact that technology has remained an inevitable means of modern mans recreation, however, it has a negative side too. The negative impact of the technology is well reflected from the all-round adverse impacts of the excessive use of modern technological devices that range from physical fatigue, eye straining, staining social relations, pornography etc. The unjust use of technology, can, therefore, cause more lethal effects over recreation.

The, present paper, therefore, intends to discuss the leisure viz-a-viz technology and its impact on the social lives of the modern day man.

RC10-202.1AHMADNIA, SHIRIN* (*Associate professor at Allameh Tabataba'i University*)KAMEL GHALIBAF, ATENA (*Allameh Tabataba'i University*)*Civic Participation in the Central Region of Tehran: A Study on NGOs and City Councils*

Public institutions are not the only agents of urban governance. Focusing on two other institutions namely NGOs and city councils, this research probes the question of participation. The aim of this research is to study the way in which people participate in the procedure of urban governance. To do so, the study concentrates on central region of Tehran, namely 6, 7, 11, and 12 districts. It also draws on qualitative research as the method and conducts 11 in-depth interviews with people from varied NGOs and 8 people from city councils of the above 4 districts. Results show that there is no significant constructive relation between NGOs and city councils, on the one hand, and between these two and the public institutions on the other hand. Neither is there a suitable context for the NGOs and city councils with considerable expertise to participate in the urban affairs. One can also witness the decreasing sense of belonging to the neighborhood even within the traditional districts such as 11 and 12. The research argues that part of this is due to the increasing rate of social problems and decaying social capital. This situation, in turn, tore apart the basis for civic participation.

RC15-JS-64.7AHMED, HUMAYUN* (*University of Toronto*)AHMED, SALEEM (*Jinnah Post-Graduate Medical Centre*)AHMED, SOHAIB (*University of Toronto*)GLISCH, SOPHIA (*University of Toronto*)*The State and Future of Medical Regulation in Pakistan: Self-Regulatory Corruption in the Aftermath of Colonization*

Self-regulation is at the forefront of the medical profession more so than any other healthcare field. While self-regulation is critical to physician autonomy and quality of care, oversight bodies responsible for generating and enforcing quality standards are necessary. While the adherence of medical regulation to its own quality standards is questionable even in the developed world, Pakistan especially houses regulatory structures that do not appear to be in compliance with the standards they set. Specifically, the colonial implementation of an essentially British system that shares salient characteristics with British regulatory structures, but does not successfully account for Pakistan's unique political and commercial landscape, has left gaps in power that demand filling, resulting in corrupt patient resource allocation and physician registration and qualification largely influenced by affiliations with the public sector. Despite a superficial commitment to ensuring registration and continuing education, Pakistan's regulatory bodies do not appear to demonstrate the quality standards that they publicly declare. In order to propose policy and enforcement recommendations to improve the current system, this paper will first look at the state of the current system. We

will describe the standards publicly set by medical regulatory bodies such as the College of Physicians and Surgeons of Pakistan, and evaluate the extent to which the regulatory bodies appear to comply with their own standards. We will then recommend revisions to the formulation and enforcement of these standards to better regulation in the future.

How Does the Perceived Risk of Infant/Child Mortality Influence Fertility Preference? a Comparative Study in Bangladesh

This study addresses how the perceived risk of infant/child mortality influences fertility preference in Bangladesh. We surveyed 759 ever-married women and did in-depth interview from 25 married women. We included two study areas, one is vulnerable to extreme weather events and the other one is not. Findings reveal that those who consider a high risk of infant/child mortality and had previous experiences with infant/child mortality are more likely to prefer additional children in the areas prone to extreme events. Higher male child mortality is found in extreme weather events area. Qualitative information reveals that people from the areas think to having a child as replacement and consider as security against the future loss. However both fertility and mortality has remarkably declined in Bangladesh but this study shows a positive link between the perceived risk of infant/child mortality and fertility preference and further studies to explore more insights on it.

"But That's Just Neoliberalism, Right?": Public Transport Organizations and Moving Beyond Representations of Macro-Historical Perspectives.

Neoliberalism, as a key theoretical concept, is often employed to explain shifts in social and economic organization. The use of this concept renders legible local phenomena through theory without exploring the nuances and details of economic organization and culture within institutional contexts. As such, I argue for the necessity of investigating meso-level institutions to see how they vitalize and effect the discursive construction of macro-historical processes. To do this, I explore organizational texts of London, U.K.'s public transport organization, Transport for London (TfL) and its predecessors, and pay special attention to language that we have come to associate with "customers" and "customer service." These are often recognized as signals of neoliberalism within public organizations. I examine the details of these organizational texts and the contextual use of the terms used above, particularly within staff magazines and annual reports, to avoid imposing a macro-historical perspective on the emergence of a current phenomenon – the customer service orientation in London, UK's public transport organization. The paper illustrates that many of the narratives, logics, and language associated with customer service preceded the dominance of neoliberalism. Consequently, the paper further argues that in avoiding imposing a reading of customer service as necessarily neoliberalism-in-action, it becomes possible to theorize the ways in which the macro-historical processes of neoliberalism articulate with pre-existing organizational discourses found at the meso-level of organizational analysis, within texts. Investigating the nitty gritty of organizational economic culture refines the way in which we may be able to think through the continued domination of neoliberalism. Moreover, employing such a strategy may reveal that what we might think of neoliberalism at first glance might be more than meets the eye.

Indigenous People's Perception about Climate Change, Forest Resource Management and Coping Strategy: A Comparative Study in Bangladesh

This study addresses how indigenous people living in a forest area perceive about climate change. This study also aims to know how indigenous people manage their forest resources and apply different coping strategies by using their indigenous knowledge. This study selected two indigenous communities living in Lawachora Punji (Khasia community) and in Dolubari/Dulahazra (Tripura community). This study included 18 households from 23 households living in Khasia Punji and 60 households from 75 households living in Dolubari/Dulahazra and followed purposive sampling particularly convenient sampling to collect information. This study used a survey questionnaire for descriptive information and also conducted in-depth interviews to explore more insights about climate change. Findings of this study show some differences between the two indigenous communities on climate change perception. Findings also reveal some variations

on indigenous techniques and knowledge for forest resource management and coping strategies. Tripura people consider that climate change is a treat for human kind and human activities are responsible for climate change. On the other side Khasia people consider more about the impacts of climate change and how to combat the impacts of climate change. They emphasize on government responsibility, raising public awareness and performing different roles by human to tackling climate change effects. This study suggests further comparative study between different indigenous communities living in forest areas, Bangladesh. Findings from this kind of study can provide more insights and understandings about climate change and its different dimensions including forest resource management and coping strategy. Guidelines and policy suggestions from the studies can contribute to sustainable environment in future in developing countries like Bangladesh.

The Stratification of Intergenerational Alignment of Educational Expectations

Building on research on the role of educational expectations in status attainment (Sewell, Haller, and Portes 1969). Kim and Schneider (2005) conceptualized intergenerational alignment of educational expectations. They reported that the alignment of parents' and adolescents' goals and actions could play a crucial role in the intergenerational transmission of social capital, thus increasing educational attainment.

While we accept the importance of aligned expectations on social attainment, we argue the need to consider heterogeneity by socioeconomic status (SES) in order to better understand the patterns and roles of intergenerational alignment of educational expectations. We focus on whether the probability of aligned expectations is stratified by SES. We further investigate if social capital within and outside the family carries the effect of family SES on the intergenerational alignment of educational expectations.

Following Kim and Schneider, our outcome variable is measured by the agreement between students' own educational expectations and parents' expectations for them. Using the Educational Longitudinal Study of 2002 and Hierarchical Generalized Linear Modeling where 12th graders are nested within school, findings from this study indicate that students and their parents from higher SES are more likely to share the same level of educational expectation for students, when compared to those from lower SES. Results are robust to the inclusion of gender, race, students' cognitive ability, and school characteristics (e.g., Catholic school, school SES) while social capital within family partially carries the effect of family SES on aligned expectations. We further address the source of intergenerational agreement patterns (i.e., upward, downward, and identical alignments) by SES and discuss implications of stratified expectations for relative risk aversion and higher education expansion across generations (Breen et al. 2014).

Crossing Disciplines to Breach the Frame

Feminism arose within a public sphere formed through masculine subjectivity. This paper proposes that Australian Aboriginal culture, where no separation between public and private existed (Etienne and Leacock 1980), offers a lens from which to view this masculine frame. Patriarchy is interpreted as a psychological process (Aitken 2013) in line with Nandy's (2009) critique of colonialism. Social psychology is drawn on to demonstrate the ongoing sway masculine subjectivity holds over Western cultures, from political ideologies and processes through free market capitalism to the control of knowledge (Aitken 2013). Masculine subjectivity also permeates all the disciplines that feminism was built upon (Tong 1992). In contrast, pre-colonial Aboriginal culture – which is increasingly thought of as matriarchal – demonstrates how knowledge is dispersed, how authority rests upon responsibility, and how balance – within society and with the environment – is maintained (Rose 1992). The argument posed is that patriarchy is not merely a mirror image of patriarchy: a hierarchy with women in power. Patriarchy is the prerequisite for an egalitarian society

Educational Expansion from the 1990s Under Deregulation and Rising Inequality in Japan

This paper shows, in moving toward universal participation in higher education from the 1990s, Japan has established educational practices and customs that differ greatly from those of developed Western countries. Higher education was not universalized because the Japanese government regulated

the new construction of colleges between the late 1970s and the 1980s. This era of government-regulated tertiary education coincided with in the Japanese economy's peak on the world stage. Social scientists around the world focused on Japanese school education because they thought that education was the most important factor in economic success; they discovered many problems with the schools and education, resulting from the severe competition for entrance examinations. These discoveries formed the typical image of Japanese education as an examination hell.

This substantial demographic shift transformed Japanese school education from examination hell to the next stage: the schooled society (Illich, 1971). Following this deregulation and loosening competition, the Japanese enrollment rate for tertiary education expanded dramatically from 30% to over 50% between 1990 and 2010. In other words, Japan entered the universal stage in higher education, in Trow's terms. In contemporary times, issues afflicting Japanese youth in relation to higher education seem to have shifted from the transition problem to other problems, such as the cost of higher education and students having to balance study with temporary jobs.

High School for All in East Asia

In the presentation, we try to answer five main overarching questions that are at the heart of this volume: How did East Asia achieve High-School-For-All?; How can we understand all of this theoretically?; What are the positive and negative dimensions of this?; Was this the source of its strong economic growth?; What is the future going to be? Through this discussion, we show merits and demerits of the East Asian development history with the expansion of upper secondary education.

In this presentation, I present a comparative sociological analysis of the historical formation of universalized upper secondary education and study societies facing declining birth rates after expanding education in East Asia. We are carrying out comparative research in East Asia with 12 members. Our project deals with upper secondary level education. Our project deals with Japan, South Korea, Mainland China (China, hereafter), Taiwan, Hong Kong, Singapore, and Vietnam.

In this presentation, we mainly show the results of the historical expansion process and depopulating stage of upper secondary education in Japan, South Korea, and Taiwan.

"Why and How Are We Here?" Analysing the Presence and Representation of Visual Arts from Sub-Saharan Africa at the Venice Art Biennale from 1990-2017.

In recent decades, there has been an increased presence of African contemporary art in some of the world's most important events related to visual arts, either through the works of individual artists, or in the case of the Venice Art Biennale, through national pavilions.

At the 56th edition of the Venice biennale in 2015, three of the five countries that participated in the show for the first time were from the African continent. However, very little research has been done to try to understand this phenomenon and analyze the curatorial strategies that are adopted in such exhibitions.

In this context, the purpose of the present research is not only to try to understand how African art exhibitions are curated, but also to identify what motivates African countries and artists to attend international art exhibitions outside the African continent.

In order to capture the full picture of the phenomenon, the research was conducted by analysing the exhibitions realized from 1990 to 2019, and within the aforementioned time frame the investigation will focus on three types of exhibitions or participations case studies: 1) especial or collective exhibitions; 2) national pavilions; and 3) and Artists participation in the main exhibition.

Through the comparison within and across the contexts of the three different types of art show venues represented by these case studies, we intend to identify the essential elements that characterize the exhibition of contemporary African art in the most important visual art event around the globe.

Narratives of Domestic Violence Survivors in Ghana and the United States.

The exponential increase in domestic violence is a global crisis that is pertinent to the struggle to protect women's rights. This problem does not only affect women (and children) in the global south but also in the global north. Interestingly, the United States, often referred to as a global super power is not immune to

the epidemic of domestic violence. Academic discourses have historically tended to emphasize the presentation of statistics or discussions of international interventions and humanitarian responses. An area that seems to have been neglected, particularly in political science writing, is that of the personal narratives of domestic violence survivors. This article therefore presents a documentation and analysis of selected narratives of survivors, and their experiences of domestic violence in both Ghana and the United States. By unpacking some critical commonalities in these experiences, the paper will thus investigate the extent to which the escalation of violence at the household level continues to be driven and affected by cultural and patriarchal norms. It also examines the extent to which these norms negate the effectiveness of international regimes that seek to address domestic violence. The paper adopts radical feminist theory as a framework. It argues that despite a range of efforts to address the problem, diverse cultural and patriarchal norms appear to intensify the tendency to view domestic violence as a private matter that could bring about stigmatization for the women if disclosed to the public. In resistance to that trend, the paper draws on the use of narrative analysis as a powerful tool of highlighting the importance of women's voices in their struggle against silencing, marginalization and abuse. It contends that the struggle to educate women on their rights can only begin when women begin to see themselves not as recipients but as creators and owners of culture.

A Discourse-Onomastics of Selected (Neo)Pentecostal Church Names in Lagos Metropolis

This study is focused on the discourse of church names in Lagos, Nigeria where there is a surge in the growth and popularity of Pentecostal religious practices. Despite several research efforts on naming in general and church names (Ecclesiology) in particular, there seems to be insufficient research on the relationship between church names and people/worshippers' needs. Thus, in examining the discourse of church names in Lagos Metropolis, the paper considers the current patterns as well as the processes of church naming. It not only identifies the linguistic features and functions of church names, but also the nexus between church names and people's socio-economic needs in the region under study. For data, 150 registered Pentecostal and neo-Pentecostal church names are purposively sampled from Lagos Metropolis – a densely populated mega city and former capital of Nigeria. Additional data comprises in-depth semi-structured interview reports from worshippers and founders to elicit information concerning such church names. Data is qualitatively and quantitatively analysed using AntConc software for concordance and collocates. The study is anchored on theories of discourse analysis, onomastics, and Maslow's hierarchy of needs. The findings reveal that while sampled church names reflect the doctrinal outlook of (neo)Pentecostal churches, many of these names are innovative and in response to diverse socio-economic needs of these church groups' respective followings.

Life Course Experiences and Health Statuses of Older Persons in Southwest Nigeria: A Gender Based Analysis.

The life course experience of individual is an important factor in the understanding of the overall health statuses in the later life in any given society. Evidences have shown in literature that there has been wealth of materials documentations in the other areas of older persons but there are dearth of materials on the relationship between life course experiences and health statuses of older persons in southwest, Nigeria. However, the life course experiences of older men and women are not homogeneous hence the need to investigate into differences in older person's experiences and its emerging health issues as individuals passes through the various stages in their life so as to understand its consequences in later life. This study attempts an examination of the nexus of interaction between life course experiences and overall health statuses of older persons. The paper is anchored on the Life Course Experiences Theory to explain the problem. 500 questionnaires were distributed through multi-stage sampling techniques and twenty in-depth interviews were conducted among older persons that were purposively selected. Quantitative data was analyzed using frequency distribution and logistic regression analysis method. Qualitative information was analyzed through content analysis and ethnographic summary. The study found that there are lots of interrelated factors that determine health status and overall well-being of individual in south west Nigeria which includes - family background, educational qualification, skill acquisition, age at first marriage among others. The study therefore recommends all inclusive policies that would be beneficial to older persons, particularly in the area of their health and overall well-being.

RC51-853.4AKAHORI, SABURO* (*Tokyo Woman's Christian University*)***Rethinking the Collapse of Reality to Live for: From a Perspective of Second-Order Observation***

Almost 10 years ago, a mass murder without a logical reason occurred in Tokyo. Following this, one of the most representative sociologists in Japan pointed out the "collapse of reality to live for" as a diagnosis of contemporary times. He also argued that recognition of "real other(s)" is needed as a prescription. However, what indicates a collapse and/or revival of reality?

What sociologists have to do is not to grieve over the loss of existing realities. Instead, we should focus on how the collapse of realities is described and distinguish between logical levels. Then, we move on to explore the mechanism of reality construction.

This paper tackles social construction of reality from the perspective of sociological systems theory. Social systems are redefined, according to Niklas Luhmann, as a kind of system that "observes" through producing communication over and over. In other words, social systems construct their own social realities. Based on such a theoretical apparatus, we approach "collapse and/or revival of reality to live for".

Through examining case studies of Japan, we discuss that: (1) Radical change of contemporary society, especially individualization, rapid demographic change, and the so-called social media revolution, also radically changes social systems' reality construction. (2) Both collapse and revival are also socially constructed realities. (3) When social systems as "observers" cannot observe properly such radical change, they can only observe it as "collapse of reality".

As for the designing of social systems, what we need is, not designing the contents of realities, but questioning how to design the paths of communication, or the circuit of reality construction. Then we conclude that, especially in Japan, the "collapse of reality" as a constructed reality is caused by the fallacy of social systems designing. What we have to analyze is a sensitivity of social systems as "observers".

TG03-964.2AKBARY, SAYED* (*University of Calgary*)***Why Is Violence Against Women Increasing in Afghanistan? Assessing the Roles of the United States' Policies, the Afghan State, & Islamic Fundamentalism***

Violence against women in Afghanistan has been increasing, and the country is still considered the most dangerous place for women in the world. This paper attempts to answer why violence against women has been increasing in Afghanistan despite the United States' intervention, large amounts of aid, human resources, and promises for 'fighting for the rights and dignity of Afghan women'. Based on a review of the literature, this paper suggests that two factors are major barriers for prevention of violence against women in the country: (1) the Afghan state's weakness to implement gender-based reforms due to the local patriarchal and kin-based tribal powers fueled by the U.S. foreign policies; and (2) the role of decentralized independent *madrassas* (local Islamic schools) and Afghan extremist religious groups who have produced fundamentalist and conservative interpretation of Islamic texts to control and oppress women. After discussing each factor, the mid-twentieth century post-colonial Tunisian state-building strategies and family-law reformations are used as a model to offer solutions for prevention of violence against women in Afghanistan.

RC40-703.2AKERMANN, GRÉGORI* (*INRA*)DAVIRON, ELIE* (*La Cagette*)***Prosumer's Commitments in Food Co-Ops in France***

Since 2011, many food cooperative projects have been developing in France. The design work of the food coop "La Louve", which opened in Paris in 2016, aroused a deep interest and led to the spinning off in several big cities of France. The objective of this paper is to explore the conditions for emergence of these food coop. On the basis of surveys of members of the food coop "La Cagette" at Montpellier, we will describe the sociodemographic profiles and motivations to get involved in the creation of such projects and in new forms of consumption. A questionnaire sent to the members in June 2016, supplemented by a qualitative investigation, allow to identify a variety of forms of commitment and representations on the project's objectives. We show that there are several levels of commitment (from the very committed project leader to the simple support) and that these affect consumption practices and motivations to engage. The more members get involved, the more they consume products distributed by the food coop, but at the same time the less they consider that the main purpose of the project is consumption. The members who participate more frequently tend to express political motivations (fostering social ties, living together, building alternatives) whereas the less active members think of the coop as a place of

consumption. These results call to deepen the effect of the participation on the practices of consumptions, in particular the way the implication of the members in a role of prosumer can bring them to change their practices at the same time as their representation.

RC43-731.4AKESSON, BREE* (*Wilfrid Laurier University*)BASSO, ANDREW R. (*University of Calgary*)HERSCHBERGER, ESTHER (*Wilfrid Laurier University- Faculty of Social Work*)CIASCHI, PATRICK (*The New School for Social Research*)***The Place Where We Lived: A Typology of Extreme Domicide***

Domicide – the intentional destruction of the home (Porteous & Smith, 2001) – is a critically under-researched human rights violation. Extreme domicile, where perpetrators utilize indirect or direct violence to partially or totally remove home occupants, has been utilized as violent means to displace and/or destroy families, communities, and cultures in many differing spatial and temporal contexts. At the turn of the century, Porteous and Smith (2001) estimated that over 30 million people were affected by domicile, a statistic that only accounts for those made homeless within their own country and not including official refugee statistics. More recently, Shao (2013) estimated 30 million people are "suffering [domicide's] ravages" at the beginning of the 21st century. And Nowicki (2014) reported that domicile has resulted in an estimated 43.3 million people being forcibly displaced from their homes due to violent persecution in 2011. Although the literature does a thorough job of *describing* domicile, there is a critical lack of understanding of the types of domicile that occur within episodes of political violence. Grounded in eight case studies of extreme domicile, our presentation will highlight commonalities and differences among diverse examples of domicile from the expulsion of Chechens within the Soviet Union starting in 1944 to the destruction of the homes of the Rohingya minority group in contemporary Myanmar. By exploring the factors that contribute to extreme domicile and the range of effects of domicile on children, families, communities, and societies, human rights actors can begin to hold those who commit domicile accountable and take steps towards preventing its deleterious effects.

RC14-271.6AKHIATE, YASSINE* (*Mohammed V University of Rabat, Kingdom Of Morocco*)BENDAHAN, MOHAMED* (*Mohammed V University of Rabat, Kingdom Of Morocco*)***When the Ideological Minority Eclipse the Identity and Linguistic Majorities (Case of Moroccan media)***

The lifting of the State monopoly in 2002 enabled the liberalization of the Moroccan audiovisual sector to enter into its operational phase with the granting of the first licenses of the private radio and television services. This change in the liberalized audiovisual sector was intended to be a new milestone in democratic construction and, above all, to be a crucial step in the process of political openness by guaranteeing political pluralism and cultural diversity at the level of the sphere of the audiovisual media.

The objective of this work is to identify and address the impact of liberalization tools on the promotion of cultural and regional specificities in the face of conservative (religious or identity) ideologies in the different poles of the media landscape (public vs. private / TV vs Radio / digital vs classic).

Thus, we will focus on the analysis of three aspects of liberalization:

1) The role of law provisions and their level of involvement in the process of linguistic and cultural equality in the media space,

2) The role of regulation, co-regulation and self-regulation and all the media actors in the construction of grids for local radio and television programs,

3) The importance of measurement aggregates to analyze the potential gap between supply and demand for audiovisual content based on an analysis of audience data.

To answer these different aspects, we will base ourselves on the Laws, specifications of the Moroccan radios and televisions, the thematic reports of the operators, data's of audience measurement as well as an immersion in the writing of two regional operators.

From a methodological point of view, this research is in the wake of studies on reception, the uses of the media, in particular the founding works of the currents "cultural studies" and "uses and rewards".

Housing Ownership and Housing Satisfaction in Russian Regions

The housing status is surely included in the list of criteria that indicate the material success of the individual and/or family. The mass privatization of housing in Russia has not solved the housing problem. The housing affordability has changed in recent years in both quantitative and qualitative characteristics. Most families in Ulyanovsk (92%) are provided with their own housing. The remaining 8% of families live in dormitories or rent. Housing ownership is usually the result of longterm life savings. Rented accommodation is more typical for the initial stage of the family life cycle. Now it is related not only with age, but also with the territorial mobility of young people [Karavayeva, 2015]. For middle cities natives - mobility to metropolises; for residents of small towns - to middle cities. All families can be divided into three groups by the criterion of "satisfaction with housing": "Fully satisfied" (a fifth); "Partially satisfied" (a half); "Unsatisfied" (a quarter). Dissatisfaction with housing conditions is caused by range of reasons. At first, ecological and geographical reasons(61%): distant place of residence; ecological problems; lack of green zones. Secondly, the social and functional reasons (43%): dissatisfaction with type of building (material, technology), state of house, heating, elevator, water supply. These problems are extremely important for the decrepit houses, where mostly low-income families live. Thirdly, quantitative reasons (30%): dissatisfaction with the housing area (especially for young families, parents with children) and the number of people living (more often for large, multi-generational families). The observed level of housing satisfaction shows that regardless the significant share of the homeownership, the improving of qualitative characteristics and comfort of housing deserves more attention.

Strengthening Participatory Approaches to the Enforcement of Employment Standards in Ontario

Although the enforcement of employment standards (ES) is generally conceptualized as the responsibility of the state, in fact, a number of state-based and non-state-based actors participate at different levels in the process of ensuring that the law is adhered to. Set in the context of an ongoing crisis of ES enforcement created by a 'mismatch' between traditional state-directed enforcement strategies and the structure of industries where noncompliance is most problematic, this paper considers the potential for forms of participatory ES enforcement to counter conditions of precarious employment. The paper takes into account the involvement of a range of actors in the enforcement process, including government agencies and representatives, workers, and community groups. Forms of participation in ES enforcement—particularly those that involve non-state actors—are considered in terms of their capacity to create alternatives to both individualized complaint-based enforcement mechanisms that fail to counter the inherently unequal power relations of the employment relationship and 'top-down' enforcement strategies of state regulators that accord workers a passive role in the enforcement process. Based on research conducted on ES enforcement in the province of Ontario, Canada, the paper outlines forms of participation in the enforcement process, beginning with ways in which the Ontario Ministry of Labour (MOL) both shapes and participates in the enforcement process. The primary form of worker participation in the enforcement process—the individualized complaints system—is also examined, with a focus placed on the factors that mitigate against meaningful worker participation. Using examples from Sudbury, Windsor, and Toronto, forms of participatory enforcement that involve community organizations acting in support of workers are then considered, highlighting methods of participation including advocacy, legal assistance, labour rights education, assistance with claims, and community organizing. The paper concludes by assessing the potential for a model of participatory enforcement capable of addressing the ongoing crisis of ES enforcement.

AKRAM, MOHAMMAD* (*Aligarh Muslim University, Aligarh*)

Illness, Choice of Healers and Illness Doubts: An Empirical Study of Role of Illness Narratives in India

Introduction

This paper elaborates the importance of illness narratives in the patient-practitioner interactions and explores the role of space for expression of narratives in healthcare seeking choices of people and especially vulnerable and marginalized people.

Methods

The data for this empirical study is collected through in-depth interviews conducted among tribal population of Rajasthan and migrant construction workers of Uttar Pradesh.

Findings

The findings reveal that only 17% tribal people (Male 12%; Female 21%) went to biomedicine practitioners for treatment of Sexually Transmitted Diseases (STDs) whereas 64% (Male 71%; Female 58%) went to traditional/ local/ faith healers and 19% didn't go to any healer at all. The tribal people largely selected the traditional healers as they listen the illness narratives of patients more attentively and patients get an immediate satisfaction. The faith healers and quacks don't have any scientific knowledge but their act of listening narratives and engage with patients attracts the patients. Many tribal people didn't go to any healer as narratives of STDs were difficult to share. Similarly, the migrant construction workers often visit to quacks and medicine shop owners for treatment as they listen the workers properly contrary to many medical professional.

Conclusion

The biomedicine practitioners often focus more on technical diagnosis and pay less attention to the illness and suffering narratives of patients whereas the traditional healers practice just the opposite. This paper explains how lack of space for expression of narratives cause 'illness doubts' among patients and distance them from medical practitioners. It becomes detrimental for patients as treatment by non-professionals cause 'healthcare illusion' and makes them chronic patients. There is need to include exchange of narratives in clinical activities of biomedicine practitioners which would humanize the care, empower the patients and won't let the vulnerable patients to go to untrained practitioners or even quacks.

AKRAM, MOHAMMAD* (*Aligarh Muslim University, Aligarh*)

Illness, Healthcare Challenges and Causation of Chronic Disease: An Epidemiological Study of Construction Workers

Introduction

The social determinants produce butterfly effects in the domains of causation of diseases as well as healthcare outcomes. This study explores the disease causation and healthcare trajectories of the migrant people working in construction sector in urban spaces of western Uttar Pradesh (India). Construction sector workers largely work as casual workers and constitute a major disadvantaged group in India.

Methods

This is a cross-sectional study based on social epidemiological perspective. It uses semi-structured interview schedule and ethnographic observation. The multi-stage cluster sampling is used to identify the 300 samples.

Findings

Findings reveal that cases of injury among the workers is 35 percent. Eighty five percent female workers and 55 percent male workers are suffering from disease or illness like prolonged cough and shivering (16.7%); exhaustion (16%); fever (13%); respiratory problems (8%); headache and gastritis problems (6%) and others including tuberculosis, skin, slip disc problems, STDs etc.

The respondents preferred private practitioners for immediate pain relief without undergoing proper medical treatment in many cases. Government hospitals were used only occasionally. None had any health insurance. Lack of immunisation left the children susceptible to several diseases. Poor food, lack of potable water and use of tobacco products etc aggravated the health challenges.

Conclusions

The findings suggest that poor health outcome aggravates the already disadvantaged conditions of these workers. Lack of public health facilities and poor economic conditions compel many of them to get treatment from quacks and alternative systems of medicines. This often cause occurrence of chronic diseases. This paper explains how feminization of casual labour, informalization of work and poor public health facilities cause chronic disease among the disadvantaged groups. It proposes concepts of 'illness doubt' and 'healthcare illusion' to explain them. It concludes that the ecology of primary care practice is complicated and often confirm complexity theories.

AL-HARDAN, ANAHEED* (*American University of Beirut*)

Colonial Critique, the Sociological Canon and Contemporary Sociology

Two recent trends in sociological theory have been instrumental to the re-imagining of sociology as a "global" discipline, especially as seen from the formerly colonized world. The first, "postcolonial sociology" refers to a recent theoretical orientation in sociology that challenges the discipline's allegedly Western European origins, classical theorists and general focus. It invokes theorists that pre-date the Industrial Revolution like Ibn Khaldun, and brings classical European sociologists like Max Weber in conversation with forgotten sociologists like W.E.B. Du Bois. Postcolonial sociology therefore attempts to center and universalize non-European and otherwise marginalized sociology in the discipline. The second trend, the so-called "decolonial turn," is an attempt to center the colonial experience of the Americas in an otherwise British Empire-focused postcolonial theory. The decolonial turn refers to a certain mode of epistemological critique inspired by the post-Bandung decolonization era. It mainly sheds light on modes of power rooted in the modern, colonial and racialized capitalist system that continue to manifest in the postcolonial era. In one important sense, the work of the decolonial turn is to bracket the "post" in the postcolonial, and to move beyond the project of the deconstruction of Eurocentrism, which is always *a priori*, through new ways of confronting coloniality and possibilities of decolonization. This paper will examine these two overlapping theoretical trends in sociology, and consider their implications for a historical postcolonial sociology of critique as emanating from the Arab world, and brings this critique to bear on a contemporary sociology of the Arab world and the Global South more broadly.

RC16-299.10

AL-HARDAN, ANAHEED* (*American University of Beirut*)

West Asia as Method

This paper will consider the potentialities of the horizontal cultural reconfiguration of the Arab world in relation to other postcolonial societies. The normative thinking of this region as the Middle (of the) East is rooted in a colonial cartography that stems from first British inter-war and later US post-world war two geostrategies. This paper will shift this geography and reason by approaching this part of the world as West Asia. Drawing from the historical moment of the Non-Aligned Movement and the Afro-Asian movements of the decolonization era more broadly, it will consider Arab thought that emerged from, and was in conversation with, this particular historical and political moment. Through this examination, this paper will explore the currently uncharted potentials of looking to other former/currently colonized peoples of Asia, and of the postcolonial world more broadly, that is inherent in the notion of West Asia and from where a historical postcolonial sociology of critique from south-south geographies and transits can be found.

'It's Sore and It Bleeds and It Catches on Things': Managing Life and Self-Identity with a Chronic Skin Condition

Chronic skin conditions such as eczema and psoriasis together affect more than one in twenty people in the UK, while acne is almost universal in young people and remains common in adulthood. The skin is in many ways a social organ, yet the symbolic value attached to the appearance, function and sensory experience of the skin, and the impact of living with skin that is disordered, have received little sociological attention. Combining in-depth interviews with 25 adults (aged 18 to 54) and the production of participant-generated videos by these respondents, this research seeks to address these issues by exploring lived experiences of a range of chronic skin conditions. Framed around the concept of embodiment, the study examines the sensory, social and material dimensions of these skin conditions, and the practices and strategies employed in attempting to manage them.

The day-to-day management of a chronic skin condition demands continual therapeutic and presentational work, while uncertainty about the illness trajectory entails a perpetual need for contingency and flexibility for future plans. The practical, emotional and social burden of treating and managing painful, cracked, scaly, inflamed or oozing skin can have a profound impact on self-identity, particularly given that skin conditions can be erratic in their presentation and their responses to treatment.

Participants experienced both enacted and perceived stigma, which was found to confer a sense of shame and marginality across a range of social fields, from work life to the development of romantic relationships. However, tactics of resistance to stigmatisation also emerged, particularly in efforts taken towards the management of interactions. Spatial and bodily presentational tactics were employed to take control over what others were able to perceive of the aesthetic signs of skin conditions as an attempt to elude the impact of stigma across a range of environments and social contexts.

Conceptualizing and Measuring Occupational Language Skills

This presentations shows the evolution and transformations during last century of language as a skill within Labor Relations frameworks. Starting with the first ILO conventions/standards, language has undergone an evolution towards becoming a key element for the definition of professional boundaries and payment systems. Our data and analysis is based on documentary analysis of Labor Rules and Collective Agreements from Spain and the European Union. We distinguish three main historical stages regarding the incorporation of language within occupational frameworks, determining different boundaries and levels of occupation and wages: 1920-1960 (faulty act); 1960-1975 (rationalization), and 1975-present (depersonalization). Building on the construction of language categories during the past century, we propose a broad system of indicators to measure language skills in the current industrial relations systems, which allows us to better understand the problems of productivity of companies and employability of workers.

Assembling Cultural Space, Assembling the City. a Comparative Case Study of the Construction Projects of the Helsinki Music Centre, the Amos Rex Art Museum and the Helsinki Central Library.

Helsinki, the capital of Finland, is currently going through something of a metamorphosis as a number of new cultural buildings have risen or are under construction in the city centre. Joining the Northern European trend, Helsinki has in the recent years invested heavily on culture. A new cultural building has the potentiality to transform the city. It not only re-organizes the socio-spatial relations of a specific field of art, but also occupies urban space and creates new ways for the citizens to dwell in the city. Cultural construction projects can thus be perceived as knodal points where art and city simultaneously take shape. Drawing on the research tradition of Actor-Network Theory, this paper looks into this dual-process of the becoming of cultural and urban space in three Helsinki-based cultural construction projects: the Helsinki Music Centre (completed in 2011), the Amos Rex Art Museum and the Helsinki Central Library Oodi (both ongoing). On the one hand, the projects are examples of cultural-led urban change in the city centre. On the other hand, the realization of the projects is in many ways dependent on how the projects respond to the aspirations of the city of Helsinki. Besides creating new conditions for art and culture these projects act as development tools for the city and are thought to carry out the goals of the city's urban development strategies. The projects hereby attach to them a rich bundle of objectives that blend together and become the ingredients of new cultural and urban space. Against this background, building on a data set of expert interviews, documents and media articles, the paper examines what kind of cultural space and what kind of city do these aspirations assemble and how are these processes connected.

Sharing and Building Knowledge with the Community to Overcome the Tensions between the Marginal Local and the Dominant Global

The presented project integrates the research processes and the collective reflection on current educational and social challenges as a tool to situate the local knowledge on the cause and result of the economic crisis in Europe, bringing questions like "How to integrate the needs of increasingly multicultural contexts with the positioning of globalization?" and challenges of interest to the Ethnomathematics Program – developed to rethink the role of education on the social violence.

One of the objectives is to investigate new methodologies, part of a participatory and critical approach, in which the members of the local communities on study can be actors of the processes of the ethnographic study, to deal with intra and inter-cultural/political/economic tensions.

The research on communitarian education is a concrete possibility in this regard – after all it already exists within the community as a process that allows the own community to establish common knowledge bases for their survival. Communitarian education is the *praxis* to live in the community, to be with and within the community, to know the environment from the perspective of the community – their own ecology; is the way of acting that the researcher assumes to observe and identify the local knowledge of the community.

Communitarian education as a research methodology – emphasizing the participation of the community in the processes of (1) identification of the problematic, (2) construction of the objectives, (3) data collection and analysis, with the Ethnomathematics posture allows interest in a transdisciplinary knowledge from an inter and transcultural approach.

The problematization of social challenges, thought educational ones, is set "with" the community, blurring the research-researched roles and allowing critically analyze also the approach of the academic community on education and its limitations to collaborate with the current problems of the dichotomy between local and global needs.

From Social Movements to Alternative Food Networks: What Role for Social Innovation?

In recent years, alternative food networks are emerging as solutions opposed to the mainstream food industry, which is widely controlled by big industrial groups. These innovative ways of producing, delivering and consuming food engender new challenges for social analysis. On the one hand, they reveal new reflexive and resilience capacities (Beck, Giddens, Lash, 1994) and show social actors' creativity in re-organizing their activities as an answer to recent socioeconomic transformations. On the other, the relations between producers and consumers are reshaped, by combining practices, narratives and actions belonging both to the field of production and consumption. The prosumer (Toffler, 1981) is thus an emblematic figure, as it will emerge in our presentation. Our paper explores the relation between contemporary social movements (Della Porta, Diani, 2009), social innovation and alternative food networks. Starting from the concept of social innovation framed through a territorial approach (Klein, Laville, Moulaert, 2014) we will examine the locally embedded creative capacity of social groups in the field of organic food production, distribution and consumption. Empirical evidence related to an Italian case study, *Genuino Clandestino*, will allow us to show how the issues of food sovereignty is tackled by small-scale local actors. We will look at how networks (at local, regional and national level) are able to mobilise human and financial resources, ideas and social innovation (meant both in terms of product, organisation and procedures). Through the literature review and the analysis of our case, we will focus on the rearrangement and networking of producer-consumer relation and inter-action, as well as the space of action of these actors and the constraints they experience. We also illustrate through which mechanisms these local initiatives may contribute to the creation of a wider social movement able to transform a collective voice into alternative social practices, creating new meanings and narratives.

Relational Knowledge and Understandings: A Paired Narrative Inquiry into Daughters' Meaning Making of Health and the HPV Vaccine

In Canada, students receive the HPV vaccine in school vaccination programs, pending parental consent. In Ontario schools, students are meant to learn about HPV and the vaccine during health class, but this education varies by school and is

at the discretion of the teacher. Based on 19 qualitative interviews with girls (aged 11-17; grades 7-12), as well as separate, yet paired, interviews with their parents (mostly mothers), this paper narratively uncovers the ways adolescent girls make sense of their health, HPV, and the HPV vaccine. Doing this, I put girls' narratives in dialogue with their mothers', often responsible for consenting to this vaccine, and focus on the ways that mothers' narratives, parental interactions, and school factor into how girls think about these topics. Analytically, I highlight five girls, each of whom have unique interactions with the topic of HPV, the vaccine, and their larger social landscapes (families, schools, churches etc.). I find that girls' health knowledge and their understandings of HPV and the vaccine operate in relation to other people and larger sociocultural structures. Unlike common and dominant research that focuses solely on what exactly girls do or do not know, my research contextualizes girls, focusing on the way girls' knowledge, understanding, and their perceptions of responsibility operate relationally.

Repositioning Epistemology; Radicalizing Realism

Discussions of epistemology in critical realism are underdeveloped. When critical realists consider epistemology, they typically start from "epistemological relativism," essentially the position that all knowledge is fallible, partial, and changeable over time. We find this position necessary, but we also find it insufficient. This is because it lacks a critique of the (highly unequal) social relations among observers themselves—relations that shape the very production of knowledge. Interestingly, while critical realism never ignored the observer or knowledge producer, we believe that its treatment remained limited by the original, Bhaskarian aim of accounting for the intelligibility of the scientific experiment. In this formulation, the positionality of the researcher is (relatively) unproblematic because it is simply the positionality of the experimenter. If critical realism is to fully move from natural science to social science, and from experiment to experience, however, a much more robust consideration of knowledge producers and their social relations is required.

Accordingly, we seek to develop a critical realist social epistemology. While it is indeed the case that all knowledge is fallible, it is also the case that all knowledge is *positioned*, it has a particular standpoint. What is more, the *social, power* relations between standpoints organize the production of truth in ways that produce systematic distortions (ideology). Grasping this point, far from a rejection of ontology, helps to extend the original promise of critical realism. Just as we must avoid the epistemic fallacy of reducing ontological questions to epistemology, we must equally avoid the ontic fallacy of reducing epistemological questions to ontology. But without reducing one to the other, we must further avoid radically separating ontology and epistemology to begin with, recognizing instead their mutual influences.

Comparing the Labor Market Effects of Alternative Credentials across the Careers of US Workers

Competency based certification programs and licensure requirements have grown dramatically in the United States over the past few decades, yet the quality of such credentials is rarely examined. Are competency based certifications and licenses as valuable to workers as credentials earned through the higher education system, and does their relative value vary across the course of workers' careers?

This paper draws upon a new dataset from the United States, the National Household Education Survey, to examine the perceived usefulness of competency-based certifications, licenses, and non-degree certificate programs earned through the formal higher education system. For each type of credential, we compare the reported level of utility of the credential for getting a job, keeping a job, and upgrading one's skills for workers at different phases of their careers. We then compare these types of credentials to each other in terms of their perceived value. Our working hypothesis is that the perceived usefulness of training-based certificates will be higher for younger workers who may lack substantial on-the-job experience, while competency-based certifications and licenses will be perceived as more useful for older workers who may already be proficient in the tasks they perform at work. However, the value of training-based certificates may be relatively more valuable for older workers who work in occupations that involve heavy usage of new technologies. If our hypotheses are supported, this research will point to the need for policymakers to consider how different types of credentials may be more valuable for workers at different stages of their lives. We argue that policies designed to help workers retrain for new careers and remain competitive in later life should consider such differences.

RC52-860.5ALBERT, KYLE* (*Harvard University*)*Trends in Professional Association Membership and Revenues in the United States: Smaller but Richer?*

In the literature on professions, it is often assumed that professional associations represent the interests of the professions they serve, yet not all professionals are members of associations. How do changes in the numbers and demographics of association members affect their advocacy and closure missions? I conduct quantitative research using membership data from the National Survey of College Graduates in the United States to track the changing demographics of professional membership associations between 1993 and 2015 and revenue data from publicly-available tax documents filed by a sample of professional associations over a comparable time period. I find that professional association membership has been characterized by an overall downward trend among US college graduates, continuing the pattern of falling membership in the 1980s and 90s documented in Robert Putnam's work on social capital. Membership decline has been particularly sharp among older and lower income workers, as well as those in managerial positions. Thus, with respect to membership, it appears that professional associations in American are becoming younger and richer.

However, by many qualitative and quantitative indicators (e.g., statistics on employment in the meetings industry), US professional associations remain strong. Using tax filings for a stratified sample of professional associations representing various sectors of the labor market, I find evidence that the overall resources of the association sector have not fallen in direct proportion to membership levels. Revenue from non-dues sources, such as conferences, certification and training programs, and publications, grew to displace some of the revenue lost as professionals left their associations. I argue that the changing demography of membership associations and changes in the revenue sources that such associations rely upon may lead to professional membership associations that are less representative of the professions they serve, which may in turn affect their interest in advancing the professionalization of their fields.

RC47-JS-22.8ALBERT, VICTOR* (*Higher School of Economics*)*Territories of Dissent: The Cultural Political Economy of Brazil's Homeless Workers' Movement*

Territories of Dissent: the cultural political economy of Brazil's Homeless Workers' Movement

The crisis in Brazil has issued in a new, highly unpopular President, a return to boldly neo-liberal policies, and renewed debate about the effectiveness of the country's political institutions and its economic future. With the political left weakened by scandals and adverse media coverage, social movements have grown in strength – none more so, arguably, than the Homeless Workers' Movement (Movimento de Trabalhadores Sem-Teto, MTST), which in five short years has gone from a clandestine movement engaging in land occupations on the periphery of São Paulo to a protagonist on the national stage.

In this paper I draw on long term ethnographic research of the MTST and propose a relational framework for theorising its emergence and some of the key spheres in which it is active. More specifically, I examine: first, its trajectory and makeup as it relates to the shifting terrain of the political economy; second, its use of a federal housing programme (My House My Life Entities), which has enabled the MTST to construct formal housing for its members; third, the movement's presence in the media, through which it campaigns together with alternative media partners such as Media Ninja; and fourth, the cultural work of the movement that serves to cultivate solidarity and shared values in occupations on the peripheries of the city. I respond to calls to 'bring capitalism back into the study of social movements' by drawing on two elements of the Lancaster school of political economy: political and economic structuration and semiosis.

RC05-121.6ALBERT BLANCO, VICTOR* (*Université Paris 8*)*Discours Islamophobes: Regards Croisés Entre La France Et l'Espagne*

Dans les approches académiques, l'islamophobie revêt différentes dimensions et plusieurs objets d'analyse. Dans cette présentation, la focale est mise sur les représentations négatives que les habitants non musulmans de trois quartiers, un à Paris (France) et deux à Barcelone (Espagne), portent à l'encontre de l'islam et des musulmans.

Dans ces trois quartiers où j'ai mené l'enquête de terrain d'une thèse doctorale en préparation, la visibilité de l'islam se traduit par l'ouverture de nouveaux lieux de culte, par la célébration de festivités dans les places publiques ou, encore, par l'installation de commerces spécialisés. Ces manifestations sont souvent perçues de manière disruptive par certains habitants non musulmans et font naître des réactions d'opposition.

Cette remise en cause de la présence musulmane s'explique et adopte des formes différentes en fonction du pays, de son contexte et de son histoire. Bien que les arguments soient différents, ils questionnent toujours la légitimité de la présence de l'islam. En France, cette contestation s'opère par la mise en avant de « la laïcité », notamment par une interprétation qui dépasse son acception juridique pour s'inscrire dans la construction de l'identité. En Espagne, cette contestation est formulée, en revanche, à partir de la tradition chrétienne, par un discours qui renvoie à une forme de « catholicisme banal ». Cette apparente contradiction (tradition laïque vs. catholique) relève au fond d'un même processus: la construction des frontières symboliques par la mobilisation des ressources culturelles et des conditions structurelles dans lesquelles sont placés les acteurs.

Dans cette perspective, cette présentation prétend interroger ces contradictions apparentes entre deux pays qui, par leurs points communs et différenciés, permettent d'appréhender l'islamophobie en tant que phénomène social. Pour nourrir cette réflexion, l'analyse est portée sur les discours et représentations des personnes interviewées sur les trois terrains.

RC53-879.2ALBERTH, LARS* (*Leibniz University Hannover*)*The Exodus of Violence: How Child Protection Reframes Abuse and Neglect.*

Despite a myopia of definitorial approaches to phenomena subsumed under the category "child abuse and neglect", all are grounded in the idea, that children are harmed by other persons, especially parents, whose behavior resulted in abuse or neglect. At the core, concepts of child abuse and neglect therefore follow a discourse of violence, which operates on the basis of three "vernacular" objects (Ibarra/Klitsuse): perpetratorship, victimship, and harmful behavior.

Interviews with child protection social workers in Germany show, however, that the professional intervention systematically transforms all three "vernacular" objects, replacing the public discourse of violence by a professional rhetoric of unreason: (1) "perpetratorship" is substituted by the vernacular object of the "overburdened mother", whose rational agency is called into doubt; (2) "harmful behavior" is either framed as circumstantial to the "unreasonable conduct" of the client or replaced by the notion of "unwillingness" or "inability" of the mother to comply with the rational intervention; (3) children are either not portrayed at all or are portrayed as "troublemakers" - the category of "victimship" is either made invisible, transformed into "irrational agency" or even transferred to the professionals, who then put themselves in a vulnerable position when facing clients.

This analysis shows how professional social problems work (Miller/Holstein) depends on the transformation of a moral discourse by presenting an alternative definition of the social problem and thereby justifying their professional claims. Furthermore, the case of child protection social work highlights the interweaving of the generational order and professional moral entrepreneurship.

RC44-744.2ALBERTI, GABRIELLA* (*University of Leeds*)CUTTER, JO (*University of Leeds*)CIUPIJUS, ZINOVIJUS (*University of Leeds*)*United in Uncertainty: British Trade Unions (and other interest groups)' Response to Migration in the Context of Brexit*

The process of withdrawal of the UK from membership of the European Union provides a significant context in which to observe how organised labour positions itself towards migration. Public concerns about migrants' supposed drain on national welfare together with the wage undercutting effects of free movement of labour have indeed been key, if certainly not the only, drivers in the Brexit vote.

The respective positions of employers and workers' associations on the question of migration regulation before and after the EU Referendum have been relatively uncertain and shifting. The Trade Union Congress (2016) has focused on unscrupulous employers who "undercut local workers by exploiting migrants" maintaining a view of migrant labour as vulnerable employment (TUC 2008). Recently, while highlighting the positive view on the effects of migration for the UK economy and the benefits of keeping free trade tariff-free markets for UK-based workers and businesses, the TUC has fallen short of taking a stance on the relevance of free movement rights for EU migrants. Brexit indeed critically affects EU migrant workers by creating uncertainties for their continued labour market rights and social protections.

This paper, by discussing empirical material emerging from interviews and a roundtable with stakeholders from labour, migrant and employers' organisations explores the persisting ambiguities and the main points of friction among unions and other interest groups on the question of the future regulation of EU labour mobility.

In dialogue with past literature on trade unions and migration policies in the US (Milkman 2011) the authors also reflect on the causes and shortfalls of such uncertainties persisting in the labour movement: at a time of anti-immigrant backlash, British unions may seek to develop an alternative message and strategies to shift the political focus from the restriction of labour mobility rights to expanding socio-economic protections transnationally.

ALCANIZ, MERCEDES* (Universitat Jaume I)

From the Ex USSR to Spain. New Paths of Migration in the New Century.

The fall of the Berlin Wall (1989) and the USSR (1991) prompted the start of an aggravated political and economic crisis for the countries that formed part of the so-called "Iron Curtain" in the final decade of the 20th century, and the beginning of a migration process to other countries by people seeking a higher quality of life. The purpose of the present text is focused on analyzing first, the increase of foreign people, specially those of the ex URSS, living in Spain since the start of the 21st siècle and second, the departure of individuals leaving those countries to live in Spain from the perspective of the emigrants. For the first goal we use a quantitative methodology analyzing official statistics and for the second goal, a qualitative methodology was employed, with life stories being judged the most appropriate technique. The results obtained point to the poor living conditions in their native countries as the fundamental reason behind making their "escape" as an individual/family strategy for building a better future, a decision that produced a major break in their biographies. On the other hand, in the destination country of Spain, the immigrants indicate their general satisfaction and subjective wellbeing. They acknowledge their quality of life has improved despite the devaluation of their human capital in holding jobs below their level of education and/or training, and allude to the process of re-signification of their identities in the context of their new daily life.

ALEIXO, IVANA* (Universidade Federal de Minas Gerais)

NUNOMURA, MYRIAN (University of São Paulo)

The Body Perception and Coming of Age in the Women's Artistic Gymnastics

Women's artistic gymnastics (WAG) is a demanding sport, both from a technical and aesthetic point of view. To achieve success, there is early involvement and intensive training since childhood. Authors have related this reality and the difficulties of gymnasts when they perceive themselves as "older". We questioned gymnasts on the representations of the body from their own perception, in order to understand the body models prevalent in this sport. The aim of the study was to gain insight into the body's perception of the age and its relationship with the coach, the training, and the family throughout the sports career. Currently, there are several studies on how to maintain the ideal physical conditioning, the coach-athlete relationship, the age-related beliefs and performance. The present study was generated by the project "Coming of age: Towards best practice in artistic gymnastics" (Kerr, Barker-Ruchti, Schubring, Cervin, Nunomura, 2013), which aim is to explore the experiences of older gymnasts and the factors associated to the prolonged sporting career. Seven Portuguese gymnasts with international experience were interviewed. The semi-structured interview focused on the oral history approach, and the thematic analysis was used for data treatment. It was identified that the main influences are the perception of matured age; the passage through moments that combine individual factors with adjustment requirements

and their own characteristics; social relations with colleagues and coach. The experience of being "older" gymnasts helps to understand how particular contexts happen and thus develop a new stage of the career. The identification of body perception with the onset of age could encourage alternative ways of coaching WAG and improve the meanings that competitive sport could assume for older athletes and thus promote the prolongation of the sports career.

ALEMANN, ANNETTE* (Paderborn University, Faculty of Arts and Humanities, Dept. of Sociology)

Between Active Fatherhood and Professional Demands: Conduct of Life and Coping Practices of Middle Class Fathers

The paper presents findings from a research project about German middle class fathers and their efforts to combine (active) fatherhood and a professional activity to provide the family income. Following Sen's capability approach, we assume that individuals have different capabilities at their disposal to achieve what they consider a good life. Social inequality is understood as a system of unequal chances to achieve relevant life goals. We follow Hobson's multilevel approach, proposing an individual, institutional and social/cultural level. Taking a pragmatist perspective, we understand individual action as a process shaped by values and environment as well as habits and personal preferences.

Structural changes in the organization of work over the last decades have significantly altered relationships between work organizations and their employees. Employers offer greater autonomy, yet they also expect a higher degree of employee availability. In spite of public discourses about the importance of family-friendly workplace, many studies have identified problems in the uptake of family-friendly programs.

Fathers' capabilities to achieve active fatherhood are not only shaped by organizations but also influenced by their conduct of life. Understanding conduct of life as an individual attainment (Jurczyk; Voß), we assume that a complex effort is required to mediate between different life areas and balance the specific demands of work and family life. How fathers are able to conduct their lives is influenced by complex constellations of factors, such as their family constellation, their own and their partners' professional and personal situations, and social and regional backgrounds. Furthermore, it is influenced by the fathers' and their partners' cultural models. The conduct of everyday life is the place where fathers experience ambivalent or contradictory cultural models of family, gender, and work commitment, and it is the place where they have to cope with these contradictions.

RC02-JS-44.5

ALEMANN, ANNETTE* (Paderborn University, Faculty of Arts and Humanities, Dept. of Sociology)

Perceptions of Inequality in Germany's Economic Elite

The paper presents empirical research about perceptions of inequality identified among members of the German economic elite. It is part of a larger study about patterns of interpretation of German top managers, company owners and board members of trade associations (54 semi-structured interviews). The elite members' concepts of inequality as well as their self-perception and concepts of justice are shaped by some basic interlinked patterns of interpretation. The dominant pattern is a meritocratic concept of a performance-related equality. In their perceptions of social inequality, however, the meritocratic concept is supplemented by ideas about insuperable barriers between the social classes. Their perceptions of gendered inequality also contain ideas of a 'nature' that disadvantages women, and of traditional gender roles that prevent women from pursuing organizational careers. The interviewees hold that full equal opportunity will never be attained - but that in Germany a far-reaching equality exists. They also believe that 'the State' is responsible for realizing equality by providing welfare state institutions and educational support. Rarely, they assign responsibility to themselves, their companies or 'the economy'.

The theoretical frame of reference that links patterns of interpretation to problems of action (Oevermann) shows that self-perceptions, patterns of interpretations and problems of action are mutually supporting components. These patterns help to stabilize the self-concept of a 'performance elite' in a performance-oriented society and thus legitimize their privileged status, even in cases when their position is challenged by conflicting experiences or public demands. The leaders' concepts of (in)equality and justice shape their orientations of action and their business conduct. This becomes manifest in their public statements and their efforts to influence political action. The results lead to the conclusion that patterns of interpretation will only change when inequalities lead to problems of action for the economic elite.

Classes, Hinges and Socialist Emancipation: South Africa and Beyond

For Erik Olin Wright, definitions of class are embedded in distinct theoretical approaches and anchored in different kinds of question. For us, like him, the principle anchors are 'emancipation' and 'class antagonism'. Drawing on South African perspectives we attempt to bridge a gap in his argument concerning the unemployed, who, at best, fit awkwardly in analysis stemming from US positioning and problematics. Three claims are made. (1) It is necessary to add and integrate an account of reproduction and consumption to one based on production and exploitation. (2) Workers and the jobless have different relations to the means of protest. (3) These two social forces are like two wings of a hinge that are linked to a common core of class interest. The hinge can be wide open, representing an absence of unity, or the wings can come closer, and at key moments in history they touch, creating possibilities for socialist transformation.

Our approach led us to emphasise a third of Wright's anchors, 'subjective location'. Early insights benefitted from empirical research in Soweto, which he encouraged. This paper has been enriched by recent work on South Africa's 'rebellion of the poor', greater historical depth, and engagement with recent literature on uprisings around the world. We argue, first, that aspects of our account have relevance elsewhere, notably where a large part of the population is unemployed or underemployed. Secondly, in South Africa, as elsewhere, after a period when the hinge was closing there has been a reversal of late. Dynamics vary, but especially in South Africa, the importance of subjectivity, especially political and organisational issues, comes clearly into view.

RC47-792.4

ALEXANDER, PETER* (*University of Johannesburg*)

Precarity, Protest and Possibilities: Analysing South Africa's 'Rebellion of the Poor'

South Africa is one of the most unequal countries in the world. Unemployment has remained steady at 35% and half the population survives on \$2.20 a day. At the same time, South Africa has been described as the 'protest capital of the world', with an average of 2,000 protests occurring a year in recent years. Community protests emanate from black townships and informal settlements in response to the lack or neglect of basic services from the state that the unemployed, in particular, rely upon for survival. However, community protests reflect more than just a battle for basic goods but also a much wider contestation over the quality of post-apartheid democracy. South Africa's protest wave mirrors elsewhere in the world where the forces of neoliberalism have forcibly excluded the most precarious sections of the working class from the post-1994 democratic gains. What is perhaps different about the South African case is the degree to which community protest action remains fragmented both internal to itself and to other arenas of working class mobilisation, such as the labour movement. This paper seeks to put the politics of South Africa's so-called 'rebellion of the poor' into perspective. The paper begins by using data from the Armed Conflict Location and Event Data project in order to make comparisons about protest across the African continent. The paper then goes on to analyse the politics of the rebellion through analysing the particular players and arenas in which protest unfolds. In so doing, this paper considers how protest and its politics are shaped not only by the underlying structures of capital but also the contingent local arenas in which protest plays out. This provides insight into both the fragmentation of the working class and current political struggles but also suggest avenues in which this may be overcome.

RC36-652.3

ALFONSSON, JOHAN* (*University of Gothenburg*)

Alienation on a Flexible Labour Market

In this paper I argue that alienation is a growing problem in today's flexible labour market. With the example of Sweden, the purpose of the paper is to investigate the situation of the growing group of flexible on-call employees with the concept of alienation. During that last 30 years the working life has become more flexible and this group now constitutes 7 percent of all employees in Sweden. They are

called in by the hour and need to move between different workplaces in their hunt for hours. The starting point is Marx's quartered categorisation of alienation. However, I argue that Marx's perspective, with the aim to explain capitalism in its most abstract way of functioning, cannot be translated directly to a concrete empirical level without risking of falling in to sociology, where the subject is excluded from the analysis. On the other hand, the psychological perspectives, mainly derived from Seemans' categorisation, risks turning into psychologism, where alienation is considered exclusively as a subjective experience rather than as alienated relations connected to an objective structure. Instead, I build on Jaeggis' definition of alienation as "relations of relationlessness". Here, relations rather than their experiences are in the centre of the analysis, and psychologism is avoided. Further, rather than consider the alienated relations as naturalistic, with no connection to the individual, I use Jaeggis' concept of "qualified subjectivism". From this perspective I analyse 18 interviews with on-call employees in order to investigate how employment affects their relation to work and private life. The results indicate that relations both inside as well as outside of work are liquefied and that parts of life are being reified. In this paper I stress the importance of the concept of alienation in order to understanding the effect of an increasingly flexible working life.

Media Capital; The State without a Chief: A New Understanding of the Role of Bridging Social Capital in the Process of Social Changes

"alphabets were confiscated. words were suffocated in our throats. We have been deprived of writing, but now we have Twitter" (Alhodhaif. Human Right Activist)

This paper undertakes a closer examination of the concept of social capital and its three components: the social networks, trust, and reciprocity. Some scholars claim that formal and informal social networks are important for civic action. Based on the assumption that social media rests a proper environment for bridging ties in collective societies. This paper claims that bridging social capital generated from interactions throughout social media has an equal importance of face-to-face interpersonal social capital in shaping individuals' choice of participating in collective action. However, being a witness of two different cases in reality arises a puzzle whether social media can influence the formation and maintenance of social capital to stimulate civic engagement in a collective society that classified as an autocratic and conservative society such as Saudi Arabia.

This paper discusses how social media played a significant role in directing a meaningful transformation of people's civic participation in Saudi Arabia. More specifically, through documentary materials, I subsidize the localized and grounded evidence of the capability of social media in a collective society to act as a tool of social changes by adhesive the bridging social capital through generating a "public sphere" where the public can freely discuss and identify societal problems, and through that discussion influence political action. In this context of this paper, I attempt to outline the significance of utilizing social media as a tool of empowerment that creates the power of popular, which promotes a continuous tension on the government to change their policies to promote serious and timely social reforms.

The Saudi Vision 2030 and the Cultural Changes; The Revitalization of the Bridging Social Capital and the Vibrant Civil Society

Saudi Arabia is seen as a dynamic state; therefore it went through several pushes of political reforms of the basic law that are believed to be essential changes. I won't talk about the waves of changes, but definitely I will mention Saudi Vision 2030 as the topic of today. Saudi Vision 2030 is set to find alternatives to support the national economy, which believed to be the new push for reform. "The National Transformation Program", which is a key element of the vision, entails the privatization of government services. The Saudi government, while aiming to decrease its involvement in the economic sphere, appears hopeful in increasing its involvement in the cultural and social realm through creating its own civil society sector. By looking at the current socio-political and economic circumstances in Saudi Arabia, medium-term structural changes in society are required for reconfiguring the society and for solving the existing social problems, which are considered serious challenges that might hinder achieving their goals within 13 years. Of all the burdens that surround the Saudi civil society, the prevailing theories on the role of civil society in the process of change are notably underemphasized, if not disregarded.

This paper argues that the lack of civil society organizations was due not only to state policy but also to the traditional social capital. Accordingly, the interpretation of the overlap between state policy and the transformation of the society could be highlighted by the trend of social capital, subsequently, the future of civil society in Saudi Arabia. To carry out this goal, this paper examines basic theoretical hypotheses that have been driven by the worldwide spread of a political principle: that the optimal system of social organization is characterized by strong

civil societies, underpinned by social capital, and capable of acting independently of the state.

International Students' Study-to-Work Transitions

International student migration has increased rapidly in the last two decades. As a consequence, there is a growing scholarly interest in international students' migration decisions and experiences of higher education in the receiving countries. However, the study-to-work transitions of the international students have received less scholarly attention. My presentation is based on a one-year study financed by the Finnish Work Environment Fund that looked at international students' study-to-work transition experiences in Finland. Finland has, as a consequence of its good reputation in education, a wide array of English language programmes, and (until 2017) tuition-free studies for all nationalities received a rapidly growing number of international students. This qualitative study builds on 30 semi-structured interviews with international students from several disciplines and countries. The international students are in a disadvantageous position in relation to the natives due to lack of Finnish language skills and lack of 'right type' of social networks that facilitate finding employment. As a consequence, a large share of the international students leaves Finland after their graduation because they do not manage to find employment. The article argues that despite the aforementioned difficulties, the interviewees successfully managed to find meaningful employment in Finland by strategically highlighting their 'international skills' and by making use of 'weak ties' as a job searching strategy. In addition, four higher education experts from Finnish HE institutions were interviewed on their views on the international students' situation. While the findings presented here stem from a single country, it is hypothesised that similar patterns can be identified in other countries.

Whose Interests? a Comparative Study on Trade Unions' Responses to Migration and Migrants in Finland, Ireland, and Portugal

Trade unions are key non-state actors influencing labour markets and immigration processes in Europe; it is therefore important to understand how they respond to migration. In Europe, trade unions have strived to oppose today's far-right populism, but the issue of immigration is far from easy for them. For example, immigrants in low-wage sectors are often victims of social dumping. Such cases have led in several countries to ethnic tensions. In the best case, unions can oppose this type of development by showing their solidarity with immigrants in concrete ways. My presentation is based on my Academy of Finland-funded postdoctoral project (2017-2020) *Whose interests? A Comparative Study on Trade Unions' Responses to Migration and Migrants in Finland, Ireland, and Portugal*, which compares the responses of trade unions to immigration and immigrants in the above three relative new immigrant-receiving countries. Overall, immigration affects different labour market sectors in different ways. In all three countries, unions' responses to immigration are examined by looking at unions in both the highly regulated healthcare sector and the less regulated hotel, cleaning and restaurant sector. This type of a three-country, two-tier research approach allows us to explore whether it is different national labour market models or the sectors in which the unions operate that best explain the unions' approaches to immigration. Trade unions' approaches have the potential to improve migrants' position in the labour markets. Their responses also show whether they have a capacity to renew themselves and find solutions to the politically complex immigration situation. The empirical material of this project is based on document analysis, interviews and fieldwork in Finland, Ireland, and Portugal.

ALI, AMEERA* (*York University*)

Early Childhood Socialization and Mental Health: A Gendered Perspective

Early childhood experiences have deep, instantaneous and long lasting biological, psychological and social effects upon one's health throughout the lifespan (Mikkonen & Raphael, 2010). Early childhood development, particularly in terms of gender socialization is a key determinant of one's overall health status. Yet, mental health is still a largely unobserved area in childhood studies. In my paper, I will explore various agents of socialization (education, family, media) pertaining to childhood and adolescent development. More specifically, I will discuss their role in perpetuating discursive notions of propriety in relation to gendered expectations as they relate to children's and adolescent's mental health. I emphasize my focus on gender identity development considering that the identity construction process in childhood is instrumental in one's development since this is when they are initially beginning to understand themselves as autonomous beings (Banse et al, 2010), which plays a role in their mental health development.

Identity politics are salient to discussions around mental health as an individual's identity and sense of self possesses a profound influence on their mental health and overall well-being. I consider how rigid conceptualizations of gender propriety restrict notions of the 'self' and thus pose particular challenges to the mental well-being of children. I examine implications of gender socialization in terms of identity development, emotion expression, peer acceptance, self-esteem, marginalization, oppression, stigmatization, depression, substance abuse, and coping strategies, as they relate to mental health. Through a comprehensive exploration of childhood socialization and development from a gendered lens, I will elicit how the period of early childhood sets the foundation for (and intersects with) many other social determinants of health including: social exclusion, education, race, and disability.

ALI, HARRIS* (*York University*)

Complexity, Black Swans and Environmental Sociology

Ulrich Beck observes that at an institutional level, the bio-physical sciences that deal with environmental problems must adapt to a new reality based on the changing nature of modern environmental risks. This adaptation, for instance, may take the form of the demonopolization of technical knowledge and the rise of sub-politics. But what of the recent changes in the epistemological and ontological basis of the sciences themselves – what implications do these have for addressing current environmental challenges such as climate change from a societal perspective? How do we take these implications into account as environmental sociologists? The epistemological/ontological shift may be seen in the increasing prominence of approaches such as those based on complexity theory and the black swan perspective in ecological thinking. Front-and-centre to these approaches are matters pertaining to confronting irreducible systems uncertainties (due to such mechanisms as positive feedback loops, non-linearity, tipping points, irreversibility, emergent and network effects, and so on) and making decisions while confronting the inherent limitations and incompleteness of scientific knowledge. In this context, we will explore the following: How do these new ways of conceptualizing and understanding socio-ecological systems converge or diverge with conventional and contemporary sociological approaches to the environment? How do they represent new ways of approaching the society-nature nexus that go beyond recent Actor-Network, Post-Humanism and New Materialism formulations? How can such approaches inspire conceptual development within environmental sociology based on a more explicitly socio-ecological positionality? How can these approaches help move towards a philosophical reorientation of environmental management and environmental sociology?

Feminisms in Post-Invasion Iraq: Between Ngoization, Militarization and the Struggle for a Civil State

Feminisms in post-invasion Iraq: between NGOization, militarization and the struggle for a civil state

Zahra Ali, Rutgers (z.ali@rutgers.edu)

This presentation is based on an in depth sociological study of Iraqi women's social, political activism and feminisms based on an ethnography of post-2003 Iraqi women's rights organizations and a detailed research on Iraqi women's social, economic and political experiences since the formation of the Iraqi state. Through a transnational/postcolonial feminist approach I look at the ways in which gender norms and practices, Iraqi feminist discourses and activists are shaped and developed through state politics, competing nationalisms, religious, tribal and sectarian dynamics, as well as wars and economic sanctions. In this paper, I particularly look at the context following the US-led invasion and occupation and analyse the realities of Iraqi women's lives, political activism and feminisms especially the challenges posed by sectarianism and militarism.

I will focus on three dimensions First, the collapse of the state and the institutionalization of a communal-based system imposed by the US-led administration and its concrete consequences and implications for Iraqi feminists' organizations and mobilizations. I will particularly look at feminists' strategies of struggles and advocacy in a context characterized by militarization and sectarian violence. Secondly, the NGOization of Iraqi feminists' organizations through the various networks of US, UN and European funds that finance their initiatives and campaigns. Finally, the involvements of feminists' organizations within the popular civil society movement that started in 2011 and re-emerged in the context of the invasion of Mosul by the Islamic State Organization in the summer 2014.

Sanctifying Public "Secular" Space: A Snapshot of "Modern" Canadian Politics

Sanctifying Public "Secular" Space: A Snapshot of "Modern" Canadian Politics

Secularism has a complex history with a multi-faceted relationship to democracy, liberalism, and religion. It is a multivalent notion that means different things to different people in various contexts. In western countries, it most often refers to the separation between the legal public sphere foundations of the state and religious institutions, the private sphere. Most often, secularism is thought of and defined as the separation of religious institutions from secular institutions in government. Rather, more succinctly the division of politics from religion. From the perspective of the public sphere, secularism supposedly transcends religion. One can argue that, as western liberal societies become more religiously diverse, states are gradually shifting the boundaries and contours between the public and private spheres to accommodate a multicultural citizenry. Despite this shift, however, one defining feature of liberal, modern secularism has become the seemingly gradual reintroduction of religious discourse in the public sphere and the strategic form of thin secularism that governments and international bodies of law collude as a mode to create techniques of separation and exclusion. In the twenty-first century nowhere does "secularism," "religion," and governmentality intersect more fully than in policy debates concerning Muslim women and citizenship. This paper critically analyzes the global, national and religious dimensions that form the basis for the 2011-2015 ban against wearing the niqab and burqa during the oath of allegiance at the Canadian citizenship ceremony. It argues that public "secular" space becomes re-configured as the site where increasingly thin lines of secularism are used as a tool to define, shape and govern in ways that strategically create and maneuver boundaries between the secular and religious that are most conducive to the secular complex of the state.

Transition from Primary to Secondary School and Ethnic Inequalities in Comparative Perspective

The phenomenon of educational tracking has been widely studied in sociological literature. While it served the needs of national economies in previous times, its relevance in modern education and economy is being more frequently contested. Most contributions conclude that it disproportionately punishes students from low socio-economic strata, provides them with narrow or basic skills, denies them the opportunity to pursue tertiary or other advanced studies, and in overall increases the social inequality in the society.

Tracking is widely present in many European schooling systems – Austria, Germany, Switzerland are the classical examples of *dual system*, but other countries like Belgium, Luxembourg, Netherlands, Czech Republic, Slovakia, and even France and Italy practice programme placement to some extent.

This paper contributes to the literature on tracking in two ways:

- While it is known that students of migratory background are more likely to be placed in vocational programmes, less is known about the systematic bias in such decisions. We impute prior achievement scores in reading or mathematics and use it as a main control in explaining potential bias.
- We combine educational data for primary and secondary schools from various educational surveys and construct three *synthetic* birth cohorts of students, observed initially in primary (PIRLS or TIMSS survey) and later in secondary school (PISA survey).

Our sample includes 14 countries and 370 000 students, of whom around 40% are in vocational education. Our preliminary results suggest no bias towards immigrant students in countries with high share of immigrant students and longer immigration history. The contrary seem to be true for cases with relatively small immigrant population who became receiving countries in recent years.

ALIKHANI, BEHROUZ* (*Research fellow and lecturer at the Institute for Sociology, Westfälische Wilhelms-Universität Münster, Germany*)

Process-Sociological Concept of Power and Democratization and Its Empirical Implications

The term 'power' is usually used as if it refers to an isolated object in a state of rest. Instead process-sociologically seen, power is an attribute of relationships: every relationship between human beings and groups of human beings is a power relationship. It has extraordinary theoretical and practical consequences if the concept of power would not be used in a reified manner, but in a connection with other words such as: *power resources, power differentials, power chances, power balances, power potentials, power distributions, power shifts and power ratios*.

Based on this understanding of the concept of power, one could grasp the degree of 'functional democratization' in different more or less democratized societies. The direction of processes of functional democratization indicates the growing distribution of all available *power resources* between all members in a society. On the contrary, processes of de-democratization could gain the upper hand if the power resources in a society become increasingly monopolized by a specific

'sector' and institution or group of influential individuals. Process-sociologically viewed, these two processes are taking place at the same time in all human societies. The question to be addressed is who among the carriers, advocates and supporters of two opposing processes could gain the upper hand at the end: the processes of democratization or the processes of de-democratization.

In this presentation, I will introduce this concept of power and the related process-sociological model of democratization and de-democratization. The empirical implication of such a concept and model will also be discussed.

ALIKHANI, BEHROUZ* (*Research fellow and lecturer at the Institute for Sociology, Westfälische Wilhelms-Universität Münster, Germany*)

The Socio- and Psychogenesis of the Concepts of 'Return to Self' By Ali Shariati and 'Westoxification' By Jalal Al-Ahmad in Iran

There is no doubt that the Islamic Revolution in Iran in 1979 inspired many other movements in the 'Islamic World' in order to find a new ideology of resistance against their rulers perceived as illegitimate and alien. Until then, especially during the Cold War, nationalistic and leftist ideologies of resistance dominated.

In this presentation, first I will analyze the socio- and psychogenesis of two important concepts of 'Return to Self' by Ali Shariati and 'Westoxification' by Jalal Al-Ahmad that both emerged in the 1960s in Iran. I also will demonstrate the influence of these two concepts on the Ayatollah Khomeini's ideology that led to the Islamic Revolution in Iran in 1979.

The emergence of these two socially influential concepts will be explained as the reaction to the authoritarian way of modernization carried out by Mohamad Reza Shah which took place without adequate social and political integration of the people affected. In this sense, these two concepts symbolically represent notions of previously socially marginalized, stigmatized and uprooted outsiders against their western-oriented and alien perceived political elites in the course of functional democratization. Based on this example, it is also possible to conceptualize the very close connection between socio-economic and habitual developments in a society and their possible non-simultaneity.

Some Features of LGBT Community Religiosity in Contemporary Lithuania

This paper aims to research the features of religiosity of LGBT community in contemporary Lithuania. LGBT community in Lithuania faces challenges of social exclusion due to the dominating cultural and social norms supported by traditional and conservative powers in Lithuanian society. Religious and political elites ground their antagonism towards LGBT community in the doctrine of Roman Catholic Church and its approach to the practices of homosexuality. Lithuanian society was undergoing quite rapid social change after the collapse of Iron Wall and recent social research data reports about the increase of the part of population with more liberal attitudes toward homosexuality. However, LGBT community finds itself as an alternative cultural group in still very traditional and conservative Lithuanian society and religion remains one of the obstacles to overcome these boundaries. How do LGBT community members construct their religiosity and everyday religious life? What are the features of LGBT community religiosity? How does LGBT community religiosity manifest in their everyday life? These and other questions have been posed in the beginning of the research.

In 2017 autumn Lithuanian LGBT community for the first time participated in the survey about their religiosity, relations with Roman Catholic Church and society. The results of the survey will allow disclosing the features of LGBT community religiosity, their beliefs, practices, consequences of their religiosity for everyday life, their assessments of activities of dominant religious community in public. The LGBT community survey results will be compared with European Value Survey results and social research data from other countries – Poland, UK (Hunt 2009, Yip&Page 2013, Hall 2014).

Sweeping Away Old Age: Senior Men's Curling, Masculinity, and Ageing Embodiment

In recent years, men's curling, a sport historically linked to the bodies of older people, where older men (and women) can compete at highly competitive levels, has taken a youthful turn. In this work, we investigate this newly celebrated curling masculinity, one that valorizes the bodies and gender expressions of younger men, and the implications of this for older men who curl. We conducted 19 semi-structured interviews with older male curlers, attending to the ways this changing curling culture impacts their gender expressions and understandings of themselves and their aging bodies. We argue that older men express themselves

as men through their participation in curling, and that the sport offers later life men a way to convey counter-hegemonic expressions of masculinity. However, given the nature of hegemony, these counter-hegemonic tendencies are unsurprisingly not total. The curlers we interviewed for this study use curling as a way to assert their own privileged form of masculine expression, one tied less to their aging bodies and instead linked to their intellectual pursuits. Exploring the intersections of class, gender and age in the under-researched sport of curling, this paper argues that older curlers alternately resist and reinforce curling's new celebration of youth.

The Impact of Erasmus + on European Citizenship: The Case of Estonian and Slovenian Youth

The impact of Erasmus + on European citizenship: the case of Estonian and Slovenian youth

Allaste, Airi-Alina & Deželan, Tomaž

The mobility of young people for education, training and other purposes has been increasing globally, influencing belonging and citizenship spontaneously. On the other hand, in Europe there are programs designed to create a sense of belonging to the idea of Europe and solidarity of young Europeans with its fellow citizens. This paper examines the role of the European Commission Erasmus + program in encouraging the notion of European citizenship among young individuals from Eastern European member states by looking at the value of learning mobility actions.

The relevance of the Eastern European context is rooted in the different citizenship traditions and practices that former socialist countries have compared to their Western European counterparts. The behaviour and attitudes inherited from an authoritarian citizenship system, amplified by the negative effects of political and economic transitions, demand additional attention. Particularly, since socialist citizenship patterns have been, by various agents, transmitted to younger generations even though they have no direct experience of living under a socialist regime or witnessing its demise as a result of civic awakening.

Taking into account contextual idiosyncrasies, the post-socialist youth still faces the same challenges as young people across Europe, including the new political and social reality related to the European Union. This paper focuses on how young people perceive the influence of their mobility experience on citizenship standpoints and practices, at the same time taking into account the impact of the wider social context. The in-depth micro-level analysis is primary based on semi-structured interviews with young people from Estonia and Slovenia, conducted before and year after they had participated in 'E+ Youth in Action' activities and contextualised by two rounds of survey data with participants of projects.

Healthy Retirements Begin at School: Education Predicts Health Outcomes of Early Transitions.

The literature on whether education is a significant moderator of the health effects of retirement is equivocal. This article assumes that part of the conflicting evidence may be linked with differences in the variability of educational status between study samples. The present study used Mexico as a sample case because it has a sizable number of older adults who have no or very little formal education, which is no longer the case in most developed countries. Thus, it presents a more balanced test of the impact of formal education on health outcomes of retirement. Drawing on panel data for 4,428 individuals over age 50 from the Mexican Health and Aging Study (MHAS) and combining propensity score matching models with fixed and random effects regressions, this article explores differences in the health effects of retirement timing between older adults with varying years of education. Subjective health is measured using a self-reported assessment of respondents' overall health and physical health is measured as a reverse count of doctor diagnosed chronic diseases. The results indicate that early retirement is associated with worse health outcomes, but years of education fully compensate for its detrimental effect on subjective health and attenuate the detrimental effects on physical health. In conclusion, formal education during childhood and youth provides a long-term protective effect on health and improves the health consequences of early retirement. Policies and programs promoting healthy and active ageing would benefit from considering the influence of formal education in shaping older adults' health during the transition into retirement.

ALLEN, HENRY* (Wheaton College (IL))

Scientific Literacy and the Sociology of Science: New Frontiers for the 21st Century

In 2016, the National Academy of Sciences (NAS) released a major report about scientific literacy in the United States.[1] Essentially, they reasoned that scientific literacy is not just an individual asset, but rather a vital community resource in a complex society.[2] It consists of: (1) an appreciation for science; (2) a general understanding of its scope and promise; (3) a trust in its endeavors; (4) a realistic knowledge of its impact within social organizations or associations; and (5) tangible insight regarding how scientists produce empirical evidence and robust explanations. In sum, the report views scientific literacy as a social process with content shaped by contextual factors across and within communities. Foundational literacy, social structures, systemic factors, attitudes, and disparities all interact to generate scientific literacy in unknown ways at present. The authors of the report caution that existing research does not validate the notion that increasing scientific literacy automatically increases support for science.

In 2017, NAS published a second crucial report about communicating science more effectively.[3] Here, they invite researchers to probe effective methods or strategies for communicating the excitement of scientific investigation, for helping communities comprehend scientific findings, and for engaging diverse communities in the scientific realm. Once again, social factors were stressed explicitly, along with impediments related to the complications of learning science and processing its results. Of course, all of the aforementioned factors affect the formation, execution, and implementation of societal policies. The purpose of my presentation is to analyze these and other new frontiers in the sociology of science for the 21st century.

[1] National Academy of Sciences 2016.

[2] Ibid. The report reveals numerous technicalities and core research questions that must be explored to understand SL. While acknowledging methodological problems, it accentuates the strategic role of the social sciences.

Legislative Protections from Discrimination in Access to Employer-Provided Training across 193 United Nations Countries

In this paper, we examine national-level policies across 193 United Nations countries that protect workers from discrimination in access to employer-provided training. Research has highlighted the importance of participation in training for advancement in the workplace. Yet participation in training often varies by sociodemographic factors such as gender, age, race/ethnicity, disability status, and social class, with potential implications for the long-term employment opportunities and wage outcomes for workers in those groups. In addition, previous studies have found discrimination to often be an underlying cause of these disparities. While private employers may choose to implement anti-discrimination policies at individual workplaces, public policies may be more effective in extending protections to all sectors, and to all workers.

Using data from the WORLD Policy Analysis Center, we compared the level of protection afforded to workers on the bases of gender, age, race/ethnicity, social class, and disability status. We assessed which countries specifically protect workers from discrimination in access to employer-provided training and identified patterns by region and country income level.

The findings from our analysis suggest that access to employer-provided training is not well-protected compared to other types of workplace protections, with fewer than three-fifths of countries enacting protections specific to training. Protection also varied greatly across sociodemographic groups: while about half of all UN countries had specific protections for training on the basis of gender, less than a quarter protected on the basis of disability. Given the advantages of training for workplace advancement, we argue that legislative protections from discrimination in access to employer-provided training could be an effective policy tool for reducing socio-demographic disparities in employment outcomes.

ALMAGUER-KALIXTO, PATRICIA EUGENIA* (*Interdisciplinary
Institute on Human Ecology and Sustainability*)

*Implications of the System's Observer in Environmental and
Ecological Knowledge Systems for Sustainable Development*

This paper reviews the concept of 'system observer' in the literature of ecological and environmental knowledge systems. Environmental knowledge has been generally related to traditional knowledge (hereafter TEK) and it addresses bodies of beliefs, traditions, practices, institutions, and worldviews developed and sustained by indigenous, peasant, and local communities in interaction with their biophysical environment (Toledo 2002, Berkes 2004, Erik Gómez-Baggethun et al 2013). Environmental knowledge has a broader conceptualization that includes (i) knowledge about collective decisions regarding the environment (Hays 2000, Almaguer 2014), (ii) conceptualizations that engage information and knowledge about environmental issues, and (iii) the decisions taken upon that knowledge with their political and economic implications (Clapperton and Piper, 2016).

By emphasizing a sociocybernetics perspective, the paper analyses both conceptual models using systems theory and second order cybernetics (Geyer and Van der Zouwen 2006). It compares the use that such models do to system reflexivity and second-order observation (Foerster 1973). Other concepts such as self-organization, emergence, positive and negative feedback (Geyer 1995) are also considered to analyse models of knowledge systems of nature, outlining conceptual similarities and differentiations with some case examples.

The second part focuses on the debate of the 'system observer/constructor'. Birrer (1999) identifies environmental issues as one of the fields where first order systemic perspective has strong development (i.e. modeling of environmental systems) he also notices that we hold ambiguity when we refer to the role of the system's observer in these fields. The paper discusses the implications of explicitly acknowledging -or not- the position of the observer within the system's construction, particularly when attempting to address sustainable development challenges as those framed by the Sustainable Development Goals.

*Contemporary Directions of the Brazilian Medical Professionalism
in the Context of the Professional Governance in Health of SUS*

The study focus on possible current consequences from the organization of the Brazilian SUS and its professional governance in health (Kuhlmann & Saks 2014), which can be producing new directions for the medical professionalism in Brazil. The investigation is grounded on analytical frameworks from sociology of profession as well as social policy analysis (Bochel & Bochel, 2013). In methodological terms, the paper intends to capture those possible changes according to the medical practice viewpoint, so that besides bibliographical analysis and the investigation of specific and normative documents from the health sector, the paper is based on semi structured interviews with Brazilian physicians. The health system of Brazil is characterized for: a) a decentralization process connected to the local or municipal prominence in the delivery of health services; b) a public-private arrangement for the system; c) the construction of institutional spheres for the political participation of civil society organizations. The analysis intends to understand the combination, and possible hybridization, of a previous civil professionalism (Halliday, 1999) and an emergent democratic professionalism (Olson & Dzur, 2004) in medical practice. The contemporary reality of the Brazilian medical profession is characterized for an internal debate over the connections between a biomedical, a sanitarian (Paim, 1997) and some new trends of alternative, complementary and integrative types of medical approach (Galhardi, Barros & Leite-Mor, 2013; Tesser & Barros, 2008). As the Brazilian health system is decentralized, the investigation focus on a local/municipal reality which could represent a sociological bases for a case study analysis (Yin, 2015).

*Governing Complementary and Alternative Medicine in Brazil and
Portugal*

Sociological research on the governance of complementary and alternative medicine (CAM) in Western societies has vastly increased in the last decades. Yet there has been a less marked expression of qualitative studies which put such governance into comparative perspective. Furthermore, research has shown that CAM regulation in Western countries has been very diverse, and so is probably best conceptualised on a spectrum containing several regulatory models. This paper investigates CAM's modes of governance in two historically, culturally and politically related countries, Brazil and Portugal. It analyses: (1) the extent to which CAM governance has changed over time in these two countries; (2) the

main modes of CAM governance in these same countries, and (3) the implications of these modes of CAM governance for CAM professionals themselves and the public. We conclude that Brazil and Portugal present some similar patterns in the way they govern CAM, but also contrasting differences, particularly in relation to the status of these therapies with the public and the private healthcare systems, and the implications of this status for CAM professionals themselves and the wider public.

*Mythical Encounters: Challenging Racism in the Diverse, Post-
Racial City*

Armed with its motto 'Diversity Our Strength', the City of Toronto has garnered a reputation for being a world leader in tackling issues related to diversity, inequality, and racism. As the municipal government of one of the most diverse cities in the world, the City of Toronto is lauded internationally in large part because of how it prioritizes the participation of racialised and Indigenous groups in consultation activities and policy-making, in order to challenge the limits of racism, democracy and belonging, and to move beyond race.

In this presentation, I situate consultations with racial and Indigenous Others in the City of Toronto within the context of diversity discourse and the racial norms that are incited into and by it. A detailed exploration of City of Toronto policy documents which report on consultations with racial and Indigenous Others reveal that diversity discourse and the promise of the post-racial simultaneously invite and reproduce race via commodification of racial Otherness, and the continued abjection of claims of racism in the City. I draw on several policy examples to show how the essentialisation of racial and Indigenous bodies as *lacking* becomes intimately connected with the co-production of the diverse, post-racial City of Toronto and the naturalization of the white male subject, his knowledge, power, and right to space in the City. I conclude by arguing that diversity discourse and promise of the post-racial are racial ideals which are enlivened in the present *because* of the claims of racism made by racial and Indigenous Others in the City of Toronto, thereby making consultation processes with racial and Indigenous Others integral to the reproduction of race in the City.

*Young People Meet Complex Organizations. an Interview Study
with Swedish Service Providers*

This paper presents findings from a Swedish interview study from 2016-2017 with 20 professionals working with young people, who suffer from a combination of mental ill-health and social vulnerability. They have been recipients of long-term support from multiple welfare service actors with the aim of promoting the young people's wellbeing. The aim of the study is to investigate professionals' experiences of work practices aiming at increased wellbeing for this group of young people. Mental ill-health among young people has increased in the past decades in Sweden as well as in many other western countries. Mental ill-health has also been connected with social vulnerability such as difficulties in completing education, unemployment, out-of-home care or substance abuse. This group of young people are sometimes referred to as *youth with complex needs*. Complex needs is a concept used to categorize people that have multiple interconnected needs that span medical and social issues, people that are considered as especially disadvantaged, or presenting challenges to welfare services. Categorizations of people and needs are prerequisites for legal, bureaucratic and professional systems within the welfare state. Welfare organizations construct knowledge and strategies regarding specific target groups according to these categorizations. In the paper we argue that the expression complex needs, when used as a way to categorize young people, not necessarily take into consideration that the problem instead may be the complex organizations that young people meet. These organizations may not always succeed in catering for the needs of young people.

*Am I the Beaded Flower in Your Moccasins? Research Experiences
of an Indigenous Feminist in the Labour Movement and Academia.*

As an Indigenous feminist researcher working within the labour movement, I came to ask myself: Am I a beaded flower in your moccasins? From the teachings of my Kohkom (grandmother) I came to understand the beautiful flowers she beaded onto moccasins to be a symbol of our Cree Metis heritage, a symbol of our strength and skill as Indigenous women. I've been invited to join several multidisciplinary research projects and grant applications within academia examining gendered experiences in the labour market, the political economy of resource extraction, Indigenous land rights, and Indigenous sovereignty over

economic development. One day leaving a meeting with academics, I began to ask myself whether I was just a cheap version of decorative flowers in the commercially produced moccasins worn by white academics. I began to question whether my years of experience as a labour expert were actually appreciated, or whether I merely fit their quota for including Indigenous scholarship in their grants. I returned to my office at the union, where I realized maybe I was a beaded flower in the moccasins worn by activists, and they appreciated my strengths as a social justice researcher and Indigenous feminist. This personal reflective essay will examine the challenges of practicing Indigenous feminism in my research within academia and activism, and my struggles with thinking of myself as a beaded flower. Is my inclusion on these research projects a symbol of the strength of Indigenous womanhood or am I just a token whose voice will inevitably be silenced? I am currently on two multi-year SSHRC funded research projects, [Just Powers](#) and the [Corporate Mapping Project](#). These projects are very welcoming to my Indigenous feminist approach. In this essay, I will also reflect on the journey I took to find these respectful allies to work with in academia.

Un/Certainty, Morality and Symbolic Boundaries in Small-Town Germany

With the recent influx of forced migrant newcomers in small towns across Germany, group identities and boundaries are being renegotiated. Especially in rural areas, where social groups have been formed and stabilized, this creates a unique sense of uncertainty, as insiders and outsiders seek to re/create a sense of identity and belonging amidst fluctuating legislation, shifts in asylum status, and housing relocations. What mechanisms do actors rely on in resolving such uncertainties? Current sociologists of morality define morality as that which "encompasses any way that individuals or social groups understand which behaviors are better than others, which goals are the most worthy, and what people should believe, feel and do" (Hitlin and Vaisey 2013, p55). Cultural sociologists maintain that moral boundary work enables actors to construct hierarchies between themselves and others (Lamont 2000). Building on this line of thought, this paper maintains that the deployment of moral discourse best characterizes how symbolic boundaries are settled, focusing on the example of how the quality of deservingness is created between local-level actors. Eighteen semi-structured interviews with forced migrant newcomers, grassroots volunteers, and local administrators across four small-town field sites in the German state of Baden-Württemberg are drawn on in making this argument. Uncertainty around asylum status, marked through the German bureaucratic category of *Bleibeperspektive* (likelihood of being permitted asylum), can have direct social consequences of stigma, such as being undeserving of mentoring services and language help, and is itself a category riddled with presumptions. This research identifies re-labeling, resignation, and accountability as mechanisms actors turn to in combating their frustration with German bureaucracy and the chronic uncertainty that colors the experiences of forced migrant newcomers and those working to integrate them. Although not in the same manner, the harmful effects of uncertainty touch everyone – forced newcomers, grassroots volunteers, and administrators alike.

ALPAGU, FAIME* (*University of Vienna*)

Visual and Verbal Strategies of Belonging and Distance in Migration

This presentation deals with the ambivalence of building belonging to a "we-group" and distancing oneself from the group at the same time. The paper aims to juxtapose the way how this ambivalence is handled in visual and verbal narratives. How do "guest workers" build a "we-group" and how do they distance themselves from the group? What kind of relationship do the so called guest workers have to the family, other workers, "host country" and country of origin?

The proposed abstract is part of a PhD project, which deals with "guest worker" photographs and letters that were sent back to family members in Turkey from the 1960s to the late 1980s. These photos and letters are to be complemented with official documents (e.g., working certificates) and recently conducted biographic-narrative interviews. Consequently, this ensures that the complexity of the interaction between the following dimensions is given: *verbal or written/visual, now/then, private/official and here/there*.

The project follows a reconstructive approach by triangulating interpretative methods such as biographical case reconstruction (Rosenthal, 2005) and visual segment analysis (Breckner, 2010). Of particular interest are interacting narratives created by biographical interviews, photos, letters and documents that provide information about migration experiences.

Locating Ramakrishna'S Revivalist Discourse in the Emergence of Modern Religious Movements in India

The aim of this paper is to analyze Sri Ramakrishna Paramahansa's (1836-1886) revivalist discourse based on three perceptions (i.e. God-Nature, Self, and Society) in the context of the emergence of new religious movements in modern India. Unfortunately, the scope of the study of revivalist movements is generally limited to the Middle East and the Western world, whereas, this piece of work is dedicated to South Asia region to make available sources for comparison of Abrahamic and non-Abrahamic religions in the context of modernity. I also aspire to provide an academic discussion to the intellectual scholarships in the field work of studying the religions and modernity.

This paper is composed of an argumentative introduction and conclusion part and literature reviews, my aims and positions in the Ramakrishna studies. I explore the core dimensions of the socio-religious changes in Bengal in order to find the basic elements of the revivalism in Bengal Renaissance during 1800-1830s. More importantly I analyze Ramakrishna's revivalist discourses in his daily speeches as recorded in his holy book the Gospel of Ramakrishna. The rest of my paper concludes an overview of Ramakrishna's life considering his spiritual experience turning into religious doctrines and how Ramakrishna's revivalist discourse was perceived by his disciples, especially by his foremost devotee Swami Vivekananda.

Outcomes of Ramakrishna's revivalist discourse regarding God-Nature shortly are; everything in the universe is an embodiment of God and God is active all the time and takes care of everything, regarding self; attachment to worldly things (i.e. women and gold and egotism) are the main problems of modern man and the solution is realization of God with guidance of a religious leader (guru) by experiencing renunciation, devotion, faith and meditation, regarding society; instead of dogmatism of religions and sects he purposes the idea of harmony of religions.

Inclusion through Organization - Social Movements in the Global South As an Exercise of Self-Inclusion of the Excluded

The major part of the population of the Global South has been excluded from participation in important spheres of society. They cannot communicate following the logics of modern society. Marginalized by politics, law, economy, and other functional systems, these people were and are considered as permanent threat and thus turned into objects of repression or paternalistic social policy – or simply invisibilized. However, exclusion can lead to major integration and by this, to a self-organization of the excluded. This text argues that self-organization of the excluded can be a way to self-inclusion. As organizations, such as community schools, sport clubs, cooperatives, are able to access, albeit in a marginal way, functional systems such as politics, education, and economics, the excluded can, through their organizations, communicate in the systems. Organization becomes therefore a way to participate in society.

This could be a way to understand social movements in the Global South. These movements often differ from the framework of social movement theory. Their organizations are based not only on protest or political engagement, but on the provision of services in their community. At the same time, they are the main pillars of some of the most influential social movements worldwide. This text will discuss how social movements in the Global South can be understood without the need to reduce their complexity to a degree where their everyday activity is invisibilized. Also, effects of the inclusion into society will be pointed out.

Localization of Global Scientific Knowledge – or: How Global Theories Became Local Buzzwords

The production of scientific knowledge is organized around a series of transnationally relevant theories. Neglect or ignorance of those theories generally leads to a rejection of the correspondent studies by fellow scientists. The production of transnationally relevant theories happens mainly in the Global North and is influenced heavily by the institutional frameworks and the academic culture there. The process of transnationalization of a given theory is therefore an act of globalization of one specific locality – the theory on power by Max Weber carries in it German values and ideals of the early 20th century. Transnationalized theories are not simply accepted in other countries, but go through a process of localization by the agents and institutions there. They are translated into the local culture and the local academic sphere. The values in Weber's theory are connected to local values and by this, the theory as such is resignified.

This presentation will study the process of localization of transnational theories in social sciences in the Ecuadorian university. Social sciences in Ecuador have a history as academic discipline since the 1960s and are marked by several breaks

considering the use of theory. The argument here will be that the localization of transnational theories happens in part in the form of buzzword-like categories, such as "North American sociology" or "positivism" and in part via subsummation under already existing theories and non-theoretic values. The result was -at least for a certain time- a contradictory and rebellious re-creation of theory that is the base for nowadays theory-building in Ecuador.

Prostate Cancer in Rural Nigeria: Cultural Interpretations of Causes, Knowledge of Symptoms, Screening Status, and Preventive Actions Among Men

About five years ago, the rate of prostate cancer was not less than 30 per 100,000 in Nigeria. This is likely to increase in the coming years. Agenda and priority setting in global health emphasizes prevention and early detection of prostate cancer. In Nigeria, the availability, accessibility, and utilization of prostate cancer screening is limited. This increases the burden of disease all the more so in rural settings. Prostate cancer, being gender specific has underlying cultural connotations. There is a dearth of evidence on the rural-cultural understanding of prostate cancer risks among rural men. Therefore, based on the arguments of Rosenstock's Health Belief Model, the study examined: rural men's knowledge of symptoms; pathways for accessing screening; and cues to preventive action about prostate cancer. In-depth interviews and focus group discussions were conducted to collect data from 55 men (at least forty years old) purposively selected from five culture clusters in Ogun State, Nigeria. Thematically structured and content-analyzed findings from the study revealed that rural men had limited knowledge about the presentation of prostate cancer. Although the term 'fejere' (Cancer) was understood, prostate cancer was mainly described as a form of hernia and/or an outcome of a sexually transmitted infection. Most respondents had not sought clinical screening for prostate cancer. Consulting with and receiving treatment from medicine vendors, traditional healers, and hospitals was common. Preventive actions included avoiding multiple sexual partners and avoiding sweet foods. Policy makers should develop prostate cancer screening outreaches that can increase the knowledge, awareness and practice of screening among rural men.

ALVARADO MENDOZA, ARTURO* (*EL COLEGIO DE MÉXICO*)

Delincuencia y Crimen en las Fuerzas Coercitivas del Estado y el Estado de Derecho.

This paper proposes a theoretical discussion of the wide and complex irregular and illicit behavior of State Coercive Forces. It builds a framework based on cases from latinamerican security forces (police, the army, special forces) and finally links the discussion to human rights violations and ways to solve this problems.

El propósito de esta ponencia es definir el campo problemático de la delincuencia de las fuerzas coercitivas del estado, examinar sus aristas y describir, comparar y clasificar algunos casos problemáticos con miras hacia A. L.

La violación de derechos humanos por parte de las policías y los militares (como individuos y como grupos) ha sido documentada con alguna asiduidad en la región, pero poco se ha hecho para caracterizar e interpretar el "hecho social" y "comportamiento organizacional" que es la desviación del comportamiento de los miembros de estas corporaciones estatales, las transgresiones que son definidas como delitos. Estos incluyen las violación a reglas, la corrupción, la colusión, la letalidad policial (ver los casos crecientes en los EUA) que empieza a debatirse en México (Pérez y Silva, 2017), como ha sido debatido en Brasil y en Argentina (Gatillo fácil. Kessler). Pero también cubre muchas otras actividades en las que se involucran individual o colectivamente para cometer crímenes, la omisión, la colusión, hasta la formación de organizaciones criminales dentro de los cuerpos policiales (Guatemala, México).

Situación similar ocurre con las fuerzas coercitivas del Estado y para su caracterización (¿legítima, ilegítima, ilegal, monopolio de la violencia legal?). Este campo tampoco ha sido explorado sistemáticamente; no obstante existen numerosos casos de actos. El trabajo precisa la problemática, define una taxonomía, hace algunas comparaciones con policías y fuerzas armadas de A.L. y contribuye a esclarecer este problemático campo de la relación entre violencia ilegal, fuerzas coercitivas del estado y estado de derecho.

Effect of External Shocks on Norms on Online Hate Speech

We examine the evolution of hate speech in an online forum before and after the Islamist terrorist attacks in Germany in Ansbach and Würzburg in July 2016. In the first part of the study we use pre and post attack data to identify a breakdown of social norms on hate speech expression. Hateful comments towards immigrants and Muslims increased after the attack. Surprisingly hate speech towards unrelated minority groups, such as LGBT and womens' rights also increased. We interpret the findings as a breakdown of norms against the public expression of prejudice towards immigrants, which causes a spillover to other domains. In the second part of the study we compare the effectiveness of censoring prior hate content as an intervention to reduce hostile content before and after the attacks. We argue that censoring hate content biases the individual's perception of the prevalence of hate speech, therefore highlight a descriptive norm against it. Results show that a high level of public debate on a topic, such as media coverage, is linked to both an increase on hate expression and an increase of the effect of environmental cues on related normative behaviour.

A New Spanish Far Right? the Alter-Activism Far Right Style of Hogar Social

Spanish far right has been always connected with the regimen of Franco. Their claims, styles, symbols, ideology reclaim the glorious past of the dictatorship. With the advent of democracy these groups didn't have a relevant political or social success. As the surveys show the far right vote was focus on more moderated political options as Partido Popular, and the relation with the ideology and imaginary of Franco's dictatorship dispelled most of people.

The Spanish far right didn't have an important evolution, being limited to different neo-Francoist and neo-Nazis formations more visible on sports events as football than on political or social arena.

But in the last years, coinciding with the economic crisis, we can see an important change with the born of new far right groups. They have left the extremist symbols, discourses and expressions, to articulate what they call the fight for the Spanish people social justice. Without given up an anti-immigration, anti-zionist or anti-diversity message, they have taken similar strategies and actions of the progressive social movements. They claim for social justice, against capitalism and job precariousness, squatting buildings, making food donation campaigns, conferences and artist events, etc.

Their similarities to contemporary progressive social movements make us to use the same analytical categories or methodologies to study what it could be also a social movement as indignados/15M.

This text present the main results of an ethnography of Hogar Social Madrid based on interviews, conferences, demonstrations and their activities in social networks.

Vulnerability, Processes of Subjectivation and Youth Activism. the "Juventud Sin Futuro (Youth Without Future)"'s Case in Spain.

On this paper we will tackle Spanish university-based youth activist group "Juventud Sin Futuro (Youth Without Future)", key actor of the 15M movement and one of the most relevant activist groups in the wave of protests following the great recession of 2008. Our objectives are twofold. On one hand, we will look into how existential vulnerabilities among Spanish young generation became political conscience and led into new and unconventional ways of understanding and participating into politics. On the other hand, we will place Juventud Sin Futuro (JSF) within the current trends of sociological analysis of social movements studies, showing its origins, development, main features and the most prominent relationships and connections with other national and international political actors.

Given also the fact that JSF political activities came into an end recently we find ourselves in a great timing to assess their achievements and verify if new youth-driven activism is able to create and promote effectively spaces and subjectivities in the fight against social and economic precariousness.

This study is part of a larger research project funding by the Spanish Government (Proyecto I+D el Plan Nacional "Nuevas Formas de Vulnerabilidad Socio-Existencial, Soportes y Cuidados en España 2017-2021") on existential vulnerability and is based on previous author's work and the empirical work carried out by the project team throughout 2017.

Research methodology includes treatment of socio-demographic data, netnography and internet-based analysis as well as discourse analysis of interviews, press releases and statements.

ALVES, PAULO* (ISCTE-University Institute of Lisbon)

The Portuguese Unions in the Health Sector and Social Media - from Bureaucracy to Infocracy

The trade union movement is facing "hard times" (Chaison, 1996) since the 70s. Trying to overcome the problem, they are implementing a set of actions towards their revitalization (Frege and Heery, 2003). The adoption of the ICTs, mainly the Internet, emerges as an important tool for supporting those actions.

The unions adopted the ICTs later than their counterparts (Pinnock, 2005), but the competitive advantages they offer and their flexibility encouraged them to adopt these tools more and more.

Some digital optimists state that the Internet gives a relevant contribution for a qualitative transformation of the unions' structure. According to them, it makes possible to deepen union democracy by the possibility it offers to create new spaces that encourage participation and accountability. Hence, they conclude that we are witnessing the emergence of a new union form called "cyberunion" (Shostak, 2002), "e-union" (Darlington, 2000), "open-source unionism" (Freeman and Rogers, 2002) or "trade unionism 2.0" (Gutiérrez-Rubi, 2009).

In this paper, we intend to answer the question whether the uses of the social media by the Portuguese unions in the health sector are deepening the organizational democracy and so, giving a contribution to the union renewal. Our main conclusion is that these organizations are very far from achieving this goal. Instead of giving a contribution to open the organization, the uses of the social media by these unions serves to perpetuate organizational closure. In this case, digital democracy is nothing more than a myth (Hindman, 2008) and what we assist is to the extension of the bureaucratic model of organization to the digital world, giving rise to an infocracy (Zuurmond 1994 quoted by van Dijk, 2000).

The main issue is that underlying the ways how the unions use Internet and social media, are social processes that the futuristic, speculative and techno-euphoric perspectives forgotten frequently.

No Tyson in Tongie! Race, Class, and the Fight for Quality of Life in Kansas

In September 2017, Tyson Foods, Inc. announced plans to build a new chicken processing plant in the small, eastern Kansas town of Tonganoxie. Within just two weeks of the announcement, however, the town had effectively mobilized to prevent the plant from being built. This paper examines the mobilization and framing of the "No Tyson in Tongie" protest to understand why and how the town rejected the meat processing plant. Drawing on content analysis and qualitative interviews, this paper analyzes the meanings that residents and movement organizers attached to the anti-Tyson movement. We argue that plant jobs and immigrant labor have been so closely associated that the anti-Tyson movement effectively mobilized fears of how immigrant newcomers might change the town if the plant were built. Specifically, the town mobilized a two-pronged effort to establish and maintain social distance from immigrants. First, town residents mobilized against the kinds of jobs associated with immigrants that would be brought to the town. The anti-Tyson movement pushed back against the association of their town with low-income immigrant jobs. And second, the town mobilized against the immigrants themselves that would come to the town. Residents effectively mobilized narratives about threats to quality of life in the town and channeled fears of over-burdened infrastructure and institutions to assert that the town would not be better off because of the plant. This research furthers our understanding of contemporary conservative populist movements. Populist leaders have vowed to bring jobs – particularly factory jobs – to rural, white, working-class communities. While Tonganoxie largely fits this description, our case suggests that residents of those communities judge the worth of those jobs by who would benefit. Jobs that are stigmatized by their close association with immigrant labor are rejected as being undesirable for locals and harmful for the community.

AMADASI, SARA* (University of Modena and Reggio Emilia)

The Relevance of the Interplay between Positioning and Narratives in the Study of Cultural Identity Negotiation in Classroom Interactions.

In the last decade, in the field of linguistic and sociological studies, positioning theory has been adopted to investigate classrooms interactions (e.g. Menard-Warwick 2008; Katz, DaSilva Iddings, 2009; Yamakawa et al. 2005)

Against this backdrop, this paper aims to focus on the operational interplay between positionings and narratives in interactions in intercultural classrooms.

In particular, the interest is directed on how the dynamism of these two concepts allows to study the construction and negotiation of cultural identity inside classroom groups in an institutional context.

By analyzing empirical data collected in workshops with children with migration backgrounds and experiencing frequent international journeys, I will focus on how participants engages at an interactional level and play with different available positionings and stories.

In particular, the interplay between positionings and narratives in communicative processes where multiple choices related to belonging and cultural affiliation are available, is relevant to reflect upon what children choose to reveal about their own personal experiences, their negotiations, and how they decide to employ these narrative choices in relation to the context and the interactional environment to show certain aspects of their cultural identity.

In this sense, observing identities' negotiation from this point of view, offers an insight into participants' agency and choice possibilities in contexts that present multiple but also conflicting and ambivalent opportunities. Culture, identity and belonging are therefore here observed as products of linguistic and interactional processes. This approach avoids and criticizes an essentialist understanding of these concepts which look at participants to a social event through the lens of pre-existent cultural features merely based on a specific national affiliation.

Informal Care Giving in Old Age : Exploring Opportunities and Challenges in Lagos State, Nigeria

Population ageing is a global phenomenon that portends great consequences for the elderly and their families. With modernization, globalization and formal education, the traditional care givers, women and adult children, are increasingly unable to discharge their filial responsibilities to their ageing relations. Thus, the roles and status of older people in the family are eroded. Unfortunately, the family is expected to cater for the welfare of older people in spite of the changing social and economic realities. While the family may be handicapped to discharge its duties, the State agencies are also grossly incapable of ameliorating the situations of older people because ageing is occurring within the context of poverty and falling state resources in Africa. Although there are enormous opportunities in informal care giving, such as bonding, dignity, reciprocity, there are equally challenges that constrain intergenerational relations depending on age, gender, health and social status. Similarly, filial obligations may be accepted but there are cases of conflicts, abuses and neglect which may compromise the quality of care and life of older people. This paper examines the roles of family members (spouses and adult children) in informal care giving, the effects of these roles on well-being of older people and the social cost of care giving to care givers. Using multi-stage sampling method, 1321 older Nigerians in Lagos State were covered to explore the opportunities and challenges inherent in informal care giving. Findings indicate that daughters provided both material and non-material support while sons provided mostly financial support. The benefits of informal care giving outweighed the challenges which buttress its importance and the need to boost informal support. Modernization and social exchange theories of ageing are adopted as explanatory tools. The paper concludes with recommendations that can improve informal care giving and enhance filial relations in Nigeria.

Exploring the Identities of a Madrassah Student in Canada: Navigating Constructions of the Menacing Muslim Man

Islamic Madrassahs have been painted as houses of terrorism and spaces for radicalization by Western discourses in the post 9/11 period. These discourses spread the continued misunderstanding of Muslims, their faith, and Islamic ways of knowing, creating a binary juxtaposition of Islam and the West, where the West is viewed as rational, humane, and developed, while Islam is inherently irrational, undeveloped and inferior. Similarly, Muslims are perceived as of two varieties: good Muslims and bad Muslims. Where good Muslims are rational, western educated and secular, while bad Muslims are irrational, extremist and

undeveloped. Consequently, Madrassah students fall under the categorization of the "bad" Muslim for their adherence to Islamic ways of knowing and being. Therefore, a "counterstory" narrative is required to empower and repair identities that have emerged from generations of dominant-group representation of Madrassahs and the students that attend them.

The lived experiences of Madrassah students are vital to the understanding of identity creation and management within a society that marginalizes their ways of knowing with fear-inducing narratives of extremism and terrorism. The literature available on Islamic seminaries focuses on issues of radicalization, terrorism, indoctrination, and extremism. These discourses ignore the lived experiences of the Muslims that attend these Islamic seminaries, as they have insisted on an implicit or explicit relationship between Islamic seminaries and terrorism, which has resulted in creating a generation of Islamic seminary students who are powerless to address the labels that have been imposed upon them. This paper explores how a Madrassah student negotiates his identities in a climate of Islamophobic narratives in popular media, as it constructs and reinforces the image of the "Menacing Muslim Man" through movies, television programs, and news stories. Understanding the lived experiences of Madrassah students can be an important means to dispel myths of a pervasive Muslim threat.

Sustainable Path and Social Justice: Case Study of Dange Dhangars and Katkaris in Southern Maharashtra and Northern Karnataka, India.

1. We can broadly classify the habitats of the tribal and semi-nomadic communities of the region into :
1) Thick forest habitats 2) Hilly and mountainous habitats and 3) Plains and Semi-arid rural habitats. By taking such a cultural- ecological perspective we can view Indian society as an Integrated one analogous to a biological community made of a number of socio-cultural groups.

Dange Dhanagars and Katkaris are two such indigenous communities discussed in this paper to illustrate the importance of taking a sustainable integrated path to ensure that growth with protection of natural resources ensures social justice to such communities.

Katkaris once a simple hunting and agricultural tribe who have been displaced from their forest base in Maharashtra and neighbouring states have settled in the interiors of forest in Karnataka. Their economic condition now is poor and they work as labourers.

The Dange Dhanagars a sub-territorial group inhabiting the forests of Western ghats of Radhanagari, Kolhapur district are in conflict with the INDAL aluminium project. There are positive and negative aspects of the effects of agricultural development and infra- structural development of roads, health and electricity.

This paper with the help of these two communities illustrates that the path of sustainable development will ensure the allround socio-economic development of indigenous communities and protection of natural resources and hence brings social justice to them .

Prenatal Sex Selection after Migration: Evidences from Italy

This study aims to explore sex ratio at birth (SRB) of migrants in Italy in order to shed light on the possible phenomenon of sex selection at birth. Recent studies addressed the same issue for migrants of Indian and Chinese origin living in Italy (Meldolesi, 2012; Blangiardo and Rimoldi, 2012). The study of Meldolesi was limited to the period of 2006-2009 and used data on birth records, while the latter study uses data from a 2011 survey of 700 women of Chinese and Indian origin in the Lombardy region.

Our objective is to go beyond these studies, analysing births from mothers with a foreign background, from countries where sex selection at birth is widespread and that are among the largest immigrant communities in Italy. The paper aims at assessing 1) if a skewed sex ratio at birth is observed among overseas communities; and 2) the possible factors affecting skewed SRB in the migratory context. When studying the phenomenon of sex selection before birth, it is important to stress that the SRB increases with birth order, as prenatal discrimination with first births is generally infrequent (Guilmoto, 2015). Prenatal sex selection is practiced for higher order births, while first and second births are often left to chance.

Preliminary results show that the sex ratio at birth is above the biological constant for the period 2005-2015 for births of Albanian, Chinese and Tunisian couples from the third child and Indian couples from the second child with a confidence interval of 95% above 105 (Ambrosetti, et al. 2017).

The study will proceed with a logistic regression model only for citizenship with imbalanced sex ratio at birth and with significant presence in Italian territory using different data sources linked together. The dependent variable is the sex of the new-born child.

Migrant Families' Assemblages of Care between Mobility, Immobility and Permanent Crisis

The presentation focuses on outcomes of an explorative empirical study of mobile individuals (and their transnational families) from Syria and Afghanistan who arrived in Germany during and after the 'long summer of 2015'. The central question addressed is: How do the transnational families of forced migrants secure the various forms of care and social protection despite their family members being located in different countries?

Synthesizing theories of care, assemblage and gender relations, the presentation introduces the concept of care assemblage, which makes it possible to approach forms of and barriers to migrant families' care organization at different analytical levels. Starting with an analysis of the micro-level of cross-border families, the paper shows that the organization of care among distant family members in the process of forced migration is best addressed as 'permanent crisis'. This 'permanent crisis' developed during the Afghan and Syrian movers' journeys to Europe and became the most dominant narrative in the course of their movements. These findings are framed by an analysis of the macro-level of institutional opportunities that shape forced migrant families' agency. The paper identifies institutional constraints imposed by the nexus of (multiscalar) asylum and family policies. Restrictions on family reunification were imposed in Germany in the spring of 2016. Along with the increased securitization of asylums policies, they contribute to the situation of 'permanent crisis' identified above.

In addition to the micro- and macro-levels of analysis, the concept of care assemblage considers the meso-level of cross-border solidarity movements, networks and migrant associations, which often function for migrant families as agents of transnational solidarity. By providing medical and other types of care, these actors become essential 'transmission devices' of care, particularly for members of transnational families who cannot themselves move.

The Language of Multiple Belonging and Legal Status: Reconstructing Intersectional Boundaries in the Process of Cross-Border Migration

This paper analyses the everyday positionings of migrants who live in Germany and who are affected by various categories of legal status. Building on the author's empirical research, it compares the everyday positionings of movers from Syria who have received refugee status, of Ukrainian migrants who have the status of third-country nationals (permanent residents) and of movers from Bulgaria who are EU citizens. This comparative analysis provides insights into the most relevant language constructs that interviewees used not only to present themselves, but also to negotiate the significance of legal status for the life projects ascribed to them by the institutional frameworks. To appropriately address the complexity of the interviewees' multiple positionings, the presentation combines intersectional theory (building in particular on Floya Anthias' work) with Michèle Lamont's concept of social boundaries to develop a theory of intersectional boundaries. The main advantage of this conceptualization is that it allows us to link analyses of the everyday language of multiple positionings to analyses of language labels used by institutions and organizations, which impact on the everyday positionings of (im)mobile individuals.

Portraits of Labour: Teachers' Work in Situations of Inequality

Public schools in South Africa are financed by the state with more funding allocated to historically underprivileged schools than those institutions which benefitted under apartheid. Unequal funding has not narrowed the gap between the haves and the have-nots as poorer schools cannot rely on parents to subsidize the employment of professionals to deal with the severe psychological, emotional, sociocultural, health and cognitive support that children require. The predicaments teachers face are related to issues of work including growing dissatisfaction with work conditions (heavy workloads and low salaries), and the growing attempts by the state to control teacher work in the wake of globalization.

Three questions framed the inquiry: I) What work do teachers' do? ii) How do teachers' perform their work? ii) What is the nature of teachers'work?

Two hundred teachers volunteered their participation in the study. Each teacher was shadowed for a day, followed by a semi- structured interview. Interviews were carefully transcribed and given back to participants for validation.

The findings revealed that the core work of teaching was displaced by emotional, social and psychological care work. The work was time- consuming, record-driven and assessment heavy. Teaching was interrupted by disruptions, disturbances and intrusions of various kinds. More time was spent on dealing with discipline and delinquency than on teaching.

The participants who worked in underprivileged schools took on the work that psychologists, social workers, school nurses and career and guidance counsellors should have done. The material conditions of the schools were debilitating for teachers. The work was intense, overwhelming, emotionally-charged and context-dependent.

It was apparent that attempts to undo the injustices of the past were paradoxical in nature. Inequalities were intensified in poor schools and working there was unbearable for many teachers.

Shrines and Their Role and Significance in the Cultural Landscape through Its Religious Festivals, Leisure, Recreation and Promotion of Integration-

Shrines are vital institutions of faith structure in the sacred geography of the world, therefore, given the emergence, significance and role of Shrines in the different socio-religious settings one can hardly afford to underestimate their vital role at the macro and micro level. Right from times immemorial the religious, social, cultural and leisure requirements of the communities and societies across the spectrum of faith structure are met by the institution of Shrines. The pilgrimage sites associated with different worldviews such as The Mecca, the Vatican, Jerusalem, Medina and the other significant pilgrimage centers like Varanasi, Haridwar, and Ajmer are frequented by the faithful and tourists in order to serve their religious and socio-psychological needs. By virtue of the religious significance the pilgrimage centers have emerged the vital source of mobility and social integration. The pilgrimage has an internal and external dimension which helps in the collective consciousness of the humans. The sacred institutions owing their origin to different faiths have offered numerous avenues of functions in shaping the behavior of the pilgrims as rightly called *communitas* by Turner. Thus the pilgrimage sites across the world have had a crucial role in the integration and coexistence of communities and societies cutting across their socio-economic, sectarian and geographical inequalities. The pilgrimage does not only serve the spiritual needs of faithful but enable the pilgrims and visitors to serve their socio-psychological needs. Thus role of pilgrimage sites need to be seen beyond the ritualization of faith as they continue to serve as the catalyst of integration, recreation and harmony.

Shrines in Socio-Psycho Perspective: A Case Study of Kashmir Valley

Kashmir is widely known for Shrines and pilgrimage centers of diverse faiths such as Buddhism, Hinduism, and Islam. With the onset of Islam toward the end of 12th century AD various shrines and tombs associated with different *Silsilas* (schools of thought) came into existence as a consequence of which Valley acclaimed a title of *Pir-i-Weird*; the valley of saints. Thus there is hardly any part of Kashmir where shrines and *Khangahs* are not located. These shrines have been the source of mobilization for all shades of life. The pilgrimage to shrines is an essential part of the religious behavior of the Kashmiri people. Thus social and behavioral aspects of pilgrims are to be explained in the context of wider cultural sphere which is enrooted into the customs, folkways and mores that have assumed a vital significance in the religious behavior of pilgrims. The ritual disposition at the shrine does not only help the pilgrims in gaining the religious-spiritual solace but as well the needs of socio-psychological nature. Given the increasing nature of personal and public troubles, these shrines have emerged as centers of healing. Therefore, ethno- methodological approach is relevant to seek empirical reality of the shrine visiting in the holistic manner. This paper would focus on gender, youth and aged in order to locate out the role of shrines in the everyday life of pilgrims.

Sociological Study of Iranian Female-Headed Households' Positions in the Rural and Urban Areas in the Last Three Decades (1986-2016)

Female-headed households are those women who manage their ménage in the drought of regular support of any adult male. Furthermore, according to the definition of "official statistical center of Iran" female-headed households have to undertake the crucial as well as vital decisions for surviving their family. Analyzing of this problematic issue is significant for these reasons: First of all, for the social, economic and psychological damages which these women have to encounter with. Secondly, the vulnerability of these groups of women and even destructiveness of them make their situation complicated. Third reason is the permanent poverty of them and finally, the sophisticated changed identity of these women caused by growing rate of their divorce beside the growing population of single women in recent decades.

A forementioned argument led us to examine the situation of female-headed households in rural and urban areas over the past three decades. Two phases were considered in order to achieve this goal: First, to study characteristics of female-headed households in the both urban and rural areas using secondary analysis and then to compare these two groups of women for recognizing their needs in order to make further plans and policies toward them.

Sustainable Happiness & Sustainable Development in Iran

Emotion is a relatively new substantive topic within sociology. Emotional attachments to others and affective commitments (e.g. desires, attitudes, values, moral beliefs) influence a significant portion of human behavior. The central thesis is that, emotions must be understood as the outcome of an interaction process between individual characteristics and aspirations on the one side, and social relations and macro social structures on the other side. Some of the emotions are positive like happiness, satisfaction and etc. Some of them are negative including sadness, sorrow, worry and so on. Focusing on the subject of happiness, this paper intends to evaluate the macro social conditions that reinforce or inhibit the emergence of it. Hypothesized that development indices (political, social, cultural and economic) are connected to happiness, I clarified the relations between development conditions in each province of Iran (31 provinces) and their residents' happiness. The method applied for conducting the research is secondary analysis of Iranian National Survey (2016). In a nutshell, I attempted to demonstrate the influence of the developmental indices on happiness based on the objective proofs in Iran

Selecting Intercultural Intimate Partners in the Late Modern Britain: The Case of Persian Immigrants

This paper discusses procedures related to Persians' outgroup partner selections in the United Kingdom. The first section explores the Persian traditional process for selecting a spouse, and compares it with the process followed by the 36 research participants selecting a non-Persian partner in the UK. To explain partner selection practices, I examine how most participants in this study are caught between traditional norms and their individual choices. Based on Smart and Shipman's (2004) argument, I explain how participants amended and changed the traditional norms related to partner selection. To explain why Persians chose partners from other social groups, I discuss a series of practical issues, such as obtaining UK citizenship and overcoming a lack of social acceptance in the host country. However and more importantly, I analyse the parts of the Persian cultural identity that participants were in conflict with, which mainly revolved around gender constructs and relations. Finally, based on Hall's (1990) notion of cultural identity, as well as Bhabha's (1994, 1996) concept of hybridity, I explain how Persian 'inbetweeners' look for those closest to their adapted position on the continuum of cultural identity –people with Irish descent for example. The final section highlights the importance of Persian family values when selecting a partner, and elucidates the role of the emotional dimension of relationships for Persians, which appears to be important when choosing a partner, despite differing from what Giddens (1992) describes as 'the pure relationship'.

The Strange Career of Occidental Citizenship - Patrimonialism and Cities

The strange career of Occidental citizenship - patrimonialism and cities
Meir Amor

Was Weber's occidental citizenship theory a Euro-centric prejudice? One can argue that modernity's hallmark is citizenship. Conventional wisdom traces citizenship to "state of nature" argumentations, to social contractarianism and to Enlightenment thinkers. Classical sociologists hardly developed a clear notion of citizenship. Marx - in his well-known debate "On the Jewish Question" - regarded political emancipation as falling short of human emancipation. As a result, citizenship did not play a central role in Marxist scholarship as an emancipatory effort and goal. In contrast, Weber's analysis of citizenship is hardly known or discussed. In this regard, Weber's article on citizenship is unique; and, it towers above other classical renditions of citizenship's perceptions.

Cities, according to Weber, played a crucial role in the development of occidental citizenship. Patrimonialism was a hindrance not only to cities' development but also to citizenship's progression. The fact that "the army of the prince is older than the city" had tremendously important significance in the development of a seemingly unrelated world phenomenon: citizenship. Hence, patrimonialism - or in other well-known appellation such as "Oriental despotism" - rooted in the hydrographic imperial ruler-ship, had a decisively negative impact on cities' development and on city-dwellers' ability to become independent political players. Such unique developmental trajectory has occurred in the Occident. However, occidental citizenship was also related to general economic as well as to religious circumstances and conditions. Weber's occidental citizenship theory presents a historically breathtaking synopsis of materialist as well as cultural conditioning of citizenship. The mode in which economy and society intertwined in such cities, could have no better demonstration than the probable but strange career occidental citizenship has developed.

An Approximation to a Self-Organizing Computer Program Addressed for Social Complex-Projects.

A good approximation to a "Self-organizing cybernetic program addressed for Social Complex-projects" (Complex-projects in the realm of the social sciences), grounds itself in being attentive and observant of the transition and stable states of a system. The general organizational model of a system derives from the general model of a cell: membrane, organelles and nucleus. This is equivalent to building a vast mechanism of assimilation by means of observables, with a permanent empirical and reflexive abstraction of the organelles that integrate the information into the operational closure of the system - the nucleus, and with a strong generalization of the principles, all of which derive into a -wide margin range coupling- with the surroundings of the system. The assimilation, abstraction, generalization and accommodation processes must be in permanent transformation in order to adapt with the environment and therefore organize the working plan of the system.

The cognitive processes that have been addressed come from Jean Piaget and conform a *functional-structure*. Jean Piaget was a systemic epistemologist that participated since the 1960's in the general principles of Socio-cybernetics. The "Self-organizing cybernetic program addressed for Social Complex-projects" which we will call "Adaptive System for Social Analysis" (ASSA) known for me as "SIAAS" due to its Spanish description "Sistema Adaptativo para el Análisis Social", has been used in several projects developed at the UNAM, México (Mexico's National University). In this article we synthesize the principal criteria used for the assimilation of observables, and the abstraction / generalization expressed in graphic and text accommodations that have been applied in various social projects. We consider that Piaget's epistemology can be of great help in or as part of the Socio-cybernetic's general strategy.

Violence, Criminality and Human Rights: From Restorative Justice to the Dignity of the Human Person

Globalization generates a network of power and control over the importance that knowledge and information have in a world context. With that in mind, in a post-modern society, with pluralities and yearnings, there's a need to regulate, through norms, the appropriate behaviors to the social coexistence. The control

aims to shape, through mechanisms, the acting exercise to avoid the misbehavior of a conduct, such as crime. An example might be criminal law, which's goal is to protect the fundamental rights of the individuals and society's, basing itself over a criminal policy of protection of said fundamental rights. Insofar, in a transforming society, the conduct's deviations are inevitable, and, as a consequence, the criminal conflict. Aside from that, despite society's reliance's over a retributive and verticalized criminal justice, violence and criminality have increased in a considerable way decharacterizing on how one deals with crime, if the punishment fits the crime, or if that's enough to maintain social order. Therefore, it was inevitable to create a criminal justice model that brings efficient and adequate results to combat criminality. On that note, Restorative Justice's arises as a new way to analyze crime, based on dialog, change, prevention, and, most of all, on the respect to human dignity. Restorative Justice's purpose is not the crime, per se, but the individual and social's consequences as well as the relations between the actors (victim, perpetrator, community). From that premise, the model of criminal justice utilizes a participative democracy to emphasize the benefits of consensual resolution, from the minimum intervention to the development of Restorative practices to offer a response to the crime based on human dignity, equity and social harmony, proposing not the substitution of the system, but a complement to the effectiveness of justice and human rights.

Incarcerated Minors and Their Health: The Lack of Data and the Risk of Institutional Stigmatization.

In 2015, the French ministry of health proposed to launch a study on a very small population, the incarcerated minors (which represent no more than 800 minors at a given moment). The question was to document the behaviour, knowledge and representation of that population in respect of HIV (and other STIs), contraception, consent, and other matters relating to their sexuality.

In order to answer this question, we decided to realize a qualitative study, based on in-depth interviews with 72 youths incarcerated in 5 French prisons. We assumed that this question was best addressed qualitatively, because of the lack of knowledge about the health and sexual issues in this population, and because of the characteristics of this youths, often dropouts, and not very familiar with the exercise of the questionnaire which could be seen as a police interrogation.

Indeed, the only studies about youths and sexuality were conducted on youths in school, whereas the young we study are often dropouts from school before their entry into sexuality. Then, the design of our study reveals the need of data collected qualitatively on such vulnerable populations. This choice could also be problematic, because it supposes that the population we are studying is "specific", in a context where these youths are sometimes considered as "deviants". Our results suggest that these youths are relatively similar to others, referring to their sexual behavior, knowledge and representations, though their living conditions impact in some ways their entry into sexuality.

In this paper, we propose to deal with the restitution of the sociological knowledge produced about invisible youth populations, to official institutions which tend to stigmatize them as "specific" or deviant "population". Finally, our study highlights the need of rhetoric precautions in order to account the complexity of their situation and to avoid miscalculated judgments about them.

AN, MI YOUNG* (School of Public Administration and Public Policy, Kookmin University)

Gender Division of Housework Among Couples with Preschool Children in Welfare States: The Good and the Bad in Social Investment Approach

Social investment approach to social policy has increased redesigning gender and family in relation to welfare states. This article examines how the approach is related to gender division of housework. It first discusses how the institutional arrangements may be pertinent to the micro level of gender stratification. It discusses differences in social investment approach to family policy across welfare regime which are importantly related to relative resources for bargaining power and attitudes on gender roles. Second, it analyses International Social Security Programme Survey on Changing Families and Gender Roles 2012 for fifteen welfare states. Preliminary results show that mothers' relative earning power is found to be positive for equal division of housework in social democratic, conservative and liberal regime. By contrast, attitudes on how mothers (women's) employment affects child's development and family life as a whole found to be important for the familialistic productive regime in East Asia. Based on findings, this article contributes to the (ongoing) debate on social investment, with

empirical evidences on gender division of housework in comparative perspective. The good in the social investment addresses familial tension between husbands and wives about who should be breadwinning. The bad is that tensions with regard to women's choice (perhaps preference) for (continuous) employment and children's development, and family life as a whole are sidelined although if not took for granted.

#Cordillerahistoryandculture, Contestations and Affirmations: Content Analysis of Facebook Comments on Cordillera History and Culture

The proliferation of social media has made knowledge generation and dissemination easier and more accessible to people. However, the vulnerability of posting unreliable news and media has also become a problem. While there are a lot of studies on the increased presence and circulation of unreliable user-generated content, the interaction and insights of Facebook users engaged in certain posts, problematic or not, are not yet fully analyzed. One of the pressing issues relating to this is the engagement and interaction of people on posts that involve historical and cultural artifacts. In particular, there are a lot of debates between users, contexts and behaviors when historical and cultural media are posted because of contested truths and differences in knowledge and understanding. The researchers conducted a content analysis of the 'comments' made by Facebook users on posted images relating to Cordillera culture and history to understand the patterns of interaction and engagement. Data mining was conducted and followed by qualitative and quantitative analysis. This research provides empirical insights on the understanding of Facebook users' insights on Cordillera history and culture. These insights may then be used in identifying focus areas for academics in relation to instruction and research.

The Dance Club As a Sociocultural Landscape: Hybridity in Music, Culture and Place

This paper narrates the presence of syncretism in the music, dance and culture seen in live music clubs in Baguio City, Philippines. This syncretism is characterized by a hybridity of practice relating to the traditional/modern music and traditional/modern dance dichotomies. This trajectory is a reflection of the socioculturally pluralistic character of the city, which also contributes to the making and re-making of the club as a 'place'. The syncretism is exemplified in two kinds: First is the entanglement of Cordilleran songs or beats played by bands playing electric instruments while the audiences perform rave dance at the dance floor; and second, the performance of the indigenous Cordilleran dance steps (*tayaw*) to the tune of modern rave/dance or pop songs played by the band. This is particularly seen and experienced in homegrown local clubs, but not in urban dance clubs. In essence, this scenario shows that dance clubs in Baguio City reflect a cross-cultural experience while maintaining a sense of place and cultural identity.

ANANE-BEDIAKOH, BEATRICE* (*York University*)

The Wall and the Border: The Project of Black and Indigenous Expulsion

In conversation with Razack's (2002) conceptualization of how space becomes raced through law, this paper highlights how the constitution of spaces reproduces racial hierarchies, exploring how spatial practices are required in the making and maintenance of a post-racial society. Under the regime of neoliberalism, through the politics of everyday terrorism, cruelty and zones of disposability, bodies have become naturalized borders of social conflict, negotiation and violence. This paper engages with the social expulsion of Black and Indigenous bodies and the myth of "degeneracy" that is often plagued with these particular communities. By examining the reality of Black and Indigenous bodies as "unproductive", this paper aims to examine how the micro politics of space, determines the [in]ability to read these bodies as part of the nation state. Despite the outright physical extermination of Black and Indigenous communities, their survival compels capitalist regimes to reconsider what it has spent centuries invisibilizing –the violent nature of its system. Bodies as naturalized borders, constitute a hallmark signature and amplification of neoliberal politics of disposability, uncovering the material and symbolic violence of the nation in the sustenance of the White settler state.

ANASTASI, MATTEO* (*LUMSA University (Rome)*)
LUPPI, ROBERTO* (*LUMSA University (Rome)*)

European Nations and the Olympic Games: Solidarity or Antagonism? from Athens 1896 to Barcelona 1992

"The practice of sport is a human right. Every individual must have the possibility of practising sport, without discrimination of any kind and in the Olympic spirit, which requires mutual understanding with a spirit of friendship, solidarity and fair play"

The fourth principle of the Olympic Charter summarizes the widespread belief that the values of friendship, solidarity and fair play should characterize the practice of sport and, especially, the modern sporting event *par excellence*, the Olympic Games. These Games combine these values with an additional aspect: that of universality. Internationalism was, in fact, one of the beliefs of Baron de Coubertin, the creator of modern Olympics, and found its graphic representation in the symbol of the Games: five intersecting circles signifying the creation of bridges between cultures and peoples.

Unquestionably, the Olympic Games have increased contacts among nations. It is more difficult to say whether these exchanges have contributed to the cause of internationalism, understood as the increase of solidarity relationships among countries. The paper aims to analyse precisely this question, in particular: is it possible to claim that the modern Olympics fostered the development of international solidarity among nations? And if so, did they contribute only to the reinforcement of pre-existing dynamics or have they served as a catalyst for developing new relations, perhaps opposing previous trends?

In this regard, the article examines five Olympic Games, which can be considered a microcosms of the international relations of their period: Athens 1896, Berlin 1936, Rome 1960, Moscow 1980 and Barcelona 1992.

The paper circumscribes its analysis to only the relations among European countries, since, in the 20th century, these nations were involved in major upheavals (World Wars, Cold War, the process of European integration), which make it a fruitful starting point for examining the influence of the Olympics in international relations.

Transnational Families across Africa Constructions of Family Networks between Morocco and the Other African Countries

Transnational Families across Africa Constructions of Family Networks Between Morocco and The other African countries

The notion of family is never regarded as homogeneous. The cross-cultural mobilities among south-north syndrome threaten the predominant configuration of home and family in its traditional ways.

Globalization has forced the new diasporic to belong elsewhere: a place where stability is motivated. Taken these new contemporanities, it is demanded that new approaches must be reconfigured so as to measure how new familial alterities affect to a certain degree the homogeneity of traditional definition of family.

To this end, the aim of this paper is to delve into questions of home and family in their transnational context. In so doing, I would like to shed light on the new transnational families and how these new modes of belonging help in deconstructing the segments of social relations in one's constructed home. It will also help in enforcing the aspect of Benedict Anderson's view of the communities as imagined.

Metrics for New Perceptions and Representations of Sustainability Issues

In an attempt to critically assess the accountability of metrics posed by bureaucratic modes of environmental governance special attention should be given to projections of fair environmental (planetary) boundaries on the imperative of economic growth, given its severe burden on the environment and the basis for future social reproduction (D'Alisa et al. 2014). From the sociological perspective, it is of special interest to have insights in knowledge creation and alternative processes of redefining problems that can be found within the expanding concept of *degrowth*. This concept underlines that degrowth should be a voluntary transition towards a just, participatory, and ecologically sustainable society with the necessity of developing new non-monetary indicators to assess the achievements of the proclaimed degrowth goals. The conventional metrics assumes uncontested perceptions and representations of sustainability challenges which is under criticism of the degrowth thinkers. In our presentation

we use the arguments that “crunching numbers” first, in a way of re-evaluating old metrics and exploring new metrics, is a mode of achieving novel perceptions and representations of sustainability issues (Giampietro, Mayumi, Sorman, 2012.). As Meadows accentuated, “we measure what we care about” and “we care about what we measure” or in other words, changing the metrics can be one of the most powerful and easiest ways of making system changes (Meadows, 1998). The aim of our paper is to improve the understanding of “the social context” in which environmental degradation occurs through combining of various indicators in the web of societal-biophysical analysis from which the socio-ecological transition posed by the degrowth goals could be measured. Empirically, we connect different aspects of the material flow, comparative developmental attainments and prevalent social attitudes. We employ survey data on representative national samples over the past 5 years and set it against the comparatively advantageous biophysical funds and flows.

A Comparative Study of Attitudes Towards the International Security Assistance Force (ISAF) in Afghanistan in Five European Countries

This paper looks at determinants of attitudes towards the International Security Assistance Force (ISAF) mission in Afghanistan and compares findings between five European countries, Germany, the United Kingdom, Italy, the Netherlands and Poland.

We approach the topic of support or disapproval of military missions from an attitudinal standpoint using Ajzen and Fishbein's Theory of Planned Behavior. Taking the hierarchical nature of attitudes into account, we look at more diffuse attitudes about the role of the country's military as well as specific beliefs concerning the ISAF mission to explain overall support for it.

Our analysis of random population samples conducted by telephone in summer and fall 2016 in five European countries (each n=1000) sheds light on different causal explanations of support for the military mission in the various countries. We use multigroup SEM, taking measurement equivalence into account, and draw attention to concerns regarding the generalizability of research findings in terms of:

1. testing the application of 'universal' theories in specific countries or subsamples
2. replicating studies at later points in time
3. the tenability of results even of 'representative' surveys and the need for more replication studies

This paper provides grounds for discussing the issue of generalizability and the testing of 'universal' social theories as well as presents substantive findings regarding the explanation of public support for the ISAF mission in several European countries. As such, it should provide for a better understanding of the country-specific generation of public opinion.

GIEHL, CHRISTOPH (*TU Kaiserslautern*)

Replicating Findings Regarding Attitudes Towards the International Security Assistance Force (ISAF) in Afghanistan in Five European Countries

This paper looks at determinants of attitudes towards the International Security Assistance Force (ISAF) mission in Afghanistan and compares findings between five European countries, Germany, the United Kingdom, Italy, the Netherlands and Poland. It replicates a 2015 study by Jedinger and Mader and focuses on the generalizability of their findings which were based solely on German public support for the mission.

They present an attitudinal theoretical approach based on Ajzen and Fishbein's Theory of Planned Behavior for understanding public support or disapproval of military missions in general. From a random population survey conducted in Germany in 2010 they found generally weak direct effects of more diffuse security related predispositions on attitudes towards the German military's involvement in the ISAF mission in Afghanistan. Attitudes towards the mission were most strongly predicted by specific beliefs about the prospects of the mission's success.

We test a replication of the casual model using a structural equation modeling framework. In a first step, we attempt to replicate the model one-to-one using manifest indicators just as the previous authors did. Second, we expand the model to include latent constructs and measurement equality between countries. Our analysis of random population surveys conducted in five European countries thus touches on issues of replicability in terms of:

1. temporal intervals between the replication of studies,
2. country differences,

3. methodological issues including latent constructs and measurement equality.

This paper provides grounds for discussing the issue of generalizability and the testing of 'universal' social theories as well as presents substantive findings regarding the explanation of public support for the ISAF mission in several European countries.

ANDERSON, ANNA* (*University of Liverpool*)

A New Conceptual Tool for the Sociological Study of Voluntary Risk-Taking

Despite the innovation and usefulness of the edgework perspective, not all voluntary risk-taking is edgework. This paper outlines the analytical promise of a different concept we can use as a theoretical tool for the sociological study of voluntary risk-taking. The contention is that this different concept can help us to identify and examine another of the forms of voluntary risk-taking. Deployed as a theoretical tool, it allows us to examine the importance for the individual and for the society of voluntary risk-taking practices when they assume an explicit and deliberate socio-political and ethical form, role and manner. A number of empirical examples will be used to demonstrate the potential analytical purchase of the concept. The paper will conclude by raising the prospect that this different concept can open up an unexplored area of investigation for the sociological study of voluntary risk-taking.

Evaluating Alternative Policies and Actions to Avoid Global Catastrophes

The first half of 2017 has tossed the world order into a new set of vulnerabilities not previously experienced. The world has been previously threatened by high risks of nuclear war but not simultaneously with giant storms generated by rapid global warming. All out nuclear war and climate catastrophes produce such devastating damage and death that humanitarian considerations give these threats highest priority for preventative measures. In other words, the suffering from these possible future events is so terrifying that measures to curb the probability of future disasters are critical for present day decision-making.

In addition to such malaise and risk of catastrophic suffering, there are a number of existing major sources of societal malaise such as racism, inequality, poverty, hunger, and disease. Using world surveys, I take on the challenge of identifying and prioritizing both of these types of catastrophic sources of disorder. This pioneering work aims to avoid stagnation in the social order and collapsed social institutions. The importance of tackling this challenge is based upon the fact that society faces serious risks of societal extinction. Therefore, improvements in public policy-making demand new urgency. Once solutions have been charted for global chaos, preparations for local disasters may be more obvious.

ANDERSON, RONALD* (*University of Minnesota*)

Global Decline in Affective Well-Being

Advances in international development require better methods for evaluating both procedures and outcomes. The need to carefully track human progress mandates that we develop better ways to assess outcomes and to link them back to development and other action programs. As this report demonstrates, greater accuracy in monitoring well-being depends upon improved measures of negative well-being such as suffering and the ongoing experience of negative emotions. Such an approach may give a very different view of the world than that provided by global economic indicators alone. Without better systems for monitoring changes in negative well-being, we lack the tools needed to shape human destiny.

Based upon the Gallup World Poll data used in this study, suffering and other negative experiences worldwide have been slowly increasing during the past decade, despite positive economic global growth. One way to characterize these findings is that the benefits of global economic growth have been overwhelmed by harmful forces such as ethnic conflicts, the so called 'war on terror,' widespread armed conflict and the resulting refugee crisis. Another culprit is the rising inequality of income and wealth. In a world where those trapped in poverty produce the highest population growth, any forces such as inequality of power, income and even suffering contribute to increasing negative well-being.

These findings lend support to international post-development and related theories that emphasize the importance of social forces other than economic growth. Positive well-being and the economic indicators remain flat across the past ten years, but negative indicators mostly have gone up. The global decline in well-being appears primarily among indicators of negative well-being. This finding calls into question the conventional wisdom that world poverty has been rapidly declining and global well-being rising.

RC03-69.8ANDERSON, SIMON (*Independent research consultant*)BROWNLIE, JULIE* (*University of Edinburgh*)JAMIESON, LYNN (*University of Edinburgh*)*Slow Solidarities*

There have been calls to rethink our understandings of what violence and power look like, including Nixon's idea of slow violence (2011). In this paper we argue that we need also to broaden our conceptualisations of solidarity and resistance. Drawing on a large, qualitative study in three diverse neighbourhoods in Glasgow, Scotland, this paper introduces the concept of 'slow solidarities' to call attention to some of the incremental and accretive practices of everyday life - small, unobligated practices of care and support that help to create 'kin' where no blood tie exists and to counter narratives and practices of 'othering' that might otherwise hold sway. It explores how such solidaristic practices and relationships come to happen (or not) and the way that these might complement more collective forms of resistance to 'slow violence', such as those associated with social movements. And it embeds this analysis in an avowedly relational sociology, recognising that discourses associated with our imaginary relationships to strangers - whether antagonistic or solidaristic in character - are not typically independent of everyday embodied interpersonal relationships and are often bound up in the relational practices of family or friendship groups or both. We suggest that focusing on the everyday, the emotional and the relational, conceptually and empirically, add to our understanding of a 'politics of perception' (Barnwell, 2017) which can both reveal and disguise social inequalities.

Barnwell, A. (2017) Durkheim as Affect Theorist *Journal of Classical Sociology*: 1-15

RC39-687.2ANDHARIA, JANKI* (*Tata Institute of Social Sciences*)*Intersectionality and Transdisciplinarity in Disaster Studies*

Disasters are often viewed as de-politicised events requiring technological interventions to prevent, mitigate or predict them. The idea of intersectionality in disaster studies challenges instrumental rationality of disaster "management", essentialism, categorical purity and classificatory tendencies. It emphasizes the need to pay attention to the logic with which concepts in disaster management are socially constructed and how they operate within power structures and create new ones through social and institutional processes, embedded within the language of disaster preparedness, response and recovery.

Secondly, what does the space of post disaster recovery look like? The paper aims at a critical re-reading of post disaster recovery and ideas of spatial justice by examining concepts of hybridity and Soja's (1991) Thirdspace. These "displace the histories that constitute it, and set up new structures of authority, new political initiatives. The process of cultural hybridity gives rise to something different, something new and unrecognizable, a new area of negotiation of meaning and representation." (Rutherford, 1998).

The paper explores Soja's (1991) Thirdspace as a radically inclusive concept that encompasses epistemology, ontology, and historicity in continuous movement beyond dualisms and toward "an-Other". "Thirthing produces what might best be called a cumulative trialectics that is radically open to additional otherness, to a continuing expansion of spatial knowledge. The paper will examine "the rebalanced trialectics of spatiality-historicity-sociality" in the context of post disasters relief and recovery processes. The paper seeks to examine an understanding of how meaning is generated, disseminated, contested, bound up with systems of power and control and produced from the social, political and economic spheres within particular social formations.

Problematising the dominant models of relief and recovery, propagated through powerful multilateral institutions, the paper would examine issues of power, local political struggles and how these inform disaster governance and disaster management practices.

RC11-228.2ANDO, KIWAMU* (*Nagoya City University*)*The Compressed Grandparenthood in Japan: The Influence of the Change of Social Policy, Low Fertility Rate, and the Lack of Social Pathway of Long Grandparenting*

This study aims at revealing today's compressed grandparenthood in Japan analysing both quantitative and qualitative data. In spite of the long grandparenthood, the change of Japanese welfare policy, its low fertility rate and the lack of social pathway of long grandparenthood have made it difficult for grandparents to enjoy the long-running relationships available in terms of demography. In other words, now the Japanese grandparents are consumed

excessively as informal and inexpensive carers at their early stage of grandparent trajectory.

The quantitative data is a random sample collected in 2016 containing 906 respondents living in two metropolises. The qualitative one was obtained in 2015 and 2016, including 41 respondents residing in large and small cities. The multilevel analyses based on the quantitative data show that those grandparents caring for their grandchildren on a daily basis are more likely to refer to their fatigue and lower significance of grandparenthood, compared to those who are not "mother saver." The finding based on the qualitative data is that even "mother saver" grandparents do not expect the close relationships with their grandchildren to last for a long time, although they devote themselves to the caring role sacrificing their occupational carriers, volunteering, community involvement, hobbies, etc.

The results were related to the embeddedness of today's Japanese grandparents into the changes of social policy and demographics from mid-1970 to the present. It was also pointed out that the grandparents, facing the difficulty to project the image on the relationships with grown up grandchildren, concentrated themselves on the early phase of grandparenthood and relinquished their social resources which could be useful for the meaningful relationship with adult grandchildren.

Finally, it was suggested based on the qualitative data that the new communication form between grandparents and grandchildren using ICTs might make a breakthrough in the compressed grandparenthood problem.

RC06-135.8ANDRADE, DARLANE* (*FEDERAL UNIVERSITY OF BAHIA*)*Digital Technology and Intimacy: A Study with Single Adults in Brazil*

This communication aims to present and discuss data from the research "Studying singleness: the use of communication technologies by singles in Salvador", held at the Federal University of Bahia. The objective was to explore opinions and practices in the field of intimacy mediated by digital technologies, specifically the apps Tinder, Happn and Grindr, used by single men and women, adults that belong to middle classes in Salvador, Brazil. This study was based on a feminist perspective and used gender as a category to analyze the data, intersectionalised with those of sexual orientation, race/ethnicity, age/generation and social class (specifically, the urban middle class). A qualitative methodology was used, with the instruments: a semi-structured interview and netnography with observations, conversations / chats on the apps Tinder, Happn and Grindr that were registered in field diaries. The interview was made with 126 participants of both sexes, 69% of single men and 31% of single women, aged 18 to 42 years. Among the sample, 45, 2% identified themselves as non-heterosexual and 54% as heterosexual. 41, 3% identified themselves as mixed color, 33,3% as black, 18,3% as white color and others, 7,1%. All of the participants lived in middle class neighborhoods in Salvador and have college education. In this communication it will be presented data regarding to the dynamics of the apps, the characteristics of the participants, the uses that they made of the apps, discussing practices in the field of intimacy, considering gender, sexual orientation and race differences. The challenges faced for conducting research in the field of intimacy using digital technology, will also be presented, including negative experiences related to sexism and racism experienced by the students who collected the data.

RC03-80.1ANDRADE, LUCIANA* (*Pontifícia Universidade Católica de Minas Gerais*)*New Expressions of Resistance and Community Organization in Neighborhood Contexts.*

This article analyzes the experience of association of residents (Salve Santa Tereza) of an old neighborhood (Santa Tereza) in the city of Belo Horizonte. This association has been acting for the protection of the neighborhood against the opposing forces, private and public. The interests of the real estate market, together with the permissiveness of the state, have radically transformed the landscape of the capital of the state of Minas Gerais (Brazil). The city, once placid and horizontal, is now populated with skyscrapers. The group opposes the mercantile attempts of the city's current administration, which have abandoned the participatory forms of public management for the adoption of business management. Among the activities of this movement, the article will address two practices currently under way: the horizontal assemblies that take place in the central square of the neighborhood on Mondays to discuss matters of interest to the neighborhood and the movement to defend a neighborhood market (Mercado Vivo). The city government closed the old market with the intention of offering it to the private initiative and for which the movement demands a participative management with local producers and artisans. It will also address the coexistence in the movement of different generations, as well as the resistance it arouses in other neighborhood groups with different visions and interests. The assemblies are held in function of diverse themes that interest the neighborhood. The mobilization around the Market, happens at different times and due to the progress of negotiations with the city or the mobilization and awareness

of the residents. Before these two experiences, the article will contemplate the protection of the neighborhood as a city's heritage in 2016, a result of the local mobilization. This work is part of an ongoing research project since 2016.

Conceptualizing an Institutional Ethnography Contribution to Education's Use of Improvement Science

There is a long history of reforms in U.S. public education that have not always resulted in effective, sustainable change. Administrators and teachers/faculty are well-intentioned in trying to bring about more equitable outcomes however they often encounter organizational processes and practices that stunt the local work they are trying to do. Recently, some educational leadership programs have advocated for the incorporation of "improvement science" into professional educational doctorate programs. Improvement Science focuses on two different types of knowledge: basic knowledge of the discipline (in this case education), and a "system of profound knowledge" (Langley et al, 2009) drawing from sociology and other disciplines to understand organizations and complex systems. One of the features of improvement science are the questions that practitioners ask to drive their improvement work: 1) What are we trying to accomplish; 2) How will we know that a change is an improvement; and 3) What change can we make that will result in improvement? While these educators are studying various data at local sites, planning change and so forth, missing in their initial questioning of the problems and issues they attempt to address is the foundational question of Institutional Ethnography, "How does it happen?" In this case, "How do the inequities you want to address happen?" should be asked before considering what kind of change would be an improvement. This paper will examine improvement science in use in doctoral study and then conceptualize how Institutional Ethnography can expand theoretically and methodologically, the ways in which educators in professional doctorate programs can study problems of practice. Drawing on the work of institutional ethnographers Smith and Turner (2014), Griffith and Smith (2014) and Pense (2011), the paper brings Institutional Ethnography into conversation with those in education who are exploring improvement science as part of the organization of schooling.

ANDREEV, ANDREY* (*Institute of Sociology, Moscow*)

Post-Christian Europe and Modern Russian Identity

For the Russians the relations with Europe are not purely pragmatic ones. They are deeply rooted in the core of Russian identity. Up to recently the majority of the Russians were strongly attached to a European perspective for their country. Being asked a question "Should the Russian Federation aspire to the integration with the EU?" the majority of the people (52 %) in 2002 answered "yes". The opposite view expressed only 35 %. But since then this ratio has inverted. This change has multiple causes, but it is evidently related to the religious background. Russia differs from Europe not only because it historically belonged to another branch of Christianity, but also by the attitude to religion as such. The level of religiosity in modern Russia is lower than in Poland, but much higher than in Western Europe. According to The polls (2016) about 69% of Russians certified themselves as adherents of Orthodoxy, while the proportion of atheists amounted to only 11%. Accordingly, post-Christian Europe, whose values are increasingly divergent from the Christian understanding of the meaning of life and the Christian model of the family, is causing increasing rejection among Russians. In fact, Europe has nearly lost the central position which it occupied in Russian worldview since Peter I. By now this central position seems to be captured by CIS. In 2002 the index of positive emotional reactions to the word "European Union" among the Russian respondents was about 60 %, while in respect to the word "CIS" that index was only 34 %. Since 2002 both figures upgraded. But if in the first case the growth was approximately 6 %, in the second case the index grew twice. These and some other empirical data witness that nowadays the European identity of Russia probably changes to Eurasian one.

Startups – Remedy or Damage to the Economy? Analysis of Startups in Poland

Startups are usually placed reductively in the sector of digital economy, often specialize in information processing and related technologies that comprise their key business model (digital native). Startup as a concept is usually equated with a new business venture, for example in the IT sector. According to one of the report, Poland has about 3 thousand startups. However, the number of initiatives, accelerators, incubators and all kinds of support for startup development is increasing. The government, business, private investors are putting a lot of effort to create 'Polish Silicon Valley'.

The goal of the proposed work is to understand the operations of startups in the conditions of Poland's capitalist. The Poland's capitalism is extraordinary approach to economy, where parallel experience post-socialist transformations are confronted with phenomena late capitalism and post-Fordist societies. The key question is: startups could be remedy or damage to the economy in Polish conditions of capitalism.

The author is also attempt to understand attitudes of Polish startup entrepreneurs in relation to the responsibility of their businesses, as well as to know about the potential of such enterprises to solve social problems and to participate in creating a social and economic value. The proposed study needs to build the defining framework and analyse the startup community in Poland. It is expected to provide answers to the following questions: What are the conditions for the growth of startups? What kinds of barriers to growth are faced by startups? This objective will be based on specific objectives related to such aspects as: analysis of socio-economic determinants of startups in Poland (identifying favorable factors and barriers) and defining the mentality of startups, ie attempting to construct a startup entrepreneurial portrait.

The empirical part of the presentation will comprise the following: qualitative study delivery (IDs), analysis of case studies.

"Put Some Sugar on... You": Negotiations of Sexual Capital Among Sugar Daddies and Sugar Babies in Online Spaces

Drawing on a sexual fields framework (Green 2014), this paper examines sexual and romantic relationships in the current digital age. Specifically, we draw on a case study of men who solicit sexual/romantic partners online to be "sugar babies," as well as people looking for "sugar daddies" and "sugar mommas," and how they negotiate their sexual capital in online spaces. In our contemporary erotic sphere, online spaces, such as Craigslist, serve as important sexual arenas where people can pursue potential sexual/romantic partners that satisfy their interests while remaining anonymous. Few studies to date have empirically looked at the negotiations of sexual capital within digital sexual fields specifically, and thus, this project focuses on how a group of individuals soliciting a "niche" form of intimate relationships in online spaces present their sexual capital in ways that might increase their chances of partnering with their idealized partner(s).

Through a content analysis of solicitations by "sugar daddies" and "sugar babies" on Craigslist's 'Casual Encounters' section (n=190) in a major urban city in Canada, we found straightforward descriptions of ideal partners that bring to view hierarchies of sexual capital in which certain ages, body types, sexual identities, behaviours, and so on are privileged over others. This paper contributes to the sociology of sexualities and technology by expanding Green's sexual fields framework to form a theory of "digital sexual fields". In doing so, we highlight how current theoretical, methodological, and analytical frameworks can be reimagined to understand online spaces as cultural arenas in which people's romantic and sexual lives are negotiated.

ANDREOTTI, ALBERTA* (*University of Milan-Bicocca*)

ANSELM, GUIDO (*University of Milan-Bicocca*)

HOFFMANN, CHRISTIAN (*University of Lipsia*)

Sharing Economy Platforms and Reciprocity: A Controversial Relation

Major services currently dominating the 'Sharing Economy' are based on online platforms employing reputational algorithms to facilitate user interactions. These reputation algorithms contribute to building relations and interconnectedness among users, as they can provide a modicum of 'trust between strangers' (Botsman and Rogers 2010), signaling potentially unpleasant interactions. However, it remains unclear whether relations facilitated by reputational algorithms can evolve into long term reciprocal relations, able to improve the emotional wellbeing of users, to provide stable support networks and, eventually, nurture a feeling of community on the sharing platform.

Sociological literature provides conflicting accounts: on the one hand, empirical studies on the early stage of sharing platforms (Botsman Rogers 2010, Parigi State 2014) have outlined how sharing activities may help users to build reciprocal relations. On the other hand, contemporary sharing platforms have become increasingly professionalized and 'mainstreamed': operated by 'unicorn' corporations, accessed through mobile apps and staffed by semi-professional 'gig-workers' (Schor and Atwood-Charles 2016, Scholz 2017). Moreover, even in the case of more community-minded platforms, such as car-sharing ventures, users are often unable or unwilling to interact with other sharers (Bardhi and Eckhart 2012, Belk 2014), opting instead to access the service on a pure rational-economic basis.

Based on a statistical representative sample of 1699 different platform users in several European countries, this contribution investigates whether, and to what extent exchanges on online sharing platforms are mediated

through reputational systems and create new long-lasting and trustful relations. Our results seem to point to few trustful relations and little reciprocity. To explain how everyday use of sharing platforms (and connected mobile apps) may inhibit the creation of reciprocal ties, we will also draw on focus group results with users of sharing platforms. The survey and focus groups have been carried out within the EU Horizon 2020 European project PS2share: <https://www.bi.edu/research/find-departments-and-research-centres/research-centres/h2020/>.

ANDRIYANTI, YULIA* (*Qbukatabu*)

The Construction of Indonesian Lesbian Bisexual and Transgender (LBT) Collective Identity after Reformasi

In Indonesia, Lesbian, Bisexual and Transgender (LBT) has become a common term, not only amongst LBT group and organisations, but also women organisations. The aim of this dissertation is to understand how the women movement recognises LBT as a movement and also how LBT activists mobilise their political identity within women movement. The method used semi-structured interviews and documents' analysis. There were eighteen research subjects who were the key leaders of woman and LBT and/or LGBT organisations. They were from four regions in Indonesia, such as Aceh Jakarta, Yogyakarta, and Solo. Using the collective identity construction tools of analysis with queer politics and the Black feminist perspective, this research found that Indonesia LBT face the oppression in all domain of power; structural, disciplinary, hegemonic and interpersonal. Consequently, they experience interlocking oppression in which the hetero-patriarchal dominant system constructs the controlling images, as sinner, abnormal and criminals. Furthermore, the LBT movement is located as an outsider within under the universalised global gay politics. As this research view the collective identity as cohort, the result delineated three different cohorts in which both woman and LBT activists contributed to construct the LBT meaning. They are: 1) the 1990s cohort or the emergence of political lesbian movement; 2) the 2000s cohort or the LBT movement's development; and 3) the 2010s cohort or the transformation of the LBT movement. Regarding the LBT activists negotiation, they used the coming out and coming home narrative, realising their multiplicity of identities. It strengthened the positionality of Indonesia LBT movement, as neither falls under the 'West' nor 'East' categorisation. Indeed, the queerness is not only reiterated at the cohort's journey, but also manifested at the LBT activist identity.

Labour Market Matching Processes of Immigrants in Canada – Results from Case Studies in the Health and Information Technology Sectors

The Canadian society is characterized by a plurality of immigrants and its migration policy is strongly geared to economic criteria, qualifications and skills (cf. Walker 2007; Guo/Shan 2013). By using a mixed methods approach, the presented project aims to gain knowledge regarding how immigrants to Canada use their foreign qualifications and skills in their current employment. This presentation focuses on the results of qualitative case studies conducted in Canadian enterprises to identify the approaches and methods which employers use to make decisions regarding foreign qualification and skill recognition. The fundamentals and reference points of these decisions and the considered information will be discussed. Furthermore, the underlying reasons for the application of differing approaches and methods, as well as their relations to operational requirements are examined.

The analysis also focuses on how immigrants present and document their foreign qualifications and skills to employers. The selection mechanisms and proposal criteria of further qualification measures by employers and education providers to immigrants are investigated. The analysis incorporates discussion regarding the theoretical concepts of signalling (Spence 1973) and screening (Stiglitz 1975).

Following a maximum variation sampling (Patton 2001), the case studies were conducted in the health and information technology sectors, which vary in their degree of regulation and their occupational requirements. In addition, the analysis considers the geographical differences between Canadian provinces and institutional frameworks. In each case study at least two employees with a migration background and two recruiters are interviewed to gain a multi-perspective analysis. Further, documents regarding relevant organizational structures, recruiting strategies and support measures for the integration of immigrants into the enterprise are analyzed. The results aim to make an empirical contribution regarding the relevance and provision of information in the recognition of foreign qualifications and skills and in doing so to support the stakeholders involved in this process.

ANNEN, SILVIA* (*BIBB*)

The Usability of Foreign Qualifications and Skills in the Canadian Labour Market – Results Using Piaac

The Canadian society is characterised by a plurality of immigrants and the Canadian migration policy focuses on economic criteria, qualifications and skills (cf. Walker 2007; Guo/Shan 2013). The aim of this project is to gain insights how immigrants use their foreign qualifications and skills in the labour market. Income differences and over-education of immigrants have been mainly explained by the imperfect transferability of human capital across country borders (cf. e.g. Li 2008), depending on how closely the country of origin compares to the host country in terms of economic conditions, educational systems, industrial structure, institutional settings, language, etc.

Using quantitative analyses and case studies, the project identifies approaches and methods that employers use to make decisions regarding foreign qualification recognition. This presentation focuses on quantitative analyses of PIAAC data to investigate if the assumptions of human capital theory (Becker 1964) or the theories of signalling (Spence 1973) and screening (Stiglitz 1975) apply to the Canadian labour market. Concrete the Mincer wage regression (1974) is used to analyse impact factors of individual wages, focusing on migration status. The findings confirm the discrimination of immigrants in regards to their current income. Furthermore, a comparison of immigrants with native-born Canadians highlights the issues of qualification and skill mismatch. These results indicate that immigrants disproportionately face the problem of qualification mismatch compared to the domestic population. Differences in the skill mismatch between the two groups are smaller. The study indicates that both qualification and skill mismatch have a negative income effect, confirming human capital theory, which assumes the lower usability of foreign qualifications due to the lack of host country specific human capital. The results also indicate that the signalling effect of foreign qualifications is lower than the one of domestic qualifications.

Issues on Affordability of Social Housing Schemes for Low- and NO-Income Earners in Nigeria

There are myriad of housing schemes of the federal and state governments including private developers towards providing affordable houses for all categories of citizens in Nigeria over the years. Available data indicate that while so many of the houses are either abandoned or uncompleted, the completed few are usually hijacked by higher powers. The study categories house seekers in Nigeria into super high-, high-, medium-, low- and no-income (aged, unemployed, special) earners and currently, it is estimated that about 17million people are homeless in Nigeria, a deficit that majorly affects the no- and low-income earners. The study reveals that the reasons for this imbalance stem from political, economic, environmental, ethical, other problems include high rental value of houses, high construction cost, high cost of land, dearth of mortgage loan, among others. These forces were examined and their impacts highlighted, for example, it observed that, if the lowest income earners in Nigeria who receive a minimum salary of eighteen thousand Naira only monthly monetary value cannot afford the monthly cost of renting a one-bedroom apartment of about ten thousand naira only, it then surmise that no-income earners, who constitute a larger population will never do. It reveals that due to the slow pace of housing provisioning in Nigeria, the forces of demand and supply will always prevail, resulting in the super- and high-income earners hijacking the available few. As a result, the financially weak no- and low-income earners will continue to wallow in abject homelessness unless urgent remedies are proffered. It recommends that Nigeria, a member of so many international organizations and treaties such as UN-Habitat, which encourages member Nations to provide affordable houses for all its deserving citizens should muster the political will to consciously and progressively decrease the housing deficit to alleviate the suffering of her teeming homeless citizens.

Conflict and Cyberspace: Challenges for Military Higher Education Institutions

Since the cyberspace is an extremely complex and large-scale social system we can consider it as a main factor with a very impressive influence on conflict and war. Therefore, study of the cyberspace related to security and defence is becoming more stringent. However, even though the diversity of matters in cyber security

and defence require multidisciplinary thought and expertise, there is no a large interest to the development of cyber defence training and education initiatives. Work in cybernetics and systems science suffers from a lack of educational programs in universities. According to Herb Lin, from sociological perspective, some of the specific study topics are as following: cyber decisionmaking during times of uncertainty; socio-psychological effects of cyber warfare; cyber security awareness; cyber narratives and cross-cultural views; successful cyber-aware organizations; organizational dynamics in cyber security; organization of the national government for cyber security; command and control of offensive operations; private cyber security companies; civil liberties and cyber security etc. A permanent challenge for the military higher education institutions is to prepare sufficient high quality cyber trained people. In this respect, we express the view on role of education as main factor for enhanced digital readiness.

The Scientific Representation of the Radicalization: A Meta-Analysis on Scientific Journals (2014-2017)

The purpose of the paper is to present main findings of a quantitative research on the scientific literature about radicalization. It is a part of an ongoing Horizon 2020 European Project called TRIVALENT "Terrorism Prevention Via Radicalization Counter-Narrative" (2017-2019). This meta-analysis is focused on International Scientific Journals publishing articles on radicalization from 2014 up to 2017 (the time of ISIS rise) and it is based on automatic statistical textual method. The analysis points out: 1. Although, during the considered time, the focus of journals has moved from a focus on socio-cultural dynamics of radicalization to international conflict in Middle East, the prevalent analytic approach is been based on a micro-approach. 2. Main factors used for analyzing radicalization have been ideology, cultural factors and group dynamics rather than macro-social factors such as inequality or social disintegration. 3. A psychologization centered over the Self and the individual is the main framework of contemporary scientific literature on radicalization, independently from Journal Topic (Sociology, International Affairs, Political Science and so forth). In conclusion our meta-analysis show that the international academic community tends to underestimate systematically macro and political factors when it studies radicalization process.

ANTONINI, ERICA* (Sapienza University, Department of Communication and Social Research)

Cultural Representations and Social Complexity: The Case of Public Policies on Neets

Social representations of NEETs are a typical example of how cultural stereotypes can affect public innovation policies. The acronym NEET stands for "Not in Employment, Education or Training" and refers to large amounts of youth - aged 15 to 29 - who are involved in neither working, nor studying nor training activities.

Many are the causes of this huge social problem - especially economic and cultural -, however public opinions tend to ignore this complexity, by reducing this phenomenon to the sole "voluntary" dimension. In other words, NEET seems to be a condition uniquely caused by youth's laziness, low attitude to sacrifice and/or snobbish attitude of only considering qualified jobs. Broadly speaking, this point of view reflects the wide-spread attitude of representing social criticalities just as a matter of individual responsibility or even as psychological problems. Thus, this paper aims at reconsidering the whole complexity of NEET phenomenon, within the theoretical frame of "the end of working society", by analyzing the structural trends that may be the ground for the large diffusion of this condition within contemporary societies. This paper will consist of the following steps:

- A comparative analysis of quantitative data (especially official national and supranational statistics) about the dimensions and the features of this phenomenon in the main Western societies
- A drawing of the main typologies of NEETs, according to specific needs and levels of vulnerability
- A comparative analysis of the public policies implemented at an international level, basing upon in-depth interviews with privileged witnesses.

Namely, the last step will highlight the impact that the *individual*, rather than the *structural* approach among decision-makers, will exert on the public policies on NEETs.

ANTONINI, ERICA* (Sapienza University, Department of Communication and Social Research)

The Spread of Populism in De-Politicized Contemporary Democracies: Features, Origins, Responses

Contemporary political systems are affected by the increasing spread of populist movements, which are taking advantage of the crisis of democracy, although presenting themselves as remedies to the crisis itself (Ionescu, Gellner 1969; Canovan 1981; Mény, Surel 2000; Laclau 2008). Most of them are characterized by: a homogeneous community-people, perceiving itself as the exclusive holder of popular sovereignty and expressing an anti-establishment attitude; a strong simplification of political speech, based on manichaeism, "us versus them" rhetoric speeches focusing on "emotional" rather than factual truths (Arendt 1972) and conspiracy logic; the praise of "the new", of the "common man" (with a discontent for expertise and intermediation) and the substitution of ideology with biographical exempla (successful life stories of ordinary people who are supposed to do better than professional politicians); the emotional construction of an immediated relationship between charismatic leader and voters (Müller 2017; Revelli 2017).

This contribution aims to highlight political and social origins of the spread of populism as well, such as polarization, social mobilization and inclusion, crisis of representation (Anselmi 2017), cultural backlash (Pippa, Inglehart 2016), a decreasing presence of parties *within society* (in terms of reduced membership, electoral volatility, decline of mass parties functions such as political socialization and social integration) *versus* an increasing presence of parties *within institutions* (in terms of selection of politicians and definition of political agenda) (Ignazi 1997; Massari 2004), widespread unease towards political elites corruption and policies carried out by international organizations.

The paper will also try to indicate some possible responses to populist rhetoric, such as redistributing, reformist and less austerity-oriented policies, wider access to social services, less punitive wage dynamics, revaluation of representative democracy and constant monitoring of the pluralistic dimension of political systems, which is essential to turn formal and "electoral" democracies into substantive and liberal ones (Dahl 1961, Diamond 1999).

Increasing Complexity of Agent-Based Models with Experiments - the Case of Structural Shirking

The paper explores possibilities of using experimental data to introduce additional complexity into agent-based models. The model under development was the model of structural shirking 1.0 - *THE CORE*, in which the manager distributes work chores among employees, who are set to complete assigned work tasks on a deadline. The manager sets the deadline on the basis of her perceptions of task difficulty and employee competence level. The employee, who knows his competences better, has an informational advantage over the manager (i.e. adverse selection). Yet, reality may outsmart both actors, who do not know the true level of task difficulty (i.e. reality fluke). The unintended consequences of the work process include shirking and overworking. Both aberrations from manager's expectations have two dimensions: qualitative (insufficient effort and working too hard), and quantitative (insufficient working time and working too much). As the model specification and simulation results proved theoretically and empirically useful, we decided to introduce interactions among employees and discover the extent to which they influence the emergent level of shirking in the organization. The first experiment was devised in order to validate assumptions regarding learning functions of employees implemented in the core model. In addition, it provided information on descriptive statistics of main variables of interest and stimuli, which were used in research design of the subsequent stage of the study. The second experiment tested the degree to which peer influence and self-efficacy in task performance impact qualitative and quantitative shirking/overworking. Results of the second experiment were used to inform behavioural rules of agents in the model of structural shirking 2.0 - *PEER INFLUENCE*.

Revisiting Distributive Justice and Justiciability of Social and Economic Rights in Thailand

In the context of the need to reform the country in 2010, social justice research in Thailand became to flourish across social science discipline, including sociology, political science, economics and laws. Nevertheless, the requirement of immediate policy recommendations had restrained theoretical research and policy research were constructed on justice concepts, which were seldom deliberated. Besides, most of researches contributed to states of economic and social inequality and social injustice causes more than social justice resolutions, especially which based on social and economic rights conceptions. This paper explores social justice concept among young Thai researchers through multidisciplinary lens and looking for the justiciability of social and economic rights. Ten young researchers, from various universities and various disciplines including political economics, economics, anthropology, sociology, social science, political science and laws are invited to co-learn and share knowledge from their own perspectives. Field trips to visit marginalized people, meetings with social work leaders, dialogue with senior researchers and among themselves are organized. Five of them generate academic papers, which are consulted by a senior research judge and peer-reviewed by three senior researchers for publication purpose. Their papers shed the light to spheres of justice they interested in, stakeholders of injustice they see, principle of justice they use. Additionally, social, legal and institutional mechanism toward resolutions, which are introduced by them, demonstrate an approach to justiciability of social and economic rights from multidisciplinary lens as well. However, this study requires more insight about procedural justice, especially in the recent authoritarian era, in which social justice became development agenda but without participation from civil society. More research papers from law, political science and social psychology perspectives are desirable.

China's Urbanization: Dealing with the Complexity of Fieldwork Practices and Data Analysis

Integrating methods of data collection and analysis can be more effective to address complex issues, but at the same time it makes the research process increasingly demanding, in terms of time, competences and finances needed to collect, organize and analyze data, and constructively feedback research outcomes. A crucial issue then is to develop strategies to deal with the mountains of words, images and numbers that researchers track, collect or produce in the whole research path, so that social sciences can effectively contribute to enhance social understanding of complex phenomena not only by developing novel empirical techniques of inquiry, but by enhancing the debate on the kinds of knowledge we are producing, and the worlds we occupy as well as make (Back & Puwar, 2012). The paper will draw on a two-years research about the perceptions of the transformations induced on landscape and imaginaries by the current patterns of urbanization in China, in particular those driven by the planning of high tech zones. A comparative research has been conducted within a Constructivist Grounded Theory framework (Charmaz, 2014). Data have been collected through several techniques and approaches (e.g. participatory workshops, photo-elicitation interviews, visual ethnography, etc.) and have been analyzed both qualitatively and quantitatively, combining visual and narrative analysis with the estimation of statistical models to discover complex latent structures in the data. Nonetheless, much information (e.g. spontaneous conversations, reports, social network posts and chats) and data collected (official statistics, maps, etc.) have been under-analyzed. The authors will discuss the strategies developed, together with the difficulties encountered and choices undertaken. To conclude some proposals will be advanced to deal with the above issues and "reduce the complexity" without giving away the richness and sensitivity of data nor of the process initiated but achieve the engagement of multiple publics, in multiple ways (Burroway, 2005).

AOYAGI, MIDORI* (*National Institute for Environmental Studies*)
Risk Perception, Attitudes Towards the National Energy Choice and Climate Change Among Japan, UK, Norway, Germany and France

Climate change and Fukushima nuclear power plants' accident are the two major policy factors for defining energy choice in each country. But responses are different among these five countries. This paper tries to analyze the differences and similarities of risk perception, attitudes towards the national energy choice and climate change among four countries, Japan, UK, Norway, Germany and France. Although Japan was severely damaged by the earthquakes and nuclear power accidents in 2011, the Japanese 2030 GHG reduction target still includes nuclear power as a main source of energy, while Germany decided to fade-out nuclear power in the long run.

The European four countries survey was a part of large EU project-EPCC, and Japanese survey was done by National Institute for Environmental Studies. Each survey was fielded between May and June 2016, using almost same questionnaires. Each sample size was over 1,000 adults, randomly selected nationally representative samples.

1. A) Risk perception on climate change, policy support: people in this five countries are very much worried about climate change. More than 60% respondents in all five countries chose "We are already feeling the effect (of climate change)." Less than 16% of respondents see the causes are mainly "natural process", rather than human activity.
2. B) Nuclear power generation as a favorable energy source: Japan's distribution is very like EU three countries, very high response rate in negative options. UK public is relatively positive in nuclear power.

Attitudes and risk perception towards the climate change and nuclear power are very much similar in Germany and Japan, but political consequences are different. We have to explore another factor for explaining this. Economy is the possible factor for this. Germany enjoys better economy, while Japan is suffering worst economic situation ever, people support economic over environment, according to our survey.

APAVALOAE, ALEXANDRA* (*Universidad Nacional de Córdoba*)
Living Uncertainty in an Argentinian Villa

In-depth interviews were conducted with residents of a *villa* (an informal urban settlement) in Argentina, a South American country that historically experiences cyclical economic crises and their corresponding political consequences, although at the time of the study it was going through a period of relative stability. Participants identify a number of urgent issues, related to employment, living conditions, the possibility of being translocated, delinquency and drugs, that impact their daily lives and, in response, they demand solutions. Intuition, based more in the researcher's experiences than the participant's, would have us think that the prevailing sentiment in such a micro and macro social context would be vulnerability driven by uncertainty. However, enriching interactions with the participants and deep critical analysis grounded in the data invalidate these preconceived notions and point towards the normalization of uncertainty. As such, the local experience is lived not as trauma but as "more of the same", a continuous and circular recurrence of events in mundanity. In consequence, a call to individual action prevails as a coping strategy among participants who perceive not only a need, but also an obligation to fend for themselves. Thus they become trapped in a contradiction between the perceived individual responsibility to "get ahead" on their own through work and study and the ability to voice criticism of insufficient social policy. In conclusion, we explore a few avenues for future research that are opened by the reflections in this article.

The Potential Role of Geographical Indications in Supporting Indigenous Food Systems in Canada.

The European Union has encouraged the protection of agricultural products since the 1800s. Currently, the protection of agricultural products and foodstuffs is operated by a unified geographical indications (GIs) system that was implemented in 1992. GIs provide intellectual property protection and give permission to producers to use the registered name. Arguments in favour of GIs include the financial benefits to producers, viability of rural economies and the transparency about the products and their production. Others point to the protection of local and traditional knowledge required to produce cultural foods. Not only does this have the potential to empower rural communities, but help protect culture and traditional ways of life. As awareness of Indigenous peoples' history and experiences continues to rise; the need to protect Indigenous knowledge and traditional ways of life, including Indigenous food systems is increasingly being recognized as a vital component of improving the complex circumstances of Indigenous populations in Canada. The Canadian market economy has largely expressed a critical view of GIs stating GIs are a form of protectionism and interfere with the free market. Nevertheless, the authors believe it is important to examine the potential role of GI schemes in Indigenous food systems in Canada. There is potential for GIs to not only protect traditional foods and culture, but to also empower communities, educate the public about Indigenous history

and traditions and provide Indigenous producers with market protections. Issues arise when thinking about the geography and movement of Indigenous peoples, assigning agricultural products and foodstuffs to specific groups and the potential for exploiting Indigenous knowledge for profit. The paper will address these issues and aim to develop a concept map, outlining the potential actors required for implementation and the benefits and challenges of implementing GIs in Indigenous food systems in Canada.

The Social Context of Rural Education in Mexico: A Barrier for the Academic Achievement of Tele-Secondary School Learners

Tele-secondary schools constitute an educational option for students in rural areas of Mexico. In these schools, one teacher covers all the areas of the curriculum with audio-visual materials delivered through satellite TV programs. Thus, these schools have contextual, structural and pedagogical characteristics different from other types of secondary schools. The TALIS 2013 report indicates that tele-secondary teachers hold higher qualifications (postgraduate studies) in comparison to teachers in other secondary school types. They also exhibit more frequent participation in professional development programs. Despite these qualifications, the PISA 2012 and EXCALE 2015 results indicate that their learners' mathematics and Spanish achievement scores are below the national average.

The TALIS survey provides an overall picture of the working conditions of teachers and the learning environment in schools in regards to school leadership, teacher development, teacher appraisal and feedback, and teaching practices, beliefs and attitudes. In order to gain a deeper understanding of the impact of these variables on learners' achievement, we conducted a qualitative study in four tele-secondary schools located in the southeast of Mexico with funding from the *National Institute of Educational Evaluation (INEE; grant number 0277083_201601)*. Based on the theoretical framework of school effectiveness research (Murillo, 2007), the study explored the factors that influence learners' educational achievement from the perspective of teachers, parents and principals. The data were collected through focus groups and in-depth interviews. The schools were selected from a larger quantitative study that examined variables associated to educational achievement such as family, student and school management. The qualitative data revealed that negative climate, little family's involvement, students' low expectation, inadequate facilities, lack of leadership, and the social context severely hinder learners' academic achievement.

Reproducing Education through Generation: the Syrian Christians and Their Social Elitism in the State Kerala in India.

This paper will examine, the strategies to maintain and reproduce educational aspirations and advantage among the Syrian Christians in Kerala. The paper specifically looks at the intergenerational practices among the families which make education central to the community's advancement. The paper draws with the Bourdieuxian perspective which highlights the differential nature that exists in the reproduction process at the family level.

The historical account of the past and present day social, economic, political dominance of Syrian Christians in the Kerala suggests that the basic factor behind the success of Syrian Christians in reaching the top/elite positions in the socio-economic ladder was their achievements in the field of education. This dominance persists even today. The discussion presented so far establishes the centrality of education among the Syrian Christian community in the contemporary Kerala and it is thus important to investigate deeper into the sociological determinants of such reproduction process. In Kerala society by and large has higher levels of literacy among all its religious communities, Christians seems to have much better literacy rates in comparison to other communities. The theory of Bourdieu draws how the children of the dominant class will progressively benefit from a positive interplay between the influences of home, community and school. Following Bourdieuxian framework, Stephen Ball notes that the class is realised and struggled over in the daily lives of families and institutions, in consumption decisions, as much as in the processes of production, and particularly at the moments of crisis and contradiction as parents think about the well being and happiness and futures of their off-springs. This paper on the contrary attempts to find out the correlation between family and educational reproduction to maintain their social elitism among the Syrian Christians.

Mindfulness Meditation and the Evolution of Secularity

This paper draws on a three-year project sponsored by the Leverhulme Foundation entitled 'Mapping Mindfulness in the UK' (Steven Stanley, Alp Arat, Peter Hemming, and Richard King) and examines the significance of the recent popularity of mindfulness meditation for the evolution of secularity. In an effort to expand current scholarship into this field beyond matters of health and wellbeing alone, this project entails the following four stages of empirical research: 1) GIS mapping of all publicly available mindfulness providers in England and Wales; 2) survey of aspiring and prominent teachers, trainers, and advocates of mindfulness; 3) personal interviews with key stakeholders in the UK; and finally, 4) participant observation of five popular sites of mindfulness implementation (religion, health, education, business, and politics). This paper argues that contemporary mindfulness presents a ubiquitous illustration of how the secular in late modernity is undergoing pivotal transformations in its capacity towards the transcendent. In light of Charles Taylor's definitive account of our secular age, these findings raise important questions as to whether they merely indicate yet another expression of novel forms of belief, or whether they go further in signalling more fundamental changes in the very conditions of belief in our contemporary secular age.

Open Government Data As a Commons? Disclosing and Managing Public Sector Information in a Comparative Perspective

Data constitute both a form of power through which people and territory are regulated, and a valuable economic asset for improving the efficiency of markets in the knowledge economy. Therefore, there are two different conceptions of data: as a commodity to be exploited through market-oriented value extraction process; or as a commons, a free and accessible non-rivalrous resource for the community welfare. This ambivalent nature of data still continue with the rise of the Open Government Paradigm in 2009, with the presidency of Obama. Most of the countries decided to adopt strategic plans for the openness of public sector information, but there are not enough analysis about the outcomes and the models adopted, especially from a sociological perspective. Looking at how different countries are implementing the Open Government Data paradigm, can we always talk about data as a commons? Can we speak of varieties of open government data systems? We adopted the comparative method for a study area, selecting 15 countries with homogeneous geographic, socio-economic and institutional characteristics, referring particularly to the comparative political economy approach. The study checks what are the different models of governing the open data respect with the IAD framework, developed by Ostrom and Hess.

The Effect of Public Opinion on Environmental Policy in the Face of the Environmental Countermovement

Research on the Climate Change Counter Movement (CCCM) has revealed evidence of a 'framing contest' whereby industry-funded think tanks work to undermine the scientific research that threatens industries' bottom line (Farrell 2015; Dunlap and McCright 2015; Brulle 2013). While the research on the efforts of this movement to shape public opinion has been growing (e.g. Farrell 2015), there has been less work trying to understand if these efforts have actually been successful at persuading the public on these issues. Moreover, and perhaps more importantly, what influence does this changing public opinion have on policy-makers? These questions take on increasing significance in light of changing local environments, which has been shown to influence the salience of environmental issues (Switzer and Vedlitz 2017). In this paper we use structural equation modeling to deconstruct these countervailing forces on environmental policy. To achieve this we utilize restricted General Social Survey at the tract level from 1973 to 2015. In our models we estimate the effect that local environmental risk has on public opinion, as well as assessing the effects that constituent opinion on environmental issues has on Congressional voting compared to the impact of industry funding. We seek to answer the questions: to what extent are voters opinions on environmental issue related to changing environmental risk at the local level? In addition, how much of a Congressional members environmental voting record be explained by their consistent concerns, and how much by campaign funding.

Commercializing Death and Appropriating Mourning. Negotiating Bereavement Scripts Among Italian Families and Funeral Service Workers.

Death is allegedly removed from everyday life in the global West. However, bereavement remains an important experience which is culturally coded as highly personal and emotionally dense. This contrasts with the sometimes aggressive advertising strategies of the undertaking and funeral industry. In this paper, based on a large number of semistructured interviews with Italian families and funeral service workers, we explore how bereaved families meet the funeral industry and negotiate emotions in an increased commercialized setting. Deploying the notion of emotional labour, we explore how funeral service workers facilitate the aftermath of death and the many practices which surround the death of a family member or beloved person. We further consider how emotional rules are marshalled by family members to de-commodify their dealing with the duties associated with the death of a close person, with particular attention to the rituals surrounding the dead body and the memory of the deceased. The analysis proceeds by reconstructing the bereavement scripts which are co-constructed by families and workers, to enquire how the commodity frontier is negotiated in such emotionally dense and intensely intimate moments. All in all, the paper aims to add to the literature on contemporary attitudes towards dying, bereavement and the dead body with particular attention to the way commercial and intimate social relations intermingle, and with the view to deploy Hochschild's sociology of emotions and her reflections on the commercialization of intimacy may be applied to this field. Furthermore, we place the result of the specifically Italian context in the framework of the broader literature on dying and bereavement in the Global West to individuate some of the specificity of a Nation which is both deeply influenced by Catholicism and has reached consumer modernity later than others.

RC30-546.3

ARIAANS, MAREIKE* (University of Siegen)

Long-Term Care Professionalization and Deprofessionalization in Germany and the Netherlands - the Role of Institutions and Policies

Organizing long-term care (LTC) for the elderly is a growing public concern in all modern welfare states. Growing life expectancy and demographic ageing lead to a rise in the number and the severity of LTC needs. In this situation governments face increasing LTC costs and at the same time pressure for a high quality of care. Thus, the question arises how countries react to these challenges. Because labour is the most expensive part of LTC and also the most important component of care quality developments in the labour force are highly important and are thus at the centre of reform processes. So the main question is: How do countries' LTC workforces develop in times of increasing cost and quality concerns? Do they opt for cheap, lowly educated labour (including informal LTC) in order to save costs, do they invest in expensive, highly educated labour to increase the quality of care or do they try to combine both strategies? Thus, do they professionalize, deprofessionalize or polarize? Trends in the LTC workforce on education and occupational degrees, as well as on organizational power and reputation are assessed by using national and international comparative data. Therefore, a professionalization continuum is used, which includes both formal and informal LTC work. By comparing two LTC systems with a similar problem structure and similar structure of occupations in LTC – Germany and the Netherlands – since the early 2000s, specific policies and institutions can be traced to influence the trajectory of the LTC workforce.

ARIAANS, MAREIKE* (University of Siegen)

Trends in Medical and Psychological Explanations for Unemployment in German Parliamentary Debates

During the last two centuries labour market policy turned to focus on pre-active, preventative and active labour market policy, rather than reactive mostly monetary benefits. This change in labour market policy also shifted the responsibility for reemployment from the society and the societal and political institutions to the individual. With this individualistic turn in labour market policy it is expected that the reasons for unemployment get more individualized and with that medical and psychological explanations for unemployment are increasingly given, whereas structural causes for unemployment are pushed into the periphery of the political discourse. Thus the main questions are: How do political and organizational actors construct explanations for unemployment in different labour market reform processes? Which actors push medical and psychological explanations for unemployment? To answer these questions, parliamentary debates on

labour market reforms in Germany since the year 2000 are analysed using content analysis. These include large individualizing labour market reforms at the beginning of the 2000s when Germany struggled with high unemployment levels, as well as small instrumental reforms in the mid-2010s where unemployment levels approximated nearly full employment. It is hypothesized that medicalization and psychologization play a bigger role in reforms that retrench unemployment benefits and rights, because these individual explanations are used as a blame avoidance strategy by the government. Furthermore, two rivaling hypotheses can be made. On the one hand, it can be expected that leftist parties and actors use medical and psychological explanations more frequently than rightist parties, because they tend to see each unemployment case as an individual case. On the other hand, it can be hypothesized that rightist parties and organizations use these explanations more frequently, because they emphasize the self-responsibility for un- and reemployment.

ARIKAN, YASEMIN* (Urban Innovation Analysis, Inc.)

Review of Neighborhood-Level Quantitative Studies for Studying the Arts As a Tool in Community Development

Most of the literature developed to date on the role and impact of art and culture in community development is based on case study research and quantitative studies at the regional or city level. This makes generalization and neighborhood level decision-making difficult. This paper discusses the analytical design (e.g., range and tendencies in types of regression analyses, variables, time frames, arts definitions, and strategies to measure arts growth and neighborhood context and change) and findings of 10 studies that model and empirically examine the relationship between the arts and neighborhoods at the county, zip code, or city block level. They were published since 2010 and focus on explorations in the U.S. and Canada. In broad strokes, the 10 studies can be divided into two streams of inquiry: where do the arts tend to grow, and what is the impact of arts growth on neighborhoods. The present paper includes an analysis of what is getting systematically omitted or under emphasized, and how we may move ahead to improve neighborhood-level specificity and generalizability in the policy and planning debate on creative city and community development. This work informs a separate forthcoming paper that extends the past work by using regression analysis to explore the impact of arts growth on neighborhoods in the national context and quantiles of neighborhood disadvantage, employing different definitions of disadvantage and arts growth, taking into account the cultural life within the neighborhood, and comparing the impact of arts growth on individual versus clusters of neighborhoods.

RC03-69.2

ARIKAN, YASEMIN* (Urban Innovation Analysis, Inc.)

Using the Arts As a Tool for Community Development: Identifying Opportunity Neighborhoods for Artist-Led Revitalization

Can artists drive growth? What neighborhoods in the U.S. are ripe for artist-led revitalization? Using regression analysis, we explore the impact of arts growth on neighborhoods in the national context and quantiles of neighborhood disadvantage, using different definitions of disadvantage and arts growth. We also take into account the cultural life within the neighborhood in terms of amenities, and compare the impact of arts growth on individual versus clusters of neighborhoods. Results suggest that there is strategic value in considering all of the following dimensions in using the arts to drive change in neighborhoods: (a) The more arts establishments are developed, the greater the impact tends to be, across various definitions of disadvantage. (b) The arts do not have a uniform relationship to neighborhood characteristics. To achieve a desired level of impact, consider the type and range of arts establishments to develop and prioritize. (c) The moderate to higher levels of disadvantage experienced in a neighborhood dampen the impact of the arts. Efforts in these contexts may need to develop a greater number of arts establishments and/or favor another type or wider range of arts to effect a desired amount of change. (d) Sometimes the speed of arts growth matters to the outcome. In certain neighborhood contexts, achieving the desired impact level may require going intentionally slow or fast about the arts growth. Which neighborhoods these tend to be, however, depends on how one defines a disadvantaged neighborhood. (e) Sometimes locating the arts growth in an adjacent neighborhood rather than directly inside the target neighborhood may better support the intended impact. (f) The impact of the number of arts establishments is subject to the particular set of pre- and co-existing neighborhood amenities, which may amplify or weaken the intended impact.

ARISTIDES DE SOUZA, SAULO* (University of Coimbra)

PROMENZIO, LUANY (Universidade de Coimbra - FEUC)

The Big Game: A Society of Conflict and Social Dialogue

Collective bargaining has been one of the most important legal instruments used by the Welfare States in decision making of public policies in Europe and in Latin America. It is potential for resolving conflicts among the actors of a society is a powerful mechanism to battle the inequalities generated by the markets. The acquired rights of workers are defined mostly in formal and informal spaces, logic established in the labor relations system, by institutional actors. Considering as a reference both cases at different stages in implementing the Welfare State, this analytical work perspective have a goals to understand the logic about negotiation and social cohesion like the basis for determining the minimum wage and the recent policies of their increase in value in Brazil and Portugal. The study takes in a social transformation phase experienced by the two countries. In contrasting moments in the political guidelines of their respective governments. That can tell a lot about social issues and the possibilities about socio-economic achievements, by workers in each context, both in the framework of the dismantling of the Portuguese-welfare state, and the expansion of social policies that are associated with the strengthening of a Brazilian-welfare state. This proposal is a methodological relevance for the purposes of sociological and economic, in qualitative and quantitative research, the comparative study of institutional focus, in the forms of organization and trade union action, and recovery measures in the minimum wage that influence into categories negotiations wage workers organized in both countries.

Inter-Subjective Differentiation between Regular and Non-Regular Employment in Japan: Increasing Labor Market Flexibilization and Legitimization of Reward Inequality

In line with the increasing flexibilization of the labor market, the number of non-regular workers, whose working conditions and rewards are much less favorable than those of regular workers, has increased in many countries. This is also the case in Japan.

Japanese non-regular employees, however, are unique in how they are defined and measured; they are captured in official statistics not based on objective working conditions, such as period of employment contract or working hours, but based on respondents' self-identified appellations at the workplace (e.g. "regular worker," "contract worker," or "part-time worker"). In this study, I use the analysis of social survey data and statements from the authorities concerned to explore the differences in circumstances of regular and non-regular workers in Japan, particularly focusing on why they are counted based on their appellations.

On the basis of the research results, I argue that the distinction between regular and non-regular employees in Japan is an inter-subjectively constructed categorization of workers to which not only differences in objective working conditions but also differences in expected duties, responsibilities, and skills/abilities are attached. In Japanese companies, which do not have rigid job differentiation based on stipulated job description, human resource management relies heavily on the distinctions that accompany even differences in assumed duties and abilities. Moreover, the assumptions regarding differences in duties and abilities that are attached to the distinction between types of employment play an important role in legitimizing large reward inequalities between regular and non-regular employees. Results suggest that the categorization of workers and the assumptions made about these categories of workers contribute to the emergence and reproduction of labor market inequalities in Japan.

ARIZA, MARINA* (*UNIVERSIDAD NACIONAL AUTÓNOMA DE MÉXICO*)

GUTIERREZ, SILVIA (*Universidad Autónoma Metropolitana-X, México*)

The Development of an Affective Disposition Towards Immigration in Donald Trump's Speeches

Following the Sociology of emotions as a theoretical perspective and discourse analysis as a methodological tool, we analyze the argumentative strategies used to build a collective anti-immigrant feeling in a selection of speeches of the former presidential candidate Donald Trump. We emphasize the anti-immigrant content based on two reasons: 1) it constitutes a key articulation axis of the populist appeal of the nowadays president of the United States; 2) far beyond de North American scenery, international migration constitutes a global fact with strong emotive shades which has acquired tragic proportions in the second decade of the 21st century.

The empirical information comes from an extensive database gathered in the frame of mayor research. Taking as a starting point the assumption that emotions are a central part of the judgments we make, we point out the exaltation of hatred, distrust fear and resentment as affective collective dispositions towards international immigration, which is in a great scale merely Mexican. From the point of view of the Sociology of emotions such states constitute convergent affective and synchronous answers of collective nature (von Scheve e Ismer, 2012), that on the one hand, stigmatize the foreigners (aliens) as enemies, and on the other, promote cohesion among those who feel aggravated.

From the preliminary analysis of the data, three recurrent argumentative strategies used in the development of the above mentioned hostile disposition, emerge: 1) the stereotyped construction of the referent (the "other", the immigrant), 2) the use of metaphors in order to re-direct and to intensify the perception of risk; 3) the exemplary narratives that anticipate and apocalyptic ending.

Regulatory Chill and Environmental Governance: A Case of India

The large corporations have an inevitable presence in the modern world. Generally, all developing countries have formulated environmental standards and regulations to preserve their environment. However, the 'regulatory chill' by powerful companies supersedes environmental regulations. Moreover, an increasing number of global corporations prefer suing the States in international arbitration court under investor-State dispute settlement clauses of bilateral investment treaties. As a result, the States either adopt 'regulatory chill' or 'race to the bottom' principles to keep the economic investment within countries. Adding to the plight of weak States, the 'corporate takeover' occupies the State, and the environmental regulations are either diluted or suspended to pave way for complete economic liberalization. It is an outcome of intrusion and takeover by corporate power into governance structures and institutions, apart from financial sponsorship of election contestants. In such precariousness of domestic environmental affairs, what are future implications? In case of perfect corporate takeover of the State, what will happen to State sovereignty or regulatory autonomy? This article based on the review of literature and observations discusses the cases of developing nations especially India.

Asymmetric Temporalities in Collaborative Transnational Media Production: The Case of Turkey

Much of the news that informs a global audience about Turkey is produced by teams of foreign journalists and local news assistants or "fixers." Similarly to researchers who rely on local partnerships or "key informants" for help with accessing communities, journalists need fixers' help making contacts and overcoming cultural barriers. Fixers also interpret their own societies for journalists, providing background information and explaining the perspectives of news subjects. Foreign journalists usually plan or are at least able to leave the area or country, sometimes within days. This contributes to a short-term perspective when it comes to considerations of safety, cultivating trusting sources, and risking problems with powerful local figures through critical reporting. Fixers, by contrast, necessarily have longer time horizons when reporting a story because they have roots in and likely plan to stay in the area, and because future journalist clients may ask them to secure access to the same communities or individuals. This research is based on interviews with foreign journalists and fixers reporting on Turkey as well as ethnographic fieldwork in Istanbul and Diyarbakir. I consider the ways that Turkish and Turkish-Kurdish fixers deviate from their employers' demands due to the asymmetry between their and client journalists' temporal relations to their work and how these behaviors shape the news that reaches the wider world. I analyze the ways in which fixers present themselves to interviewees and other local contacts, creatively translate between languages, and are selective about the introductions they make and background information they provide to their clients. I also address the strategies that foreign journalists use to manage the disjuncture between fixers' interests and time horizons and their own.

Bourdieu's Field Theory As General Theory of Religion

The sociology of religion is still divided between approaches of secularization (Weber) and market structures (Stark, Bainbridge, Iannaccone), because both present themselves as opposed to each other. In our paper we propose *Pierre Bourdieu's field theory as a general theory of religion*. By conceptualizing religion as a social field, we can integrate the two paradigms and solve some of the key theoretical problems of the sociology of religion. First, we locate the religious field in relation to other social fields, in particular the political field and the field of power. With illustrations from Germany and Lebanon, we provide a theoretical framework to answer ongoing debates of secularization and how to capture

power relations between politics and religion. Secondly, the religious field is an arena of competition, where the professional agents struggle for specific social groups or individuals as potential religious consumers. Therefore, Bourdieu speaks of an economy of symbolic (i.e. religious) goods. However, while the theory of religious market structures reduces the religious meaning to solely economical motives of the supply-side (Iannaccone), field theory provides a comprehensive framework to reconstruct the motives of the competition as specific religious motives of the producers and the consumers as well. Thus, the competitive struggles can be understood as processes of a specific symbolic economy, with specific social structures of professional agents and religious capital as media of exchange. Both market structures of religion and religious meaning can be linked to each other. Within our contribution we will consequently show how Bourdieu's theory of fields resolves the theoretical problem of combining religious meaning and the market structures of religion. Furthermore, by analyzing secularization and religious competition with the same theoretical approach, we demonstrate field theory's capability to integrate different and until now opposed theoretical concepts of the sociology of religion.

Social Relations As Processes of Configurations of Events

With its focus on actors, Relational Sociology (RS) has not developed a general account of social relations. Even the radical RS (Powell) regards (observable) relations as between social actors. To resolve these theoretical shortcomings of RS, I conceptualize social reality as consisting of events: "The world is a world of events" (Mead). A social event is not a substance, rather it is an observable phenomenon that is shaped and gets meaning by other events. For example, events are actions, organizational decisions or historical events like the French Revolution. According to Abbott (1992), events differ in duration, may overlap and are moving at different speeds. With Abbotts eventful sociology, I propose a definition of a social relation as *a configuration of at least two events*. Relying also on processual sociology, these connections of events are *dynamic processes*; they are embedded in a (structured or interactional) context and are influenced by the number, shape, and duration of the elements. Essential to the dynamics of processes are turning points, understood as intense changes that affect the direction of the ongoing processes (Bidart et al. 2013). Therefore, processes that connect events are whether determinable nor predictable. In my paper, I will show that several benefits arise from conceptualizing social relations as dynamic processes of configurations of events: First, it is a throughout relational approach without any essentialism. Second, I offer a general definition of relations that can operate at any scale and is in line with other forms of relations (e.g. figurations or agency [Emirbayer/Mische]). Third, the temporal dimension of events and turning points of processes contradict a "general linear reality"; "time matters" within a dynamic process of configuration of events.

ARMBRUSTER-SANDOVAL, RALPH* (*University of California, Santa Barbara*)

Starving for Justice: Hunger Strikes, Spectacular Speech, and the Struggle for Dignity in California in the 1990s

In the 1990s, Chicana/o, Latina/o students on college campuses in California stopped eating. Racialized neo-liberalism--budget cuts, anti-immigrant measures, rising fees, and the rapid expansion of the prison-industrial complex--had sparked widespread outrage. Moreover, specific "blunders" or missteps from administration officials had further exacerbated these feelings and emotions. These students had been pushed to the edge. They had tried to redress their grievances, but their pleas generally fell on deaf ears. So they "screamed" and spoke "spectacularly," that is, they went on hunger strikes, sacrificing their health and potentially their lives to create a dignified world. This paper examines these actions, along with their outcomes, but it also seeks to spark debate and dialogue about hunger strikes in the social movement literature. Currently very few studies have published on hunger strikes, with the exception of biographies on critical activists such as Cesar Chavez, Bobby Sands, and Gandhi. Those works--while crucial--are not generally theoretically-driven. I contend that other social movement strategies, especially those involving the body (e.g. self-immolation), can be seen as spectacular speech. Spectacular speech is not new, but conceptually it is useful for understanding how activists sometimes rely on their bodies as weapons in order to be heard and achieve their demands.

Los Derechos Al Cuidado De Madres y Padres Trabajadores En Chile: Titularidad y Experiencias

Los debates sobre la conciliación de la vida laboral y familiar han tenido gran importancia en la última década en el mundo académico y en las políticas públicas. Su presencia se debe en parte a las transformaciones sociodemográficas derivadas de la incorporación de las mujeres al mercado de trabajo, el envejecimiento de la población y el surgimiento de nuevas formas laborales y condiciones contractuales.

En medio de ese debate, el interés por el cuidado ha devenido en un derecho de ciudadanía que reivindica el dar y recibir cuidado en una lógica que supera la relación interpersonal entre cuidador y dependiente, y llega a ser considerado como un asunto de responsabilidad colectiva. Entre los investigadores existe un rico debate acerca de la provisión de servicios de cuidados, la titularidad y el ejercicio de derechos, el que puede agruparse entre los enfoques individualistas posmodernos y los enfoques de género que hacen hincapié en la capacidad de penetración de los factores socio-estructurales.

Esta ponencia presenta los resultados de una investigación cualitativa en base a 30 entrevistas en parejas de madres y padres trabajadores de diferentes orígenes sociales y tipo de empleo en Chile. Su objetivo es comprender la construcción de la maternidad y paternidad desde el cuidado de sus hijos en un escenario de conciliación de la vida laboral y familiar, asociándola a interpretaciones relativas al *social care* (Daly & Lewis, 2000; Saraceno, 2008). Esta investigación muestra que ante el cuidado de los hijos, madres y padres trabajadores presentan discursos más igualitarios, pero persiste cierta naturalización de las identidades que no sólo facilita la sobre carga de trabajo a las madres, sino también debilita el carácter político de cualquier reivindicación de derechos.

ARMSTRONG, JOSHUA* (*York University*)

#Heterosexualprideday: Heterosexual Pride and the Changing Face of Gay Pride

On June 29, 2015 Twitter users were asked to tweet #HeterosexualPrideDay to support a newly-declared 'Heterosexual Pride Day'. This movement had limited success. However, on the same day in 2016 the hashtag rose in significance and became a trend (one of the most highly tweeted about hashtags on Twitter) at the international level. #HeterosexualPrideDay resurfaced again on June 29th in 2017 with similar levels of attention from the global community. Given the disparate visibility of heterosexual pride offline, an exploration of the #HeterosexualPrideDay hashtag's popularity is warranted. In this study I utilize content analysis to address the research question, why are Twitter users referencing the #HeterosexualPrideDay hashtag? Although the #HeterosexualPrideDay hashtag originated as a means of 'trolling' (Internet slang for the purposeful aggravation of other users), several supportive users did not do so in jest. The findings suggest that supporters reasons for associating with #HeterosexualPrideDay can be linked to contemporary understandings of pride while those opposed to the hashtag held traditional understandings of pride. Further, the majority of users co-opted the hashtag as a means of demonstrating their disapproval for heterosexual pride and confronting its supporters.

Overdiagnosis and Overtreatment: A Sociological Perspective on a Contemporary Healthcare Systems Issue

Overdiagnosis and overtreatment are increasingly being recognised as a significant problem in contemporary healthcare but are yet to receive any significant sociological attention, over and above that which is arguably transferable from the medicalisation literature. Overdiagnosis and overtreatment occur when a diagnosis is 'correct' according to current standards but the diagnosis or associated treatment has a low probability of benefitting the patient, and may instead be harmful.

Overdiagnosis and overtreatment might be constructed as problems best addressed by educating patients and clinicians, and improving the relationships between them. The emergence of tools seeking to support decision making and to facilitate patients' asking questions about whether interventions are really necessary certainly supports this conceptualisation.

However, notwithstanding the efforts of interventions of this type, it is unlikely that significant traction on overdiagnosis and overtreatment is possible through these means alone. Even when professionals and patients may wish to do less rather than more, the system within which care is delivered and received can make this challenging to achieve. Overdiagnosis and overtreatment are compounded by the way in which many attempts to improve care quality tend to encourage both doing more rather than less and the standardization of care. Guidelines intended to reduce variation and improve care have arguably encouraged the neglect of respect for patients' preferences.

This paper will argue that a sociological perspective on overdiagnosis and overtreatment recasts them as issues that must be understood as a consequence of the organisational, financial and cultural attributes of the system, not just individual interactions. Social theory exploring accountability, governance and regulation can enhance our thinking about how features of the health system may make

it challenging for clinicians and patients to do less rather than more, not least because of concerns that doing so might be considered deviant.

TG04-984.3

ARMSTRONG, NATALIE* (*University of Leicester*)

The Risk Work of Overdiagnosis and Overtreatment

Overdiagnosis and overtreatment are increasingly being recognised as a significant problem in contemporary healthcare but are yet to receive any significant sociological attention. Overdiagnosis and overtreatment occur when a diagnosis is 'correct' according to current standards but the diagnosis or associated treatment has a low probability of benefitting the patient, and may instead be harmful.

There are now numerous resources and tools available that seek to facilitate decision making and support patients and professionals to become comfortable with doing less rather than more. As an example, the Choosing Wisely campaign provides lists of interventions that may be unnecessary and seeks to support patients to ask questions of professionals about the necessity of these.

As yet though scant attention has been paid to the 'risk work' that such initiatives create for health professionals. Taking decision making about population-based screening as an example, this paper will explore the work professionals do in order to attempt to navigate the risks and uncertainties of screening for both themselves and their patients. While participation in screening is increasingly being framed in terms of informed choice and emphasis is being placed on decision aids and shared decision making, evidence shows that professionals lack confidence and guidance on how to support patients to make decisions, feel uncertain of the evidence about harms and benefits of screening, lack external triggers to prompt meaningful engagement with patients, and, importantly, are concerned about being held accountable for decisions.

Examination of the interactional work at the 'sharp end' of screening offers important insights into the way in which this form of work gets done by professionals and is experienced by patients, including problematizing ideals of non-directive counselling and the challenges of working with ambiguous or contested knowledges about risk and uncertainty.

ARMSTRONG, PAT* (*York University*)

ARMSTRONG, HUGH (*Carleton University*)

Privatization in Long-Term Care Homes

This paper is a product of our major collaborative research initiative, "Reimagining Long-Term Residential Care: An International Study of Promising Practices". The initiative brought together in 2010 Principal Investigator Pat Armstrong with 26 faculty from six countries (Canada, Germany, Norway, Sweden the UK, and the US) and from a dozen academic disciplines in addition to sociology. About 60 graduate students, postdoctoral fellows and research associates have also participated.

We employ two main methodologies: analytical mapping and rapid, site-switching ethnography. Mapping enables us to examine developments on issues such as legislation and regulations, funding, access, quality measures, staffing models and levels, and outcomes. In our ethnographic approach, teams of 12 to 14 researchers together spend up to a week observing and interviewing in one of the 27 nursing homes we have visited. Some bring long experience in nursing home research; others bring fresh eyes to the sector. Over 50 publications have resulted from our collective teamwork.

It has become increasingly clear that financing and ownership issues have an impact on the project's other three central themes: work organization, approaches to care, and accountability and governance. The impact is demonstrably felt at the level of public and non-profit vs. for-profit ownership. The focus here is on several other forms of privatization. We examine the insertion by branches of for-profit nursing home chains and consulting firms into the management of non-profit and public homes. We consider the adoption of the practices and the language of business in these homes. We explore the influence of increasing for-profit ownership on the state's regulatory, inspection and data collection activities. We assess how restrictions on the numbers of publicly funded nursing home spaces impose in turn increased burdens on that other private realm, the household, and on the predominantly unpaid female workers there.

Do New Digital Technologies Generate or Kill Jobs

Recent advances in the fields of robotics and artificial intelligence have raised the question of whether machines and algorithms will after all make human labour obsolete (Brynjolfsson/McAfee 2011). The debate has been fuelled by a recent series of 'future of work' studies according to which up to half of the workforce faces a high risk of automation in coming decades (Frey/Osborne 2017). But, most studies rely on the initial routine task intensity of occupations (Autor 2015) – only an indirect indicator of technological change; or focus only on robots (Acemoglu/Restrepo 2017) – and do not capture other new digital technologies; or neglect beneficial channels of technologies which generate jobs; or ignore that firms deal with new digital technologies differently. Our aim is to study the firm-level job creation and job destruction channels arising from new digital technologies by overcoming these shortcomings.

To estimate worker-group specific labour demand as a function of firm's technology investments, we conduct a representative firm survey among about 2.000 firms in Germany. Within the survey, we ask firms about their technology investments between 2011 and 2016. We then link the survey data to employment biographies from social security records of all workers employed in the surveyed firms. We decompose aggregate firm-level employment into a part reflecting capital-labour substitutions and product demand effects. So, we are able to empirically quantify the relative size of job creation and job destruction channels.

Our preliminary estimates suggest that technology investments are not associated with negative aggregate employment effects as job creation and job destruction effects seem to balance out. In particular, certain occupational and task groups benefit from technology, depending on the degree of automation, whereas others workers are replaced. We also find that certain task combinations are responsible for lower and higher group-specific labour demand effects from technology investments.

The Factors That Influence Completion and Non-Completion Among Disadvantaged College Students

Previous research has found that college graduates are more advantaged than those who drop out. However, little is known about the subjective differences between low income graduates and dropouts. Based on in-depth interviews with 100 students at a four-year commuter university in Metropolitan Detroit, U.S., and an analysis of their academic transcripts six to eight years after the interviews, we found that high income students were much more likely to graduate from college than low income students. To focus on the factors that influence completion and non-completion among disadvantaged college students, we examine data from a sub-sample of 59 students, who were all below the 2010 U.S. median household income. Considering the characteristics of low income graduates and dropouts, we found that the graduates were, on the whole, slightly more disadvantaged than the dropouts: graduates had lower household incomes and were more likely to be students of color and first generation college students. Although both groups overcame many obstacles, graduates (more often than dropouts) reported overcoming extreme hardships, such as homelessness and taking out loans to pay for food and housing. Our analysis further revealed that dropouts reported difficulty assessing their academic needs and weaknesses, and often took no action when confronted by negative circumstances. In contrast, graduates were able to effectively confront their challenges, and more often displayed high self-efficacy (the view that they can influence their conditions). This perspective suggests the development of "grit" (the ability to persevere toward long-term goals). Graduates drew on their own resilience to make use of what we call a "toolbox" of strategies to overcome their obstacles. Thus, we find that self-efficacy, resilience, and the ability to confront obstacles are important factors that enable some disadvantaged students to complete college while others drop out.

The Methodological Foundations of Studying Negative Emotions in Biographical Research

Researchers face a dilemma when negative emotions emerge in biographical research. When they ask participants directly to reflect on difficult experiences, they risk provoking negative reactions or the mobilization of protective barriers. Alternatively, when researchers avoid direct questioning, they risk missing important information for understanding biographical decisions. Both of these approaches can create obstacles to meaningful disclosure and reflection. This paper will examine the methodological foundations of studying negative emotions and experiences in biographical research.

This research focuses on one particular emotion, regret, which is a negative assessment of an action committed or a path not taken. Biographical regret can be painful, as the actions (or inactions) have typically altered one's life path in a negative or detrimental way. While experienced in many life spheres, we focus on education, a life domain that is one of the most common areas of regret. Our

insights are based on an analysis of 204 in-depth interviews at a four-year public commuter university in Metropolitan Detroit, U.S..

We propose three methodological approaches when examining negative emotions in general, and the concept of biographical regret in particular. First, we argue that a comprehensive, highly structured, yet flexible interview guide is ideal in this circumstance. Second, we examine an interview question that assesses what respondents would change about their biographies. Finally, we examine an interview question that asks respondents what advice they would provide to someone in a situation similar to their own. These questions ask respondents to think about biographical regret from a positive, rather than a negative, standpoint. They encourage disclosure because they do not dwell on problems but instead focus on alternatives and solutions. These methodological foundations are effective at eliciting information in a meaningful and respectful way and can be incorporated into a variety of biographical studies where negative emotions emerge.

BIFULCO, LAVINIA* (University of Milano Bicocca)

The Theoretical and Empirical Contribution of the Interstitial Organizations to the Study of Power and Elites. Fobs, Think Tanks and Political Foundations

The paper discusses the heuristic potential of interstitial organizations such as FOBs (banking foundations), US think tanks and German political foundations. These organizations share significant features:

- They are interstitial space (Eyal, 2010) among different fields such as politics media, academic, business, financial, philanthropic fields (Dakowska, 2014; Medevetz, 2012).
- They have a prominent decision-making role in issues of public concern without having a specific responsibility.
- They are difficult to place because of their interstitiality that however seems to be a key to enlight central dynamics about power.

In the context of financialization and philanthrocapitalism two focuses seem relevant: the depoliticization dynamics associated with the rise of arenas and devices that "do politics without saying it"; the relationships between power and knowledge.

The paper focuses on Italian FOBs and their potential for theory building in the sociology of organizations also trying to shed light on affinities and divergences with US think tanks and German political foundations. Fobs are an exclusive Italian institution, born with the privatization of banks in the 1990s that separated financial and philanthropic activities. They appear to be real institutions of government, which influence public issues at local, national and (partially) international scale, and are fundamental places where political, economic and financial Italian elites meet and 'mix' together. In spite of that, little is known about how they act.

The first part of the paper introduces the theme of interstitial organizations. The second part analyses the three cases focusing in particular on the results of the study on Italian FOBs, carried out through an interpretive and socio-historical approach from the 1990s to the present day. In the third part, we discuss and argue how research paths coming from the analysis of interstitial organizations can contribute to studies on elites and power.

Encounters between Native Peoples and Recent Syrian Refugees in Hatay, Turkey

Recent Syrian refugee crisis is fundamental issue not only the classic immigrant countries and the neighbours but also the other far countries and also the region as the European Union. The order people are not interested in the refugee just international or political subject. Rather, they encounter within everyday life, live and work together in same or next/closed neighbourhoods and places. Beside these, states take extreme security precautions to protect the borders. Border people and their practices are affected these precautions and required to take intersectional positioning.

In the Syrian refugee crisis, Turkey has applied and changed different refugee politics since the war started. Recently, it takes extreme precautions to prevent the refugee flows. The border people should deal with difficulties from these precautions on the Turkey-Syria border. Thus, both the natives and refugees have taken position to live and survive under new conditions. Cities on the Syrian border have different and difficult intersectional positioning in Turkey. This study aims to understand and explain socio-cultural and economic intersectional positioning in everyday life in Hatay as a Turkey-Syria border city.

This research aims to answer the questions: How and where the natives and the refugees come across in everyday life? How and what kind of relations emerge among them? What kind of positioning are taken by the natives and what kind of interaction are realized in Hatay?

This study scrutinizes the patterns of intersectional positioning and interaction in everyday life in Hatay. In this qualitatively designed ongoing research, data provided by 50 in-depth, 30 focus group, many spontaneous interviews, small

talks and observation in the border villages and neighbourhoods of Hatay since July 2017. The findings are shared in the presentation. This study is supported by Hatay Mustafa Kemal University, Scientific Project Foundation by the Project Number: 16776.

Social and Symbolic Violence in the Construction Process of Turkey-Syria Border Wall in Hatay

After the fall of Berlin Wall in 1990, it is thought that any new Wall cannot be installed in the globalization era to restrain the circulation of capital, goods, political ideas or images as well as human in the World. However, the construction a Wall is still in-use to separate between peoples and the states. Walls is not only drawing borders but also reinforced the sovereignty and power of states using the Wall's social, political and also symbolic violence. Beside installation process of a Wall includes social, economic and political relations as well as power dimensions.

This study focus on the local people's experiences as social and symbolic power and violence in the construction process of the Turkey-Syria Border Wall. The installing Wall identifies both "inside" and "outside", as Anzaldúa (1981) stated, in recent days. The construction process is started in Hatay and unique experience for the local people within different ways including dirty, dusty and huge trucks, crowded roads, broken infrastructure, noisy days and nights, many strangers and new regulations and prohibitions, and so on. While some dwellers accept that is good for them and security; some others complain and criticize nowadays' extreme and tiresome precautions in their regions.

This study ask for these questions: How the local people are affected the construction process of the Wall in Hatay? How and what the wall symbolize for the local people? How the local people takes and evaluates advantages and disadvantages of the Wall?

Used data in this qualitatively designed ongoing research is provided by in-depth, focus group, many spontaneous interviews, small talks and observation in the border villages and neighborhoods of Hatay since July, 2017. The findings will be shared in the presentation. This study is supported by Hatay Mustafa Kemal University, Scientific Project Foundation by the Project Number: 16776.

ARTEGUI ALCAIDE, IZASKUN* (University of the Basque Country)

Construyendo Vidas: El Impacto De La Incertidumbre En Las Trayectorias De Los Jóvenes Adultos

Planificar el futuro es un hito ineludible en la transición de la juventud a la edad adulta que requiere de una estructura temporal normalizada y de unos contrafuerzas lo suficientemente sólidos que otorguen cierta guía de certezas a la hora de organizar la propia biografía. El ciclo vital estandarizado, fuertemente ligado a la norma social del empleo propia de la época dorada del capitalismo, trajo consigo algunos de esos elementos clave, contribuyendo a crear un mecanismo de simplificación que ayudaba a los jóvenes a detectar la siguiente etapa vital a enfrentar. No obstante, las transformaciones de los mercados laborales de las últimas décadas, unidas a la crisis financiera que comienza en 2008, han provocado que estos pilares se erosionen. Desde la tesis de la desestandarización del ciclo vital se sostiene que el ciclo vital estandarizado, hoy, tiende a sustituirse por un ciclo de vida desestructurado e individualizado desde el cual, elaborar un plan de futuro se complica. El objetivo de esta comunicación es analizar de qué manera los jóvenes enfrentan y resuelven este escenario de incertidumbre y buscan estrategias que contribuyan a (re)desconfigurar sus futuros. Para ello, presentaremos cuatro perfiles de trayectorias (avance, espera, deriva y resiliencia) y ahondaremos en sus principales características (oportunidad, distanciamiento, riesgo, reflexividad, pérdida de agencia, crecimiento, inestabilidad, desengaño generacional, empoderamiento, frustración, adaptación, vulnerabilidad,...). Lo expuesto se apoyará en los datos producidos a través de veinticuatro entrevistas en profundidad realizadas a jóvenes en transición en el ecuador de la crisis. Además, este material se complementará con una serie de gráficos dibujados por los propios entrevistados que muestran de forma visual algunas de las características más significativas que acompañan a cada uno de los perfiles: la linealidad, la inestabilidad, la ralentización, el caos, la discontinuidad, etc.

To Share or Not to Share? the Maker Movement and Agroecology As Cases of Collaborative Collective Action

The concept of collective action has long been ubiquitous in the field of sociology, and has even given birth to the area of social movement studies. Our interest lies, however, in an aspect of collective action that has so far remained relatively understudied: its collaborative dimension. We argue that collaborating

implies a shared and active participation in the design and operation of initiatives. It entails, as well, the development of a collective identity generating a sense of belonging, and a conscious commitment to living in a community of equals. Collaborating means, thus, much more than the "mere" act of sharing associated to the booming sharing economy.

Our paper sets out to unpack some of the arguments and debates that are emerging in the context of the novel sharing economy scenario. We will begin by presenting a theoretical and genealogical analysis of what we understand for collaborative collective action. We will then examine the empirical continuities and disruptions with regards to previous forms of cooperation.

Our analysis will be based on the comparison of two a priori dissimilar case studies: the maker movement and agroecology. The former constitutes the epitome of innovation, new technologies and open source code. The latter rests on tradition, sustainability and responsible consumption. We argue that despite their marked differences in terms of origins, trajectory and goals, both have developed a certain "politics of sharing" and have managed to satisfy individual and collective needs while pursuing the principles of equality, justice, horizontality and the reconstruction of the commons.

Data will come from a qualitative study conducted between 2017 and 2018 in the Basque Autonomous Community through in-depth interviews, non-participant observations and the analysis of secondary sources.

The "Flagship"-Institutions of Current Higher Education and Research Policy Under Scrutiny

According to current policy, global university rankings are assumed to identify successful HE- and research policy in the style of the more universities a country has at the top, the better is its HE-system. However, the fact is that rankings grant prominence only to a limited number of universities and thus do not tell a great deal about any national HE-system as a whole, not to mention the scientific level of universities in various fields.

The paper asks to what extent the top 200 universities in scientific publishing in four main research fields (biological, physical, social and life sciences) also reach the top 200 positions in global university rankings. Currently there are 53 such universities that are among the 200 most publishing universities in each of the four main fields and reach top 200 in three most distinctive global rankings NTU, URAP and USNWR. Most 'all-rounders' 19 (out of 53) reside in EU countries and 18 in the United States. In the rest of the world remains 16 'all-rounders' so that five in both of Canada and Australia and one in each of Brazil, China, Japan, Korea, Singapore and Taiwan. As opposed to a common assumption that "money matters", the paper finds that from the best of the best research universities (53 'all-rounders') fewer than every other is listed among the hundred wealthiest in the world.

Undoubtedly any region is proud of its every 'all-rounder', and for a good reason, but the few 'all-rounders' do not represent accurately the level of research conducted in region's universities. The paper assesses the extent to which the number of 'all-rounders' indicate the level of scientific publishing of universities in four main research fields by regions and territories.

Challenges of Pursuing Traditional Technology Based Occupations in Contemporary India – a Case Study of Chhipa Community of Balotra, Rajasthan, India

Block Printing on textiles has been a traditional occupation practiced by the Chhipa community of Rajasthan, India, since many centuries. It involves multi-generational households in various processes of block-printing and is an important criteria of their social and professional identity. However the number of families pursuing this occupation in this region has drastically declined due to various reasons. Some have adopted other means of earning livelihood. But most members of this community are facing economic hardships and social exclusion. The present study focuses on the conventional technology methods followed by the people in this occupation. It analyses the sustainability of these practices in the present conditions, and the challenges posed by the new 'modern' methods available in the market in the pursuit of this occupation. The present study is an ethnographic approach and is based on primary data collection comprising of interviews, formal and informal interactions, census reports and site visits.

Ugly Trends in Child Sexual Molestation, Rape and Incest: A View from South West Nigeria.

Out of the blues, sexual molestation especially rape and incest is suddenly on the increase in Nigeria. It seems, somehow, that many Nigerians have lost their once cherished values of decency and responsibility, with several cases of adult males assaulting young under-aged girls being widely reported daily in both the print and electronic media. Most times, these heinous acts are perpetrated by trusted neighbours, uncles, respected grandpas, revered pastors, imams, or teachers and even fathers. Benefitting from documentary data **assessed from the internet and national newspapers, In-depth Interviews (IDIs) were conducted with some personnel of NGOs, the Police, Courts and notable victims for the study.** The paper submits that sometimes, the victim is cajoled and benignly taken advantage of; but oftentimes, it is forceful, violent rape; leaving the victim physically and psychologically bruised and scarred. In some extreme cases, the victims – especially those who resist, lose their lives or get maimed for life. The study identifies that both the Criminal and Penal codes in Nigeria, on child sexual abuse, are not stringent enough, while the Nigerian Child Rights Act, has not been enacted by many States of the Federation, to address the problem and also the issue of delay in the Courts. The Police are equally hampered by lack of specialised training/skills and poor logistics for quick responses. **The study strongly** suggests that child sexual molestation can be significantly reduced through aggressive mass sensitisation programmes at all levels, while the formal punishment for sexually abusing a child should be quite severe and even to the limits of the law, to serve as deterrent to others. Parents/guardians especially mothers should be careful and vigilant.

Interrogating Leisure and Development from an African Perspective

The interrogation of leisure and development from an African perspective is imperative within the context of globalization and the theoretical musings of the terms in Sociology of leisure. Modern discourses and usage of the terms, from an African perspective, raise important theoretical and practical issues, and not solely on the nuances that are associated with them. Implicit in the theorizing of the terms and in discussions surrounding them is the presumptions of their universal applicability. In this paper, we attempt to address the following questions: what is the nature and components of leisure? How do we conceptualize the relationship between leisure and development? And what implications does the knowledge so derived have on African nation-states? We propose that studies in this field will lead to the issue of contextualization and the particular situation of the intellectual production.

The Historical Entanglement with Power and Interest: Western Medicine Versus African Medicine.

Modern discourses and usage of the terms "Western medicine" and "African medicine" raise epistemological focus on the "how" and "whose" knowledge, and not solely on the functions of these forms of knowledge and practice. Implicit in discussions of indigenous knowledge, with accounts of the historical variability of structures of thought and action, is the ontological predicate of a difference in identity; the entanglement with power and interest, of rational subjects as embodied and practically engaged in their life worlds, traditions and worldviews. Hence, African medicine stands as alternative to Western medicine. The idea that Western medicine involves the production of knowledge that has as its components, logic, rationality, and replicability and, therefore, has a universal applicability, in itself, is a hegemonic narrative, which taints other medical systems as inferior to it. To entrench this hegemonic power relations, African medicine is portrayed as revolving around the issue of identity and the culture on which it is predicated. In this paper, we contend against the common assumptions that every paradigm of African indigenous knowledge, from a non-African ontology and perspective, has as its elements impreciseness, vagueness, contingency, and lack of synthesis and reflexivity. Thus, from an African cosmological stand point, we argue that African medical system is grounded in the theory of embeddedness; the co-existence of the real and the illusion; the stable and the unstable, the spiritual and the physical, separate at one level of awareness but enmeshed at another level of opacity. As a preliminary submission, we contend that there are multiple realities and the real and the unreal are a matter of degrees and methods of inquiries. This is what makes Western and African medicines distinctively different: it is in the arena of the methods of inquiry, knowing, and practice.

An Analysis of Transformations in the Mass Media Constructions of Black Women's Hair - the Leisurely Way

The Negroid woman has gone through various physical transformations in terms of her body and shape but for this paper specific attention will be on her hair which has passed through transformations in terms of shape and texture. The mass media through the entertainment industry has over the years visually presented and verbally described the Negroid woman in terms of her hair through adverts, celebrities and fashion. Exposure to such mass media messages for many is a leisure exercise which nevertheless has served as symbols of Black identity while re-enforcing concepts such as political and social class. Through the lens of the mass media Black women all over the world have been exposed to leisure coated messages that promote a desire and craving to change the shape and form the Negroid hair takes; a shape that has ensured that the Black hair care industry stays alive and thrives. Through drama, documentaries, news and adverts; constructed with the use of words and visuals, the African Negroid woman has been encouraged to hide her natural hair texture and replace it with long and straight hair in order to look 'acceptable' or 'sexy' thus promoting a false sense of self-worth. Today the story has changed slightly with more Black women coming out to express a sense of freedom through the grooming of their natural hair. Blogs and YouTube sites are created and designed to teach Black women the skills of growing and maintaining their natural hair. This paper considers some of these social media websites in order to analyze the new vocabulary and images associated with this transformation through leisure. To achieve this, a qualitative method of discourse analysis is employed using Multimodal techniques to analyze the words and images used by Black women in defining, describing and discussing the Negroid hair.

Beyond Western Medicine: Interrogating Magun As a Cultural and Medical Reality

Sickness, disease and healing are elements the human species has sought to find answers to; mainly because they can determine the unfortunate possibility of death. In a number of African cultures, sickness and disease begin with the spiritual leading to a physical manifestation thus healing begins with the spiritual. This is unlike Western beliefs that theorize that the physical manifestations of bacteria and viruses lead to diseases; thus, healing methods only prescribe medicines that deal with the apparent ailment. However, there are some African ailments that cannot fit into Western theories of sickness, disease and healing. One of such is the Yoruba concept of *Magun*. *Magun* is based on the theory that a man can lace his woman with *Magun* if he suspects that she is sexually unfaithful. *Magun* is spiritually transferred and the female victim is usually unaware. If she has sexual intercourse after the lacing, her sexual partner dies; if she is innocent and does not have sex within the stated timeframe, she dies. Western trained medical practitioners have classified this phenomenon as the mere imaginations of primitive and illiterate Africans and thus both its existence as well as healing methods are considered barbaric. These contentions form the core of the paper. Using Qualitative and descriptive methods, the Nigerian home video titled *Magun (Thunderbolt)* is analyzed. Through drama *Magun (Thunderbolt)* presents the complexity of an ailment initiated spiritually and treated through interventions of custodians of the spiritual. The fact that Western trained practitioners did not believe in its existence and contended against it through Western based theories of experimentation to physically prove this; did not mean it was not real. It is hoped that this paper can spur more discourses on the power relations behind African and Western definitions and theorization of sickness, disease and healing.

Why Are Japanese Youth More Satisfied Than before? : Structure of Youth Life-Satisfaction

Life satisfaction is one of the important factors of well-being. According to several statistics, Japanese youth today feel much more satisfied with their life than before, despite deteriorating socio-economic conditions surrounding them. This study examines the factors which contribute to life-satisfaction among Japanese youth, and also investigates whether the combination of those factors could individualize their well-being, or it could encourage social and political participation against inequalities and contribute to the promotion of justice. This presentation is based on quantitative analysis of the data collected in Tokyo and Kobe, two urban areas of Japan, in 2012. Respondents are randomly sampled from Basic Resident Register, aged from 16 to 49. We grouped those from 16 to 29 into youth and others into middle-aged.

In this study, we conducted a multivariate regression analysis, in which the dependent variable is life-satisfaction measured with 4 point scale. We put several variables supposed to affect the life-satisfaction into the model. To summarize the results;

1) Their life-satisfaction are sustained by mainly three factors: present life conditions, future prospect and intimate relationship.

2) In contrast, life-satisfaction among middle-aged respondents is sustained just by two factors: present life conditions and future prospect.

3) Life-satisfaction and intimacy, particularly good relationship with their friends, among youth do not affect the degree to which they participate in social or political activities.

The fact that youth satisfaction is sustained by intimate relationship seems to imply some risk that their well-being could be individualized or even privatized and that social and political participation could be discouraged. Results show that this is not the case. However, the participation rate among Japanese youth has been quite low for the last half century. A new way of participation should be developed along with the structure of their life-satisfaction.

"Taming the Beast": Exploring the Adoption of Mobile Phone Innovation through the Daily Routines of Traders in Ghana

Most studies on the mobile phone in sub-Saharan Africa traditional markets have not considered the social "journey" that one takes on the "journey" of owning and discarding the mobile phone handset. The purpose of this paper is to explore an aspect of this process and examine how the social journey of owning and using a mobile phone can contribute to our understanding of technological innovation and adoption among traders. Using a survey of 363 traders this paper argues that technological innovations gain acceptance and are adopted when they fit into the daily routines of traders. When these technologies fail to be routinized by the traders, they easily get abandoned. However, these routines are ignored when governments develop policies for technological acceptance in Africa either at the micro or macro level.

Effects of Displacement, Forced Migration, and Resettlement on Arab Family Relationships

This qualitative research examines the subjective effects of displacement, forced migration, and resettlement on Arab family relationships. Interviews were conducted with 30 mothers and fathers who were displaced by war in Syria and Iraq, lived in transit countries for varying amounts of time, and arrived in Canada in the previous 7 years. They reflected on their family life in their country of origin before and during wartime, in transit countries, and post-migration. A thematic analysis of the interview data was guided by the principles of constructivist grounded theory methodology.

Identified themes suggest a complex intertwining of the following influences on family relationships over the course of displacement, migration, and resettlement: (i) dramatic sociocultural changes challenge and emphasize gender norms in public and family contexts; (ii) trauma associated with living in and fleeing from conflict zones affects personal and relational well-being, risk, and resilience; (iii) the unique and complex aspects of each family's journey direct the course of family interactions, decision-making, and settlement; and (iv) key aspects of cultural and religious values, traditions, and practices guide parents' decisions and hopes for the future.

This presentation highlights how accepted gender norms in the pre-migration context become secondary to safety and security priorities in temporary flight, while gender role changes during resettlement in a new sociocultural context can create conflict and distance in spousal relationships. Traumatic experiences contribute to distress and conflict in family interactions, furthering suffering and increasing risk of violence in some families. For others, or at different times, family interactions and support from others contribute to resilience. Skilled service providers can play an important role in addressing personal and interpersonal struggles during resettlement. These families report a tension between integrating into a new context and holding onto valued aspects of their former family life.

What's 'doux' about 'doux Commerce'? the Case of Surrogacy

What's 'doux' about 'doux commerce'? The case of surrogacy

Samantha Ashenden, Birkbeck College, University of London

Practices of kinship are currently being re-written by the development of markets in reproductive technologies and associated services and by transformations in legally recognised family forms. In particular, the emergence of international commercial surrogacy has raised a number of legal and ethical concerns: many assert that making people should not be the result of market transactions, and

many states attempt to proscribe commercial surrogacy specifically because it is seen to undermine the dignity of women and children.

This paper examines the apparent contradiction between markets and morals thrown up by commercial surrogacy. It does so both by looking at practices of family formation historically, and by exploring the idea that altruism can be clearly distinguished from commerce in this set of practices in the present. Historically, marriage as alliance made kinship part of an economic calculus. In the present the idea that altruism and commerce stand opposed to each other undergirds opposition to commercial surrogacy in the idea that women working as surrogates are engaged in 'exceptional' labour.

In the paper this new nexus of relations is investigated by looking in detail at a number of recent cases in which a commercial market in surrogacy and the normative horizons of states have come into direct conflict.

The Paradoxical Repertoires of Diversity and Professionalism: Exploring Socio-Economic Diversity and Change in the Elite Professions.

In recent years, the critical literature on diversity has underlined the extent to which associated practice and policy tends to reproduce the status quo. In order to do so, attention has turned to discourse, to demonstrate how language exerts power within organisations, to naturalise social reality and secure managerial control. This literature offers important insights, yet recent contributions have implied a clarity in the performativity of organisational and individual texts, in favour of continuity not change, and overlooked how the inevitable dilemmas of diversity are negotiated and managed in everyday life, with what effect. The current paper contributes to this debate. Drawing on 51 interviews with professionals at ten leading law and accountancy firms in the UK, we explore how they understand and articulate the contradictory relationship between socio-economic diversity and professionalism, and how they manage the tensions that emerge. Elite professional service firms provide an interesting context in which to study the difficulties of doing diversity because they are currently presented with a clear dilemma: as external pressures to diversity on the basis of socio-economic background increase, their legitimacy as assessed by multiple stakeholders increasingly rests on demonstrating both exclusivity and inclusivity at once. Using an analytical method grounded in a critical discursive psychology approach, we show that diversity is framed by organisational actors in relation to 11 'interpretative repertoires'. Inconsistency within and between these repertoires may be interpreted as a form of hypocrisy and therefore viewed in negative terms. However, we argue that the ideological dilemmas that result may constitute an important resource, by offering professionals new ways of talking about the relationship between professionalism and diversity, thus facilitating some progressive change. In sum, we show that organisational actors concerned with diversity work both in and through paradox, which (paradoxically) represents potential for both continuity and change.

Conceptualising Complex Identities of British Muslim Women

In this controversial era of Trump in the USA, and Brexit in the United Kingdom, Muslims and immigrants and their identities have come to the forefront of public debates. Highlighting and understanding immigrant identities is essential. To date, there has been little research focus on exploring the intergenerational identities of Muslim women in the West. This paper offers multi-sited ethnographic research

that explores the complexity of identities across the generations and cultures of British Muslim women in the UK cities of Newcastle-upon-Tyne and Glasgow. To achieve the aims of this study, forty in-depth oral history interviews were conducted, alongside the participant observations of the researcher, in a variety of settings and situations. The methodology of the research provided a profound insight into the complex and sometimes contradictory notion of identity, through the intersection of the gender, ethnicity and religion of the research participants. The paper will discuss the multiple challenges and opportunities experienced by the research participants in the secular space of the UK. Theories of double consciousness and black feminist thought, in conjunction with intersectionality, were utilised in order to demonstrate and explore the multiple identities of the research participants at the micro and macro level. The study investigates not only family and community issues and tensions, but also includes the research participants' interaction with the wider society, and the impact of this interaction on the construction of their identities. Thus, the study intends to empower the research participants, through the provision of a platform for their voices to be shared with the wider society.

Name-Based Discrimination and Resume Whitening: How Do Second-Generation Immigrants Understand and Navigate "Anticipated Discrimination" in the Canadian Labour Market?

Research on name-based discrimination in the Canadian labour market shows that job applicants with "non-White"-sounding names tend to receive fewer responses from prospective employers when compared to those with "White"-sounding names. The phenomenon of name-based discrimination has largely been studied through audit studies, which help to capture the pervasiveness of racial discrimination in the hiring process. However, less is known about job applicants' awareness of such discriminatory practices or about how applicants use their own knowledge of racial discrimination to navigate labour market inequalities. Additionally, of the literature that does exist, very little has been conducted on the experiences of racialized second-generation immigrants. This is quite surprising, given higher rates of "perceived discrimination" reported by racialized second-generation immigrants than either their first-generation or their non-racialized peers.

The present study explores the phenomenon of name-based discrimination (and racially discriminatory hiring processes more broadly) from the standpoint of young racialized second-generation immigrants themselves, as they make their transitions from school-work. Through the use of interviews, open-ended surveys, and focus groups with second-generation immigrants, this paper examines not only the attitudes of our participants toward name-based discrimination, but also the ways they come to know, understand, and navigate this phenomenon as social actors. Findings revealed a high level of awareness of name-based discrimination among these young people. Some participants engaged in "resume-whitening" tactics that are intended to circumvent anticipated discrimination, but they expressed varying levels of moral consternation about using these tactics. Participants also shared their views on the intersections of racial and gender discrimination, including the assumptions employers may have made about them. Overall, participants' responses indicated a critical, reflexive, and agentic awareness to the challenges they faced, and a proactive orientation to navigating these phenomena.

Thinking of Social Future: The Paradigms of Theoretical Constructing

This paper analyzes theoretical-methodological approaches to the study of the social future. Sociological research aims at the description and the explanation of the social phenomena in the regime of "here and now". At the same time, sociology always has in its view the project of a better future society. The features of a futuristic/social-utopian concern can be seen in the concepts of postindustrial society as well as in the studies of urban conflicts over parking lots and playgrounds. The object and the subject of sociology are asynchronous: the object of sociology is the present whereas its subject (overt or latent) is the future. Three main theoretical paradigms in sociology are based on different ratios of the present, as the obvious object of the research, to a hypothetical project of the future, as not so clearly reflected subject.

The "revolution" paradigm suggests viewing present as a moment on the eve of the arrival of the future, whose models become a dominating subject of the researched are constructed in the opposition to the realities of existing society as its observable object.

The "historical" paradigm brings the research to the systematization and interpretation of the past and the present as its objects, turning the statements about their nature into the formal historical universals where social future is presented only in the reduced form of theoretical idealization.

The "dialectical" paradigm, in its study of the progressive future-oriented social dynamics, focuses on the present as its research object. It constructs the models of the social future as resulting from the resolution of the contradictions in the hidden trends of the present. The application of this approach to the analysis of current version of capitalism allows us to study the emergence of the new forms of social interactions, control and inequality.

Explaining the Problem of Political Corruption in Ghana's Fourth Republic

Political corruption involving illegal use of power to advance private interests by government officials is one of the major problems impeding development in Ghana since the country gained independence in 1957. In the recent decade, however, reported cases of pervasive political corruption from the judgment debt saga to the recent bus rebranding scandal have caused public outrage. Using relevant publicly available data on specific cases of corruption scandals, this paper proposes a corruption-ignition framework, which argues that the problem of corruption in Ghana mainly stems from an interaction of greed, power, and dysfunctional institutions of accountability. This proposed framework integrates and builds on other theoretical insights, including Klitgaard's model, opportunity theory, global anti-corruption framework, and rational-choice theory to illuminate the opportunities and the incentives shaping the state of political corruption in Ghana. It concludes that uncontrolled political corruption is primarily a function of the consistent political leadership failure to aggressively regulate greed, and limit power by enacting, amending, and strictly enforcing relevant legal provisions. It calls on major stakeholders, particularly the political leadership, to critically analyze power structures, and how the mechanisms of accountability are easily compromised with impunity to help institutionalize robust systems, which are not easily amenable to manipulation. This paper extends our current substantive knowledge of the fight against corruption, and the implications this has for anti-corruption crusade, particularly in Ghana and Sub-Saharan Africa generally.

ASOR, BUBBLES BEVERLY* (*De La Salle University Manila*)

'more Than a Home': Sacred Spaces, Home-Making Strategies and Filipino Migrant Communities in South Korea

In this paper, I examine migrant home-making as a process of not only forging communities and expressing ethnic identities but also as an (in)visibilizing and (re) politicizing strategy of migrants' presence in the public sphere of a host society. Based on multisited ethnography of Filipino migrant communities in South Korea, I explore how migrants employ religious resources and Catholic affiliation in carving ethnic identity, new subjectivities and migrant collectivities through various home-making strategies both in the sacred and secular spaces. These home-making strategies have the performative power to challenge spatial and integration regimes through which the Korean state and its apparatuses manage the migrant population in the public sphere. I specifically look at two of the creative strategies of recreating 'imagined' Filipino communities and 'homes' in South Korea: (1) how Filipino migrant communities observe calendrical religious rituals such as *Santacruz* and processions as embodied performance of Filipino identity and collectivity in public spaces; and (2) how Filipino migrants replicate and restage their 'homeland' through the most mundane and quotidian activities such as buying and selling Filipino products at Filipino stores and markets, sending remittances and meeting co-ethnics. These home-making strategies operate in two intertwined levels. First, the intramural level occurs between and among co-ethnic Filipinos in the (re)creation of an idealized notion of home through collective memory, nostalgia and continuity of religious and cultural practices and beliefs. Second, the extramural level transpires when home-making is performed for non-Filipino spectators to assert social and cultural identities which Filipino migrants perceive as 'unique' from Korean culture. I argue that although migrant home-making are strategies for migrants to 'survive and thrive' in the host society, they are also powerful tool to negotiate and resist migrants' invisibility and marginal positionality.

Construction of the Fight Against Human Trafficking: An International Analysis

Construction of the Fight Against Human Trafficking: an International Analysis

Human trafficking has been conceptualized as a global problem especially after the fall of the Soviet block. Slavery-like experiences of migrants differ according to gender, class, race and age. How governments deal with irregular and regular migration affects migrants' legalization conditions and their chances to

survive and get access to human rights. Within the contemporary migration policy discussion, irregular migrants are conceptualized either as criminals or as victims. The common image of human trafficking has been key for the construction of the 'victim/criminal migrant' image as well as for the development of policies for fighting human trafficking and the securitization of migration. The study explores the ambiguities of the migration-trafficking nexus and investigates the development of the fight against human trafficking as a transitional field in which some migratory experiences are defined as human trafficking. It tries to show how "connected stances against a global social problem" - common policies - are produced internationally in general, and nationally in particular, within the example of three countries which are defined with different positions according to the phenomenon: Ukraine as a "source country", Turkey as a "transit and destination country", Germany as a "destination country". The study is based on field research, 50 semi-structured expert interviews carried out with relevant bureaucrats and activists in the abovementioned three countries, as well as documentary research covering 141 research papers, 57 best practice studies, 33 international conventions and agreements, 11 EU documents, 34 action plans and national legislation texts. It uses a Bourdieusian approach and investigates the relation between the structure of the field and the produced discourses and policies within the construction of counter-trafficking and current migration policies, and provides suggestions for integrating a gender-sensitive and human rights approach into counter-trafficking issues.

Biafra Renaissance in Communities in South-Eastern Nigeria

More than four decades after the cessation of the Nigerian Civil War, there has been a resurgence of Biafran consciousness and agitation for a return of the defunct Republic of Biafra among the people in South-Eastern Nigeria. The end of the Nigerian Civil War only signalled a long silence by Biafran 'secessionist-activists', but it did not signify an end to the appeal of Biafran ideology to the succeeding generations. With the re-introduction of multi-party democracy in 1999 and the emergence of the Movement for Actualization of the Sovereign State of Biafra (MASSOB) in the year 2000, the hitherto comatose Biafra consciousness and agitation have once again been reactivated. It is important to note that, within the last fifteen years, the idea of 'Biafra' has once again gained social value among the Igbo people in South-Eastern Nigeria. Biafran agitation and its popularity have continued to foster repeated open and violent confrontations between members of Biafra activists, their supporters and coercive forces of the Nigerian state. This study, with particular focus on the violent agitation, examines the context of Biafra renaissance in South-Eastern Nigeria. Using social identity theory, we illustrate how group formation gives an individual a sense of identity and how people tend to ally with their in-group identity against another out-group in relation to group cohesion and violence in explaining the social context of Biafra resurgence. Using qualitative methods and exploratory research design, the study was conducted in three communities in South-Eastern Nigeria where Biafran activism and activities are prevalent - Onitsha, Aba and Okigwe. The interviewees were selected using purposive and snowballing methods while data were collected using both secondary and primary sources. This study presents the sociological underpinnings of the context of the violent Biafra activism and activities in South-Eastern Nigeria.

Violence Against Aged Women: Implication of Witchcraft Label in South-Eastern Nigeria

Of what essence is graceful aging and growing old to the Nigerian society? Belief in existence of witchcraft has remained a strong phenomenon in our society today. It cuts across the Nigerian society, gender and age group but mostly associated with old women, thus old age is synonymous with witchcraft. This phenomenon against every other societal problem increases the level of violence and mortality in places where witchcraft believe/practice is prevalent. Thus the need curb this menace becomes inevitable. This study is descriptive and twenty interviews were conducted with aged women who are victims of violence associated with witchcraft label and their relatives using qualitative methods of data collection (Key Informant Interview and In-Depth Interview). The interviewees were selected using purposive and snowballing methods while the data collected were analysed using ethnographic content analysis. The findings show how aged women when been labelled a witch are subjected to different forms of dehumanized violence such as, dejection, battering that result to death. This study suggests that laws should be made to protect aged people especially women against this witchcraft label, abuse and to defend their human rights in the Nigerian society.

RC20-371.4ATKINSON, WILL* (*University of Bristol*)*Capital Composition in Capitalist Social Orders: Examining the Applicability and Variability of Bourdieu's Model of Class across Nations*

This paper reports on efforts to test the contemporary applicability and generalisability of Pierre Bourdieu's recasting of class as a multidimensional 'social space'. Specifically, the task is to determine whether a prime vertical principle of stratification based on volume of all pertinent forms of capital (economic, social and cultural) is consistently accompanied by a secondary, horizontal 'capital composition' principle distinguishing those richer in economic capital from those richer in cultural capital and, if so, whether there are any national divergences in its strength. Drawing on data from the 2009 International Social Survey Programme's Social Inequality module and deploying multiple correspondence analysis, separate models of social spaces for twenty mature capitalist countries are constructed. The main finding is that Bourdieu's model generally holds good for a wide range of nations in the 21st Century, but the strength of the capital composition principle, and thus its likely salience in everyday perceptions of social difference, varies considerably from country to country. While limits of the data encourage caution not to overstate conclusions, the potency of the capital composition principle does seem to correspond with the level of economic inequality and average years of education within nations.

RC20-JS-78.1ATOBE, CHISATO* (*Shizuoka university*)*Does Japanese Women's Labor Force Development Cause Gender Inequality?: A Focus on Maternity Leave Substitute Jobs in the 1940s-70s.*

In this paper, I explore the social segregation surrounding female labor in recent years in relation to the historical case of the Japan Teachers' Union (JTU)'s movement. The Women's Bureau of JTU had been demanding a substitute teacher system for maternity leave since 1945. This system was finally established in 1961.

A previous study insisted that this system realized the continued employment of women after childbirth. On the other hand, we can point out the system had a problem in that non-permanent substitute teachers support permanent teachers. That is, despite aiming for gender equality, the substitute teacher system has created a new unstable employment for women. Thus, this system has made the issue of gender inequality more serious. However, the previous study did not regard the process of establishing the maternity leave substitute teacher's system.

Therefore, I considered, from the interview survey and historical document analysis, how the maternity leave substitute teacher system was formed, and whether the problem of the treatment gap between regular employment and irregular employment had to intervene in the institution establishment process.

As a result, female teachers revealed that they attempted to overcome poor treatment, paying attention to the treatment of substitute teachers during maternity leave at the time of system planning. On the other hand, in an era when the housewife increased in Japan, this movement did not spread beyond gender. Also, they could not realize the original concept of maternity leave substitute teachers being regular employees pooled into each county or city. This historical case suggests that it may lead to a disruption of hierarchy, for example between permanent and non-permanent employees, if we don't have a comprehensive view of female labor when we think about the contemporary policy issues in women's labor force development.

RC42-JS-49.4ATRIA, JORGE* (*Pontificia Universidad Catolica de Chile*)CASTILLO, JUAN CARLOS (*Pontificia Universidad Catolica de Chile*)*The Moral Economy of Merit and Meritocracy: An Analysis of the Chilean Lower-and Middle-Class*

Merit represents an expanded principle in modern societies, related to social mobility, equal opportunities, redistributive preferences and the legitimization of inequality. Although it is commonly used to study unequal results in school, divergent work trajectories, and access to different income levels, there are still great gaps in understanding the elements that form part of the concept of merit, the values that sustain it, as well as its competing justice ideals.

This article analyzes the principle of merit from a moral economy perspective. To this end, it explores popular consensus on legitimate and illegitimate practices in social exchange and collective orientations related to meritocracy. The analysis is based on an extensive review of the literature on merit and meritocracy, as well as 9 focus groups carried out on lower-and middle-class individuals in three large cities of Chile. The results show the main conceptions of merit and meritocracy, the extent of their desirability and the contrasts between these perceptions and everyday social experiences. Finally, we discuss the extent to which the moral di-

mension of merit is linked to redistributive preferences, providing insights on the role of the state in financing social rights and confronting inequality.

RC04-96.4ATTERBERRY, ADRIENNE* (*Syracuse University*)*The International Baccalaureate: International Sensibilities, Global Mobility & Social Science Textbooks*

This article builds upon research related to capital, migration, and education in its analysis of four social science textbooks from the history, economics, and business management courses taught as part of the International Baccalaureate Degree Programme (IBDP) at an international school in India. It illuminates how textbooks fulfill the IBDPs dual purpose of inculcating global-mindedness in students while also giving them the skills necessary to excel educationally and professionally. This article argues that these textbooks represent important sites of cultural and cosmopolitan capital that includes information and activities that facilitate students' development of global sensibilities, while also enabling them to develop skills in public speaking, writing, literacy, critical thinking, as well as the ability to work as a team and independently. In addition to providing students with important forms of capital, these textbooks also help lead to a credential that helps facilitate students' transnational mobility to well-resourced western universities, such as those in the United States. Because access to international schools that provide the IBDP in India remains limited to those from relatively affluent families, this article suggests that textbooks represent an important site of social reproduction within India; however, because it provides access to globally renowned universities to those who may otherwise not be able to attend, the IBDP represents an important source of potential social change in terms of educational inequality on a global level.

RC34-624.10ATTERBERRY, ADRIENNE* (*Syracuse University*)*Transnational Indian American Youth: Redefining What It Means to be Second-Generation Indian American*

Using in-depth interviews with 18 alumni of international schools in Bangalore, a city in southwest India, this article examines the role of migration in ethnic identity formation among transnationally mobile second-generation Indian American youth. It seeks to examine the following questions: How does transnational migration affect the development of ethnic identity for Indian American youth? How does transnational migration complicate what it means to be a second-generation Indian American? Building upon literature related to transnational migration, ethnic identity, and youth the findings indicate that transnational Indian American youths' experiences of travelling between the US and India before reaching the age of majority shapes their orientation to India and Indian culture in such a way that makes them fundamentally different from US born and raised second-generation Indian Americans. This brings into question what it means to be a second-generation immigrant youth and the role of transnational migration in shaping youths' ethnic identity.

RC25-JS-20.4ATWAL, ABNEET* (*Ryerson University*)*Where Are the Children? Deconstructing the Ontario Autism Program*

The Ontario Autism Program (OAP) provides behavioural supports and services to autistic children and youth, and their families. This study applied a critical discourse analysis (CDA) to examine the OAP policy documents using a children's rights framework. The purpose of the study was to examine how autistic children's rights are respected in the OAP policy documents. A CDA of the documents led to three key findings: the difference in roles of different social groups, quantifying and classifying autistic children, and the one size fits all approach in the program. The three themes present in the OAP policy documents are power and dominance, ideologies of childhood, and the medical model. The ways in which children are presented suggests that children's rights are being neglected. The paper concludes with recommendations for how clinicians can facilitate children's participation when implementing the program and changes required in the policy documents to incorporate a children's rights framework.

RC11-JS-81.3AUDEN, DANA* (*University of North Texas*)CREADY, CYNTHIA (*University of North Texas*)*Retirement Status, Retirement Conditions, and Sleep Quality Among Older U.S. Adults: Findings from the Health and Retirement Study*

Research suggests that work experiences can adversely affect sleep among U.S. adults, yet the impact of retirement has not been adequately assessed. This is an important oversight as poor sleep continues to garner attention as a public health problem and the "Baby Boomer" generation, which comprises nearly a quarter of the U.S. population, exits the paid labor force. This study ascertains the likelihood of trouble sleeping by retirement status and retirement conditions with a large, probability sample of U.S. adults over age 50. Using the 2014 wave of the Health and Retirement Study, we estimated eight separate logistic regression models—four to evaluate the effects of retirement status on 1) trouble falling asleep, 2) staying asleep during the night, 3) waking too early, and 4) feeling rested after sleep, and another four among the subset of retirees to evaluate effects of selected retirement conditions. Those who considered themselves completely retired had consistently higher odds of reporting troubled sleep compared to those who were not retired at all. The same was found for those who identified as partly retired, with the exception of not feeling rested after sleep. Among the retired, those who expressed dissatisfaction with retirement were more likely to report troubled sleep in each model compared to those who felt very satisfied. Other retirement conditions yielded mixed results. These findings suggest that trouble sleeping among older U.S. adults is patterned by retirement status, and to some degree retirement conditions.

Social Media Control and Christian Churches in Burkina Faso

In recent years, Burkina Faso has experienced a significant growth in the use of social media platforms. This trend has touched religious organisations in particular, with Christian Churches, both Evangelical and Catholic, increasingly turning to Facebook and other platforms to convey their messages. However, despite this growing presence and a larger democratization context marked by the ousting of President Blaise Compaoré in 2014 and a subsequent liberation of public speech in the country, Christian social media have remained remarkably consensual and uniform. This uniformity is seen in the constant circulation of the same content and an almost complete absence of contradictory debate. This presentation analyses the main social media publications from Christian Churches and associations in recent years in Burkina Faso and shows how a limited number of key actors, or gatekeepers, control the quasi totality of the Christian social media presence. It will also show how this situation gives rise to the creation of virtual sectarian practices where radical content flows without contradiction.

AUGUST, MARTINE* (*University of Waterloo*)

"Apartments Make Money!": The Financialization of Canadian Multi-Family Housing

After twenty years of disinvestment in multi-family rental housing in Canada, new vehicles for financial investment began to target ageing apartment towers in the 1990s. In 1999, Canadian Apartment Properties Real Estate Investment Trust (CAPREIT) triumphantly proclaimed that "Apartments Make Money!" on cover of their Annual Report, a reversal of the real estate industry's common wisdom for decades. This paper explores the financialization of multi-family rental housing in Canada – a process initiated jointly by state and industry players – and the role of this process in intensifying gentrification and uneven patterns of urban development. This paper documents the rise of financialized landlords in Canada, and their consolidation of ownership of apartment housing from the 1990s through 2016 – efforts that have intensified in the post-crisis period. Financialization has enabled investors in Canada to overcome former barriers to investment in multi-family housing, posed by the multi-family sector itself and by the country's diverse regional geography. Financialized landlords have, in fact, capitalized on these barriers to preserve a competitive advantage, from remote Northern communities, to resource boom-towns in the Alberta tar sands, to trailer parks in the Maritimes. This shift in multi-family ownership, and the novel treatment of multi-family homes as pure financial assets has led to property management strategies that are putting new pressures on tenants, via rent increases, new fees, harassment, and renovations to attract higher-income renters. The practices of financialized landlords also intensify existing patterns urban socio-spatial polarization both within and between communities, exacerbating gentrification pressures, and squeezing revenues from low-income tenants living in marginally located properties. This paper also touches on efforts to contest these pressures, led by tenants in Toronto's Parkdale community, who have fought back against financialized landlords via city-wide organizing, rent strikes, media engagement, and legal battles.

Financialization and Organizational Change in Professional Service Firms: The Case of Externally-Owned Alternative Business Structures in England and Wales

Financialization is a distinct form of capitalism, elevating the significance of financial markets, financial actors and financial motives (Cushen and Thompson, 2017). At the organizational level, financialization entails the process by which external financial actors are able to influence or control the internal organizational strategies and management practices of non-financial firms (Batt and Appelbaum, 2013). To date, scholarship exploring financialization in the context of professional services has largely focused on firms owned by professionals (e.g. Faulconbridge and Muzio, 2009; Alvehus and Spicer, 2012). Yet, with regulatory reform in some countries enabling the emergence of publicly-owned accounting and law companies (Pickering, 2012) our knowledge of how financialization may affect externally owned PSFs is sparse. Taking the legal services field in England and Wales as an illustrative case, we focus on a new type of legal practice – Alternative Business Structures – and draw on qualitative interviews undertaken with senior lawyers and investors to illustrate an intensification of performance monitoring, managerial control, and a professionalization of governance following a change in firm ownership. We compare the different financialization approaches adopted by investor type – private equity (Wright et al., 2013) and publicly listed companies (Roberts, 2001) – illustrating that, in accordance with the corporate finance literature (Kaplan and Strömberg, 2009; Gompers et al., 2015), the two investor types differ as to the performance metrics they prioritise. Our study also provides insights as to why legal practices in sub-fields are more inclined to seek external investment and which investor type is likely to be preferred. Faulconbridge and Muzio explained how a proxy indicator (PEP) "unexpectedly reproduced the logics of finance capitalism" amongst large law firms (2009: 659). Building on this, we show how financial logics have permeated other sub-fields.

Care Provision By Home Care Agencies – Insights from 24H-Care in Austria for Trans- and Cross-National Research on Care and Inequality

Comparative studies have shown that conservative, family-oriented welfare states have become forerunners of the marketization of domestic care. Austria is one of them pushing marketization by legalizing and professionalizing 24h-care and by cash-for-care policies in a subsidiary model of welfare. Home care agencies are new actors on the increasing care market providing 24h-care by recruiting female care workers from Eastern Europe and offering care services to Austrian private households. Drawing on the sociology of care, research about the welfare state in Austria and Eastern Europe and the Institutional Logics-perspective the paper takes three steps: The first part presents findings of our policy analysis showing how 24h-care and care provision by home care agencies are embedded in the Austrian welfare state. The second part discusses the findings of an analysis of the homepages of all (roughly one hundred) Viennese care agencies and sheds light on their recruitment of care workers and the services they offer. Our analysis focusses on the following questions: How are home care agencies addressing care workers and describing the demands and tasks of 24h-care? How are they addressing the households and which services are they offering? How are they referring to values and ideas associated with the institutional logics of the family or the profession, the market or the state, the religion or the community etc.? How the care arrangements they are providing are stratified by and reproducing differences and inequalities of gender, ethnicity, and class? How the provided care arrangements are legitimized? The third part emphasizes in how far and how the perspective on the embeddedness of care markets in the welfare state, on the institutional logics of the market, the state, the family etc. and on the legitimization of care arrangements including social differences and inequalities is instructive for trans- and cross-national approaches.

RC07-152.1AULENBACHER, BRIGITTE* (*Johannes Kepler University*)DECIEUX, FABIENNE (*Johannes Kepler University*)RIEGRAF, BIRGIT (*University of Paderborn*)*The Economic Shift in Child and Elder Care: Conflicting Demands and the Logics of the Market, State, Profession, and Family*

The paper shows how elder and child care is going along with changing demands, tasks, needs and forms of care provision. In the first part, it argues that the social reproduction and constituent care and care work are reorganized under the auspices of an economic shift in contemporary capitalism. In a Polanyian perspective on the relation between market and society this "movement" of marketization and quasi-marketization of care and care work can give a rise to "countermovements" of protection or protest in civil society. Neo-institutionalist and pragmatic perspectives as well as approaches of the sociology of care invite to investigate how these processes touch hitherto existing relations of care provision between the public and the private sphere and which role the logics of the market, state, profession, and family play. In the second part, referring to these research strands and to our empirical findings in Austria and Germany we discuss such a Polanyian "double movement" in the case of home care agencies, residential care communities and social investment policies. The studies shed light on contradictory and conflicting demands and the way how care provision is embedded in a new mixture of the public and the private, family and professional engagement, market principles and political regulation of the welfare state. Furthermore they show how conflicting demands in care provision are challenging the discussion about (in)equality and (in)justice, decent care and decent work in the field of care and care work. The third part discusses the Austrian and German case in the frame of a global sociology of care and care work showing how national, trans-, inter- and supranational dimensions of the reorganization of care provision are interwoven.

RC30-550.4AUNIS, EMILIE (*CRISES (centre de recherche sur les Innovations Sociales)*)POGLIAGHI, LETICIA (*Universidad Nacional Autonoma de Mexico*)HANIN, FREDERIC* (*Université Laval*)*L'Impact Sur Les Conditions De Travail Et d'Emploi De l'Arrivée d'Uber Dans l'Industrie Du Taxi : Une Comparaison Québec-Mexique.*

L'arrivée d'Uber au Mexique en 2013 et au Québec en 2014 a suscité de nombreuses mobilisations de la part des chauffeurs de taxi. Se présentant dans un premier temps comme une société de covoiturage, ainsi non soumise à la réglementation de l'industrie du taxi. Cependant, l'entreprise réalise de fait le lien entre des chauffeurs et des passagers. Pour autant, et malgré la volonté de nier toute relation d'emploi avec les chauffeurs impliquant une relation de subordination, l'entreprise impose différentes formes de contrôle de l'activité aux chauffeurs. C'est à ces formes de contrôle que la communication est consacrée, à partir d'entrevues avec des chauffeurs et des représentants des entreprises, ainsi que la documentation législative.

L'activité du taxi est une forme très particulière de travail et d'emploi, traditionnellement exclue du cadre général des rapports collectifs. D'où le développement de formes hybrides d'encadrement et de contrôle de l'activité, entre le salariat et le travail indépendant. Cependant, à certains égards, les spécificités de l'activité du taxi sont devenues des caractéristiques plus générales des rapports de travail dans la « nouvelle » économie, et plus largement dans le secteur des services. Le vocable « d'ubérisation » du travail et de l'emploi traduit bien cette perspective de généralisation, et même de modèle, des nouveaux rapports au travail et à l'emploi à l'ère du « digital labor ».

Les cas québécois et mexicains seront ainsi comparés afin de mieux saisir les enjeux pour l'emploi dans les deux pays sur les conditions de travail des chauffeurs et sur le diptyque autonomie/dépendance de la relation d'emploi. Il s'agira d'examiner précisément les modalités d'encadrement et de contrôle de l'activité portées par les intermédiaires classiques et par Uber pour mieux saisir ce que l'arrivée d'un nouvel acteur transforme dans les relations d'emploi et les conditions de travail dans le secteur.

RC16-311.14AVAR, ADILE* (*Izmir Institute of Technology*)*A Critique of Assemblage Urbanism Focusing on Conceptual Constellations and Research Practice*

This paper is composed of two parts. The first part elaborates on the relations between scientific concepts and practice by drawing on the Works of Georges Canguilhem, the founder (together with Gaston Bachelard) of the epistemological history of sciences. The second part offers a critique of "assemblage urbanism." The latter is backgrounded by De Landa's "assemblage theory of society," having

used the Deleuze- Guattarian conceptual apparatus. However, assemblage urbanism relegates the very critical impulse of the Deleuze- Guattarian concept of "assemblage [l'agencement]."

Ian Hacking puts forward that Canguilhem's method of epistemological history can be used for making the history of other disciplines, as he used it in the history of statistics. Nikolas Rose, on the other hand, argues that Canguilhem's way of working the concepts and their relations can also be applied on the current state of scientific disciplines. For Canguilhem's works offer us methodological and heuristical tools to inquiry into how, and at which levels, social, ideological, political and technical concerns are articulated to a particular scientific discipline. As Canguilhem shows in the history of life sciences, concepts precede the formation of theories. Especially in the exploratory field they are formed and used without rigorously established theories. Furthermore, concepts regulate the relationships between the field of theory and the empirical research.

Then, the second part of the paper develops a critique of assemblage urbanism by focusing on how its founding concepts, its problems, its methodology and actual empirical researches are connected to each other. The critique is structured around the question how its overemphasis on the empirical materialities of urban phenomena relegates the problematic (founding) concepts, exploratory tools of critical urban theory like 'capital', 'state' 'accumulation', 'dispossession', 'deprivation', 'inequality', 'uneven spatial development', 'territorialities', different structural contexts.

RC28-525.5AVOLA, MAURIZIO* (*University of Catania*)PICCITTO, GIORGIO (*University of Milan*)*Blocked or Short-Range Mobility? Immigration and Labour Market Integration in Italy*

In recent decades, Italy has been one of the main destinations of international migration inflows. Even the socio-economic effects of the Great Recession did not reverse the trend: from 2008 to 2016, the number of legally resident foreigners increased about 50%. These dynamics are closely related to the need of immigrant labour force expressed by the segmented Italian labour market, characterized by a substantial qualitative mismatch between the labour demand structure and the native supply.

Thus, differently from the old receiving countries of Centre-North Europe, in Italy immigrants face a trade-off between low (or none) penalty with respect to natives in terms of employment entry chance and high occupational segregation at lower levels of the professional hierarchy (Kogan, 2007; Fullin-Reyneri 2011; Avola, 2015; Ballarino-Panichella, 2015; 2017).

Furthermore, recent studies (Fellini-Guetto-Molinari, 2017) have highlighted that such segregation characterizes not only the entrance of immigrants into the Italian labour market, but their whole career. Upward mobility chances are indeed very limited.

From this evidences, this work has two research questions. The first aims to understand whether, and to what extent, the occupational immobility of immigrants is due to their status of foreigner (ethnic penalty), or instead is the effect of a structural immobility characterizing the Italian labour market. The second research question aims to shed light on the chances of short-range (horizontal\ intraclass) mobility and/or changes in working conditions (contractual regularity, stability of job, wage, etc.) that can improve significantly life and working conditions of migrants without modifying their class position.

The analysis is conducted on two dataset from Istat: Multipurpose survey (2009, nearly 40.000 observations) and Condition and social integration of foreigners (2011, nearly 25.000 observations). We compare natives' and immigrants' occupational trajectories with OLS techniques, so to grasp the magnitude of the eventual mobility and the characteristics associated with it.

WG05-951.1AWASTHY, RUCHI* (*JNU*)*Ecological and Social Impact on Lower Riparian States: A Case Study of Brahmaputra Basin*

The Brahmaputra River flows through the three most populous countries in the world which are China India and Bangladesh. Therefore, management of its vast water resources warrants adequate regional as well as international cooperation and pooling of resources and expertise at the national and global levels. The life of a region is intricately linked with its water resource. Any form of alteration in it leads to changes and impacts the society. Brahmaputra is the lifeline of Himalaya region and the entire northeast India. This region is also the homeland of many ethnic tribes like Garo and Mising. The dam will impact not only the natural flow of the river but the flora and fauna dependent on the river. The dams will restrict fish migration, availability of water downstream on which large number of people and wildlife depends. Building of dams at such great height, especially a region which is prone to earthquake poses an ecological risk of floods also. Further the pollution from the dam construction will also be carried downstream, impacting farmland and depleting fish stocks, adding to food security concerns. Another adverse impact would be on the natural heritage of the region. Brahmaputra has

direct impact on the Kaziranga national park, Majuli Island and Sunderban delta. These areas are the home of some of the most endangered species of plants and animals. A strong political will is needed both at the state and national levels and a sustained popular zeal to convert the water resources of the region into a force for sustainable development of the region through an integrated, multidisciplinary approach that covers not only technological aspects but also social, economic and environmental dimensions. Under the existing circumstances, modest interventions with minimum possible impact on the environment appear to be the safest option for this region.

Experiences Housing Developers in Jeddah, Saudi Arabia

The rising demand for suitable housing for low- and middle-income Saudi residents in the Jeddah, Saudi Arabia metropolitan area exceeds the supply. This study explored the possibilities and obstacles facing private sector real estate developers in the development of suitable housing in the Jeddah metropolitan area. The study identified and described developers' perspectives relative to supply and demand trends; obstacles that inhibited the development of suitable housing; incentives that might help build suitable housing; and possible long-term solutions to address the ongoing mismatch between supply and demand. The study employed a qualitative case study design, and the case was private sector real estate development in Jeddah. The researcher conducted semi-structured, open-ended interviews with 16 private sector, residential real estate developers in Jeddah, Saudi Arabia. Case study findings revealed four major obstacles: bureaucratic frustrations with the Ministry of Housing and the Municipality of Jeddah; lack of financing options for potential homeowners and private sector developers; lack of land with the necessary infrastructure to create communities; and potential homeowners' culture-based desire, or housing norm, for large, expensive villas. Future research could investigate the efficacy of the solutions recommended by the study's participants; how other nations' housing solutions could be adapted to the Saudi context; and best practices for integrating the study's findings, conclusions, and recommendations with the Kingdom's *National Transformation Program 2020* and *Saudi Arabia's Vision 2030*.

AYASS, RUTH* (*University of Bielefeld*)

The Media of (Qualitative) Methods

In the methodological discussion, surprisingly little attention is generally paid to the technology and the media used in the research process. This is astonishing in that devices, machines, software tools, and media of all kinds play a key role in the production of empirical results. The discipline of Science and Technology Studies has been concerned mostly with the *natural sciences* in its descriptions of how technology and media influence the generation of scientific knowledge. However, technology and media are also highly relevant for empirical research in *sociology*. The technologisation and mediatization of research activities affect empirical research in general, but it is of particular importance within the *qualitative* paradigm. The reason for this is that the constitution of the data material and the reflexivity of the research process, for methodological reasons, are of special relevance here. Thus far, the discussion of the media's contribution to the research process has been rather erratic: ethnography, for instance, in "Crisis of Ethnographical Representation", analysed the role of *writing* and the authority of the author; in Conversation Analysis, there is an intense ongoing discussion about the status of the *transcript* in the research process. However, these debates mostly regard themselves as the problem of the individual methods and are considered a specific problem in each particular case – notwithstanding the fact that they are relevant also in other methods. This is because the media, devices, and machines inscribe themselves in the research process and thus in the result of the empirical examination. The presentation will discuss the media-driven constitution of qualitative methods as well as its methodological consequences.

AYER, NADINA* (*University of Waterloo*)
MCCARVILLE, RON (*University of Waterloo*)

Exploring the Power Dynamics in an Online Sports Fan Community

Technology can change the way sport is consumed and experienced (e.g., Sage & Eitzen, 2016; Sanderson, 2011). For instance, sports consumption increasingly takes place within electronic settings with fans joining thousands of others from across the world in online communities. Each of these communities is comprised of "a collection of people who adhere to a certain (loose) social contract and who share certain (eclectic) interests" (Rheingold, 1998, p. 116). These collections can offer a convenient, timely, and a reliable way to socialize (Chayko, 2008) as well as the opportunity for self-expression, companionship, and stimulation (Nimrod,

2014). In many ways, they place power and opportunity in the hands of users. Where power typically resides in the hands of leagues, team owners, television broadcasting systems, and the players themselves, online communities can liberate the individual users from the shackles of traditional power structures (Jenkins, 2013). It is the fan base that populates and maintains online forums by deciding what is posted, what voices are heard, what questions are asked, and what topics are debated. We were interested in how power relations between forum members and administrators play out in an online community. We monitored group dynamics within 3,431 messages posted to 21 discussion threads of a popular tennis forum. Results suggest that posters tend to interpret, critique, and debate events and practices within the online community and their sport at large. The online dynamics were often complex as posters sought to fulfill their various goals. They exchanged information, shared experiences, and expressed emotion all within a simultaneously harmonious and adversarial environment. We demonstrate how an online forum offers a setting that is both supportive and acrimonious and where norms, values, rituals, and traditions can emerge and evolve.

Rescued but Endangered? the Plight of Women and Children in Idp Camps in Northeast Nigeria

The accidental bombing of an internally displaced persons' (IDP) camp in Rann, Borno state on 17 January 2017 by the Nigerian Airforce brought global attention to the danger IDPs face in the ongoing Boko Haram insurgency. More than 100 IDPs were killed in that attack, most of whom were women and children. Drawing on data and reports from international organizations such as UNICEF and Amnesty International, and media reports on the narratives of IDPs and aid organizations, the paper analyzes the plight and experiences of women and children in IDP camps in northeast Nigeria. The paper demonstrates that despite being rescued from Boko Haram's captivity, the concentration of IDPs, particularly women and children, in camps exposes them to new forms of danger and victimization. The paper argues that the victimization of women and children in IDP camps is reminiscent and iterative of the cultural and structural violence against women and children in the society. In all, the paper adds to the scholarly conversations on the impact of the Boko Haram insurgency.

AYSAN, MEHMET* (*Istanbul Sehir University*)

Change in Family Structure: New Challenges and Social Policies

In the second half of the 20th century, total fertility rates (the average number of children per woman) in Turkey declined gradually as it had in many industrialized countries. In 2010s, total fertility rates in Turkey were down to two children and even lower in certain regions, especially in Western Anatolia. This situation has mobilized an effort to formulate policies that counter the adverse economic effects of the rapid decline in fertility rates and, indirectly, of the aging population. However, comparative demographic studies show that the decline in fertility has a complex causal structure and that it is impossible to understand this process through economic causes alone. This study makes use of data on Turkish families (Turkish Family Structure Survey) conducted by the TURKSTAT in 2006 and 2016 to explain the factors that influence fertility from a sociological perspective with special emphasis on the transformation of families in Turkey. The main argument of this paper is that low fertility rates can be understood through social and cultural changes in Turkey, and particularly through the analysis of the transformation of the Turkish family structure. Social policy recommendations will be discussed at the end of the study.

Is War an Instrument of Politics? the Flux of Violence and Social Theory

This paper critically examines a prevalent mode of explicating violent armed conflicts, which posits war as fundamentally *instrumental* in nature. There is certainly some analytical validity to this approach, but it limits the conception of violence to a one-dimensional view that does not take into account the flux of violence. Within the instrumentalist perspective, violence appears explicable strictly as an instrument of politics and is consequently posited as inexplicable outside of its instrumental purpose, often as chaos, a black hole, and/or nonsense. There are two major shortcomings to this approach: (1) it subordinates violence to something greater that explains it – most often politics (the mechanisms/structures of governance) or some conception of the political (the theoretical ground of what constitutes a political act/event) – thus directing the analytical gaze away from violence; (2) the subordination of violence as means to political

ends is often driven by an untenable analytical distinction between so-called productive and destructive violence. Instead of delimiting violence, I argue for a "freeing" of the concept of violence, *not* in the sense of discussing the gruesome details of violence or glorifying violence, but in the analytical sense of following the flux that is inherent to violence. The paper examines how two prominent theorists and their respective trajectories in social theory (Carl Schmitt-realism school; Antonio Gramsci-critical school) fail in their attempt to theoretically subordinate the flux of violence. To capture violence is to think of it as residing within a delimited and fixed space from which it operates but never leaves. To free the concept of violence is to think of violence in its continuous movement. An analysis "in accordance with the flux" offers the most fruitful way of "freeing" the concept of violence, which will help us understand the diverse impacts, paths, and roles of violence in society.

Protests and Generations: Legacies and Emergences in the Middle East, North Africa and the Mediterranean

The aim of the book is to problematize the relations between generations and protests in the MENA and the Mediterranean. We contend that the articulation between generations and protests relies on the tension between historical ties and their rejection. The contributions to the book address this tension in specifically documenting several case studies that highlight the generating processes by which generations and protests are correlated. What the production and use of generation brings to scholarly understanding of the protests and the ability to articulate them is one of the major questions this collection addresses. Our book is divided into three main sections. The first, "Forms of Protest and the Production of Generations," examines how "generation" can act as a frame of reference that enables a tactic/strategy of protest, a sense of unity and solidarity, and as constituting the novelty of protest practices. The second, "Genealogies of Generational Formations," explores entangled temporalities and the production of generations, particularly as this production revolves around the category of "youth." The third, "Memory, History and the 'New Generation,'" challenges scholarly work that associates forms of protest that seem to appear from nowhere with the category of a "new" generation. Investigating how generation works in those three different ways is crucial for further understanding the challenges that these protests present against the injustices of social and political orders and, just as importantly, the obstacles that they themselves might face in advancing their causes.

Boom Town Poison: Political Culture Under the Shadow of Lead Poisoning in West Texas

How do citizens reconcile conservative politics with the daily consequences of state inaction? How does the lack of access to basic services, such as clean water, shape particular forms of political ideology? Based on 40 in-depth interviews, three months of participant observation, and historical and archival research, this paper examines how political culture is produced and contested in a small working-class community in rural West Texas, USA. An oil boomtown of the early 20th century, the population of our field site has steadily declined over the last one hundred years. Save for a small boom in the 1970s, the crumbling infrastructure, lack of jobs, and contaminated water containing twenty-eight times the federal limit of lead are consequences of socioeconomic transformations that are not unique to West Texas, but are characteristic of rural America. Rather than seek to argue that residents are beholden to an ideological contradiction and/or false consciousness, this project seeks to understand a "paradox" (Katz 2001): how support for authoritarian populism emerges from rural dispossession and is legitimized through everyday practice. By paying particular attention to not only what residents say, but also what they do (Jerolmack and Khan 2014), we argue that political ideology must be understood as a lived experience rooted in the routines, decisions, and practices of everyday life. While some residents resist the evidence and continue to consume the water, many residents purchase bottled water for consumption, cooking, and bathing. By observing and analyzing how residents engage with a contaminated water supply, we argue towards a moral economy of rural dispossession which provides ideological support for populist authoritarianism.

From Snapshots to Movies: The Association between Retirement Sequences and Aging Trajectories in Limitations to Perform Activities of Daily Living

Objectives: This study analyzed the dynamic association between retirement sequences and trajectories of functioning to perform ADLs. **Methods:** Health and Retirement Study data for 7,880 older Americans were analyzed using hierarchical linear models. **Results:** Functioning trajectories were similar for sequences characterized by complete retirement from full- or part-time jobs, baseline functioning was lower for sequences characterized by early retirement and being out of the labor force, and functional decline rates were slower for sequences characterized by partial and late retirements. **Discussion:** The conventional model, in which people completely retire from a full-time job at normative ages, and the new conventional widely-promoted model of late retirement, are both associated with better functioning in old age. But unconventional models, where individuals keep partially engaged with the labor force, are also associated with better functioning. These findings highlight the importance of using dynamic approaches to inform novel policy solutions for unprecedented demographic challenges.

The Teacher Is a Victim of Education Modernization in Russia

In light of the reforms currently taking place in Russia and related to the globalization processes, the education modernization problem has become an acute one – especially the pedagogical problem.

Presently, the entire policy in the educational sphere in Russia, starting the signing of the Bologna process agreement, ultimately comes to the educational institutions being now united, now separated, one day new standards are introduced, another day they are altered or dismissed, today additional examination tests are assigned, tomorrow their content is changed.

It should be pointed out that at the end of the day, it is the teacher's shoulders that have to bear all aspects of the education modernization, the teacher acts as some "progress driver" in the implementation of innovations in the teaching methods and ways. Yet, is it really so? No, rather the "victim" of this entire crazily cooked "stew" called education modernization. Because the victim...

- of educational standards. The teacher must comply with the standard, because the standard is an education's outcome and if it is an outcome then it is the teacher's performance quality. What is perceived by a standard? It is still an open-end question for the Ministry of education.

- of the educational process. Not only is the teacher required to draw educational programs, but he/she should also yield continuous new educational technologies, innovative methods of teaching, interactive means of education, etc. All this must be clearly manifested and meet the standard.

...

So as a result, since the moment Russia entered the Bologna process and integrated into it, we have the fact that the entire national intellectual and pedagogical experience that was accumulated over the years is now being lost in all these changes where the teacher becomes the one to be blamed and deemed guilty.

Incarceration and Penal Alternatives in Brazil - Elements for a Sociology of Punishment

The Brazilian prison population grows throughout the post-Constitution period of 1988. In this period, the so-called penal alternatives were expanded, with rights-restrictive sentences and the precautionary penalties in criminal proceedings. The expansion of the use of penal alternatives does not present a direct and necessary relation with the reduction in the use of the prison, and may even occur the expansion of both them. However, from the possible conclusion that the penal alternatives did not break with the centrality of the prison does not follow that such alternatives are incapable of any rupture. The effects of such alternative strategies to imprisonment are linked both to the interactions between the various political-criminal tendencies present in its emergence and implementation, as well as to the forms of understanding about the crime and

the criminal that, at a given moment, guide its specific configuration. Thus, if it is relevant to question what the penal alternatives “did”, that is, the impact of its implementation on reducing incarceration, it is equally relevant to question “what has been done” with the penal alternatives, that is, in what way the actors involved in its production and implementation, as well as in other areas of the judicial field, sought to lead, implement or oppose them. In this sense, this study intends to analyze the rates of incarceration and the application of alternative penalties and measures in Brazil, especially after the 2011 edition of the precautionary law in the criminal process, which creates alternatives to provisional incarceration, in the context of a sociology of punishment, seeking to verify the relations between the imprisonment movements and the criminal policies adopted, as well as to deepen the theoretical possibilities of interpretation of these data.

Police Violence, Provisional Imprisonment and Control Mechanisms - an Analysis of the Implementation of Custody Hearings in Brazil

Brazilian society is still characterized by the abusive use of violence by public security forces. The interactions between civil society and the police are still marked by abuse of power, lack of criteria for the use of force and distrust, which produce high rates of police killings and police victimization, evidence of an authoritarian model of police. In addition, research has shown the increasing participation of the military police as an institution responsible for prisons in Brazil, through the arrest warrants in the act, which have been converted into pre-trial detention until a future criminal conviction. The present research aims to compare data on flagrante arrests and police violence practiced by the Military Police of the State of Rio Grande do Sul during the years 2016 and 2017, based on records made by the Human Rights Reference Center of the Public Defender's Office RS, with data of reports of police violence presented at custody hearings in the region of Porto Alegre. Through the analysis of the collected data, it is sought to identify the context in which arrests occur, and the elements that characterize the cases of police violence, as well as the referral given by the judicial institutions for the reported cases.

Labour Movement Action Against Free Trade in the Americas: A "Tale" of Two Campaigns

This paper presents a comparative analysis about the building process of two major anti-free trade campaigns, in which the labour movement has played a key role: the *Continental Campaign against the Free Trade Area of the Americas (FTAA)*, that took place during the 90s and early 2000s; and the *Continental Campaign for Democracy and against Neoliberalism*, ongoing since late 2016, that mixes an anti-free trade agenda with the broader opposition to the recent right-wing rise in the Americas.

The work focuses on both the broad political context in which these campaigns have emerged and unfolded - a state-centered approach -, as well as on issues concerning non-state actors in general and the labour movement in particular - alliance building strategies, repertoires of action, the relations towards national governments and the construction of alternatives “from below”. Through this double perspective, this paper highlights the main differences and similarities between the two campaigns.

The methodology is based on research of scientific literature, trade union official documents and publications; as well as governmental documentation and news from mainstream media. Qualitative interviews with trade unionists and social activists in the region who are/were active in both campaigns are explored in addition to the collected data.

The final considerations point out to the fact that at the present time - in a context of right-wing rise and a “race to the bottom” in labour rights - new and different challenges arise for the workers’ struggle, making it much harder to repeat the building of a broad and strong hemispheric alliance in the Americas led by the labour movement. However, the negative social effects of the conservative-neoliberal comeback might be the unforeseen ignition that will strengthen social resistance again in the near future - as it once did in the late 1990s.

BAAR, MARYSE* (*Université catholique de Louvain*)

The Use of Innovative Methods with Children from Mixed Parents Living Under Shared Custody Agreements.

This paper will draw attention on the identity construction of children from mixed couples (Unterreiner, 2015) (parents from different ethnical backgrounds) who are living under equal shared custody agreements after the separation of their parents. I will seek to understand how they position themselves in reference to both cultural backgrounds in the context where family socialization takes place in two different households.

Drawing on fieldwork conducted in Belgium with children aged 10 to 13, in the context of the research program “*MobileKids: Children in Multi-Local, Post-Separation families*” (ERC Starting Grant project under the supervision of Prof. Laura Merla), the paper will focus on innovative and active methods used for an egocentric network analysis: Network map (Hertz, Olivier, 2012) and Socio Spatial Network Game (Schier, 2015). By playing, those methods will allow us to understand the strategies used by the children to navigate between these two households where the norms and values may be different (Winther, 2015) in a multi-local and multi-cultural context.

While transnational families and mixed families have been extensively studied in the recent years (Baldassar, Merla 2014; Fresnoza-Flot, 2017), studies focusing on the experience of children living in post separation mixed families have largely been overlooked up to now.

Refugee Catastrophe, Ethno-National Conflict and the Crisis of Democracy

The aim of this theoretical study is to understand the relationship between the refugee catastrophe, the increase of nationalism, inter-ethnic conflict and violence and the crisis of democracy in the 21st Century. The refugee catastrophe alludes to the estimated 70 million migrants/refugees expelled from their homes and home countries by a complex set of factors, such as: global and national inequalities, climate change, growing xenophobia, inter-ethnic conflict and violence. The increase of nationalism refers to the appeal of “essentialist,” “communalistic” notions, and mythical claims of imagined “volks” and “nations,” which ignites “normal” ethnocentrism to its heights. The crisis of democracy alludes to the growth of fundamentalism and authoritarian regimes in all corners of the world: India, Russia, Turkey, Hungary, Poland, and recently the USA, accompanied by the rise of national-populism and far-right political movements and parties in all corners of the world. The poor management of a similar refugee crisis in the past century, accompanied by the growth of nationalism, fascism and nazism, produced the most violent century in world history. If these developments are not better managed, in a humane and democratic way, the likely outcomes in the 21st Century are to be feared. What to do? For a short time, policies such as the “New Deal” helped to confront the systemic crisis of the 30s, same as the welfare societies in the post-war period, ECOSOC at the time the UN was created, namely, development to diminish the socio-economic gap between the haves and have nots, as a platform to sustain democracy, might be looked anew - as an urgent alternative to global militarization and violence, before is too late. Is another world possible? The answer lies in each and all of us, sociologists or not.

RC05-106.2

BACAL ROIJ, AZRIL* (*Uppsala University*)

Understanding Ethnic Identity Politics in the 21st Century

The primary aim with this theoretical study is to understand ethnic identity politics against the background of the contemporary world crisis, a crisis characterized by: increasing levels of inequality, international migration, nationalism, populism, xenophobia, ethnic identity politics, and threats to democracy from far right movements and authoritarian regimes. Ethnic identity politics is linked with nationalism, racism, and ethno-mobilization. This study looks at ethnic movements and at the interface with the ethnic identity orientation of their members. The sociological problem is defined by the relationship between inequality, international migration, xenophobia, and a new wave of ethnic identity politics in American Society, and it further examines the divergent responses of the white and non-white ethnic segments of the U.S. population to inequality and immigration flows from Mexico. Alternative explanatory factors are examined to account for the rise of white national-populism, ethnic polarization and confrontation in the USA. The two ethnic movements examined are: White National-Populists and Brown Latinos. The argument asserts that growing global and national inequalities, in conjunction with international migration explain

the upsurge and bifurcation of ethnic identity politics. This study draws from a previous conceptual model to account for ethnic identity orientations among Mexican Americans. This model is extended to examine the nexus of white national-populism with the white identity orientation of their members. The results show that growing global and national inequalities, in conjunction with (a poorly managed) crisis of international migration, partially explain: rising levels of xenophobia, ethnic discrimination, the new saliency of ethnic identity, and the upsurge and bifurcation of ethnic identity politics.

BACALSO, CRISTINA* (*Youth Policy Labs*)

How Does "Age Matter" in Relation to Youth Wellbeing? An Examination of Minimum Age Legislation Research in Europe and Central Asia

Minimum age legislation are contentious, contextual and at times, contradictory. They directly influence the realities of young people: for example, when they can make independent health choices, be tried and held in adult courts and prisons, access financial credit for business, be heard in judicial proceedings, or consent to marriage.

In 2016, UNICEF Europe and Central Asia Regional Office commissioned a the multi-year research project called "Age Matters!: Age-related barriers to service access and the realisation of rights for children, adolescents and youth". The first phase, completed in October 2016, was a desk-based mapping of minimum age legislation in the region. The second phase, due to be completed in January 2018, is a consultation with adolescents in five countries in the region (Armenia, Bulgaria, Kazakhstan, Romania, Ukraine) to understand how the knowledge, perceptions and experiences of adolescents with minimum age legislation impacts their subjective well-being and aspirations for the future.

This paper looks specifically at the way the project considers the relationship between minimum age legislation, access to rights, and service provision, and concepts such as "vulnerability" and "wellbeing" as conceived by UNICEF. In particular, it will zero in on two key components of the project explicitly relating to wellbeing: the research scope, where the thematic domains selected are tied to domains of youth well-being popularised by global-level youth indices, the Youth Wellbeing Index (2014, 2017) and the Youth Development Index (2013, 2016); and the outcomes of responses by adolescents during the consultation phase, in relation to their subjective wellbeing. Lastly, the paper will reflect and interrogate the policy, programmatic and advocacy impacts of research like "Age Matters!" for child's rights organisations like UNICEF.

BACHSLEITNER, ANNA* (*German Institute for International Educational Research*)

Social Background Effects in the Transition to a Doctoral Degree

Social inequality in early educational transitions, especially the transition to secondary school as well as to tertiary education, is well documented. Most studies have shown decreasing social background effects over educational careers, thus, the question arises how far the social background and the aspiration to avoid downward social mobility are still relevant for late transitions after university, like the transition to doctoral studies. Socially unequal access to doctoral programmes is individually and societally relevant, since a doctoral degree is linked with positive labour market effects, e.g., subject-specific higher incomes (e.g., Mertens and Röbbken 2013).

The aim of this study is therefore to examine the relevance of social background at the transition to a doctoral degree based on data of the longitudinal study "Learning Processes, Educational Careers and Psychosocial Development in Adolescence" conducted in Germany. The study is drawn on the theoretical concept of primary and secondary effects of social background developed by Boudon (1974). It is analysed what proportion of the social background effect is transmitted via performance differences in final secondary school and university marks and standardised tests. Further, the relevance of mechanisms of a cost-benefit analysis and education-biography-related factors is examined.

The results show, that tertiary graduates from higher educational backgrounds are more likely to start doctoral studies, especially if at least one of their parents holds a doctoral degree. The social background effect can be traced back in particular to differences in final marks and previous decisions made at the beginning of the tertiary degree, the subject and type of tertiary institution.

Between Preconceptions and Reality. Perception of Higher Education for Polish Youth.

Over last decades the world has witnessed a tremendous expansion of higher education. Poland has been one of the countries that have undergone a rapid transition from an elitist system, in which only tiny minority of secondary education leavers could pursue further education, to a massified one that widely broadens the access to tertiary education. The rise in educational attainment is by and large perceived as a positive development, however it has its downsides as well. The increased supply of university graduates has deprived them of their 'privileged' status in the labour market, lead to the rise in graduate unemployment rate as well as overskill and overeducation. This has sparked a debate over improving higher education system in order to make graduates more suitable for the labour market by among others steering them towards academic programmes granting better occupational prospects.

High student attrition is another problem of the Polish higher education system. Poland has one of the highest rates of premature departure among OECD countries, which makes the system inefficient for students and higher education institutions. Moreover, it poses unnecessary burden on the public purse as higher education in Poland is in large extent publicly funded. Research suggests that student attrition can be partly attributed to a wrong choice of studies.

Any policy aiming at improving the prospective student's decision making requires a good understanding of it. That was the goal of several mixed-methods research projects conducted in the last few years, concentrating on such described decision processes of youth from upper secondary schools and students of University of Warsaw, problems associated with their motivation and generally their perception of higher education.

How Flexibility and Control Affect Stress in the Work-Family Interface: A National Longitudinal Study of Canadian Workers

The ability to control when and where we work is a coveted job resource that can help workers fit their multifaceted lives together easier. Much scholarship

reveals that through its link to flexibility, workers with schedule control may be better able to achieve a more harmonious fit between their work and non-work roles. Yet, schedule control's actual functions as a "resource" are not entirely understood, especially its potential negative consequences for our well-being in the work-family interface. As the stress of higher status perspective suggests, schedule control may be accompanied by excessive job demands and greater expectations that workers will fully devote themselves to work even when they are at home, potentially undermining its utility as a resource. This paper scrutinizes the assumed flexibility benefits of schedule control when workers find themselves in high pressured overwork contexts. Most research on schedule control and the work-family interface has been cross-sectional and tentative regarding causal inferences. While longitudinal studies exist, they have either been done outside of a North American context governed by different overarching expectations about work, or they have utilized group-randomized trials in an experimental design but have been confined to a single organization. Within a fixed-effects framework, the present study tests and elaborates on both Job Demands-Resources and border/boundary theories by moving beyond analyses of between-worker differences to focus explicitly on within-individual changes over time. This approach helps address bias from dispositional attributes or unobserved value orientations that might be influential. We analyze four waves of data from the Canadian Work, Stress, and Health Study (CAN-WSH), a large national sample of working Canadians from 2011 (wave 1), 2013 (wave 2), 2015 (wave 3), and 2017 (wave 4). Preliminary analyses suggest that while increases in schedule control alleviate work-family conflict, there are potential downsides to this resource within particular contexts.

Intellectuals in Pursuit of Populism: A Historical Perspective

In this paper we present a historical perspective on the relationship between intellectuals and what is current referred to as 'populism', arguing that the current political developments have a long pedigree. We focus in particular on the interbellum and how, in the context of the trauma of WWI, various writers in France and Germany expressed reservations about liberal democracy, deplored its alleged degeneracy, accused the establishment or of conspiring against 'ordinary' people, and advocated a more direct relationship between leadership and the 'masses'. We explore the similarities and differences with the current wave of 'populism' that has engulfed various countries.

BAH, BELINDA* (*University of Montreal*)

What Defines Citizenship? Perspective of Immigrants Living in Northern Metropolises

In the context of globalisation, the big cities of the North tend to attract migrants from the South. International immigration to these metropolises raises controversial questions about citizenship. This is one reason that citizenship needs to be thought of not only as a legal status, but also, as a cultural construct. The concept of "cultural citizenship" is increasingly present in the literature and implies the existence of diverse "citizen identities". Cultural citizenship is often analysed through the study of concrete participative practices, or the ways in which individuals engage in collective action. In this context, if "being a good citizen" is "being an active citizen", what does this really mean in big cities of the North? We propose to understand the dynamic of cultural citizenship through the concept and process of "citizen acculturation". To this end, our doctoral research focused on the (trans)formation of citizen identity of individuals for whom this process might be more problematical than for others: international immigrants. In Montreal, we interviewed twenty-seven immigrants with diverse profiles, identified by others and above all by themselves as "active citizens". Through qualitative interviews, followed in some cases by a questionnaire, we elicited their idea of "active citizenship" and analysed how this interpretation was constructed. Because our goal was not simply to list what being an active citizen might mean in the context of our study, we also looked at identity content, referencing three ideological frameworks: communitarian, liberal and republican. Based on this field work carried out over a year and a half, the presentation will focus on the results regarding the meaning of active citizenship for international immigrants in a so-called pluricultural metropolis.

Social Exclusion, Discrimination and Xenophobia in the Middle East: A Sociological Study of Indian Emigrants

History of the world can be seen as the history of migration. People have been migrating since the beginning of their existence. Today, it has become a predominant phenomenon in the world. The present paper deals with the

emigration from the Punjab state to the Middle East countries. It is a state situated in the northwest region of the Republic of India. People living in this area are known as Punjabis. Emigration is the part of Punjabi heritage, for centuries the Punjabis have been migrating to the different parts of the world; they have followed different trends and patterns in different periods to different destinations. But a totally new dimension was added in the profile of Punjabi emigrants after the oil boom in the gulf countries. Large numbers of Punjabis youngsters started migrating as semi-skilled or unskilled workers to the gulf region to meet the need of huge construction work in this region. This paper examines the migration of Punjabis to the Middle East countries and their trends and process of emigration. Attempts have been made to examine their interaction with the citizens of host countries and the reaction of the governments and citizens towards them. This paper also highlights violation of human rights of the emigrants by the host countries by focusing on the problems faced by them and their miserable conditions at work and in labour camps and as a result how this large group has been ignored by the government and socially excluded by the host country. The present paper is based on the two types of data: first, three hundred interviews conducted from the returned emigrants from the Middle East countries, and second, some secondary sources such as news papers, reports of various government and non government departments of both sending and receiving countries.

Mosques, Women and Charity Activities in Iran (A Study of Women's Charity Activities in Isfahan Province)

The charity-based activities in Iran from the past can be known affected by the factor of power in the micro, middle and macro ranges. The mosques in this country were one of the most important centers of charity social organization, following a good relationship with political and economic institutions, they followed the pattern of a traditional city. The effective and active presence of women around the charitable activities of the mosques and during religious ceremonies and religious rituals is evident. It seemed that women, through participation in the proclamation, mourning, and ..., had the opportunity to temporarily suspend the men's power and on the other hand, after this presence, through the establishment of charities, they obtained the opportunity to make decisions independently of the patriarchal society and its constitutions, which violently was depriving many of the rights of women, including the right to comment and decision-making at a high level.

According to the evidence, the presence of women in mosques after the Islamic Revolution and in the form of charity can be divided into three periods including Iran - Iraq war and support for fronts, construction period (after the war) and attending reconstructive and relief activities, the post-construction period and the formation of new charities. Studying the experience of women in how to set up, form and attend these charities can provide an analysis of the social context of the Iranian society and the experience of women's civil activities.

Therefore, in this article, using qualitative research methods, we will study the women's charity activities in the mosques of Isfahan and the experience of women in attending these activities in different periods after Islamic Revolution. Considering the interpretive social approach adopted in this topic and using the phenomenal methodology, the Colaizzi method is used to analyze the findings.

BAHAR, MEHRI* (*University of Tehran*)

Typology of the Quiddity of Charity in the Virtual Network (With emphasis on the telegram messenger)

Introduction: Religious and cultural traditions alongside with technology has provided extensive facilities for development of charitable aids. The aim of this study is to understand the new quiddities of charity in virtual networks. This study has demonstrated that social aid has been influenced by technology in such a way that it has significantly changed our perception of charity in the past few years. The use of technology has increased the components of individualism and possibilities. In other words, it has changed the social group that used to be involved with charity and it has brought in individuals from different backgrounds seeking different varieties of charitable acts.

Methodology: Qualitative content analysis has been used as the main method for data gathering in this project. Deep data analysis has been done in order to extract and show the concepts of charity and the donor's motivations. The data has been sampled from many different Telegram messenger groups of charity institutions.

Findings: On the basis of social constructionism and deductive methodology, data is categorized in two main parts: Person-Centered data (which contains actions of a person who is identifiable without cohesive organization) and NGO-related data. Eight dedicated categories were associated to people-centered data, and twenty categories were associated with NGO-related data.

Conclusion: Technology has caused charities institutions to undergo a revolution from the traditional method they were pursuing which surprisingly has not ended badly for them. It has caused an increase in the number and specialization of NGOs in general so everyone can now donate to any institution that they want and can relate more to. Components of individualism, humanism, religion-belief, micro needs assessment, anonymity and impersonality have been changed in the NGOs from the way they were before and these are all thanks to the influence of technology in the people's lives.

WORM, ARNE* (University of Goettingen)

Involved Outsiders – Reflections on the Combination of Ethnography, Biographical Research and Figurational Sociology

In this presentation, we will discuss how we combine biographical and ethnographic research methods within the framework of the research project "The Social Construction of Border Zones", funded by the German Research Foundation (DFG).

We will tackle the question of the benefits and challenges of combining participant observation and (biographical) narrative interviews by reflecting on the various figurations that frame (and are framed by) our interactions with members of different groupings. We will show how patterns of interaction, as well as presentations of images of the self, of the we-group and of other groupings represent the complex web of power relations within the research field (including our position as researchers). This includes the different levels and ambivalent dynamics of being an 'outsider' or a 'stranger' as a researcher while at the same time becoming involved with affairs in the field. For example, in some circumstances, conducting interviews as an 'outsider', in the sense of not being part of the local everyday interactions and relations, may turn out to be beneficial in gaining access to certain perspectives, especially when it comes to the members of marginalized groupings. In other cases, we may only gain access by closely participating in everyday interactions.

From our perspective, both methods – which are rooted in similar sociological backgrounds – can benefit a lot from each other if we reconstruct these (unequal) power balances in the field as a part of the research, and reflect on how this relates to a specific methodical approach. We argue that we need to adjust our methods to the circumstances in the field, and that a figurational perspective sensitizes us to the socio-historic genesis of these figurations.

BAHL, EVA* (Center of Methods in Social Sciences, University of Goettingen)

Perspectives on City History and Their Interdependency with Constructions of Belonging in Ceuta and Melilla

In my paper, I will discuss the interdependencies between life- and collective histories, perspectives on history and constructions of belonging in Ceuta and Melilla. These two Spanish cities in the north of Africa were conquered in the wake of the so-called *Reconquista* in the 15th century and have been Spanish ever since. The two cities played a central role in the colonial period of Spanish-Morocco (1913-1956) and were the setting for a military coup that led to the outbreak of the Spanish Civil War in 1936. Today they are known all over the world because of the high fences that surround them to prevent illegalized migrants from entering this small piece of the European Union on the African continent.

My research, which deploys biographical and ethnographic methods, explores how these border cities' conflictual histories are remembered and referred to by members of different groupings and how these historical perspectives relate to their respective constructions of belonging. It is part of the project "The Social Construction of Border Zones", funded by the German Research Foundation (DFG).

Nowadays, the proportion of the population in these two cities that is Muslim and/or Moroccan is growing constantly. As a result, power balances are shifting slowly, and part of the Christian-Spanish population feels endangered by this societal change that is perceived by them as "Moroccanization". Furthermore, there is a tendency in the established population to harmonize the conflictual history (and present) of these cities by a discourse of peaceful coexistence ("*convivencia*"). On the basis of my empirical analysis, I argue that this discourse essentializes cultural differences and hinders the negotiation of historical conflicts and power inequalities.

Abuses Against Street Children

There is no way to thoroughly enumerate the various ways in which children around the world are economically exploited and physically mistreated. But the

numbers are great and the suffering widespread. Behind the hideous imagery of children beaten or sexually abused by parents; ravaged beyond their years by hard living and drug abuse on the streets; maimed by landmines or turned into killers by war; stricken with AIDS are the all too common struggles against disease, hardship, and family or social traditions that compromise children's humanity or subject them to physical and emotional suffering. While 18 million children work on the streets of India, it is estimated that only 5-20 percent of them are truly homeless and disconnected from their families.

RC32-578.4

BAHRI, ANUPAM* (panjab university)

Child Trafficking: A Global Challenge for the Whole World.

Trafficking in persons shall mean the recruitment, transportation, transfer, harboring or receipt of persons, by means of the threat or use of force or other forms of coercion of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or of receiving of payments or benefits to achieve the consent of a person having control over another person's, for the purpose of exploitation. Exploitation shall include, at a minimum, the exploitation of the prostitution of others or other forms of sexual exploitation, forced labor services, slavery or practices similar to slavery, servitude or the removal of organs. The recruitment, transportation, transfer, harboring or receipt of a child for the purpose of exploitation shall be considered 'trafficking in persons' According to NHRC Report on Trafficking in Women and Children, in India the population of women and children in sex work in India is stated to be between 70,000 and 1 million of these, 30% are 20 years of age. Nearly 15% began sex work when they were below 15 and 25% entered between 15 and 18 years. The law has relevance to addressing the problem of trafficking. India has also adopted a code of conduct for Internet Service Providers with the objective to enunciate and maintain high standard of ethical and professional practices in the field of Internet and related services. Juvenile Justice (Care and Protection of Children) Act, 2000 Enacted in consonance with the Convention on the Rights of the Child (CRC); and Consolidates and amends the law relating to juveniles in conflict with law and to children in need of care and protection. The law is especially relevant to children who are vulnerable and are therefore likely to be inducted into trafficking.

BAHTINA, DARIA* (Finnish Centre of Excellence in Research on Intersubjectivity in Interaction)

On Constructing the Self and the Other in Imitation Game Experiments: The Role of Interactional Expertise in Multicultural Societies

Intersubjective differences are often used to construct the image of 'the other' (Kapusinski 2008) and cement stereotypes that 'invent the enemy' (Eco 2012). The threat of a social divide is even bigger in modern societies: in addition to classical majority/minority tension there is a shift towards polarization as a result of changing media landscapes. Estonia presents a good case study, with over a quarter of Russian-speaking population. Estonian restoration of independence in 1991 upon decades of Soviet occupation led to Russian losing its dominant status of 'majoritized minority' (Ozolins 2003), which nowadays is reflected in a complex mix of unresolved tensions but also merged identities and new opportunities to build social cohesion. In this paper we propose an innovative research method to address the processes of social group construction in this multicultural reality.

We use the imitation game format adapted from Turing's Test (1950) to explore the dynamics of group formation and maintenance through interactional expertise. The latter is claimed to complement formal propositional knowledge and embodied skills as interlocutors try to understand the conceptual structure of the social world of the other (e.g., Collins & Evans 2002, Collins 2004). In our experiments the participants are involved in an interactive game: their task is to display their actual membership, imitate belonging to another social group, or provide a judgement about another person's identity as recognized through interaction. We seek to replicate findings from previous studies that demonstrate a striking difference between how majority and minority groups use these resources in social interaction. These results and the data from focus group interviews are expected to shed more light on how fluid various social boundaries are and indicate which elements are used to construct relevant identities. The insights have the potential to avert conflict situations by promoting the acceptance of diversity.

BAHTINA, DARIA* (Finnish Centre of Excellence in Research on Intersubjectivity in Interaction)

The Power of Talk: Reducing the Potential for Conflict through Constructing Common Ground

The notion of common ground (henceforth, CG) refers to shared knowledge that advances both interactional efficacy and social affiliation (Enfield 2013).

The existence of CG is often taken for granted, yet when insufficient it poses risks not only to mutual understanding, but to overall acceptance of 'the other' (Kapusinski 2008): limited CG may hinder social cohesion and trigger intergroup tensions. We explore how interactional participation practice enables the shift from 'imagined certainty' towards 'acknowledged complexity' (Holliday 2008) and promotes a more diversified view on social boundaries. More specifically, this paper reports on an experimental study with Estonian and Russian-speaking Estonians to demonstrate how group membership is negotiated through active co-construction of CG.

The Imitation Game is an experimental approach adapted from Turing's Test (1950), in which a 'judge' (here, an ethnic Estonian) through a series of questions detects a 'pretender' (a Russian-speaking Estonian) and an actual 'representative' of their social group. The method has proven itself valuable in the assessment of interactional expertise, a key element that enables cooperation between different social groups (Collins et al. 2006, 2015). In this paper we zoom in on the communicative characteristics that facilitate a dialogue across putative group boundaries. To this end, we focus on the interactive means people use to achieve informational and interactional CG. To analyse the processes behind the establishment of CG we adopt and appropriate a number of concepts, such as psycholinguistic alignment (Pickering & Garrod 2004), joint action (Clark 1996), affiliation and affective stance (Stivers 2008, Stivers et al 2011). Each is served by meta-communicative strategies for monitoring CG in more tacit or more explicit manners (Bahtina-Jantsikene & Backus fc.). Finally, we investigate the interplay between pre-existing and emergent CG (Liu & Liu 2016) and how their manifestation in conversation reflects the formation and maintenance of social groups.

Influences of Socio-Economic Status of Parents on Youth Identity: Exploring Youth Identity and Consumerist Fashion in South Africa

Fashion is a symbol of culture and is often used to express various identities. Youth today create, replicate or imitate various subcultures which in turn form their identities. Very often the youth deviate from social norms, as is the case with the Izikhothane subculture in South Africa. The subculture is characterised by extravagance and destroying the expensive items they buy. The parents of these young people are predominantly middle class to lower class as they live in townships and therefore cannot afford their children's lifestyles, leading to them living in debt.

The purpose of this study, with an efficient literature review on youth, fashion, identity, parents influence on young people's consumer behaviour as well as desire and conspicuous consumption is to find the relationship between youth identity, with particular focus on fashion as an expression of identity and how it is affected by the socio-economic state of the parents. It also seeks to identify other social problems that may arise thereafter.

This is a qualitative study, making use of focus group interviews as a research tool. The study is conducted amongst the students of North West University-Mahikeng Campus including an analysis of literature and media reports on Youth Cultures and Consumerist Styles in South Africa.

Various findings are discovered and recommendations are given and the most important finding is one that proves that parents do have an influence on youth identity and preferred consumer fashion styles which go with the identity of choice.

Social and Genetic Influences of Educational Attainment and Their Variation According to Social Background.

Abstract:

Genetically informed studies provide consistent evidence that genetic influences account substantially for individual differences in nearly all inequality-related outcomes. What is more, the empirical literature comes to the conclusion that the relative importance of genetic influences even exceeds the importance of shared family influences. Strikingly, educational attainment differs from this pattern as shared family influences are almost as important as genetic influences even in adulthood. So far mechanisms leading to this divergent finding are poorly understood. In this paper we examine whether this pattern for educational attainment replicates for Germany. Germany, represents an interesting case due to its highly stratified schooling system which is characterized by an early tracking system. Drawing on sociological theories on class-specific education decisions we hypothesize that the finding of a substantial role of shared family influences replicates. In contrast to previous studies we investigate whether the relative importance of shared family- and genetic influences varies by social background. In line with previous evidence that impoverished environments suppress genetic expressions

we expect that the relative importance of genetic influences increases with social background. We test our hypotheses by estimating ACE-variance decompositions of educational attainment based on about 950 young adult twin pairs in their early 20s based on the novel German twin family panel study *TwinLife*. Preliminary results reveal a substantial impact of shared family influences for educational attainment in Germany and support the hypothesized larger share of genetic influences on educational attainment among higher social status families. Furthermore, our results indicate that more advantaged families provide family influences under which children can realize their genetic potential.

Deep Organizing in Education: An Analysis of Teachers' Union Strategies in Ontario and British Columbia

This essay assesses the neoliberal restructuring of kindergarten to grade 12 public education as well as the character of teachers' union struggles to defend good quality public education in Ontario and British Columbia. I will focus on the recent struggles over education reform and collective bargaining in Toronto and Vancouver to demonstrate this shifting policy environment as well as the declining working and learning conditions facing teachers and students in those cities. I contend that in the face of mounting pressure from neoliberal reformers, teachers' unions continue to be a progressive force in defense of accessible public education, however, the degree to which they have been successful in halting or reversing the restructuring and cuts to public education varies from province to province. Drawing upon the work of Jane McAlevey (2014; 2016), I aim to examine how teachers' unions can effectively develop their capacities to mount resistance movements that move beyond the realm of any particular round of collective bargaining and into the social sphere via the whole worker approach to deep organizing (McAlevey 2014; 2016). This entails an examination of the organizational character of each teachers' union as well as the dominant strategies they employ to achieve success. Here each teachers' unions' relationship to their employer, the communities they serve, their own members, and the wider labour movement will be explored.

Dismembering Organisation: How Medical Algorithms Are Remaking the Human in Healthcare

Algorithms are increasingly being adopted and implemented within the English National Health Service, promising increased safety, productivity and efficiency in the delivery of health care. Following Berg (1997), medical sociological literature on algorithms often conceptualises these technologies as 'decision support' (e.g. Peiris et al., 2011). More recent work makes a corresponding move in analysing the meaning-making practices of algorithmic data users (e.g. Maiers, 2017). Both kinds of analyses involve a coupling of the algorithmic world with the social world of medical practices, and proceed according to the negotiations involved in making this coupling 'work' (Turnbull et al., 2017). By building upon analyses of financial algorithms, we present a slightly different argument, calling attention to the essential and non-negotiable disjuncture between the algorithmic and the social, and the consequent need for a reconsideration of the forms of human agency available within health care organisations.

We build our argument with ethnographic data from a study across two hospitals of the implementation of an algorithm that aims to identify cases of acute kidney injury (AKI). By analysing the differences between the approach taken in each hospital to implement the algorithm, we juxtapose two problematisations of the concept of 'algorithmic work', in which the technological and social worlds are coupled. We then draw upon 'interruptions' in the smooth flow of the algorithm within each setting in order to highlight the 'dismembered' (Lenglet, 2013) organisational state that constitutes the ideal expression of this technology. In discussion, we draw lessons from our data for rethinking extant conceptions of the technological and social, which, we argue, are remaking both the caring and the cared-for human. As the use of algorithms becomes widespread, sociologists of organisation may find our analysis helpful for understanding how organisations split tasks from human experience in the automation of work.

Responding to Violent Radicalization: Contextualized Resilience and Risk-Focused Prevention in Europe

Recent terrorist attacks in France, the UK, Belgium, Spain, Germany and Sweden have led to renewed attention being directed towards risk-focused responses to terrorism, such as those exemplified by the Prevent strategy in the UK. There are many equivalents to Prevent across mainland Europe which seek to reduce the threat of future attacks by deploying policies of pre-emption and intervention. Aside from well-documented problems with ascribing risk factors to specific ethnic and religious groups, risk-focused prevention measures have tended to lack appreciation of social, political and economic context. Partly as a consequence of public, media and academic criticism, risk-focused measures have been modified and increasing attention in policy making circles has been paid in recent years to the positive potential of developing resilience amongst communities and individuals considered to be susceptible to radicalization.

Addressing the issues raised above, this paper examines the uses of resilience in the context of policies directed towards preventing violent extremism in Europe. In particular, we will examine the utility of context sensitive alternatives to risk-focused prevention, for example, those geared toward enhancing dialogue through community mediation and improving social cohesion. Drawing on empirical evidence developed during explorative area-based research in a few European cities recently affected by terrorist attacks, we elucidate the possibilities of and limits to engaging key actors such as teachers, youth workers and community-leaders in building trust and promoting social optimism. In so doing, we confront critical questions that are crucial in developing appropriate policy responses to the threat of terrorism. How is resilience understood and mobilised by the various actors involved in preventing radicalization? Which structural factors encourage or inhibit the building of resilience? How do contextualised resilience approaches work in relation to risk-focused approaches to violent radicalisation?

Wellbeing and Prescription. Self-Realization and Social Recognition in a Sociological Perspective

This paper discusses youth wellbeing from the angle of how adolescents define the goals of their lives and of how they are told what is respectable in matter of a 'good life' to aim for. In the context of the knowledge economy, engaging in higher education and getting a university degree have been repeatedly been pushed forward as highly respectable aspirations. However, encouraging young people facing social inequality to engage in higher education has also been arguably criticized for being imposed upon them, at the expense of other understandings of a fulfilling life that may be more in line with young people's aspirations. Yet, that alternative understandings of wellbeing – such as 'self-realization' – are not prescribed may seem doubtful in many ways. Is there any non-prescriptive understanding of a 'good life' that could be useful for the sociology of youth? To what extent can sociologists escape from top-down definitions of youth wellbeing? This paper questions the relevance and the limitations of social recognition as a pivotal concept for sociological research regarding desirable futures, drawing on a discussion of Sen's holistic framing of wellbeing and Appadurai's reflection on the 'terms of recognition' and building on qualitative observations amidst young people facing social inequality in the European context (chiefly in the Netherlands).

Can Contemporary Art Really Liberate Young People?: A Critique of the National Galleries of Scotland's Outreach Project and Exhibition, the Untitled: Bad Entertainment (2014 - 2016)

'Only if we learn to aestheticize the lack of gifts as well as the presence of gifts, and thus not differentiate between victory and failure, do we escape the theoretical blockage that endangers contemporary art activism.' Groys (2014)

Faced with (post)-crisis personal, social and economic uncertainty, young people in Scotland participating in The UNTITLED, were offered the chance to describe the reality of their lives by creating their own 'contemporary art'. This paper will assess the meaning and impact of the art they created; on the young 'artists' themselves, on their peers and on the wider audience who visited their exhibition at the Scottish National Portrait Gallery. What kind of testimony did they deliver about the challenges that faced them, springing from societal conditions that they hadn't created? The participants were drawn from social work centres, employability courses, mainstream and special schools, in an attempt to engage those excluded from cultural representation. Would anyone take notice of their artistic statements, and would anything change as a result?

An assessment of the inequalities surrounding the much-promoted panacea of 'creativity', and an examination of the unequal distribution of the entitling designation of 'artist', in relation to young people, forms the core of this paper. Contemporary art in Scotland, as promoted by the government funded arts agency, is seen as a 'place-making' success story, whose 'effect' it seeks to spread throughout society. In this context, could the participants transcend the instrumental nature of their collaboration with the gallery, and could they utilise the supposedly 'rule-breaking premise' of contemporary art methodology, to actually alter their own life chances and affect the perceptions of a public audience? The paper concludes by assessing whether The UNTITLED challenged the current distribution of the power of representation and if so, by what (evidenced) means it did so.

Young People in the Russian Labour Market: Challenges and Responses

The problems of youth is always under scrutiny by the government officials, humanitarian scientists and international organizations. The most unsettling and topical problems in the contemporary field of work is related to significant changes in economic structures, forms of employment and work organization, work content; raising diversity, flexibility and dynamic. Young people all over the world face with more and more challenges.

Our investigations show that young people in Russia are actively involved into the economic life of the country. In 2015-2016 they were more likely to start working earlier, to combine work with study, to engage in entrepreneurship than in 2006-2008. Generally, the population notes the increase in the jobs' opportunities, and especially for young people. At the same time, we have revealed a series of specific features and contradictions in the youth labor market of Russia: increasing demand for quality jobs against decent jobs deficit and precarization; bigger number of the youth employed in the economy and smaller number of youth, registered in social insurance funds; increasing share of young people with higher education along with delay in modernization of the economic structure and jobs; growing differentiation of regional labour markets despite of globalization and intensified migration etc.

The author examines the labor market situation of young people (at the age of 18-24 and 25-29) at the national (Russia) and regional (the Republic of Bashkortostan of the Russian Federation). Based on sociological and statistical data, the author analyses challenges of the transformational processes and problems of young people, their feelings, expectations and career strategies; compares with available data, characterizing global tendencies and processes.

Cruise Corporations Step Ashore: Urban Waterfronts As Sites of Power

Adding to the proliferation of leisure and recreational activities - an overall trend in the post-industrial urban context -, port-cities now host new leisure driven actors and practices, specifically related with cruise ship tourism.

Given the exponential growth of cruise industry, and the magnitude of cruise ships themselves, the landscape of many European port-cities has been changing rapidly in the last decades. However, the transformative power of these aquamobilities in the visited places goes well beyond their almost daily visual impact, playing a part in the co-production of their urban space and everyday life. This happens, for instance, through the investment in new cruise terminal infrastructures, often linked to wider regeneration projects. Here, power issues are frequently related with unaccounted surroundings, and lack of community involvement in urban planning process, raising questions about the 'right to the city'.

Surprisingly, or not, the huge power of cruise mega-corporations is also gradually stepping ashore, as they extend their holdings to other tourism segments, and even port facilities and services. This paper will discuss how cruise aquamobilities actually unfold at, and co-construct, the visited places. Drawing on empirical research in several port-cities, I will highlight the more fine-grained findings reached through my visual/sensory approach.

BAJARD, FLORA* (*LEST (Institute of Labour Economics and Industrial Sociology) - France*)

Are the "Grey Zones" of Employment Reconfiguring the Relation of "False Employees" to Their Occupation?

This proposal focuses on a particular form of "grey zone" of employment: collective working spaces and organizations through which self-employed persons get paid through wages, whether these organizations are cooperative - cooperative, mutual - or not - "umbrella companies" or portage wage companies.

These workers are therefore somehow “false wage-earners”, because they consider themselves as self-employed, and yet, they receive a pay slip; in other words, they are “autonomous employees” (Grégoire et al.). So, once inscribed in these organizations, productive activity might be perceived differently, as well as the categories associated with it: self-employed /wage earner, boss /employee, capital/labor, etc. Based on a first phase of investigation among people from a variety of occupations but grouped together in these organizations, this communication sheds light on the mental categories that workers use to situate themselves in social space: do they still consider themselves as freelance workers, and what relation do they have to such visions (and divisions) of the world? To what extent are these categories used in a logic of self-assignment, reject/foil, or claim? In connection with the topic of the session, an attempt will be made to understand the impact of these evolutions on occupational groups: how do the individual appropriations of these categories consolidate the occupations or, on the contrary, divide them (logics of segmentation and unity)? Do they transform the social image of occupations, i.e., the way in which workers are subjectively connected with it? This proposal is part of the first phase of an inquiry into work collective spaces in France and Belgium (*Cooperative d'Activité et d'Emploi, Scop-Cooperative society, portage wage societies, mutual work companies*).

Efficacy of Jacobson's Progressive Muscular Relaxation Therapy in Strain, Anxiety, Caregiver Burden and Quality of Life of Caregivers of Cancer Patients in Bhopal City, India

The present study was undertaken to investigate the efficacy of Jacobson Progressive Muscular Relaxation Therapy (JPMR) in alleviating the strain, anxiety and caregiver burden experienced by caregivers of cancer patients and also in improving the Quality of Life of cancer caregivers. A sample of 80 subjects with specified inclusion-exclusion criteria was selected with caregivers divided equally into experimental (n=40) and control (n=40) groups. The study was an experimental, two group comparison design with pre and posttest intervention assessment. Assessment was done using Semi-structured Interview Schedule, Caregiver Strain Index (CSI), Hamilton Anxiety Rating Scale (HAM-A), Zarit Burden Interview and WHO Quality of Life - BREF scale. The Intervention program consisted of Jacobson's Progressive Muscular Relaxation Therapy, Psycho education, and Counseling to significant others. The duration of intervention program was 60 sessions over the period of three months and each session of 30 minutes. Subjects, each of the experimental group and the control group, completed participation. The two groups were statistically comparable at baseline on socio-demographic, clinical and outcome variables. Following the intervention, at post intervention assessment, the experimental group showed a significant improvement on Strain, Anxiety, Caregiver Burden and Quality of Life measures. No significant changes were noticed among the control group at post assessment on these variables. The implications, limitations and strengths of the study along with suggestions for future research for cancer caregivers are discussed.

Examining Relationship between Urbanisation & Health: A Case Study of Metropolis in Punjab, India

India is witnessing rapid urbanisation. The total urban population has increased from 28.6 million to 37.7 million during the period from 2001 to However absolute increase in urban population is 9.1 million which is one million more than increase in the rural population. There are 53 million plus cities out of which two are located in Punjab one Ludhiana and Amritsar having population of 1,613,878 and 1,132,761 respectively (Census 2011) and they constitute 26.7 percent of the total urban population of Punjab.

The process of urbanisation tends to have profound stress on the urban infrastructure on which Indian government spends US\$ 17 per year. The metropolitanization drive would lead to increased demand for basic services that include water supply, sewerage, and sanitation, solid waste management which are inadequate and deficient in service delivery. The fast pace at which urbanisation is occurring has impact on urban environment which directly or indirectly affects the human health. The impact is felt greater by those who are living in slums as they do not have access to basic necessities of life. The inadequacies of basic services affect the poor slum dwellers more as they forced to live in unsanitary living conditions. This brings in plethora of issues relating to personal health of slum dwellers in particular and public health in general.

The campaign by the Prime minister of India Narinder Modi for cleanliness and sanitation proves that *Swachta hai toh Sehat hai* Thus there is a need for examining the complex relationship between urbanisation and health in a comprehensive manner. The universe of the present study would be the 'notified slums' of Amritsar. Focused group discussions and interview schedule would be used to elicit response from the slum dwellers and stakeholders in healthcare system.

Creatour: Creative Tourism Initiatives As a Tool to Promote Sustainable Rural Futures in Portugal.

Addressing the theme of how sustainable rural futures can be realized by taking into account 21st century realities, this paper presents a unique project on the future of rural economic development and social cohesion through the initiation of creative tourism products in rural areas and small cities.

The promotion of crafts to fuel rural socio-economic development is gaining momentum and simultaneously a change towards what is known as 'transformative tourism' (Pritchard et al. 2011) is observed, as tourists demand more immersive experiences. Creative tourism, which differs from cultural tourism in terms of being an active transfer of the past into the present via local-visitor interaction, rather than a passive observation of the past (Richards & Marques 2012), offers a novel rural development tool that this paper investigates through a co-creation approach.

The CREATOUR project investigates how rural organizations, tourists and rural communities interact and forge new alliances in the Portuguese context. This three-year project started in 2016 and has 20 pilot projects, which will grow to 40 by 2018. Pilot projects are entrepreneurs or organizations who propose innovative creative tourism products for rural areas and small cities, which will be actualized by the end of the project. Whilst at a preliminary stage, by the time of the conference, this project will have a large amount of data from tourists (through questionnaires handed out by pilot projects), IdeaLabs (meetings of pilots and researchers for knowledge exchange), e-portfolios, a documentary and researcher site visits, which we intend to analyze and disseminate.

'out of Time and out of Money': How Female Tourism Micro-Entrepreneurs in Greece Attain Sustainability in a Crisis.

Handicraft tourism increasingly is conceptualized as a legitimate avenue to encourage women's engagement in micro-entrepreneurship by development programs which aim at alleviating poverty and promoting gender equality. However, women who become entrepreneurs face conflicting gendered expectations to be primarily responsible for the activities necessary to maintain life on a daily basis and intergenerationally. These activities, referred to in political economy literature as 'social reproduction', are used here as a lens through which to examine how female tourism entrepreneurs survive an economic crisis.

As an economic crisis brings on additional pressures to accumulate and options to hire privatized social reproductive help diminish, I investigate how the delicate balance between entrepreneurs' caring and productive roles is affected. Situating the study in Greece during June-December 2012, I use the ethnographic methods of participant observation and semi-structured interviews with female tourism handicraft micro-entrepreneurs. The analytical approach focuses on how gender permeates and operates within tourism labour, by exploring the ways in which micro-entrepreneurs remain sustainable during a macro-economic crisis. As time is intricately woven into life-processes and the ability to re-distribute time is increasingly valued by neo-capitalist discourses where work hours merge into 'rest' hours, I investigate the gendered significance of time in tourism labour.

I find that the female tourism entrepreneurs' sustainability is highly influenced by gender's operation at the intersection of economic activities with feminine caring subjectivities, with the economic crisis accelerating intra-familial negotiations to accommodate new economic demands. Female entrepreneurs use intriguing techniques to combat some of the negative effects of the crisis, such as recruiting unemployed husbands into feminised types of handicraft entrepreneurship, and renegotiating household duties in order to have more time to engage in craft-making and selling.

BAKER, JAMES* (*McMaster University*)

Racism and Social Media: Post-Secondary Youths' Observations of Peer Attitudes Towards Canada's Response to the Syrian Crisis on Facebook and Twitter

While Canada's response to the Syrian crisis has been commendable, there are those within Canadian society who view this response with apprehension. Indeed, Angus Reid (2016) noted that while 44% of Canadians oppose the Liberal's plan to resettle Syrian refugees, 58% of Canadians aged 18-34 supported it. When the broader public express disparaging views or opinions about refugees, the

result, whether intentional or not, is the reinforcing of negative prejudices and stereotypes. Using Integrated Threat Theory, this paper explores the social media observations of post-secondary youth regarding Canada's response to the Syrian Crisis. While primarily a psychological and social-psychological theory, Integrated Threat Theory has been adapted to sociology, particularly when examining, for example, racial threat (Stephan & Stephan 2000). While there is evidence to support the argument that these youth perceive their peers as viewing the Syrian arrivals as a threat, interestingly, they respondents were generally supportive of the Government's plan.

Educational Strategies of Socioeconomically Disadvantaged Students in England: Locating a Means of Broadening the Higher Education Choice and Decision-Making Landscape

In presenting data from a longitudinal narrative inquiry exploring the Higher Education decision-making and choices of English Further Education students over a two year period, I show the ways which socioeconomically disadvantaged young people construct their own capital to assist them in this process. Existing literature that has explored HE decision-making and choice amongst socioeconomically underrepresented groups have often used Bourdieu's notions of habitus, field and capital as a conceptual lens, demonstrating how unequal access to resources leads to the perpetuation of inequalities (Ball et al., 2002; Reay et al., 2005). Yet, by considering the role of agent's reflexivity (Archer, 2003, 2007, 2012) alongside the forms of capital (Bourdieu, 1986), the diverse and strategic ways that participants made their HE decisions and choices, without access to beneficial resources, were able to emerge. Participants showed instances of 'bridging' social capital (Putnam, 2000) to access 'hot knowledge' (Ball and Vincent, 1998), and the mobilisation of experiences into valuable capital during the HE application process (Bathmaker et al., 2013; Shuker, 2014). Moreover, students strategically used national and HE-delivered widening participation schemes and initiatives to overcome constraints arising from limited access to economic capital, and lower levels of prior educational attainment (cultural capital in its institutionalized state). In adopting such strategic approaches in their HE choices and decision-making, some participants were able to successfully broaden their landscapes of choice.

BAKER, ZOE* (*The University of Sheffield*)

'It's Just Not Financially Doable': The Higher Education Decision-Making Journeys of Socioeconomically Disadvantaged Students in England

The purpose of this presentation is to show how financial concerns shape the Higher Education (HE) decisions and choices of Further Education (FE) students from socioeconomically disadvantaged areas in England. Scholars have highlighted how financial concerns and constraints can influence HE choices and decision-making, with potential applicants employing various strategies to minimise the financial burden of HE. This may consist of applying to HE institutions located in areas where living costs are low (Callender and Jackson, 2008), or remaining within the family home (Patinotis and Holdsworth, 2005). Drawing on findings from a qualitative longitudinal narrative inquiry, the presentation provides enhanced insights into the ways that financial concerns shape and restrict students' HE decisions and choices over a 14 month period. Issues arising from financial constraints were found to emerge early in the decision-making process, limiting participation in institutional visits, and in turn, restricting access to information. Delays in the realisation of financial limitations were also apparent, with the longitudinal approach allowing students' 'ideal' HE plans and later renegotiations of these, to be fully captured. The findings collectively convey that the majority of participants were unable to go where they *preferred* in their HE decisions, and, instead, had to decipher the 'reasonable' option when financial constraints were realised.

BAKER-HUGHES, SHARON* (*Texas A&M University*)

Forms of Income and Economic Disparity for Lesbians, Gay Males, and Bisexuals

Research on the economic impact of sexual orientation has consistently revealed disparities in the wages of gay males and lesbians, relative to their straight counterparts. Most of these research studies rely on a single measure of sexual orientation for analyses, and compare differences between gay and straight respondents. Little is known about the impact of other sexual orientations, such as bisexual men and women, on economic outcomes. Few studies have examined multiple measures of sexuality to determine whether the definition of sexual orientation impacts income. This study is an attempt to bridge these gaps. Using the NSFG Public Use Data Files, I found that people with a sexual majority status

(e.g. those who are straight) do have significantly different incomes than gay males and lesbians. My analysis also reveals that people with a sexual majority status have significantly different incomes from people with any sexual minority status, and from those who are defined as bisexual men and women. Additionally, *how* sexual minority status is measured changes the impact of sexual orientation on income. I compared sexual behavior, sexual attraction, self-identity, and combinations of these measurement variables and found that the measurement variable chosen impacts the significance of economic disparity. Finally, I examined the forms of income across sexual orientations and found significant differences based on sexual majority or minority status. That is, the likelihood of being self-employed, working for someone else, or receiving disability income varies significantly based on sexual majority/minority status as well as between minority statuses.

BAKKER, JOHANNES* (*University of Guelph*)

Social Movements and Comparative Historical Sociology: Alienation at the National Level

The conceptualization of alienation in Karl Marx's original work on the topic includes the alienation of the proletarianized worker from the products of his or her labour. But there has not been as much emphasis on the ways in which citizens of nation-states also help to "produce" the nation itself. We tend to see "labour" in terms of manufacturing products ("widgets"). But citizens also "manufacture consent" (Herman and Chomsky 2002 [1988]). To fully grasp that requires taking a long-term historical and comparative perspective. The Frankfurt School implicitly had such a perspective but did not always develop it fully, due in part to the necessity of dealing with the immediate situation in Europe in the 1920s and 1930s, and after. A Comparative Historical Sociology (CHS) based on key ideas found in Marx and Max Weber's *verstehende Soziologie* helps us to grasp the link between key factors. The idea of "self-alienation" should not be restricted to the level of individual psychology or small group social psychology. Work on the concept of the "nation" and the development of the "nation-state" by thinkers like Zygmunt Bauman, Ben Anderson, Charles Tilly and others should also be consulted, even though they are not usually included in the Frankfurt School pantheon. Walter Benjamin's solutions are somewhat different than those put forward by Adorno and Horkheimer. Jürgen Habermas' communicative action is often regarded as too "liberal" rather than Marxist or even Neo-Marxian, but there is much to be said for his defense of Enlightenment rationalism. Complete freedom from alienation is a utopian ideal but a transparent representative democracy is more likely to benefit the average person dependent on wages or salary. Global neo-liberalism is not the answer. Social movements must be directed to clear goals. A combination of strategies is required. Good theory is essential.

BALA, RAJNI* (*Baring Union Christian College, Batala*)

Surrogacy Regulation Bill 2016, India: A Critical Analysis

India has emerged as a surrogacy hub for all those couples from different countries, who have difficulty in attaining parenthood biologically. In spite of this flourishing market, there have been reported incidents of exploitation of surrogate mothers, unethical practices, rackets of intermediaries, and abandonment of children born out of surrogacy in India. Print-and electronic media have also highlighted the need to prohibit commercial surrogacy and all the exploitation going on in the name of surrogacy services

In the light of all these, Union Cabinet of Government of India has given approval to the "Surrogacy Regulation Bill, 2016", which will ensure effective regulation of surrogacy by establishing National Surrogacy Board at the central level.. This bill totally bans commercial surrogacy in India and allows those married infertile couples to go for surrogacy, who have not been able to produce their own child after five years of their marriage. Only a close relative woman, who already has given birth to a healthy child, is eligible to be a surrogate mother. Homosexuals, live-in-couples, foreign nationals and single persons are not allowed to go for surrogacy in India. Although this bill has been introduced to regulate surrogacy

services and to stop exploitation of surrogate mothers, yet, this bill raises many social, ethical and legal issues, which need to be addressed.

The present paper presents a detailed analysis of the Surrogacy Regulation Bill, 2016, India. It focuses on the violation of the rights of certain groups and discusses how this bill is in contradiction with the right to equality provided by Constitution of India. The data used for this paper are based on secondary sources as Government reports, Surveys, newspapers etc.

BALACHANDRAN, LAVANYA* (*Asia Research Institute, National University of Singapore*)

"They Don't Need Me to Amplify Their Voices, I Need Them to Render Visibility to My Research.": Making Sense of Marginalized Ethnic Minority Youth Narratives

Discussions about researching marginalized groups have often acknowledged the politics endemic in knowledge production and the research practices that produce them. To deal with that, reflexive practice in qualitative research has urged scholars including 'natives' and 'insiders' to be honest and upfront about their class, race and gendered locations, recognize their privilege and appreciate the 'difference' between themselves, as knowledge producers, and the researched, their subjects. Despite the calls for transparency, the ultimate act of knowledge production – theorizing – has often been less than rewarding because it remains distanced from the pain of alienation experienced by disadvantaged subjects whom researchers at worst patronize and at best feel guilty about. This paper is situated within the broader context of destabilizing the alleged mutual exclusivity of the outsider/insider, native/non-native, us/them, colonizer/colonized binaries. In particular, I draw upon my own methodological trajectory in my study of educational underachievement in Singapore amongst ethnic minority Indian youths in terms of how their lives intersect with my biography as a researcher from the same ethnic community. Here, I suggest how reflexivity carries with it a certain responsibility of humility that sensitizes us not just to differences between the researcher and researched but also the shared experiences of anxiety about belonging and acceptance, fear of failure, moments of exclusion, articulations of resistance and expressions of resilience; about how all of us as social actors are embedded in multiple hierarchies in the same context that simultaneously make us advantaged and disadvantaged, outsider and insider, us and them, accommodate and resist; and how when these experiences translate into acts of theorizing, they still require a language of reason that can be inclusive without showing benevolence, and intellectually contribute towards understanding the struggles of the marginalized and produce morally and politically enabling knowledges.

Democratisation of Justice: Learning from Indian Experience

DEMOCRATISATION OF JUSTICE: LEARNING FROM INDIAN EXPERIENCE
No body can deny the fact that democratisation of justice system should start at the grassroots level through transforming and sensitizing the existing dispute settlement mechanisms to human rights and constitutional values and linking with formal justice system. The traditional dispute resolution system in India has got a new vigour with the introduction of 73rd Constitutional Amendment Act . Strengthening the Panchayats(rural local bodies) and empowering people at the grass roots to resolve their disputes amicably would solve many of the problems that are faced by the conventional justice dispensation machinery in its attempts to percolate to the lowest levels. Democratisation of justice by making use of the potential Panchayat Raj institutions can be seen a best practice that can be emulated. The author explores its possibilities.

Women's Political Participation in Panchayats in the Scheduled Areas of India: An Analysis of Women's Empowerment through Political Reservations

Political participation of women and their engagement in electoral process is an important marker of the maturity and efficacy of democracy in any country but women representation in political arena has long been overlooked in the process of development. Women in India, after being marginalized for long are being granted statutory status in the local bodies' leadership with the passage of 73rd and 74th constitutional amendment and extended it to Scheduled Areas by PESA Act. Though, the constitution guarantees legal equality to woman but male dominated political spheres has thwarted the woman's political participation. Political reservations for women can be a channel to address issues of women empowerment as many research evidences suggests that political reservations to woman at the local bodies, has not only enhanced the overall status of woman

in terms of health and decision making choices but has also led to several potentially positive advances for women as well as for the local political system and administration. In this backdrop, the paper attempts to draw linkages from reservation at panchayat level to woman empowerment and advocacy for political reservation at the levels of parliament and state legislatures. This paper has three main objectives. The first objective is to assess the socio-cultural factors that affect the political participation of women. Second objective is to assess the impact of women's political participation at local bodies on to the development indicators. Last objective is to have a comparative analysis based on few studies done across on woman's political participation in panchayats and scheduled areas. By this the entry of women into politics and decision-making structures can change the policies, vision and structure of institutions leading to an overall development of humankind in totality, as said by Anthropologist Marget Mead, every time you empower a woman you actually empower a man

BALLESTÉ ISERN, EDUARD* (*University of Lleida, Department of Geography and Sociology*)

Political Participation and Activism in the POST15M Era: Young People's Political Identifications in Lleida, Catalonia

New spaces for political participation have emerged since the beginning of the Los Indignados 15M movement, in 2011. Drawing on an ethnographic inquiry into youth activism in Lleida (Spain), the authors identify and analyse new forms of political participation generated since 15M. They focus on the discursive construction around the actors' own accounts of what they call 'new political activism', and consider how it differs from more conventional understandings of political participation. In this way, two post-15M movements are analysed, including their evolution and how the involvement of the young activists has changed them. In that sense, their focus is on the intergenerational tensions that emerged between the so-called White Tide (*Marea Blanca*), in defence of public health, and the Platform for People Affected by Mortgages (*Plataforma de Afectados por las Hipotecas*), which was committed to stopping home evictions and to fighting for citizens' rights to adequate housing. This communication pay special attention to examining youth activism in Lleida from the perspective of the dichotomy of the 'good' and the 'bad' political practices.

The communication starts with a description of the conceptual approach of different types of young political activists in the post-15M era. Next, the authors analyse the participation of young political activists in both movements, from December 2014 until summer of 2016, establishing some conclusions on youth political participation and its relation with other (older) actors in these movements.

Finally, these dynamics are traced using data obtained through participant/engaged observation in these political movements, semi-structured interviews guided by the ethnographic process and a discussion group in each movement, together with a review of the information produced by the media and the movements themselves. This analysis enables the authors to examine the concepts of 'new' and 'old' politics, and the understanding that the young activists have of them.

BALUCH, GUL MUHAMMAD* (*Taylor's University, School of Medicine*)

Gender, Food Choices, and Body Image: The Intersections of Health, Behavior and Beauty

This research investigates the relationship between gender, ethnicity, eating habits, food choices and body image among the Malaysian youth with age range of 17 to 35 year. Total sample size was 309 (Malays 148, Chinese 103, Indians 53 and 5 from other ethnicities) where 195 were female and 114 were male. Questionnaire was adapted from the Eating Attitude Test-26 (EAT-26), the Body Shape Questionnaire (BSQ), the Body Image-Acceptance and Action Questionnaire (BI-AAQ) and the Figure Rating Scale (FRS) to explore the differences in perception among ethnicity regarding body image as well the differences in perception among gender regarding body image and eating habits. The association between body image and eating habits was also assessed. Findings showed that more females preferred slimmer bodies. Results also suggest that Indians had a higher body satisfaction as compared to the other two races. We also looked into the respondents' fear of gaining weight and practicing unhealthy eating habits

My research interests are, generally, in the areas Social & Behavioural Sciences, Gender, Sociology of Health, Health Psychology, Public Health, and Qualitative Research. Funnelling down a bit, I am interested into understanding the dynamics of social and cultural contexts for the determinants of health and healthy lifestyle at individual and community level. It is not the bacteria and viruses only that determine the health conditions, but social, tribal, religious and 'patriarchal' paradigms also regulate the outcomes and indicators for health conditions. For example how 'institutional patriarchy' affects the maternal health, how sexual orientation is treated and approached by the institution of religion and how violence against women affects the physical and mental health of women, especially in Asian underdeveloped countries.

I would be eagerly looking to have discussions, interaction, and get guidance from the seasoned scholars in these areas of the intersections between sociology and health.

BALLOCH, GUL MUHAMMAD* (*Taylor's University*.)

Released from One, Confined into Other Prison: The Suffering Continues for Female Offenders in Pakistani Society

Whether they did the crime on their own, lured, forced, or trapped into it, the suffering for the female offenders has no end. From police station to prison to after-release scenario, it is the prevalent multi-faceted patriarchy that endlessly persecutes them for their whole life. This study was conducted with all the 100 women prisoners in the Sindh province of Pakistan. The study explores the problems, needs, helplessness, after thoughts about the crime, worries about the children (inside and outside the prison), and the trepidations about their acceptance by family and society, their livelihood, and the life security of female offenders, once they are released from the prison.

Problems inside the prison included upbringing of children, financial support, communication issues and the remission. A total of 25 children were living inside the prison with ages from one month to eight years; there was no educational facility for these children. The 'most needed assistance', while in prison, was the legal help in their cases and the majority of these inmates was housewives, belonged to poor families, and was illiterate. Ten under-trial inmates who expressed feeling very helpless, depressed, and having suicidal ideation, had never received any psychological support inside the prison. Regarding needs after release 25 needed financial help, followed by 19 fearing safety of life and 14 mentioning need for getting education and skills and help to get a job.

The findings show that there is dearth of social reintegration interventions as there are very little or no institutional efforts are taken in this regard. Irrespective of whether a women prisoner is acquitted innocent or released after serving the conviction, the taboo that she went to prison is enough an stigma for the rest of her life for re-integrating in the society; if lucky enough to not axed to death.

BALOURDOS, DIONYSIS* (*National Center for Social Research*)

Immigrant Multidimensional Poverty in Europe and the Reaction of Civil Society

The paper overviews the main trends and empirical evidence regarding immigrant poverty in Europe. Providing first descriptive analysis on trends and current characteristics of the immigrant populations at risk of poverty, it is then discussed key policy integration problems. It is also explained that immigrants – in particular those from non-EU countries – are severely disadvantaged in most EU countries, presenting among the highest at risk of poverty and severe material deprivation rates. The situation is worst for children, youth and low skilled adult immigrant in secondary and precarious occupations (working poor) that awful affected by the recession. Immigrants are predominantly positioned at the lower parts of the overall wage distributions. Misuse of vulnerable workers – especially immigrants – has been an increasing concern during the period of recession with high unemployment while there face high risk of labour market detachment. This has crucial implications for policymakers as they must ensure effective targeted integration measures; active labour market policies to assist vulnerable immigrant and native workers.

State partnerships and civil society involvement through multi-level governance, may benefit governments by contributing to actual debate and intervention towards more effective implementation of policies and/or delivery of public services.

The crucial hypothesis to be tested is that broad involvement of civil society organisations, representing the various social and ethnic segments of the population, is essential to influence immigrant antipoverty policies in Europe.

The key questions to be addressed are:

- What similarities and differences can be identified on immigrant poverty in European countries?
- What is the effect of recession on immigrant poverty?
- Is the strengthening civil society necessary for the enhancement the immigrant inclusion?
- Do Civil Society Organisations influence policy formulation in immigrant and poverty issues?

BALOURDOS, DIONYSIS* (*National Center for Social Research*)

PETRAKI, MARIA* (*University of Athens*)

Multi-Tiered Poverty in a Tiered Europe

In many European countries, the consequences of the budget cuts and the unprecedented economic and social crisis on poverty have been considerable.

As the available data indicate, it is not only the level of poverty that matters, but also the way in which it should be examined and interpreted. New concepts such as "new poor", "severe poor", "near poor", "persistent poor" "subjective poor", "materially deprived" indicate that we deal with new forms of poverty, completely differentiated from the "old poor". The "old poor" have become poorer and stay in poverty for extended periods of time. Nevertheless, a new category of poor appears that is the persons who fall for first time below the conventional poverty line and have never dropped in on before.

These developments show the multidimensional nature of poverty lead to a multiple measurement approach. In this paper, we use four dimensions each one presenting separately a unidimensional measure: monetary relative poverty, monetary absolute poverty, subjective poverty and severe material deprivation-severe poverty. Each of these different ways of perceiving and measuring poverty offers a different perspective on the same phenomenon.

Using EU-SILC data, we perform a correlation analysis to investigate the relationship between different poverty concepts and their measures. We also analyze the poverty identification patterns of the population by country and country group. According to our results, multiple dimensions of poverty are identified in all Member of the EU, although the extent of each one displays fairly large cross-country differences. The percentage of those living in extreme poverty situations is highest in the New Member States and the Southern countries including Greece one of worst -hit countries by the economic depression.

Impact of Immigration Policies on Syrian Refugees' Integration in Canada, Germany, Turkey, and the United States

This research compares the integration experiences of recent Syrian refugees who have been displaced since 2011 in four countries: Canada, Germany, Turkey, and the United States. I ask: How are possibilities of integration shaped within different policy contexts? Why do refugees in one host country perceive a better future for themselves than refugees in another host country? Among Syrian refugees, what are their experiences and perceptions of integration in Canada, Germany, Turkey, and the United States? How do representatives of non-governmental organizations (NGOs) and resettlement agencies in these countries understand and explain the impact of national policies on Syrian refugees' integration? The primary method of data collection in this qualitative project is in-depth interviews with Syrian refugees and other key informants such as representatives of the NGOs who work with refugees. At least twenty interviews with refugees per country are conducted, and key informant interviews are conducted as needed. One city in each country serves as the primary source for sample respondents: Toronto, Canada; Buffalo, New York; Istanbul, Turkey; and Berlin, Germany. A purposive snowball sampling method is used to recruit respondents. Findings suggest four common themes: (1) a sense of temporariness related to refugees' legal rights, (2) a loss of economic capital, (3) cultural change, and (4) a sense of being unwelcome. When refugees think that their future in one place is uncertain, when they perceive a loss of economic and cultural status, and when they feel negative public attitude toward themselves, then their perceived prospects of integration seem worse. As contribution, examining this topic with an international comparative study design allows for the development of a typology of different countries' reactions to refugees, as well as similarities and differences in the mechanisms of integration. This research aims to find out what works best in different countries, and why.

Social Norms As Connections: An Agent-Based Model to Understand Changes in Social Network Dynamics

The present study aims to investigate how to find changes in social behavior patterns, combining analysis of social networks and agent-based models. The research takes the concept of norms as reference to discuss the methodological limits of the analysis of social networks for the understanding of emerging social phenomena. Social network analysis provides analytical resources for measure connections among agents, but it is not the best tool for the perception of emerging social patterns. On the other hand, agent-based models can become entangled in unnecessary details when applied to identify social action patterns. Agent-based models facilitate the construction of emerging systems, but have limitations for modeling dynamic interconnections between agents. These limits can be enhanced when combining social network analysis and agent-based models, having the idea of norms as conceptual reference to understand the emerging phenomenon. The research developed an Netlogo agent-based model with analytical parameters of social networks to check the possibilities of identifying patterns of change in social norms simulation. The paper first reviews the different concepts of social norms and their applicability to computational sociology. Argues mainly with the BDI models. The second part is the exposition of the agent-based model combined with social networks parameters. The results

expect to contribute methodologically to studies about the emergence of complex social phenomena and the identification of patterns of social change.

Politics or Nature? Factors Explaining Climate Change Risk Perception in Europe Using a Multilevel Analysis

The cross-national differences in climate change risk perceptions has been the focus of many empirical studies (e.g. Brechin and Bhandari, 2011; Capstick et al., 2014). The models, explaining climate change concern include both individual level factors and macro level factors. For example, the role of direct experiences for climate change risk perceptions was identified as a significant factor in several studies (e.g. Lujala et al., 2015; Cardona et al., 2012), on the other hand the climate change concern in different countries is also shaped by dominating political discourses (e.g. Leiserowitz, 2006, Whitmarsh, 2011).

One of research questions addressed in this presentation is to explore if climate change risk perceptions in Europe is framed by policy discourses or it is rather influenced by country's vulnerabilities related to natural hazards and climatic abnormalities.

We use multilevel analysis that combines first level variables at individual level and second level variables (at country level) into one analytical model. For the dependent variable of climate change concern and first level variables we use the Eurobarometer 80.2 (2013) on climate change, which provides information from over 28,000 individuals in 27 countries. For second level variables we use data from Manifesto Project, Eurostat, United Nations University Institute, Germanwatch Institute and else. We also take into account the institutional context by introducing the role played by the policies of climate change mitigation and adaptation. Employing multilevel logistic regressions we find a double mechanism to explain climate change perception in Europe. Whereas in Mediterranean countries the effect of natural hazards are more important, in Northern countries the trigger seems to be the pressure of Green parties.

This presentation is a part of the research project 'Public Perceptions of Climate Change: Lithuanian case in a European Comparative Perspective', funded by a grant (No. MIP-17-183) from the Research Council of Lithuania.

Measuring Depreciation Rates of Human Capital and Use of Skills in Comparative Perspective

This study measured depreciation rates of human capital and compared the rates of Korea and other OECD countries. The effect of skills use on the depreciation rates was also analyzed. Findings suggest that Korea faces the largest depreciation of human capital and Korean young generation undergoes severer depreciation in the workplace. Moreover, young Koreans have larger depreciation rate while being employed than while being unemployed. Korea has the largest depreciation rates while being employed in all age groups, compared to the surveyed countries, suggesting that it has results from low demand for skills in the Korean workplace. Contrary to Korea, UK faces the lowest depreciation rate among OECD countries whereas its level of skills is similar with Korea's level of skills. It can be inferred that UK maintains human capital although its initial level of human capital accumulated through formal education is not as large as Korea's one. Analysis with distinguishing the states of being employed and unemployed also showed clear difference between Korea and UK. In case of UK, depreciation rate of young people while being unemployed is distinctly larger than that of while being employed and accumulation of human capital is observed while being employed in all ages groups, except the elderly. This study supports the intellectual challenge hypothesis and the 'use-it-or-lose-it' hypothesis, meaning that the demand for skills and actual use of skills in daily life and workplace is important in the depreciation and maintenance of human capital whereas the supply of education and training is important in the accumulation of human capital. However, demand for skills is a relative concept. Korean young people possess high level of proficiencies but low level of skills in the workplace, while British young people possess low level of proficiencies but high level of skills in the workplace.

Sensing, Seeing, and Striking: A Case Study of Two U.S. Airstrikes on Protected Sites

Drone, satellite, and other remote-sensing technologies enable dramatic lines of imagery, visuality and forms of power. Studies have revealed that, far from being self-evident or unproblematic, the processes by which "civilians" are visually distinguished from combatants and thus made into appropriate military targets vis-a-vis drones and other aerial surveillance technologies involve ways of seeing that are situated, assumption-laden, and technically and epistemically fraught. While much research has focused on problematic classifications of individuals from the "view from above," little work has examined the interpretive logics, technical mediations, and visual habits through which architectural structures are made sense of from this vantage point--whether as targets, sites outlined as protected by international humanitarian law (IHL), or both simultaneously.

Through an analysis of two U.S. air strikes targeting protected civilian structures, a hospital in Kunduz, Afghanistan and a mosque in al-Jinah, Syria, we examine two questions: 1) How do protected structures become visualized and interpreted as military targets? 2) And, how do state actors and NGOs strategically deploy images to support or challenge official narratives regarding these attacks? We find that visual artefacts play a central role in displacing and assigning accountability within debates over the operations' legality, successes, and failures. U.S. military actors mobilize images "from above" to simultaneously justify force and construct its attacks on the buildings as "precise" and "proportional," while conceding to gross organizational and technical errors. Drawing on local knowledges and visualities, NGOs instead produce and circulate visual material to challenge state narratives and its mis-recognition of the buildings' lived uses. Our analysis points to the ways in which a range of novel image types--from drone images to multimedia composites and architectural reconstructions--become enrolled in these contestations and help to unsettle meanings of "precision" itself.

LAGESON, SARAH (*Rutgers University-Newark*)

Surveillance and Social Control through the Collection and Distribution of "Mug Shots" in the U.S.

Recent years have seen a dramatic surge in the release and circulation of booking photographs on third party or official police webpages. While some advocates of this practice uphold booking photographs as evidence of justice being served and of law enforcement doing its job, others frame such images as a check on law enforcement, arguing that they warrant disclosure precisely because the facial expressions captured therein are capable of signaling police misconduct or abuse.

In contrast to these utilitarian arguments, a surveillance lens extends debate by highlighting the profound reputational and material consequences wrought on those depicted through disclosure. Magnified by the internet's reach, the stigma of arrest carried in a digital booking photo has been found to extend well beyond an individual's involvement with the legal system to pervade myriad areas of life including employment, housing, and dating (Lageson 2017). In this paper, we draw on theories of privacy, surveillance, and photographic evidence to analyze arguments concerning the release of mug shots as expressed within public debate, court cases, and Freedom of Information Act lawsuits. Positions challenging and affirming the release of such photos are found to be undergirded by starkly disparate assessments of their probative value. These findings point to evolving public understandings of the affordances and dangers of mug shots and surveillance footage in the digital age.

Cattle Fulani Herdsmen Attacks, the Changing Face of Violence in Nigeria: Responses and Reflection

In recent times, Nigeria has been plagued with the Boko Haram insurgency. The rise of Cattle Fulani Herdsmen attacks has further complicated the security situation as increase in violence and crime is becoming alarming. Thus, alternative responses from various parts of the country for example the Southern Kaduna and Agatu killings has further complicated the national security situation. This has placed the government in a huge dilemma. This study reflects on the identity of the perpetrators, their violent attacks, strategies, responses of affected communities and its implications to the national unity of Nigeria as a nation. Data is drawn from news media, personal interviews and visit to some of the communities affected. The finding of this study shows that it is a far more greater threat than the Boko Haram insurgency and solutions seems to be farfetched and eluding both affected communities and the government.

RC47-789.5BANDELLI, DANIELA* (*LUMSA University*)CORRADI, CONSUELO (*Department of Human Studies, Lumsa University*)*Women's Movements Facing Surrogacy. Frames, Alliances and Reflections on Freedom.*

In Italy Women's Movements are facing a new divisive struggle of reproductive politics. Some groups, inspired to the philosophy of difference and eco-feminism, joined the international campaign Stop Surrogacy Now, born in the US in 2015, and along with pro-life activists, call for the universal ban of all forms of gestational surrogacy. Core arguments of WMs in this coalition build upon a frame of commodification of women and children. Other women groups, close to gender feminism and social constructivism, disagree with the abolitionist demand and frame surrogacy as a space of freedom and reproductive rights. In Italy surrogacy is illegal as provided by the law 40/2004 on assisted reproduction. However, increasing number of babies are born to Italian parents from surrogacy arrangements undertaken abroad. Although majority of commissioning parents in the surrogacy industry are heterosexual couples, the topic has risen in the Italian public debate during the Parliament discussion on a new law on same-sex marriage and parenting in 2015. This discursive context share similarities with the surrogacy debate in France, where WMs started to mobilize for the universal ban before Italy.

Our paper will outline key diagnostic and prognostic frames employed by both WMs fronts in Italy, and their alliances with other social movements (in particular with pro-life and LGBT) at a national and transnational level. Also, we will highlight similarities in the evolution of discourse, and its connotations, as well as mobilization strategies applied by WMs in Italy and France.

Through the action theory of Hannah Arendt and Jurgen Habermas's critique of liberal genetics, we will argue that surrogacy are posing to WMs a defining challenge: reflection on the meanings and boundaries of freedom and power in the procreation sphere is urgently needed.

RC16-309.6BANERJEE, ADWAITA* (*Youth for Unity and Voluntary Action*)*The City Resists: Questioning Infrastructural Reconfigurations in Bombay*

In south-east Asian urban centres, gentrification, urban development, pressures of capital, together with broader neoliberal trends have led to hardships, precarity and displacement for the urban poor and working classes, especially in terms of eviction and access to infrastructure. Poor urban residents are increasingly evicted into informal settlements.

This paper tries building on current conceptualizations of the term eviction as contextualized within the socio spatial complexities in the marginal communities of Mumbai, India. Through ethnographic practices set within a slum settlement in Mumbai, the research tries to investigate the practices of resistance in the face of infrastructural transformations. While making use of a critical geographies methodology, the work is mainly concerned with the concept of eviction at an everyday experiential level in the micro-spaces of everyday life.

I explore the structures through which people resist the transformations and the unmet expectations of urban citizenship, that plays out in the everyday. Cresswell (1997:343) writes, "the geographical interpretations of metaphors as they are thought and acted out in the realms of politics and ideology can do much to delineate the praxis of everyday life". The objective of the paper is to theorize eviction in terms of repeated metaphors within the respondent's collective unconscious and secondly to contribute to the growing literature of marginalised experiences of uncertainty and waiting (Yiftachel 2009; Datta 2012; Auyero 2011) through a focus on the infrastructural and spatial anxieties of those displaced.

The concepts of eviction and infrastructural transformation are looked at from a critical geographies perspective with a particular emphasis on caste/class experiences in making evictions an everyday imagination. Making my way through the daily spaces and routine situations I try to document how infrastructural resistance is embedded in the domesticities. Unpacking these metaphors of transformation can help us theorise and problematise the spaces of urban transformation.

TG04-977.4BANERJEE, LOPAMUDRA* (*Bennington College*)*Class Situation, Spatial Location, and the Risk of Exposure to Weather Extremes*

The role of global warming in generating extreme weather patterns is well-recognized in climate sciences. These extreme fluctuations are being associated with rising incidences of disaster events, including heatwaves and flooding, in various regions of the world. It is argued that the poor are at greater risk of exposure to these events than the wealthy. The reasons offered are two-fold.

First, weather extremes are more frequent in tropical regions (vis-à-vis temperate regions) where poverty is also endemic and population density is higher. Thus, risk distribution is indirectly associated with spatial distribution of global population. Second, risk distribution is directly associated with wealth distribution within a region's population. It is argued risk is less for richer households than the poor even when both face similar conditions of natural hazards, as, the former has the wherewithal to avoid exposure and the latter does not. My study examines the "spatial location" and "wealth distribution" hypotheses using nationally-representative household survey datasets from two countries – Bangladesh and Germany – where rises in weather extremes are increasingly being linked with human-induced global warming. Measuring risk as the probability of disaster exposure for a randomly-chosen household in the population, I, however, find that neither wealth nor the relative hazardness of a households' spatial location can explain risk asymmetries in the population. Instead, I find risk follows a pattern of class distribution in the population when classes are identified based on their access to various forms of capital – economic, cultural, social. I employ latent class analysis to identify the classes and a hierarchic linear regression model to explain risk in terms of class situations and spatial situations of households. I present a Weberian reading of Pierre Bourdieu to explain my results, and associate the conditions of disaster vulnerability with rising conditions of precarity in global north and global south.

RC06-128.2BANERJEE, PALLAVI* (*University of Calgary*)*Middle-Class Indian Immigrants and Transcultural Parenting*

In this paper, I examine if and to what extent might Annette Lareau's theory of middle-class parenting – namely concerted cultivation – works in the context of Indian immigrant families where one parent holds a professional job in the US and the other spouse is highly-qualified but is dependent and stays at home due to visa restrictions. Lareau (2003, 2011) proffers two distinct parenting styles – *concerted cultivation*, as the kind of parenting done by black and white middle-class parents and the accomplishment of natural growth, as the parenting path enacted by working class parents. Here I explore if dependent visa laws that prohibit one parent from working influence parenting in these middle-class families or do they simply engage in concerted cultivation. The data for this paper is based on interviews with both parents in 40 families (total of 80 parents) in the United States, where the breadwinner is a highly skilled male immigrant worker with a dependent wife and in families where the breadwinner is a highly skilled immigrant female worker with a dependent husband. In my findings, I unpack the parenting styles in these middle-class immigrant homes using Lareau's lens. What I find is that Lareau's theories don't completely explain parenting styles in these families. The parenting done by my participants lie squarely between Lareau's concerted cultivation and accomplishment of natural growth due to the immigrant parents' evocation of transnational and transcultural parenting norms. Additionally, the particular parenting activities undertaken by the dependent mothers and the dependent fathers are gendered in nature but, both the mothers and the fathers spent equal amount of time parenting their children. The parenting goal is to provide what they thought were the best of the (East) Indian and American cultural and child-developmental practices. I call this form of parenting "transcultural cultivation."

RC22-410.1BANERJEE, PALLAVI* (*University of Calgary*)*Muslim Immigrant Bangladeshi Women and the Politics of Gender, Class and Religion*

In this ethnographic study, I explore how participation in two types of religious groups – mosque-based and home-based – structures the material lived experiences of Muslim immigrant Bangladeshi women in terms of their immigrant experiences and gendered relationships within the families. I deploy "multiple intersections" approach to find that women's participation in the two forms of religious groups is filtered through their class identities such that their religious participation is largely mediated by how they perceive their own class positions. This approach "interrogates the boundary-making and boundary-defining process itself" and focuses on "social groups at neglected points of intersections" (McCall 2005, 773-74). Class dictates what religious groups and institutions the women can access, their experiences participating in religious groups and what it does for them as women and migrants in the context of these groups, their own conjugal families and the larger American social structure. I interrogate how different forms of religious participation (in the mosque and in the home) become the site of contestation over multiple identities filtered through class, immigrant subjectivities, religious participation and gendered relationships. The strength of this work is twofold: first, it illuminates the importance for qualitative researchers to tease apart nuances in their data. Second, it shows that even small differences in class locations can alter access to religious participation, which in turn has incremental but lasting influence on familial gendered relationships and overall affective well being of the women participants of this study.

Mobilizing Strategic Capacity: Logistics and Retail Unions at Walmart Chile

Chile has long been described as the "cradle of neoliberalism." Its mainstream labor movement severely weakened by changes in the labor law under the dictatorship. Yet there is an emerging labor movement, mobilizing outside of the confines of the main labor federation the Central Unitaria de Trabajadores (CUT), that is inspiring a new generation of activists. In the last 15 years we've witnessed these activists engage in a series of important labor strikes and mobilizations. A significant subsection of Walmart workers in Chile, belonging to independent labor federations who are part of this movement. These workers have been making unprecedented gains in terms of wages, rights, and working conditions. How do we explain the success of these Chilean workers against Walmart, possibly the most anti-union company in the world? This paper argues that logistics and retail workers in 3 federations are changing conditions at Walmart by mobilizing what Marshall Ganz calls "strategic capacity." These workers have strategic capacity because they have been able to effectively mobilize their associational and structural power in unique ways. A central part of their success is related to building grassroots democratic unions, where workers have a day to day stake in the decision making of their organizations. These unions place a strong emphasis on building power from below and political education, thereby allowing workers to maximize their leverage against Walmart.

The Political Class and Tokenization of Pro-Poor Social Policy in Nigeria

Pervasive poverty despite huge resource endowment is no doubt a defining feature of the contemporary Nigerian society. It is a problem that has generated different responses from state and non-state actors. Tokenizing social policy in this paper is operationalized to describe the chosen trend by the political class to use non-formal and quasi-formal measures to 'deliver' dividend of democracy to the massively impoverished Nigerian citizens. The emergence of the concept of 'stomach infrastructure', traceable to the failure of the state, became instrument of entrenching the structure of inequality by both the incumbents of and aspirants to political offices.

On the framework of social exchange theory, this paper examines the transactions, commoditization and symbolism of non-formal option of 'delivering' social policy intents to the Nigerian people. The sources of financing these 'stomach infrastructure' products are identified and the propriety of these sources vis-à-vis the ideals of good governance. The findings reveal interconnectedness between this trend, endemic corruption, and failure of the state to meaningfully and sustainably perform its roles to the citizens.

The paper concludes that the Nigerian experience of tokenizing social policy provides a case study of how the political class maintains its hegemony and the status quo of inequality through conscious acts of dehumanizing the vulnerable masses. The need to chart a new course of governance system where corruption is minimized and the state becoming alive to her primary responsibilities is recommended. Value reorientation is also crucial to the overhaul of the warped social system.

Lying in the Margins: Environmentalism and Making of Adivasi Subjectivities in India

This paper tries to reflect on the question of how the new development intervention through Forest Department is affecting the rural subjects. How this is affecting the forest management and how it is changing the relation between State and tribals. Taking Foucault's notion of power I argue in this paper that in this transnational developmental regime, the developmental State and transnational flows are transforming the adivasi community by creating new subjectivities. Here I will bring into the notion of domination. I understand 'being subject' as being dominated and subjugated. There is an argument that subjectivity of tribals started with colonial rule (Bose, 2011; Skaria, 2009; Sivaramakrishnan, 2005). I argue that even before the colonial rule, subjectivity of the tribals had started. In Odisha, we see the making of the subjects among the tribals. First, through forest regulation and laws which categorized them into various categories like backward groups then to scheduled tribes. The current forest regulation which needs people's participation is another technique of state to make them subjects. This is another technology for surveillance and control. I argue that through villagers participation state wants to monitor each and every movement of the villagers, keep them in good terms hence to avoid resistance. On the other side,

they take people's help in protecting forest which is physically and economically not possible for the forest department. However, we also see people not resisting and they want to be controlled. Why they are not resisting. People themselves want to be subjects. This paper tries to bring this antagonism and reflect among the making of subjects in tribal belt of Odisha in India.

Infertility in Men and Coping Strategies: A Study from India

Diagnosis of male factor infertility questions on men's procreativity and masculinity. There is insufficient knowledge of how male-factor infertility influences the wellbeing and Coping ability of men (Johansson et al., 2011). This cross-sectional study was conducted at infertility centres in Mumbai, India. It aims to explore about the coping strategies adopted by the infertile men receiving infertility treatment in Indian scenario. Coping questionnaire scale developed by Schmidt et al. (2004) has been used. The principal component method was used to extract components for each four of the coping scales i.e. Active avoidance strategies, Active confronting strategies, Passive avoidance strategies and Meaning based coping. The results indicate significant increased use of Active avoidance coping as intensity of infertility treatment increases compared to the lower intensity infertility treatment. Meaning based coping was used by most of the educated males and those having high income. They think about infertility problem in a positive way, they search for other life goals, try to analyse the problem. It was seen that Active Confronting coping was used largely by the lower age group men than higher age group. Passive avoidance was largely used by Muslims and in other religions than in Hindus. Problem solving strategies or active confronting was chosen by lower age group as there were more chances of successful infertility treatment and high hopes for having a child. The Study shows that the socio-economic determinants influence the coping strategies of males undergoing infertility treatment.

Infertility in Men and Treatment Seeking Behaviour: A Study from India

Diagnosis of male factor infertility questions on men's ability to reproduce and their masculinity. There is a status of inadequate knowledge on how men with male factor infertility seek help, especially when men are considered as not so important part of infertility treatment as women. This study aims to understand the treatment seeking behaviour of men undergoing treatment for male factor infertility. This cross-sectional study was conducted at infertility centre in Mumbai on 150 male infertility patients. An infertile man is defined here as one, who is diagnosed with primary or secondary infertility and undergoing infertility treatment, irrespective of fertility status of wife. Results show that after knowing about their infertility status for the first time, many of them felt depressed, some

felt guilty, got shocked and many of them got stressed and felt isolated. On asking about the discussion of the problem, it was found that every respondent discussed the problem with his wife for the first time and then with parents, in-laws or other family members. A big proportion of the respondents (32 percent) never discussed the problem with anyone except their wives. In almost 70 percent of the cases both husbands and wives decided to go for medical treatment while only in 21 percent cases, husbands themselves decided to seek medical help. Out of 150 respondents, 65 percent of the respondents sought only Allopathic while 35 percent of them opted for AYUSH. On asking about the religious and traditional practices to cure the childlessness, 60 of them confirmed the use of these practices. Destiny, bad luck, life style, medical reasons, late marriage were found as perceived causes of their infertility status.

Transformative Knowledge Claims: Ironic Disidentification Against Hate Speech

In my talk I wish to discuss the ways irony may contribute to the empowerment of disadvantaged communities by exposing the coercive logic of the dominant regimes of truth in contemporary Hungary in the wake of their recognition of the consequences of forced migration since the summer of 2015. In response to the past two years that have seen an intensification of hate-speech organized by the Hungarian Government, I will focus on the symbolic (conceptual) aspect of agentive power in favour of political mobilization for transformative action that could emerge in spite of the overwhelming presence of the official political discourse of hate. I shall expose, on the one hand, the three major strategies of hate-speech in the current Orbán Government's ongoing billboard campaigns. I will argue that the Hungarian Government's coercive campaign routinely tap into the rage of the 'white angry men' in their anti-refugee campaign since the summer of 2015 to date. On the other hand, I shall explore the subversive logic informing the discourses of the Hungarian mock-party, the Two-Tailed Party (MTTP) and analyse the strategies of disidentification as a viable disposition that can eventually result in moments of agency articulated in the refreshing voice of irony. I shall also claim that their ironic discourse is much more effective in bringing about transformative knowledge of/about 'migration' than the three major models of 'integration' in Europe: multiculturalism; assimilation, or selective exclusion; and transnationalism.

Ignoring and Embracing Science: Psychometry, Intelligence and Race

The idea of the "post-fact" era associates right wing populism with the denial of 'facts', 'expert' knowledge and 'science', particularly with regards to climate change. Yet websites like American Renaissance, which advocate a genetically-based racial hierarchy, contain references *not* to pseudo-science published on the blogosphere but to *legitimate, peer-reviewed, scientific* works published in academic journals conducted by tenured academics and researchers at well-known universities (See, for example, the work of Richard Lynn and Santoshi Kanazawa). These articles affirm the rationality and rigor of the 'scientific' tradition through their embrace of the concept of race. This paper suggests that rather than a full denial of science, the current moment sees (at least) two contradictory approaches to science used by right wing populists. One is centered around the denial of 'science', as in the case of climate change; the other is a full embrace of the rhetoric of science as in the case of 'racial' IQ differences. Examining the psychological sub-field of 'psychometry' (with a focus on intelligence testing), this paper will examine two phenomena: 1) 'Spearman's hypothesis' or the idea that ethnic differences on intelligence tests are the result of innate intellectual differences between ethnic groups; 2) the 'Cold Winter theory' which suggests that differences in IQ between racial groups are the result of "different evolutionary pressures faced by the ancestral humans who left Africa, compared with those who remained.... plac[ing] a natural-selection premium on higher IQ" (Pesta and Poznanski, 2014, p. 271). It will demonstrate how the language and practices of science are being used to advance the idea of heritable racial differences in intelligence. It will then draw on Karl Popper, Donald MacKenzie, Pierre-André Taguieff, Pietro Basso, and Sandra Harding in order to contextualize and understand this simultaneous denial and embrace of 'science'.

BRYAN, CATHERINE (*Dalhousie University*)

Great White North Vs. Tim Hortons: Filipino Service Workers and the Mobilities of Capital and Labour

This paper explores the entanglement of domestic and transnational labour mobility policies in the case of Philippine migrants entering Canada as temporary foreign workers. Various studies have explored how labour export and import policies in both countries have been finely calibrated to secure maximum economic benefit from this highly motivated mobile labour force. Typically the existing literatures reflect what Wimmer and Glick Schiller described as "methodological nationalism" in that they maintain a primary focus upon either the site of labour export, or labour import. Filipino migrant workers thus become products of their nation's labour brokerage, or emplaced within Canada as temporary workers exploited by the capital friendly "just-in-time" immigration system.

Here we wish to complicate the relevant mobility scenarios through an emphasis upon how workers engage with and are subjected to the mobilities (and fictions) of capital. We do so through an examination of labour recruitment and capital accumulation scenarios attending the labour import strategies of that most quintessential of Canadian fast food chains, Tim Hortons. In reality, Tim Hortons is owned by Brazilian based global corporation, RBL. Through 2016 and 2017, the corporation sought to enhance its profitability by pressing cost-saving measures on North American franchisees, while at the same time expanding its global reach, including into the Philippines. Drawing upon ethnographic fieldwork conducted in Manila in 2017 and 2018 with migrants seeking employment contracts in Canada, and with recruiters interested in deploying these mobile workers to Canada, or indeed, any available global labour market acceptable to the workers, we examine various relevant mobility scenarios. The respective sets of class interests and accumulation projects underlying the intersecting inter-national modalities of labour and capital are central to the analysis.

Countryside Ghettos? Segregation in Small Towns and Rural Areas in Italy.

Migrants' settlement trends in Italy have seen a major role of small towns and rural areas well before recent humanitarian flows. A mix of labour and housing market opportunities resulted in a significant share of non-metropolitan migration. Such trend was even reinforced in the last 5 years of so-called "migration crisis" in the Mediterranean basin -- due both to resettlement policies and to the inclusion of asylum seekers and refugees in the severely exploited labour force of the agri-food industry.

This presentation describes reasons and dynamics of migrants settlement patterns in Italy outside gateway cities in a comparative perspective, focussing especially on the creation of concentration and segregation areas -- usually considered a typically urban-metropolitan phenomenon -- in micropolitan and rural areas in Italy. In particular, after a framing based on relevant literature, attention will be paid on some case studies from Central and Southern Italy, focussing on the link between concentration/segregation, radical social exclusion, and downward subordinate economic participation.

As a final discussion, this presentation debates on the inadequacy of usual segregation measures for countryside ghettos, due to the limited availability of reliable data, and the coexistence of proximity and exclusion.

The "Headscarf Affaire(s)" in Italy: A Socio-Juridical Analysis of Institutional Practices and (non-)Policy

Even though not debated so much at the national and international level, Italy had quite a number of "*affaires du voile*" - the first one dating as back as 1994. The "affairs" that took place in Italy concerned the right of wearing hijab (a) on ID and driving licence photos and (b) on the workplace, and the right of wearing niqab and burqa (c) to access public facilities; (d) in public spaces.

This presentation will analyse the "hijab affairs" in Italy focussing on some cases and practices of exclusion and the following institutional management of the case. Evidences will be shown that the management of the cases is mostly local, sometimes informal, never "scaled up" to the national arenas (if not with procedural regulations). In most cases, a local practice of exclusion is managed either informally or by regional administrative courts. The evolution of jurisprudence shows an increasing acceptance of discrimination, but also a persisting "local treatment".

As a consequence, rights are never affirmed in a clear way, and are mostly conceded here-and-now. Conflicts are retained at local level, but never really solved, providing the grounds for the risk of enduring and repeated discriminations.

Taking Care of Others' Work-Family Balance : The Case of Family Child Care Providers in France

This paper presents preliminary results of the collective research on child care professionals' work practices we initiated in France in April 2017. This qualitative research relies on a series of interviews and observations with family child care providers during their working time, at their home and at collective child care activities provided for them by the city council. The research analyses how parents of young children (employers) and professionals (employees) negotiate their own work and family imperatives with one another. We analyze how both parties engage specific resources in order to weigh in the work/family bargain. First, through studying one of its very old modalities, we aim at increasing knowledge on the expanding sphere of work-at-home employment. Second, the analysis will focus on the social outcomes of such negotiations of work/family for woman professionals working from home, who are coming from modest social backgrounds, and whose skills and social status are relatively neglected.

Class Strategies in Higher Education: Reproduction of Elites and/or Professional Closure

The literature on educational stratification has shown that the differentiation of higher education diverts non-elite students away from first-tier majors (like Medicine, Law, or Engineering), and that the chances of college access and graduation are still strongly affected by the students' social background and higher education institutional features. In a previous study we could show that the private colleges clearly reinforce the advantages of the students from the highest-income families in graduating in higher education. The medical courses illustrate this pattern beyond any doubt. On the other hand, the public sector consistently favors the graduation of students with more educated parents (with the notable exception of Education). Medicine and Law, which are traditional and prestigious professions in Brazil, remain niches of the elite. The completion of STEM majors is barely affected by family income or parents' education. In the Brazilian case, where the educational system is an essential factor of social inequality, there seems to be at least two main strategies for controlling social opportunities. The first strategy, which was developed by the educated and relatively traditional elite, would use the public system of prestigious universities. The second one, promoted by more recently enriched social groups, would tend to value the private higher education system, with less prestigious but more easily accessible careers. These two strategies involve different values regarding education and distinct orientations towards the diverse academic degrees conferred by the Brazilian colleges. In this study, we propose a more qualitative and conceptual analysis of the evidences of these strategies, in order to be able to label them as reproductive or as forms of professional closure. The supposed strategies to be examined include: exams for professional licensing, system of access to medical residency, certification of jobs by professional councils, access to postgraduate courses.

Scenarios of Strategic Secularism and Neoconservatism in Mexico

In Mexico, as in the rest of Latin America, the evangelical churches have become the second strongest religious group, after the Catholic Church, that is, they represent the religious minority with the largest number of people in each country. In view of the legal, cultural and social achievements of the feminist movement and the sexual diversity movement in favor of the construction of a secular sexual morality, evangelical churches, from their places of religious enunciation, have established a citizen and political position to challenge the regulation of contemporary sexual morality. Even the specialization of some of its representatives in political, juridical and social issues has led to legitimizing the

defense of a conservative sexual morality based on rights, liberties and scientific arguments, secular practices that have characterized the feminist movement and the sexual diversity movement. Through a qualitative methodology, this paper will analyze the religious and political tactics of the evangelical churches in Mexico in three scenarios in which the construction of a secular sexual morality is disputed: 1) The right to decide on one's own body, which implies freedom to express the sexual orientation and build the gender identity. 2) The right to same-sex marriage and 3) The right of homosexuals and lesbians to build a family.

Politics of Demonetization: Its Effect on the Village Economy in India.

The Government of India's call for demonetization on 8th August 2016, banning Rs500/- and Rs1000/- notes was promoted as a positive step against black marketers and black money hoarders. The long term effect of such decision became disastrous to the agri-business chain, run on soft cash. Affected group included the producers, small and big Agri- business houses and prospective consumers too. Producer lost sustainability, market lacked buying capacity and the pressure on the customers will be the long term outcome of the chain. The producer failed to buy inputs for better production. The Middleman incapacitated to buy the produced goods for instant sale and for storage for off season. The consumers expected to be the future victim of scarcity. The overall effect of demonetization thus came on all involved in agri-products. The overall effect of demonetization thus created a negative impact on the rural economy for the present as well as for the future years. The present article while offering an insight on the effect of demonetization on rural economy made an effort to extend first hand information on the position of rural farmers and also to the business houses as an effect of demonetization. The paper while emphasizing the adverse effect of demonetization in West Bengal would prefer to extend first hand information on the negative effect of thoughtless policies. The main focus of the study is to expose the effect of demonetization on agri-business chain in the country and more specifically in West Bengal. The findings of the present study will be used to evaluate the socio-economic impact of policy initiative like demonetization on the economy of the country.

Does Small Farmer Really in Distress Under Neoliberal Agriculture Policy ? – West Bengal Scenario

Moderate temperature regime, sufficient rainfall, different agro-ecologies and agro-systems allow West Bengal farmers to grow different kinds of Tropical and sub-tropical crops in Southern Gangetic Plain and in Northern Himalayan ecology round the year. Rice is the main crop covering 80% of net cropped area. Average land holding <0.6ha. Potato, vegetables, jute, Oil seeds are few commercial crops cover the rest. However, Rice culture is main stay of livelihood and contributes subsistence rural economy.

New crop production technologies, weather resilient crop varieties and agro-infrastructure support help the farmers to increase their production. Neo-liberal policy of the Government along with globalisation open a new vista for quality crop and fish and poultry farming for export, value added processing for increasing urban culinary demand, bestow improved village economy. Food giants like Pepsi, Reliance, Caventer, Metro, Spencer etc consumes farmers produced at a higher rate at farm gate. Geographical location of the state opens a path of exporting farm produced and value-added processes food to adjacent Asian countries and also in the neighbouring states. Thus contribution of Agriculture and allied farming in states economy has increased gradually.

Over the decades, there is hardly any report of suicidal death of small farmers due to failure of rice / cereal crop in the state. Commercial crop like Potato, fish culture, poultry need high monetary investment which small farmers unable to spend. Big farmers, urban business people invest on it in large scale for a quick return. Environmental hazards, Over production, Market glut contribute heavy loss in certain years. Failure to repay loan leads to suicidal death.

The Intergenerational Transmission of Parental Involvement in Education: Evidence from British Data Spanning over Three Generations

An important body of research has studied the intergenerational transmission of parenting behaviours in order to identify the causes of child maltreatment and harsh parenting. The intergenerational transmission of parenting behaviours, however, has received less attention as a potential driver of social stratification

in parental involvement in children's education. In this paper, we ask whether parental involvement in education is transmitted inter-generationally and, if so, whether this helps to explain social class differentials in parental involvement in education. Understanding the transmission of parental involvement is important because recent evidence suggests widening social class differentials in certain types of parenting, including reading to the child (Richards et al. 2016, Putnam 2015).

We use data from *The 1970 British Cohort Study* (BCS) to explore the relationship between intergenerational transmission of parenting behaviours and social class. The BCS is ideal for this task: it provides information on the involvement of the cohort members' parents and the cohort members' own involvement in their children's education. We use information collected in 1975, 1980 and 2004. We examine how much the cohort member's mother reads to her child when the child (i.e. the cohort member) is 5 years old and the mother's involvement in the child's schooling at age 5 and 10. We then analyze the cohort member's own reading to their children and involvement in school when they are 34 years old and their children are between the age of 5 and 16. Hierarchical regressions are used to identify the extent to which the involvement of the participants' parents in 1975 and 1980 can account for social class differences in the participants' involvement when they were 34 years old (2004). We also include factors related to cohort member's social class and involvement behaviour such as the social class of the cohort members' parents.

BARGSTED, MATIAS* (*Pontificia Universidad Católica de Chile*)

The Social Structure of Acquaintanceship Networks in Chile

What makes some people develop larger networks than others, and consecutively benefit from the material and non-material resources nested in those networks (Lin, 2002)? To respond this question, we track down and systematize previous work on social homophily and primary networks, as well as develop some new insights following Blau's (1977) macro-structural approach. Our main claim is that people who belong simultaneously to social groups that partially overlap at the societal level, and therefore are exposed to social divisions that reinforce each other, will have less contact with members of other social groups, which in turn, will decrease the size of their acquaintanceship networks. We test this claim using data from a national probability sample that included twenty-five items of the form "How many X's do you know?" where "X" represent a sub-population of interest (also known as aggregate relational data). With these measures we estimate the size of respondent acquaintanceship networks using the scale-up estimator developed by McCarty and colleagues (2001). While controlling for an ample set of demographic variables, we find support for our social group configuration hypothesis. For example, we show that Chileans who simultaneously identify as Catholics, lean towards right-wing positions and have a high educational level, all three traits that are positively correlated, have significantly smaller networks than other Chileans who have a crossed group membership configuration.

BARKER, EILEEN* (*London School of Economics*)

Religious and National Identity in Trans-National New Religious Movements

New Religious Movements (NRMs) often tend by their very nature to be considerably more important in their members' lives than their religion is for members of older, more established religions. They also tend to have a dichotomous world view which makes clear distinctions between good and bad; Godly and satanic; and, significantly for this paper, 'them' and 'us'. You are either a member or you are not a member, and if you are a member then your membership is the primary identifying characteristic. One's religious identity is, thus, more important than one's national identity. For a number of reasons, this can become particularly significant when members move to different nations. For example, the NRM usually has a *lingua franca* that the members need to share. Frequently this is English (though it could be French or Japanese or some other language, if, like the Raelians, the movement is predominantly in Francophone countries). Tensions can arise, however, when the second-generation comes along and cannot speak the language of their parent's nation. One problem is that grandparents can be very upset when they find difficulty in communicating with their grandchildren. This paper examines some of the tensions that can arise between an individual's religious and his or her national identity in a number of situations, not least when official claims (for, say, pensions or medical insurance) require not just a subjective identity but also an official citizenship.

Conceptualising Belonging in the Context of Well-Being Among Young People in Contemporary India

The notion of belonging is invariably discussed in relation to social locations and identity within sociological literature. Ideas of being and becoming, belonging and longing, performativity, and intersectionality are at the core of understanding the social meaning of belonging (Butler, 1990, Bell 1999, Yuval-Davis, 2006). By drawing upon a new qualitative empirical study focused on young people's own meanings and actions, this paper utilizes Nira Yuval-Davis's conceptualisation of belonging (Yuval-Davis, 2006) to offer fresh theoretical and empirical insights in relation to gender, and space and place. Study findings related to 11-14 year old young people's conceptualisations of well-being, in both city and village settings, in India, are discussed along three different analytical levels - social locations, identifications and emotional attachments, and ethical and political values. Using the framework of the sociology of childhood that constructs children as agentic beings, the paper stresses the importance of the involvement of children in the research process as active participants with their own narratives and authentic authorial voices. Mixed-methods data from in-depth interviews, small group discussions, 7-day diary, and written exercises are utilized to triangulate disparate sources to advance thinking in the area of youth and belonging. A total of 92 young people contributed to the data collection. By contextualizing the debate and discussion within the notions of space and place, this paper seeks to contribute to new understandings of the meaning and sense of belonging among young people. This study is part of an international research initiative involving 25 countries engaged in qualitative study of child well-being.

Disability Protests in India 1970 - Present

Protests relating to disability issues, whether or not carried out by people with disabilities, have occurred at least since the early 1970's in India, but there has been little attention paid to them by social movements scholars. This paper examines over 200 such protests which occurred during this time period. It asks about patterns in timing, impairment type, protest demand, type of tactic, organizational involvement, and societal reactions, including police presence and arrests. Data are part of a larger event history analysis project on disability protests around the world. Data are primarily drawn from English language newspaper articles, although other sources, such as web sites and interview data, are used when possible. While newspaper articles do have problems of reliability and validity, their use can begin to provide an introductory picture which can then be analysed more intensively. Variables are coded and analyzed quantitatively. Cultural differences in protest history and meaning, as well as in views of disability in general and impairment types specifically, exist, but some cultural comparisons seem possible. Preliminary analyses show that, while the largest group of Indian disability protests relate to issues which potentially touch all persons with disabilities, the second largest group of protests focused on blindness issues. This is somewhat unusual, since, in most other countries analyzed, blindness-related protests comprise only a small percentage of all protests. (In some other countries this can be explained by patterns of organizational mobilization.) Other analyses suggest greater protest disruptiveness than in many other countries and greater social control attention paid to the protests. For example, hunger strikes and protests setting themselves on fire are more common in this context, as are arrests. This analysis attempts to consider these and other patterns within the Indian context as well as how data limitations affect the results.

Using Online Surveys to Research Diverse Sexualities and Gender Identities: Opportunities and Challenges

Cyber spaces and digital technologies have created new opportunities for minority and/or stigmatised groups to test, claim and live out identities and to form communities. A key example concerns diverse sexualities and gender identities, whereby online spaces potentially facilitate freedoms which may be inaccessible in 'real' life, providing political, educational, expressive, relational and even intimate opportunities. In parallel, the rapid expansion of digital access has fuelled the growing popularity of online surveys amongst social scientists, not only for reasons of cost and efficiency, but also because of their capacity to access harder-to-reach and/or stigmatised groups. This has had important implications for research with lesbian, gay, bisexual, queer and/or transgender populations, and others who seek to explore or self-define beyond binarised gender identities

and/or heterosexuality. However, whilst online survey methodologies have increased researchers' access to larger and more diverse samples in terms of sexuality and gender identities, there are various challenges which researchers need to consider including: 1) questions of representativeness, such as the extent to which online surveys reach the most marginalised within these communities (for example, the poor representation of minority ethnic people); 2) the development of appropriate, inclusive language to describe sexualities and gender identities which can be highly politicised and fluid; and 3) the diversity and uniqueness of the terms through which participants articulate their identities in free-text responses, where the freedom to self-define comes into tension with the constraints of quantitative measurement and analysis. This paper explores these issues, drawing from online surveys of lesbian, gay, bisexual, queer and/or transgender individuals, including our own study which collected data in the UK on homo/bi/transphobia, intimate relationship expectations and the experience and enactment of abusive behaviours.

Articulating Interests: How Kinship, Caste and Regional Identity Enable and Impede Union Organising in an Indian 'Industrial Village'

Arguments that unions should adapt to advance informal or precarious workers' interests often sit uneasily alongside claims that these workers have different interests to traditionally-unionised workers. This paradox has been accompanied by increasingly discursive treatments of informal and precarious work, with some arguing to collapse the former into the latter or into broader concepts of social class. In accepting views that concepts of informal work, precarious work and social class address overlapping but distinctive processes, this paper goes further in arguing that a more refined theory of work-based social interests would help to critically assess the possibilities of solidarity between workers with diverse experiences and identities. The paper uses a study of a recent unionisation campaign among automotive components workers in an 'industrial village' near New Delhi to illustrate a framework of 'articulated interests', which represent work-based interests held neither in-common nor in-conflict. The study shows how 'local' workers leveraged gendered networks of kinship, land ownership and caste identity to enable a unionisation drive and found common cause with migrant workers brought in by labour contractors via a union-hostile local labour control regime. However, these same local networks also limited the campaign's impact and produced radically different outcomes for workers in different 'employment configurations'.

Building Individual and Community Resilience through Global Health Literacy: Responding to the Trauma, Somatic and Mental Health Needs of Incarcerated Genocide Perpetrators in Rwanda

In today's rapidly changing world with global conflicts, climate change crises, immigration challenges, and economic inequities individuals live with a near-constant presence of stress, distress, and trauma. A cascade of physical, emotional, cognitive, and spiritual symptoms arises from each of these crises, straining the capacity of health care organizations to respond to all who are in need.

Drawing upon our research with incarcerated genocide perpetrators in Rwanda, this paper introduces a global health literacy approach, called the Social Resilience Model (SRM). The model equips trauma survivors with leading-edge neuroscience information about ways the mind-body system is wired to respond to threat and fear, and how people can harness the brain's capacity to change itself for the better using neuroplasticity. Accompanying the "neuroeducation" is a practical set of self-regulation skills which can be easily used for self-care and care of others.

Our paper will first describe incarcerated génocidaires' experiences of somatic symptoms, posttraumatic stress, mental health difficulties, attitudes towards unity and reconciliation, and hopes and fears for the future. We found strong associations between trauma experiences, somatic symptoms anxiety and depression. In addition, hostility was strongly correlated with somatic symptoms, anxiety, and depression. Through interviews we learned that reconnection with children, rebuilding destroyed homes, and resolving land disputes were the immediate post-release challenges to be overcome.

In our paper we will then present SRM's core neuroscience concepts, provide an overview of the self-regulation skills, and describe the ways the model builds individual and community level resilience in Rwanda, and promotes positive physical and emotional health outcomes. In addition to post-genocide Rwanda SRM has also been used globally after large-scale catastrophic events such as the

Thailand Tsunami, hurricanes Katrina and Rita in the U.S., and the earthquakes in Sichuan Province, Haiti, and Nepal.

La Situación De Los Jóvenes De 18 a 24 Años Que No Trabajan Ni Estudian En El Marco De Los Determinantes De La Salud the Situation of Young People Aged 18 to 24 Who Do Not Work or Study within the Framework of Health Determinants

RESUMEN

La investigación, de corte cualitativo, se realizó en el Departamento de Caucete, provincia de San Juan, aborda el tema de los jóvenes que no trabajan ni estudian y su vínculo con la salud mental en relación al consumo de sustancias y cómo responden los servicios de salud a esta problemática; cuyo objetivo es describir y analizar la situación por la que atraviesan desde sus percepciones e intereses.

El estudio se hizo posible a partir de observaciones y entrevistas a los jóvenes, familias, profesionales de la salud y diversos representantes de la comunidad. Estos instrumentos posibilitaron dar voz a los actores, quienes aportaron información suficiente para describir el espacio social, ciertos esquemas de pensamiento que dominan la estructura social, el problema del consumo que no es exclusivo de la población estudiada y los servicios de atención de la salud. De esta manera, el estudio considera determinantes sociales en la salud de los jóvenes.

El análisis del material constituye un insumo a tener en cuenta para la ejecución de políticas públicas que contemplen el trabajo entre diversos sectores por los que transitan los jóvenes, y a la vez ofrecer un conocimiento para el campo de la Salud Pública respecto de la situación que viven estos jóvenes que dejan de pertenecer a las instituciones de la comunidad.

Information Barriers and Social Inequalities in Participation in Higher Education: Evidence from a Field Experiment

The presentation addresses the possible contribution of information barriers to socio-economic and gender inequalities of participation in Higher Education (HE). Relying on models of bounded rationality, we consider information barriers concerning the costs, benefits and chances of success of investments in HE, and we assess whether these barriers affect continuation to HE, the choice between university and higher vocational education, and field of study choice.

For this purpose, we ran a multi-site clustered randomized controlled trial that involved all of the senior students of 62 Italian high schools. The experimental treatment provided senior students with detailed information concerning the profitability of educational options, that is, their costs, academic selectivity and occupational prospects, with particular attention to differences between fields of study and between college and postsecondary vocational programs. We met each single class separately on three occasions for a total of six hours. Longitudinal data concerning the students' initial college plans and final college decisions were collected among treated and control students before and after the information treatment. Our first substantive conclusion is that information barriers do not affect the choice to continue to HE in Italy, but rather the "horizontal" preference between university and vocational programs, and between different fields of study. Our second result is that these barriers affect gender inequalities more than socio-economic inequalities. In the presentation we discuss the methodological and policy implications of these results.

Corruption, State Capture and Informal Institutions in the Public Sector in Latin America: The Case of Chile

This paper makes several contributions to the existing literature on corruption and informal institutions in the public sector in Latin America, using the case of Chile as an example, a country where corruption in the political arena associates with practices of elected officers to reproduce themselves in power rather than personal enrichment. Addressing the question about how social and political transformations impact institutional and structural corruption, and based on the theoretical framework laid out by Helmke and Levitsky, we analyse the compared outcomes of corrupt practices at the local, regional and national level. We extend the list of commonly analysed informal institutions to mechanisms that have not been considered from these perspectives before, such as campaign finance arrangements, rules of public appointment, nepotism, transversal arrangements, informal decisions or clientelism, as well as their impact on social inclusion of lower and middle classes. Second, we examine the dynamic nature of these informal institutions and their operation in six different social and geographic backgrounds, analyzing how the transparency laws applied

since 2015 impact on political practices in an environment of low institutional trust and high corruption perception. Finally, following Granovetter's approach on corruption and its embeddedness in social relations, we show that similar practices in different contexts may or may not be corrupt: in some cases they allow part of the population to solve their problems while in other areas, they foster resource concentration in local caudillos' hands. Our research reveals that informal institutions shape politics and policies as well, but have similarly helped grease the wheels of post-authoritarian politics in Chile and supply social benefits to lower classes. We use data from legislative debates and 130 interviews to experts and local, regional and national actors conducted in the last two years in six territories of the country (Fondecyt project).

BARR, MICHAEL* (Newcastle University)

Where Biography Meets Ethnography: The Psychoanalytic Foundations of Autoethnography

Autoethnography combines biographical narrative with ethnographic methods. It operates at the intersection of the personal and the cultural, where the author thinks and observes as an ethnographer but writes as a storyteller (Denzin, 2014). In recent years autoethnography has become an established, if at times contested, method across the social sciences. Yet despite its popularity, autoethnography remains undertheorized. As a method, it is indebted to a social constructivist project that rejects binary oppositions between the researcher and the researched, objectivity and subjectivity, process and product, self and others, and the personal and the political (Ellingson and Ellis, 2008). Yet beyond these broad claims, many proponents resist articulating a firmer basis for the ontological, epistemic and reflexive status of autoethnographic writing. In this paper I argue that a reluctance to underpin autoethnography with a more robust theoretical justification ends up harming the attempt to combine biography and ethnography. The paper draws on empirical data from a course on autoethnography at a British university where MA level students were asked to consider their own autobiographies as political texts and to systematically analyse and relate their personal experience to wider political, cultural and social events. I combine this data with variants of psychoanalytic theory (Ruti, 2009) and insights from the literature on philosophy as a way of life (Hadot, 1995) to critique autoethnography's epistemic inadequacy of strong reflexivity. The aim of the paper is both facilitate a dialogue between ethnographers and biographical researchers and to bolster the theoretical underpinnings of autoethnography.

BARRAL, STÉPHANIE* (Institut National de la Recherche Agronomique)

Ecological and Management Dimensions of Metric Production in Conservation Banking

Since the 1990s conservation banks have grown in the USA as one market-based instrument allowing developers to meet the requirements of the Endangered Species Act (ESA). They have been developed unevenly in the different States of the country, two third of them being currently in California, other States bearing a dozen of them at the most. Conservation banks can respond either to regulatory requirements of the ESA only, thus being certified by the US Fish and Wildlife Service, or to multiple regulatory frameworks intertwined at the State and federal levels. This is for instance the case in Sacramento County, California where the certification of a bank requires the coordination of eight agencies.

As regulatory frameworks such as policy and implementation guidance don't compel with the use of specific metrics, these can be designed, produced and negotiated on a case-by-case basis by the bank sponsors and the relevant State and federal agencies (through the work of the Interagency Review Team). The aim of this paper is to explore the relationship between the organization configuration of a bank certification process and the metrics being produced and implemented during this process. It is based on qualitative interviews with bank developers and members of bank review teams in several States. They show that the production of one metric is carried out through a negotiation process between those stakeholders within which not only ecological considerations but also economic and management ones can be addressed in order to ensure the outcome of the project. This reflects how the economic imperatives of the bankers are embodied in the scientific grounds of the projects on the one hand, and how the multiplication of regulatory bodies in the certification process can lead to the use of a simplified metric in order to limit coordination hindrances on the other hand.

Are We There Yet? Contemporary Struggles for Gender Justice and the Legacy of Caribbean Feminisms

In this presentation I draw on two projects in which I examine the development of feminism in the Anglophone Caribbean, to contemplate feminist consciousness

and its mediation of contemporary struggles for gender justice within the region. From activism to academia, Caribbean feminisms have long been built on movements of women propelled by challenges to gender justice emerging in multiple political, social and economic sectors, such as politics, labour, religion, social development and health. These issues are structural and systemic, affecting all women though the effects may be felt differently depending on the intersection of social identities such as race/ethnicity, class and religion.

From the first project, I am informed by observations of my feminist theory students who, on the one hand, express a theoretical awareness of the legacy of Caribbean feminisms and an understanding of self as postcolonial subjects, connected locally, regionally and globally to systems of political, social and economic subordination. However, at the same time they express, through their in-class discussions and independent work, a presumption of self as inheriting a secure agency and a preoccupation with issues that threaten, above all else, individual body sovereignty and personal freedom. This preoccupation, I suggest, diminishes if not erases the relevance of persistent social, political, economic and cultural challenges to gender justice in the region.

From the second project, I add to my consideration of their perspective, their experience of self in a creole (understood as mixed/hybrid) society, where, as part of an intersectional identity, many negotiate mixedness as part of their gendered identity. I reflect on this mixedness through the experience of *douglas*, one mixed race group well recognized in Trinidad and Tobago, Guyana and Suriname, considering how this group may see themselves positioned within feminism, a positioning that may influence their feminist consciousness.

Insecurity, Fear and Cruelty in Contemporary Urban Settings

Insecurity, fear and cruelty in contemporary urban settings

The debate about violence, which is taking place in several cities across the world, acquires contemporary specificities either because of the growing number of cases of cruelty categorized as heinous crimes, or because of their unexpected widespread. The growth in the absolute number of cases entails other variables, such as fear and feeling of insecurity, which impose long-lasting effects in the social order, not to mention their difficult resolution. This paper seeks to reflect on questions that stand out in contemporary urban settings, intertwined with the issues of insecurity, fear and cruelty. In this perspective, the aim is to shed light on this topic based on core analytical standpoints: widespread violence, actions of intensity categorized as heinous or cruel, and new practices of sociability cross-cut by fear and the feeling of insecurity. For experts, the emerging challenge is to interpret the latest configuration of this phenomenon, which presents broad manifestations as well as practices identified as violent. This research is particularly based on debates taking place in Brazil and brings about ways to understand different aspects around the phenomenon.

Gender Recognition and Political Representation in the Postcolonial Debate

GENDER RECOGNITION AND POLITICAL REPRESENTATION IN THE POSTCOLONIAL DEBATE

Postcolonial debates are reshaping the discursive field that gives meaning to hierarchical relations, repositioning the various ways of domination, such as practices and narratives of gender. This paper focuses on the participation of women in political representation in Brazil, analyzing their processes of presentation of self and recognition. Relying on empirical data from previous research projects, the aim is to take into account how women present themselves in electoral campaigns, and the recognition that is mobilized in settings of political representation within the National Congress, both in the Senate and in the Chamber of Deputies, over the last decade.

It is important to emphasize that seats of representation in the National Congress indicate relatively long-term political careers, with a previous experience in running electoral campaigns and serving terms. In spite of a gradual increase of political capital, women who currently serve as members of Congress account for 10% of the seats. How do women in Congress understand this condition of representation?

Moving beyond the quantitative dimension of representation, the work reflects on the markers of gender associated to the symbolic conflicts performed during the impeachment process of former president Dilma Rousseff, in 2016. Power and subjectivity stood out as important markers to think about the issue of representation, based on non-formalized references of male dominance in politics. In this sense, it became relevant to assess how women interpret their own presence in politics, and how they create collectives that adhere to references of both gender and party ideology. Finally, the data is based in postcolonial debates, which contribute to the understanding of subjectivity in politics, as well as highlighting

the tensions and possibilities involved when taking part in a field of practices that has been historically built by men.

Education of the Body and Childhood: Power and Coercive Violence to the Body of Children at School

This research seeks to discuss the social relations established through the body of children and adults control in the school play, as well as analyze the issues of power and violence that permeate these relationships. Therefore, it is based on the assumptions of the Sociology of Childhood, which considers children as social actors, capable of interacting with the environment where they are inserted and assign senses to their actions. The methodology used was ethnographic orientation, focused on childhood and children culture. The research was developed in a public school in Brasilia, the capital of Brazil, through participant observation and conversations with the children. It was observed the children's daily life in the times and spaces where they used to play at school, during 4 months. The data were categorized and analyzed based on interdisciplinary theoretical references. The results suggest that children are not inert to the social action logic established by the institution. On the opposite, they are active and react to the conditions imposed upon them. By playing, the children are able to exert power through the interactions with their pairs, but not with coercive purpose – as adults do. Thus, it is also possible to infer that the children are organized in their social relations expressed in the games and that in turn reflect the relations of power. The children reveal this set of relationships by their body when they play. As a central challenge, we highlight the necessity need to reflect about the education of the body, on the organization and socio-cultural systems, which can generate symbol violence and injustice against children.

Analysis of the Visibility of Bedouin Women in the Negev, As Reflected in the Private Photographic Archive of Dr. Ben-Assa, an Israeli Physician.

This paper presents a private archive of photographs of Bedouins living in the Negev Desert in Southern Israel in the 1950s–1960s. The archive is the personal collection of Dr. Benjamin Yehudah Ben Assa (1917–1976), a medical doctor known to the Bedouins as Abu Assa. The study explores the forms of presentation of women in his photographs, mostly while being treated in his clinic during his medical practice. The analysis of the photographs relates to lifestyle and traditions of Bedouin women, the way in which these affected his construction of images. The exploration relates to the forms of visibility of Bedouin women in the public sphere, expanding on traditional practices of photographing Bedouin women in the Middle East in the 19th and 20th centuries.

Among the tens of thousands of photographs taken from the mid-19th century to the end of the second third of the 20th century in the Middle East and Palestine, there are relatively few photographs of Bedouin women. The paucity of photographs of Bedouin women in the 19th and early 20th centuries affected visual constructions of Bedouin women by Western photographers, allowing room for stereotypes, which circulated and influenced image production in the Western world, as well as cultural practices of viewing Bedouin women by Western audiences. In general, Bedouin women, living in a “traditional male dominated society” were absent from the visual public sphere (Abu Rabia and Oplatka, 2008, 398). Behrend explains that there exists an “ideal (gendered) modesty, purity and seclusion that does not allow women to expose themselves in public” (Behrend 2013, 148).

The study explores his photographs and aims to understand whether, under his circumstances as healthcare provider, he succeeded in creating an alternative visual representation of Bedouin women, taking into account the social status of women in Bedouin society and gender discrimination against them.

Anticipation and International Media Communication: How Do Interaction Shifts Happen?

In previous papers I have explained that it seems that Donald Trump has created a media character using social media to gain a reputation as an unpredictable performer, a troublesome person, and a punishing negotiator. At least at international level, we can suspect that international audiences are

somehow learning to grasp Trump's media strategies and hence his bluffs could be resulting less effective. Can we anticipate a shift in Trump's media strategies by observing certain events along 2017 due (maybe) to balance his loss of success? If we can, how we did it as international audiences and how can we anticipate his forthcoming moves? According to Christensen and Hooker, “Self-directed systems anticipate and evaluate the interaction flow, directly modifying the interaction process so as to achieve goals that regenerate or improve the system's autonomous closure conditions (n. d. P. 18)”. If this is true, how do international audiences could be “directively modifying the interaction process”? This presentation will analyse six media events and the possible adjustments among them will be inferred seeking to observe anticipation dynamics in international communication affairs.

The Post-Colonial and Decolonial Perspectives in the Production of Knowledge on Latin America in Brazil

The Post-Colonial and Decolonial Perspectives in the Production of Knowledge on Latin America in Brazil

Latin America has been an important object of knowledge in the Social Sciences, both in the region and abroad. It has not only figured as an important field of the so-called AreaStudies in the United States, but also the main subject of some of the most relevant contributions of Latin American social scientists to the field. Most recently, the Post Colonial and decolonial theories' influences on the field of studies on Latin America has prompted a change of perspective as for the place and status of Latin America, now figured not only as mere object but also subject of research and knowledge. Even though this perspective has gained terrain in this area of study, the impact of such an approach in the production of knowledge and information on Latin America in Brazil is something to be still investigated. The present paper seeks to be a contribution in this regard as it seeks to examine the importance and relevance of the Post-Colonial and Decolonial theories in the research agenda of the study groups that investigate and do research on Latin America in Brazil and that are registered in the CNPq (Brazilian Ministry of Science and Technology) database

BARROS, LUIS* (*Universidade Federal do Ceara*)

Brazil's Development Brokers: A 21st Century Reading of Internal Colonialism

This paper discusses the legacy of colonialism in 21st century Brazil by analyzing the role of development brokers (Bierschenk, et al., 2002). Development brokers rely on social capital to construct and maintain their privileged positions of power (Vásquez-León, 2009; Wolf, 1990). To understand the structures and institutional arrangements that result from brokerage, it is useful to draw on Durkheim's (2010) distinction between mechanical and organic solidarity. On the one hand, there is the mechanical solidarity characteristic of Brazil's authoritarian culture (Holanda, 2014; Martins, 1999; Sondrol, 1991). On the other hand, there is the organic solidarity of transnational power structures, which operate through a new kind imperialism (Harvey, 2003). By analyzing the way development brokers navigate these different forms of solidarity it is possible to better describe the ways in which internal colonialism functions. It is then argued that the incompatibility between these two coexisting forms of solidarity partially explain both the failure of capitalism to function productively in Brazil (Soto, 2000) and some of the dysfunctional aspects of postcolonial institutions – such as relationships of clientelism and patronage (Barreira, 1999; Nelson and Finan, 2009) – present in the country. The paper concludes by suggesting a way forward in the construction

of a "theory for weak and fragile states" (Magrath, 2010) that could contribute to the debate of postcolonial capitalism.

Sick Role Non-Identification and New Regime of Representation: Effects of the Non-Conventional Practice in the Type II Diabetes Treatment

Illness narratives have been allowing the advance in the understanding of the health, disease and care of people with chronic diseases. It has helped to understand the variances related to different medical systems treatment for type II diabetes, in primary healthcare in Brazil. Although all patients take medicines, some places have been associating the Lian Gong, body practice from Chinese Medicine, obtaining positive results. The aim of this paper is to discuss comparatively the narratives of type II diabetes patients, who associate and do not associate Lian Gong to the conventional treatment. Semi-structured interview were conducted with 96 people with type II diabetes undergoing treatment in primary healthcare in a large Brazilian city. 45 out of the participants were Lian Gong practitioners and 51 were non-practitioners. The interviews were recorded and the data were processed from the content analysis and narrative analysis. Although the practitioners' tales coincides with those of non-practitioners regarding the dependencies, invalidations, and dismay brought about by diabetes, there are significant differences in their plots associated to the non-identification to the disease labels and the oppression imposed by the diabetes. The narratives of non-practitioners are composed by expressions such as "you are always taking medicine"; "you have to always be controlling, always be alert"; "always being on the doctor, having tests". On the other hand, the narratives of practitioners bring expressions such as "I try to live as if I didn't have a disease"; "I do not feel like a sick person, even though I know I have to take all these medicines, I feel like a healthy person". It is concluded that people with diabetes who associate Lian Gong with conventional treatment in primary healthcare develops sick role non-identification and new regime of representation of health, disease and care.

Building My Place in the World: A Clinical Sociological Approach of Young Migrants Experience in France

This proposition focuses on young foreigners arriving in France without their legal guardians: the so-called "unaccompanied minors". Since the years 1990 the migration of young minors by themselves challenges European countries to develop welcome policies regarding child care. If the International Convention on the Rights of Children establishes the responsibility of public authorities regarding the vulnerability of their situation, it is for us today to observe the specificities of educational-protective work and the mishaps of care provide to this population.

The research centers on these young people experience of welcoming and "un-welcoming" in the region of Ile de France (Paris), more specifically for those who are relegated outside the child care institutional walls.

Following a clinical sociological approach, our research noticed the many effects of a policy of un-welcoming, referring subjects constantly on the condition of "not being". For the XIX ISA Congress, we propose to focus on one aspect of this research: the social and psychological support that these young migrants mobilize to be able to build their professional and life projects despite the difficulties faced. What kind of strategies they develop to face this un-welcoming policies? What type of support they are able to find and to invest - in and outside institutions / in and outside themselves?

Based on the work of G. Devereux (2012) and J. Favret-Saada (1977), this communication grants an important matter to the notion of implication and transference / counter-transference in research. Our results propose an interdisciplinary dialogue between sociological, psychological and philosophical fields in order to understand the complexity of this contemporary situation. These young migrants crossing borders challenges countries around the world to think and re-think immigration patterns.

Unaccompanied Minors and Young Migrants in France : Challenges for a World-Wide Child Care System

This proposition focuses on young foreigners arriving in France without their legal guardians: the so-called "unaccompanied minors". Since the years 1990 the migration of young minors by themselves challenges European countries to develop welcome policies regarding child care. If the International Convention on the Rights of Children establishes the responsibility of public authorities regarding the vulnerability of their situation, it is for us today to observe the specificities of educational-protective work and the mishaps of care provide to this population.

At first, this research focuses on the social care of these young people provided by the Aide Sociale à l'Enfance (ASE), a French institution of child protection, as well as the tensions produced by the encounter of two opposing institutional discourses within the care/host organizations: the child protection discourse and the regulation of migration discourse. Secondly, as a result of the current migratory situation, this research focuses, on the experience of young people who are not hosted by the ASE, those who are relegated outside the institution's walls.

Following an interdisciplinary approach, between clinical, sociological and philosophical fields, we propose to analyze the types of investments around this youth and focuses on the effects of a policy of "un-welcoming" referring subjects constantly to the condition of "not being". For the XIX ISA Congress, we propose to focus on this youth who crosses borders in the search of a place to "be" an active social and political subject and found themselves confronted with the dimension of "not possible", relegated to the margins of institutions. Analyzing the life story of three young migrants, their choices, paths, arrivals and projects for the future, we will approach the complexity of this migrant population and the challenges it engages world-wide.

Conveying Risks through Storytelling

As critical infrastructure systems such as energy grids and communication networks become increasingly complex and intertwined, there is more need to evaluate and communicate risks of failure, the systems' vulnerabilities, and scenarios of possible operational failures. This is true not only within organisations that operate infrastructure networks but also across organisational borders as in interconnected systems by definition effects can be transboundary. In this case it is a major obstacle that stakeholders aren't experts for the respective technology that may affect their own operations, e.g. firefighters depend on communication services in emergencies but mostly are not familiar with the technical functionality and default risks of mobile networks.

During contingency planning discussions with experts from different infrastructures we observed that the participants often conveyed risks within and towards their own systems by telling stories of incidents or near-misses rather than elaborating on the functionalities of their system architecture. This way they raised awareness of malfunction risks and explain their operative processes to react to disruptions in way that is easier to understand and remember. The importance of storytelling for raising risk awareness within organisations has been widely acknowledged (Weick 1993; Hayes/Maslen 2015). Little attention though has been given to its role in overcoming organisational borders.

Our observations showed that with external stakeholders the participants tended to tell stories that described extremes: On one hand they told stories that emphasized the reliability of their networks and how well they are prepared for disruptions as especially heroic stories are remembered and passed on. On the other hand the representatives stressed the importance and complexity of their systems by focussing on worst case scenarios. This contribution identifies types of stories that are commonly told in such settings and reflect on the chances and shortcomings of awareness this story-based risk communication induces.

BARTELS, MARIE* (*Technische Universität Berlin, Germany*)

Scenario Development for Collaboration Exercises

During disasters which affect or are caused by supply infrastructures, system operators and public authorities have to cooperate closely in order to minimize damage, help those affected, and control the situation. This collaboration is regularly hampered a lack of communicative routines, different expert languages, incompatible organisational and professional cultures, and a lack of knowledge about each other's mode of operations, resources, and constraints (Kapucu et al. 2010; Crowther 2014; Ansell et al. 2010).

Scenario-based training is commonly used to conduct exercises which address the abovementioned problems under conditions that are characterized by (a) an overflow of uncertain information, (b) difficult to assess risks of escalation, and (c) distributed responsibility and expertise for the evaluation of the situation across

organisational borders. Due to the increasing functional interconnectedness between infrastructures, especially (c) becomes a major challenge for disaster managers (Pescaroli/Alexander 2016).

Little attention has been paid to methods to develop scenarios that exercises are based on. As the storylines are supposed to be realistic, transboundary in nature, and beyond what has been experienced yet in order to confront the trainees with the unknown, different organisations have to participate in the scenario creation. This is barely ever reflected upon scientifically which is even more surprising as while the value of collaboration exercises has shown to be limited (Moats et al. 2008; Berlin/Carlström 2015) most practitioners who have participated in the preparation of exercises have emphasized the learning effects during this phase.

This presentation will introduce research conducted in Berlin, Germany with ten organisations from different sectors that would be involved in case of crisis or disaster. Over three years different approaches to building scenarios have been tested and evaluated. Measure centred scenario building has proven to be more revealing to the participants than approaches based on incidents, hazards, coping resources, or working along timelines.

Neighbourhood and Social Capital in Urbanising India- Mental Health Implications for Women

Neighbourhood as a social capital has become a prominent field of study with recognition of social capital as an important determinant of mental health outcome of urbanising societies. The complexity of the relationship is not so well understood though. This holds special relevance in case of Asian countries like India. India is witnessing a rapid social change reflected in her growing urban population, breakdown of joint families and inadequate provisions for growing socio-economic aspirations. Uprooted from their socio-cultural milieu and bearing the brunt of caregiving, women in urbanising India are particularly vulnerable. With men being out for the greater part of the day to earn a living, women have to often fall back upon neighbours for support. Not many studies have examined the mental health outcomes of neighbourhood related social capital in Indian context. Such studies become all the more relevant in context of emergence of nuclear families as a norm and breakdown of familial and community accountability in urban settings.

OBJECTIVES- The major goal of this study was to find the relationship between neighbourhood related social capital and mental health outcomes using a sample of 200 women from Mumbai suburbs in India. Neighbourhood social capital is operationalised in terms of perceived neighbourhood trust, neighbourhood ties, perceived safety and reciprocity.

METHOD- The relationship of neighbourhood related social capital and other demographic variables like age, income, education, marital status with mental wellbeing is measured using qualitative and quantitative data collected through in depth interviews. Warwick Edinburgh mental wellbeing scale was used to measure mental wellbeing.

RESULTS- Path analysis was done to find relationship between various neighbourhood variables and mental health outcomes. Results showed mediating role of collective efficacy and individual factors like income. Out of neighbourhood indicators perceived safety predicted mental wellbeing. The study advocates a more complex model of neighbourhood social capital ..

Health and Reemployment of Older Workers in Germany

Demographic ageing has promoted different approaches of 'age management' in many countries of the world as the Madrid International Plan of Action on Aging (MIPAA) shows. The extension of working lives is one of these approaches leading to an increasing activation of older workers. In Germany, the employment rates of age groups 50plus have increased considerably during the last decades due to decreasing possibilities of early retirement and to decreasing risks of unemployment of older workers. Complementary to these developments unemployed persons 50plus have become a special target group of labor market policies. Unemployment is known to deteriorate psychological wellbeing and physiological health. This is one of the reasons why labor market policies in Germany have started to offer health courses for older workers. Against this backdrop the proposed contribution will analyze determinants of reemployment of older unemployed persons and pay special attention to effects of health status and participation in health courses.

The theoretical framework of this study is based on an institutional life course perspective. From this point of view legislation on the official retirement age and on criteria of employment disability pension schemes are crucial for processes of reemployment because they influence decisions of employers and (potential) employees as opportunity structures. Furthermore, organizational characteristics of potential employers (e.g. age stereotypes), personal features of the unemployed (e.g. qualification, health, search behavior) as well as the regional context (e.g. level of unemployment) play a major role in the reemployment process.

The empirical analysis is based on nine waves of the panel study 'Labour Market and Social Security' (PASS) by the German Institute for Employment Research (IAB). First results show that both, subjective health status and participation in health courses increases the chances of reemployment significantly. However, this effect is smaller for older unemployed.

Fitting into the Public Milieu: Findings from a Participatory Inquiry Study on Use of GPS Technologies By People with a Dementia

This talk explores the complexities of aging and use of GPS technologies by men and women with a dementia in middle-age and later life. The discussion is based on a 28 month empirical project, completed in February 2018 and funded by the Alzheimer's Society. It was called Using Technologies for Safer Walking: A Participative Inquiry and sought to address this question: How effective and acceptable are technologies for promoting safer walking? We took a disability-rights perspective and centralized the opinions, concerns, and experiences of citizens with dementia.

The project had three phases. Phase one involved focus groups with the police ($n=20$), and individual interviews with people with dementia ($n=16$) and family members ($n=16$). Phase two employed go-along walking interviews with people with dementia ($n=15$) who were using some form of technology, such as a GPS device or phone app, when they went out. The third phase involved an overnight residency with key stakeholders including research participants.

Here we present a key finding from phase 2, which involved participants of different ages; two were in their 50s; four were in their 60s; six were in their 70s; and three were in their 80s. We found that safer walking is not simply about going outside independently or avoiding risks but fitting into the public milieu. The fitting occurs whenever there is a 'harmonious interaction' or agreeable encounter with a material thing, which might be a GPS-enabled device. Significantly, several participants referred to their dementia as a 'thing' that got in the way of them fitting in, and participants in their 70s and 80s related to their GPS device in a less harmonious way than younger participants. By the end of this talk we hope delegates will be more informed about GPS use by people with dementia.

Situating Social Performances: Material and Spatial Contexts of Cultural Change

Within the material turn in cultural sociology, there is a range of specific agendas that thematize the constitutive role of materiality for social life, from means of symbolic production to forms of embodied practice. But social life is not only represented and embodied; it is also emplaced and spatially configured. This insight is present in various intellectual traditions, from phenomenology to critical realism, and yet only recently was space approached in non-reductive ways. Today sociologists increasingly recognize that the contemporary processes of reconfiguration of space are not of merely representational or discursive character but emerge out of experiential formations based on reciprocally conditioned spheres of discursive performance and spatial situatedness. These processes are said to engender novel forms of localisation, interconnectedness and spatially shaped self-experience. This presentation offers a range of preliminary observations regarding this topic drawn from my research projects on social resonant performances in media and urban spaces. Key implications for more general theory of culture and meaning making are then presented, reconsidering ways in which linguistic, phenomenological and critical realist perspectives can converge on this topical ground.

BARTONE, SHAUN* (U. New Brunswick, Fredericton NB Canada)

A New Subsystem Called Ecology: A Way out of the Ecological Dilemma in Luhmann's Ecological Communication

Abstract. Ecology is at the early stages of formation, not only as a scientific and moral discipline, but as a *new functional subsystem*, whose specialized purpose is to develop communications about the system/ environment difference for the whole social system. Historically, the discipline of ecology has always been both a social and natural science, thus enabling it's specialized function to communicate the system/ environment difference. As both a social and natural science, it has the capacity to perform second-order observations of both the natural environment and the social system. Functionally it acts as a gateway between the environment and the social system that allows in certain kinds of information and translates it into a coded form of communication (fit/unfit) that other subsystems can comprehend. As such it mitigates the problem of the under-resonance and over-resonance of the social system to ecological crises. I will show that the

development of the new subsystem 'ecology' is possible within all the parameters for the social system and its subsystems that Luhmann specifies in both *Social Systems* (1984) and *Ecological Communication* (1989). Not only is it possible, but it is necessary for the continued evolution of a social system whose closure from its environment and division into functional subsystems renders it unable to steer itself as a whole system in relation to its environment, which reduces its capacity to accurately adequately address threats from the environment. Without an apparatus to perceive and communicate threats from the environment, the social system threatens its own demise as a system. The new subsystem ecology is a functionally sufficient and rational subsystem that is capable of communicating the system/environment difference to society as a whole, thus ensuring its continued autopoiesis.

BARTONE, SHAUN* (U. New Brunswick, Fredericton NB Canada)

Critical Evolutionary Systems Theory: Social Movements As System Attractors

Critical Systems Theory bridges the work of the Critical Theory of Habermas and the Frankfurt School with evolutionary systems theory devised by Luhmann. Christian Fuchs' Critical Systems Theory argues that 'cognitive liberation' is an essential condition for the emergence of protest and social movements. The mere fact of system failure, defined in one sense as 'social problems', is not sufficient grounds for the emergence of social movements. Critical consciousness emerges when there is a break in the fit between social structures and subjective expectations, yielding an 'issue' for discussion, and when individual consciousness reflects upon and debates the issue.

Blüdhorn's Systems theory of social movements also employs elements of Critical theory but those critical elements are constructed within his Systems' theory and are explained as a outcome of functional systems. Blüdhorn restates Luhmann's definition of the radical function of protest movements as *maintaining the possibility of system difference and change*.

I propose a Critical Evolutionary Systems Theory which explains that social systems generate social problems defined as the exclusion of issues from functional systems. Individuals develop a critical consciousness to critique functional systems and the exclusion of those issues. Individuals communicate with others to deploy deviant semantics in the form of *protest* to simulate as *within* systems that which has been excluded, including issues that lie entirely outside the system, i.e. the natural environment. Protest movements are self-organizing movements which autopoietically generate alternatives for functional systems. Protest movements self-organize around a new cognitive *attractor* that can generate new patterns for a ground-up production of new social forms. Protest movements network on an as-needed basis to create emergent social movements. Protest movements select among those alternatives and generate new functional subsystems which increase the complexity of the system and continue the evolution of the social system.

Does the UK "Citizenship Process" Lead Immigrants to Reject British Identity? a Panel Data Analysis

In societies where solidarity and cohesion are experienced primarily via shared national identity, immigration raises questions regarding how non-nationals can gain social membership, so that they are not perceived as undermining solidarity and cohesion. A key aspect of immigrants' experiences is thus whether they embrace the national identity of the destination country. Governments in many destination countries increasingly seek to ensure that they do, via policy initiatives that impose specific requirements for gaining legal citizenship: applicants for naturalization are commonly required to pass a test (ensuring sufficient knowledge of e.g. "life in the UK") and attend a ceremony that includes a pledge of loyalty.

This paper considers whether the British version of these requirements is effective in leading immigrants to embrace British national identity. It uses data drawn from the UK household panel survey ("Understanding Society") to facilitate a comparison between those immigrants who become citizens and those who do not. The main finding is that those who become UK citizens significantly increase their attachment to British identity, relative to those who do not become citizens. Whether they do so specifically because of the policy requirements (the test and ceremony) is debatable: possibly this pattern comes despite (not because of) the policy requirements. It nonetheless seems clear that these requirements do not inhibit development of a sense of Britishness among the immigrants who meet them.

RC31-JS-13.1

BARTRAM, DAVID* (University of Leicester)

The UK Citizenship Process: Integration or Marginalization?

The UK 'citizenship process' subjects immigrants (especially those who want to become citizens) to a set of requirements ostensibly intended to enhance their identification with 'British values'. What impact does that policy have on the immigrants themselves? Proponents of the policy suggest it will facilitate their integration: as they learn about 'life in the UK', they will become better able to understand and navigate core institutions. Many external observers, by contrast, believe that the requirements exacerbate marginalization, by constructing immigrants as objects of presumptive suspicion and concern.

For the most part, this debate has been conducted via analysis of policies and documents. In this paper I adopt an empirical strategy focusing on outcomes for the immigrants themselves. Using panel data from 'Understanding Society' (the UK household panel survey), I investigate interest in politics among those who are non-citizens at Wave 1, comparing those who became citizens by Wave 6 to those who remained non-citizens.

The analysis indicates that those who became citizens subsequently reported lower interest in politics, controlling for other determinants. The longitudinal nature of the analysis suggests that this decrease comes as a consequence of their naturalization, rather than indicating lower interest already prior to naturalization. This unexpected finding reinforces the concerns of critics of the 'citizenship test' regime: the policy appears to do more to alienate new citizens than it does to facilitate their integration in the political sphere.

Performance and (Re)Construction of the Body: Queer Perspectives on Kõçek

The relationship of masculinity and dance in Turkish society has always been problematic. One of the reasons is the fact that many dances are mostly identified with femininity except for the types dominated by "masculine" forms in the last few decades under the influence of Western countries such as hip-hop and break dance. Therefore dancing can be seen as a threat for masculinity by men. Turkish culture, on the other hand, includes a tradition that is performed by dressing directly as "woman" and often performed by acting "feminine" and it still continues to exist in certain regions of Anatolia. The dancer who performs this traditional dance is called as *Kõçek*.

*Kõçek*s represent the traditional dancer boys in Turkish culture who wear the clothes which are attributed to women today like skirt and fancy waistcoat. They first emerged in the palace life in Ottoman Empire as servants who provide the sultan and establishment of the palace entertainment and sexual service and this tradition survived until contemporary times as part of a wedding and celebration culture especially in the North-western region of Anatolia. The problem of this study is to question the historical progress of *Kõçek* tradition which can be thought to open different doors to the reproduction of the body by performance. Our aim is to reread this tradition from Ottoman Empire to Turkish Republic with queer perspectives and to demonstrate that *Kõçek*s, as already accepted traditional male dancers, provide a queer stance that can be destructive for gender roles by their performance which implies deconstruction and reconstruction of the body at the same time. This study is supported by the opinions and performances of 15 *Kõçek*s, who are interviewed and recorded while performing, and is willing to support the queer colors of Anatolia.

Power Relations of Men in (Pro)Feminist Research: Two Fieldwork Experiences from Turkey

This study focuses on how a male researcher who has questioned any kind of identity politics and rejected all kinds of power relations finds himself mostly in such relationships with his male participants during his research studies.

While feminist standpoint theory, which is often used in feminist studies, aims to see the experiences of the researched women by their point of view, it attempts to destroy the "outsider" position of the researcher at the same time. This attempt involves the rejection of researcher's superior position and the act of dominating the group or individuals studied. Can we apply standpoint theory's approach to methodology to the research contexts in which the research is conducted by a man who adopts (pro)feminist values and who examines men? I focus on this question from the point that the outsider position of the researcher who rejects the privileges of being a man is generally created and enforced by the hegemonic position and domination of the male participants. I argue that the relations of men in the research field which have been progressed with the knowledge and views of men can ensure the continuity of superior position and oppression of participants. With the masculine domination of researched men, fluid positions of researcher and participants can be stabilized in such men-to-men relations. I share the fieldwork experiences I gained in two field studies on two separate male groups, which can be perceived as quite different from each other, namely, men in the coffeehouses in Turkey and (pro)feminist fathers in Turkey. I also show how my fieldwork experiences actually resemble each other in the eye of

the researcher and how similar they can be in terms of power relations which are created in the field.

BARYLO, WILLIAM* (EHESS)

A Theology of Social Care: Muslims and Sikhs Serving London's Homeless

Since the early 2010s, various Muslim and Sikh faith-based initiatives have been emerging in London for serving soup kitchens to the homeless. As opposed to large-scale social organisations, they are local, small and have little means; most of them started as unregistered informal groups and managed by unpaid volunteers. However, they successfully gather dozens of mainly young people each night, who do not necessarily share the same culture, social background or orthodoxy. These open community hubs happen to weave a cloth of strong social bonds through conviviality where are expressed alternative forms of democracy and citizenship. They are accessible and therefore attractive means for action for many who do not believe in state-level politics. Paired with a theology of social care, serving the homeless becomes a devotional practice and means to shift the perceptions about Sikhs and Muslims in Britain at the same time. Presenting three Muslim and Sikh initiatives, this paper explores the internal dynamics, the outcomes and the social impact of these grassroots charities.

From Enorb to 'Sacred Activists': The Changing Face of Multi-Faith Grassroots Movements?

Launched in 2016 by St Ethelburga's Centre in London, Sacred Activists is an ongoing training programme aiming at building a network of young people from various cultural and religious backgrounds committed to social justice. Offering workshops, fieldtrips, retreats, mentoring and activities such as a week of volunteering in a refugee camp, the programme supports 20 people (Sikhs, Muslims, Sufis, Buddhists, Jews, Brahma Kumaris, Christians, Baha'i etc) for whom activism becomes a shared devotional practice. Similar 'multi-faith action initiatives' differ from traditional structures based on 'inter-faith dialogue' (European Network of Religion and Belief (ENORB), Christian-Muslim Forum, London Boroughs Faiths Networks etc) in terms of audience, motivations and outcomes, which reflect dynamics previously existing only within particular faith communities. This paper offers insights from four years of fieldwork in both established 'inter-faith dialogue' and recent multi-faith grassroots initiatives, analysing their characteristics and the factors explaining how in the span of a few years they have build a strong social capital. Moreover, these initiatives are illustrative of how young people articulate religion and spirituality with current social issues in a hyper-modern, increasingly secular and neo-liberal society.

'This Thing of the Victim Has to Prove That the Perp Intended to Assault Is Kaki' Social Media Responses to Sexual Violence on South African Universities

Since 2015 South African universities have emerged as central sites for the decolonial project which manifested through various movements such as 'Fees Must Fall' and 'Rhodes Must Fall'. Understood as Fallism, these movements have looked towards the deconstruction of various forms of oppression not only in universities but across South African society. Although issues of race and class were central to the recent wave of student activism, the issue of sexual violence became a critical feature of the project. Public protests and social media were important platforms on which the issues of South Africa's rape culture, as well as a space in which university policies on sexual violence were interrogated.

Using the theoretical framework of gender-based violence and rape culture, this paper explores public opinion regarding sexual violence on university campuses. This paper analyses university policy as well as social media data on the topic using the approach of document and content analysis. An examination of these narratives reveals the ongoing power of patriarchy and its impact on sexual violence. Findings show dissatisfaction with university policies on sexual assault which are perceived as outdated and ineffective. Rape culture at universities is depicted here as a symptom of broader patriarchy in society.

Modern Interpretations of Correlations in Sociology As a PATH to Mock-Scientific Results

In sociological science traces the exodus (intentional or subconscious) to low values of the correlation coefficient, when non-zero correlation (the hypothesis for correlation coefficient equality to zero) is sufficient to describe the statistical relations as strong.

This can be explained as a shortage of the really strong linear statistical relation with in magnitude higher 0.6 in the analysis, when studied sociological objects mostly non-linear in nature but used tools, still represented the linear models, and researchers do not want realize the synergy paradigm and non-linear models.

Let's consider the model of exponential dependence within solving the problem of investigation of statistical relations using the author's method for 58 parameters: mathematical functions and regression lines for them, based on the correlation coefficient.

A dependency for a function with a single maximum (cut off on the right):

$Y = -X^2$ (left from the maximum);

$Y = -0.7 * X^2$ (right from the maximum)

In this case, the correlation coefficient is equal to 0.25.

Dependence of the parameter Y from the parameter X as comparative weightiness of the parameter Y for quinters on a scale X:

X-1(Y=-12902); X-2(Y=-4658); X-3(Y=-742); X-4(Y=-3362); X-5(Y=-10978)

Dependence of the parameter Y(regression line) from the parameter X:

X-1(Y=-9616); X-2(Y=-8328); X-3(Y=-7196); X-4(Y=-5730); X-5(Y=-4866)

If we build graphics it will be apparent what a small part (21%) causation (and obviously one-sided) describes the regression line near the average value of the dependent parameter. While sociologists announce this correlation the «significant» and describe the dependence between parameters as linear.

A dependency for a function with a symmetric maximum:

Dependence of the parameter "Y=X^2" from the parameter "X":

X-1(Y=-11944); X-2(Y=+6356); X-3(Y=+12310);

X-4(Y=+6356); X-5(Y=-11944)

Factor of the connection strength=1.65 (feedback is weak=0.00)

Coefficient of correlation=-0.00

The correlation is absent. In this case, is lost out of consideration not just the strong dependence but the dependence stronger than a linear function.

Between Humanitarianism and Control: Mexico's Treatment of Undocumented Migration.

Mexico's 2011 Immigrant Law proclaimed unrestricted respect for migrant rights. Yet, policies adopted in the last six years seem to contradict this commitment. The intensification of migration control and the rise in the number of detentions and deportations are the examples of the double speak the Mexican state uses in its approach to migration. Within this context, even though the 2011 Immigration Law, and the Regulations that followed, set procedures for the regularization of undocumented migrants, due to inadequate dissemination of information, excessive costs, and stringent requirements, for many migrants interviewed in our study conducted between 2013 and 2015, residency status was an unfulfilled dream. Recognizing the limitation of the legal provisions of the 2011 Law and the inadequacies in the execution of the 2015 special status regularization program for undocumented migrants, the Mexican government launched another special program in 2017. In this article, we will evaluate both the 2015 and 2017 status regularization programs, governing rationalities and contradictions behind both programs, and the role of civil society organizations in promoting the programs and assisting migrants to negotiate status, placing the analysis in the context characterized by the tensions within Mexico's immigration approach between humanitarianism and control.

Emergent Meaning Structures: A Socio-Semantic Network Analysis of Artistic Collectives

This paper explores meaning structures in the social practice of small groups. While social and institutional fields impose meaning structures, they are put to practice (emerge) in the context of specific activities that take place within a field. Collaborating in small groups, field participants form such practical contexts. It enables playing on gaps and overlaps among imposed meaning structures and

joint creation of emergent meaning structures that define them as a social group. Difficult to capture, emergent meaning structures are largely disregarded by institutional and field perspectives on meaning structures. As a consequence, the importance of collective practice to meaning structures is underrated.

We investigate imposed and emergent meaning structures in artistic collectives. The field of contemporary art does not impose its meaning structure explicitly, so meaning structures that emerge in artistic practice are relatively free to vary across social groups. In particular, we study two St. Petersburg collectives of artists, who intensely interact with each other and engage in joint creative work and exhibitions. We show that these collectives elaborate their own meaning structures within the framework of field-specific meaning structures, blending meanings corresponding to the different fields and field positions occupied by members of the collective.

The duality of semantic and social structure is central to the notion of meaning structures. We use word collocations in natural language as semantic structure and interaction ties as social structure in a mixed methods socio-semantic network analysis. In this approach, social networks help to understand semantic networks.

Material Matters: The Duality of Persons and Objects in Everyday Life of an Artistic Community

The aim of this paper is to highlight the role of materiality in dual ordering of the social and the cultural. Within Bourdieusian theoretical tradition, we argue that throughout trivial everyday material activities, often unnoticed but concrete, culture continuously intertwines with interpersonal ties, ordering the micro structure of physically collocated individuals and objects with regard to social macro structure. To enable a search of the principles of socio-material micro structuring, the paper proposes a mixed method network-analytical approach that combines ethnographic and statistical (multilevel exponential random graph models) components. We study a collective of artists based in Barcelona, Spain and find that in the everyday life of small groups material culture not only facilitates the reproduction of social fields, but also mediates between them, invisibly securing cohesion in the collective that 'large' social forces are taking apart.

Childhood within the UN Convention on the Rights of the Child and the 2030 Sustainable Development Goals Agenda

The UN General Assembly opened the Convention on the Rights of the Child for signature in 1989. The Convention addresses child-specific needs and rights, and it requires the 196 countries that have ratified it to act in the best interests of the child as they are now bound to it by international law. While the 2018 ISA Congress in Toronto sets itself as an ideal point at which to take stock of the progress in this area, as it is the year running up to the 30th anniversary of its Declaration. This paper then takes the more recently passed UN Sustainable Development Goals Agreement (passed in 2015), which sets out human, social and economic goals to be accomplished by 2030 and compares across the Convention on the Rights of the Child and the SDG 2030 Agenda. To what extent is there progress, and to what extent does the SDG 2030 Agenda stand to bridge the gap? This paper examines human development markers that engage metrics and goals set out within the 1989 UN Rights of the Child and the UN Sustainable Development Goals (2015-30).

Consumerism, Risk Commodification and Transformation in Nigeria: A Reflective Discourse

This paper offers a critical evaluation of the widespread consumerist culture in Nigeria, a consumerism that is not just about tradable goods and service, but consumption of public service inertia, discontent, fragility and distrust. Like every consumable good, there is a saturation point as a precipitant for transformation. Based on the above, the paper draws on existing data to present economic risk landscape of the country by highlighting the resource curse mentality and how this has affected sectors of economy while also impeding social change efforts. The intent is to note how risk has become a tradable public good among businesses and politicians and how this commodification distorts the market and development. The second dimension of the paper focuses on regulatory governance through a reflective lens as a means of understanding government response to the peculiar characteristics of each economic sector. Through this analysis, the paper seeks to explore the implications of regulation on economic wellbeing, while admitting the challenge of balancing the scale of protectionism and laissez-faire approaches to market capitalism and adapting this as a model for regulatory governance and risk management at a country-wide level. Beyond the above, the paper raises questions about the role of consumerism in Nigeria society, and how the construct of economic actors, aligned with perceptions of prevalent risks in the society, can serve as instruments for advancing a new socio-economic system that does not necessarily focus on expansionary economic interventions, but rather on market governance system that optimizes resource utilization for inclusive human wellbeing.

BASTAS, HARA* (*LaGuardia Community College, City University of New York*)

Girls Rights & the Human Rights Enterprise: Public/Private Partnerships

Creating awareness of the girl child is in many ways the beginning steps of advocating for girls rights. Understanding girls rights comes with an appreciation that the girl child has rights and that her rights can in fact be violated. Due to her precarious position in the social order, girl children become trapped within the confines of a social category of age that denies her agency and gender that denies her legitimacy.

Without a larger understanding of girls rights itself within the most utilized global space of the United Nations, without the general discourse of girls' rights exposed within global capitalism, the contextualized differences of the girl child can become misplaced in the battle between public and private interests. Without a structural understanding of the discrimination and social inequities that affect the lives of girl children, the social problems become individually located. But, what happens when the private interests are given more value than public interests? What are some challenges and triumphs to this newer relationship in the human rights enterprise? Are we globally addressing the structural conditions or hiding them with individual "success" stories?

Through content analysis of thirty transnational and national organizations dedicated to the girl child, my research seeks to offer a primarily substantive contribution using a feminist human rights analysis. Understanding the contradictions within the human rights enterprise offers the context for how the girl child becomes simultaneously the social problem and the social redeemer. In this complexity, the over 250 million girl children take on new interactions within multiple social institutions that both silence and allow her voices to be heard for sustainable social change. The public/private relationship of advancing girls' rights within the global community through the United Nations allows for multiple social categories to be centered which are usually left to the margins.

RC37-664.3BASU, NAYANEE* (*San Diego State University*)*The Power of Healing: Art Workshops in Select Prisons of West Bengal*

The paper is based on the field study undertaken in select prisons of West Bengal where creative art workshops have been introduced for purposes of inmate-rehabilitation following a penal change. Qualitative methodology have been used to collect data that reflect centre-periphery realities of governance and how artist-activists are creating a difference among the beneficiaries behind bars. Digitally recorded primary data has been analysed and presented that bring out the healing potential of art for marginalized people in a post-colonial India. The complexities of access to and management of resources to the centre-periphery debate are highlighted through the paper.

RC33-JS-41.2BASU, NAYANEE* (*San Diego State University*)*'Healing' through the Arts: Notes on Methods and the Researcher's Dilemma*

The paper attempts to look at how narrative interview and the ethnographic method of participant observation contribute to discern the reality of the field in qualitative sociological research as well as give rise to dilemma for the sociologist in creating a Rashoman effect when representing social phenomena that span across the level of the individual and that of the larger collective process as each remain enmeshed in the other. This is experienced while conducting a field-based research in West Bengal, eastern India where certain artist-activists belonging to the civil society enter into long-term workshop relationship with inmates of prisons and with survivors of (and those belonging to sections economically and socially vulnerable to) human trafficking. Digitally recorded on-site data from interviews, with both the artist-activists and their beneficiaries within select prisons and in the space of an NGO working with rehabilitation through art training of survivors and people vulnerable to trafficking, and field observational notes, form the primary data. Questions of interpretation of such data is deeply embedded in the relationship that these two data-collection methods have with each other and this is what I try to present through a discussion of the complexities that confront the researcher.

RC04-93.4BASUMATARY, FWISHALI* (*Tata Institute Of Social Sciences*)*Human Rights Education in Indian Universities***Abstract****HUMAN RIGHTS EDUCATION IN INDIAN UNIVERSITIES**

Author: Fwishali Basumatary

The process of developing into a modern nation, with new socio-political and economic institutions, and with emphasis on science and technology, has moulded up many new values and challenges in all aspects of our life. While also, the rapid social transformation in the contemporary society is forcing the weaker and the marginalized sections feel as just individual consumers and bare minimum beneficiaries of policies and schemes. Therefore, it is important that higher education institutes examine these challenges and prepare our youth to face and resolve them. The second phase of the World Programme for Human Rights Education (2010-2014) decided to focus on human rights education for higher education and on human rights training programs for teachers, educators, civil servants, law enforcement officials and military personnel. Taking note of the dire consequences, it is relevant to encourage universities and colleges to undertake academic and other activities pertaining to teaching, research and extension programs in respect of values and practices of quality education.

In this context, the paper examines the practices and patterns of teaching human rights in Indian Universities.

Key Words: Human Rights, Education**TG03-959.2**BASUMATARY, FWISHALI* (*Tata Institute Of Social Sciences*)*Human Rights Education: A Critical Analysis of North Eastern Region of India***Abstract****HUMAN RIGHTS EDUCATION: A CRITICAL ANALYSIS OF NORTH EASTERN REGION OF INDIA**

Author: Fwishali Basumatary

Globally, human rights has emerged as a pertinent tool for governance for both State and Civil society addressing range of issues and rights covering caste, tribe, gender, minority, women and child rights, et al. linked to peace and development. People's experiences have given the quest for ensuring peace through

human rights awareness and education plays a major role. Here, Human Rights Education (HRE) is seen as a pivotal medium to preserve and promote human rights. There are various dimensions of human rights out of which only civil and political rights were focussed upon for a long time. However, today the economic, social and cultural rights are also being given importance. As such, human rights in the broader sense have paved the way to new laws, charters and covenants. There is emerging synergy between the global human rights movement covering UDHR, ICCPR, ICESCR, CEDAW, CRC, Indigenous rights, et al. and national laws with its own gaps in the implementation. In spite of the existing human rights framework at national level, there are serious threats to human rights and its various features.

India's North-East although endowed with rich natural resources, is economically backward with intra-regional disparities in levels of development. The region has been undergoing through multiple transitions of identity and culture at the local, sub-regional, regional as well as in national levels. Development of state depends on access, equity and quality.

A multi-sectoral holistic model is required to address the various cross cutting issues and challenges of human rights education. Therefore, this paper explores the status and promotion of human rights education in the state of North-East India to ensure peace and prosperity in the state

Key words: Human Rights, Education**RC08-178.4**BATAN, CLARENCE* (*University of Santo Tomas*)*Recent Developments and Prospects in the Teaching, Training and Practice of Sociology in the Philippines*

This paper documents recent developments and prospects in the teaching, training and practice of Sociology in the Philippines as result of the establishment of the Commission on Higher Education (CHED) in 1994, the state-based regulatory body of higher educational institutions (HEIs), and the recent promulgation of K-12 Basic Education Law in 2013, which shifted the ten-year basic education training to 12 years in the country. It reports the process and dynamics of developing *Policies, Standards, and Guidelines* (PSGs) for offering academic degrees in Sociology including baccalaureate, masters, and doctorate levels. Correspondingly, it relates how Sociology and social science experts from CHED were tasked by the Department of Education (DepEd) to assist in developing and shaping Grades 11 and 12 curricula guides for the humanities and social sciences track. Using archival documents and ethnographic observations, this paper examines how these recent structural developments in Philippine educational system project an emerging set of academic scenarios and challenges for Philippine Sociology both as an academic discipline and profession. This paper argues that while state regulation in the teaching and training of Sociology has relatively been in place, and earlier introduced as a social science discipline as part of the new K-12 curricula, the pursuit to develop a more-grounded and contextualized Philippine Sociology (in terms of theory and methods) remains wanting. In so doing, the paper ends with concluding insights on how Philippine Sociology may continue to evolve as a relevant and engaging discipline and profession through academic departments from various HEIs and the Philippine Sociological Society, the recognized-professional organization of sociologists in the country.

RC34-625.4BATAN, CLARENCE* (*University of Santo Tomas*)*Unearthing Structural & Symbolic Violences in the Lives of Filipino "Istambays" (On Standbys)*

This paper interrogates the concept of structural and symbolic violences in the lives of selected self-reported Filipino istambays (on standbys) in relation to the widely perceived notion of "waithood" particularly experienced during youthhood, locally known in the Philippines as the "istambay" phenomenon. Using life course data from the *Social Investigation on the Lives of Istambays in the Philippines (SILIP)* project covering four marginalized research sites, this study examines how istambay experiences constitute, shape and influence what may be considered as experiences of violence impacting specifically their education and employment life trajectories. The paper argues that the limited education and employment experiences (and the lack thereof) of selected istambay respondents unravels both structural and symbolic violences that entrench the stereotypical perception of their idleness and inactivity. These violences appear to constitute and engender varying dynamics of social interruptions that these istambays encounter, negotiate, and to some, able to overcome. The paper concludes with some research insights on how further analysis of violences and social interruptions as working concepts may offer new avenues in studying istambay phenomenon in the country.

RC46-776.3BATISAI, KEZIA* (*University of Johannesburg*)***Gender and Reproductive Health Violence: Experiences of South African and Migrant Women in Johannesburg***

Critical mapping of existing scholarship reveals that in many African countries, mainstream systems have historically failed to meet health care demands of the public. Failure, in a context like South Africa where the gap between the rich and the poor is wide, has produced a healthcare system that is stratified along class and racial lines. As South Africa's rich exclusively access private healthcare, the poor, who often bear the brunt of mass unemployment, not only rely on a failing healthcare system, but they resort to parallel systems. Building on bio-politics theorisations that emerged as I interrogated questions about, and the realities of natalism in Zimbabwe, this paper explores South African and migrant women's experiences of access to reproductive healthcare in Johannesburg, South Africa. The central argument here draws on earlier observations that migrant women are often framed as a burden on the healthcare systems for destination countries because of the limited general healthcare services for citizens, let alone sexual reproductive health needs. The situation of migrant population is further worsened by the mismatch between policy and reality in contexts like South Africa where policy guarantees every one access to health care but access is hindered by lack of immigration documentation such as passports and visas. Thus, this paper works with the theorisation that when juxtaposed with the reality of a failing healthcare system, the reproductive experiences of South African and migrant women tell a particularly interesting narrative about reproductive violence and gendered access to reproductive healthcare in South Africa. Questions emerging out of this paper are theoretical and practical lenses through which clinical sociologists could move into discursive spaces from where they engage in critical debate that furthers our understanding of reproductive violence and the subsequent interventions meaningful to the sexual reproductive healthcare needs of South African and migrant women.

RC32-JS-37.1BATISAI, KEZIA* (*University of Johannesburg*)***Re-Reading Masculinities and Gender-Based Violence in South Africa***

The sight and thought of women whose throats have been slit open; who are burnt to/after death; sexually and brutally abused in the name of corrective rape; and violently battered for challenging patriarchal loved ones and strangers push intellectual activists and feminists to the limit. It is against this backdrop that this article reads masculinities and gender-based violence in the context of socio-economic and political volatility in South Africa. The article juxtaposes constructions and realities of masculinities with past and recent ruthless attacks and brutal murders of women in South Africa within and beyond their private spaces. The juxtaposition allows the article to unravel the reasoning behind these violent and brutal actions that have characterised the post-apartheid nation. Furthermore, it paves way for interrogating whether the attacks and murders hint at manhood at threat and the subsequent urge to re-assert one's masculinity; a lack of a moral campus or social fibre; a mere reflection of a 'violent nation'; or a deeper revelation of a failing state and its legal system. It is within this zone of theorisation that the article pays particular attention to the subjective meanings South African men – across racial class and age categories – assign to the violent contours that women constantly navigate in this country. Being a feminist who works with 'talk' as a way of generating knowledge and solutions to complex realities, I draw meanings from the narratives gathered during a six-month long fieldwork journey in different pockets of Johannesburg South Africa. Overall, the article strives to arrive at a meaningful synthesis of the impact shifting socioeconomic and political landscapes have on the everyday, and how 'talk' and the subsequent language emerge as powerful tools for tackling violence against women in South Africa irrespective of race, class, sexuality and age among other subjective positionalities.

RC07-152.2BATTHYANY, KARINA* (*FCS UDELAR*)***La Organización Social Del Cuidado. Políticas, Desafíos y Tensiones En Uruguay***

El tema del cuidado, principalmente el cuidado de los niños y las personas dependientes, plantea de manera directa la interrogante acerca de la posición de las mujeres y su igualdad en distintos ámbitos de la sociedad, pero principalmente en la esfera de la familia y el trabajo. Si bien existen rasgos comunes a todas las mujeres que tienen responsabilidades de cuidado, éstas no son un grupo homogéneo, pues sus responsabilidades dependerán de la clase social a la que pertenecen, su pertenencia racial, la edad, el estado civil o el lugar de residencia.

El aumento generalizado de la tasa de actividad femenina, particularmente de las madres, replantea la pregunta acerca de las obligaciones familiares y la forma de compartirlas. ¿Quién asume los costos del cuidado de las personas depen-

dientes, en particular de los niños y los ancianos? ¿Cómo deben repartirse los roles y la responsabilidad entre el Estado, la familia, el mercado y la comunidad? Las diferentes respuestas que puedan darse a estas preguntas, la intervención y articulación de diferentes actores en el cuidado de las personas dependientes, es un elemento estructurante de la posición de las mujeres en las familias y en el mercado de trabajo, así como determinante de la efectiva capacidad de ejercer los derechos vinculados a su ciudadanía social.

Uruguay implementa desde 2015 un Sistema de Cuidados como respuesta a esta problemática. En este artículo se presentan, desde una perspectiva de género y derechos, las bases conceptuales que llevan a colocar el cuidado como un elemento central de las políticas sociales y los principales elementos de este proceso analizados desde una perspectiva de género.

RC03-72.1BATURINA, DANIJEL* (*Faculty of Law, University of Zagreb*)***Impact of Third Sector Organizations in Croatian Local Communities: Welfare State Helping Hand?***

From the turbulent post-socialists and war period in the nineties third sector (in this paper was presented as one between market and state) in Croatia has reached a certain degree of institutional and infrastructural development (Bežovan, 2017). But in the social policy still, there is a notion of the centralized and paternalistic state that is over-regulating the development of services and social programs. So, development of local social programs is not coordinated and planned (Stubbs, Zrinščak, 2012). Synergy effects in strengthening the welfare mix are missing (Bežovan, 2007).

This paper aims to show how the third sector impacts the socio-economic development of local communities. We will present part of the results of the research conducted in the frame of a doctoral dissertation, "The impact of the third sector on the socio-economic development of Croatia" (Baturina, 2016) and research conducted as part of EU Seventh Framework Programme project Third Sector Impact 2014-2017 (grant agreement 613034). Both types of research were conducted using the qualitative methodology that included interviews with key stakeholders and case studies of different types of organizations in the sector.

The impact of the third sector on local communities was found in several different areas: building of social infrastructure and social capital, the creation of community identity, social inclusion of different social groups, providing social services developments and enhancing the local economy.

We will discuss the potential of the third sector as possible carriers of modernization on Croatian social policy. Changing characteristics of the third sector/welfare state relationship would be especially highlighted. In conclusion, we will explore what are some obstacles to realizing bigger decentralization of Croatian social policy that presumes cooperative relationships between state and third sector and further development of welfare mix and good governance principles for achieving the greater quality of life and social cohesion in communities.

RC13-250.6BAUER, MICHELLE* (*University of Ottawa*)***Exploring Single, Stay-at-Home, and Gay Fathers' Perspectives on Their 4-12 Year Old Children's Outdoor Risky Play***

Parental perspectives on risk and danger are important to consider in leisure and child injury prevention research, as they influence children's adoption of safety strategies and influence how children approach risk and danger. Despite single, stay-at-home, and gay fathers' increasing numbers and the important roles they play in their children's development, there has been a lack of research on their perspectives on children's engagement in outdoor risky play until now. This research is comprised of two studies, which were informed by poststructural feminist theory. In the first study, I used semi-structured and photo-elicitation interviews and critical discourse analysis to explore single, stay-at-home, and gay fathers' perspectives of their 4-12 year old children's engagement in outdoor risky play and how they relate to tension-filled discourses of "good" fathering. In the second study, I also used semi-structured and photo-elicitation interviews, but I explored single, stay-at-home, and gay fathers' perspectives of masculinity and its influence on their understanding of their children's outdoor risky play. Taken together, the findings from both studies showcase the important roles that single, stay-at-home, and gay fathers play in their children's outdoor risky play and leisure experiences.

RC10-205.1BAUMGARTEN, BRITTA* (*ISCTE-IUL, Av. das Forças Armadas, Lisbon*)***Transnational Cooperation in the Brazilian Struggle for Social Rights******Transnational cooperation in the Brazilian struggle for social rights***

The history of transnational cooperation of Brazilian social movements goes back several decades. It has, however changed with economic conjunctures,

world politics and changes in national policies since Lula da Silva came into power in 2003. Based on a four-month fieldwork in six cities in Brazil in 2013, namely 39 interviews and several informal conversations with activists and movements and organisations that fight for social rights on behalf of the poorest, I explore changes in transnational cooperation and their meaning for such groups.

With the government of Lula da Silva and Dilma Rousseff the structure of political opportunities, social movements have become more favourable. Access to political decision making and to resources has become easier for most groups struggling on behalf of social rights. There are more members of trade unions and social movements in parliaments and political administration, more opportunities to participate. Brazil has become an example of best practice regarding political participation. Also, a great part of the resources come from private national institutions, state or closely related to the State. At the same time, resources from abroad have been cut tremendously. International partners have shifted their resources to other regions. These shifts do have a great impact on transnational cooperation as such, especially in terms of power relations and extent of cooperation.

Learning from the Past. How Local Economic Conventions Influence Responses to Global Crises

Reactions to global crises vary locally, and the specific reaction to a particular crisis does not only depend on structural aspects (such as city's placement in the world system) but also on local economic practices. Based on concepts from 'Economics of Convention', we argue that people handle complexity and contingency in everyday life by drawing on knowledge of approved routines and practices of how things are typically done. This knowledge is highly context-specific. Adopting the idea of the 'Intrinsic Logic of Cities' which tells us that cities create and maintain their own distinct constellations of knowledge and modes of expression that are reflected in their everyday practices, we conceptualize the space of local economy as a figuration that develops procedurally and depends on the hidden structures that over time get inscribed in the urban space. Comparable to an imprint, one can track the history of the conditions that pre-structure this figuration over time. Using material from a comparative study carried out in four cities – two in Germany (Dortmund and Frankfurt), two in Great Britain (Birmingham and Glasgow) –, we show that the specific reactions to a crisis and the ability of coping with it can only be grasped by understanding a city's past.

BAYAR, YESIM* (*St. Lawrence University*)

Religious Minorities and Navigating Exclusionary Landscapes

The story of nation-building has long been told through the eyes of the state and through the actions of the political elite. This particular focus remains warranted especially for late nation-building cases such as Turkey, where the political elite undertook sweeping societal and political changes swiftly and single-handedly. It was again in cases such as Turkey that the formation of a minority regime by the state have been at the heart of the process of nation formation. While examining the formulation and treatment of minorities by the state has its obvious merits, the story remains incomplete. The present discussion follows those works which aim at rectifying this state-heavy focus. To this end, and rather than looking at the actions of the state, this paper looks at the exclusionary state practices and rhetoric from the perspective of the minorities themselves. More specifically, it discusses the case of Armenians from Turkey and their experiences of growing up in a nationalist political and social landscape.

The discussion here draws on the in-depth interviews conducted with Armenians who have grown up in Turkey and who have eventually immigrated to Canada. The findings elucidate the complexity and multi-layered quality of the lived experiences of my participants as well as the ways they navigated a highly exclusionary and nationalistic social and political landscape. The nationalist policies and rhetoric of the Turkish state have long simplified, and reduced the understanding of the religious and ethnic minorities to their respective identities. Contrary to this, my data presents a clear challenge to the treatments of ethnic and religious minorities as homogenous entities. The findings further suggest that ethnic and religious identifications are often subsumed under other ones such as identifications with a particular geographical area, political preferences and class.

BAYATRIZI, ZOHREH* (*University of Alberta*)

Nature, Culture, Ruin: Toward an Alternative Conception of Socialization

This paper argues that a narrow reading of Durkheim's legacy as well as constraints imposed by the need to institutionalize sociology in the US after

WWII led to a narrow and one-sided account of the process of socialization that is still common in sociology, despite decades of theorizing informed by post-structuralism, feminism, and psychoanalysis. This dogma pervades introductory textbooks where we expose students to basic, widely accepted sociological teachings, representing the sociological consensus. In this narrow account individuals are still portrayed as blank slates that submit to socialization with little or no resistance. Tension, conflict, oppression, and resistance are all wiped from these accounts. My paper argues that a re-reading of Durkheim, especially his 'Dualism of the Human Nature', enriched in light of insights from Simmel and Freud, reveal that Durkheimian sociology was never meant to produce a conflict-free process of socialization. I will draw on these classical writings to offer an alternative conception of socialization that is more conflictual, more realistic, and inevitably darker.

Lost in Scales: The Turkish Climate Movement between Global, National and Local

Since the beginning of 2000's, the Turkish climate change movement set up a political agenda largely related to the United Nations Climate Summits. It became a part of global climate action days through European and international networks (European Greens, Greenpeace, 350.org, Via Campesina) by organizing national marches and meetings and participating in global protests during the summits. The main objective was to put pressure on Turkish government to take real action against climate change by setting national greenhouse gas emissions reduction target. Yet years of politically "addressing" the solutions for the climate change problem at the global level made lose sight of national and local levels. Climate movement shifted strategy after Copenhagen Summit failed to deliver a binding climate deal. Firstly, a national umbrella group "Climate Network" established by mainstream environmental NGOs to monitor national and sectoral policies. Secondly, there has been an effort to band together local environmental struggles of energy (coal-fired thermal power plants, hydropower projects), industrial activities and mining under the climate movement. This mostly remained limited to the operational level through organizing marches and meetings, lacking a strategic coalitional framing. Certain groups have initiated the "climate justice coalition" which also proved to be ineffective and short-lived. This paper aims at examining what accounts for ineffective linkages across different scales and organizational fields within the Turkish climate change movement. Why national and local organizations did not coalesce around into a strong climate movement? How local environmental struggles tackle climate change in a highly centralized political and administrative system?

BAYON, MARIA CRISTINA* (*Instituto de Investigaciones Sociales, UNAM*)

Dealing with Class Contempt. Reframing Stigmatization in Mexico City.

Social scientists have increasingly recognized the relevance of moral and symbolic dimensions in the persistence and deepening of social inequality. Together with the satisfaction of material needs, recognition, respect, and feeling valued by others, are essential for well-being. Misrecognition includes both material and symbolic deprivations, usually resulting in severe distress, shame and self-contempt.

One of the defining features of the neoliberal rationality is the morbidity of the social sphere, evidenced from the hegemonic perspective toward all things public and collective, recasting social problems as individual problems, blaming the underprivileged for their "own failures". Representations of most disadvantaged sectors become spatialized; negative valuations are often translated into a pathologization of their spaces (neighbourhoods, schools, streets, etc.) resulting in demonized place images that associate *types of places* and *types of people*. Disadvantaged groups are not only aware of the stigma attached to them and their places; they have to deal, respond, and cope with these denigratory images.

In this paper, we analyse the place images and stigma, circulating in the mass and social media, attached to disadvantaged public high schools and neighbourhoods in the periphery of Mexico City. Based on qualitative research –in-depth interviews, newspaper notes, and social media images– conducted by the author, the social perception of both spaces is analyzed through the lens of the stigmatized subjects. We focus on students' and dwellers' narratives on their experiences and perceptions of (dis)respect, (mis)recognition, and stereotyping, and their implications on school and community belonging. By relying on this two cases, I pursue two complementary aims. First, to dismantle the myths, stereotypes and stigmas on the poor and their places underlying the public discourse. Secondly, to identify the coping mechanisms deployed by disadvantaged residents and students to deal with class contempt and a dominant discourse that stigmatizes and denigrates them, daily and systematically.

BEAUBATIE, EMMANUEL* (*Ecole des hautes études en sciences sociales, Institut de recherche interdisciplinaire sur les enjeux sociaux*)

The Gendered Temporality of Sex Changes. Relational Lives and Social Trajectories Among Transgender Men and Women in France.

The social diversity of the transgender population is rarely mentioned in academic research on sex change. The heterogeneity of trans paths is neglected in transgender studies just as the plurality of women's lives was -and still is- in feminist research. Although most studies on sex change are pursued in the field of gender studies, they don't compare the experiences of transgender women and transgender men. Drawing from a qualitative study of 30 biographic interviews and from a quantitative survey (381 respondents) carried out in France, this presentation proposes an analysis of the gendered temporality of sex changes. MtFs (male-to-female or transgender women) and FtMs (female-to-male or transgender men) do not have the same social trajectories, and they experience different living conditions. Young transgender women experience more violence within their families and relationships than transgender men. Thus, half of the MtFs try to give up on their sex change and engage in a lasting marital and familial life as men. They transition around middle age, while FtMs generally engage in this process at a young age. As a result, the median age of the beginning of the sex change is much higher for transgender women than for transgender men. As for MtFs who engage in their sex change at a young age, they face precariousness more than FtMs, who receive more support from their families and relationships. The description of these different transgender paths will enable a discussion on sex as a social determinant of family acceptance/non-acceptance of members belonging to gender and sexual minorities, and on the impact of these relationship lives on the living conditions of LGBTQ2 people.

Jóvenes y Narcocultura: Otra Forma De Colectividad

La relación entre los jóvenes y la narcocultura cobra relevancia por el incremento y diversidad de productos culturales como la músicas, series de televisión y películas de ficción sobre el tráfico de drogas, y porque los jóvenes son sus principales receptores, tengan o no relación con el narcotráfico.

En Nayarit, México, se realizó una investigación donde participaron 217 jóvenes del poblado de Pantanal, de entre 15 y 20 años de edad a través de una encuesta y grupos de enfoque. Entre los hallazgos se encontró que es notorio que estos tres productos culturales están entre sus elecciones como medios de entretenimiento, lo que conlleva su consumo, apropiación e interiorización. La predilección de estos productos no depende necesariamente de su nivel económico, ya que los consumen jóvenes de familias de bajos y altos ingresos; lo hacen tanto hombres como mujeres, aunque el sentido que le dan es distinto: para ellos representan imaginarios de una vida llena de acción, riqueza y poder, mientras para ellas es la imagen de la mujer que triunfa por ser la esposa de un capo o logra estar al frente un cartel. La apropiación de estos productos va más allá del mero entretenimiento, ya que también los toman como fuentes de información sobre aspectos que los jóvenes consideran reales, sobre todo la corrupción del gobierno, la inteligencia de los narcotraficantes para lograr lo que quieren, así como el poder que adquieren aunque pongan en riesgo su vida o su libertad.

Ante un entorno de elevada exclusión y desigualdad social, los jóvenes encuentran en la narcocultura pautas de significación que llegan a configurarse en rasgos de identidad y pertenencia a grupos, basados en ideales de transgresión y en la búsqueda de reconocimiento y movilidad social fuera del orden y la legalidad.

Glocal Youth Culture As a Bridge between Two Ethno-Religious Adolescents Groups As Mirrored in Body Perception and Self-Image

The study investigated how in a multicultural society, adolescents from two ethno-religious groups, Israeli Jews and Muslims perceive themselves and their body. The adolescents construct a glocal youth culture in order to cope with two cultural competitive influences: traditional versus global, expressed by contradicted values and norms that impose practices of body maintenance and self-images. Traditional influences mean maintaining a local social order where

collective values and norms prevail over individual needs and desires; global influences mean entitling individuals to shape their lives according to individual desires.

Data were obtained from 1560 adolescents, 804 boys (397 Jews, 407 Muslims) and 756 girls (355 Jews, 401 Muslims) aged 13-15. Participants completed a questionnaire modified by language and gender, assessing self-image, body perceptions, and attitudes towards otherness.

Similarities between the ethno-religious groups were greater than differences. The results support the existence of a glocal youth culture, influenced by new media technologies, integrating local-traditional and global values. Differences are associated with traditional ethno-cultural norms while similarities, with global processes.

Jewish and Muslim girls share a positive self-image; they ascribe characteristics like beauty, respect, and happiness to the slim body (global influence). Muslim girls compared to Jewish girls appreciate slimmer bodies of girls and tolerate chubbier bodies of boys (ethno-cultural norms versus global influence).

Jewish and Muslim boys prefer a slim body for girls and boys alike (global influence). Muslim boys, more than Jewish, tolerate chubbier bodies for both boys and girls (ethno-cultural norms versus global influence).

A noticeable difference between Jews and Muslims was found concerning acceptance of "otherness" (handicapped etc.). Jews are more tolerant than Muslims; within the gender groups, girls are more tolerant.

Findings partly reflect a "collaborative individualization" process, based on similar age, exposure to global media, identity formation, and individual desires that bridges between the two ethno-religious groups.

Power Relationships and Pressure to Perform at Work: The Case of Medical Clowns Vs. Animal Assisted Therapists and Evaluators Vs. Stakeholder

Power relationships at work are a common phenomenon that appears in a variety of contexts. In organizational literature we find two types of explanations to this phenomenon: one that focuses on structural characteristics like organizational climate or organizational culture that encourage poor relationships, dissatisfaction, lack of motivation, and even bullying; the other one, focuses on personal or professional factors that illuminate power relationships and pressure to perform.

Based on our experience evaluating two programs in which power relationships created undesirable outcomes; we suggest to adopt a dialogical approach that integrates between organizational, professional and personal aspects that better explains power relations.

One program was an intervention conducted by an animal assisted therapist (AAT) and a medical clown (MC) in an emergency center for young kids, and aimed to be a relaxation activity; the other program was an innovative training program for teachers who intended to become school headmasters, that was conducted by an expert in that field.

In both programs, performance expectations were high, the time table was limited and proven outcomes according to goals were required. These prerequisites formed problematic work relations among the actors; impaired performance and even bullying were detected. For example, *At the structural level*, the lack of clear role definitions and clear division of labor created professional and personal tension; AAT didn't give MC enough leeway in choosing how to carry out her role; having fear of evaluation, the training program head didn't accept the evaluators' role, didn't cooperate, and limited access to information. A different perception of professional and organizational culture (AAT-MC/program head-evaluators) led to professional disagreements that permeated *the personal level* and caused personal disparagement and incredibility.

In order to cope with power relations that impair personal, professional and organizational performance, an ethical contract that characterized by a dialogue approach is proposed.

Comparing Frenchs in Casablanca and London: A Daring Experimentation As an Original Socio-Historical Approach of Post-Colonial Memory

This proposal aims to provide a reflection about comparison from objects apparently incomparable: Casablanca and London. Actually, following the typology of Sassen (1991), the second is a global city that could only be compared to other global cities like Paris, New-York and Tokyo. This insight comes from my PhD thesis in sociology, defended in 2015, that is still regularly criticized because of this apparent incomparability. Yet, following a *similar system design* would be a normative standard that shall be counter-argued. Whether comparing similar

objects allow us to make emerge differences, from a comparison between apparent different objects may emerge astonishing results or new insights.

Actually, I argue that everything can be compared if justified as said by the French historian, Marcel Detienne (2000) to dare experimentation and constructivism. In my PhD, the comparison with ethnographic and qualitative methods within both cities allowed to go beyond the methodological nationalism. As French schools and teacher's position were compared, this method provided strong results on French colonial memory. Actually, as an unexpected results, comparing a city in Morocco, that is obviously a French post-colonial one (1912-1956), it reminded that London and a part of UK could be considered like an old French colony (Anglo-Normand) after 1066.

In term of colonial memory, this is revealed in some interviewees and readings on history of international relations, especially French-English relations (Tombs, *That sweet Enemies*, 2006). The rivalries also emerge from French expression like « Perfidie Albion » and daily jokes in English tabloids or Rugby games between national teams.

Finally, this sociological comparison looks important to avoid the continuation of the theft of history (Goody, 2006) as it shows complexity in international relations on a long term period. In this case, it shows for example that international relation are more ambivalent than the recent post-colonial memory.

Subjective Demands on Occupational Positions and Their Consequences for Social Mobility Analyses

Modernization theories and empirical trends point to fundamental structural changes both within and outside the domain of work. In post-industrial societies, the amount of physically demanding work in the industrial sector has decreased in favor of non-manual jobs in the service sector. Moreover, theories of cultural change posit that younger cohorts have not only aspired material security but have also increasingly emphasized values such as self-enhancement or personal autonomy.

These trends are consequential for determining which occupational positions individuals aim to obtain and which they wish to avoid, and for their subjective experience of mobility. Given that jobs involving physically demanding manual work have become exceptional in many industries, working conditions have become more relevant as a dimension of social inequality. Similarly, if subjective demands for self-enhancement and personal autonomy are comprehensive and also hold for the realm of work, the complexity of job tasks and the flexibility of working time have also become increasingly important. We therefore believe that a topical classification of socio-economic positions and an analysis of relevant social mobility processes should account for these aspects of social inequality.

Following these considerations, we utilize a large-scale dataset of detailed occupational characteristics, the German BIBB/BAuA Labour Force Survey of 2012 (N = 29,737). We first provide a multidimensional classification of occupations which takes employees' working conditions into account. Second, we analyze the distribution of central job characteristics such as income and sociodemographic characteristics such as gender across our classification. Third, we merge this new occupational classification to individual-level longitudinal data. We use two recent waves of the German Socioeconomic Panel (GSOEP) in order to assess amount and patterns of intra-generational occupational mobility. Preliminary findings indicate a satisfactory model fit of our classificatory scheme and corresponding mobility patterns which differ markedly from findings that are based upon conventional classifications.

The Teacher and the Ghetto – Applying the Model of Frame Selection to Investigate the Influence of Neighborhood Contexts on Teachers' Evaluations of Primary School Students

We apply the *Model of Frame Selection (MFS)* to investigate the relation between neighborhood-level conditions and the formation of primary-school teachers' expectations of their students.

It is well-known that teachers' expectations of their students ground on individual-level factors such as achievement, but also social and ethnic background. Moreover, evidence suggests that teachers take contextual-level factors (e.g., school or school class) into account. However, empirical analyses mostly lack a theory-based concept that integrates contextual-level explanations. We aim to close this gap in research by utilizing the MFS to deduce hypotheses about the variable rationality of teachers' expectations on the level of *frames*, *action scripts*, and *action* itself.

On the level of *frames* we expect a less advantageous neighborhood to *automatically* reduce teachers' expectations in students' capability of being successful. Consequently, teachers' *rational reflection* on students' aptitude should be attenu-

ated. Furthermore, framing effects of neighborhood contexts should vary by the *link between situational objects and the frame*. Hence, framing effects should be stronger for more visible neighborhood characteristics (e.g., ethnic composition, housing conditions).

Moreover, framing effects of neighborhoods on teachers' expectations depend on the *chronic accessibility* of the *script* they activate. They should therefore be moderated by teachers' beliefs about the impact of social and ethnic context on student ability. Additionally, the *temporal accessibility* of this script is triggered by teachers' perception of school and classroom composition.

Finally, the extent to which the script determines the *action* of an automatic evaluation depends on the *type* of teachers' expectations (e.g., short-term vs. long-term evaluations).

The theoretical model is tested by utilizing data from the German National Educational Panel Study (NEPS-SC2). Elementary school teachers' evaluations are queried on a yearly basis from 2nd-4th grade. Information on teachers, students and school classes is linked to contextual-level information on the socio-economic composition of schools' neighborhoods.

BECKER, JOHANNES* (University of Goettingen)

Migration, Family Memory, and the Tightening Borders in the Middle East

Based on biographical and family-story interviews in Amman, Jordan, my presentation deals with families whose history is strongly marked by multiple migration processes over the past three generations as well as in the present.

I will show that interpreting migration processes solely in the framework of nation states (e.g. as transnational migration) might overlook that in the Middle East, borders were only introduced gradually, and their porosity varied in different socio-historical periods. Family memories might still be permeated by memories of unhindered travel which has a positive connotation of migration for the purpose of connecting family members living spatially apart, and as a general strategy of mobility. These memories and migration practices increasingly clash with border regimes that have been gradually intensifying in many Middle Eastern countries in recent decades.

I will illustrate this argument by introducing the case of a woman (born in Syria and holding a Syrian passport) whose mother's family resides in Jordan and who has other family members spread over the Middle East. The family memory is shaped by family members' successful migration experiences in past generations. I will show, however, how her self-initiated process of migration from Syria to Jordan before the start of the war in Syria was later 'belittled' when she needed to register as a refugee in Jordan. However, the changing socio-political situation affected not only her, but the family system as a whole, changing the figurations or power relations of the family members and their terms of interaction, and creating rifts which, again, contributed to migration processes.

My research is part of a larger project on 'Dynamic figurations of refugees, migrants, and long-time residents in Jordan since 1946: between peaceable and tension-ridden co-existence?' which is being sponsored by the German Research Foundation (DFG).

BECKER, JOHANNES* (University of Goettingen)

ABDUL KARIM, DOLLY* (Center of Methods in Social Sciences.

Qualitative Research)

Understanding Dynamics of Belonging through Complex Migration Processes and Intertwined Experiences of Violence

Our presentation builds upon research in Amman, Jordan, a city in which a majority of inhabitants or their families have migrated to the city, mostly as refugees from violent conflicts. On the basis of narrative-biographical interviews with members of several groupings and generations of refugees, we will reconstruct (multiple) processes of migration and how they are intertwined with differing and multi-layered experiences of violence. Central to our presentation is an analysis of how experiences of 'individual' and 'collective' migration, and 'individual' or 'collective' violence in the context of life-histories are interrelated with shifting we-I balances and feelings of belonging to various groupings in different places at different times.

We will introduce case reconstructions of interviews with two women who came to Jordan from Kuwait (in 1990/1991) and from Syria (in 2009). The analysis highlights the ways processes of migration and experiences of violence – for example in the context of wars or state persecution and/or within the family – can be interpreted not only as changing the conceptions of national or ethnic belonging, but also, for instance, as altering conceptions of family, education and liberal or less liberal 'lifestyles', and therefore also the interviewees' social positioning in Amman.

Our discussion is based on first results from our research in the context of the project 'Dynamic figurations of refugees, migrants, and long-time residents in Jordan since 1946: between peaceable and tension-ridden co-existence?' (located

at the University of Göttingen and funded by the German Research Organisation, DFG).

Employment Mobility of European Doctors in Germany: The Importance of Occupational Setting.

The EU constitutes a unique opportunity for its citizens to be mobile beyond national borders without formal restrictions. This implies a promise of an improvement in an individual's occupational situation in the context of employment-related mobility. Especially high-skilled are assumed to move more freely within the EU whilst not facing barriers as they usually possess more "transnationally valid forms of cultural capital" (Weiss 2005: 716), making upward mobility more likely. However, even this group face difficulties – proving the 'frictionless mobility' assumption wrong (e.g. Ryan and Mulholland 2014). Nevertheless, we still know little about the employment mobility of high-skilled intra-EU movers.

This paper aims to diminish this gap by observing employment mobility of EU medical doctors in Germany as an intriguing example of high-skilled intra-EU movers. It builds on previous research that traces career mobility of immigrants measured by comparing the 'last job before moving' to the 'first job upon arrival' and the 'second/current position' (e.g. Chiswick et al. 2005, Favell and Recchi 2011). This paper however, emphasizes that employment mobility is strongly shaped by profession-specific factors such as labor shortages and professional regulations/requirements. The central research question is; *to what extent are European physicians able to improve their occupational situation through geographic mobility and which factors influence their success.*

Building on previous approaches of skill transfer and human capital, this paper develops hypotheses that consider the setting of the medical profession and its implications for European doctors in different regions of Germany. Based on detailed original survey data (Teney et al. 2017), it adds to the current research on European mobility with an in-depth analysis of one professional group in a specific context going beyond a class scheme approach. This further enhances our understanding of the workings of an integrated European labour market.

Professionalization By the State – the Case of Child and Adult Protection in Switzerland

In our presentation we want to explain, how in Switzerland the state respectively the government has tried to professionalize the practice in the field of child and adult protection by a law reform in 2013.

We will concentrate on the adult protection and describe first the practice before the law reform. Then we will describe the reasons, intentions and goals of the state in the law reform. In a third part of our presentation we describe the changes in the practice according to the law especially in respect to the professionalization goals. In the last part we discuss the question whether the changes could be interpreted as professionalization and how far the state was successful in his goal. Our presentation presents central findings of a three year research project in the field of adult protection in Switzerland. The aim of the project was to clarify how organization and professionals interpret law prescriptions and how they make use of degrees of freedom in creating a practice based on new law prescriptions.

Mobility Among Regulated Professions Facing Various Institutions Towards Entry to Professional Practice: From an Empirical to a Literature-Based Analysis.

The process of admission of foreign-trained professionals (FTP) by a profession's regulating body reveals much of the profession's identity and its role in society. It is also an expression of various institutions' ability to respond to this challenge. Indeed, regulated professions are more and more pushed to open their admission procedures and articulate its process with immigration and complementary training institutions in order to offer a more efficient, transparent and fair entry into professional practice for FTPs in various countries. This presentation will first show how case studies on French professionals in

Quebec brought our attention to these processes' characteristics. This is at first surprising since French immigrants in the selected professions benefit from mutual recognition arrangements (MRAs) between France in Quebec since 2010. Following this empirically-based analysis among 7 regulated professions in Quebec, a literature review on disjuncture or lack of coordination among institutions in these processes leads to questioning regulating bodies' rules of admission, in the context of transformation of professions through globalization and rising flux of migrating professionals worldwide. When some countries succeed in allowing given categories of FTPs to practices, how can others who don't allow similar categories of FTPs, not give the impression of protecting themselves? Such questions are bound to be raised within today's paradigms of mobility (Pellerin, 2011) or hyper-mobility (Hawthorne, 2013). Literature analysis shows that admission of FTPs in regulated professions is a complex issue and "how institutions think" (Douglas, 1986) can contribute to further inertia through disjuncture or coordination problems between institutions.

BEDNAREK, INGO* (*Braunschweig University of Art (HBK Braunschweig)*)

The Gender of Technology. Approaching a Feminist Actor-Network Theory.

My PhD Project focuses on gender in sales environments and sales negotiations in digital technologies and digital media. Key terms characterizing the change in technologies and their social uses from analogue to digital media are interactivity, hypertext, and virtuality. They are characterized by new images of the flexible, the flowing, and the differentiation in process; gendered images of transformation. Media and their specific uses are, however, mistaken almost exclusively for genderless and, supposedly, neutral objects, whereby the (re) producing properties of society and gender are lingering in hiding. For a scientific recording of media transformations, new perspectives are, therefore, needed on the subject of media in order to decipher the images mentioned and take their effects seriously. Actor-Network Theory (ANT) offers such a perspective, which allows the actions of human and non-human actors to be taken seriously in their interconnectedness. With a research perspective inspired by Actor-Network Theory, the project asks how gender and gender inequality are produced in this human-machine encounter, which characterizes current sales environments. The dissertation project stands out through an innovative approach to the field of media studies, since it integrates the material practices of use and sale with new digital media. It is located at the intersection of Media Studies, Sociology of Science and Technology, Science and Technology Studies, and empirical social research. The Actor-Network Theory, which is relevant to all these disciplines/ subjects, is to theoretically develop out of a gender-sensitive perspective and to be contrasted with and enriched by empirical case studies in the field of new digital media distribution, which has not yet been explored from this perspective. In the panel I would like to take the opportunity to present my project and its progress, developing further the sociological and social research elements which are central to my project.

Advances in the Characterization of Global Development Models

The Global Models to explain human development on the planet have been conceived to be important and useful. They are the result of simulation methodologies and paradigms for viewing the world in their macro dynamics, considering many possible causes of the problems that arise, and that, based on historical data, shows how the world will behave in a determined future in different possible scenarios. They were born due to worldwide concern about the impact that human actions would have on the environment, the unsustainability of population and economic growth, and the disappointing results of the programs that governments have repeatedly adopted to combat these ills. The objective of the Global Models is to provide the necessary tools to formulate alternative responses so that humanity moves towards the best scenario. Many have been formulated, but it is necessary to develop others that may serve to analyze specific contexts such as South American or Colombian. Continuing what was presented at the 3rd ISA Forum of Sociology Vienna in 2016, this paper includes the advances in methodology, results and analysis of the realization of a representative inventory of Global Models developed in the last sixty years, which allows to characterize them and identify the components that could be useful for the design and future construction of a System Dynamics model that studies the performance of the implementation of development policies.

TG07-1002.4BEECHAM, NELL* (*London School of Economics*)UNGER, CLIO (*Royal Central School of Speech and Drama, University of London*)*Designing the Female Orgasm: Omgys and the Virtual Disciplining of Sexual Pleasure*

Since 2015 the sex education platform Omgys has been working on "closing the orgasm gap" (Allen, 2016). A website aimed at improving and exploring the female orgasm, the pay-to-view service offers videos and 'hands-on' touch screen interaction to teach their users different techniques of sexual stimulation.

Through the mediation of motoric practices the website contributes to the regulation of the sensorial experience of the female orgasm. Omgys operates within the context of a widespread emergence of disciplinary technologies and discourses of the quantified self. It thus requires critical analysis into the affective performance and sensorial expectations of the sexual wellness and its associated technologies.

Bringing together design and performance studies, this analysis of the female-focussed sex education platform Omgys explores the entanglements of neoliberal iterations of the sexual entrepreneur and design thinking. Taking Parsons' definition of design as "the intentional solution of a problem, by the creation of plans for a new sort of thing" (2015), the paper explores the platform's utilisation of design thinking in the context of the website's aim to "close the orgasm gap". Emphasising the gendered dimensions of product design and the domination of male thinking within design practice (Schroeder 2010) and engaging with debates about asymmetries within sextech design (Devlin 2015), the paper explores Omgys's attempts to centre the female body within design processes. It uses Harvey and Gill's (2011) framework of the contemporary sexual entrepreneur to analyse the website's emphasis on technique (over fantasy or desire), its sterile design, and its techno-plastic transference of erotic touch. It examines Omgys within the conditions of neoliberal subjectivities and sexual commodification and draws out key questions surrounding Omgys claims of neutrality and feminist emancipation.

RC48-805.14BEHAN, CORMAC* (*University of Sheffield*)*Resistance, Repression and Resilience: The Evolution and Disappearance of Prisoners' Rights Movements*

As long as prisons have existed, prisoners have challenged their confinement. Prisoners have protested against the conditions under which they were held and resisted the disciplinary limitations inherent in the denial of liberty. Protests have manifested themselves in many forms: violent and peaceful, legal and illegal, individual and collectivist. As long as individuals have been held against their will and their freedom restricted, they have attempted to circumvent the rules, regulations and standardisation inherent in daily life in prison.

While resisting the constraints of confinement is as old as the prison itself, this paper will examine the prisoners' rights movements which emerged in a number of European and US jurisdictions throughout the 1970s. It will investigate how prisoners organised in such difficult conditions and consider how their resistance manifested itself through a variety of different forms, political and non-political. It will analyse why prisoners' rights movements faded away, not just as organisations, but also from narratives around social movements and accounts of penal history. Finally, it will argue that there is a need to excavate the history of these movements in order, not just to provide a more comprehensive analysis of the penal experience during this period, but also to understand the relative lack of prison organising in the 21st century.

RC22-407.2BEHRENS, KATHRIN* (*Heinrich Heine Universität Düsseldorf*)*Secular Constitutions? the State-Religion-Relationship in National Constitutions*

The separation between state and religion is integral part of what can be called the western type of modern secularity. The relationship between the newly formed nation-states in Europe and religion, respectively churches, has its legacy in the Treaty of Westphalia establishing the "unity in diversity". However, these relationships have taken on different forms during the course of the national histories. One way to study the diverse state-religion-relationships comprises of analysing the formal descriptions provided by the nation-states' constitutions. As constitutions incorporate basic rules, regulations and values of a society, they additionally mirror the nations' self-understanding, which potentially reflect the status of secularity at the time of their enactment. The presentation focuses on the regulations concerning freedom of individual religiosity, consciousness and worshipping as well as religious institutions (as churches, communities or parishes) and their rights and duties. The presentation contains results of a unique explorative, quantitative analysis of constitutional texts and contributes

to the comparison of state-religion-relationships in different national and cultural contexts. Thereby, the formal distinction of secularity and religion as constitutional regulations of the state-religion-relationship is highlighted. The comparison between constitutions of countries from different continents reveals that the separation between state and religion in fact is a feature of a particular westernized modernity.

RC31-559.5BEHTOUI, ALIREZA* (*Södertörn University*)*The Presentation of Self: Identity Construction of Young Descendants of Migrants in Sweden*

This study is the result from a survey conducted on a sample of young people aged 17 to 18 years old, born in Sweden with family roots in Iraq, Iran, Somalia and Bosnia. We have moreover included in the survey a reference group of youth with Swedish-born parents in the same age group.

The aim of the study is to illuminate processes of the constructing of the identity positions shared by descendants of different migrant group in a European context. Compared to North-American experiences, the specific European mode of "ethnic" identification restrict the range of identity positions. By focusing on how these young people perceive themselves in various context of everyday life in Sweden, the paper problematize the way mainstream society perceive their identity. Using a relational approach, i.e. who our relationships with other contribute to shaping of identities, we explore who embeddedness in various social networks have an impact on our respondents' way of identity construction.

As results show, the majority within different groups of young people with immigrant background identify themselves as both Swedish and of their particular grouping. In line with our relational approach that rely on the assumption that we construct our identities in a dialogue with others, our results demonstrate that, respondents class background, their friendships network, their relationships within schools with teachers and other adults and their participation in various extra-curricular activities have a significant impact on the processes of the identity construction.

RC08-172.2BEIGEL, FERNANDA* (*INCIHUSA-CONICET, Universidad Nacional de Cuyo*)*A World of Circuits: Academic Fields in the Crossfire of the Local, the National, the Regional and the Global*

Academic publishing is the main support for the evaluation of academic careers and university accreditation, through a set of bibliometric indicators currently used world widely. It has become the universally accepted unity of measurement of global exchanges and the production of knowledge has become in turn more dependent on the opportunities and rewards given by diverse publishing circuits. Several studies (Wouters 1999, Ortiz 2009, Guédon 2011, among others) have discussed the emergence of the "mainstream science" established starting with the creation, in 1959, of the Institute for Scientific Information (ISI). The "universalization" of the SCI criteria of evaluation was impelled by the increasing interest of journals around the world to enter the ISI complex, including journals from peripheral communities eager to be indexed. The local and the international, both inseparable features of scientific production (Gingras, 2002) became divisible in terms of the process of academic recognition: peripheral scientists ended circumscribed to local rewards while scholars from central universities accumulated "international" scientific capital.

Even if truthful as a general historical pattern, this picture simplifies the diverse and complex forms of integration and/or resistance observed recently along science in the periphery. More than reinforcing the spatial asymmetries separating marginal communities versus "centers of excellence", in the last decade the logics of circulation led to the segmentation of different principles of recognition. The internationalized elites that only write in English and publish in mainstream journals, and the scholars attached to writing in non-indexed journals gifted with local recognition. In this paper, I observe the dynamics of four circuits that cross-through the national spaces in particular combinations related to the paths of professionalization and internationalization that must be observed empirically in the field. Theoretically, I put forward a combination of field/circulation approach by merging Bourdieu and Dependency Analysis.

RC38-675.2BELA, BAIBA* (*University of Latvia*)*Ethical Considerations in Biographical Research on Vulnerable People*

Paper addresses the ethical challenges during the research on subjective experience of poverty and social exclusion, focusing on respect to dignity of research participants during fieldwork and during final stage of research - writing. Analysis focuses on research under the programme SUSTINNO 2014-2017. The

project's goals are in-depth analysis of Latvia's post-crisis social problems, the options to overcome these problems and their impact on sustainable social and regional development. Data for this study is collected using quantitative and qualitative research methods. The biographical research is used in order to elucidate the lived experience of vulnerable persons. Twenty five life story interviews with persons representing various experiences of adversity were recorded.

The problem is that the terms 'poor' and 'socially excluded' is perceived as humiliating and stigmatizing by people in temporary or prolonged difficulties (Walker 2014) and research participants are reluctant to identify themselves as 'poor' (Fahmy, Pemberton, 2012). In the same time, social scientists are using poverty objectification language in all quantitative research and also in many qualitative research.

At first, ethical issues addressed by students involved in interviewing will be analyzed (for instance, how to explain research aim and interview purpose without injuring dignity of potential research participants) and at second, the challenge to write about personal experiences of vulnerable narrators avoiding poverty objectification language and further discursive marginalization of research participants (for instance, how to relate to body of texts exploring poverty and social exclusion and in the same time not reproducing dominant discourse of poverty objectification). There is few excellent examples of ethical writing on subjective experiences of poverty in English, but not in Latvian - it was very difficult to find a different discourse in Latvian in the discussion about the experiences of living with limited resources and long-term accumulation of difficulties.

Broadening Conceptual Horizons of Creativity. a Comparative Analysis of Creative Processes through the Case of Community Managed Socio-Cultural Centers in Two Differentiated Urban Contexts.

Economics, management and political sciences have been deeply influencing the definition and uses of creativity in cities during the last thirty years. As many scholars have shown, this fact -that has been related to welfare state retrenchment and the rise of cultural-cognitive economy-, has led to a fuzzy, narrow, instrumental and normative approach to creativity. Despite the increasing efforts to "unpack" the notion of creativity from different perspectives, the sociological analysis of practices that allow broadening the understanding of creativity is an incipient area of research. Therefore, the aim of this paper is to contribute to the development of a sociological approach to the analysis of creativity in urban dynamics. We argued that creativity cannot be reduced to a market rationality point of view because empirical reality is challenging this reductionism. Since the crisis in 2008 the proliferation and consolidation of bottom-up creative practices (as community and self-managed socio-cultural centers or the so-called creative brownfields) based on redistributive and reciprocity social relations are claiming for the adoption of perspectives that consider creativity as a socially and historically embedded process. Thus, we wonder, what kind of rationalities and social relations shape this kind of creative practices in a determined socio-territorial context?, what kind of notion of creativity arises from these alternative practices?, and how urban and organizational context shapes and guides this kind of cultural creativity processes? We examine this problem through a comparative approach that analyzes a significant sample of community-managed socio-cultural centers located in Barcelona and in Buenos Aires. We have collected data using qualitative methods that include observation, in-depth interviews and the study of documentary sources.

BELANDO, MARIA VICTORIA* (University of Barcelona)

Governing the Socio-Cultural Field of the City from the Bottom-up. Potential and Limits of Community-Management in the Case of Barcelona.

Global crisis has prompted different social reactions that have been manifested in mobilization and collective organized practices to contest and overcome welfare retrenchment but also to claim the democratization of the forms of governing common goods. Under European austerity policies, cities have become a laboratory of bottom-up initiatives aimed to cover different types of needs. This

phenomenon, particularly meaningful in the social and cultural field of cities, is challenging local level state institutions since arise as a socially innovative force that seeks to counterbalance the dominance of bureaucratic and market rationalities in the city. In the case of Barcelona the proliferation since 2008 of self-organized initiatives to transform urban wastelands, old industrial complexes and other infrastructures (many of them state-owned) in socio-cultural spaces, illustrates a new scene regarding community participation through socially innovative initiatives. The aim of this contribution is to study the nature of these *socially innovative initiatives* and their capacity to contribute to the democratization of decision making processes in urban affairs. We examine this issue by analyzing a significant sample of community-managed socio-cultural centers located in Barcelona that have emerged since 2011 as an outcome of social contestations against the deepening, during the first years of the crisis, of a market-centered view of culture and creativity within urban economic growth strategies. We propose to answer how and to what extent this socially innovative initiatives (1) led to a democratization shift in the forms of governing the socio-cultural field and the city (2) encourage alternative discourses and practices regarding culture and creativity in urban life (3) represents a mean to decommodify social relations and urban dynamics through culture. We have collected data using qualitative methods that include observation, in-depth interviews and the study of documentary sources.

Roots Tourism of Israeli Ethiopian Jews: Stories of Identity Reformulation

The Ethiopian Jews, also known as Beta Israel and/or the Falasha, are one of the most distinct ethnic groups in Israeli society. In 2015, approximately 141,200 Ethiopian Jews live in Israel, out of which 85,700 were born in Ethiopia and 55,500 born in Israel. Researchers who studied Ethiopians' integration in the Israeli society suggested that Ethiopian second and third generations would undergo identity crises due to the cultural gap between old and young members in the community, their unique racial features as black Jews, the questions raised about their Jewishness, and the low status awarded them in Israeli society. In light of this premise, the current study seeks to examine the travel experiences of Israelis of Ethiopian descent who have visited Ethiopia as tourists. Informed by narrative theories, it seeks to explore personal stories related to the decision to travel to Ethiopia, the actual experience there and how travelers believe this experience influences their life in Israel. The study will follow the psycho-cultural analytical tradition by which identity is conceived as a social construct that derives from one's own understanding and intersubjective articulation of experience. More specifically, the study employs a framework of identity reformulation as a theoretical standpoint to understand how their travel experience shapes the way they describe their ethnic, national, cultural and religious identity. By recognizing repeated themes, the study also seeks to shed a broader light on social processes and issues related to the Ethiopian community in Israel.

Jerseys Off: An Investigation of Basketball Players and Body Commodification

From amateur wannabes to professional superstars, the stereotypical mental picture of basketball players in the United States is intertwined with tattoos. Whether purposeful or happenstance, the prevalence of highly visible tattoos in the NBA and college basketball world has been growing rapidly. With the increased prominence of tattoos, fans in the United States are commodifying the tattooed bodies of basketball players leading to their objectification. Furthermore, the tattooed portions of player's bodies become commodified as objects of their own. As both whole bodies and individual tattooed body parts, the commodified body takes on meanings associated with the experiences of those interpreting them. These commodified tattooed bodies and tattooed body parts combine the idea of the Maussian symbolically charged gift, due to the symbolism the body adopts while necessitating reciprocity, and the Marxian notion of a good. In this study, we discuss how the commodification of the tattooed body and body parts of professional and collegiate basketball players are symbolically charged objects that can be bought, sold, and traded. Furthermore, using symbolic interactionism and Norbert Elias' ideas as a framework, the study investigates how tattooed bodies act as commodities influencing marketing, identity, performance of

masculinity, and the chains of interdependency inherent in the player/player, player/team, and player/fan social structures.

Youth Mental Health, Poverty, and Social Inequality: Youth, Parent & Service Provider Perspectives

Youth mental health policy is quickly emerging and shifting in many western nations as new data emerges. However, this policy is lacking in nuance as to how social inequality and poverty operate and how new data could feed policy and practice. This paper provides data for such nuance and direction.

In this presentation, we explore the complicated relationships between poverty and social inequality on the access and care that youth encounter in their mental health journey. Interviews (n=164) were conducted as part of the *Atlantic Canada Children's Effective Service Strategies in Mental Health* (ACCESS-MH) project, funded by the Canadian Institutes of Health Research. Drawing from these narrative and story-based journey interviews with youth experiencing mental health challenges (n=42), parents of such youth (n=45), and mental health service providers (n=77), we examine multi-vocal lessons as to how poverty and social inequality operate in these journeys.

We take a multi-vocal approach in this presentation to highlight not only the complex relationship between youth mental health and social inequality/poverty but the details as to how these three groups make sense of the way in which it operates. As young lives continue to be marked by increasing challenges with mental health, it is crucial that the links between mental health, poverty, and social inequality are fully established, nuanced, and recognized in policy and practice. Particularly for impoverished youth, it is important that policy and practice reflect the tiered system of access and care that remains inequitable.

Organisational Survival from Communism to Post-Communism: Czech Youth and Environmental Organisations, 1945 - 2017

Sociology, with its nuanced contextual views on social change, is ideally suited to analyse how organisations survive dramatic rearrangements of the social and political environment. Organisation studies in the disciplines of business and management often limit their focus to quantitative accounts of organisational mortality and economic factors, even within the context of crises in established democracies. To broaden the use of sociology for the study of organisational survival, I suggest the following: (a) to push the boundaries of studies of organisational mortality by analysing organisations in extreme social and political conditions, such as authoritarianism and post-communist transformation, and (b) to employ in-depth qualitative methods. This paper employs these approaches to theorise on, and empirically address, the complex process of organisational survival during regime change by synthesising new institutionalism, rarely applied by organisational research in these contexts, with sociological theories of social and political transformation. Specifically, using archival research and in-depth interviews with leaders and participants, I explain how four Czech youth and environmental non-governmental organisations (NGOs) manage the shift from the communist regime (1945-1989) to an aspiring liberal democracy (1989-2017). I find that NGO survival in the post-1989 Czech Republic reflects the challenges and processes of post-communist transformation, including the issues of lustration, collective memory, 'voluntarism,' and trust in social and political institutions. I also find that instability and conflict between views of the communist past and prospects for the future are key factors in whether and how organisations survive.

BELL, MICHAEL* (*University of Wisconsin-Madison*)

The Absolute and the Unsolved: Community, Difference, and the Seductions of Populism

Why is populism so seductive? Weren't modern, liberal societies supposed to be done with that kind of thinking? In this paper, I contend that we have been misled by the civilizationist and evolutionist biases of modernism, leading us to misframe the dynamics of community such that we were unprepared theoretically and politically for the re-emergence of populist authoritarianism. It is common to call populism a form of "tribalism," implying that populism represents the primitive backwardness of jungle life. Such implicit racism is unhelpful. Rather, I argue that populism is a thoroughly modern social form, and equally thoroughly traditional. I do so by reframing an old strand of social theory, most strongly represented by Durkheim's distinction between mechanical solidarity (solidarity of sameness) and organic solidarity (solidarity of difference), and by Tonnies's related distinction between *gemeinschaft* (affective action) and *gesellschaft* (instrumental action). I offer instead the distinction between *absolute community* and *unsolved community*

which accepts that Durkheim and Tonnies were not completely off the mark, but rejects their civilizationism, evolutionism, and modernism, and rearticulates their understanding of the motives and logics of community life. Instead of seeing populism as a solidarity of sameness based on affect, I argue that understandings of difference and instrumentalism are equally crucial to it, and for all community forms. What is the decisive difference, rather, is the absoluteness of their boundaries and their resulting moral movement. The moral world of the absolute community, including populism, is that of the *difference of samenesses*, with sameness within and difference without, and moral motion from sameness to difference. The moral world of the unsolved community, on the other hand, is that of a *sameness of differences*, of difference within and sameness without, and moral motion of difference to sameness. The social context of modernism, alas, often promotes the former.

Crossing Borders: Power and Violence in New York City Galleries

This paper considers two recent exhibitions that used artifacts and other tracings left by refugees when they crossed the Mediterranean from North Africa to Northern Greece and undocumented migrants when they crossed the Sonoran Desert from Mexico into Southwestern United States. Both combine objects (e.g., backpacks, clothing, prayer cards, boots and shoes, water bottles) with documentary films, stories, photographs, text, and other media to explore state violence, suffering and resistance.

"Laundromat" (2016) focuses on clothing, shoes and boots left behind when Idomeni refugee camp was closed and residents were forced to leave. Ai Weiwei and his team documented the camp's closure and laundered the objects and displayed them at the Deitch gallery. The exhibition reflects the artist's long-standing commitment to art and activism: to make art that speaks truth to power and hold states accountable for their violence, negligence, and authoritarianism. "State of Exception/ Estado de Excepción" (Amanda Krugliak and Richard Barnes, with Jason De Leon, at Parsons School of Design, 2017) focuses on a wall of more than 700 backpacks. Each was retrieved by anthropologist Jason De Leon after 2009, when he began a study of the border crossings in response to the US immigration enforcement strategy known as "Prevention through Deterrence."

This paper takes a comparative focus to look critically at how these contemporary artists and social scientists depict experiences, situations and social contexts of displaced people in contexts of power and violence. What stories and identities are carried in/by the exhibitions' images of walls, water, and documentation practices? What relevance and responsibility do they have to contemporary politics in the Americas, Europe and Northern Africa? What risks do they take in reclaiming and transforming objects and stories in their efforts to understand and resist violence and suffering in crossing borders?

Chacabuco and the Crystal: Relating Narratives and/As Refracting the Past

This paper takes the gift of an interview that emerged unexpectedly on fieldwork in Chile with an ESRC(UK)-funded project. As part of the project, we visited the ex-detention centre Chacabuco in the Atacama desert, where hundreds of political prisoners were held in the 1970s during Pinochet's dictatorship. The paper considers how we meet the past multiply in such research, as the story of 'what happened' emerges via several routes: experientially, visually, cinematically and biographically. Drawing on Benjamin's comments on story-telling and Cavarero's arguments concerning 'relating narratives', the paper considers how the story told by our interviewee, Osvaldo Valdés, a survivor of the camp, adopts a mode of a narrating the history he has lived that shares and supplements the 'crystalline' approach adopted not only in Gúzman's majestic 'Nostalgia de la Luz' (2010) but also in the film 'cited' by Gúzman, 'Yo He Sido, Yo Soy, Yo Seré' (1974), shot clandestinely in the camp at the time it was being used as a detention centre. Valdés shares the telling with a friend, another survivor, and they distribute not only the story but the sentiments between them, allowing a web of generosity and receptivity between us that like a game of cat's cradle (Haraway, 2016:34) enables the remarkable story of torture, creativity and laughter to be gifted to us.

Golems, Superman, and Social Theory? ... Connecting Dialectical Myth to Popular Fiction

Social theory is as readable as a popular novel or comic book. This is a hard sell to many people until they learn that there are numerous commonalities between social theory and popular fiction. The Golem myth emerged from pre-Enlightenment Jewish mythology to deeply encode its dialectical three-part structure in early sociological theories, especially on the work of Karl Marx. The

importance of the Golem's mythic structure surpassed Enlightenment rationality and became embedded in Marx's critique of capitalism as much as in Mary Shelley's gothic novel *Frankenstein* (which Marx most certainly read). The idea of an Übermensch expressed by Nietzsche (and popularized today in the comic book character Superman) is a recasting of the Golem as a hero in the last stage of the mythic structure. Christopher Knowles (2007) recognizes Nietzsche's *superman* is where Superman creator Jerry Siegel most likely encountered the name. So get comfortable while we explore the connections between social theory and popular fiction.

Talking Politics: The Delimitation of the 'Political' As a Gendered Disciplinary Mechanism in Intra-Group Dialogue Among Young Israelis.

The current research concentrates on the discursive mechanisms that construct the way young Israeli women and men talk about politics. Our work is based on two case studies of intra-group dialogue groups comprised of Israeli women and men that were held between the years 2013-2015 at Ben Gurion University in the Negev. Each group met for weekly sessions along two semesters. In the meetings, the group members encountered Palestinian collective narratives followed by processing sessions in which they discussed and expressed their thoughts and feelings regarding the Israeli-Palestinian conflict.

Analyzing the discourse in these two groups, we argue that the political space is being marked, defined and delimited through gendered discursive practices, creating hierarchies between emotional and cognitive knowledge. We present the different roles participants take in the group, and address the different disciplinary mechanisms and practices of resistance that are being used by participants in the group. We address three main strategies: cognitive talk, emotional talk and silence and their manifestation within different phases in the group process.

Finally, we discuss the meanings of the internal group dynamic in face of the external socio-political processes that happened in these years, and in particular related to the 2014 Gaza war.

Between Academic Ornament, External Expert and Suspect Ally: Lessons from Research on the Israeli Military

This paper offers some reflective insights from three decades of research on the Israeli armed forces. The perspective I take is that of the sociology of knowledge, that is the social structures and dynamics by which my participation in a variety of forums shaped the kinds of "military knowledge" that was created. In other words, I trace out the social situations through which my research (often in cooperation with serving officers) was amalgamated in forms that military actors used. I explore four key experiences that I encountered: first, writing about the reserve infantry battalion in which I served during the first Palestinian Intifada to show the kinds of obligations and self-censorship that were involved in the ethnography I eventually wrote about it. Second, being invited to a multiplicity of committees as an "expert". Here I deal with the tension between contributing critical views or functional advice and the fact that I was often turned into little more than an "academic ornament". Third, I analyze the research that I have carried out along with serving officers to explore the ways these officers used me to offer critiques of army policy as well as to mediate academic knowledge so that it can be ingested by the military institution. Fourth, I analyze my work outside the IDF on military issues to show how my arguments and findings are usually ignored or at best selectively cited. In all four cases, I offer reflections on the kinds of ties that bounded me to the military, the emergent "contracts" that these ties entailed, and the knowledge that was created.

Jewishness and Antisemitism: Transnationalisms Confronted

As discussed by Bauman and Sandauer, Jews have often been the target of singular – mostly hostile – attitudes on the side of their environments. After a few decades of relative decline following the discovery of the amplitude of the Shoah, to-day, as shown by Taguieff and Fishel, antisemitism is again on the rise in the context of globalization and the migration of Muslim population groups in many non-Muslim countries. In the context of the ongoing Israel-Palestine conflict, from among those groups, extremist elements come out who articulate a judeophobia drawing from their ethno-religious support of the Palestinian cause. This hostility vis-à-vis Jews does not stem exclusively out of racism and nationalism like in the past, but of anti-racism and anti-nationalism associating Jews and Israel to racism

and imperialism. The pro-Palestinian atmosphere propagated by this hostility attracts leftist and media people sensitive to third-world causes. This kind of confrontation is new. Jews and Muslims share indeed in common their constituting transnational diasporas disseminated in numerous countries where they make up ethno-religious minorities. These minorities also refer to countries that are homelands to their folks as majority groups – the Muslim nations on the one hand and Israel on the other. The conflict in the Middle-East fuels on either side the animosity between those diasporas granting it a dimension of transnational confrontation. While, however, Israel may seem to be the stronger party on the "battlefield", diaspora Jews may seem to be in a vulnerable position vis-à-vis neo-antisemitism. Among the several sociological issues at stake, this case evinces the possibility that forces speaking on behalf of diasporas become transsocietal opponents. The consideration of these issues leads to new perspectives on our era of globalization.

BENALI, AMIRA* (*University of Geneva*)

Beyond the Smile: The Infra-Politics of the Host in a Nepalese Orphanage

Central to the volunteer tourism experience is the encounter with the host community. Despite this fundamental role, most of the research focused on the volunteers, while little attention was paid to the local community (Wearing & McGehee 2013). Local are often depicted as an object of action and not as active. They play the role of the submissive. In this paper, I try to challenge this established configuration of power, applying Scott's (1990) concept of *Infra politic*. An ethnographic study in an orphanage in Nepal was held. I follow an Extend Case Method methodology (Burawoy 1998) in order to subscribe the individual narratives in the global postcolonial context.

The analysis reveal a dialectical tension between resistance and compliance. In fact hosts are aware of the business making out of their orphanage. They are also not impressed by the western volunteers. Their bitterness and revolt are expressed through disguised forms of resistance. However, at the same time, they are conscious of their powerlessness against the global market and the advancement of western world. That is why they encourage and sustain the volunteer tourism market. It seems that Nepalese try to be selective, deciding what to learn from western and what to keep from their own culture.

The Construction of Administrative Big Data As an Innovation for the Regulation of Social Welfare Benefits Delivery: The Case of Milan

In Italy, as in most Mediterranean countries of Europe, social assistance benefits are poorly developed and regulated mainly at local level. Reforms in the last 20 years have strengthened the 'municipalization' of social assistance. Local public bodies (firstly Municipalities) currently enjoy a remarkable degree of discretionary power in the regulation of the provision of welfare benefits. However, this institutional discretion is rarely supported by an adequate process of evaluation of the conditions of the recipients, apart from administrative practices of "means-testing" in the initial assessment of applications.

This paper aims to fill this gap using a large database on recipients of monetary benefits in the city of Milan (the second largest city in Italy) that we obtained by the local administration. This archive is the result of a complex operation of merging of data originating from very different sources: the national fiscal administration, the national and local registers of buildings, the register of motor vehicles, the register of social housing, the local chamber of commerce, the registry office of the city, and so on. This is the first time that researchers have access to such a complete set of micro data.

The availability of administrative big data emerges both as an institutional innovation for policy design and as a professional and organizational challenge, since the construction, maintenance and use of administrative big data require a strong political involvement. The first findings of our analysis point out how the provision of local welfare benefits reflects broader social trends, such as the ageing of native inhabitants and the growth of young immigrant population. Likewise, our data show how benefits provided at local level can overlap benefits provided by other institutions who operate at a regional or national level: this raises some questions about the multi-level regulation of social welfare benefits.

Transnational Care Agencies: Formalization As a Fig Leaf?

A new division of care work and the transnational migration of care workers related to it is a permanently increasing global phenomenon. At the same time, it continues to be better understood with newly developed analytical frameworks, both on the micro-level and the macro-level. In our presentation, we address two aspects that we believe deserve attention in this context. First, we take a look at the so far neglected meso-level, exemplified by transnational organizations that act as intermediaries between home-care givers and home-care receivers. Second, we go beyond the conventional, methodologically nationalist framework in order to capture the specific transnational character of the emerging care-work-labour market in Germany.

In our comparative, cross- and transnational research project *"Decent Care Work? Transnational Home Care Arrangements"*, we track migrant care worker recruitment by transnational agencies in Central Eastern European Countries, and follow migrant 24-hour care givers in the global city of Frankfurt (Germany). Hereby we employ a comparative framework which covers two other global cities, Vienna (Austria) and Zurich (Switzerland). Our first results show that transnational care agencies are filling a gap in the German care regime: Providing a hidden narrative, they satisfy a deeply culturally rooted demand for care work, traditionally performed by female family members which is now outsourced to cheap mobile workers.

At the same time, the agencies's narrative adds legitimacy to migrant care work and promises to guarantee professional care and "decent" working conditions. However, the agencies' promise of formalizing an informal economy appears dubious. Their business model relies on rendering the actual nature of the contract invisible to both care givers and care receivers by relying on a complicated legal framework and public policies (in both the sending and the receiving countries), which can be characterised as semi-compliance and complicity.

Memories, Violence, Tuareg Rebellions and State Building in Mali and Niger

The aim of this article is to compare the memories of the Tuareg rebellions in the postcolonial states of Mali and Niger. These countries lived two synchronic Tuareg rebellions during the 1990s. However, after the peace agreements, they took two very different paths. The Malian state is now considered as trapped in cyclical Tuareg rebellions while the state of Niger seems to have achieved the reconciliation with the Tuareg communities. Many authors are explaining the Tuareg rebellions by using a functionalist framework. For them, the causes of the rebellion are the lack of political and economic inclusivity of the Tuareg minority in the two countries and the failure of the decentralization implementation in the northern parts of the country. However, the process of decentralization seems more advanced in Mali than in Niger. Furthermore, we can observe significant progress in the integration of Tuareg in Mali and Niger since the 1990s. Then, to understand the difference between the two cases, we must focus on the memories and representations of the political violence. The representations and memories of the Tuareg communities, particularly of their elites, are under-studied. However, memories and how they are used by the actors are a key piece of the puzzle to explain the emergence of an armed rebellion or the acceptance of the political national rules. To answer the following question: "How the Tuareg communities are depicting their relations within the state?", we used two methodological tools: discourse analysis and ethnography. Based on a field research and semi-structured interviews conducted in Mali and Niger, we will be able to map the different representations and memories of the Tuareg communities and mobilized by their elites.

Crime in Their Midst: A Thematic Analysis of a Crime Committed in an Orthodox Jewish Community and Its Impact on Community Members

Much is unknown about insular communities as they are often closed and guarded. This is especially so when it comes to crimes committed in their midst. Furthermore, a community's interpretation of crime committed within may differ from that of the general public. Online forums geared to community members can reveal the discussions they have following a crime and the thoughts and feelings of the group. Using a functionalist approach, this study fills a gap in the literature on crimes committed in insular communities by and against community members by asking: what topics of discussion arose for Orthodox Jewish community members following a crime in their midst and were community members united or divided in their discussions? More explicitly, the sociological importance of what they discussed and how this affected community cohesion was examined. To address these questions, the comments following articles about a murder committed in an Orthodox Jewish community in New York on two Orthodox Jewish news websites (*Yeshiva World News* and *Vos Iz Neias*) were examined. The comments were posted in response to articles about the murder in

the mainstream media that were posted on these two Jewish websites. Qualitative thematic analysis was used to examine how community members reacted to the murder through the discussions they had and whether these discussions affected and reflected community cohesion. Implications for better understanding crime in insular communities are discussed, as are directions for future research.

Victims Are Doing It from Themselves: Examining the Move from Sexual Victimization to Anti-Sexual Violence Advocacy

Conversations about sexual violence have been front and center since 2016 in both Canada and the United States. Victims' voices have fueled the global conversation around sexual violence and many have characterized themselves or have been characterized as activists or advocates (Brothers 2016; Houpt 2016; Yashari 2016; Kort 2015). While victims raising awareness about sexual violence is not a new phenomenon, the experiences involved in the move from victim to advocate have yet to be studied. Therefore, this study asks: *How do some victims of sexual violence become anti-sexual violence advocates?*

Drawing upon labeling and stigma theories, it examines the parallels between primary, secondary, and tertiary deviance (Lemert 1951) and primary, secondary, and tertiary victimization (Kenney 2002). Primary and secondary deviance can explain the process of becoming a victim through the conceptual counterparts of primary and secondary victimization (Karmen 2007; Taylor et al. 1983). Tertiary deviance, in which those who have been shamed, silenced, and marginalized demand recognition and rights, can explain victims' move to advocacy (Kitsuse 1980; Kenney 2002).

To examine the avenues out of victimization and the new identity that may be found in the tertiary stage (Lemert 1951; Osborne 1974), narrative interviews were conducted with participants who have experienced sexual victimization and are currently anti-sexual violence advocates or activists. Interviews captured participants' life stories beginning with their experiences of victimization, including their disclosures and reactions to these disclosures, and their subsequent involvement in advocacy (Kenney 2002; Kitsuse 1980). Discussions around the tensions in being both victims/survivors and advocates/activists provided an understanding of how participants manage competing identities. The life stories shed light on how participants' advocacy work has been affected by their experiences of victimization at each stage as well as how they construct and claim their identities as they continue to evolve.

STATTIN, MIKAEL (*Department of sociology, Umeå university*)

Health Care Workers' Motives for and Experiences of Working in Late Age

Ageing populations create a number of challenges for labour markets, and extending working lives has emerged as one possible solution among policy makers. Labour shortages combined with high retirement rates means that employers increasingly face difficulties finding experienced and skilled labour. The possibility to retain older workers is therefore considered as a key challenge for employers in both the private and public sector. However, research shows that although the interest in retaining older workers has recently increased, few organizations have well defined age management strategies in place. To develop such strategies, knowledge of what may facilitate labour force participation in late age is needed. This includes a better understanding of older workers' own experiences and perceptions of their role in the workplace. Therefore, in this paper we explore older workers' own motives for and experiences of their careers after the age of 65. The study draws on qualitative data derived from a survey of employees working in a large health care organisation in Sweden. Eighty-six employees, from various occupations, shared their positive and negative experiences, including their views on the hindrances and promoters they have encountered in this late stage of their careers. Participants commonly identified interesting and stimulating work as a motivation to continue working, and this reason was often paired with a wish to make use of the substantial knowledge and expertise gained over the years. Participants also identified a lack of appreciation and flexibility as problematic, among other organisational drawbacks and difficulties. Findings also indicate differences in prolonging the working life based on occupational and socioeconomic status. We conclude the paper by pointing to relevant areas for organisational interventions.

BENITEZ, PAULINA* (*Universidad de Concepción*)

Análisis De Los Principales Indicadores De Desigualdad De Ingreso Del Período 2011-2015 En Chile.

Una explicación de la masiva acción colectiva de los estudiantes universitarios de 2011 fue la existencia de un malestar en la sociedad debido a la desigual distribución de los resultados del modelo de desarrollo (Mayol, 2011, 2012) que correspondería a que el crecimiento económico chileno no cambió su estructura en los últimos años. Calderón y Castells (2016) señalan que no hubo desarrollo informacional que orientara el crecimiento económico en Chile e incluso los gobiernos democráticos dejaron que el mercado condujera el proceso.

El presente trabajo analiza esta hipótesis en base al examen de la desigualdad en la distribución de ingresos en el territorio nacional y regional de Chile, para lo cual se generaron algunos de los principales indicadores de desigualdad de distribución de ingresos: Coeficiente de Gini, Índice de Palma, Índice de Theil. La base de información es la Encuesta de Caracterización Socio-económica Nacional (CASN) de los años 2011, 2013, 2015. A partir de lo anterior se presenta la discusión acerca de los cambios temporales y territoriales más significativos, lo cual se apoya en los indicadores de ingreso medio y la línea de pobreza.

Critical Analysis: Influence of Video Games on Youth Leisure in India

In our future society patterns of our Indian culture and leisure will change according to technological development. India is a humanistic, prosperous and technologically progressive society. Leisure is very important factor for entertainment and technology provides us lots of tools. Nowadays, leisure activities may change, as we can see that charm of digital games specially video games or we can say addiction of video games increased in youth. But still the meaning and purpose is unchanged. It's fundamental to our spiritual, mental and physical well-being. Globalization does some changes in leisure acts and it has challenged our traditional values and thought process.

The growing interest in video games or increasing use of social media, research on the influence of video games on youth leisure is very low in India. Youth seems to be spending their leisure time in front of mobile, computer and TV screens. We can call them the digital generation. Technology has the potential to force people to mould themselves according to its uses fracture. Therefore, it is necessary and indispensable to understand the use of technology for the purpose of recreation and leisure by the youth and consequently be used by the policy makers to improve on National Youth Policy on youth recreation and leisure in India. Very few studies have explored the critical aspects of these games. As sociologists of leisure we need to be aware that virtual leisure has the potential in negative sense and we have to struggle against this for better world. This empirical study will focus on understanding how the video games influence youth and how youth allocate time in active leisure as they used to spend more with video games.

BENJAMIN, ORLY* (Bar Ilan University)

Gender and Government Procurement in Israel: How Do Privatization Contracts Promote Gender Inequality?

In contemporary public administrations worldwide, principles of marketization and managerialization are held applicable throughout the social services: education, welfare and healthcare. The applications of the marketization and managerialization toolkit was recently examined, showing that the applied practices of quasi-marketization reduce levels of professionalization and knowledge preservation across various services. The deterioration of job quality and service quality that occurred in this context was already dealt with. However, the gendering impact of these processes is still somewhat blurred because of the failure to include the different stand points of the women who are exposed to its impact. Here, I examine the gendering impact of the contracting out of Israeli services from three distinct women's stand points: professional women employed as administrators shaping services contracts (17 interviews) whose professional knowledge is undermined in the contract design; contracted out services' employees whose skills are not recognized leaving their level of remuneration very low (45 interviews); and, finally the stand point of low income mothers who depend on services for their work life balance but are unable to trust their quality (60 interviews). Three processes have emerged from a grounded theory analysis which the interview material was subjected to: firstly, contract design is based on a rhetoric of dialogue which disguises a forceful erasure of professional knowledge in the area of care; secondly, an ambivalence emerged to reflect the making of privatized entitlement where employees insist of valuing their work in the context of deskilling and devaluing but they their sense of entitlement does not help negotiate their jobs quality. Finally, low income mothers whose young children rendered them dependent on health, welfare and education services described the incongruity between the needs of their children and accessible services. I discuss the gendering impact of each of these processes and its contribution to gender inequality.

Surveillance, Big Data, Micro-Targeting and the Profiling of Western Electorates

The recent publicity surrounding the influence of the firm, Cambridge Analytica, on the 2016 US presidential election, and the Brexit referendum in the UK, has raised to public consciousness the larger roles played by data analytics in contemporary elections. The conventional wisdom, whether accurate or not, is that the modern political campaign needs to be "data driven" to consolidate existing support and to find potential new voters and donors. The capture and consolidation of these data permit the construction of detailed profiles on individual voters and the "micro-targeting" of precise messages to increasingly refined segments of the electorate, using the most efficient medium. The logic of 'Big Data' has clearly now penetrated electoral politics.

This paper is based on documentary and interview research (funded through the Big Data Surveillance project) and interrogates the influence of consumer micro-marketing techniques within the electoral arena within European parliamentary democracies, rather than the United States. We consider personalized "micro-targeting" on three levels: conceptual, organizational and technological. The segmentation of the electorate, using consumer profiling techniques, has a range of normative consequences that deserve to be analyzed through a surveillance lens. Mindful that the surveillance literature is driven by empirical work in criminal justice, the workplace, and consumption, the norms, dynamics and consequences of surveillance in this campaigning and electoral context are, and should be, different. The subject is the voter (or potential voter) rather than the suspect, the employee, or the consumer. Different subjectivities, we know, dictate different power dynamics, organizational relations, and technological practices.

Agency Collaboration on Social Media during Disasters

Agency collaboration is an important function in the management of disasters and catastrophes. For effective emergency management the need for intergovernmental and cross sector collaboration grows as the scale of the disaster increases. This study explores the use of social media platforms as a means to establish and maintain agency collaboration for emergency management related agencies. Using qualitative observational and coding analysis, this study identifies the types of connections made by theme and context. While several researchers have examined the use of social media during disasters. Most studies examine the use of social media by the public. The findings from this study will assist emergency management practitioners in developing social media strategies that incorporate methods to connect with other agencies on social media.

BENSON, MICHAELA* (Goldsmiths)

FDI, International Property Markets and the Individualisation of Risk: Structuring Lifestyle Migrant Investments in Panama

In this paper, I illustrate how state-led promotion of property investment in international markets, are a significant feature of the structures that support and facilitate lifestyle migration. As I argue, the explicit pursuit of migrant capital through property investment is embraced by nation-states as a channel for Foreign Direct Investment (FDI). With many countries involved in courting FDI through such mechanisms, there is a competitive arena for such investments, an international and global market in international property investment. A vast industry has grown up around international property investment including the myriad smaller property fairs, magazines, investment seminars and workshops, and broadcast media. The global middle classes, the prime neoliberal entrepreneurial subject, are courted and rewarded, their needs and desires for a better way of life met, through an industry that has been set up to pursue international and individual investment capital.

The paper brings together understandings of the relationship between migration and development with the emerging body of work on transnational gentrification to highlight how (middle-class) migrant capital is being courted in the service of neoliberal economic development strategies. It presents the case of lifestyle migration to Panama, highlighting the development of the lifestyle industry that supports this. It outlines the place-making and marketing through which Panama was made one of the best places in the world to retire to. Further, it highlights how this understanding of Panama becomes part of the cultural logic of lifestyle migrants, feeding into the practice of their everyday lives in the destination. And yet, income distribution in Panama is one of the most unequal in central and south America, widening as neoliberalism seeps further into the economy. As I conclude, such foreign investment through property is part of the problem in ways in which the migrants themselves are unaware.

RC31-566.1**BENSON, MICHAELA*** (*Goldsmiths*)*Lifestyle Migration in the Political Economy of Migration*

In this paper, I critically reflect on the question of who is a migrant; or rather, how might our understandings of what counts as migration need amending to recognise what current global economic structures do to population movements? It takes as a starting point my experience of working with relatively privileged populations who have moved to and settled in other parts of the world, primarily to enhance their lifestyles. As this panel makes clear, such movements are often positioned as a case apart from migration studies. And yet, as I argue, careful observation reveals how neoliberalism articulates with postcoloniality in the practice of privileged migration. I illustrate this through my research into North American migration to Panama, outlining the structural and material conditions that support such migrations alongside their agency in this process. While labour migration was a solution to industrialised and agricultural economies, the creep of financialisation—and profit without production—into capitalist economies, similarly makes migrants. The difference is that these migrants are drawn as consumers, attracted to relocate their finances to other economies through individual property and business investments.

This case, and others like it, demonstrate that the relationship between economics and migration would benefit from being reconceived so that it better reflects contemporary economic realities. Such a move would permit the recognition of such privileged populations as migrants, and bring further into the light those structures—currently obscured from general view—that facilitate the migrations of the world's elites and relatively privilege in ways that fully recognise the contemporary political economy of migration. Simply put, in a world economy that functions not only through labour, but is being increasingly financialised, might we also need to reconceive of who is a migrant?

RC32-581.5**BEOKU-BETTS, JOSEPHINE*** (*Florida Atlantic University*)*African Feminism(s): Contemporary Standpoints and Sites of Interpretation*

Debates in the field of African feminisms have grown exponentially over the past three decades and interpreted from multiple and shifting sites. These debates are not mutually exclusive. They share common goals of empowering women to realize their full potential, share concerns about poverty, illiteracy, health, reproductive rights, political participation, and many recognize the importance of addressing issues of race, class, ethnicity, religion, and bodily and sexual integrity in their analysis of issues affecting women's empowerment in Africa. African feminisms are also informed by local and global geo-economic, political, and cultural processes, and by engagement with transnational and regional feminist movements.

This presentation will critically examine commonalities and variations in African feminist dialogues, ranging from neoliberal feminism, "sociocentric" feminism, "negofeminism" or indigenous African feminism, to transformative models informed by scholarship and activism and an open commitment to the goals of global and African feminist dialogues. In addition, I will discuss some of the distinctions between African feminist and women's movements, collaborations between activists and scholars, dialogues on women's empowerment and emergence of increasingly politicized and ideological feminist agendas which are informed by critical theory and praxis.

RC13-256.1**BERDYCHEVSKY, LIZA*** (*University of Illinois at Urbana-Champaign*)**STODOLSKA, MONIKA** (*University of Illinois at Urbana-Champaign*)**SHINEW, KIMBERLY** (*University of Illinois at Urbana-Champaign*)*Violence, Risk, and Leisure Lifestyle in Gangs: The Impacts on Health, Well-Being, and Life Prospects*

The purpose of this qualitative research was to explore leisure lifestyle in gangs, the roles of violence and risk in it, and its impacts on health, well-being, and life prospects. The data were collected with 39 in-depth, semi-structured interviews (lasting on average 1-1.5 hours) with former gang members and practitioners working with potential, current, and previous gang members. The interviews were audio-recorded, transcribed verbatim, and analyzed using constructivist grounded theory and the elements of the situational analysis. The findings revealed that violence (both perpetration and victimization), vandalism, substance abuse, and sexual risk taking were prevalent in gang leisure lifestyle leading to various detrimental physical and mental health consequences as well as negative repercussions for life prospects. Violence was described as a "glue" that holds the gang together, defines the hierarchy in it, and underpins many of the gang members' leisure practices. Participants explained that gang members' perceptions of risks are distorted because many of them believe that the only two ways to get out of the gang are through death or prison and some even

presume that they are destined to die young. Former gang members reported having been shot, stabbed, beaten, raped, abducted, and addicted to drugs, which resulted in severe health-related ramifications (e.g., coma, paralysis, or acquired disability). The gang lifestyle was the cause of various subsequent mental health issues, including depression, paranoia, suicidal ideation, posttraumatic stress disorder, sleep disorders, loneliness/isolation, nervous breakdowns, emotional detachment, and anger issues. This lifestyle also led to psychological wounds, traumas, guilt, regrets, self-doubts, fear of exposure, and trust issues. Some former gang members noted that their experiences in gangs had altered their personality and sense of self, and this has affected their ability to relate to others in both their personal and professional lives, which continues to influence their life course negatively.

RC04-89.1**BERG, JANA*** (*Deutsches Zentrum für Hochschul- und Wissenschaftsforschung*)*International Prestige or the Burden of Charity: A Comparative Investigation of the Perspective of German Higher Education Governance and Administration Actors on (prospective) Refugee Students*

Education is a crucial topic for refugees: It determines their access to the labour market and influences their chances of integration in the host country. In reaction to the strongly increased number of Asylum applications, German higher education institutions (HEI) and preparatory colleges started programs to assist prospective refugee students on their way to and through higher education. If and to what extent such support programs are available and whether (refugee) applicants can enrol, depends largely on the individual HEI.

Within the research project "WeGe – refugees on their way to higher education", I am working on my dissertation, focussing on whether governance and administration actors understand and position refugees as a part of higher education internationalization and how different positioning in connection with different strategies of integration and internationalization influence the self-perception, aspirations and academic achievement of refugees; also considering the influence of educational background as well as social, economic and cultural capital on the positioning and the academic achievement of refugees.

In this paper, I will first identify specific challenges for refugees on their way to German higher education and the way HEIs address them. After that, I'll reconstruct and compare the perspective of different HEI-members on refugees. The aim is to establish a comparative perspective on various positionings and strategies and to develop a hypothesis on their influence on prospective refugee students. Therefore, I will analyse internationalization concepts as well as access and integration strategies for refugees in addition to qualitative interviews with prospective refugee students and expert interviews with higher education governance actors at different HEIs in Germany. I will relate the results of content analysis to a theoretical framework of organisational and education sociology and forced migration studies and discuss hypotheses on the influence of this positioning on prospective and enrolled refugee students.

RC08-173.4**BERGER, YVONNE*** (*Institute of Sociology, Ludwig-Maximilians-University Munich*)*Eurocentrism in Social Sciences – Does Chinese Sociology Remain Voiceless in Global Academia?*

My presentation will discuss the question of hegemonic language(s) of publication in a globally connected academic world. This question will be discussed on the basis of interviews which were conducted with social scientists from China (PRC). I will argue that a linguistic eurocentrism in social sciences produces a structural voicelessness of the 'other' in academia. On the basis of the empirical data I will discuss the role of eurocentric practices of publication in a system of global knowledge production. In the presented empirical data the social scientists talk about their challenge how to voice their academic findings on a global level. The interviewees link this question essentially to their choice of language in their publications. In their view English is required as a hegemonic means of communication to be recognized in a global academic system. The discussion of these empirical findings raises more general questions of language and knowledge legitimization, their embeddedness in a neoliberal exploitation logic and the question if English is the hegemonic language of academia. Therefore I want to link my empirical data to questions of how this hegemony in academia makes certain knowledge unheard and therefore voiceless. And how this practices of publication reinforce hegemonic power relations in global knowledge production.

RC15-296.4BERGEY, MEREDITH* (*Villanova University*)CONRAD, PETER (*Brandeis University*)*ADHD Goes Global: Notes on Variations in Medicalization and Responses to a Diagnosis in 16 Countries*

Sociological research on medicalization has provided important insights into the ways in which social problems come to be defined in medical terms. There has been little research on medicalization occurring beyond national boundaries, especially beyond Europe and North America. This paper is based on an examination of the definitions and treatment of ADHD in 16 countries with an analytical focus on medical, cultural and administrative aspects of the ADHD diagnosis (see Bergey et al., 2018). Until the 1990s ADHD diagnosis and treatment was largely limited to the United States and a few other countries. By 2015 the diagnosis had migrated to many other countries, though its manifestations may differ considerably (Conrad and Bergey, 2014). For example, the prevalence can range from 1% to 15%, in some countries there is a medication-first orientation while others could be called family-intervention first, in some countries an ADHD diagnosis reduces behavioral stigma while in others the diagnosis actually increases stigmatization. Using the case of ADHD as a model we will reflect on the role of states, cultures and markets in the global medicalization of ADHD. Seeing the 16 countries in a comparative frame allows us to begin to analyze differences in global migration and medicalization of this increasingly diagnosed medical category.

RC23-434.11BERGH, ARILD* (*Norwegian Defence Research Establishment (FFI)*)*Heroes and Zeroes: The Anatomy of a Failed Software Project*

Any software use, whether posting messages on Facebook or analysing cancer data, emerges from the work of programmers. Despite this, little sociological work examines programmers and their worlds, where they act as creators, mediators and translators of ideas into tangible applications. Existing work tends to focus on practical aspects such as education or management of programmers or they provide journalistic "hero" accounts that focus on clichés such as all night coding marathons to create compelling narratives with little in-depth analysis. Emerging research areas, e. g. software studies, seem uninterested in empirical work rooted in programmers' social interactions. The programmer is either invisible, or at best, an interchangeable element in a broader discussion.

This paper attempts to fill this gap by examining a failed software project from the inside. The author is a former programmer and current sociologist who in this case provided specifications to external programmers and evaluated the resulting web application. Using a combination of auto-ethnography and document analysis I will apply a micro-sociological perspective to discuss an "ideal type" timeline from the "dream" stage to the "final breakdown". The purpose is to highlight social interactions, power issues and conflicts between different actors' goals and actions, how events were perceived and framed and the role of individual mediators in the larger "software development chain". Using a grounded theory approach for a tentative, initial exploration of very rich data will hopefully lead to further research regarding programmers and their roles in science and technology.

Understanding software development failures also have a value in itself. Although failure is fetishized in start-up environments, the reality is that in most cases failure happen in custom software development; thus a real-world need goes unfulfilled. Evaluations tend to focus on management issues; this paper will thus also provide additional perspectives for assessments of such failures.

RC01-45.6BERGH, ARILD* (*Norwegian Defence Research Establishment (FFI)*)*Rebel with a Temporary Cause: The Asymmetrical Access to Distrust, Hipness and Intensity As Resources in Cyber-Conflicts*

Research indicates that online interactions can be more conflictual and aggressive than face-to-face interactions. This, combined with a sense of exclusion among certain constituencies in mature democracies, can provide an opportunity to harvest angry online exchanges as a form of free, crowdsourced microwork, similar to Amazon's "Mechanical Turk" marketplace. The energy expended in brief, angry online exchanges can thus be funnelled into a broader cyber-campaign against a target.

This paper suggests that the political term "useful idiots", meaning someone who is not fully aware of the implications of a cause they (temporarily) support, can be used as an analytical lens to examine how negative campaigns in cyberspace, whether voluntary or organised by governments, attract additional support. It will examine the asymmetrical access that parties have to non-tangible resources which may help recruit such supporters. Resources include distrust of authorities, the hipness that comes from rebelling and the equivalent of an endorphin rush that may arise when participating in online attacks on individuals. Being against something is more exciting than defending the current situation;

the fact that it may be unsustainable does not matter to those who want to attack the status quo. This also ties in with the attention economy where actions that provide higher-intensity affects while demanding less investment in time will be more successful than actions by nation-states who need to consider more diverse needs.

To examine the implications of this for the defence of the nation state this paper will unpack recent examples of well documented cyber campaigns, such as "gamergate" and the use of so-called fake news in the 2016 US election. A particular focus will be on how those trying to defend nation states can be overwhelmed in cyber campaigns by the sheer number of temporary followers of the attacker, i.e. the useful idiots.

RC04-83.3BERGSTRÖM, YLVA* (*Uppsala University*)*Sustainability, Higher Education of Civil Engineers and the Art of Social Engineering in Sweden*

Sustainability, Higher Education of Civil Engineers and the Art of Social Engineering in Sweden

Sustainable Development (SD) has become a catch word in contemporary educational debate and even become a metaphor for welfare in Sweden as well as many other countries. This paper analyze SD as an area of education during the period 1993-2010 at Royal Institute of Technology in Stockholm, one of the elite institutions in higher education in Sweden. The main focus is the change in content in this area of education and its nearby areas of knowledge: ecology and environment, and how the recruitment to these courses and programs has developed over time: analyzing students' social origin, admission qualification, gender and students educational strategies. It is shown that a higher proportion of female students enter engineering programs profiled towards sustainable development. The paper also disclose SD as an area of education that has shifted from specific knowledge of environmental protection towards abstract skills and insight into the social environment of engineering as a technology. In this sense SD is interpreted as a general ethical subject within the engineering programs. It appears the art of "social engineering" is occupied by its opposite, according to which it is the civil engineer who enters areas where social science traditionally hold a prominent position and addresses social and political issues.

RC55-907.7BERHEIDE, CATHERINE* (*Skidmore College*)*The Effect of Increasing Satisfaction with Work-Life Balance on Faculty Wellbeing*

Employed parents often struggle to reconcile their work and family lives. The demands of work, such as the number of hours worked, and the demands of home, such as caregiving, are the main sources of work-family conflict, which can have a negative effect on employees' quality of life. For university faculty, the years immediately following receipt of the doctorate are critical for launching one's career and for starting a family. This overlap between the prime childbearing and working years may negatively affect the wellbeing of faculty who want to combine a career with a family.

Using data from the 2009 baseline and the 2012 follow-up survey of work life administered to faculty at two elite private liberal arts colleges in the United States, this paper examines whether increases in satisfaction with work-life balance between 2009 and 2012 predicted a higher score on the nine-item wellbeing index (happy, fatigued, stressed, nervous, depressed, short-tempered, well rested, healthy, and physically fit) in 2012. The 2009 survey had a 70 percent response rate with 237 responses, 136 of whom also completed the 2012 survey.

OLS regression analysis revealed that controlling for hours worked, the college of employment, faculty rank, marital status, parental status, gender, race, and age, a positive change in satisfaction with work-life balance between 2009 and 2012 significantly predicted greater self-reported wellbeing in 2012. One measure of work demands (rank) and one measure of family responsibilities (children) were also statistically significant predictors of wellbeing. Full professors reported greater wellbeing than those in lower faculty ranks. Faculty with children reported lower wellbeing than faculty without children. These nine variables explained 20 percent of the variance in faculty wellbeing ($R^2 = .197$; $p < .05$). To improve faculty wellbeing, universities need to improve faculty satisfaction with work-life balance by providing a more family-friendly workplace.

RC35-638.1BERIAIN, JOSETXO* (*Universidad Pública de Navarra*)PEREZ-AGOTE, JOSE MARIA (*Public University of Navarra*)*Cultural Performance, Creativity and Social Change*

Social performativity and social creativity are the two sides of the same token. In this paper we analyze the ingredients needed to build up a theory of social creativity borrowing ideas from Georg Simmel, Cornelius Castoriadis and Hans

Joas. With this theoretical frame we analyze modern forms of social action that express social creativity. Creativity and performativity go together. Those types of social action embody, are carriers of social creativity and, therefore, social change. Thus we study the rise of the carisma as well as the rise of the first modern revolutionary personality according to Max Weber, the power of modern collective revolutionary mobilization in Tocqueville, the power of collective effervescence and the new modern resacralizations according to Emile Durkheim and the power of social performativity and "re-fusion" according to Jeffrey C. Alexander.

From Tips and Tricks to Ideology and Empowerment: Adopting Liberal Feminism to Encourage Makeup Use on the Internet

This paper explores the recent adoption of liberal feminist concepts such as self-empowerment by authors of makeup-related articles on the Internet. I use qualitative analysis to code and identify themes of 24 makeup-related non-advertisement articles targeted at girls and young women. According to the authors of the articles, the main problem surrounding makeup is "makeup shaming," or, the discouragement of women from wearing makeup. Makeup use, thus, is a subversive and feminist response to this "dominant" norm of makeup shaming. According to the articles, makeup use is a feminist act because it is an expression of agency and a vehicle of empowerment. I evaluate these claims and ultimately argue that makeup use is not a feminist act because individual acts do not lead to social empowerment. I also argue that the idea of makeup shaming as a dominant norm is a red-herring meant to encourage the use of makeup. The true dominant norm coerces girls and women to wear makeup as part of the general encouragement of their conformity to the subordinating construct of femininity.

Determinants and Role of a Business Meta-Organization in Regulatory Changes and Market Development

Crowdfunding is a growing financing system. Its emerging business models deeply disrupt traditional banking activities, but also pose risks for consumers and therefore call for the development of new regulatory frameworks around the world (Philippon, 2016). How may crowdfunding platforms collectively organize to successfully dialogue with public actors and develop a new regulatory framework?

In France, January 2013, a legislative assembly commission invited crowdfunding platforms to a hearing to initiate a dialogue about the regulatory requirements to develop the market. Rapidly during the meeting, participants realized that the hearing was destined to fail for a lack of structured collective action. Our article examines this specific moment in time, when participants realized that they needed to organize themselves in an industry representative capable of engaging in regulatory dialogue. This representative took the form of a meta-organization named "Financement Participatif France".

The paper studies how this meta-organization emerged and developed from an informal network. It also analyzes how the MO contributed to co-construct crowdfunding's regulation with public actors, thus breaching half a century of banking monopoly. Our methodology builds upon a body of legal literature and interviews to reconstitute sequences in this co-construction and identify determinants and roles of the meta-organization.

Our results show that the transformation of collective action from an informal network into a strong meta-organization happened by: 1) defining governance mechanisms within the meta-organization, 2) borrowing legitimacy from traditional sectors such as consulting or banking, and 3) ensuring market trust by building members' ethics. The MO became a strong and credible device for Business Collective Action, which facilitated the successful co-construction of industry regulations. This article helps develop the idea of an "organizational gap" in policy networks, i.e. the lack of a structured intermediary in negotiations and regulation, that meta-organizations may fill under certain conditions.

Meta-Organizations and Inter-Organizational Arrangements: A Partial Organization Framework

Recently, scholars have called for increased collective research efforts to theoretically and empirically investigate meta-organizations (Berkowitz & Bor, 2017; Lawton, Rajwani, & Minto, 2017; Spillman, 2017). The concept of meta-

organization (Ahrne & Brunsson, 2005), covers a broad range of phenomena of collective action among organizations. Berkowitz and Bor (2017) show that while there is a growing understanding of the nature and functioning of meta-organizations, little work has closely examined differences between them and other devices for inter-organizational coordination and governance. Yet, Bor and Cropper (2016) have highlighted that meta-organization theory can richly borrow from multi-partner alliances literature (see for instance Das, 2015), whole networks (Provan, Fish, & Sydow, 2007) or other interorganizational arrangements (Phillips, Lawrence, & Hardy, 2000). Understanding where meta-organizations stand in the broad range of collective action among organizations is a critical issue to further develop a "European school of meta-organization".

In this paper, we compare inter-organizational arrangements, including meta-organizations (Ahrne & Brunsson, 2005), policy networks (Jordana & Sancho, 2005), multi-partner alliances (Das, 2015), industrial districts (Becattini, 2004), and supply networks (Harland, Lamming, Zheng, & Johnsen, 2001). To do so, we develop a framework based on the concept of partial organization (Ahrne & Brunsson, 2010). For each arrangement type, we review five criteria: hierarchy, membership, rules, monitoring and sanctions. We then attribute grades for each criterion (from 0 to 5) depending on the level of strength. This leads us to develop spider-web diagrams for each inter-organizational arrangement, allowing us to compare them based on a partial organization profile.

This paper compares types of inter-organizational arrangements with two main objectives: 1) applying an organization theory framework to a literature that has mainly been using network theory, thus contributing to contrast inter-organizational arrangements 2) positioning meta-organizations on the spectrum of inter-organizational arrangements thus providing finer theoretical understanding of meta-organization's nature.

MACNEVIN, MAGGIE (Ryerson University)

Research with Children: Ethical Issues and Dilemmas of Power

In this paper, the three authors discuss ethical issues and dilemmas of power connected to experiences of conducting research with children in three qualitative studies. All of the children participating in these research studies were enrolled, or had been enrolled, in a laboratory school childcare setting, and ranged in age from two and half to six years. Two projects, one building upon the other, explored children's perceptions of their experiences in two different learning environments. Another project sought to explore children's perceptions of 'race' and racial identity. The authors reflect upon their experiences with the goal of provoking further thought and discussion on how we might move towards a more equitable and fuller participation for children in research. Uncertainty and new and unanswered questions emerge through the discussions of the various stages of the research process. More specifically, we consider issues of: adult-initiated research; researcher's positionality and social location; gatekeepers; consent and assent; and conversation and drawing as data collection methods. Looking towards future research, recommendations based on lessons learned are offered.

Webdocs Interactivos: Reflexiones Sobre La Construcción De Alternativas Narrativas, Procesos Artísticos Colaborativos y Sus Implicaciones Como Sistema Complejo De Información

El cine es un importante medio para la construcción de imaginarios sobre el mundo, se ve trastocado por el surgimiento de las tecnologías digitales audiovisuales y la utilización de la computadora. Con la evolución de los procesos cinematográficos digitales basados en el ordenador, a finales de la década del 2000 surgen los *webdoc* interactivos; formas híbridas donde confluyen el género cinematográfico documental y la operatividad de un sitio web. Estas propuestas incorporan elementos como la hipermedialidad y la interactividad con el usuario para generar una estructura rizomática y una narrativa no lineal. Esto implica un cambio en el paradigma de construcción de discursos de no ficción. El presente estudio es un análisis de dicha transformación a partir de tres *webdocs* interactivos: *Prison Valley* (2009), de Philippe Braut y David Dufresne; *Mapa Fílmico de un País* (2012 -), del colectivo MAFI TV; y *Las Sinsombrero*, de Tania Balló (2015). Esta obra nos permite identificar de los elementos principales del cambio de paradigma: a) las formas alternativas de montaje cinematográfico que permiten que las películas habiten fuera de su dispositivo tradicional; b) los diseños colaborativos que permiten la participación del usuario -normalmente pensado como espectador-, lo cual trastoca la experiencia cognoscitiva del mismo; c) los procesos de investigación que, a través de un medio artístico, permite el *webdoc* interactivo; y d) la organización de la investigación en un sistema de información con características similares a las descritas por Edgar Morin como propias de la epistemología de la complejidad; tales como el reconocimiento de la presencia del sujeto, el conocimiento como organización de datos bajo una lógica que

admite su imperfección y que permite la interacción con la sociedad y que esta exprese sus dudas con respecto a la información presentada.

BERNARD, GODFREY ST.* (*The University of the West Indies*)

Historical and Projected Population Dynamics of Caribbean Youth Populations: Implications for Youth Policy Agendas

Population dynamics are reflected in changes in the sizes and composition of youth populations in all societies and have a profound impact in shaping current and prospective youth policy agendas. This paper traces such dynamics over a period of one hundred years beginning in the post World War II period and ending in 2050. These dynamics permit today's governments to learn from the errors of earlier administrations and appreciate the power of population dynamics in informing pro-active thrusts toward framing youth policy for subsequent generations.

Given such policy thrusts, the paper focuses on population dynamics in six Caribbean countries - Barbados, Belize, Guyana, Jamaica, Saint Lucia and Trinidad and Tobago. These dynamics are explored to discern the extent to which cohorts of youth in the immediate post-independence eras, may have been disadvantaged due social planning strategies that may have either overlooked or inappropriately addressed population dynamics in framing youth policy agendas. Specifically, the paper seeks to demonstrate the value of social planning in embracing population dynamics as a pro-active mechanism for bestowing advantages upon emergent generations of youth between 2020 and 2050.

Secondary data are obtained from all population census counts in each of the six countries between 1946 and 2012. From the mid-2010s until 2050, population projections are provided in accordance with five-year intervals. Descriptive statistics are used to link changes in youth population sizes to the variable fortunes of different youth cohorts in their quest to participate in education at different levels and in their pursuit of labour force activities.

Notwithstanding similar youth demographic trajectories that are likely to characterize emergent youth populations between 2020 and 2050 in each of the six countries, current socio-demographic outcomes characterizing the first decade of the 21st century imply that some countries may experience likely differences in framing their youth policy agendas.

BERNARD, LISE* (*CNRS*)

Les Rapports De Pouvoir Chez Des Précaires En Col Blanc. Enquête Sur Les Négociateurs Immobiliers.

Les négociateurs immobiliers ont pour tâche de chercher des logements à vendre et de leur trouver des acquéreurs. Ils peuvent être indépendants ou salariés. Dans ces deux cas, ils se trouvent en fait dans des situations hybrides entre salariat et indépendance : les négociateurs indépendants au regard du droit du travail travaillent pour des entreprises leur demandant de respecter des règles qui ne sont pas toujours loin de certaines formes de subordination ; quant aux négociateurs salariés, leurs rémunérations sont en grande partie déterminées par les ventes qu'ils réalisent et leur avenir économique est ainsi très incertain. Cette communication analysera les effets de ces conditions d'emploi sur les manières dont les négociateurs exercent leur travail, sur les relations et les rapports de pouvoir qui se nouent entre collègues, et sur les revendications des négociateurs. Elle s'appuiera sur une enquête ethnographique attentive au travail et aux styles de vie des négociateurs immobiliers, ainsi que sur des analyses statistiques menées à partir des enquêtes Emploi (INSEE)[1]. On montrera, tout d'abord, que les négociateurs sont conduits à déployer diverses stratégies pour trouver des biens à vendre, à trier leur clientèle, et à vivre les négociations avec leurs clients comme des rapports de force. Nous verrons ensuite que, au sein des agences, la concurrence entre négociateurs est particulièrement vive, que l'argent est source de prestige, d'influence, et qu'il est au cœur de tensions récurrentes. Nous montrerons aussi que ces tensions s'accompagnent de nombreux moments de complicité. Enfin, nous analyserons les revendications des négociateurs les plus précaires et montrerons que la très petite taille des entreprises et les rapports – souvent ambigus – qu'ils entretiennent avec l'indépendance limitent la mise en place d'actions collectives.

Une Mobilisation Improbable Dans Les « Zones Grises » De l'Emploi. Le Cas Des Chauffeurs VTC En France

Uber symbolise l'émergence d'un nouveau modèle économique dans lequel les entreprises prennent la forme de plateformes numériques et jouent le rôle d'intermédiaires entre clients et prestataires de service indépendants. Si Uber a attiré en France 15 000 « partenaires » en quelques années, des tensions sont néanmoins rapidement apparues. Après la mobilisation des taxis, ce sont aujourd'hui les chauffeurs des plateformes eux-mêmes qui s'organisent contre Uber. Des premières contestations devant le siège ont lieu à l'automne 2015 et c'est une contestation plus organisée et institutionnalisée que l'on observe en hiver 2016.

Au moment de son implantation en France, les conditions tarifaires proposées permettent aux chauffeurs VTC de se dégager des niveaux de rémunérations relativement élevés. Ils apprécient le fait d'être des travailleurs indépendants et de bénéficier d'une forte autonomie au travail. Cependant, une fois qu'Uber s'est imposé comme un acteur incontournable dans le secteur, les conditions tarifaires ont été revues à la baisse. Bien que travailleurs indépendants, les chauffeurs VTC deviennent ainsi de plus en plus dépendants des applications. Ils s'organisent alors collectivement pour résister à l'emprise et à l'influence des applications. Or au vu de leur statut d'indépendant, de leur jeune âge et de leurs parcours sociaux, ces mobilisations semblent à de nombreux égards largement improbables. Comment débute et s'organise cette mobilisation ? Quels sont leurs représentants ? Quelles sont les registres d'action mobilisés ? Quelles sont leurs revendications ?

Pour traiter ces questions, nous nous appuyons sur les résultats d'une enquête en cours s'inscrivant dans un projet de recherche collectif portant sur le « capitalisme de plateforme » (ANR CAPLA). Le matériau mobilisé comprend des observations de manifestations, des entretiens avec des chauffeurs VTC et avec des représentants de chauffeurs, les résultats d'un questionnaire passé auprès de chauffeurs, l'analyse des échanges sur un forum de discussions.

lot Opportunities and Challenges in Developing Countris

Terms such as smart cities smart data and smart world have become part of our daily language. We have grown accustomed to connectivity in this digital age. The mechanisms through which data, cities and the world become 'smart' however derive what is now being called Internet of Things (IoT) or the ability of remotely connecting devices and interact with them wirelessly. IoT, it will be argued, can be seen as a metaphor, indicating the metamorphosis of our attitudes and behaviors, as well as subjectivities.

Digitization of human existence, although not a new issue, is being further transformed through and thanks to IoT. This paper will address the potential effects of IoT on the life of citizens in the developing countries such as Iran. Particular emphasis will be put on the positive consequences of IoT such as a growing sense of responsibility toward others and the environment. The aim is to demonstrate how connectivity can go hand in hand a growing sense of responsibility and social cohesion.

Unfolding the Mechanisms of Compensatory Advantage: An Instrumental Variable Approach

In this paper we study how previous school results affect parental responses and expectations concerning the age at which their children will leave the educational system. We are particularly interested in how these responses and expectations vary depending on parental socio-economic status, in the case of poor academic results. Our analysis draws upon the longitudinal survey "Panel d'élèves du second degré, recrutement 2007-2013". We start with naive OLS regressions with measures of parental responses and expectations as dependent variables, and social origins and previous school performance as independent variables. Previous school performance is measured with the results in a national test at the beginning of lower secondary education and with a dummy that distinguishes those who have repeated a year during primary education. In the next step, we address the issue of the possible endogeneity of previous school performance using an IV framework. The IV analysis is our specific contribution to the session. As instrument we use month of birth. Previous studies have shown

that in countries like France with a strick rule for admission to primary education based on the date of birth, those born just before the cut-off date for admission are at higher risk of retaking one year and have lower school results. Previous studies have also shown that month of birth is not related to social class or to other factors that might affect parental responses or expectations, outside the causal path through school performance. Preliminary results suggest that the effect of previous school performance and also its heterogeneity by social origin is larger in the IV estimation. Our study is important because it sheds light on the mechanisms underlying compensatory advantage ie. the disproportionately large likelihood to move on to higher education for initially low performing students from socio-economically advantaged social background.

Different Disasters, Differential Impacts: The Effect of Droughts and Floods on Women's HIV Burden in Developing Nations

Environmental change is an under-examined factor impacting women's health, globally. Climate-related disasters lack research in their connection to HIV, but nevertheless potentially have a tremendous impact on women's health in a variety of ways. Drawing on ecofeminist perspectives as a theoretical basis, I conduct analyses examining if the HIV burden among women is higher in nations that experience elevated rates of floods and droughts. In so doing, I examine whether different disasters impact women's health in different ways. Specifically, I posit that droughts, which are unpredictable, prolonged, and less understood, more negatively affect women's HIV burden than floods. I utilize two cross-national datasets and conduct ordinary least squares (OLS) regression to explore and interpret these relationships between climate-related disasters and women's HIV burden across developing nations. Overall, the results support the hypotheses, and also reveal important interaction effects between droughts and urban growth. Together, these findings suggest that suffering from disasters and moving to rapidly growing urban environments differentially impact women's health, as transactional sex likely becomes a coping mechanism in the face of such hardships.

A Matter of 'access'? an Exploration of the Patterns Leading to the Non-Use of Law in Canada

Despite the numerous reforms aiming at making courts more accessible to citizens in Canada and Quebec in the last 50 years, access to justice is still considered to be a pressing social issue. In line with past efforts to eliminate "barriers" to courts, the problem is generally conceptualized as matter of the judicial system's capacity to meet existing "legal needs", with the emphasis being put on structural issues such as the complexity and formalism of the legal system, the availability of legal information, and the costs and delay required for a judicial decision to be rendered.

The focus put on unmet legal needs suggests that there actually exists an untapped reservoir of problems ready to be seized by the legal system, with little consideration being given to the processes by which specific situations come to be perceived as "legal" ones by social actors, and the reasons why the legal system seems unable to fulfill the existing needs. Our research project aims at examining those questions by shifting the focus from the structural issues limiting access to justice to the subjective constraints (conscience and knowledge of the law, moral conception of justice, anticipated profits...) preventing individuals from either constructing their problems as legal issues or perceiving the legal avenues offered as valuable solutions. Starting from the idea that the non-use of law can result from deliberate choices (*voluntary non-use*), the inability to identify and/or construct problems in legal terms (*involuntary non-use*), or the differential impact of certain characteristics of judicial institutions on certain social groups (*provoked non-use*), we propose to document the patterns leading to the non-use of the law and identify the subjective and structural constraints at play in four case studies involving different areas of law (criminal law, consumer law, labor law and youth protection law).

Le Droit Comme « Agent Thérapeutique »? Judicialisation Et Psychiatisation Des Problèmes Sociaux

Nous faisons ici la proposition théorique d'un double mouvement de judiciarisation et de psychiatisation des problèmes sociaux. Ce processus implique la traduction de situations, de comportements, de rapports sociaux en termes experts, psychiatriques et / ou juridiques, impliquant l'exclusion de tout ce qui ne peut être appréhendé par les cadres conceptuels de référence. Cette interface droit-clinique s'observe à différentes étapes du processus judiciaire compris dans son sens large.

À partir d'exemples tirés de nos recherches en santé mentale et en déficience intellectuelle, nous montrerons comment les notions mobilisées dans l'interface sont établies selon une logique binaire (dangereux ou pas, apte/inapte) qui excluent la complexité des réalités cliniques. Elles sont considérées par les cliniciens comme difficilement opérationnelles et aucun consensus n'existe dans la communauté scientifique sur les méthodes d'évaluation. Elles sont pourtant mobilisées de façon récurrente pour gérer les problèmes sociaux et produisent leurs effets.

De même, toujours à partir de nos recherches, nous discuterons des enjeux méthodologiques alors qu'une pluralité de professionnels aux formations diverses produisent des évaluations dont la cour ne peut apprécier les fondements scientifiques.

Nous concluons en discutant de la remise en cause de l'interface droit-clinique par les tenants du mouvement de la jurisprudence thérapeutique. L'incapacité des tribunaux de répondre aux besoins de certains groupes sociaux ainsi que la volonté des juristes de contribuer au changement social se transpose dans la mise en place et la multiplication des dispositifs d'adaptation judiciaire avec l'ambition explicite de faire du droit un agent thérapeutique.

BERRA, MARIELLA* (*University of Turin*)

A Long Path to Full Citizenship. Women and Technology

Gender digital gap is based on a gender stereotype that affects women jobs and careers in one of the most promising economic sector. Despite their higher qualifications, women have often little presence in most qualified and well paid tasks, while men are advantaged in technical, scientific, executive and entrepreneurial roles. Furthermore, there are whole segments of the ICT labor market in which women are absent. Women under-representation reinforces traditional power dynamics between men and women. If the information technology sector represents the future, women seem to be partially excluded. Technology is still stereotyped as a male role. This bias is strengthened through a vicious cycle that sees young student girls still poorly oriented (primarily by families, but also by the school and the social representation of technological professions) to STEM (Science, Tech, Engineering, Math) choices.

The present paper aims to provide a review of the research on Italian and Piedmont situation in a comparative European perspective through secondary institutional databases, taking into account the areas of education, labor skills and careers. The goal is twofold. On one hand I want to provide deep insights of this complex phenomenon based on some statistical evidence. On the other through case study analysis. I want to identify the actions implemented by the Digital Agenda of Piedmont in order to reduce the gender digital divide. In particular, the paper will evaluate the way in which public and private interventions and policies, addressed to Millennials generation, reach the goal of bridging the gender digital gap in order to offer new and adequate opportunities for future professional career of young women coming out from high school courses or universities.

BERRA, MARIELLA* (*University of Turin*)

Pluralization and Democratization of Innovation Sources. the Relation between Producers and Users.

The last twenty years have seen the rise of a third way to produce innovation, characterized by a pluralization and decentralization of sources of innovation. This mode outlines a form of democratization based on the relationship between producers and users that is defined as a "private collective innovation model. Protagonists are often non-economic private subjects who, through a cooperative exchange in global learning process, contribute to the creation of an innovation heritage available to everyone, which may constitute a public or collective good. On the base of literature and empirical research on digital entrepreneurs, the paper will provide a framework for this new model, describing characteristics and advantages for SME, big companies and local economy.

The aim of this paper is to highlight how models of innovation in the ICT sector, strongly marked by open and cooperative relationships are likely to promote an appropriation and a widespread use of ICT through the involvement and participation of a variety of social actors. Starting from the relationship established between the technologies and its use it could become possible to think of appropriate ICT policies that facilitate the interconnections between people, ideas and resources in different contexts of action. In fact, many innovation policies, including the European ones, are already based on the assumption that promoting innovative processes requires not only an increment of investments in enterprise activities but also an increasing process of mutual involvement of enterprises, public players, research centers and users. This line of actions goes beyond the

well-known triple helix models. In fact the massive entry of innovative collective actors suggests the need to add a fourth helix, which is activated by individual involved in innovative activities for both ethical or utilitarian reasons.

Divergent Perspectives in Care Dyads on Remote Monitoring and What That Portends for Older Adults

Increased use of passive remote monitoring technologies is based on the assumption that diminished privacy, autonomy and other risks are outweighed by new efficient means of enhancing safety, reducing hospitalizations, and allowing people to remain living in the community; however, the potential benefits and harms of these socio-technical practices fall differently to older adults and family caregivers. We report findings from a dyad study that employed cognitive-based interview probing and value-centered design techniques to understand how older women and their adult children think about GPS location tracking, activity sensing, and webcams – three categories of technologies that are now covered in the U.S. through Medicaid home and community-based services programs in some states. Individual interviews were conducted with 18 Meals on Wheels clients and 10 adult children. We compare their assessments of each technology's impact on privacy, safety, independence, freedom, relationship with family member, social life, and identity, as well as the meanings each participant attached to "privacy" and "independence." Older adult participants found each technology less appealing than did their children, and children underestimated their mothers' ability to comprehend the technologies. This underestimation influenced the extent to which children reported they would seek their consent. Adult children perceived that they have the ability to persuade their parents to adopt those technologies that the adult children found useful despite anticipated resistance. For both groups, privacy was the most-cited concern, but participants perceived overlap and interdependence between values of privacy, independence, identity, and freedom, highlighting privacy's instrumental role in enabling and protecting these values. Differences in perception of need for and comfort with these devices have not previously been examined. These findings describe significant differences that should be understood to promote remote monitoring practices and public policies that are consistent with older adults' values and to prevent conflict and caregiver overreach.

Kinship and Politics in Mexico.

Kinship and Politics in Mexico.

The anthropology of kinship is closely linked with belonging to a social group, the transmission of heredity and the rights of a lineage, and even influences the dynamics of social relations. Basically, Anthropologists recognize four types of social relations of kinship: consanguinity or blood, affinity or marriage also called political kinship, ritual like compadrazgo and adoption. Based on authors such as Peter H. Smith and Roderic Ai Camp, among others, we analyze the change and continuity in political career structures, the issue of elections, the Mexican political system, organized crime, violence and security in Mexico as well as the always complicated relation with the United States to explain the dynamics of the succession of those who occupied leadership positions. In the light of the above, the research attempts to apply the ethnographic methodology of anthropology to the analysis of social relations of kinship to elucidate the extent to which they have influenced the trajectory of some characters of the Mexican political system to try to explain how and, above all, why there are individuals who, without being part of the political elite, become part of it, or how, being part of it, they even inherit via kinship their charges to their descendants or related, ritual or even adopted relatives.

Genetically Unsound?: Science, Technology, and Risks in Salmon Production

Rapid advancements in the field of genomics in recent years have produced technologies that are revolutionizing human-environment interactions. New levels of precision in our capacity to understand and alter plant and animal genomics are pushing the boundaries of environmental sociology to consider genes as important objects of sociological inquiry. This paper uses the controversies around salmon hatcheries in Canada and the United States to look at contrasting

perspectives on the social construction of nature and ecological modernization in environmental management. Hatchery programs have responded to declines in Pacific salmon stocks by breeding juvenile salmon and releasing them into rivers and waterways. However, genomics research has shown that hatchery-produced salmon are biologically and behaviourally distinct from "wild" salmon, fostering concerns that hatchery salmon are replacing vanishing wild stocks and polluting their gene pools. Two key debates have emerged: are hatchery fish wild? And, should hatcheries be "modernized" through technological innovation or should they be closed to protect wild stocks? We trace these two debates through an analysis of interviews with 20 genomic scientists and 25 hatchery managers in Canada and in 234 newspaper articles from 2005 to 2015. We demonstrate that conflicting constructions of nature at the genomic level have consequences for environmental governance (e.g. endangered species protection) and can forestall solutions to environmental issues. These findings suggest the need to move beyond perspectives that treat nature as socially constructed to also consider nature itself as a constructed entity.

BERSETH, VALERIE* (*University of British Columbia*)

Privileging the Few: Boundary Work and the Multiple Roles of Expertise in Environmental Decision-Making

Although environmental governance and decision-making has conventionally been the exclusive domain of scientific experts, several Western countries have experienced a "participatory turn" that has opened government and scientific institutions to greater participation of non-experts. Recent work in environmental sociology has emphasized the need to examine the power dynamics of expertise that frequently privilege a narrow definition of legitimate knowledge. In this paper, I draw on scholarship on boundary work (Gieryn, 1983) to examine how divisions between experts and non-experts were constructed and reinforced in the 2009-2012 Cohen Commission of Inquiry. Following record-low returns of sockeye salmon to the Fraser River in British Columbia, the commission held public forums and gathered evidence from 179 "expert" and "non-expert" witnesses to determine what factors caused the decline and made policy and management recommendations to the Canadian government. Experts were overwhelmingly scientific researchers, while non-expert participants included First Nations and Canadian government representatives, local fishers, NGOs, and fishing industry members. Through an analysis of the procedures, transcripts, and final reports from the inquiry, I find that although public engagement was a key objective of the inquiry, participants designated as experts were substantially more involved than non-experts in both the design and the content of the inquiry, which elevated the importance of scientific knowledge and knowledge-holders in the decision-making process. In addition to understanding expertise as performative or relational, I argue that institutionalized boundaries between experts and non-experts can undermine efforts to support public participation in environmental governance.

Dynamics of the Results of Brics Countries in the Ranking Web of Universities (2012-2017)

The paper presents the results of a study on the development of mass higher education in BRICS based on the analysis of Ranking Web of Universities - the only international university ranking that promotes the development of mass higher education.

Tasks of the analysis: study of the dynamics of BRICS performance.

Indicators: number of national universities starting with the top 2000: N_{2000}^*

N_{3000}^* , N_{4000}^* , N_{5000}^* , N_{10000}^* , N_{20000}^* , N_{25000}^*

Results:

India leads the scale of mass higher education and the pace of its development. A sharp increase in the number of ranked universities in July 2016 (2,5 times) provided India with the first place in the world in terms of N_{25000}^* . Since July 2015 India is in top ten countries with six out of seven indicators. However the quality of education in mass universities remains low: the quality indicator (ratio N_{5000}^* to N_{20000}^*) is only 12-13%

China ranks third in the world in number of ranked universities (after India and the USA). It leads the BRICS by the quality of education and is among the top ten world countries by all seven indicators. In relation of N_{5000}^* to N_{20000}^* China ranks second among countries with a large-scale system of higher education (after the USA).

Brazil and Russia are close by the scale of higher education. But the quality of mass universities in Brazil is higher than in Russia. Brazil consistently enters the top ten countries by six indicators; Russia since July 2015 - only by four. According

to the conditional quality indicator Brazil ranks second in the BRICS; in Russia this indicator is extremely low (10%).

Taking into account demographic factors, it can be stated that attention to the problems of youth in these countries will determine the pace and ways of developing mass higher education on a global scale.

Indicators of Achieving the Competencies of Graduates and the Quality of Mass Higher Education

The low quality of mass higher education is one of the global causes of social inequality in education. The aim of the research is the formation of competencies of graduates as a means of improving the quality of mass higher education.

The methodology for forming competencies is based on the identification of indicators for achieving each competency and the distribution of all indicators according to the elements of educational programs. It will allow to increase the effectiveness of each element in the formation of professional competence of graduates.

Stages:

- Monitoring of Russian educational programs for bachelors and masters regarding the formation of competencies of graduates;
- Drawing up the list of indicators for achievement of each competence;
- Definition of the descriptors for each indicator;
- Distribution of competency indicators and descriptors by the elements of the educational program.

Results:

1) Based on the analysis of domestic and foreign documents there were proposed the lists of indicators for the achievement of universal competencies. For ensuring continuity of educational programs of different levels it is provided the development of each indicator from bachelor to master;

2) professional-level descriptors are proposed for each competency indicators. Using the example of educational programs in Sociology, it is shown an approximate distribution of indicators for the achievement of universal competencies;

3) there are given the examples for achieving bachelor and master degree competencies in Sociology with labor market requirements.

The proposed lists of indicators for achieving competencies are planned to be introduced into the educational programs of Russian universities after the stage of discussion. For mass use in Russian universities the main criteria are: clarity in the wording of indicators; verifiability of indicators; completeness of the lists of indicators for each competence; the development of each indicator from a bachelor to a master.

BERTAUX, DANIEL* (*Dynamiques Européennes, Université de Strasbourg*)

Two Styles of Biographical Research

German-language scholars are numerous in biographical research. Many of them seem to believe hopeless to ascertain the degree of "truth-value" of life stories. They have developed complex *hermeneutic* procedures for making explicit the implicit levels of meaning that are entrenched in interviewee's mind. They see this psychological step as leading to another, sociological one, as society is constructed by individuals acting according to their mind's (diverse) semantic structures. The next step however is quite steep...

Another way to proceed is the reverse. The researcher will first choose to focus and study a small piece of the mosaic (it was done e.g. with the artisanal bakery in France – a *social world* in H.S. Becker's sense – or with the *category of situation* of poor lone mother in various European countries). Then s/he will, among other observation methods, collect life stories of differently-located actors (e.g. as bakery apprentice, bakery worker, baker, or bakers' wife) as *testimonies* about their lived experiences in the bakery's social world; or as lone mother in various European countries with diverse social rights systems, e.g. Sweden vs. Portugal). While interviewing, and later on analysing and comparing narratives, researcher will keep in mind the kind of socio-structural relations, recurrent configurations, generating mechanisms, logics of situations and logics of action, dynamics from conflicting interests, unwritten rules of games, recurring moves from given situations to resulting courses of actions, and other sociological features of the underlying fabric of the *societal piece* under study (social world or life situation). As such focused life stories get collected and analysed, recurrences will emerge from one

to the other, leading testimonies to cross-check each other (thus solving the issue of their truth-value) and opening the door to first generalisations, to be critically examined and confirmed only after a search for "negative cases".

BESCHERER, PETER* (*University of Tubringen*)

Facing the Populist Challenge – Bringing Labor Movements and Urban Social Movements Together

Social change (precarious work, labor market liberalization, workfare programs etc.) has broken up the connection between wage labor and social security and has caused fear of losing social status among many people. Furthermore, wage labor has lost social recognition. Labor is hardly considered a reason to feel proud and the working class is usually represented by the so called underclass. In both respects, material as well as cultural, the transformations of labor bring about worries and frustrations for the working class. Working people consider unions and parties to be part of the elite that has betrayed them and prevents them from enjoying the fruits of their labor.

Next to the working place housing and neighborhood are crucial points for peoples political attitudes and ideas of society. The less labor could cover social security and the more it loses its reputation, the more important those other ways of social integration become. Urban politics is, however, as well a site of insufficient democratic representation as labor. But it also became a major issue for social movements all around the world. They address the whole range of people who suffer from the rejection of their material as well cultural interests. Urban social movements, therefore, are important for initiating a counter-movement. Cross-movement building means to address common interests (e.g. the distribution of the surplus value on the job and on the housing market) but also to bring the ethical debate among different forms of life and their contribution to a 'good life' back in the liberal political public sphere.

Based on an outline of the "populist gap" in labor as well urban politics, I discuss first empirical findings of urban activism in the struggle against right wing populism conducted in the context of a research project on populism and democracy in urban areas.

BESEDOVSKY, NATALIA* (*University of Hamburg*)

How Non-Sociologists Study the Social: The Case of Social Neuroscience

The traditional divide between natural and social sciences is crumbling. Not only have social sciences started to be interested in medicine, artefacts, technologies, or mathematics. Natural and life sciences have increasingly started studying instances of "the social", be it in epigenetics, evolutionary biology or artificial intelligence studies. Overall, it seems that there is a strong interest of different "hard" sciences to study what is traditionally regarded as the domain of sociology. On the other hand, while there is a huge body of work in science and technology studies studying these "hard" disciplines, less is known about this recent trend to include social phenomena. Using interviews with leading scientists and participant observation in graduate-level courses, this paper studies the conception of "the social" in the field of social neuroscience. It finds that their concept of social behavior is based primarily in philosophical thought, such as theory of mind, and that sociological concepts play almost no role in the development of research designs or curricula.

BESEK, JORDAN* (*University at Buffalo, SUNY*)

On the Logics of Social and Biophysical Change: From the Asian Carp Invasion to the Reversal of the Chicago River

Increasingly unsustainable relationships amongst societies and environments are drawing considerable attention across disciplines. In sociology, this attention has largely focused on developing theoretical frameworks for explicating how various social processes negatively impact the environment, however, what this literature has done less well is develop rich understandings of the other side of this relationship, namely how ecological change can create instability in social processes. To fill this gap, I connect recent theory from environmental sociology geared towards explicitly "bringing nature back in" with contemporary theoretical developments in historical sociology. In particular, I incorporate how George Steinmetz, Neil Gross, Chares Demetriou, and the late Charles Tilly have developed an approach in which social relationships are understood to be loosely structured via interactive causal tendencies, articulated as "mechanisms", which, contingent upon social context, can organize particular sorts of social events. I then demonstrate how biophysical "mechanisms" can also structure social relationships through an extended case study of the interplay between the social and ecological processes related to the introduction of Asian carp, an invasive species that has set into motion considerable contestations across political,

cultural, economic and scientific social processes in the greater Chicago area as well as the Great Lakes. Through this case study I demonstrate how biophysical "mechanisms" such as invasion can impact social processes. I finally provide an historical analysis of the 1900 reversal of the Chicago River to show how social responses to the Asian carp invasion are structured through previous histories, thus demonstrating that the interaction of social and biophysical mechanisms is not, in itself, a single transformative process, but rather a cumulative development generated and constrained via several connected social and ecological histories.

Big Data and Decision-Making in Insurance Organizations

Insurance, manifested in countless forms like health or liability insurance, is a key component of risk management in modern society. In recent years, big data analytics and data-driven algorithms have increasingly influenced the work of insurers and its impact on people's lives. Car insurers often use big data analytics to monitor and analyze the driving behavior and performance of policyholders and adjust their rates accordingly.

Yet although these changes have significant social implications, we know surprisingly little about how digitalization is affecting the organizational processes of insurance companies. We believe that an inquiry into the effects of digitalization on insurers as organizations can hold important insights, as it may also contribute to our understanding of how their processes affect society.

Drawing on an extensive review of existing research and a content analysis of insurance documents, we highlight the following three aspects: First, we see the use of big data as the result of a sensemaking process that has brought a new species of knowledge production into the preparation of decisions. We stress that although new techniques such as data-driven algorithms promise increased analytical precision, they still remain socially constructed interpretations. Second, numbers are excellent "persuaders" because they suggest rationality and objectivity, with the end effect of creating legitimacy. Therefore, big data-based decision-making promises a new dimension of credibility that enables insurers to make a fundamental switch: from solidarity-based policies to insurance based on the principle of individual accountability. Third, the power of digital computing makes it possible for decision makers to be replaced by algorithms. This raises the question of whether automated decisions can actually still be considered decisions and to what extent decision-making, the core element of organizations, is in the grips of transformation.

Hijacking Political Art and Youthful Imagery: The Di Lampedusa Principle

New information communication technologies have promoted a rich repertoire of political communication embodied in digital cartoons, satire, poster art, political memes, music, street art and performance art. These technologies provide an almost global reach and unprecedented opportunities for co-operation which has positive implications for politics and art. In this context I observe the persistence of an old practice: the co-option of political art and images of youthful resistance by traditional power holders.

In this paper I examine contemporary examples of how political art and images are appropriated by traditional power holders. Attention is given to how the material is repackaged, how the political sting is dulled and how the meanings are altered so it is transformed into something else and ready to sell merchandise or promote the agendas of government and other institutions. A series of cases are offered including the appropriation of street art by private and public organizations to sell tourism and to promote institutional policies, and the appropriation of 'Black Lives Matter' protest images by Pepsi to sell soft drink.

In a bid to understand what is happening I draw on theorists like Adorno and Marcuse and contemporaries like Critchley, Goehr and Ranciere who argue that art practice forms a part of the politics of liberation. While their work is helpful I note they omit to say what makes art political. I attempt to clarify the political nature of 'political art' and images of youth resistance as a prelude for understanding what is happening: Do we, for example, see the interest of governments and corporations in 'repressive tolerance' (absorbing critique into safe spaces to neuter or negate the political message)? Or, do we see the *di Lampedusa* strategy in play, a strategy that involves co-opting the symbolism, terminology and expressivity of 'the discontented' to prevent significant change?

BESSANT, JUDITH* (*RMIT University*)

The Great Transformation and the Techno-Axial Age: Politics, Labour and Learning.

The Great Transformation and the Techno-Axial Age: Politics, Labour and Learning.

This paper draws on a five-year research project into the radical transformation arising from new technologies. This transformation is producing socio-cultural and economic changes (eg reduced demand for human labour), how we represent and experience reality and indeed the human condition. I draw parallels with the first Axial age (800 BCE-200 BC) that brought forth our modern (theoretic) consciousness (Jaspers 1954, Eisenstadt 1984, Bellah and Wittrock 2008). Evidence indicates we are encountering a new axial age, what I call a Techno-Axial age that is changing human consciousness.

Critical of determinist and social determinist accounts of technology, I draw on two non-reductionist theoretical traditions: the tradition of historical sociological theories of continuity-change (Comte, Marx, and Weber through Wallerstein, Eisenstadt, Collins and Arnason). It's a historical sociology that engages different orders of time including structural or long time (*longue durée*) (Braudel 1984), the medium time of conjunctures and the short time of events.

The second theoretical frame informing this project is co-evolutionary cognitive science (Donald 1998, Corballis 2015) that focuses on historical and co-evolutionary change over very long time spans, using relational or ecological accounts of the human mind, body, consciousness and culture. For Donald (1998) Corballis (2015) and Tallis (2010), human cognition and consciousness is a consequence of an interactive and evolutionary relationships involving human biology, social arrangements and sites of external cognition and memory (eg language, books, libraries, the internet...). Along with Midgley I argue that such complimentary explanations encourage a linking of the social with and the biological (2004).

I explain how these two traditions of historical sociological and cognitive science, which address the question of change in complementary and insightful ways helps provide an understanding of the transformation now taking place.

Cross-Cultural Measurement Invariance Among German Migrants

An emphasis of many surveys is the measuring of subjective indicators concerning a wide field of topics. The measurement instruments used for these purposes (e.g. batteries of multiple items) rely on the assumption of measurement invariance. This means, that all respondents have a similar understanding of the measured underlying construct as well as each individual item. To compare means of different groups of respondents we must ensure that these groups understand and respond to the questions in similar ways. Otherwise comparison between groups can lead to incorrect conclusions. Previous methodological research has shown that measurement invariance is not given for all instruments and groups. Particularly, differences appear between groups of different cultural background (Davidov et al., 2014). Therefore testing measuring invariance is of utmost importance for surveys including respondents with cultural diversity. The Panel Study "Labour Market and Social Security" (PASS) is an ongoing yearly household panel study of German welfare benefits recipients and is concerned with their living conditions, socio-economic situation and the dynamics of welfare receipt. Culturally the PASS respondents are very heterogeneous due to the large proportion of individuals with a migration background. This is intensified by the rising number of refugees from Syria, Iraq and Afghanistan over the last years, which enter the study through annual refreshment samples. The recent developments and their socio-political implications increase the need for valid sociological insights. To assure comparability between groups of different cultural background we test multiple measurement instruments for multiple subjective indicators in PASS (e.g. self-efficacy, gender role, psychometric measures) using a multi-group CFA framework (see Vandenberg & Lance 2000). We operationalize cultural background using questions on migration background, spoken language, religion and nationality.

BESTE, JONAS* (*Institute of Employment Research*)

The Role of Financial Literacy at the Transformation of Income into Living Standard

In welfare research, many different approaches of measuring welfare have been developed. The most basic distinction is between indirect and direct approaches. Indirect measurement concentrates on the resources available, while direct measurement tries to capture an actual deficiency. The resource approach based on income is the most popular indirect measure. The standard of living approach provides a direct way of measuring welfare. It refers to goods of the household and the pursuit of activities of household members.

The living standard is generated primarily from the available income. However, similar income must not lead to a comparable living standard. There are several reasons responsible for differences in the transmission. In addition to individual preferences, also debts and assets, support networks, household composition and regional differences can affect this process.

In the transmission of available income into living standard also the ability of a person to use knowledge and skills to manage financial resources effectively is of central importance. This ability is described by the concept of financial literacy.

While financial literacy has a large impact on the financial situation, it is supposed to have also an impact on the transformation of income into living standard.

To investigate the relationship of income and living standard respecting the financial literacy of a person, we developed a questionnaire module which runs on waves 8 and 11 of the Panel Study 'Labour Market and Social Security' (PASS). PASS is a longitudinal data set for Germany that focuses on welfare receipt and labour market participation.

BESTER, VIDETTE* (University)

The Development of a Corporate Social Responsibility (CSR) Conceptual Framework to Address Unregulated Artisanal Gold Mining in South Africa: A Micro - Developmental Approach.

Artisanal and small-scale mining (ASM) is a worldwide occurrence with the majority of artisanal mining occurring in the global South. With the availability of mineral resources, coupled with high unemployment and poverty, many are pushed into this source of livelihood. Therefore, ASM is widely considered as a viable livelihood strategy to alleviate poverty. Yet, the sector falls mostly outside the state's legal framework and mining laws, making the activity extra-legal. This, causes much unease for government and the mining houses, and the question on how to address the growing challenges of the ASM sector has become a general concern globally.

Unregulated artisanal mining has become a problematic issue over the past couple of years in South Africa too. The sector, which falls outside any regulatory framework, has a serious impact on the country's socio-economic landscape, and a need to develop a framework to support the sector has become urgent. With limited formal responses from the government, this marginalised growing sector is being left to a great extent unaddressed by the state and mining companies. Yet, there is an increasing recognition on the role that Large-scale mining (LSM) can play in supporting the ASM sector. Large-scale mining companies must start seeing the ASM issue as an essential part of the Corporate Social Responsibility (CSR) strategy. Equally important is that the plan (strategy) to address artisanal mining in South Africa should involve a multi-stakeholder approach which involves governments, civil society, ASM representatives, LSM officers and international development agencies working collaboratively.

Through discussions with relevant stakeholders around the issue of artisanal mining and CSR, the paper aims to discuss findings that can contribute to the development of a CSR conceptual framework to address unregulated artisanal mining in South Africa.

Questioning Negotiating Skills in Light of the Transformation of Collective Bargaining: Lessons from France and Quebec

From the 1980s the onward decentralization of collective bargaining, from national or sector level to company level, has received much attention in the literature, in North America as well as in Europe. But the growing number of agreements concluded at company level is not a mere quantitative process. It is closely related to a more complex shift in regulating employment relations and in defining labor rules which questions the autonomy of industrial relations actors at company level and their capacity to act as rule-makers. In the aftermath of the 2008 economic crisis negotiation practices at company level have given rise to even more complex practices and issues for unions and for management, both of which have seen their routines put to the test.

In this context the paper questions negotiating skills in light of the transformation of collective bargaining, examining the difficulties that industrial relations actors experience in their daily practices. The paper is based on a comparative study on the cases of France and Quebec, which allows to compare countries with different bargaining structures (longer experience of decentralized bargaining in Quebec than in France) but also to compare how collective bargaining training is diversely thought of and is organized in these contexts. It thus reveals to what extent negotiation is considered (or not) as a professional activity by the very actors who participate in the rounds of negotiations.

The research design combines focus groups and individual interviews with union leaders and negotiators, labor relations experts and human resources managers in the two countries. Three questions are addressed to: How has collective bargaining evolved over the past 10 years in terms of agenda, process and outcomes? What are the impacts of these changes on negotiators' activities and profession? Which skills are considered necessary to act as a professional negotiator?

Educational Inequality after State Socialism: The Effect of German Unification Revisited

In 1990, German unification led to an abrupt and extensive restructuring of the educational system of the German Democratic Republic (GDR) as the latter was reintegrated into the Federal Republic of Germany (FRG). However, the consequences of the large-scale institutional change in East Germany for the educational inequality between children from different social class backgrounds continue to be poorly understood. This paper exploits the quasi-experimental nature of German unification to examine, first, whether state socialism in the GDR succeeded in realising its ideological commitment to increasing the educational attainment of children from working-class backgrounds, relative to children from more advantaged backgrounds. Second, it assesses whether the restructuring of the East-German educational system and economy in the wake of German unification led to a convergence in the level of educational inequality in East Germany towards that of West Germany. To address these two research aims, we compare changes in the class gradient in educational attainment in East and West Germany across six birth cohorts, including three cohorts of individuals who completed their schooling after unification. We use the German Socio-Economic Panel Study (SOEP) as the primary data set for our analyses and we verify the robustness of our results by replicating all our analyses using the German General Social Survey (ALLBUS/GGSS). Contrasting with past research, our findings show that before unification, educational inequality at the mid-secondary, upper-secondary and tertiary level was substantially lower in East Germany than in West Germany. German unification then led to a sustained increase and convergence of the level of educational inequality in East Germany towards that of West Germany. Our findings suggest that large-scale institutional reforms can have a profound and lasting effect on the level of educational inequality in society.

Understanding the Mobility Chances of Children from Working-Class Backgrounds in Britain: How Important Are Cognitive Ability and Locus of Control?

Research in social stratification has shown that children from working-class backgrounds tend to obtain substantially lower levels of educational attainment and lower labour market positions than children from higher social class backgrounds. However, we still know relatively little about the micro-level processes that account for this empirical regularity. Our study examines the roles of two individual-level characteristics – cognitive ability and locus of control – in mediating the effect of individuals' parental class background on their educational attainment and social class position in Britain. Contrary to recent claims that differences in cognitive ability account for most of the educational and labour market inequalities between individuals from working-class backgrounds and individuals from higher social class backgrounds, we find that cognitive ability mediates less than 40 percent of the parental class effect on individuals' educational attainment and social class position. Moreover, our results show that, while individuals' locus of control also plays a role in mediating the parental class, this role is substantially smaller than that of cognitive ability. Contrasting with previous studies on the subject, we measure individuals' social class positions at two crucial points in their careers: labour market entry and occupational maturity. We find that the mediating roles of cognitive ability and locus of control remain stable across individuals' working lives.

Workplace Conflicts of German Teaching Staff – Prevalence, Work-Related Aspects and Health Issues of a Burdened Sample

Objective: Cooperation and support between colleagues are important resources for work satisfaction and also for health aspects. The aim of our contribution is to present data of an occupational medical/psychological consultation concerning teacher's health. We present characteristics of teachers seeking consultation and focus on workplace conflicts and its consequences. Methods: We analyzed medical records of N = 634 teachers and educational staff who had attended an occupational medical/psychological consultation between 05/2011 and 08/2016 at the Institute of Teachers' Health at the University Medical Center of the Johannes-Gutenberg University Mainz (Germany). We used a comprehensive set of measures containing demographic and work-related

variables as well as health-related aspects from the Patient Health Questionnaire (PHQ). Preliminary analyses of the data (05/2011-07/2016) are presented in this abstract. Data from 05/2011-12/2017 will be presented at the conference. Results: The majority of the clients were women (approx. 73%), the mean age was 49.6 (SD = 9.1) years. Approximately 37% of the clients reported on conflicts with colleagues or supervisors. Extreme or severe conflicts were indicated by every fifth client. Preliminary results showed highly significant correlations between the severity of conflicts and work-related demands ($r_s = .34, p < 0.001$) as well as job satisfaction ($r_s = -.36, p < 0.001$). Further associations were found between conflicts and health issues concerning subjective general health ($\text{Eta} = .19; p < 0.01$) and depressive symptoms ($\text{Eta} = .31; p < 0.001$). Conclusion: Conflicts at the workplace are a major topic and a common reason for consultation. We found significant associations to work-related aspects and health issues. Professionals who are concerned with occupational health management should consider multiple impacts of workplace conflicts. In order to support those clients and to prevent early retirement or health-related problems specific intervention should be offered, such as support for professional conflict solutions or coaching.

The Capabilities Based Multidimensional Poverty Determinant Analysis: Case Study from Turkey

Sen's capability approach has been widely recognized for measuring well-being and poverty from a multidimensional perspective in the past three decades. With United Nations Development Programs, the capabilities approach has been operationalized based on poverty dashboards for different purposes such as Millennium development goals or most recently sustainable development goals, and also based on composite indices like the Human development and Multidimensional poverty indices. These measures have helped to see the life in the global south from a different angle focusing on non-monetary perspective to assess the quality of life. For long time, the evaluation process of living conditions in these developing countries were reduced to monetary basis. However, Sen showed that the life is not about the money but it is about the combinations of opportunities, resources, and means. Arguing the importance of Sen's framework, in this study I shed light on education, health, dwelling, financial, and material well-being related capabilities in Turkey by using the 2011 Statistics on Income and living conditions survey. Based on different combinations of these capabilities captured in the data, I identify different groups of poverty such as the most prosperous, the most deprived and the in between of well-off and destitution. After this identification process, the regression based multivariate analysis shows the significance and magnitude of various socio-economic indicators on poverty groups. As a result, comparative analysis shows how different poverty groups are affected in a multidimensional perspective. This study, therefore, aims at better understanding the complex configurations of poverty and contributing to the development of new quality of life programs in Turkey.

On the Social Conditions of Antifeminist Speech

With a focus on antifeminist social norms the present paper investigates the mechanisms of modern antifeminism both on a theoretical and empirical level. By adopting the concept of "cultural codes", antifeminism is discussed as a form to communicate a general authoritarian worldview and an opposition towards "political correctness". The results of an empirical study based on a German sample show that antifeminism in fact correlates with concepts connected to this worldview, namely authoritarianism, social dominance orientation and distrust in public and political institutions. Using a factorial survey design the study further analyzes which situational characteristics determine whether individuals agree with antifeminist speech. Looking at the gender of the speaker, the expressed form of devaluation of women and feminists and the expression of different feminist topics it is shown that not only antifeminist statements uttered by women are more likely to be accepted but also that situational factors and personal traits of respondents work together when complying with an antifeminist social norm.

LOCAL Area Plans As a Tool for Inclusive City Planning

Inclusive city has been defined by several researchers, scholars, professionals of various disciplines ranging from sociology, economy, urban planning and governance as well as by UN bodies, i.e. UNESCO and funding organisations, like World Bank. The connotation incorporates the concepts of social and economic inclusion, inclusive planning and empowered, place- based democratic institutions. The inclusive city

encompasses the concerns of stakeholders, equal rights, opportunities and ability for access to affordable land, housing, services, employment and participation in the processes of city development and governance. Inclusive city thus targets to overcome the issues related to marginalisation, exclusion, gentrification, inequality and inequity. At the heart of the "Inclusive City" are three inter-related ideas that contribute to the realization of full citizenship: respect for human rights, good urban governance and equitable growth.

Whereas the policies, guidelines and approaches have echoed the same thought, however in reality it has been a challenging task to plan for and achieve inclusive cities. There have been problems pertaining to participation in development and decision making; one of the significant reasons being the top down approach in existing situation fails to effectively involve the citizen in the process of development planning.

Local Area Planning has been conceptualised as a participatory, collaborative, bottom up approach to city growth and development so as to counterbalance the top down approach. The Master Plan of Delhi 2021, has put forth Local area plans as the third tier of plan with Master Plan and Zonal Development plan being the first two tiers respectively. "Local area "for the city of Delhi is understood as 'Ward' as the administrative unit. Local area plans is the right scale of plans that would help to achieve inclusive cities.

The paper thus explores the role of local area plans as a tool for inclusive city planning.

Epistemological Justice in Postcolonial Times

As Horkheimer most famously set out, critical theory is not simply about understanding emancipation or the conditions for emancipation, but contains also the practical aim of 'emancipation from slavery'. For this latter claim to be borne out, it would require an acknowledgement of the ways in which freedom in the old world came into being alongside the introduction of slavery in the new world. Epistemological justice in postcolonial times would require an address of the ways in which slavery was integral to the Enlightenment project – structuring its knowledge claims – but rendered invisible to it. Further, the reparative history that brought slavery back into a consideration of Enlightenment's 'reason' would then also have to consider the very real question of reparations for slavery by those who call themselves the inheritors of the Enlightenment. Challenging Enlightenment reason, has the related consequence of making reparations 'reasonable'.

Domestic Violence, Family Structure and Status of Married Women- a Comparative Study of Joint Family and Nuclear Family System in Jodhpur (India)

Domestic violence against women is a global problem and present in every country cutting across the boundaries of culture, class, education, income, ethnicity and age. Domestic violence is related to family structure, and to greater extent to social structure and the prevailing systems of values and beliefs of a particular culture. In the specific context of familial relationships, social norms dictate the specific roles and expected behaviour of the various members of the family which have impact on and violent act in the family system. It is interesting to research these power differentials within the family – power differentials that structure the occurrence, the subjective experience, as well as the adjudicatory evaluation of domestic violence. In India, the joint family system has been in existence since ancient time; however, with the passage of time, the joint family system has disintegrated, giving rise to the nuclear family system. Women belong to joint or nuclear family varied significantly on the issue of domestic violence. In this backdrop this paper tries to explore the relationship between family structure and incident of domestic violence on the women of age group of 21-50 in the city of Jodhpur. This is a cross sectional study in 100 families (50 joint families and 50 nuclear families). Families are selected by using random sampling method including all married members of family with a semi structured questionnaire to interview the respondent members of family. The questions included demographic profile, satisfaction with current family pattern, opinions about changing trends of family, occurrence of violent act, socio-psychological impact on the women, awareness about legal norms. Finally the suggestion are provided based on the research conducted to overcome the situation.

Social Media As a Tool for Social Disconnectedness – Analyzing the Facebook Usage Pattern of Youth in Delhi

Today, we all very proudly boast of the fact that we live in an era of technology. It has become immensely easy for us to know what is going around the world with merely a click on the screen. Undoubtedly, today we are highly connected with each other. We know what our friends, relatives and acquaintances are doing every day in their respective lives. But, the irony lies in the fact that the connection that has been established today among us is primarily limited to social media. Quite possibly, for an instance, we might never even talk to our neighbor next-door if we pass by them on the street. But, what updates they make on their Facebook profiles are of utmost interest to us.

Particularly, talking about youth today and their engagement on social media platforms, it would not be wrong to say that they are living in a virtual world of social media and are very distant from their real lives. This excessive usage of social media by youth has certainly changed the way they behave and also communicate. Ranging from few hours to staying online almost the whole day on social media, youngsters are today more interested in their virtual lives rather than the one they lead in reality. Gone are those days, when youngsters used to share their problems with their parents, siblings or close friends. Owing to the same, the bonds among the youth with either their families or friends has undergone a massive change. For an instance, it has now become more important for them to update photos of any event online rather than enjoying the same. Thus, by analyzing the Facebook usage pattern of youth in Delhi, an effort has been made by the researchers to understand social disconnectedness as a result of social media.

BHATTACHARYYA, IPSITA* (*Department of English*)

Sri Ramakrishna Seva Samity (RKSS) and Leisure Opportunities for the Urban Aged in Dibrugarh, Assam, India

Sri Ramkrishan Seva Samity (RKSS), Dibrugarh is a private centre established in 1928 and registered as a Religious Trust under the Societies Registration Act and follow the spiritual and ethnical ideals and principles of Sri Ramakrishna. Sri Ramakrishna (1836-1886) was a great 19th century saint of Bengal, who is regarded as the Prophet of the modern age. The Ramakrishna Math and the Mission together have more than 187 branch centers in India and in other parts of the world.

In this paper we have tried to focus the different leisure opportunities availed by the urban aged (age 60 and above) from RKSS Dibrugarh. We have interviewed fifty (50) numbers of such urban aged who resides in and around RKSS along with ten (10) local leaders and five (05) office staff of RKSS. We have altogether 65 respondents in total. Secondary source of data is also taken into consideration.

Major findings are :

1. In the Morning session from 6 to 8, urban aged come to RKSS and performs yoga and Jogging.
2. There is a library which is used by the aged for reading.
3. Regular medical camps are attended by the aged organized by RKSS.
4. In the evening 6 to 8 pm urban aged participate in the regular prayer program of RKSS.
5. Aged Women during evening time engage in preparation of the Prasad (offerings made to god).
6. They participate and pass time in all different religious activities organized through out the year.
7. Some of the aged respondents are also office bearers of RKSS and they along with other aged ordinary members participate in official assignment and welfare activities like flood relief, to spread the ideals of Ramakrishna, spreading education, rendering medical services, extending help to villagers, upliftment of poor and the downtrodden.

The Immediate Settlement Service Needs of Refugees – a Study on Recently Arrived Syrian Refugees to Canada

The purpose of this study is to investigate the settlement service needs of refugees in Canada. Baseline information was collected using a survey examining the use of settlement services of 624 newly arrived Syrian refugees in three Canadian provinces. I address the following research question, "How the resettlement capacity of the state can be used most effectively to resettle large numbers of refugees depending on the composition of families within a limited time period?" A theory of *two-sided matching systems model* was used to evaluate the available settlement services that each province provides to refugees and if those services match the needs of family units during their first months in Canada. Though the provinces encourage the individual localities and private organizations to participate with extra funding and support to newly arrived refugees, from a sociological standpoint, real diversities such as cultural, linguistic, racial, gendered, religious, etc., differences are compressed and homogenized through settlement policies. There are many factors such as housing issues, language acquisition problems, lack of knowledge on job hunting, etc. that require attention while matching the available resources to the individual family needs. The results indicate that there are multidimensional service constraints and certain mismatch among the services provided versus settlement needs among refugees, challenging the process of resettlement. Families with higher number of children have different needs with regards to housing, language training and childcare, whereas, families without children have different sets of needs. For example, families with small children need houses close to schools, bus stops and playgrounds, whereas families without children can live in studio apartments without these amenities. In case of single parents with small children, special quota should be made for their language class enrollment and it is the responsibility of the employment service providers to provide extra help with their job search.

BHATTACHARYYA, PALLABI* (*Department of Sociology*)

RAHMAN, MOHAMMAD AZIZUR* (*University of Manitoba*)

Understanding the Economic Integration of Refugees into the Host Societies

According to the UNHCR, economic integration is a key factor of refugee integration. Research shows that active participation in the labour force hastens integration in other aspects of life. Although there are numerous studies on employment integration, the bulk of them has not made the distinction between labor immigrants and refugee immigrants. Coming with pre-settlement adversities, refugees face various post-settlement challenges while integrating into the host communities. Though the host societies try to facilitate labour market integration among refugees through settlement programs and integration policies, they still face structural barriers that act as obstacles in achieving economic integration. Due to cultural, economic, and political differences within the host societies, the factors/processes that influence the labor market success of refugees are not likely to be the same. The lack of economic integration of refugees is associated with many other issues like joining gangs or criminal activities, welfare dependency, safety and security. In this round-table discussion, we aim to get a global perspective on these different obstacles that the refugees face while entering the labour market and what integration strategies should be adopted to rid the market of obstacles to integration. Knowledge of local language, education, appropriate professional and vocational skills are considered essential requirements for labour market integration which, in case of refugees, act as deterrents to integration. Refugees may lack employable human capital resources and therefore they tend to remain mostly unemployed or in low paid, low skilled jobs. Questions such as, what are the different ways that the host society prevents refugees from entering the labour market?; what strategies can be adopted to increase refugee employability as well as measures to overcome personal and structural barriers to the labour market integration?; etc. will be discussed. From this round-table, we will think globally to inculcate strategies for acting locally.

Cultural Repression, Caste in Educational Sphere and Psycho-Social Experiences: Sociological Interpretation from Dalit Narrations in India

Culture has become an important part of social life which gets birth from home and grown up in society and strengthen in educational sphere and died either

in social/educational or home setting. It has also faced isolation and supports in a sociological phenomena. It also fights one against another, it dominates, dominated, appropriate, assimilate, integrate with the different group of society (Bhoi 2016). Caste derived from the cultural communities or ethnic groups, then it spread away, fight each other from one community to another, survival became question in one group against another. Then the diversity became closer and the unit became deviated from its origin (Natrajan 2016). *Diversity spread by acknowledging group, communities, caste, religion and nationality* (italics mine). In Indian context the formation dominant vs. domination, pure vs. impure comes from the superior vs. inferior, raw vs. ripe as culture. This paper looks at how cultural hegemony of superior community repress inferior community culture both at the societal and education level and how transmitted from social sphere to academic sphere. It also examined how a particular group of students has experienced cultural repression and heard their psycho-social experiences in the academic sphere. The methodology of this paper was exploratory in nature and mixed methodology approach was adopted to collect the data analysed. The sample size was 250 for quantitative and 10 for qualitative and descriptive and thematic analysis was applied in the analysis and interpretation. The findings of the study concludes that in India the society is based on caste ridden structural hierarchy where the dominant caste students have reproduced caste domination at educational sphere. However, the Dalits students were dominated by the upper caste students and they have been facing cultural repression and bitter psycho-social experiences in educational sphere.

Intellect and Labour Revisited: Collective Alternatives of Self-Management and Co-Production

Productive labour is being penetrated and constrained by systems of control, regulation and violence based on current neoliberal knowledge. This paper aims to discuss and answer the following question: Is the *decolonization of knowledge* possible without transforming its epistemic foundations? The hypothetical answer is that social emancipation cannot be thematized without referring to and discussing the epistemic foundations of productive labour. Based on Latin American critical knowledge as well as social movement praxis, the purpose of this project is to discuss and develop a theoretical perspective on self-management experiences in academia, firms and prisons in Argentina and Chile. These productive spaces at first glance seem very different, but today reveal very similar regulatory logics.

Be Aware of "Mass Societies". Simultaneities between the 50's and 60 's Sociologies of Argentina and the United States

From the 1930s onwards, the social-theoretical problematization of masses and crowds took a new path in almost all over the world. On the one hand, greater emphasis was placed on technical progress and bureaucratisation of organizations (both State and business, as well as the media, political parties and trade unions). On the other hand, the various effects of these processes, from the democratic blurring of cultural distinctions between elites and non-elites to the transformation of the class structure that could –and did– lead to totalitarianism were stressed. Authors like José Ortega y Gasset or Karl Mannheim were illustrative of these positions.

Starting from a previous work, in which we have comparative studied the perspectives of David Riesman and Gino Germani, this paper proposes a broader effort. To do this, we will recover the comparative perspective of the "simultaneous approach" between theories of the South and the North that we had deployed there, although we will leave aside the specificity we had then reached by comparing only two perspectives. Now, we intend to systematize more generally the

dominant characteristics, similarities and peculiar features that the analysis of these problems assumed in sociology in the United States and in Argentina during the 50's and especially the 60's. At that time, sociology reached higher levels of institutionalization in Argentina and, consequently, a greater volume of research and theoretical reflections, while in the United States its elaborations and research proposals achieved global reach. There, we will highlight certain common "epochal crossroads", related to the emergence of the so called "mass society", and at the same time we will trace the different ways in which both sociologies elaborated and intervened on such crossroads, based on public opinion, social structure, long-range historical or organizational studies.

Solidarity and Competition: Simulating Social Support between Competing Collaboration Partners

This study aims to understand the consequences of competition between collaborating

partners on the emergence of solidarity between them. Previous research has suggested that peers engaging in economic exchanges, e.g. professional collaboration, can develop expectations of social support if trust arises between them, which fosters confidence in receiving support from the partner. Yet, these results might have been favoured by context-specific lack of competition. In order to study this, we developed a stochastic Agent-Based Model (ABM) which includes a multiplex network of collaboration, trust and social support. The model is an adaptation of Stochastic Actor-Oriented Models simulation algorithm. By running computer simulations, we manipulated heterogeneity in resource endowment and need for social support among agents who competed over resource-rich partners for collaboration. This allowed us to study the connectivity and integration of the emergent social support networks. Preliminary results showed that competition in collaboration can be detrimental for the connectivity of the emergent social support network if resource heterogeneity was sufficiently high. Moreover, the emergent networks were highly segregated along differences in resource levels, giving rise to a core-periphery structure in the collaboration network, in which resource-rich actors found the most attractive partners to relate to. However, once heterogeneity in need for support is added, the effect of resource heterogeneity is neutralized by a 'double-edge' effect of heterogeneity on social support relations. Resource-poor but needy actors established mutual help relations due to their stronger social activity in search for attractive partners, which made them less peripheral in the emergent network than without heterogeneity in neediness. Finally, resource inequality could generate networks where integration between high- and low-resource agents was similar to what was produced without competition. Our study also showcases the potential of ABMs to expand the scope of empirical network research results.

A New Place a New Community. the Case Study of Gillet Square, a Community-Led Urban Regeneration Project.

The urban regeneration is not merely a process that affects the physical structure of cities but it deals with many other aspects, such as the local social structure and the environmental issues. This article focuses its attention on the inner cities and asks questions on the possible redevelopment of them, with particular attention to the social innovation. I refer here to social innovation as Moulaert et al. (2003, 2009, 2014) have theorised it. This aims to find innovative solutions for a range of problems that affect people such as exclusion, deprivation, poverty, lack of wellbeing. This process involves many actors and it fosters inclusion and wellbeing through the implementation of social relations and people empowerment. This article presents the main features of Gillet Square, a project promoted by Hackney Co-operative Developments (HCD) a community interest company based in the London East End. This area is one of the most disadvantaged in England. Moreover, it is witnessing a strong gentrification process, which is excluding many dwellers from local services and house affordability. This qualitative research assesses the coherency of the Gillet Square project with its objectives and values, and how the HCD has worked in partnership with other organisations for the renewal of the square. Findings show how a community-led initiative can involve local stakeholders in the regeneration of a critical area and develops a new local asset for the promotion of social cohesion and integration of marginalised citizens. Elderly isolated people are more engaged in community life, teenagers have designed the temporary skate park and families can enjoy leisure activities. The Action Group, which is composed by members of ethnic groups, local businesses, charities and the Hackney Council, have created the wide cultural program of Gillet square. All the activities are free entry and promote a good social mix.

RC14-274.3BIBANG, CLAVER* (*Université de la Sorbonne Nouvelle Paris 3*)*De La Surhumanisation Religieuse a La Deshumanisation Sociale
DES Albinos Enquête Sur Le Processus De Négation De L'Humanité
Des Minorités En Afrique Subsaharienne*

L'Albinos, minorité visible en Afrique, est dans un processus permanent de déshumanisation, sa couleur, qui n'est pas ethnique, mais génétique (déficit de mélanine), constituant, par le pouvoir quasi divin qu'on lui confère préalablement, l'élément axial du *stigmat* dont il est l'objet. Elevé au-dessus de l'humain du fait de sa peau blanchie, toute violence contre l'Albinos n'est alors plus vécue comme un crime, constituant désormais le droit de l'homme ordinaire à exploiter les pouvoirs qui lui sont faussement prêtés. Ainsi, le rejet de l'Albinos, transformé en groupe ethnique à part, s'explique dans une superstition mercantile que Patrick Imbert appellerait « un stéréotype de croyance »^[1]. L'albinisme, attribut génétique qui fait prétexte à la stigmatisation sociale du groupe ethnique ainsi constitué, repose donc également sur la cupidité de différentes personnalités africaines, en mal d'enrichissements rapides et sans effort, qui vont consulter des prêtres traditionnels véreux, dans le farouche espoir - qui est aussi une conviction identitaire séculaire - que par l'exploitation rituelle du corps de l'Albinos ainsi rendu extraordinaire, l'ascension de l'échelle sociale et la réussite matérielle sont garanties. Comment la télévision rend-elle compte de cette barbarie instituée, ainsi que les méthodes de sa cessation ?

[1] Patrick Imbert, « Le Stéréotype de la croyance que la vie est un jeu à somme nulle et sa remise en question au Brésil, au Canada et dans les Amériques », in *Brésil / Canada : Visions, Paysages et Perspectives, de l'Arctique à l'Antarctique*, Rio Grande do Sul, Editions Abecan/Furg, 2006, pages 147 à 162.

RC23-439.2BIBIMOUNE, KELTHOUM* (*University of Batna1*)*Algerian Family Life "Online" and "Selfie Culture" from the Social
Exposition Expectations to the Challenges of Digitalization. the
Field Study of a Sample of Algerian Families Using the "Messenger
Application" in the City of Batna -Algeria*

The present study is supposed to detect the changes occurring in the role of socialization of the Algerian contemporary family by focusing on the effects of adopting « selfie culture », as a daily practice, on its daily life. This happens when the family members expose their family life photos in Digital Networks in order to achieve social presence/exposition and satisfy their expectations towards global culture's openness and communication. That is why the present study tries to highlight some reflections of the selfie culture implications on the nature of the family's socialization role which is gradually taking a new character. Additionally, the study aims at highlighting the challenges of these digital socializations over the daily life of the Algerian family. The present work relies on the results of a field study held on a sample of Algerian families using the messenger application in city of Banta . Discussions of those challenges, within the sociology of everyday life, are supposed to give way to the suggestion of some new mechanisms that enable the contemporary family's rationalization and management of its everyday practices within the digital space in a way to promote its openness to the other, keeping safe its stability and human sense of the effective interaction in the family daily life.

RC57-JS-7.3BIDIAN, OLIMPIA* (*University of Toronto*)*Towards a Holistic Understanding of the Spatial and a-Spatial
Social Life of Toronto's Newly Developed Urban Public Spaces*

The historical functions of urban public spaces are to create a physical link between buildings and land use, and to sustain the economic, administrative, and transportation functions of a city. They also link people, facilitating social interactions and communication, binding the social order of local communities, by creating a realm in which the greatest amount of human contact takes place (Gencel and Velibeyoglu 2006; Tibbalds 1992). They are an important component of the social communication system that brings people together to discuss important aspects of their lives and form relationships (Hampton, Goulet, and Albanesius 2015).

However, with the emergence of internet technologies, the lines between the physical and digital worlds are constantly being crossed, the traditional qualities of public spaces are being redefined, and the very ways in which we make sense of the surrounding world, and attach value to our environment, is modified (Jackson 2012). As such, understanding of the social life of urban public spaces needs to take into account not only the spatial, but also the a-spatial processes brought about by internet technologies.

The purpose of this project is to examine this synergetic relation between urban public spaces, social interactions, and internet technologies, to ascertain the ways in which internet technologies help redefine the traditional qualities of ur-

ban public spaces and transform the ways in which people experience them. Ethnographic methods are being used along video-recordings and content analysis of images posted on Google and other social media sites.

RC22-409.21BIDIKHOVA, IYA* (*Saint Tikhon's Orthodox University*)*The Models of Attitudes of the Population Towards Significant
Sacred Objects in the Context of Modern Sociological Theories (an
example of the city of Sergiev Posad (Russia))*

In the modern world there are a lot of rapid global changes in the different spheres of existence: economic, political, cultural and others. One of the consequences of this is the change in the system of values and the emergence of the phenomenon of the "consumer society".

Due to this it is interesting to investigate how modern people perceive sacred objects and values: do they see in them objects of the realization of spiritual and religious needs or the historical and cultural artefacts, or do they perceive them as source of some advantages?

We tried to answer these questions using the results of a survey in the city of Sergiev Posad where there is one of the most significant sacred objects in Russia – Trinity-Sergiev Lavra. The data analysis shows that there are several models but two of them were most common "Lavra as capital" and "Lavra as value".

These two models are quite common for the investigated set of respondents. However, the larger percentage of the people whose answers can fit to the model "Lavra as capital" shows that in modern Russian society there is a specific consumer attitude towards significant sacred objects. This attitude fits in the framework of the sociological concept of capital with its symbolic, economic and cultural meanings. We can confidently say this about the inhabitants of this city.

We can make a conclusion that such an attitude is largely the consequence of the spread of consumer values and patterns of behaviour. For example, Baudrillard, one of the main researchers of the consumer society compared consumption with religious ritual when authentic meaning replaces simulacrum. Thus, we can assume that the attitude towards sacred objects as capital is such a replacement.

RC44-742.3BIELER, ANDREAS* (*School of Politics and IR, University of Nottingham*)*Towards an Alternative Trade Regime: What Are Potential Joint
Demands By Labour Movements from Around the World?*

There have been divisions within the global labour movement over free trade agreements (FTAs), part of an expanded free trade agenda covering not only trade in goods, but also services, trade-related investment measures, intellectual property rights and investor-state dispute settlement mechanisms. European, export-oriented trade unions have tended to support new FTAs, as they perceived them to be beneficial for "their" companies, thereby securing their members' jobs. By contrast, labour movements in the Global South have objected as free trade has often signified deindustrialisation and loss of jobs in their countries. In this paper a number of key demands are developed for broader discussion, which can potentially be supported by labour movements from all over the world in the collective struggle for an alternative trade regime.

One set of potential demands is suggested around the re-assertion of national sovereignty including demands for more democratic, participatory ways of decision-making on trade policy as well as the right to food sovereignty. Another set of potential demands is directed against the increasing structural power of transnational capital, undermining the right of people to determine their own way of development.

RC23-432.7BIELINSKI, JACEK* (*Collegium Civitas*)TOMCZYŃSKA, ALDONA (*National Information Processing Institute*)*Ethos of Science and the Marketized Mentality of Academics in
Contemporary Poland*

In this paper we response to the Panofsky's (2010: 141) appeal for sociologists to return to the topics of the ethos and autonomy of science. The domination of other institutional fields over science may have both positive and negative effects for advancement of certified knowledge (see Merton 1938; Storer 1973: xix). Science dominated by some other social institution may encourage deviant or non-conformist behaviour (Zuckerman 1977; Steh 1978: 175). The result is some form of incompatibility between the scientific ethos and the normative structure of dominating social institution: "the source of deviance lie outside of the ethos itself, in the wider social environment" (Sztompka 1986: 57).

In recent decades we have observed the increase of neoliberal attitude to knowledge creation. It is based mainly on the expectancy that effective allocation of resources leads to more efficient knowledge production. Thus, the economic norms are values supersede those of traditional ethos of science, i.e. economy

dominates over science (see Messner and Rosenfeld, 2001). The case of Poland is of special interest because over last 27 years this country has undergone a significant economic and political transformation that in many ways covered the scientific governance.

The goal of this paper is to examine how the ethos of science changes under the conditions of excessive pressure from the economy and market values by investigating the relationship between the ethos of science and the marketized mentality (Hövermann et al. 2015a; Hövermann et al. 2015b; Hövermann et al. 2016) in contemporary Polish academic community.

The empirical basis for statistical analysis is a survey conducted from December 2015 to January 2016 on a representative sample of academics in Poland. The sample size was N=801. The results show negative correlation of marketized mentality with ethos of academic science and positive correlation with industrial science ethos.

What caused variation in compliance and non-compliance with military disciplinary laws over time, across units, and within units during the decolonization war in Indonesia?

In 1945, shortly after the end of World War II, many young men enlisted for military service in the Dutch armed forces. The government was, at the time, actively recruiting people to re-occupy one of its former colonies, the Dutch-Indies. When the recruitment campaign started, Japanese forces still controlled the archipelago. Yet by the time the Dutch military arrived, Japan had surrendered. The Dutch government expected a smooth re-occupation. But to its dismay, it faced a stiff nationalist movement – a movement that had begun to emerge in the Dutch-Indies at the end of the nineteenth century, and that had become quite powerful under Japanese rule (see generally Kahin 1952). The nationalists did not want the Dutch to return. A decolonization war started, and lasted until late 1949 when Indonesia officially became independent.

This dissertation project explores that war at the micro-level. It combines military personnel files with other primary sources to explore variation in discipline – compliance and non-compliance with military disciplinary law – by Dutch soldiers. The dissertation is embedded within a larger research project that focuses on the social histories of military units. Accordingly, the dissertation will have a strong historical character. But it also aims to contribute to the social sciences. Most importantly, it seeks to further our understanding of compliance and non-compliance with the law (e.g., Tyler 1990). The socio-legal question at the heart of the project is: What caused variation in compliance and non-compliance with military disciplinary laws over time, across units, and within units during the decolonization war in Indonesia?

RC19-365.2

BIFULCO, LAVINIA* (*University of Milano Bicocca*)

Social Innovation, Knowledge and the Inclusive City

The theme of social innovation has gained a growing space in European agendas centred on welfare/urban policies thanks to the perspective that sees cities both as places of crisis and as places of experimentation of new governance relations.

In the basic meaning of the term, social innovation refers to new answers to the needs of a community, by means of new products, services, organizational structures or activities. In a more profound sense, the concept involves new ways of defining and facing situations of social exclusion in connection with integrated approaches of local development.

Yet social innovation is a quasi-concept. This makes it malleable and adaptable to different points of view – even here its success – and at the same time elusive and ambiguous. Moreover, the picture emerging from the empirical investigations on its inclusive effects is far from univocal. In addition, it is unanimously recognized that local innovative experiences are fragile, fragmentary and uncertain unless they cross wider scales, resources and powers. The need for an institutional infrastructure that supports upscaling processes – through regulations, policies, and rights – is consequently one of the main indications given by the research on the theme.

Following these indications, in this paper I discuss how institutions are important for social innovation by focusing on two connected points: the relationship between innovation and knowledge, and the role of the state as an institution for public knowledge. In the first part, I illustrate the general framework in which social innovation develops as a social/urban policy strategy in European cities, highlighting its elements of vagueness and heterogeneity. In the second part, after getting some research data that corroborate the importance of the institutions, I discuss the importance of the cognitive and ideational dimension of social innovation.

Patriarchy, Religious Radicalization and Social Media in Israel: The Case of Yad Le'Achim

Religious radicalization is generally perceived as the belief that people should refer to unchangeable rules established in the past; that these rules allow for only one interpretation, and that religious rules should prevail over modern – secular ones. Moreover, it is also agreed that these components foster engagement in direct action – **violent or nonviolent**.

In the last decade, as many research works have shown, social media has become a major platform for the dissemination of religious radicalization, via recruitment of adherents, communication with supporters and fundraising.

Few studies, however, have recognized the patriarchal underpinnings of this process i.e. the romantization of the patriarchal family and its gendered hierarchies. Actually “The Family”, with its rigid gendered spheres and clearly marked boundaries between “us” and “them” appears as a central theme in radical religious discourses, the answer to “corrupt modernity”.

In this paper, I illustrate this approach by analyzing the textual and visual posts appearing in the randomly chosen months of July-August 2017 on the Facebook of Yad Le'Achim. An Ultra-Orthodox Jewish (Haredi) organization, Yad Le'Achim focuses now mainly on preventing intermarriage between Jewish women and Muslim men.

Six interrelated themes promote Yad Le'Achim's ideology: the presentation of Haredi Judaism as the single authentic Judaism; the fight against intermarriage – “the silent Holocaust”; the rescue of “failed Jewish women” who marry Arabs; the fight against the (demonized) Arab man; the “poor children” of intermarriage; the “good people” of the Haredi community.

My analysis refers to the transformation of “the family” and to the growing numbers of mixed families in post-industrial societies, including Israel, and to the way this evolution is constructed on social media to radicalize people for social change.

My conclusion relates to the need to integrate these issues on the family research agenda.

BIJAOUI, SYLVIE* (*College of Management Academic Studies*)

The Politics of Cooptation: The Kibbutz Movements' "Gender Equality Departments"

The kibbutz is a collective, democratic, socialist-inspired form of settlement that grew out of the Jewish national movement in Palestine, at the very beginning of the 20th century. As with (some) other voluntary forms, of association that were influenced by socialist visions of utopia, the promise of gender equality emerged as a fundamental principle in this collective community-but was not fulfilled. As a consequence, the historical unequal gender order was historically reproduced.

In this paper, I use the concept of cooptation – the formalized inclusion of challengers into the authority system they are challenging so as to neutralize them (Selznick, 1949) – to analyze the institutional role of the kibbutz movement's “Equality Departments” founded by kibbutz feminist activists and functioning at different times, from the 1980's until now.

Retaining a dynamic approach to Selznick's classical definition, I first point to the fact that in the long run, as demonstrated in recent scholarship (Couto 1988; Body-Gendrot, Carré and Garbaye 2008; Prilleltensky 2014; Korteweg, 2017), cooptation, can transform the power structure and further economic redistribution and/or cultural recognition and/or political representation.

In the second part of my work, on the basis of documents and of interviews, with the heads of the Equality Departments, conducted between 2011 and 2015, I apply this dynamic approach to the feminist sections.

In the third part of my research, I map alternative possible scripts for the actual cooptation process, in the kibbutz

My conclusion relates to the possible joint futures between co-optation, social justice and social change in diverse socio-political contexts.

BILAND-CURINIER, ÉMILIE* (*Rennes 2 University*)

Family Justice and the Culture of Parenthood. a Cross-National Comparison of Gender and Class Entanglements (France-Québec)

This paper studies the culture of parenthood that is conveyed by legal interventions regarding marital dissolutions. It is based on a long-term (2009-2016) collective ethnographic research project that was led in two countries, France and Québec (Canada), in courts as well as in law firms.

It shows that lawyers and judges strongly encourage what they call, along with psychologists and social workers, “coparentalité” (shared parenting). However, this norm does not end with gender inequalities regarding childcare. Women remain exposed to an *obligation* regime, while interventions targeting men are more likely to be *incentives*. Those maternal obligations are hardly the product of

explicit constraints: in most cases, they are based on consent, which is anchored in gendered socialization and in parental investment prior to divorce.

However gender roles vary a lot across the social ladder. Precarious men tend to deviate from the norm of shared parenting, because of their difficulties on the labor market and because of their distance from legal institutions. In this social group, women remain the main caregivers – they cannot pass away when fathers do not show up. Among middle-class and upper-class fathers, the professional incentives find more echo: these fathers can pay for child alimony and they can mobilize legitimate educational resources with their children. Therefore, middle and upper-class women are enjoined to give them a place, although these fathers' involvement remains very variable.

These gender-class entanglements depend on national contexts. In France, the norm of shared parenthood is mainly defined in symbolic terms, whereas in Québec, it has got a practical sense. Shared physical custody is then more frequent in Québec than in France, as well as child support payments. Canadian middle-class mothers are more likely to get child support than their French equivalents. Their openness to sharing childcare is counterpart to economic "joint parenthood".

BILAND-CURINIER, ÉMILIE* (*Rennes 2 University*)

Gender and Class Inequalities in Access to Family Justice (France-Québec)

Since the 1970s, along with the unprecedented increase of marital dissolutions, major changes have occurred in the ways the legal profession intervenes in family disputes. Across Western countries, adjudication through the Courts has become less common, whereas alternative dispute resolution devices have involved more and more ex-partners. From a public policy standpoint, these trends follow two main rationales. They are inspired by liberal ideas, which supports individual rights; they also aim to ease the financial burden of Court adjudication, both for litigants and for public spending.

The paper aims to assess the effects of such changes on class and gender inequalities regarding legal services. It is based on a long-term (2009-2016) collective qualitative and quantitative research project that was led in two Western jurisdictions: France – a civil-law country – and Québec (Canada) – whose legal tradition mixes civil law and common law influence.

In both jurisdictions, the diversification of ways and means for family disputes has led to large class inequalities. Upper-class families manage to choose, and to combine, intervenors from the public sector (judges) and from the private sector (expensive lawyers). But working-class litigants have less scope to decide who counsel them and they depend on public-funded services, which may be difficult to access or less accurate.

Gender inequalities add to these class inequalities: working-class women are the first to be targeted by public intervenors, while precarious men tend to be left out by them and have to deal with the procedures on their own.

In Quebec, this diversification is much higher, so that class inequalities are larger than in France. In the former, the "each according to need" official goal is rather an "each according to means" system. In the latter, adjudication through the Courts is still massive, but it varies a lot depending on social status.

ÖBERG, PETER (*University of Gävle*)

From Society of Widows to Society of Divorcees – Late Life Singlehood Revisited

More than four decades ago Lopata coined the concept "society of widows" to describe the gendered reality of late life singlehood, where widowed women were excluded from coupled social life and had to depend on other widows for social integration. We have coined the concept "society of divorcees" to describe the changing reality of late life singlehood. More people enter later life as divorcees or become divorced at a high age. Among Swedes 60+ divorcees outnumber widowed people, and the incidence of late life divorce has more than doubled since the millennium in what has been called the grey divorce revolution. Many other Western countries follow the same demographical trend, posing important questions about late life singlehood. Based on two Swedish studies we will show that the structure of the late life single community is becoming less gender skewed as a consequence of the emerging society of divorcees, and that in this society relationship careers are increasingly complex, attitudes to repartnering increasingly liberal and partner sanctification seldom an issue. We will conclude by discussing the consequences of the emerging society of divorcees for late life support structures.

BILGE, SIRMA* (*Université de Montréal*)

Intersectionality As Critical Pedagogy: Some Issues and Challenges

How is intersectionality embedded in actual pedagogical practices? Building on a review of scientific literature as well as an on-going (SSHRC-funded) research project on minority knowledges and neoliberal academy, this paper provides an overview of classroom initiatives that put intersectionality into action for critical education and frames some of the main issues and challenges for the praxis of intersectionality as a critical pedagogy in a context of the increasing neoliberalising of higher education along with the diversity work within it.

The theoretical framework relies on the neoliberal governmentality which addresses neoliberalism as an educational project that aims to transform society to its own image of market relations and expands itself by successfully absorbing and neutralising its own critiques, among others counter-hegemonic knowledge projects and producers. Building on a substantial literature tackling the neoliberal extension of economic logic beyond the borders of the economic sphere to irrigate all parts of life, wherein all aspects of social conduct are reconfigured along economic lines and a person's relation to all their activities and even to themselves is to be given "the ethos and structure of the enterprise form" (Rose 1999: 138, 141), the paper focuses on the actual pedagogic practices that sustain, accomplish or counter the incorporation of intersectionality (as an initially racial justice and social justice oriented academic formation) into the operations of neoliberalism. A specific focus is given to the ways in which teaching intersectionality can hinder, albeit unintentionally, the antiracist education.

BINDER, WERNER* (*Masaryk University*)

Populism and the Power of Performative Transgressions

Jeffrey Alexander's theories of civic sphere and social performance suggest that political actors have to orient themselves toward the shared code of civil society in order to be successful. They have to obey to the norms of civility and avoid any form of symbolic pollution in order to become a sacred representation of a societal community. The performative strategies of populist politicians around the world and in particular the electoral success of Donald Trump suggests otherwise. I propose to revisit our theoretical assumptions regarding the theory of the sacred and performance theory. More specifically, I will explore the theoretical implications and political consequences of performative "transgressions", drawing on the works of Durkheimians like George Bataille as well as on a more recent paper by Dmitry Kurakin (2015). In order to understand the power of transgression, we have to follow the suggestion of Kurakin and rediscover the ambivalence of the sacred in Durkheim's theory, in which the sacred is not only opposed to the profane (understood as mundane), but exists in two forms, the pure sacred and the impure sacred (often conflated with the profane). I will argue that the transgression of sacred norms is an overlooked populist strategy to perform "authenticity" (1) and to create new forms of the sacred as the impurity produced by transgressions can easily become purified (2). Finally, the power of transgression will be illustrated using examples of performances by the Czech president Miloš Zeman as well as by the American president Donald Trump.

BING, ALEX* (*Carleton University*)

Children of the Knowledge Economy: Gendered Experiences of STEM Youth from Skilled Migrant Families in Canada

This paper explores the gendered experiences of East and South Asian youth from skilled migrant families in the secondary and undergraduate STEM (science, technology, engineering, mathematics) educational settings in Canada. Feminist scholars have made note of both the gendering of skilled migration (Boucher, 2007; Meares, 2010) as well as the gendering of STEM careers (Faulkner 2007), but these two lines of inquiry remain disconnected. My study asks three questions which will ultimately connect the gendering of migration and the gendering of STEM. [1] First, I ask whether the gender-asymmetric de-skilling of skilled migrant labour can impact the identity formation of the children in the migrant family. Literature on migration has in recent years recognized the gendered nature of skilled migration, especially how skilled migrant women are more likely to be de-skilled than skilled migrant men. Thus if skilled migrant families come with children, it is worthwhile to ask whether the career identifications of these children could be impacted. [2] Secondly, I ask whether the daughters of these families face additional contradictory cultural messaging with respect to STEM education and careers. In particular, when working with racialized women in STEM from the East and South Asian diaspora, it is worthwhile to ask whether contradictions between STEM-affirming racial stereotypes and STEM-averse gender stereotypes create persistent double binds, whether this troubles our ability to celebrate the existence of minority women in STEM as simple success narratives, and whether there are stories of chronic suffering behind the cases of success. [3] Thirdly, I ask whether these young women can in fact rely on the male STEM members of their own ethnic group for solidarity, in the face of the competition-based reward structure of STEM curricula as well as the unique challenges faced by Asian men in STEM.

RC05-117.4BINKS, EVE* (*Liverpool Hope University*)FERGUSON, NEIL (*Liverpool Hope University*)*Islamophobia: An Exploration of the Lived Experiences of British Muslims*

While there is considerable research exploring Western attitudes towards Muslims, little is known about what it is like to live as a Muslim in Britain and how Muslim's feel they are perceived and represented in the UK. Previous research has determined that British Muslims are viewed as having values that are incompatible with British society (Kundnani, 2007), while Saeed (2007) suggests that social and political concern related to Muslim groups in the UK constitute cultural racism. In addition to this, the British media have been seen to represent Muslim groups in ways described as hostile and negative (Poole & Richardson, 2006) while Sheridan (2002) highlights an 83% post-9/11 increase in British Muslim reports of implicit and indirect discrimination with overt discrimination rising by 7%. In order to examine the lived experiences of British Muslims, an Interpretive Phenomenological Analysis (IPA) was employed. Analysis of interviews with nine British Muslims revealed four key emergent themes grouped around media influence, the role of education and integration, experiences of anti-Muslim racism, and the perpetuation of antecedent risk factors. The findings highlighted a frustration with media-fuelled generalisations of British Muslims, a desire for increased integration between Muslims and non-Muslims, experiences of anti-Muslim racism, and a perpetuation of antecedent risk factors for radicalization stemming from UK governmental policies which have the potential to lead into harm's way the very communities that these policies purport to protect. Findings will be discussed with reference to psychological theory and recommendations made for improving intergroup relations.

RC05-124.6BIRCAN, TUBA* (*University of Leuven*)*Should We Support or Should They Go? Public Opinion on the Role of State in Helping Refugees in Europe.*

The Syrian crisis has reached its sixth year and the durability of the crisis bolsters tensions occurring at a political level between European countries. Alongside political disagreements and differentiation between states, another source of concern derives from the growing discrepancy in citizen's support to the refugees. There has been an on-going debate about the responsibilities of the European countries towards more than one million (Syrian) refugees fled from the war zone. Variant political rhetoric, mainly focuses the challenges with refugee influx, is stuck between "controlling" the refugee inflow and "helping" refugees in need. In this context, the socio-economic burden of the situation rivals with its humanitarian aspect. There exist no unanimous response to the refugee crisis among European countries on a political and individual level. The aim of this paper is thus to explore the role of states in helping refugees and asylum-seekers on the public opinion about refugee support. Due to the hierarchical nature of the research question, we will opt for a multilevel approach. Data from 2016 Eurobarometer survey will be used to employ multilevel models to analyze the impact of the refugee influx on the public opinion on if the country is responsible for helping refugees. On contextual level, in particular, the magnitude of the refugee inflow in the host country, the political standing (supportive or critical) of the government towards refugee crisis, and European state typologies (Western, Nordic, Eastern) will be investigated to explain individual differences in attitudes toward their countries' support for refugees.

RC04-89.5BIRCAN, TUBA* (*University of Leuven*)SALMAN, MOHAMMAD (*Free University of Brussels*)*Syrian Refugee Youth Seeking Hope: Educational Aspirations and Integration of Refugee Youth in Belgium*

The aftermath of Syrian civil war has expanded to the entire world. Since the WWII, one of the largest forced migrations has been experienced as a mass influx of Syrians. The durability of the crisis in Syria intensifies the urgency for refugee support. Recent policy agendas include education on the top of their lists. Tertiary education, which will enable refugee youth to have better careers and become more integrated within the community, is also a facilitator for economic growth as much as being an investment in the human capital of refugees. Therefore, a better understanding of the refugees' perspective might be a convenient tool for developing better integration strategies. A large body of empirical research and policy documents documented the traumatic experiences of refugee youth and their families before or during the migration. However, except a limited number of reports, there has been little discussion and evidence on the educational experiences of refugees in the host communities. Therefore, this study intends to discuss the educational aspirations of newcomer refugee youth in Flanders and Brussels. This proposed research will be based on qualitative methodology.

The data will be collected through semi-structured interviews and two focus groups. In this study, based on content analysis with NVivo, we will report on the experiences of the refugee youth, perceived discrimination, the aspirations for higher education, future expectations/plans/hopes. Findings from our study will provide new insights about educational aspirations of refugee youth between the ages of seventeen and twenty-six who arrived in Belgium between 2011 and 2017, the challenges they encountered during their efforts in assessing higher education, their solution attempts and the help they have received from governmental or non-governmental institutes. Our critical discussions will reckon with the social and political aspects of the intersection between the humanitarian refugee policies and immigrant integration policies.

RC31-570.5BIRKE, PETER* (*Soziologisches Forschungsinstitut Goettingen an der Georg August Universitaet*)*Refugees@Work: Re-Composition of the Workforce and Re-Regulation of Border Regimes in Germany*

Refugees@Work: Re-Composition of the Workforce and Re-regulation of border regimes in Germany

The demands of capital to mobilize skilled labour plays a major role in current debates and reforms. This affects the definition of political and social rights of refugees, notably in Germany. While the majority of refugees is prevented from entering the EU by way of a militarization of the border regime, access of refugees into the German labor market is facilitated by the latest reforms of immigration law. After all, some degree of brain drain is regarded as acceptable, given that it serves to reduce the shortage of labour and skills in some parts of the German economy. This tendency has been analyzed in depth, as far as its consequences for the legal status of migrants are concerned. Its potential influence on the stratification of workforces is, however, rarely discussed in current sociological research. If a commodification of migration regimes occurs: how does this influence the composition of workforces in industries that see an influx of new migrants? In this presentation, we will discuss preliminary results of our research in the meat industry, metal works, the steel and the chemical industry in Lower Saxony, Germany. This will include the question of how trade unions react to the re-composition of the workforce and of whether the promotion of citizenship rights and equal conditions for all are promoted (or neglected) at the point of production.

RC47-788.3BIRKE, PETER* (*Soziologisches Forschungsinstitut Goettingen an der Georg August Universitaet*)*The Politics of Strikes: Strike Movements and Social Movements in a Global Perspective*

Whether new organisations of informal workers in much of Asia, wildcat strikes in textile factories in Bangladesh, Cambodia and Vietnam, the crucial role of trade unions for the Arab spring in Tunisia and Egypt, mass strikes in emerging economies like China, Brazil and South Africa or the wave of general strikes that hit Europe after the crisis in 2008 – the new forms of strikes and workers organisations across the globe are widespread. But they also differ a lot concerning their political orientations, relationships with state institutions and the general social conditions in which they operate. This paper examines the interrelation of strike movements and social movements in the framework of an international comparison. It is based on a book project on the politics of worker's resistance against neoliberal politics in 15 countries around the world (edited with Madhumita Dutta, Ohio State University and Jörg Nowak, City University of Hong Kong). The paper will compare strategies of workers struggles and social movements in four countries: Germany, India, Brazil, and China. Based on this comparison, the diffusion of social movement strategies within strike movements will be discussed. Finally, the notion of the "political" strike will be revisited: In which sense can current strike movements in those four countries currently be considered as anti-systemic movements (Wallerstein) and what does this notion mean in the four named cases?

RC34-620.5BIRZLE, MAIKE* (*University of Basel*)*Situational Accounts of Collectivity and Individuality Among Un(der)Employed University Graduates in Burkina Faso*

University graduates in Burkina Faso very often face great difficulties to enter the labor market and thus attain the social markers of adulthood. Moreover, they have to cope with high expectations by their families, as well as the individual disappointment they experience when their intended careers are inaccessible after graduation. Students and university graduates face uncertainty

concerning the future; and their former image of being the country's elite has changed into today's image of them being potential troublemakers and future unemployed masses. This paper inquires the way their self-presentation as (a group of) graduates switches between collectivism and individualism by applying a narrative analysis approach. The empirical data consist of annually successive interviews I conducted with 30 informants over a period of three years. Most narrations refer to a collectivity of young graduates who deal with a lack of possibilities due to a labor market that is most often only accessible by helping relations. University graduates present themselves as abandoned by the government and despised by society. Nevertheless, there are further discursive threads woven in these narrations, which highlight individual agency that enables the narrators to overcome the blocked situation. On the one hand, there is a sort of habitual collectivity emerging when it comes to future imaginations, because graduates share the idea that their diploma has to pay off after all and underline the role they should play as intellectual elite. On the other hand, strategies for an amelioration of the situation are imagined on an individual level, rarely involving ideas of collective action.

This paper aims to explain which strategies of self-presentation and placing occur under which circumstances in graduates' life courses, in order to give an insight in ideas and implications of collectivity and individuality among Burkinabe university graduates.

BISHOP, JOHANNA* (NA)

An Ethnographic Journey into Raising Human Trafficking Awareness with Students

The United Nations Palermo Protocol and the United States Trafficking Victims Protection Act have brought attention to the problem of human trafficking. Millions of people are being trafficked, forced into labor and servitude, and being held in debt bondage, and according to the United Nations Office on Drugs and Crime, human trafficking has become the third largest international crime industry behind illegal drugs and arms trafficking. Within the United States alone, the National Human Trafficking Hotline has received over 143,000 calls of suspected human trafficking since 2007, and documented 36,270 victims of human trafficking with the predominant form of human trafficking occurring in the sex trade industry. At greatest risk for being trafficked and exploited are women, youths, and children, and often they are being trafficked in our midst. This presentation will describe the emerging and ongoing ethnographic journey of faculty and students working to raise awareness about human trafficking in their region, and building local capacity among citizens and professionals to be able to recognize suspected cases of trafficking. Student research projects have documented levels of human trafficking awareness in their communities. Throughout this process, human trafficking has gained visibility in academic dialogue and become legitimate academic study.

Climate Change, Famines and Conflicts in Globalized World: Participation, Organizational Democracy and Self-Management

Human development is affected by climate change due to direct and indirect impacts on environmental, social and economic spheres. One of the impacts of climate change is negative effects on crop yields due to uncertain weather pattern, which pose a threat to food security as stated in the Fifth Assessment Report of the Intergovernmental Panel on Climate Change (IPCC). This aggravates the condition of people by impacting their livelihood and availability and access to food. A recent study conducted by researchers from the Columbia University established a link between the extreme severity of drought due to climate change and crop failure in Syria. As a consequence of this, food prices increased and many people lost their means of income further deteriorating their situation. This triggered the migration of population from rural to urban areas further stressing the system. Such a situation exacerbated poverty. This effect combined with poor governance sparked violent conflict in Syria further leading to people fleeing the country to escape civil war. The example of Syria highlights interlinked explicit and implicit threats posed by climate change and lack of good governance worsens the problem. Considering the future climate change impacts and risks stated by IPCC, and some parts of the world already experiencing these impacts, it becomes important to discuss the role of governance to address such issues. This paper explains the need for the change in conventional governance systems and planning required to tackle the challenges posed by climate change. It further discusses the kind of new dimensions required in governance systems and the importance of participation of people or various stakeholders in climate adaptation efforts to the build resilience of systems to face these challenges.

Prejudice, Hegemony, and Distorted Communication. Three Ways of Conceptualizing Anti-Muslim Racism

While there is a growing consensus that such a thing as islamophobia or anti-Muslim racism does exist, the ways of conceptualizing this phenomenon differ strongly. The two most common approaches are conceptualizing it as prejudice or as hegemonic discourse. In my paper, I will elaborate the strengths and weaknesses of both approaches and then propose a third approach combining their strengths while avoiding their weaknesses.

The discussion of Islamophobia as a prejudice was prominently introduced by the 1997 Runnymede Report and has since been particularly relevant for quantitative scholarship. From this perspective, Islamophobia is discussed as a phenomenon of individual consciousness. The most commonly named defining marks of prejudicial consciousness are homogenization, rejection, and distortion. This implicitly distinguishes prejudicial consciousness from a consciousness living up to the standards of critical thinking. The resulting ability to discern prejudice from rational critique is the most important strength of this approach. However, the focus on individual consciousness makes this approach blind to dynamics of discourse and power.

The understanding of anti-Muslim racism as a hegemonic discourse can be traced back to Edward Said's *Orientalism* (1978) and has recently been employed by a growing number of scholars. Building on notions from Foucault and Gramsci, this approach highlights the very dynamics of power and discourse to which the prejudice approach remains oblivious. However, abstaining from a strong concept of reason, this approach shows reductionist tendencies, rendering it unable to distinguish racist speech from legitimate utterances.

To combine the strengths of both approaches, I propose introducing Habermas's concept of "systematically distorted communication". Since this concept builds on a notion of reason not located in individual consciousness but in discourse itself, it is able to distinguish racist discourses from critical debates while also accounting for dynamics of power and discourse.

BISKAMP, FLORIS* (University of Kassel)

Uneven and Combined Populism in the European Union

While there are some very general theoretical claims about populism (e.g. those connected to the names of Mouffe and Eribon), empirical research (e.g. that connected to the works of Mudde and Rovira Kaltwasser) shows a more complicated picture, suggesting only medium-range theories can hold. I combine these medium-range theories with research on EU's economy and politics in order to develop a more systematic understanding of populisms in Europe as *uneven and combined populism*.

Most European countries have witnessed a surge of populism – but the populisms differ strongly from country to country. While the most successful populists in most countries are from the right, those in Greece and Spain are from the left. Moreover, there are significant differences among right-wing populists. While some stick to a neoliberal agenda, others reworked their position in an almost socialist fashion. These programmatic differences correspond with different social bases.

Yet, in their unevenness the populist movements are combined in many ways. The most obvious combination is that populists on the right collaborate and learn from one another, as do those on the left. These direct combinations account for similarities but not for differences. There are, however, indirect links that partially explain why certain types of populism are more successful in some countries than in others. These indirect links are to be found in the economic and political system of the EU. Different countries have very different positions within these systems – some running trade surpluses, others deficits, some being net contributors of EU funds, others net recipients, some wielding more, others less political power. Using the cases of Germany, Greece, and France, I argue that their respective positions within the European system make the success of different kinds of populisms likely. These populist successes in turn have ramifications for the political and economic system.

RC14-JS-16.3

BITTNER, VANESSA* (Yale Sociology)

"Man, Superman, Gunman". the Rise and Fall of Oscar Pistorius. a Cultural Sociological Analysis of Celebrity Discourse.

This paper takes into consideration the empirical case of the media representation of South African athlete Oscar Pistorius. The portrayal of the disabled sprinter changed dramatically following the murder case of his girlfriend, Reeva Steenkamp: While the man himself went unchanged, the image put forth by news outlets shifted from a public national hero to a villain figure. In this paper, I present an analysis of this case by weaving together three similar but disjointed strands of sociology: Goffmanian and cultural sociological approaches

to performance and facework, Weberian approaches to the relationship between charisma and stigma, and dramaturgical theories of social tragedy. Through this theoretical lens I illustrate how his murder trial was not only a scandal but in fact a social tragedy, promulgated by challenges to Pistorius' authenticity as a charismatic hero who had overcome stigma. This analysis shows how the drama of the Pistorius case is a social one, rooted in South Africa's specific social and cultural structures, as well as in its history of Apartheid. This paper contributes to understanding how stories of violence and (in)justice connected to celebrity are covered in the media, while giving insight into more subtle questions of how power is related to race and status in post-Apartheid society.

Post-Fascist Cosmologies and Civil Religion Revisited: On Black Ethnocide and Secular Sacrificial Processes in the City of Rio de Janeiro

This study analyses the fading boundaries between secular and religious discourse in the Brazilian public sphere from the perspective of the far-right sympathies stirred in the context of the 2016 coup and of the social groups standing as their most visible alterity in the city of Rio de Janeiro, the favela dwellers. On the one hand, ostensibly religious discourse, as a corollary of its continued deprivatisation, has been progressively called to postulate its agenda in secular terms; on the other hand, predominantly secular discourse, such as that of the Brazilian far-right, have come to display many cosmological features, ever more commensurate with a full-blown religious dimension. By revisiting and problematising the hypothesis of the civil religions and the contemporary characterisations of fascism, this paper seeks to illustrate this transit, evincing both the post-fascist cosmologies and the endogenous resistance against them, stemming from favela dwellers and militants defined by a composite stigma, simultaneously racial and territorial. The frequent "resistance killings" and "stray bullets" that victimise black favela youth, more than mere bureaucratic forms of the black ethnocide, may be conceived, within either group, as different forms of secular sacrificial processes, whereby political action and resistance may draw novel and as yet unknown potentialities. Evidence of this conflict and its centrality abounds to such an extent that even incidental observation of the cityscape, particularly of mortuary graffiti and urban epigraphy, may provide a valuable empirical ground to comprehend the rise of authoritarianism in Latin America and the many intricacies and fractures of the secular-religious divide in the 21st century.

BIZBERG, ILAN* (*El Colegio de México*)

He Diversity of Capitalisms in Latin America, a Regulationist Approach

The diversity of capitalisms in Latin America, a regulationist approach
Against the dominant institutionalist perspective on Latin American capitalisms that believes that all countries in the continent have followed the same mode of development, we defend the idea that there are significant structural and socio-political differences between them. This does not mean that every country is radically different and that we cannot find any general trends, but that we can find that there are clusters of countries that have had similar historical trajectories, analogous economic and class structures that make them react in a comparable manner to changes in the world economy.

This perspective is not only different from the ones that seek to find general patterns to the impacts of liberalization, for example. But it also differs from macro-economic analyses that try to define the best manner to react to a crisis, or to a favorable economic situation in order to extract most of its benefits. It is rather an analysis in *political economy* based on the manner in which socio-political conformations determine economic policies. It is an explanation on why States make economic decisions that are not always the "best way". This perspective also judges that every capitalism in Latin America has its own crisis that must be distinguished from others.

We propose a theoretical perspective that analyzes certain "determinants" of a type of capitalism: On what is the economy of the country based: commodities, industrial products, both? What are the characteristics of the wage relation: the labor market and social policies? What is the character and the form of intervention of the State? What are the fundamental socio-political groups that dominate political and economic decisions? What is the character of the political system?

BIZBERG, ILAN* (*El Colegio de Mexico*)

The Actionalist Perspective of Social Movements Vs. Resource Mobilization; With References to the Mexican Case.

This paper defends the perspective of the significance of social movements developed by Alain Touraine, against the hegemonic outlook to study these phenomena owing to the contentious politics/resource mobilization school developed in the United States by Tilly, Tarrow, McAdam, and others. I will defend the idea that to understand social movements, it is necessary to move away from most of the current sociological studies that are dominated by the perspective of resource mobilization, according to which social movements have to be analyzed in terms of their ability to influence the power system of a society, considering their action merely as strategies to seize opportunities to impose their power or influence a government. This perspective analyzes movements based on their ability to consolidate themselves internally and accumulate resources to influence the political system. It distinguishes the character of social movements according to whether they are competitive, reactive or proactive, but does not analyze the signification of their action.

In this paper we endorse the idea that although it is important to analyze the capacity of social movements to impact on the political system, we miss the point if we do not study them according to the meaning that they themselves give to their action (so to speak: the inner face of their action), as does the actionalist school of Alain Touraine. From this perspective, movements that seem unimportant if viewed on the basis of their immediate political impact may be strongly charged with an ethical sense, which may (or may not) have a greater influence in the future, or in a place other than that of its emergence. In the case of Mexico, movements that have not had a weighty political impact like #Yosoy132; MPJD, and the movements over Ayotzinapa, are the basis of a reconstruction of the Mexican society.

Transitions, Risks and Rehabilitation of Young Drug Users in a Life Course Perspective: How Young Individuals with Drug Related Problems Can Integrate Themselves Back to Society through Social Intervention and Rehabilitation Programs

Title:

Transitions, risks and rehabilitation of young drug users in a life course perspective: How young individuals with drug related problems can integrate themselves back to society through social intervention and rehabilitation programs

Abstract

This research project will study the lives of young drug users as they transition into adulthood, with an intention to observe changes in their lives as they participate in rehabilitation programs carried out by local humanitarian organizations. The drug users participate in intervention programs aimed at rehabilitation through one-to-one guiding and social integration in a medium rural town in Northern Norway. The study's focus is on the process of rehabilitation, social difficulties and risks that the drug users face in this period of their life. As the study's design is concerned with temporality and changes that can happen in their lives over time, the study will make use of a life course perspective. By including such a framework, one is able to properly structure and order the different events and changes that happens in the lives of the young drug users as they come in to contact with the rehabilitation programs. Two specific and overarching research questions are formulated to guide the research: The first question addresses what experiences do young drug users have from participating in humanitarian rehabilitation programs. The second question is concerned with what factors that can be important for young people with substance-related problems, when they over time try to integrate themselves back into society. The two questions imply that the study will be conducted on an individual level, focusing on the participants themselves and their experiences with a specific rehabilitation program. Methodologically the design will have a Grounded Theory approach. Methods will include ethnographic observations, analysis of documents and biographical interviews that together will produce thick descriptions on the informants.

Evaluation of a School-Based Program Designed to Develop a Positive Body Image and the Adoption of Healthy Lifestyle Habits Among Youths

Introduction: During adolescence, body image and self-esteem are associated with youths' mental health and quality of life. However, intervention-based

programs intending to improve body image satisfaction, global self-esteem and healthy lifestyle habits in youth do not seem effective: More than 50% of Quebec's (Canada) teenagers report body dissatisfaction.

Objectives: The major purpose of this research is to evaluate the short and mid-term effectiveness of the school-based *Healthy Mind, Healthy Body* program. This program, designed by *EquiLibre*, aims to develop a positive body image and adopting healthy lifestyle habits among youths.

Methods: This case-control study was conducted in two high schools in the province of Québec. All students in Grade 8 (mean age = 12.0 years) and Grade 11 (mean age = 15.2 years) were invited to complete online questionnaires at three stages of the research (baseline, T0 – Oct. 2016; one month at the end of the five-hour session school-based program (T1 – May 2017); and six months later (T2 – Oct. 2017). A total of 740 girls and boys in T0 (intervention group = 401 and control group = 339) had completed the questionnaire on body dissatisfaction, self-esteem and lifestyle habits, such as dieting attitudes.

Results: As expected, preliminary analyses reveal a variation in global self-esteem and various measures of body dissatisfaction throughout the school years. Our results show a significant effect of the intervention program, at least in the short-term: compared to the control group, youth in the experimental group reported an improved body image satisfaction and global self-esteem. Results of the six-month follow-up will also be discussed.

Conclusion: The effectiveness of the *Healthy Mind, Healthy Body* program was assessed. This will contribute to the identification of school-based program's best practices and to promote the use of these practices in schools.

Social Representations of Pharmacogenetic Testing in Clinical Practice: How to Speed up Knowledge Transfer?

Introduction: Some pharmacogenetic tests (PGT) are recommended by Health Canada when prescribing drugs that can cause adverse events or be ineffective according to specific gene variants. However, medical professionals do not apply PGT testing in Quebec (Canada), even if the possible advantages, such as improved therapeutic dosage and response, are generally well-recognized.

Objectives: In this original research, objectives are 1) to understand how medical professionals and patients stand with regard to PGT and 2) to make recommendations to improve the social acceptability of PGT and knowledge transfer.

Methods: We have conducted six focus groups in the Saguenay-Lac-Saint-Jean region (Quebec, Canada): two groups composed of general practitioners (GPs) (n=25), two groups composed of pharmacists (n=11) and two groups composed of patients (n=30). Part of the interview was based on real-life situations with drug examples that are commonly prescribed. In addition, we had asked all participants about their knowledge and perception of genetics in medical practice and what could be the roles of different professionals in regards to PGT.

Results: The data highlighted a willingness in regards to PGT application in all interviewed groups, but it also highlighted the central role of social representations on the acceptability of this technology. GPs and pharmacists had expressed the limitation of implementation of PGT in healthcare system mainly because of a lack of information about the accessibility of these tests, the delay of obtaining results, cost-benefits studies and ethical considerations. The patients were generally in agreement with the PGT and they trusted the medical professionals.

Conclusion: We have been able to highlight the social representations of PGT which have led to a set of recommendations that could help better apply PGT knowledge in clinical practice.

'Road to Nowhere' and Complex Transitions: Why We Are Not Living in a Post-Neoliberal Age

The most recent global recession exposed significant cracks in the façade of neoliberalism, so much so that many viewed the post-recession era as one of renewed Keynesianism or perhaps a more amorphous 'post-neoliberal era'. This article seeks to conceptualize the contemporary political climate by critiquing the concept of post-neoliberalism and arguing for a different understanding of the 'strange non-death' of neoliberalism. By analysing the protracted period of what has been called permanent austerity, we interpret the present period as a long transitory phase within which the crumbling of neoliberalism reduces political legitimacy of mainstream parties in the West, but does not seem to produce the passage to a new era. This protracted instability reflects the absence of viable political alternatives and seems to analytically assume the form of a

'road to nowhere' in which neoliberalization continues in a climate of exacerbated material hardships and weakening legitimization.

BLAIN, MICHAEL* (*Boise State University, Sociology*)

Progressive Violence: Theorizing the War on Terror

Many sociologists have idealized sociality to legitimate their role as "positivist" social scientists and fulfill their desires for progressive social change. They have ignored or played down the intense in-group solidarity generated by hatred of out-group enemies. It is anathema to many social scientists that groups can fall into hate as well as love, that we get intense pleasure from vicarious participation in power elite orchestrated victimage rituals (VR) that feature the ritual domination and destruction of villainous powers.

As a corrective, theorists should deal directly with the actual geopolitical practices of political and military violence. The power / terror dynamic was central to the emergence of the liberal nation state, Empire and settler colonialism, and the social sciences. This dynamic continues to essential to any theory of the US lead WoT. The imperial tradition survives in the contemporary strategic practices of the national security state. Geopolitics produces cycles of resistance and political violence.

The WoT is conceptualized as a mode of empire by means of global victimage ritual, involving the practices of vilification and glorification of heroes and the ritual destruction of villainous powers. Conceptions of power, good and evil, and life and death organize and glorify these violent power struggles. Heroic sacrifice has appeared in mass media spectacles broadcast to a global audience—for example, the "man-hunt" and "assassination" of Osama bin Laden and its reflection in contemporary politics and culture.

This paper proposes that sociologists should reengage with the problem of theorizing political violence by reactivating the Weberian tradition of historical sociology and its elaboration in terms of research in political sociology derived from C. Wright Mills' theory of the US power elite. This argument is elaborated in terms of three related issues: power, knowledge, and ethics.

BLANCANEUX, ROMAIN* (*Sciences Po Bordeaux*)

When the European Commission (dis)Credits Experts (un)Fit to Its Needs : The Decline of the French Label of Origin in Wine

Since Brussels has set regulatory measures for the wine sector in the 60's, the French government has endorsed policies offering a high level of recognition of its traditional, "Denomination of Origin" (D.O.) wines at a European scale. In 2007, however, it voted a reform calling for a more industrialized European policy with a new hierarchy for its wines. This article defends the hypothesis that this switch is ascribable to a change in the institutional relations between French experts and the European Commission. In the early European Community, French experts gained legitimacy among European officials, whose demand for expertise, and sociological background, favored them. Whereas the French expertise production was fit to the Commission's demand in the 1970's, the situation differed dramatically fifty years later, as the Commission's expectations in terms of expertise had evolved. Its changing institutional role progressively played a pivotal role, as it contributed to depreciate the French expertise at the origin of the European wine regulation. It inclined the French Ministry of Agriculture to recourse to other experts in order to fit to Brussels' demand in terms of expertise. Adaptation to Brussel's orientation led the French Ministry of Agriculture to regain power over the experts in wine Law, and develop its own expertise to negotiate with the Commission. As it did, it also adapted the wine sector to European norms, and abandoned the specificity of its D.O. wines. Thus, the French Ministry of agriculture's vote in 2007 took a radically different stance, as compared to the past.

Well-Being and Successful Aging Predictors in a Costa Rican Sample of Older Adults

Purpose: Successful aging was defined as the older adults' ability to experience low risk of disease and disease-related disability; maintain high mental and physical function; and continue engagement with life, which includes relations with others, supportive and productive activities (Rowe & Kahn, 2015). The model identifies specific mechanisms impacting older adults' adaptation and satisfaction with life while controlling by a constellation of factors related to health, cognitive

and social functioning. This study examines which factors are associated with the life satisfaction of older adults attending a lifelong learning program at the National University of Costa Rica.

Method: Using a questionnaire including socio-demographic information, health, social and psychological factors and wellbeing outcomes, data was collected on a sample of 282 older adults (55 and older) in participating at programs at the National University in Costa Rica. Items referred to variables related to well-being like life satisfaction, spirituality, social support, self-efficacy, social support, self-perceive health, and others. A structural equation model with latent variables were specified and estimated using AMOS.

Results: SEM results indicated a good model fit (Chi-squared 1.426 $p < .000$; df 726; CFI = .901; RMSEA = .059). Main findings suggested that life satisfaction for older adults attending programs at the National University is primarily impacted by health (physical and emotional troubles, $\beta = -.17$), social and emotional support ($\beta = -.38$), self-efficacy ($\beta = .14$) and spirituality ($\beta = .22$) while controlling by age.

Discussion: Results are consistent with the traditional variables included in successful aging models, with particular attention to the significant weight of spirituality and self-efficacy among older adults in Costa Rica. We will discuss the role of attending lifelong learning programs in improving the well-being of older adults.

BLASKO, ANDREW* (Bulgarian Academy of Sciences)

Taking the Role of the Other in Submission

The general issue addressed in the present discussion concerns the ways in which interaction within systems can be determined by forces, processes, and media apparently beyond the voluntary control of individuals. The particular focus in this regard is the medium of power. We will ask whether and how the exercise of power, especially subjection to power, can potentiate interaction such that particular types of interaction tend to occur with a significantly higher degree of probability than others. We will argue that the addition of subjection to power as a potential to interaction can lead to specific types of meaning being constituted in interaction that may facilitate the functioning and propagation of power. In this respect, looking at ourselves through the eyes of the other becomes the dominant mode of self-reflection such that we become, on the level of interaction, what the other wants us to be.

RC36-645.3

BLASKO, ANDREW* (Bulgarian Academy of Sciences)

When Dignity Is Impossible

This presentation questions whether and how the exercise of power in the form of the submission to power can act as a formative force upon the operations of the imagination, perception, and cognition by making the constitution of certain types of meaning significantly more likely than others. This restricts not only the types of meaning that can emerge in what is taken to be the objective world, but also the types of self-reference, with the latter extended to include possibilities for action on the part of individuals. This results in social life operating with a determining causality to the degree that social interaction constitutes subjection to power, the restriction or reduction of alternative ways of thought and action, and the perpetuation and expansion of alienation in both subjective and objective forms.

Borrowed Grandfathers – If Men of Older Age Care

What if old, i.e. aging, men in transition and/or during retirement engage in intergenerational and extra-familial care relations? The phenomenon of older men who decide to care for young children who are not related by blood is still a niche phenomenon and has until now found very little scientific attention. If we consider the increasing number of people of old age, the increasing occupation related mobility and the increasing share of female workforce within Western industrialized countries and the economic, cultural, political and social effects, borrowed grandfathership might play an increasingly important role in society.

But, why do aging men engage in such a care relation, how does the care practice look like and what effects does it have on processes of "doing aging"? The discussion of the care-crisis, and the debate about active aging are, as we suggest, fruitful approaches to explore this phenomenon. Furthermore, borrowed grandfathership may also challenge hegemonic masculinity and concepts of grandparenthood as such.

In order to get insights into the practice of borrowed grandfathership we carried out semi-structured interviews with men involved in such care relations and with a small control group of women in a federal state of Germany. One result being that borrowed grandfathership seems to be pushed by a female partner or

closer friends being involved in such care relations. Secondly, borrowed grandfathership very often is initiated by a sense of regret of not having been a good father to one's own children due to occupational duties.

In this paper we will present further results of our research as well as some thoughts on the social relevance of this phenomenon in future. It would be very interesting to get some insights of borrowed grandfathership in other countries, i.e. differing social-cultural frames.

How Racial Violence Is Provoked and Channeled

Drawing on interviews with a broad set of former racist activists, this paper explores the relationships between violence and the vicious racist ideologies of modern white supremacy in the United States. Through this empirical approach, this paper contributes to a conceptual understanding of the linkages between micro- and meso-level dynamics of race and violence. In particular, we examine how racist ideologies and violent practices shape individual experiences, motivations, and actions as well as group dynamics.

Ecologies of Boundaries: Boundary Work in Emerging Trans-Local Professional Jurisdictions

In recent years, ecological approaches to professional work, authority and regulation has seen a resurgence in the sociology of professions, as epitomized in the linked ecologies framework of Andrew Abbott (2005). Alongside this resurgence comes a renewed attention to the wider and multi-scalar set of socio-spatial relations in which professional groups operate, including the way symbolic boundaries within and between professions, as well as between professional, academic and political institutions, come to be defined, negotiated and changed as part of professional projects. So far, however, the varieties of situated boundary work (Fournier 2000; Liu 2015) in which professions and professional actors engage in order to forge jurisdictional claims, niches and linkages has yet to be fully interrogated. Building on and comparing case studies set in Denmark into three emerging trans-local professional jurisdictions – of climate adaptation, lifestyle disease prevention and innovation management – this paper seeks to identify key modalities of intra- and inter-professional boundary work, as this is set within wider reforms in the linked ecologies of professional, academic and political institutions. In doing so, the paper makes two theoretical contributions to an ecological approach in the sociology of professions. First, it grounds Abbott's meso-level framework of linked ecologies in more situated accounts of inter- and inter-professional boundary work, by way of reconnecting to a wider tradition of symbolic interactionist studies of professions. Second, and conversely, it updates these latter approaches for a world of trans-local professional governance, by way of highlighting the multi-scalar relations and boundaries whereby linked professional ecologies are constituted.

'I Don't Have a Project Mentality'. Stories of Crafting Life in the Context of Intersectional Stigmatization of Black Women Living in US Public Housing

This paper asks how the stigma of public housing impacts the ways in which Black young mothers crafted their lives outside of a now demolished US housing project, addressing this question through ethnography. Much has changed since I conducted ethnographic fieldwork in a US public housing project in a small New England college town in the early 2000s, in how academia engages with studying intersectionality and marginalization and in how Black female experiences of racism and discrimination are publically discussed and perceived. This paper aims to highlight only one particular dimension of public housing stigmatization that brings together the intersection of housing stigma, race and gender, namely that which categorizes those with a 'project mentality' from those who lived in the projects but distinctively distanced themselves from this way of life. I explore how this idea was used in conversations of young Black female project residents, to what it referred, and how they constructed the notion in the context of the settings of marginalization they encounter when they are crafting their lives outside of the physical space of the projects. Similar to some categorizations also used by scholars between hoodlums and decent poor, these categorizations include aspects of behavior linked to violence, crime and 'not doing the right thing'. However, I aim to show that an approach that orients on the women as agents

crafting their urban lives rather than as subjects reacting to a stigma imposed requires us to rethink some of the standard understandings of stigmatization.

Women Traders in Southeast Asia Vs Sub-Saharan Africa: With and Against the Odds

I've begun applying my theories of gender stratification and gender and development to trade – in which women are important in Southeast Asia and sub-Saharan Africa, areas where I've done research on gender and economic power. I posit that a prerequisite of female involvement in trade is participation in significant production activities. But the nature of the kinship-property system can facilitate or complicate women's trade. In Southeast Asia's overwhelmingly bilateral or matrilineal groups, women freely engage in trade ranging from selling in local markets to long-distance and/or cross-border trade. In sub-Saharan Africa, however, 75% of ethnic groups are patrilineal and women rarely inherit land. Yet, especially in West Africa and increasingly in Southern Africa, women are crucial in both local and informal cross-border trade. In Southeast Asia, women traditionally worked in horticulture in the uplands; in the lowlands both genders cultivated irrigated rice, with many women trading seasonally, while others traded year-round. In Africa, formal trade takes 12 days to clear customs whereas women informal cross-border traders take hours, greatly enhancing food security: Polygyny is common in sub-Saharan Africa, as are "separate purses" for husband and wives, especially in West Africa, where cultivation is horticultural and men are primary cultivators in <20% of ethnic groups. Women there often organize to facilitate their trading. But female trading is so entrenched that after the 1800 jihad that imposed Islam and seclusion marriage on the Nigerian Hausa, women began running their businesses from their homes, aided by non-secluded pre-adolescent daughters or brothers – with ~98% having income-generating activities. Women traders face many obstacles and dangers (in 2016, I found sexual coercion at one Malawi border and having to use wild animal corridors at night in Northern Botswana). But few governments facilitate their situation, reducing their development contributions. I end with some policy suggestions.

Strangers in a Familiar Land: Negotiating Christian and Thai Identities in Buddhist Thailand

In Thailand, the perspective that "to be Thai is to be Buddhist" pervades everyday social existence, fundamentally defining the unifying essence of community, national, and ethnic self-understandings. Within this contexture, Christian conversion introduces not only the restructuration of personal beliefs and allegiances, but also the displacement of the convert from pre-existing group memberships and social identities. By imbibing the new world of Christian belief and identity, Christian converts concomitantly become members of a socially marginalized sub-group. To cope with life "on the hyphen," therefore, converts must unravel this presumed interpenetration between Buddhism and Thai national identity while, at the same time, imaginatively reintegrating "Thainess" with "Christianity."

How exactly this identity negotiation transpires has not been adequately explicated by existing sociological, anthropological, or social psychological theories. While theorizations such as the "marginal man" or the "stranger" have contributed much to our understanding of this phenomenon, up to this point, a thorough description of the "lived" nature of religious identity negotiation in marginalized contexts has received little attention. In this paper, I will present a phenomenological explication of the lived experience of marginalization and its effects on identity (re)formation as arising from religious alternation among Christian converts of Northern Thailand. The descriptions are based on in-depth interviews that were conducted with Christian converts in Chiang Mai, Thailand, and processed utilizing the social science methodology of interpretive phenomenology. I argue that the integration of national and religious identities among Christians in Northern Thailand is negotiated via the convert's everyday, lifeworld performance and is founded on core personal and social legitimations which provide both meaning and interpretation to that performance. This negotiation process allows converts to re-define the elements of accepted national and ethnic identities such that Christian identity is perceived as not only an acceptable, but possibly even superior, mode of "Thainess."

Beat of Your Own Drummer? the Entanglement of Time and the Embodied Witness in 87 Capital Cities

The human sensorium and our experiences of time are intimately interdependent and intertwined. Time is additionally an integral, deterministic

component of the social world, palpable through our collective pace of life. Pace matters, as our conception of temporality itself springs from our encounters with, and traversing of, space. There has been a long-standing interest in measuring this pace, as it allows us to glimpse what it means to experience time as it is embodied differently in different contexts, constrained both by the infrastructure of urban spaces and by our individual, gendered biological trajectories through life. In this paper, by using the latest live stream video technologies, I build and improve upon the existing measures of the pace of life. In addition to expanding the data from the previously measured 31 to 87 cities, I standardize the measure for greater accuracy, while also taking gender and age in consideration. My contribution extends beyond the descriptive. As the pace of life is multifaceted, with technological, economic and social drivers, I examine how country-level population characteristics along with socioeconomic drivers influence this pace. Moving from macro to micro: to illuminate how time influences our biological temporal rhythms - through an examination of the relationship between temporality, fertility, birth spacing, and health - I also touch on the ways in which the pace of life interacts with the constitution of humanity through space and time.

Identifying Vulnerable Populations through a Combination of Big Data, Demographic and Qualitative Techniques

Despite long-standing interest in the health of the most vulnerable segments of the population, assessing the situation of hidden and hard to reach minority populations is impeded by a seeming lack of data. This perception persists, as social scientists have not fully tapped into our ongoing 'big data revolution': We are surrounded by individually generated digital data deposits; invisible to us, perpetually documenting our location, health, socioeconomic status, thoughts and habits. Yet, we do not routinely use this wealth of historic and live data available to us to address enduring gaps in social scientific research. In this article, I use a novel combination of research methods, relying on qualitative, machine learning and demographic techniques. I test my method through a case study of a high-profile, yet also highly stigmatized and vulnerable refugee population - the Hungarian Roma refugees of Canada. My work is guided by the following questions: (1) *What are some shortfalls in the existing, commonly deployed methods of counting hard to reach populations such as the Roma?* (2) *How does my holistic methodological intervention differ when it comes to tangible differences in the population portraits uncovered?* (3) *How can researchers apply my proposed methodological intervention to other hidden and hard to reach populations?* I illustrate that by using comprehensive sampling, data, and statistical techniques, in contrast to the existing crude population portraits of the Roma, we can arrive at a much more nuanced and ethically responsible representation of this population. My contribution extends beyond the descriptive, as I also examine and contrast the socio-demographic realities facing both the Hungarian and the Hungarian Roma populations of Canada. In an effort to aid the design of appropriate interventions, I highlight some ways in which the socioeconomic constraints the Roma contend with shape their survival strategies in their new homeland.

The Centrality of Race to Inequality in the World-System

Recent scholarship on racial and ethnic inequalities (Dunaway/Clelland 2016, 2017) takes the increasing racial and ethnic diversity of the transnational capitalist class in the past decades as an indication of the ways in which nonwestern semiperipheries will increasingly cause and/or exacerbate most of the world's ethnic/racial inequality in the 21st century. This paper instead argues that the boom in the number of non-Western capitalists seeking the advantages of residence and citizenship in the U.S. and Europe is no challenge to core dominance or white supremacy. Rather, it points to the paramount role that race continues to play for a global stratification in which the "premium citizenships" of core Western states highly correlate with whiteness; and to which only very wealthy non-whites have recently gained access through the commodification of rights in semiperipheral states that share a visa-free travel zone with core Western states. For wealthy

non-Westerners, investment residence and citizenship of Western states constitute global social mobility as well as a means of "buying into" whiteness. Such capital-facilitated moves up the citizenship ladder are themselves ways of buying into whiteness, or what has been referred to as "whitening with money" (Hasenbalg 2005). At the global level, they are strategies of eluding the ascription of citizenship of one's place of birth. As such, they belie the experience of the great majority of transnational labor migrants, for whom international migration in search of upward economic mobility entails the risk of downward racial mobility through reclassification as non-white.

BOCCAGNI, PAOLO* (University of Trento)

For a Comparative Sociology of Home(s). Tracing Variations in a Universal Need and Practice across Settings, Notions and Emotions

This paper outlines a theoretical and methodological agenda for the comparative study of home. Sociologically, this notion stands for a socio-material setting, a kind of social relationship with place, and a value-laden category for the discursive production of identity, belonging and the boundary between insiders and outsiders. Each of these analytical foci is significant in itself and as an entry point for research into housing, care, social reproduction, emotion, material culture and majority-minority relations. Each of them raises significant methodological challenges. In both respects, the ways in which home is conceived, sensed and enacted by individuals or social groups are a promising terrain for comparative analysis, at several levels: between countries, socio-cultural groups, housing and household arrangements, and degrees of (im)mobility – or through a combination of these axes, in light of the "usual" socio-demographics. Large-scale comparison, particularly through collaborative and multi-sited ethnography, can advance knowledge of the drivers of (and variations in) fundamental issues such as the relationship between house and home; the ways in which people conceive home and feeling at home across countries and groups of reference; the interaction between the fixity of dwellings and the mobility of life trajectories; the ways in which dwellings as lived environments mirror societal or group-specific values, life styles and inequalities. In the abstract, home and feeling-at-home are virtually universal social patterns, whatever the ways of phrasing, conceiving and enacting them. In practice, a comparative study of their enactment over space and time can illuminate the experience of home and, indirectly, a range of other sociologically meaningful issues. This paper interrogates this research prospect and the attendant challenges, based on the preliminary findings of ERC HOMING – a comparative study of the home experience among natives and foreign-born, "mobile" and "immobile" people, in several countries, as connected by international migration flows.

Homing: An Emerging Conceptual Bridge between Migration Studies and Sociological Theory

This paper advances a new conceptualization of "homing", as a connection between migration studies and social theory on belonging, place-making and circulation. I define homing as the aggregate of social practices through which people – including migrants – try to make themselves at home in their life circumstances, and as the moral and emotional economies underpinning them. Homing depicts the ongoing ways in which home is conceived, felt and enacted in the everyday, by individual or collective actors, in interaction with their external environments. As an intransitive verb, homing highlights the processual and biographically evolving constitution of home, rather than essentialising it. Indeed, a critical revisit of the elusive notion of home is the starting point for a homing perspective. While "homing" has often been evoked, metaphorically, out of its original "home" in biology (e.g. in diaspora studies), the development of a consistent theoretical framework about it illuminates three broader debates, drawing on a variety of examples:

- i.) the negotiation of belonging, identity and the insider/outsider boundary under circumstances of (super-)diversity, with an emphasis less on abstract claims than on the attendant day-to-day interactions;
- ii.) the potential for people to appropriate space, or to feel attached to it and exert control on it, given their resources and the external structure of opportunities – with all of the conflicts between opposing claims;
- iii.) the portability and reproducibility of material cultures and everyday life styles – after biographic thresholds such as migration-driven ones – and the relevant enabling or constraining factors, which feeds into the debate on translocality and de-territorialization.

The paper is an invitation to homing as a new category of analysis. It need not lead to "discover" unprecedentedly new social realities, but does provide better coordinates, and a more sophisticated gaze, to make sense of the present and past ones.

BOEDIONO, KUSHARIYANINGSIH* (Binghamton University, State University of New York)

Transnational Operations and Controversies Around the Rapid Growth of Oil Palm Plantations in Indonesia: The Case of Sumatra

Amidst its negative impacts on the environment and local communities, oil palm represents a vast economic opportunity for the Indonesian government and considered as the main component of its development strategy as well as the main driver of people's economy. The strategic role of oil palm in Indonesian economy is due to its comparative advantage in terms of labor and land costs, and the prospect of increasing demand from new biofuel markets in Europe and the United States. The palm oil plantations in Southeast Asia have been in operation since the colonial period. In Indonesia it was imported from West Africa by the Dutch colonialists in 1848. The first large-scale commercial oil palm plantations were established in the eastern coastal region of Sumatra in 1911 and have been characterized as transnational operations. During the Old and New Order periods, oil palm was associated with direct state investments via state-owned companies where direct foreign involvement in the plantation industry was relatively minor. However, the structure of the industry changed drastically, when in 1998 the International Monetary Fund's (IMF) required the country to liberalize its plantation sectors. The agreement with the IMF has led to substantial investments by Malaysian companies and allowing maximum foreign ownership in both domestic and foreign investments. The center of Indonesia's oil palm production is in Sumatra where in 2013 fifty percent of the country's 10.5 million hectares oil palm plantations is located in that region. Due to the fact that since the mid-1990 Indonesia's oil palm industry has been characterized by the growing importance of TNC's, this paper will discuss the impacts of the industry on the environment and local communities in the eastern coastal region of Sumatra.

BOEGENHOLD, DIETER* (Alpen-Adria University)

Middle Classes, De-Middledization and Stratified Societies: Observations of the Heterogeneity of Self-Employment

In the recent discussion about the future of modern capitalist societies many well-thought speculations rely on the interplay between continued processes of globalization, increased trends of so-called digitalization and other forms of technological progress and their effects on the system of social stratification and social mobility (Wallerstein et al. 2013). Middle classes serve as a kind of conflict buffer of modern societies. In his discussion why there is no socialism in the United States which was questioned in book format by Werner Sombart in 1906 (see Sombart 1976), the upcoming middle classes and their related relative wealth played a central role. Sombart argued that if people earn means to engage in different consumption activities they start to arrange positively with a political-economic system receiving a status, which is worth defending. With roast beef and apple pie all socialist dreams disappear, was somehow the answer by Sombart to the stability of capitalism in early 20th century.

According to Collins (2013), technological displacement of middle-class labour is not much more than twenty years old whereas it took almost 200 years to destroy the working-class labour force. Therefore, none of the previous ways to compensate job losses will work effectively anymore in the future. Now the twenty-first century trajectory of technological development is likely to push the middle classes into redundancy.

This paper is about a sociology of middle classes in a theoretical discussion and empirically focussing at the occupational group of self-employed people. This category of the labour market as a whole was very much connected to ideas of a typical "middle" position. The paper wants to question this assumption theoretically and empirically by referring to the heterogeneity of self-employment, which may give proof for Collins' thesis of an increased *de-middledization*.

Between Helplessness and Group-Based Control Restoration - Identity, Political Action and Resignation in Focus Groups of Left Wing Groups

This lecture reports the findings of a research project aimed to understand the escalation of political violence in contemporary Germany. Several focus groups have been conducted in an eastern German city. We will present selected results of our depth-hermeneutic interpretation drawing the experiences of left wing group members. Evident is the helplessness and its denial. The perceived threats from neo-Nazi groups as well as the inability to articulate strategies against neoliberalism lead to spheres of pseudo-control (e.g. politicization of eating or identity politics). The results will be discussed against the background of the

polarization in the German society, described by the longitudinal "Center"-studies on right-wing extremism.

Are Socially Cohesive Societies Healthier? on the Influence of the Societal Level of Social Cohesion on the Health Status of Western Publics

The paper analyses the relationship between the quality of social cohesion in 34 countries of the Western world and the average health status of citizens of these countries. Based on assumptions that can be derived from the work of Veenhoven, it tests the hypothesis that high levels of societal cohesion are positively related to both physical and mental health. The *Bertelsmann Social Cohesion Radar* (Dragolov et al. 2016) serves as a database for the assessment of societal cohesion levels. The Radar is based on a new multi-faceted concept for measuring social cohesion, developed by the authors. Cohesion data are being related to health data from WHO files, namely the so-called disease-adjusted life years (lost), DALYs. Correlation analyses (bivariate and partial) exhibit surprising results; Prevalence of physical diseases is indeed lower in countries with high levels of social cohesion, whereas for mental health indicators no relationship emerges. However, when the relationships are partialled for a country's per capita state expenditures on health, the relationship between social cohesion and physical health disappears, whereas for mental health indicators it emerges that more disease-adjusted life years are lost to mental diseases in countries of high social cohesion. The authors interpret this finding in line with Maslow's Hierarchy of Needs. They propose that in countries with a high level of social cohesion all basic needs of citizens tend to be fulfilled (as opposed to countries with low levels of social cohesion), so that more people turn to the fulfillment of self-actualization needs. However, as major proportions of the population fail in fulfilling these needs, mental health problems increase in comparison to countries where people predominantly need to fulfill their more basic needs. This interpretation puts the research into the tradition of Inglehart's political development theory.

Intergenerational Transmission of Family Values and Gender Role Attitudes – a Comparison of Immigrant and Native Families in Four European Countries

The paper analyses intergenerational change in family values and gender role attitudes among immigrant and non-immigrant families in four European countries: UK, Germany, the Netherlands and Sweden by studying adolescent-parent dyads, using data from the Children of Immigrants Longitudinal Survey in Four European Countries (CILS4EU). The CILS4EU is a large (N gt 2500) multi-wave longitudinal study of initially 14-year-olds and their parents that commenced in 2010. Whereas for autochthonous families we assume an intergenerational decline of both 'family values' and traditional gender role attitudes, we encounter mixed arguments for the intergenerational transmission mechanisms within immigrant families. Analyses shall furthermore shed some light on the question whether interfamilial change in family values and gender role attitudes is related to cognitive, structural and social assimilation processes, thereby bringing together perspectives from cognitive psychology, sociological social inequality research, and acculturation studies.

BOELHOUWER, JEROEN* (*The Netherlands Institute for Social Research*)

The Social Indicators Movement at 50: Onwards in Unity with a Model-Based Approach

Before we can move forward with new topics in quality of life research, it would be useful to settle a number of issues that have been a source of debate over the last 50 years. Broadly speaking, this leads to seven principles for measuring and describing quality of life: the central focus is on people; quality of life is about more than just economics; a full measurement must incorporate both objective and subjective indicators; quality of life incorporates several dimensions; the outcome must be viewed separately from the determinants; there must be attention for distribution and difference; the domains can be combined into an index (though this is not essential). The main debate is perhaps about whether or not there should be an index. An index is necessary if we wish to give social indicators the same status as economic indicators have through GDP. In my view, that is desirable. Once these principles are established, the agenda for future social indicators research can be shaped using a model-based approach

BOERIO, PRYANKA* (*University of Milan-Bicocca*)

Social Exclusion of Older Immigrants, and Its Consequences: A Study on Share Data

The elderly population in Europe is rapidly increasing (EUROSTAT, 2017). This increase is even more important when focussing on older immigrants. Between 2010 and 2015, non-native people over 55 years of age increased by 50% in countries like Finland, Portugal and Luxemburg. A strong increase is also recorded among future elderly in this category (45-54 years old) (Ciabanu et al., 2017). Against this background, issues concerning older immigrants' social inclusion are becoming more and more actually.

Social Capital's (SC) approach is widely used in social inclusion studies of the elderly (Litwin, 2009; Tomini et al., 2016; Craveiro, 2017). The situation is not the same for the literature on non-native seniors and future seniors. The aim of this study is to fill this gap, and shows what kind of SC (*bonding or bridging*) allows the elderly or aging immigrant population to have the best outcomes in terms of health and well-being. Here we refer to a micro-level approach of SC, following the definition of Van der Gaag and Snijder (2004). With the aim of isolating the effect given by the place of birth, a comparison with the native populations will be performed.

To carry out this research I used the *Survey of Health Ageing and Retirement in Europe* dataset (wave 4 and 6), and I created a measure of individual social capital, which covers many of the dimensions identified as salient ones in the literature; and through a systematic study of the European context. In order to check the macro aspect of data, I consider using regression models that take differences within and between groups into account. The macro variable is represented by Welfare regime (Esping-Andersen, 1990; Ferrera, 1996).

The Migrant Knowledge Workers in Italy: A Structural Problem?

One of the most serious consequences of the economic and social crisis which from 2008 to 2015 has struck Italy, along with a large part of the countries of southern Europe, is the strong growth of youth unemployment which has particularly affected those with a higher level of education. An the effects is the exponential growth of emigration of young Italian knowledge workers, that has not at all been offset by incoming flows of migrants at the same level of qualification. A phenomenon deepened by the joint action of two aspects mostly affecting the research and innovation sector, i.e. a stop in the recruitment in the public sector, due to implemented austerity policies and a structural difficulty of the Italian labor market to recruit highly skilled workers.

The paper analyzes this phenomenon by exploring the quantitative dimension of Italian knowledge workers' migration, also referring to the pre-crisis period. The analysis is articulated both in terms of size of the migration and of estimating economic costs for Italian society as a whole. It also includes a study on motivation to emigrate and on conditions for possible return. It is based on a survey specifically tied to research and innovation, i.e. the knowledge workers in some hard scientific fields. As this situation, by reducing the highest quota of human capital in the country, is likely to have permanent consequences on Italian society, the paper also explores some points for potential return policies of expatriates knowledge workers.

A Participatory Approach to Create Knowledge and Actions to Improve Immigrants' Health.

The paper presents a two-year experience of critical university extension at a public primary healthcare center in the Old City of Montevideo. The project has a participatory approach, integrating knowledge and action, to improve immigrants' health. This process provided the basis for a collaborative research project. In 2016, a group of workers that were concerned with the new immigrant scenario, requested the participation of our Research Group: Human mobilities, work and human rights (CSIC, Udelar). It's important to mention that Uruguayan nation was built on cultural diversity but efforts were directed to get a homogeneous social landscape. Uruguayan cultural identity was consolidated on the narrative of a *homogeneous mixture*. Recent immigration flows from Latin America have increased. In general, no significant conflicts are identified. Locals have difficulties to reflect on the problematic issues connected to immigration. Immigrants have

very few social spaces and opportunities to express discontent. Immigrants get together and become invisible in the city. But they are *not* invisible for public services workers who deal with their presence. Workers have no specific knowledge or guidelines to understand the experiences immigrants go through. Tension is increasing. The paper reflects on the process of building together this project called "Health and interculturality", the participation and engagement of the different actors, the challenge of co-producing critical and good-quality knowledge on contemporary human mobilities, interethnic relations and urban conviviality.

From Victim to Perpetrator and Back? Biographies of Former "Child Soldiers" in Uganda

As Foucault and others have emphasized, it is impossible to understand the actualities of macro-violence or collective violence unless one takes seriously, and confronts, the *concrete, bodily and sensorial*, bloody and cruel aspects of this subject matter - in a detailed and palpable, virtually painful manner. The paper summarizes some findings of a research project on the life stories & life courses of former so-called child soldiers or abductees of the "Lord's Resistance Army" in Uganda. The biographies of individuals who were abducted as children or adolescents by this Christian-millennarian and ethno-nationalist rebel group and forcefully recruited as fighters and/or "wives" (often in the context of very bloody raids on the homes of their families, relatives or neighbours) show central features of their experiential history, their life courses and their changing biographical self-interpretations. Amongst others the biographies show the necessity of a critical analysis, and empirical investigation, of the *concrete* relations between self-presentations and reality, or between narrated and lived lives. The same applies to the relations between practices and discourses among the civilians who were close to them before their abduction/recruitment and after their "return" from the rebels. I focus on varying blends or ratios of enslavement/subjugation and agency/autonomy, at various moments and in different phases of the lives of the former rebel fighters or abductees. At the same time the research shows the power and actual *working* of ethno-political belongings as discourses that shape the images of the self and the we-group, their history and the world.

Challenges of Implementing an Online Survey for Assessing the Occupational Risk for Pregnant School Teachers in Rhineland-Palatinate, Germany

The Institute of Teachers' Health at the University Medical Center of the Johannes-Gutenberg University Mainz, is responsible for the occupational-medical care of public school teachers in Rhineland-Palatinate, Germany. In line with the Maternity Protection Act, the employer (here state ministry of education) has to assess the potential workplace risks of a pregnant teacher after the pregnancy has been announced.

In practice, the school principal has to report the pregnancy as well as information on gestational age, status of immunity, potential risks at workplace and personal data to the Institute of Teachers' Health. Based on this information the occupational physicians at the Institute of Teachers' Health evaluate the occupational risk for the pregnant teacher. In case of existing unavoidable occupational risk factors, a (temporal) employment ban will be recommended to the teacher's employer.

Besides the individual occupational risk assessment, the anonymized version of the data on immunity, work place factors and gestation are used for research purposes.

Currently about 130 cases of pregnant teachers per month are reported to the Institute of Teachers' Health via an online survey process. The development

of the online survey process had been challenged by privacy questions because both personal data and health data are required. As a solution, two downstream processes were implemented to separate personal from health data. The first process conducts information on gestation, immunity and workplace factors by an online survey. The second process is an independent IT solution which conducts the personal data of the pregnant teacher. Only at the Institute of Teachers' Health the data is combined by an individual code.

Focus of the presentation is to report the challenges of developing the process of risk assessment for pregnant school teachers in Germany, the technical online solution and the feedback the Institute of Teachers' Health gets of its users.

Getting Ill Teachers Back to School: Sickness Absence from Work and the Performance of an Occupational Re-Integration Management Program for School Teachers in Rhineland-Palatinate, Germany

The Institute of Teachers' Health at the University Medical Center of the Johannes-Gutenberg University Mainz is responsible for the occupational-medical care of public school teachers in the state of Rhineland-Palatinate, Germany (about 41.000 persons). In accordance with Volume Nine of the German Social Insurance Code, the institute offers an occupational re-integration management program (RIMP) to teachers who have been absent due to sickness for at least six weeks within the last 12 months.

The causes for sick leave of those teachers taking part in the RIMP (N=100 cases per year) are due to mental illnesses (amongst others depression, chronic fatigue syndrome, anxiety disorder) in 50% to 60% of the cases. Patients assume that mental illnesses are mainly caused by work environment strains or by a combination of workplace and personal strains. The other 40% of supervised teachers suffer from physical illnesses. Accidents at work or in personal life are only minor causes for incapacity for work.

After repeated examination and consultations with patients the physicians at the Institute of Teachers' Health suggest several actions for re-integration, i.e. successive or stepwise re-integration; discussions with the staff council; further medical care by external experts as e.g. psychologists, physiotherapists; ergonomic workplace design or reduction of teaching hours.

In September 2017, three years after the introduction of the re-integration management program, a study is started to evaluate its Performance: First, we conduct qualitative interviews with selected former patients to learn about their experience/satisfaction with the RIMP; their status of illness/work ability; their job-satisfaction and evaluation of appropriateness of the action taken to retrieve work ability. Study results will be reported at the conference. Second, all former patients will be invited to evaluate the RIMP by a standardized questionnaire. Based on the results, the RIMP will be adapted to meet the respective requirements.

Assisted Reproductive Technologies in Russia: To the Question of New Forms of Social Inequality

The paper is devoted to consideration of social consequences of assisted reproductive technologies (ART). ART has become common practice in many

countries today and raise many medical, social, ethical, political questions, often leading to controversial and sometimes inaccurate opinions about the outcomes of pregnancies resulting from these techniques. Despite the fact that initially, these medical technologies were designed to smooth out the natural, biological inequality, their implementation and using have led to the emergence of new forms of social inequality. Using statistics data from both Russian Goskomstat and the Russian Association of human reproduction, as well as conducting secondary data analysis, we analyze the emerging new forms of social inequality. The main criterion for the production of inequality is affordability of ART. Despite the existing legislative regulation of the availability of ART in Russia, the implementation of reproductive rights and using these methods of human reproduction are determined by socio-economic and financial status of the person. In some cases, gender, ethnicity also are of importance. In Russia, it is also possible to highlight the regional disparities. Differences in access to ART induce new forms of social mobility, both at global and regional levels. «Reproductive tourism» develops. ART also contribute to emergence of a new biological inequality and genetic discrimination, thanks to such a method as preimplantation genetic diagnosis. This method contributes to symbolic discrimination against people with disabilities and their families in the present. We can also speak about reproductive bioeconomics, where the reproductive labor e.g. surrogate motherhood is a central element and reproductive material (donorship) are main objects to be exchanged. In the most cases customers of the reproductive market are from developed countries and suppliers accordingly are from developing economies, so we can suggest a new form of colonialism and exploitation.

The Museum – the Storytelling Institution in Society. What the Museum Can Tell Us about the Society and Social Relation?

In contemporary world the museum plays new and crucial role. The idea of narrative museum is crucial for understanding the role of this institution for the social and cultural relations between people, institutions, nations and states. I am going to dedicate my presentation to the narrative museum as an object which very actively take part in construction of dialogue and social negotiation of meanings of history, partnership between countries and ideas.

The new model of narrative museum is very strongly connected with new technologies and the medias. The new museum model is like a book that tells stories, events, predicts the future. It involves not only rational thinking, but also people's emotions. Thanks to technological possibilities, it creates the atmosphere and atmosphere of another world. The main idea of my presentation is that the narrative museum tells the story. It is storytelling institution. It is space of encounters. This is spaces of various types of relations like institutional, interpersonal, international, intergeneration or intercultural relations. The museum as a social space demands the presence of the recipient. The narrative museum need "readers" to tell the story.

In my presentation I am going to concentrate on some examples of the museum storytelling model which are extremely popular in Poland. Presently we observe the process of social narrative and negotiation of history in Poland. Here are some examples of such institutions that have a huge impact on society: The Museum of the Second World War, The European Solidarity Centre, The Frederic Chopin Museum, The John Paul Institute, The Museum of Polish History, The PRL Museum.

I attempt to explain what this museum model tell us about the society.

Organ Donor Cards As Effectual Artifacts

Since the 1960s postmortem organ transplantation has kept influencing both research and practice of medicine and provides a lot of narrative material that shows how organ donation is being processed in a cultural sense. Due to the option solution organ transplantation in Germany is strongly linked to its acceptance by the people. Thus organ donor cards have become part of our material culture. While on the surface they mark a decision process, in the context of organ donation the artifact and its handling become a mirror for an existential individuality, as well as for complex social processes. The presentation focuses on what people mean when they talk about "being a donor" (or not), use an object to make it "come true" and express their feelings and attitudes in confrontation with the concept of donating body parts. The research is based on Latour's considerations on non-human actors and combines artifact analysis, narrative interview and participant observation, as well as material of the DFG-funded project »I would prefer not to: Organ donation between unease and criticism« that provides material from interviews and focus groups. In the empirical data we can identify important aspects of organ donation and a broad range of emotions associated with the card – from a positive idea of being a hero to the deepest fears and doubts regarding ones value for the system: The idea of postmortem

transplantation confronts us with our own mortality and physicality in a way that we would rather exclude from our emotional environment, while the concept of donation touches notions of solidarity and mutual help, thus, something we might feel obliged to. The "official" document helps to transform our attitudes towards organ donation into simple actions, gives a way to *handle* fear, pride or ambivalence in a true sense of the word.

Implicaciones y Consecuencias De La Impunidad En Casos De Femicidio En Dos Escenarios Latinoamericanos: Ecuador y Argentina

El femicidio es un fenómeno global que implica la muerte de mujeres por el hecho de serlo incluyendo diferentes tipos de asesinatos, entre ellos, los cometidos en el ámbito de las relaciones de pareja, como consecuencia la violencia sexual o los denominados crímenes de honor. El femicidio es un grave atentado contra los derechos humanos que debe involucrar a los gobiernos, a la academia y al conjunto de la sociedad en la comprensión de sus causas y en el desarrollo de políticas públicas que permitan su erradicación.

En este escenario, la impunidad en la que quedan muchos de estos crímenes puede ser un factor crucial para entender algunos de los mecanismos por lo que estas muertes se producen.

El objetivo de esta comunicación es analizar las implicaciones y consecuencias de la impunidad en casos de femicidio en dos escenarios latinoamericanos: Ecuador y Argentina. Para ello, se estudia de manera comparativa el desarrollo reciente en Argentina relacionado con el movimiento 'Ni Una Menos' y se presentan los resultados en relación con la impunidad de una investigación cualitativa donde se realizaron 12 entrevistas en profundidad a familiares de mujeres asesinadas y de supervivientes de femicidio en Ecuador.

En el análisis realizado se identifican diferentes modos en que la impunidad se manifiesta: a) impunidad por acción o por omisión en relación a la aplicación de la Ley; b) impunidad como consecuencia de un deficiente funcionamiento del sistema; c) como resultado de la falta de recursos socioeconómicos de la familia que les coloca en una situación de desventaja respecto a poder emprender acciones de denuncia.

Asimismo, los resultados apuntan a que la impunidad representa un factor de riesgo para nuevos asesinatos y atenta también contra las posibilidades de reajuste psicológico y social de los familiares de las mujeres asesinadas.

Access to Public Spaces and the Mental Health of Adult Women in Tijuana, Mexico

Public spaces (PS) (parks, sports fields, etc.), are elements of the built urban environment related to both physical and mental health. By providing a free-access space where people can engage in physical activity, social interaction, or relax, PS could be especially important for less affluent communities and persons. However, previous studies in Latin American cities have documented that the PS are distributed differentially, benefiting higher-income persons. The inequitable distribution of PS in cities might be a determinant of avoidable differences in health, and the association of PS and health.

We analyse the association of access to PS and mental health in a sample of adult women living in Tijuana, Mexico. We combined data from a representative household survey conducted in 2014 (n=2,345), and from a study that inventoried PS in the city in 2013, to assess: 1) The prevalence of depressive symptoms (DS) as measured by the Centers for Epidemiological Studies – Depression Scale (CES-D); 2) The association of DS with access to PS; and 3) If the strength of the association varied by indicators of social position.

The prevalence of DS was 17.7% (CI95% 15.1, 20.7). Adjusting for individual characteristics, the association between access to PS in a 400m buffer around home and DS was protective and marginally significant (OR 0.75, p=.081). The interaction between access to PS and years of education was also marginally significant (OR 0.95, p=.097), showing that the protective effect of access to PS was stronger for participants with higher levels of education. In the presentation, we explore possible explanations for this unexpected result, including differences in the quality of PS available to participants in different areas, and differences in other elements of the built environment and in social practices related to use of PS.

Anti-Semitism in a Transnational World: Recurrences and Changes

In recent decades, complex systems of interrelations have developed on different planes- global, regional, national and local- enhancing the expansion and intensification of interactions in an increasingly mobile and transnational world. Primordial and elective identities, collective affirmation and individualization processes, secularization and de-secularization, draw novel scenarios in which "transnational ideological packages" circulate. New convergences between seemingly different and even opposing social actors and political currents lead to an interplay of diverse motivations and arguments which overlap at the meaning-making level. Their impact on the social representation of the Other is both subjective and behavioral as well as related to structural constraints and institutional arrangements. Diverse sort of prejudice, symbolic violence and anti-Semitism display differentially along shared regional traits and local singular configurations. Latin America's recent resurgence of antisemitism stems from a complex combination of geopolitical shifts and trends. An examination of such changing patterns reveals several of the less obvious social and political forces.

Emerging tensions, contradictions and disjunctures between the national, the regional and the transnational dimensions allow to recover old paths of prejudice and redefine (not only) symbolic violence. Thus, whereas we witness a greater conceptual awareness of the complexity of anti-Semitism, we still need more clarity when analyzing related contemporary expressions of prejudice, rejection and exclusion. Anti-Semitism, anti-Zionism and anti-Israelism (differing of legitimate critique of a government or State policy) are singular yet overlapping phenomena at the meaning-making level. The ways they are produced and reproduced discursively pose conceptual and empirical challenges -to define, to measure and to combat it. This paper aims to approach several of these challenges from a Latin American and global perspective.

Of Bmws, Bananas, and Banks: The Genealogy of Credit Cards in Central Europe

This paper examines the relationship between the introduction of credit cards to post-communist Poland and an evolving consumer class, with an emphasis on advertising techniques used to disseminate credit. I will expand upon the naturalization of the credit card in a debt-averse economy by examining media campaigns of English and Polish phrases, images, and copy designed to promote the purchase of big-ticket items such as cars and appliances on credit. I have chosen to trace the object of the credit card because it is emblematic and can offer a window on how the adoption of Western financial instruments in a debt-averse and formerly demonetized economy reflects larger themes of consumerism, financialization, and micro-macro relationships between monetary institutions and consumers. Dismantling the Socialist vacuum of exchange/distribution as well as credit, debt, and consumption requires new 'free market' spaces, such as marketing and advertising. Advertisements for credit cards present a curious interplay between encouraging credit, and a population that for the most part, has never purchased anything using credit. Primary sources for this project include advertisements from two Polish publications (1991 - 2008): *Magazyn Nowiny* and *Magazyn Dziennik Dolnośląski*.

After 1989, the patrimonial, socialist state gave way to the "big bang" reform of the 1990s and many services previously provided by the state were phased out; families scrambled to find new ways of accessing homes, cars, vacations, and other commodities. By attempting to fill in the gap between what the old order provided and what the new capitalist system demanded, the introduction of formalized lending – imbued with the regulatory, opaque framework of global finance – proved to be at odds with local economies of favor. The credit card developed alongside a growing market of mortgages and car loans; yet as other types of loans have increased, the credit card lags.

BOLAT, DEMET* (Muğla Sıtkı Koçman University)

Beyond to Privacy and Family Bonds: What Are the Promises of Solidarity Communities to Women?

The modern social world is divided into two realms: the "public sphere", which is controlled by politic and economic authorities, and the "private sphere", which is determined by the principles of privacy. Since the 18th century, in which the world was reshaped by capitalism, the private life has emerged as the only realm where "genuine" and solidarist relationships can develop in a world full of "strangers". Nuclear family, which continues to be an ideologically and practically hegemonic pattern in most of the world, was constituted as antithetical to public and heterogeneous relationships. This reorganization of institutions, spaces and social relations according to the public-private duality obstructs solidarity relationships and negotiation processes for common interests that could arise from public encounters. This social pattern, in which the values of individualism and pluralism are economically and politically consecrated, is based on housewifization of women and their being positioned by reference to familism in both public and private spaces.

This study focuses on women's experience as commoners in communities which are organized with egalitarian, solidarist, non-hierarchic and collectivist principles in Turkey. By utilizing qualitative methods, the study examines solidarity networks as alternative public spaces which go beyond public-private duality and familist bonds in terms of empowerment and liberation of women. The discussion follows these questions: i) How does being a commoner in these communities, in contrast to patriarchal and familist roles, change women's lives? ii) How do the egalitarian and non-hierarchic principles that are claimed to be held by such networks of solidarity work in the decision-making, actualisation and labour processes in terms of gender equality? When do they fail? iii) How do the heterogeneous encounters which occur in solidarity networks differ from familial bonds in terms of "trust", "conflict" or "negotiation" in women's lives?

BOLDT, THEA D.* (Kulturwissenschaftliches Institut Essen)

Methodological Innovations in Spacial Analysis in the Context of Religion. Some Remarks about the Practice of Spacing in Religious Rituals on the Example of Silent Buddhist Meditation.

Whereas the theoretical approaches to the problem of space in social sciences have been problematised in the wake of 'spatial turn' and discussed broadly in the recent years, there is still a need for empirical research on spacing practices, especially in the context of religion. Taking spacing as an innovative concept that relates materiality and sociality of space into account (Löw 2001) and brings space in close relationship with communication and body (Knoblauch 2017), this paper presents the empirical project on spacing practices as material objectivation of the religious in the context of silent buddhist meditation rituals (also known as mindfulness meditation) in the West.

The project objectives focus 1) on material objectivation of religious as a product of communicative actions of the social actors involved in the design, construction and utilisation of meditation spaces, 2) on the question in what way and through what means the spacial organisation influences the structure of meditation rituals taking place in them. Since the paper understands rituals as forms of symbolic action (Soeffner 2004, 2010), the main concern of the project is not only how meditation spaces are shaped in their materiality through the translocal, polycontextual and mediated communicative actions but also, on the other hand, how the meditation spaces are being constructed through the relational arrangement of social actors, objects and technologies insofar that we are able to speak about the ritualisation of the space and ritualisation of religious practices at the interface between the materiality and sociality of religious.

The paper addresses several methodological issues raised in the framework of this particular project, f.ex. what are the specific data requirements for spatial analysis in relation to silent meditation and how can these data be collected as well as how the hermeneutic analysis can be applied in order to interpret such data?

RC22-419.3

BOLDT, THEA D.* (Kulturwissenschaftliches Institut Essen)

Mindfulness in the Discourse. Secularization of the Religious and Sacralization of the Secular on the Example of a 'Travelling Concept' of Mindfulness.

Over the last two-three decades the term "mindfulness" has been progressively gaining in importance in the West, particularly because of its interdisciplinary application in the fields of the neurosciences, psychology, psychotherapy, as well as in education, sports, economy, social work, etc.. The 'travelling concept' of mindfulness, which was originally deduced from Buddhist philosophy and meditation practices, and which entered public Western discourse(s) via Anglo-Saxon translation practices at the end of the 19th century, is thus subject to an interesting history of dissemination and transformation in the West; a history the adequate reappraisal of which constitutes a scientific desideratum, which shall be largely remedied with recourse to discourse analysis in the work-in-progress project presented here.

The project presupposes that mindfulness is not a uniform entity, but rather an ambiguous communicative construction which shapes itself by means of the interlinkage, the collision, as well as the reciprocal influence of various Buddhist and secular texts and contexts, discourses, and practices. The project is geared towards the examination of the communicative construction of the diverse fabric of meaning associated with the term mindfulness in the West over the time span beginning at the end of the 19th century, thereby covering its development from its origins up to the present day. The central question concerns the manner in which a layering of interpretations is brought about by the contradiction, critical influence, entanglement, takeover, supersession, transformation, and correlation of secular and religious discourses and practices of mindfulness. This will be effected by an analytical examination of the field of tension and overlapping between the Buddhist texts and practices on the one hand, and the scientific discourses and practices – particularly Buddhological, psychotherapeutical, neuroscientific, and those connected to education, social work, sports, economy, and consumption – on the other hand.

Endogenous Segregation Dynamics and Housing Market Interactions: An ABM Approach

In contrast to previous research, I hypothesize that residential segregation patterns do not only result from an individual's perception of different ethnicities in a particular neighborhood, but is rather influenced by socioeconomic factors. The underlying assumption here is that the interpretation of Schelling's statement "being close to people of your own kind" can be extended to the social status of an individual, which is part of the comparison from oneself to the society and to the respective peer group. Accordingly, agents are endowed differently with respect to income, education and skin color, which leads to the emergence of a system with a higher degree of heterogeneity. Furthermore, this theoretical model becomes more complex by introducing a housing market, in which agents have to interact, if they decide to move elsewhere.

In order to analyze these dynamics, I implement an agent-based model with several features, where the decision criterion of moving to a particular place is connected to housing affordability and individual preferences by ranking available spots, which fit into the agent's disposable budget. One of the main features of the model is the endogenization of the tolerance threshold in the segregation dynamics. Other decisive components for the endogenous segregation system are denoted as multidimensional dissimilarity index and life-satisfaction function, which serve as determinants for the individual willingness-to-stay in the current neighborhood and subsequently for the actual moving decision. First results indicate that agents cluster themselves rather according to house prices and income levels than to skin color. These results imply that individual tolerance is not only dependent on different ethnicities in one neighborhood, but rather on the socio-economic status of an individual.

BONANNO, ALESSANDRO* (*Sam Houston State University*)

Geographical Indication (GI) in Agri-Food Its Role in the Neoliberal Global Era

Through the use of sociological theory, this paper probes the role of geographical indication in the current neoliberal global agri-food system. Two broad theoretical positions are employed to construct the analysis. The first refers to the currently dominant neoliberal theory of the free market. The second refers to the variegated theoretical sphere that contemplates the political and state-based regulation of markets. These two broad theoretical postures assume differing roles for geographical indication as they view socio-economic development in opposing terms. The paper underscores the differences between these two theoretical spheres. Simultaneously, it stresses the contradictions existing in each of these two theories. The support of intellectual property rights in the neoliberal camps contradicts the tenets of open entrance to markets and the positive effect that competition generates in the economy. The intervening role of the state in controlling markets promotes conditions that ultimately clashes with requirements for market expansion. The overall role of GI in terms of socio-economic development is reviews in the concluding portion of the paper.

BONGAERTS, GREGOR* (*University Duisburg-Essen*)

Towards a Processual Understanding of Action and Actors

A fundamental problem of relational and processual social theory is to develop a proper understanding of the phenomena, which are treated as relations, and of the entities between which those relations take place. Processual thinking forces sociologists to conceptualize the relations and the related entities as processual phenomena. Regarding sociological theory in general, actors are understood as the entities in question and actions either are treated as relations themselves (e.g. interactionism) or are treated as the structured activities which create relations understood as social structures (e.g. Bourdieu; Giddens) (classes, systems etc.). Most theoretical approaches conceptualize action as process, but get stuck to a rather substantialistic concept of actors. An exception can be found in ethnomethodological thinking, which – like Sharrock and Button – conceptualizes actors as "courses of treatment" (1991). However, as well as in other approaches, ethnomethodology lacks a theoretical concept, what exactly "courses of treatment" means. It is theoretically unsatisfactory to shift the problem of a concept of "social actor" into the empirically observable social reality instead of developing a theoretical framework for such a concept. Such a framework is also necessary regarding the concepts of action. Although action is in general understood as a process, the concept is mostly still 'substantialistic', because it is deduced from the concept of the social actor. For example, actions are understood as things actors do on basis of intentions (Weber), habitus (Bourdieu) or the memory and orientation (Giddens) etc.

Within my contribution, I will argue for a radical processual conceptualization of both, social actors and actions. What is treated as social actor and as action is, in this understanding, the result of processes of attributions of actors and actions. Social actors and actions therefore will be understood as Points of attribution in the course of observable processes of sign mediated communication.

FREDIANI, ALEXANDRE A. (*The Bartlett Development Plannig Unit*)

Assessing Participatory Video through Well-Being Analysis. a Collaborative Research Project in Lagos (Nigeria)

In this contribution we present an analysis of a participatory video (PV) research project conducted in Lagos (Nigeria) by the Development Planning Unit of the University College of London and Justice and Empowerment Initiative, an organization supporting the Nigerian Slum/Informal Settlement Federation to resist evictions and claim for security of tenure in Nigeria. The bulk of the research project was a 5-day PV workshop between DPU and JEI in Lagos with 25 members of the Federation.

This experience demonstrates that applying well-being analysis through participatory mechanisms has a series of potentials in advancing social change. While the findings are related to a very punctual action-research activity and related mostly to the practice of PV, the underpinning lesson learned is that there are synergies and complementarities between participatory action research and well-being analysis. Through participatory processes, well-being analysis can deepen and broaden its findings, revealing hidden dimensions of wellbeing as well as unpacking the instrumental relations between them; participatory processes, as applied in this experience, can unpack social diversity, exploring people's experiences and how they relate to issues of age, gender, class, ethnicity and (dis)abilities; participatory processes has also the potential to reveal the enabling/disabling conditions within which wellbeing is being negotiated, finally, the participatory process, most importantly, engages in a reflection about action, about people's (un)freedom to bring about change, therefore addressing issues of agency.

The research shows that participatory well-being analysis has a key role and potential to expand the participatory capabilities of research participants. As it took place in our workshop, the research process can facilitate relationship building as well as enabling critical collective learning.

Nevertheless, this research also demonstrates the importance to design research activities collaboratively in ways that builds on synergies of interests and capacities among research partners.

Growing up Female in Post-Colonial Philippines: Education, Militarism and Activism

I was 9 years old when martial law was declared in the Philippines. Everything seemed normal in the elementary and high school, except that all students underwent mandatory citizen military training before graduation. This paper uses a semi-autobiographical lens to examine gender under the turbulent years of post-colonial militarized Philippines, ideological class conflict, religiosity and the seeds of activism that shaped notions of social justice and feminism in the academe and beyond. Extrapolating the socio-political context of discipline, national service, commodification, this paper further looks at the construction of Filipina womanhood through the institutionalization of care work and service for export, the role of the state and its agent—education—in the reproduction and subversion of oppression along multiple axes of power. The theoretical reflections based on participant observation and autobiographical narrative contribute to the discourse of reviving citizen military training in contemporary Philippines since 2001, female labour diaspora and the state, and the implications for growing up female under a system that claims as the most gender-equal country in Asia, and consistently at the top ten spot in the world measured by the World Economic Forum.

BONIFACIO, GLENDA* (*University of Lethbridge*)

The Personal Is Professional: Balancing Objectivity, Empathy and Academic Activism in Disaster Research

In November 2013, the strongest typhoon ever to hit landfall destroyed millions of homes and thousands of people dead in Central and Eastern Visayas in the Philippines. Most of my family members and friends were left homeless and suffered casualties from the storm surge brought by Haiyan, local name Yolanda. Haiyan created a 'new normal' in people's lives, government response, and international collaboration; a global condemnation to muddy local politics hampering relief efforts and rehabilitation; and synergy of activism to protect

the environment amidst changing climate. Natural disasters radically shift our realities and focus to the most important human act of all---building a sustainable future---regardless of perceived differences and systemic prejudices.

Two years after super typhoon Haiyan, I conducted a field course with Canadian students on local-global relations. Four years after Tacloban City was flattened and cleared most of the debris, I conducted a field research in urban and rural communities about gender, migration, and reconstruction. This paper presents a reflective summary of balancing objectivity in the research process with personal connections to the tragic loss of families and communities, and the inevitable trajectory of activism in the academy. It sets out the unique simultaneous challenges of being both an "insider" and "outsider" with quest for valid claims and how these claims are translated into policy and practice. The Philippines rests on a volatile geopolitical region with much at stake with rising sea levels, yet its global connectivity in trade and commerce have left the issue of environment and recurring disasters sidelined. As a researcher with a 'personal but professional' stake in the topic, the moral dilemma of doing enough or little comes aground. Translating this into a macro perspective where 'home' is the world, what is the duty of scholars?

BONNEVILLE, LUC* (*University of Ottawa*)

Retour Sur Le Concept De « Critique » En Sciences De l'Information Et De La Communication

Fondamentalement, la « critique » est intimement liée à ce projet de vouloir faire usage de la Raison pour mieux comprendre et expliquer ce qui nous entoure. Poser un regard critique sur le monde, c'est le questionner et le confronter. C'est mettre au cœur de l'analyse les multiples problèmes auxquels nous sommes collectivement confrontés, en les dévoilant. Il y a un peu plus de 15 ans, dans son texte consacré à l'état de la critique en théorie des organisations, Gabriel (2001) évoquait la nécessité de penser le monde de manière critique devant la montée de l'incertitude liée aux multiples problèmes sociaux qui structurent le monde lui-même : « Never before has the future seemed less certain, less knowable than it does now. And yet, never before has the future appeared as one-dimensional as it appears at the present time. Unfettered capitalist markets, globalization, the disappearance of political alternatives and the universal hegemony of the consumer have led not only to melodramatic pronouncements on the end of history, but also to a floundering of critical imagination. We have become unable to envision a future at all, other than as more of the same, more goods, more trade, more pollution, more natural catastrophes, more wars and more inequality between the haves and the have nots » (p. 23). Nous voudrions profiter du thème général du congrès (Power, Violence and Justice) pour revenir sur les grandes lignes des approches dites critiques notamment en sciences de l'information et de la communication. Ne serait-ce que pour montrer en quoi celles-ci permettent de poser un regard essentiel sur certains problèmes et enjeux auxquels nous sommes collectivement confrontés.

BONNIN, DEBBY* (*University of Pretoria*)

Regulating Professions: Associations and the State. an Examination of Changes in the Regulation of the Legal Profession in South Africa

This paper examines the regulation of the legal profession in South Africa over time; in particular it is interested in exploring the relationship between the associations of legal professionals and the state in the context of both the Apartheid as well as the post-apartheid state. The paper is divided into four sections. In the first part it outlines the regulatory framework of the legal profession in South Africa, primarily focusing on the legislative frameworks and how these have changed over the last eighty years. In the second part it explores the ways in which this regulatory framework – particularly in the apartheid period – facilitated (or not) access into the profession. It argues that the Law Societies played an active role in the closure of the profession to black legal professionals and that their activities went beyond the regulatory framework in order to support and uphold the political project of the Apartheid State. In the third section it looks at the post-apartheid period and at the ways in which the State has intervened in the regulation of the profession in order to transform and open access, to previously excluded groups (black and female), to the profession. In the final section the paper reflects upon the relationship between the (legal) profession and the state in the post-apartheid context suggesting that the state's need to weaken the power of professional groups is linked to the imperative to transform and to open up access to the professions in a context where professional closure had been used to exclude people on the basis of their race. While it is primarily an empirical paper, the empirical case study will be used to reflect upon and engage with the theoretical literature.

The Catholic Church's Deconstruction of the Philippine President's War on Drugs

This research critically examines the Catholic Church's responses to an ongoing major societal problem plaguing the Philippines which has even attracted the attention of foreign media and worried some nations and international organizations. Our study describes this "war on drugs" as a dominant discourse and contemporary powerful "text" dictated by the Philippine President Rodrigo R. Duterte. His declaration and use of the word "war" already set the stage for a violent approach in addressing the drug menace. It has become in Jacques Derrida's language, a "theatre of cruelty." The underlying script for the "war on drugs" has been written and directed by the Philippine President himself and acted by certain units in the government bureaucracy.

Amidst this context, the "decentering" and "deconstruction" processes emerged. During the Duterte administration, the Catholic Church and other civil society organizations (CSOs) have developed more proactive non-violent responses to the drug issue. At a certain point, Catholic Church hierarchy, its affiliated religious and lay organizations began to actively engage in creative and "unconventional resistance" against the Philippine government's war on drugs. This study analyzes their writings, pronouncements, processes, strategies, and tactics geared to unmask, decenter, and deconstruct the "war on drugs" and/or drug-related killings. This study includes an assessment of the Catholic Church's strides and limitations, as well as external factors (i.e. socio-cultural realities) affecting their promotion of human rights and attainment of justice for many extra-judicial killings (EJKs).

Research methods include textual analysis, interviews, focus group discussions, participant observation, and visual sociology. Theory triangulation, the use of multiple perspectives from Jacques Derrida, Michel Foucault, and Pierre Bourdieu will be attempted to interpret different sets of data. An interdisciplinary and reflexive approach has been used given the investigators' diverse expertise and engaged research praxis as among leaders in religious communities and other civil society organizations.

Offspring of Norwegian World War II Collaborators As Children at Risk

Offspring of Norwegian World War II collaborators as children at risk

During Nazi Germany's occupation of Norway 1940-45 about 50 000 Norwegians joined the collaborationist movement "Nasjonal Samling" (NS). As a consequence, they were branded as traitors and in the post-war judicial settlement collectively sentenced for treachery. Thus, when democracy was reestablished a strict and exceptionally wide-ranging purge was a central part of the transition process, i. e. key political actors chose a form of transitional justice that could lead to social consequences for a considerable number of people. The enduring stigmatisation of former NS-members also affected their families, not in the least children. Within the historical context of German occupied Europe, the NS-children fall in to the broader category of collaborators' children but also share some common traits with war children fathered by German soldiers. In my paper, I will demonstrate how the NS-children in many ways and through various phases of their lives were influenced – generally negatively – by their family background. The empirical analysis is based on qualitative and quantitative data collected through an internationally unique survey in 2000-2001 among 376 NS-children born between 1928 and 1971. As expected, their life stories vary greatly but a majority have experienced problems related to their background, a phenomenon that I will term "transitional victimisation". Some of the individual variation in likelihood for experiencing different problems can be explained by social mechanisms that were identified through the quantitative analysis. As a final point, I will discuss how political decisions made with regard to transitional justice indirectly may influence the lives of children, a problem so far largely ignored by transition theory. How can new democracies deal with perpetrators and others who supported the authoritarian regime while avoiding extensive negative, social consequences for the 2nd generation?

New Tools, Novel Consequences: Testing Unconditional Quantile Regression Using Simulated Data

Quantile regressions make it possible to test powerful hypotheses of whether the association between a predictor and an outcome varies across the distribution

of the dependent variable (Koenker and Bassett, 1978). It has many possible applications in social mobility and stratification research.

Recently, however, researchers have raised concerns over using conventional conditional quantile regression (CQR) modelling. Especially one issue has been highlighted: whether adding control variables changes the interpretation of the predictors, with even more devastating consequences when using fixed effects (e.g. Killewald and Bearak, 2014). To remedy these shortcomings, Killewald and Bearak (2014) argue that a new unconditional quantile regression model resolves these issues. A study showed higher motherhood wage penalty among low-wage women using individual-level fixed effects (Budig and Hodges, 2014); Killewald et al. (2014), however, demonstrate that new unconditional quantile regression give different results.

This new unconditional quantile model (UQR) was developed by Firpo et al. (2007, 2009). In Firpo et al (2007), they show how this method can be used to generalize conditional Oaxaca-Blinder decompositions, a counterfactual model devised for means, to other distributional statistics.

Conditional and unconditional quantile regressions should yield the same estimates when only one predictor is used. In this study, we test this key assumption. We use simulated data to test the performance of CQR and UQR. Our findings reveals that (1) CQR and UQR with one predictor sometimes produce different results – especially for skewed dichotomous variables; (2) the discrepancies worsen with specific types of measuring the predictor; (3) and also with the sample size. These findings do not necessarily undermine UQR, but we believe they are crucial guidelines to when and under which circumstances this new method can be safely deployed.

Documents That Matter More Than Rights

The aim of this paper is to understand how bodies in Brazil are legally subjectified by the biological and legal notions of “sex”. Butler, Fausto-Sterling, and trans feminists (Spade, Jesus, Vergueiro, Namaste) have been challenging the dichotomy sex/gender. Even though sex has biological properties, it is also socially constructed. The main consequences of the construction of sex/gender by the Law are seen in trans people. In order to understand it, it was conducted an interdisciplinary literature review and a discourse analysis of fifty decisions of Sao Paulo's Court about the civil registry alteration of trans people. The main results were: education, health and work are denied to trans people because of the incoherence between their documents and their gender expression; Brazil is the country with the highest trans murder rate; there are several institutional obstacles to change the civil registry; there are limits of intelligibility in those judicial decisions, which constitute transsexuals and exclude transvestites by creating non-positive criteria of recognition. Sex is designated mainly considering the genitals, so “sex” is created legally at one administrative act (birth certificate). After that act, genitals are not taken into account by Law, but when trans people struggle for recognition, their sex is questioned and legal procedures are used to fit people in solid and coherent “sexes” (genders). The naturalization of fixing identities is a power effect and it has not been seen legally as exclusion. The hegemonic legal discourse is limited and it has been an ally of the exclusion process of trans people as they still must struggle for basic human rights in Brazil, such as using a restroom. Some of the challenges are: gender neutral documents and overcoming the precarity of trans people in Brazil. Law should not continue to marginalize it - it ought to be used to fight inequality.

Educational Inequalities in Germany after the Rise of Comprehensive Schools

The traditional German tracking system—characterized by a rigid sorting of fourth-grade pupils into three hierarchically structured and spatially-segregated school types, only one of which (the *Gymnasium*) leading to the university-entrance certificate (the *Abitur*)—has been substantively transformed in the last decades, under the pressure of demographic developments, increasing educational expectations of the middle-class, and institutional reforms. This contribution focuses on the expansion of comprehensive schools (*Gesamtschulen*), a once-residual school type granting access to the *Abitur*, which in some states has now replaced all pre-existing school types except for the *Gymnasium*.

What are the implications of the rise of comprehensive schools for social-class inequalities in access and progression through secondary schooling in Germany? According to status maintenance theory, access to the *Gymnasium* should become less socially selective as the supply of comprehensive schools increases, because this opens up an alternative pathway towards the *Abitur*, which could be especially attractive for the middle- and upper-class families whose children are not among the top-performers at school. In contrast, according to cultural reproduction theory, comprehensive schools could be attractive for the upper-class only insofar as they remain a residual sector (e.g. pilot projects in specific urban areas, sometimes with non-traditional pedagogy). In this perspective, as comprehensive schools expand to the point of replacing the other school types, both upper- and

middle-class parents should increasingly turn to the *Gymnasium* as the most prestigious and therefore only “appropriate” school type for their children.

In this contribution I test these alternative hypotheses by analyzing data from the National Educational Panel Study (NEPS), which provides rich information on a nationally-representative sample of students who entered lower-secondary schooling in 2010/11 and on their subsequent transitions and competence development.

BORGNA, CAMILLA* (WZB - Berlin Social Science Center)

Sixteen Educational Systems in One Country – or More? How Institutional and Regional Variability Shape the Opportunity Structure of Students Transitioning from Primary to Secondary Education in Germany

Cross-national comparisons are crucial to shed light on how institutions interact with individual characteristics in the process of social stratification. Yet, it is often challenging to isolate single institutional elements, because countries differ in several other factors. Thus, institutional variety within a single-country (across both space and time) is particularly attractive for comparativists.

The federal structure of German educational policy-making provides this opportunity. In particular, in the last years, the sixteen German states have implemented various reforms of secondary schooling that have resulted in a substantial (and heterogeneous) transformation of the traditional tracking system. The latter, generally held responsible for the high level of inequality of educational opportunity in Germany, was characterized by an early and rigid sorting of pupils into three tracks, only one of which (the *Gymnasium*) prepared for university entry.

Among the institutional reforms implemented in some states are the postponement of tracking age and the decreased rigidity of the system by allowing more freedom of choice and/or “permeability” between tracks. Most importantly, some states have reformed the schools preparing for vocational training, whereas the supply of comprehensive schools, a once-residual school type preparing for both vocational training and university, has substantially increased in several states, in some cases becoming the only alternative to the *Gymnasium*.

Hence, while overall German secondary education remains tracked, the *degree* of tracking varies between states and over time. Moreover, educational choices are affected by the *de facto* availability of school types, which varies substantially not only between, but also within states.

By combining time-series statistics at the state (*Bundesland*) and regional (*Kreis*) level with individual-level data from the National Educational Panel Study (NEPS), this contribution investigates how institutional and regional variability shape the opportunity structure of students from different social backgrounds in the transition from primary to secondary education in Germany.

Vaccines: Hard or Soft Facts?

In the 2017 summer Italy approves the vaccination obligation for school enrollment. It mobilizes a wide no-vax net.

A vaccine is the product of the advanced scientific knowledge application. It incorporates scientific facts and represents a technological product. They both are constructed in the laboratories.

No-vax and vax-free action shows that the fate of vaccines depends also on all of us as consumers: do we accept those? Or not? What takes an always increasing number of people, today, to refuse the vaccines? Why a part of the population doesn't recognize to vaccines the status of ‘hard’ scientific facts? Which social logiques explain that? Is it possible to distinguish and separate facts from scientific evidences?

We try to respond to this kind of questions, analyzing recent Italian events about vaccines.

Nordic Fields of Higher Education. Stable and Similar Social and Gender Structures across Time and Space

When the Nordic systems of higher education are analysed as fields of higher education, that is, as structures structured by the resources possessed by the students attending different programmes and courses at specific institutions, a fairly similar pattern emerges across time and space. The fields of higher education in the four studied Nordic countries are all characterised by a dual structure. The first axis describes the division of men and women and separates education in technology and natural sciences from education aiming at professions in health, education and caring. The second axis displays a social hierarchical dimension with social groups rich in economic, social and cultural assets in contrast to groups with small such resources. This latter dimension also differentiates the

traditional universities along with prestigious professional schools and long and selective professional programmes at the pole of students from well-to-do homes from regional university colleges and colleges of health science and shorter non-selective professional programmes at the other pole.

The stability and similarity of the structures are even more remarkable given that all systems have gone through rapid transformations during the last two, three decades. There has been a very pronounced expansion, due to both establishment of new institutions and growth of existing institutions. The systems have also been subject to profound organisational changes including adoption to the Bologna process, increased internationalisation, and an augmented emphasis on efficiency, competition and market orientation. In short, the systems appear to have been transformed from cohesive and standardized systems, administered largely within the state, into larger, more diverse and complex national and international higher education landscapes. The puzzle of the stability of the recruitment patterns in times of transformation will be further developed in our presentation.

The Social and Credential Structure of the Elite Segment of Swedish Higher Education

The structure of acquired and inherited national and transnational assets among students in Swedish elite education is the main issue in this paper. Based on a survey answered by nearly 1,200 students on 25 elite educational programmes in Swedish higher education, the distribution of such properties as language resources and experiences of travel, studies and work are set against more refined Swedish assets, like good grades from established schools and programmes. By using specific multiple correspondence analysis three distinct poles are identified: one pole where formal acquired educational assets and inherited national and international resources are weak, one pole with a strong international orientation and accumulation of inherited international resources, and one based on predominantly heavy investments in the Swedish educational system. These poles correspond to three different sorts of positions in the field of higher education: at the first pole, students in art and theatre are overrepresented, while the national pole is primarily defined by the medical programme and the international pole by the engineering programme in industrial economics and the programme in economics at Stockholm School of Economics. The poles also display three different modes of gaining access – by special tests at artistic pole, by grades from upper secondary school at the international pole, and by scores at the national aptitude test at the national pole – articulating different valuation of former educational investments, and, more broadly, of cultural capital possession.

Key Issues of Social Integration of Young Migrants from China in Russia

International migration is a global process in which Russia plays an important role given the great number of international migrants coming into the state. The dissolution of the Soviet Union led to the intensification of migration processes and formation of post-Soviet migration system, in which Russia plays the role of the recipient country. The mass forced migration of Russian-speaking population of the former Soviet republics, which was the repatriation of emigrants from Russia and their descendants, gives way to the mass migration consisting largely of young residents of the Central Asian and Transcaucasian republics. However, in recent years, the number of young migrants from China has increased. International migration is primarily a return migration, however, a significant proportion of labor migrants settle in Russia, staying legally or illegally. The results of a survey conducted among Chinese migrants living in the Far East (Vladivostok and Nakhodka) are discussed in the paper. Illegal status, language problems and discrimination are the main problems that create barriers for the social integration of Chinese migrants in this region. The analysis of cases of young migrants from China in Saint-Petersburg also demonstrates various types of discrimination against migrants and very limited contacts between the Chinese and the local communities. Contemporary migration policy should be aimed not only at the regulation of migration flows but also at the development of effective mechanisms of the integration of international young migrants. Understanding integration in the frame of the absorption concept seems to be the most promising theoretical basis for investigating the issues of integration of Chinese migrants in Russia but, first of all, integration, in our opinion, is connected with overcoming discrimination.

The Brazilian Experience of the "Justiça Itinerante" in the State of Rio De Janeiro: A New Paradigm of Access to Justice?

"Everyone strives to attain the law", says Orson Welles in his film adaptation of Franz Kafka's novel "The Trial". In fact, access to justice is one of the main challenges of modern times. One can rapidly foster social, economic and political changes by guaranteeing equal access to legal services. This is particularly highlighted by the Brazilian experience of the "Justiça Itinerante" ("mobile justice"), implemented in the state of Rio de Janeiro since 2004. The project's main goal is to assure access to basic judicial services (such as civil registration, marriages, family cases and small claims) to the poor population living in the suburbs – usually apart from the conventional courts of law – by using buses as mobile courts. This paper will analyze the historic development and implementation of the "Justiça Itinerante", as well as evaluate it as an alternative form to more conventional judicial services. It will also reflect upon specific theoretical questions regarding the classic functions of the judiciary system inside democracies. Furthermore, it will point out to similar experiences in other Brazilian states, such as in the amazon region and question if "Justiça Itinerante" can be replicated in other parts of the world with similar social and geographic characteristics, as well as if it can profit from exchanging experiences with equivalent initiatives worldwide. Finally, the work raises the question whether this experience constitutes a new paradigm of access to justice more adapted to the demands of citizenship in contemporary societies.

GENEDY, MOHAMED (*Goethe University, Frankfurt aM, Germany*)

The Grudging Modernizer. a First Look at the Outliers of Postwar Social Science

In the spring of 1959, a young Harvard lecturer, Robert N. Bellah, traveled through the Middle East during a seven-week study trip. The drafts of Bellah's travelogue and the letters he wrote to his wife reveal the portrait of a grudging modernizer, an intellectual whose personal, epistemic, and theoretical convictions were miles away from the typical cliché of the "cold warrior" or the modernization theorist. Given that Bellah was Talcott Parsons's favorite student and a junior member of major first order CWSS circles, it might prove interesting to detect and underline the idiosyncrasies and his many "deviations" from the main paradigm. Moreover, since in the late 1960s Bellah was going to be one of the main agents of the "interpretive revolution," together with other former apprentices from Parsons's workshop, such as Clifford Geertz and David Schneider, it might prove interesting to cast some light on the adumbrations of ideas, arguments, and sensibilities that would definitively come of age ten years later. We start from the vantage point of a domain where Cold War preoccupations for national security and the worldwide struggle against Communism *really* made a difference with respect to the 1920s-1940s: the unprecedented mobility of social scientists in the Postwar era. We then sketch Bellah's intellectual career and his Middle Eastern trip, the institutions he visited, the people he met, and the troubles he faced in adjusting to an environment he immediately saw as alien and hostile. We then read his sociological travelogue, *The Well of the Past*, side-to-side with the classic of modernization theory: Daniel Lerner's *The Passing of Traditional Society* (1958). We conclude advancing some hypotheses on the diversity of the wider field of mid-century social science and a plea for more scholarly work on the mobility networks of social scientists and humanists during the long 1950s.

Changes in Perception of Success and Agency in Poland: An Analysis Based on Two Kinds of Longitudinal Data

The last 30 years brought extreme changes to Polish society. Political transition from authoritarianism to democracy in 1989 influenced the lives of Polish citizens in both private and public spheres. Other processes observed worldwide, such as globalization or technological development, also had an impact on everyday life of Poles, their beliefs, values and attitudes. In this paper we focus on changes of perception of success and agency, reflected in two types of longitudinal data.

First, we use data from POLPAN panel survey conducted every 5 years since 1988 on a large representative sample of adult Poles. Second, we analyse unstructured biographical interviews with a group of the oldest POLPAN panel respondents. In result we obtain a unique combination of quantitative and qualitative data containing information concerning the same individuals which allows us to simultaneously take advantage of two kinds of longitudinal studies: a long-term panel study and retrospective biographical interviews.

The comparison of the two sources of information allows us to enrich substantive analyses, but also makes us face some divergences. As Baczkó-Dombi and Wyszniak (2016) proved and our analyses confirmed, the POLPAN survey data show an increase in significance given to meritocratic aspects of success (such as "hard work") over time. The retrospective biographical data gathered from the oldest POLPAN respondents suggest that age also influences perception of life success and its determinants. Moreover, some categories used in the survey tool for defining the most important determinants of life success are almost completely absent in the biographical narratives. In our paper, we reflect on possible sources of discrepancies and on benefits brought by using two types of data described above.

WG01-936.3

BOSCO, ESTEVÃO* (University of São Paulo)

Quest for a Cosmopolitan Social Theory: From Habermas to Gadamer, and Back Again

The main question addressed by this article is whether or not the theory of communicative action grapples with the challenges to social theory posed by the cultural experience of globalization. It assumes that cultural globalization is a total sociological phenomenon which sheds light on the entanglements among societies. At the micro-sociological level, this is shown in the research of Cicchelli and Octobre on aesthetic-cultural cosmopolitanism, and, at the macro-sociological level, by three of Appadurai's global ethnoscapes as well as by the main arguments from Lévi-Strauss' *Race et histoire* and Chakrabarty's provincialization of history. Based on this, I formulate two reconstructive hypotheses. First, I argue that the *continuum* between communicative action and strategic action, lifeworld and system, and socio-moral and cognitive-technological evolutionary spheres gives shape to a culturally endogenous concept of society, thereby preventing us from approaching the entanglements among societies, i.e. cultural globalization. This is because the formal pragmatic foundation of mutual understanding takes intersubjectivity as given (Vandenbergh). The second hypothesis claims that, when starting with the hermeneutical preconditions of our world experience (Gadamer), we are able to outline a complementary perspective to Habermas' theory of society. This perspective encompasses the entanglements among societies and conceives the cultural experience of globalization as a hermeneutical experience, having as a *medium* an indicatory concept of intercultural understanding. Finally, I identify two major implications of this hypothesis. At the theoretical level, cultural globalization indicates that we should consider social evolution alongside cultural co-evolution. At the politico-normative level, if we consider the entanglements among societies as based on a *quasi-naturalistic* argument related to the human condition, nationalism can no longer only be taken as a problematic politico-cultural feature of modern societies, but rather, and fundamentally, as a deficient worldview which drives action. This perspective is sympathetic to the cosmopolitical claim for inter-cultural dialogue (Delanty).

BOSISIO, ROBERTA* (University of Turin)

OLAGNERO, MANUELA (University of Turin)

Children's Well-Being and the "Trap" of Protection Vs Autonomy

The aim of the paper is to make some reflections on the different approaches to address children's well-being. Notwithstanding the progress made at normative level to safeguard children's well-being (see the 1989 UN CRC), the transition from the statement of rights to their implementation does not take place in a "neutral" time frame because it depends on the ability of the legal system to tap into the signals from the social system (King 1993, Wyness 2015). As known, the tension contained in the CRC between rights to protection and rights to participation and autonomy is reflected in the different perspectives looking at guaranteeing children's well-being. The *protectionist* approach considers children in need of protection and care from family and social institutions, not looking at them as individuals in their own right (Ackerman 1984; Freeman 1983), and leaving sociability and *peer to peer* exchange in the background. In the *liberationist* approach children are attributed needs and skills that cannot be sacrificed for the sake of a future benefit (Franklin 2002).

Starting from these premises we present some findings from different research (recently conducted in Italy) whose aim was to analyse how children's autonomy is promoted and practiced in daily life by the new cohorts of parents and children. These findings show that both 'autonomy from' and 'dependence on' adults give rise to unintended results. Protection can become invasive, making children to depend excessively on adults (Nelson 2010; Gomez Espino 2013). Encouraging autonomy could lead to parents shirking their responsibilities. In a context in which

generations are coming closer together and the relational asymmetry of the past is vanishing it is getting more and more difficult for both parents and children to find a balance between autonomy and protection.

BOSKOVIC, BRANKO* (University of Donja Gorica)

From Policies to Practices: Work-Family Balance and Gender Equality in the Balkan Region

Balkan region is often perceived as part of Europe which lags behind Western Europe, economically, politically, socially and in other areas too. However, looking into specific areas of life there is significant improvement and the gap behind the rest of Europe is narrowing. One of the areas where both trends can be observed the case are gender relations. Nevertheless, there is a vast amount of factors that may impact this development. It is under-researched area and needs more attention. Due to all of this, the focus will be on four countries: Croatia, Macedonia, Montenegro and Serbia. Croatia is already the EU member state and the three other countries are candidate states. Therefore, it is important to see how social and institutional practice and policies interact in these countries and what the effects are. Gender policies will be in the focus, most specifically those tackling labour market and family. Practice does not always follow policy and the paper will look in how women are treated beyond just data on employment, maternal leaves, care and policies supporting labour market activity. Reconciling work and family is becoming crucial if we are to sustain personal and family well-being and preparing future European Union citizens in this sense becomes one of the major goals for prospective member states. Accordingly, comparison of Croatian practice with the other three countries will be valuable asset to get the insight on the impact of the EU membership. Missing research of this policy area for Balkan region may result and serious deficiencies that will be difficult to counteract later. Most crucially, it will be presented whether there is gender balance in the mentioned policy areas and how they can be improved.

RC33-606.5

BOSVIEUX-ONYEKWELU, CHARLES* (ECOLE DES HAUTES ETUDES EN SCIENCES SOCIALES (PARIS))

"How to Ensure the Replicability of an Ad Hoc Research Strategy: A Few Lessons Drawn from the Sociology of the Concept of Public Service"

This contribution investigates the methodological issue raised by my doctoral research on the exponents of public service under the French Third Republic. My survey rested upon a specific kind of prosopographical enquiry (n = 116), based on a *concept* rather than on just being a member of a given institution. It was not about studying a "grand corps" (the "Conseil d'État"), a professional group (legal academics) nor a discipline (administrative law), it was about taking an idea ("public service") in its historical formation as a starting point. The attribute "being an exponent of public service" is not as objectively given than an event (such as "being deported in a camp") or a membership in an institution (such as "being a MP"). In other words, one cannot find a list of public-service thinkers in any historical sources. Therefore, the point of the research was to define indicators that could operationalise individuals who significantly used the syntagm "public service".

This presentation will account for the replicability of a constructionist method that can be deemed unusual. Namely, set theory, used to compare the studied population with a control group, proved particularly appropriate for a "sample" that was not meant to be representative since it had not been randomly drawn from a population, but rather constituted by the weight that each actor exerted in the studied field. Also, in such a varied corpus comprising "conseillers d'État", academics, politicians and trade unionists, it proved impossible to compare the sample of "conseillers d'État" with the thousands of members of this institution under the Third Republic while, at the same time, doing the same for all other groups, given the countless number of public servants in this 70 year period. Instead, we used other techniques (archival ethnography, geometric data analysis) to devise an unbiased "sample".

RC52-873.6

BOSVIEUX-ONYEKWELU, CHARLES* (ECOLE DES HAUTES ETUDES EN SCIENCES SOCIALES (PARIS))

"Lawyers and the State: A France-USA Comparison of Public Service and Pro Bono Work"

Taking its cue from Pierre Bourdieu's idea that professions and professional groups should not be opposed to the State, but rather be understood as dependent on it to have their "jurisdictional boundaries" (Abbott, 1988, p. 2) acknowledged, this presentation focuses on lawyers and on the legal field in France and in the USA, in both a diachronic and synchronic approach. The comparison between these two countries is oppositional: it contrasts French

"State lawyers" (*i. e.* members of the "Conseil d'État" and public law professors) and their role in the construction of a State-oriented legal field, with US lawyers and their self-regulation outside of the State, or, more precisely, "at the expense of a bureaucratic construction of State power" [Dezalay, 2013, p. 68]. Under the Third Republic (1870-1940), the former strove to impose the notion of public service as the heartland of work of their "jurisdiction" (in the proper sense as well as in the sense of Andrew Abbott's ecology of professions). Over the last 30 years, the latter promoted *pro bono* work as a means to improve their professional reputation, which had been questioned and undermined by their intense practice of corporate law, as well as an alternative to the redistribution of wealth through the tax system. This contribution will be based on two different surveys: the first one is a prosopographical enquiry (n = 116) on the exponents of public service in France between 1870 and 1940; the second one is an ongoing postdoctoral research on *pro bono* legal practice and its importation in France; it includes an ethnographic immersion in two global law firms in Paris (DLA Piper and Morgan Lewis) and a series of interviews with *pro bono* partners and members of the French bar.

BOUCHET-VALAT, MILAN* (*National Institute for Demographic Studies (Ined)*)

Detailing the Macro-Level Factors of Homogamy in Europe: Using PLS Regression to Overcome the "Many Variables, Few Observations" Problem

Comparative sociological research frequently suffers from the "small N" problem, *i. e.* the fact that the number of independent cases (often, countries) is small. Among other issues, this severely limits the number of explanatory variables that can be introduced simultaneously in the analysis. Therefore, sociologists cannot be certain whether a macro-level variable (*e.g.* GDP per capita) actually has an effect on the studied phenomenon, or whether the effect is merely a by-product of its association with another variable which could not be introduced in the model (*e.g.* poverty rate or cultural liberalism).

We propose to use Partial Least Squares (PLS) regression to overcome this issue. PLS regression can be seen as an intermediate method between standard OLS regression and factor analysis. It allows introducing as many dependent and independent variables as appropriate, disregarding the number of observations. These variables are then summarized into a handful of factors, which are the linear combinations of the variables which explain the best the covariance between dependent and independent variables. Results can be interpreted graphically, considering factors as latent variables whose signification is given by their association with variables. Classic regression coefficients for each variable can also be computed.

We illustrate the interest of this approach for the analysis of the macro-level variations of educational and socioeconomic homogamy between European regions (sub-national units). About 25 independent variables are introduced to identify the precise drivers of homogamy. Overall, the level of development is the main factor of the intensity of homogamy. In more detail, variables at play are GDP per capita (negative effect), tolerance to homosexuality (negative effect), and poverty risk (positive effect). A weaker homogamy is thus related to both economic and cultural openness. When comparing effects on dependent variables, Orthodox and Catholic countries present higher socioeconomic homogamy, and Protestant countries higher educational homogamy.

Guardians of the Night: Sensing Nocturnal Rhythms in Guantánamo

Guardian of the Night (2018), co-directed with Eleonora Diamanti, is an experimental and sensorial short-length ethnographic film about the cyclical and spontaneous life activities that emerge at night time in the city of Guantánamo. Entirely shot at night time, the film engages with the synesthetic aspect of practices that take place in Cuba after the sunset, from the post-revolutionary *guardia* sessions of neighborhood night watching, to nocturnal activities related to technology, media infrastructure, and night time economy. The senses are at the centre of the night experience along with reduction of visibility. This creates a perfect focus to reinvigorate discussion and to promote an innovative approach around sensory visual ethnography. Moreover, the film challenges the day-centered focus of social sciences in engaging with nocturnal activities in order to undertake an anthropology of the night. Being shot in a context where vision is limited, the paper engages with some of the strategies adopted by the directors to develop a multisensorial experiencing of the night in Cuba. More specifically, strategies of video shooting, sound recording, and video montage, and a careful attention to shadows and movements will be discussed. Based on extensive sessions of sound recordings accompanied by an original soundtrack produced by Cuban DJ Zevil the film is especially rich in sonic textures and poetry, stimulating new essences of sensing the night. Poetic performances of the night travel through the lenses of the camera accompanied by the sounds and shadows

of the Cuban streets. *Guardians of the Night* reflects a desire to play with rhythms, shadows, performance, design and poetry in using video and sounds as mediators of the night experience. Clips from the film will be used to illustrate some of the strategies developed to stimulate a synesthetic atmosphere of the shadows that live through the night.

La Cause Des Migrants à L'échelle Euro-Africaine. La Difficile Construction Du Mouvement Des Expulsés D'Espagne (2006-2012).

Plus de 10000 Sénégalais illégaux sont expulsés à partir de juin 2006. Dans les centres de rétention comme à leur arrivée au Sénégal, ces migrants protestent contre leur réadmission, et créent des associations pour faire valoir leurs droits. En dépit de leur force numérique et subversive, ils peinent à se structurer. En mouvement social en raison (1) des stratégies étatiques à la fois répressives, clientélistes et corruptives du gouvernement sénégalais qui ont créé des divisions internes au sein des associations d'expulsés et à un fort turn-over aux postes de leaders ou de porte-paroles du mouvement des expulsés. (2) en l'absence d'alliances et de mouvements de solidarité au Sénégal et à l'international. Le mouvement des expulsés sénégalais n'a très peu bénéficié du soutien des organisations et des militants européens et sénégalais. L'incapacité du mouvement à accéder aux réseaux militants transnationaux illustre le caractère socialement sélectif de l'international. Souvent analphabètes et sans capital, les expulsés ne représentent pas les « bons » partenaires déjà professionnalisés que recherchent les associations ou ONG européennes de droits de l'homme. Les relations entre espace associatif sénégalais, français et espagnol, historiquement construites sur la thématique « migration et développement », expliquent la réticence initiale et la lente conversion des militants et du personnel associatif sénégalais à faire du plaidoyer en faveur des droits des migrants. Pour finir, les référentiels des politiques publiques migratoires euro-africaine ont disqualifié les expulsés comme interlocuteurs ou bénéficiaires légitimes. L'échec du mouvement des expulsés Sénégalais illustre une nouvelle étape dans l'histoire de la cause des migrants dans l'espace euro-africain.

"Mobilization without Protest". What Popular Dissent in Senegal Tells about the Blind Spots of Social Movement Theories.

My communication bears on a Senegalese popular mobilization about "illegal emigration". In 2006, more than 30000 young sub-Saharanans tried to reach Spain by boat-peoples. Number of them died during their exile. In the suburbs of Dakar, 350 mothers mobilized against their sons' emigration. Not only they voice their grievances about this scourge, but they publicly express concerns and make claims on broader issues such as female conditions of life, the economic crisis, or the failure of the State. They were joined by Senegalese expelled from the EU, foreign and national NGOs. This African case study enables to bring out and grasp the implicits and unthoughts of social movement studies, mostly built from Western cases. Social movements are classically defined as a social process through which actors engaged in a conflictual collective action with clearly identified adversaries, mainly States or institutions, to promote or oppose social change. Popular dissent in Senegal challenge this definition. I will show that (1) the State, or institutions, are not always the target. A mobilization can be its one purpose, it does not require the presence of opponents classically defined in political terms (here, collective action was a place of sociality and solidarity for mother's migrants, a way of personal empowerment for Senegalese expelled, a form of self-help and service delivery); (2) when the State, or institutions, are targeted, social actors can choose forms of actions which are not disruptive, "confrontational", or unconventional. Actors can voice their concerns, blame authorities, and claim for rights without protesting (for example, through patronage politics, or lobbying, the organization of public rallies or performances instead of marches). Thus, African cases invite scholars to scrutinize theoretical blind spots of social movement theories, and reconsider the analytical frontiers between mobilization, contention, and social movements, between unrest, contest, and protest.

Ethnocentrism and Attitudes Towards Tourism Destination Choices: Empirical Evidence from the GENE Scale

Tourism is a social, economic, and cultural consumption phenomenon involving human mobility across geographical and cultural boundaries. Its process includes the willingness to explore the otherness (pre-visit stage), the actual interaction (on-site stage), and the attitude adopted after interacting (post-

visit stage) with communities away from one's usual place of residence. Although the tourism industry has considerably expanded over the past six decades into becoming one of the largest and fastest-growing economic sectors in the world, a general examination of the regional distribution of international tourists arrivals between 1960 and 2016 reveals unchanged consumption patterns, consistent tourist clusters, and imbalances in distribution of tourism benefits among Africa, Americas, Asia, Europe, and the Middle East.

The present paper is part of an ongoing PhD study investigating the effects of ethnocentrism on tourist destination choices. It argues that the recognition and emphasis of the potential benefits of tourism has generated intense competition among destinations, which in turn is not only shaping policy-makers' approaches, but also the behavior of tourists globally. Within this line of thought, the construct of ethnocentrism is applied to tourism as an independent variable hypothesized to exert biased influences on one's attitudes towards domestic versus foreign destinations. The Generalized Ethnocentrism (GENE) scale is used to assess 400 randomly selected respondents' ethnocentric tendencies towards the functional attributes of domestic versus foreign destinations.

Ethnocentrism is a nearly universal socio-psychological trait, summarized into the tendency of judging other cultures (the out-group) according to the standards of one's own (the ingroup). In consumer behavior, this tendency is translated into the beliefs held by consumers about the appropriateness and morality of purchasing products foreign origin, and is underpinned affective, cognitive, and normative structures, such as cognitive bias, moral obligation, economic threat, and rationality. Applying this theory in tourism can further the understanding of destination choices.

The Future of Ageing By Gender

Current trends in population ageing result in higher proportion of women at older ages. Older Women have a higher risk of limitations, e.g. walking, than men even at the same age. Furthermore they are more likely to live alone without help in the home. Pension policies need to recognise the needs of older women, but current austerity efforts in Belgium, Italy, Germany and Sweden are resulting in reducing or eliminating derived pension benefits which support widowed women. Since women predominate at very old ages these measures to cut their benefits can help nations meet budget goals. Should older women be paying a disproportionate price for austerity? Medical care should also be adjusted to older women's needs. Women are more likely to have 2 or more chronic conditions at older ages while men are more likely to have only one. While men's chronic conditions are less likely to be disabling, women are most likely to be disabled with one or more of their chronic conditions. And older men are much more likely to have a wife at home to share tasks or help with post-hospitalisation. What this means is that a gender neutral approach to medical care, post hospital care and help in the home will typically provide sufficient support for older men, but less than sufficient support for older women. The EU principle of assessing "how policies affect the life and position of both women and men" needs to be applied to policy analysis of the ageing of the population. Of course the future may be different in that men will live longer and women will be less disabled so that active life expectancy is more equal. But future planning needs to confront the fact that these changes are not likely to happen, if at all, for several decades.

Recruitment Gone Digital?: Analyzing the Effects of Social Media Usage on Civic Engagement

The non-profit sector is a huge economic sector that relies on citizen's charitable donations and volunteer hours to survive. This study asks: how have community groups used social media to engage citizens and what are the effects of social media use on civic engagement? This study addresses a clear research gap in the study of social media effects, as determined by recently published meta-analysis and literature synthesis (Boulianne 2017; Stoycheff et al. 2017). The study is unique in combining an analysis of seven community organizations' twitter usage with a large, random digit dialing survey (n=1200). Interactions with community social media pages have a consistent and significant positive correlation with donating as well as volunteering. However, the call to action to volunteer, donate or help are relatively rare in Twitter communication (n=5500). While social media use is positively associated with donating and volunteering, civic groups have not fully optimized the potential of social media to engage citizens.

Sustaining a People Centered Health Workforce: The Mental Health Experiences of Health Professions

The experience of mental health issues among health professionals is an area of growing concern, yet it is seriously understudied. Mental health issues experienced by health professional workers are uniquely challenging because of the importance of mental acuity in their knowledge service role, the potential impact on clients and their professional license to work. We can ask, how can we create a people centered health workforce without attending to the mental health issues of health professionals. The role gender plays is also conspicuously absent as an explicit focus despite the fact that nearly 80% of health professionals in Canada are women. In this paper, we present preliminary data that addresses the range of mental health and work-related experiences of four health professional groups: dentists, midwives, nurses and physicians. These professions were chosen for their range of work contexts – from unionized salaried positions to private practice – and because of their differential gendered compositions – dentistry and medicine being feminized and nursing and midwifery being traditional feminine professions. The data we present are derived from three sources: insights from a scoping review of the literature; a preliminary online survey of nearly 300 health professionals and data analysed from the Statistics Canada 2012 and 2013/14 Canadian Community Health Surveys on these groups. These latter two sources also include data from other professional groups outside of health care for purposes of contrast: academics, teachers and accountants. In brief, we find that the mental health experiences of health professionals are predominantly work-related; regardless of the gender of the respondent, all health professionals feel women experience more work-related mental health issues and although absenteeism is high among health professionals, there is a significant amount of presenteeism particularly where professional work structures and culture do not enable leaves of absence for mental well-being.

BOURGEAULT, IVY* (University of Ottawa)

Women in Healthcare Leadership Roles: Contributions to Healthcare Governance

Healthcare leadership is a key component of healthcare governance; the composition of those leadership roles is in turn a key problematique. While we know that the healthcare workforce is predominantly female, in Canada nearly 80%, disproportionately fewer women are in healthcare leadership roles. Women lead fewer than 20% of hospitals and only 4% of other health care organizations. Women leaders are also "uniquely positioned to leverage traits such as compassion, transparency, and the ability to foster teamwork" (Fontenot 2012) to transform health care. The growth of women's leadership in health sciences is critical to advancing scientific inquiry to foster the generation of new knowledge to improve health and health care. In this paper, we present preliminary data from an ongoing research project entitled, Empowering Women Leaders in Health. In this first phase, we have collected and analysed descriptively women's preponderance in four key leadership roles using the Canadian province of Ontario as an exemplar: 1) women's participation at the governance level on hospital, local health integration networks and public health unit boards; 2) women's participation in senior management levels in healthcare organizations as CEOs, Presidents and Vice Presidents; 3) women in leadership roles in healthcare sciences, including as Deans and Associate Deans; and 4) women in health professional leadership roles, as CEOs, Presidents and Vice Presidents of professional associations and regulatory bodies. We discuss the varying degrees of involvement of women in these different health care leadership roles and the systemic economic, social, and institutional barriers they experience achieving these leadership positions. We also discuss with reference to the recent UN High Level Commission on Health Employment and Economic Growth which calls for action to "maximize women's economic participation and foster their empowerment through institutionalizing their leadership, addressing gender biases and inequities in education and the health labour market."

A Planet in Crisis, a Cacophony of Solutions: Competing Narratives about Science, Technology, and Innovation in the Anthropocene

The idea that we have entered a new geological epoch, the Anthropocene, where human activities are fundamental drivers of earth system processes is presently the center of considerable debate. The core idea, that humans have shifted from inhabitants of a planet defined by the operation of various biophysio-chemical processes to co-creators of that planet, has generated diverse reactions toward the human achievements (notably science, technology and innovation) responsible for the transition. The purpose of the paper is twofold. First, it will describe the three major narratives and the vision of science,

technology and innovation associated with each: 1) the 'good Anthropocene' narrative in which planetary problems are rendered as a great opportunity for science, technology and business; 2) the 'bad Anthropocene' narrative which emphasizes the peril humanity faces and argues we must radically transform contemporary society (e.g., ending capitalism, consuming less) in order to avoid extinction and 3) the 'contingent Anthropocene' narrative which emphasizes both the magnitude of the peril and the potential (though not the certainty) for humans to avoid catastrophe through the appropriate application of science, technology, and innovation. Second, the implications for science, technology and innovation policy will be addressed. How should we proceed when faced with such a diverse cacophony of voices and the competing implications they present for science, technology and innovation policy?

BOWDEN, GARY* (*University of New Brunswick*)

Environmental Sociology 2.0: Towards an Environmental Sociology for the Anthropocene

Attention to the relationship between nature and society has been a defining feature of environmental sociology since its inception. Early research, incorporating insights from ecology, argued for the need to (1) theorize the causal connections between nature and society and (2) contextualize those connections in terms of biophysical limits resulting from resource scarcity. Over the past two decades, partly in response to new forms of existential threat such as climate change, the treatment of nature and society as distinct entities has given way to a focus on socio-natural assemblages. Using the Anthropocene as a lens to explore this emerging view, it is argued (1) that current theorizing on the socio-natural assemblage needs to pay more attention to the issues of temporality and complexity, (2) that taking these factors into account re-conceptualizes the nature-society relationship as a complex, evolving socio-natural assemblage, (3) that this evolutionary process needs to be understood in the context of cosmic evolution and the tension between entropy and the emergence of local complexity, and (4) that constraints on human development arise from the tension between these two tendencies, not from resource scarcity.

Higher Education As a Common Good: Towards Conceptualization and Measurement of a Challenging Reality

On their way to mass and universal higher education, the public systems have decreased their capacity to fund this sector and the emphasis on cost-sharing in higher education has enhanced. At the same time, in many countries the level of (qualitative) socioeconomic inequalities in access to higher education has increased. These challenges raise a question to what extent higher education can be perceived as a common good.

Against this background, the paper aims to: 1) outline a theoretical framework for conceptualizing higher education as a common good; 2) develop an index for measuring the extent to which higher education has been realized as a common good in a given country; 3) reveal the influence of country's specific institutional arrangements on the extent to which higher education functions as a common good in Europe.

We accept that higher education is intrinsically neither a private, nor a public or a common good. Being nested in the wider social and cultural settings higher education as a good is policy-sensitive and varies in time and place. The paper argues that the extent to which higher education is accomplished as a common good in a given country reflects its accessibility, availability and affordability and depends on country's specific institutional arrangements.

The analysis uses cross-sectional data from the OECD, World Bank, Eurostudent survey, European Social Survey and Eurostat. We introduce an index which includes three sets of indicators referring to accessibility, availability and affordability of higher education. The preliminary results show that higher education as a common good is a complex phenomenon and that there are large country differences across European countries in the development of their higher education as a common good. We further distinguish various clusters of countries depending on the extent to which higher education is realized as a common good in them.

From Protection to Coordinated Preparedness: A Genealogy of Vital Systems in Canada

This article provides a genealogy of the governance of vital systems in Canada. It focuses in particular on a largely unknown and unexamined civil defense

initiative introduced during World War II that sought to count, categorize, and, under emergency conditions, directly protect what were then known as 'vital points' from sabotage. The analysis recounts major episodes and turnings points in the deployment of this organizational apparatus by the various institutions responsible for civil defence and emergency management in which it was embedded. The latter sections of the article shows how efforts to adapt this apparatus for a new federal emergency management landscape failed at the precise moment that new concerns associated with critical infrastructure were emerging. The final section shows how federal planners assembled the new strategy of 'coordinated preparedness' through which the longstanding emergency power derived from Canada's commitment to peace, order, and good government could be exercised.

BOYO, TOJU* (*University of Toronto - Ontario Institute for Studies in Education (OISE)*)

(Mis)Representation of Black Women in the Media

The media is a powerful source of representations, with an unparalleled ability to shape ideas and beliefs about people and events. In the study of inequality, representations are often a distortion of reality and serve to legitimize the power and social positions of individuals and groups in society. The portrayal of black women in the media is an example of how representations can be mismatched with reality. Black women are diverse, complex and dynamic individuals with unique life experiences. However, the media insists on portraying them in a demeaning and often distasteful manner. Today, it is not uncommon to find images or stories of the angry black woman, the single black mother on welfare and most commonly, the hypersexual black woman disseminated throughout the media. The very existence of black women seems to have been reduced to their physical parts and their sexuality. Central to this paper is the idea that media representations of black women are often distortions, which serve to reduce their diverse realities to a single experience, based on their sexuality – ultimately reinforcing existing power relations. In order to better understand the current state of media portrayals of black women, it is important first to trace the historical origins and development of these representations. Secondly, this paper explores some contemporary representations of black women in various mediums. Such representations serve to legitimize power, violence, oppression and injustices towards black women. Finally, this paper concludes by examining some of the ways in which black women are redefining themselves sometimes in direct opposition to these representations. These efforts to reflect more authentic representations of black women in the media require conscious and sustained efforts in order to dismantle oppressive power relations.

BOZZETTI, ALESSANDRO* (*University of Bologna*)

Second-Generation Immigrants and Higher Education: The Italian Case Study

The interest for young people of "second generation" in Italy (a country characterized by the "Mediterranean immigration model") is quite recent: this growing population needs different interpretative frameworks than those used for early migrants. Starting from the segmented assimilation theory, the analysis focuses on their educational path, a "privileged observatory" and, at the same time, a key place for their identity and cultural development, as well as a fundamental turning point for the delicate transition to the labor market.

Studies and research followed the demographic growth of the reference population, stopping at the secondary education. However, these young people have more and more visibility to the highest educational levels, up to the university level: according to ministerial data, in the a.y.2015/16 were slightly less than 31,000 (estimated by default, as these data do not take into account those who have acquired Italian citizenship).

Such silent disinterest can be partially explained by the successful biographies of these young people: if on the one hand it can be considered synonymous with a successful integration, at the same time it prevents any anticipatory analysis of the phenomenon. Indeed, the barriers encountered in access to post-secondary education may be various, some similar to those encountered by native students, some typical of students with a migratory background.

Starting from the ministerial data, a descriptive analysis will be carried out to highlight some significant aspects (gender, age and pre-university formation) of the target population. The paper will also refer to the empirical research carried out at the University of Bologna, realized with the mixed methods approach, in order to meet the multiple research objectives pursued (exploratory value and deepening of individual biographical paths). The reasons, the support, the success in their studies and the plans for the future are the aspects deepened in the analysis.

RC52-859.3BRADY, JENNIFER* (*Mount Saint Vincent University*)*Naming Nutritional Injustice: How Might Dietitians Articulate a Socially Just Dietetic Practice?*

This presentation will invite listeners to consider how the ideals, concepts, and language of nutritional justice may be incorporated into the everyday practice of dietitians whose work is often carried out within large, conservative, primary care institutions. How might dietitians address the nutritional injustices that bring people to their practice, when practitioners are constrained by the limits of current diagnostic language, as well as the exigencies of their workplaces? Although advocacy skills are important for dietitians to address social justice concerns, I suggest that dietitians also need a practice-based tool to help connect the nutrition problems experienced by those who use dietetic services to underlying structural, systemic causes. I draw on literature from occupational therapy to imagine a diagnostic tool for dietitians working toward a socially just dietetic practice. I share my visions of a politicized diagnostic language that articulates nutrition problems as the outcome of nutritional injustices rather than individuals' deficits of knowledge, willingness to change, or available resources. The presentation will discuss how a change in diagnostic language for dietitians may help practitioners reframe and address nutrition problems as the outcomes of systemic nutritional injustice and may hence, further shape socially just dietetic practice.

RC52-872.10BRADY, JENNIFER* (*Mount Saint Vincent University*)*Toward a Feminist Sociology of Expertise*

This paper draws on feminist actor-network theory to advance an emerging theoretical framework, the sociology of expertise. The feminist sociology of expertise developed in this paper will likely be of interest to scholars of the professions and professionalization who are familiar with the frameworks developed in the sociology of professions literature. The sociology of professions has served as the main body of literature in which the stratification of work and elite knowledge, or expertise, has been theorized. However, the sociology of professions largely oversimplifies the implications of expert claims-making because of its narrow focus on the actions of professional groups. The sociology of expertise draws on the tools of actor-network theory (ANT) to illuminate the wider workings and consequences of expert claims-making as a participatory and diffuse phenomenon. However, like much of mainstream ANT, this emerging body of work has not considered how gender, race, and class inequities inform the expert performances that give rise to networks of expertise. Using my empirical work on the history of the home economics and dietetics professions in Canada, I elaborate a feminist sociology of expertise. In this paper, I offer a brief primer on the sociology of expertise and the ANT concepts on which it is built before sharing my thoughts on how this framework may be expanded to engender a feminist sociology of expertise.

RC15-287.10BRADY, JOHANNE* (*University of Sydney*)O'LOUGHLIN, KATE (*The University of Sydney*)*Living with Parkinson's Disease: Sociological Perspectives on Older Australians' Narratives*

Parkinson's disease is a chronic illness generally associated with biological processes of ageing in later life; increased longevity suggests that the prevalence will increase with population ageing. The dominant discourse on Parkinson's disease is a medical one and very much framed around diagnosis and treatment. In this context, the body-self and external environment are partitioned off and not recognised as part of the 'disease', therefore little attention has been given to the socially constructed meanings of living with Parkinson's put forward by people diagnosed and their partner-carers. The objective of this qualitative study was to understand the lived experiences of Parkinson's disease from these two different perspectives; embodying the illness and caring for another body in illness.

The data included here are from focus groups (n=6) and individual interviews (n=18) carried out in the Sydney metropolitan area with people diagnosed with idiopathic Parkinson's disease and their partner-carers. Participants' narratives evidence the ways in which, outside of the clinical setting, the simultaneous process of ageing and living with this chronic illness affects their physical, social and emotional wellbeing. At the same time, narratives illustrate the often creative and productive ways that participants mitigate the physical and emotional suffering and loss experienced in living with Parkinson's disease.

The findings demonstrate that, for health professionals and policy makers, a more nuanced framework is needed to move beyond the clinical understanding of Parkinson's disease as a movement disorder. That is, one that provides an interpretation and understanding of the diversity and complexity of the lived experience of Parkinson's disease and its intersection with the ageing process, and

also how the person embodies, sees and experiences life with Parkinson's disease, and the partner-carer sees themselves implicated in their partner's illness.

RC01-39.3BRAENDER, MORTEN* (*Aarhus University*)HOLSTING, VILHELM (*Royal Danish Defence College*)*The Power of Experience? Innovative and Authoritative Leadership Values Among Army Cadets*

The military profession in general and the army in particular is associated with conservative values. Offhand, this is hardly surprising. After all, it is the purpose of the Armed Forces to protect, (or to conserve), society at large. Moreover, the monopoly of violence can only remain legitimate as long as the violent professions observe strict rules, i.e. if they are conservative in regard to executing this monopoly. Accordingly, we would also – offhand – expect service experience to correlate positively with a more traditionalistic approach to leadership.

This study challenges that expectation. Based on survey data with two types of cadets – recruited either from the rank and file or among civilian BAs – it is shown that future officers with a civilian background are much more authoritarian when it comes leadership values than their fellow cadets from the military. The paper offers two different – albeit not necessarily competing – explanations for this finding: It can be seen either as a result of the power of experience. Those who have tried leadership in practice know that leniency sometimes works best. Or it may be seen as a result of a general thrust towards more innovative and inclusive approaches to leadership in society at large, a thrust that is now also affecting the military professions. Unlike the newcomers, those who have been socialised into this profession have already learned to perceive such values as superior to other approaches.

RC02-53.4BRAGA, RUY* (*University of São Paulo*)*A Precarious Hegemony: Neoliberalism, Social Struggles and the End of Lulism in Brazil*

Analysis of the Brazilian political and economic crisis tends to emphasize the economic 'errors' of the government of President Rouseff of the Workers' Party (PT) inherited from her predecessor Luiz Inácio Lula da Silva. It is clear, however, that the focus on political and economic regulation is too narrow to understand the current crisis. Such explanations are unable to reveal the changes in class structure that took place during the Lula era as well as the effects of the international economic crisis. This article thus analyzes the conflicts produced by the neoliberal regime of accumulation and the Lulista mode of regulation, emphasizing the role of precarious work in the current historical cycle of strikes and popular struggles in Brazil. In this context, it interprets the nature and characteristics of the social forces behind the impeachment of President Rouseff.

RC47-782.4BRAGA, RUY* (*University of São Paulo*)*Brazil Post-Impeachment: June Days of 2013 and the Parliamentary Coup*

With the consolidation of the parliamentary coup d'état in Brazil, political and sociological analyzes are multiplied, whose core consists in affirming a supposed continuity between the popular mobilization cycle of 2013 and the pro-impeachment protests of 2015. In this presentation, we intend to analyze both the arguments of those who claim that the so-called "June Days" of 2013 opened the way for the parliamentary coup and the prospects of the renewal of popular social movements in a political context marked by the deconstruction of labor and social rights and, consequently, by the deepening of the inequalities between the social classes. To this end, we will analyse case studies and ethnographic records of peripheral populations and precarious workers in five large urban centers of the country, and especially in the city of São Paulo.

RC23-441.4BRAGA FILHO, EDMAR* (*Federal University of Rio de Janeiro*)*International Mobility of Scientists and the Structuration of a Semi-Peripheral Sociological Field*

This project is the result of two years of research on geopolitics of knowledge, academic dependency and internationalisation of sociology in Brazil, in particular the international mobility of scientists.

In this paper, my aim is to analyse the relation between the international mobility of sociologists and the structuring of the sociological field in Brazil. The research project is based on two premises: 1) structurally, there is an asymmetry in the production and international circulation of sociological knowledge; and 2)

in relational terms, science should be understood within a broader framework of transnational dynamics and processes. Taking the latter into account, international mobility is a key element of analysis, as it enables scientists to have greater insertion in international networks and thematic agendas, giving prestige and better opportunities to agents in the national sociological field.

Theoretically, I consider the social fields theory, in the light of some insights come from social studies of science and technology. Secondly, in order to a better understanding of the dynamics of power that shape the mobilities and their consequences at the international level, the research is inspired by what has been consolidating as the new mobilities paradigm.

In the paper, I draw on quantitative analysis of the curricula of the professors of the postgraduate programs on sociology in Brazil, which are available on an online database, of public access.

Outcomes of E-Word-of-Mouth Use in the Health Domain: Are the Physicians-Patients Boundaries Blurring?

Social network sites and social media in general are becoming health care information hubs. People want to learn from each other, not just from institutions, and to partake in the conversation about their own health. Medical professionals' quasi-monopoly on knowledge about diseases and treatments create a crucial disparity in power between patients and doctors. The boundaries between medical experts and laypeople serve as an essential tool for preserving the current hierarchy of knowledge production and diffusion. A force that goes against this kind of hierarchy is the lay opinion system. For years, WOM has been shown to be one of the most influential sources of information for health care decisions. Currently, more and more consumers are turning to the Internet to help make important health care decisions. Creating and uploading content to the network effectively turns the users into significant participants in the lives of their anonymous acquaintances and peers, thanks to the technological platform that provides a virtual place to conduct and maintain online social activities. The purpose of the current study was to explore what people do with the recommendations they receive through e-WOM. Using an Internet survey of 970 individuals found on various Israeli health forums, we assessed the extent and outcomes of active and passive use of health-care-related e-WOM. The results show that participants used these as leverage to convince the physician to take steps that are not essential and some of them refused to follow the physician's recommendations, in light of information obtained via e-WOM. The patients' new knowledge did not help them engage their physicians in conversations about the purpose and nature of tests or procedures already received, about the care they truly needed, or about choices of evidence-based care involving minimal harm, but helped them feel more involved in their own healthcare decisions.

BRANDAO, ALEXANDRE* (*Onati Institute for the Sociology of Law*)

Social Media and Criminal Courts: An Initial Proposition

Mason (2013) and Castells (2015) have investigated about the potential impacts that the internet and Social Media have had in connecting activists in the Arab Spring, the Indignados, and other New Social Movements that have recently erupted. For these, the connectivity increased political pressure from communities improving accountability and enhancing governance. On the other hand, the US election and the *fake news* phenomena have also brought the role of Social Media into the spotlight on a less positive way. For Sunstein (2017), Facebook has created echo chambers, enabling populism and opening up the space for confusion between facts and opinions.

However, the powerful role and impact that social media and the rapid advance of communication technology can have on Law has been underdeveloped. This is a major overlook, especially when it comes to Criminal Law and Criminology, areas that have traditionally paid attention to the role of media into its functioning. The objective of the research proposed is to analyze and attempt to provide a framework under which Social Media's impact on and relationship with Criminal Law and its Courts can be understood. To accomplish this, the investigation will, through multiple case studies globally (Australia, Brazil and USA) elaborate about how do discussions and interactions on Facebook and Twitter affect the functioning of jury and non-jury based criminal courts and in what way are these handled by the courts themselves in cases of great political or social repercussion.

The research will take advantage of the methodological opportunity that has been created and will utilize the Twitter and Facebook Application Programming Interfaces (APIs) to obtain big data and conduct the studies based on the information gathered from them, court transcripts, and on a smaller sample, interviews with the legal actors involved in the criminal proceedings.

Changing Belongings in the Life Cycle. Collective Shifts in the Life Trajectories of Older Migrants in Australia.

As stated in migration research, we-group belongings can transform in the migration process. Different social discourses, knowledge bases and values in the sending and the receiving societies lead to a reinterpretation of the sense of belonging. In this paper I will discuss the change of belonging in the life cycle and especially in older age. I will present first results of my biographical and ethnographical study on transnational aging of older migrants of different migration groupings in Australia, which indicate an intensified sense of belonging linked to the country of origin. The case studies also reveal a shift in the "we-I-balance", towards the interpretation of the own life in the more collective context of the family and the social support networks linked to the country of origin. Elderly migrants thus seem to experience another re-interpretation of the life history and a shift in the sense of belonging in the process of aging and in the increased dependence on care provided by the family. This paper will shed light on a so far little researched topic of the sense of belonging of elderly migrants, as migration and transnationalism research tended to focus on labour migration and the belonging of younger adults and middle-aged migrants.

Transnational Care Networks of Older Migrants in Australia. the Influence of Migration and Health Care Policies on Transnational Care Strategies.

TITLE: Transnational care networks of older migrants in Australia. The influence of migration and health care policies on transnational care strategies.

In this paper I will examine the implications health- and migration policies on transnational aged care strategies of different migration groupings in Australia. The paper draws on the results of an ethnographical and biographical study on transnational support networks and aged care of older migrants in Perth. The presented case studies demonstrate that increasingly restrictive migration- and citizenship policies, and especially the lack of bilateral agreements in migration and welfare policies, are considerable obstacles for transnational caregiving. In this paper I will examine, how the older migrants and their families reconfigure care arrangements in the context of the structural constraints of an immobility regime. The case studies will give an insight into the close and distant support networks of elderly migrants and the practice of distant and transnational family care. Also, the unequal access to mobility, which impacts on already existing global asymmetries and inequalities in the capacity to circulate care, shall be discussed. Whereas professional, affluent, and mobile migrants, often from the Global North, can move freely between different countries without severe visa or financial obstacles, other migrants e.g. refugees are restricted by migratory politics, border regimes, and insufficient financial resources.

Building Solidarity Among Youth for Achieving Gender Equality – Experiential Learning from Gender-Responsive Trainings amidst Grassroots Leaders in Rajasthan

This paper is based on the author's insights of experiential learning in promoting gender-responsive attitudinal change among the rural youth and community leaders gleaned as a trainer-professor at the *State Institute of Rural Development (SIRD), Rajasthan*. It endeavors to capture the proactive initiatives taken by organizational leaders and elected representatives of local governments for striving to build a gender inclusive society — fostering values of gender equality and gender justice.

The paper aims to draw upon the rich variety of voluntary initiatives for social transformation, uprisings, movements and capacity building undertaken for re-socialization of young leaders of local governments for promoting gender responsive planning with the community to bridge gender gaps in human development and ensure enjoyment of human rights by all, encompassing and enabling the realization of the vision of achieving gender equality as articulated in the SDGs (specifically Goal 5: Agenda 2030).

At the outset, the paper shall explore the 'Whys' or the rationale for addressing the young leaders of the communities through '*Training for Social Transformation*' to achieve the formation of gender-friendly social collectives and networks for instilling a culture of Gender Responsive Local Governance in the developmental planning as well as day-to-day functioning of *Panchayati Raj Institutions (PRIs)*.

The paper shall move on to illustrate the transformative potential of voluntary initiatives such as UN-Women's '*He for She*' campaign as well as elaborating the successful grassroots experiments in creating gender-friendly *Panchayats* (rural

elected local bodies) through massive gender-responsive training campaigns undertaken at State Institute for Rural Development (SIRD) Rajasthan and beyond.

Insights emerging from social uprisings and movements in the post-Nirbhaya context in India expositing regional inter-group dynamics and youth leadership in its voluntarist avatar will also be captured and critically analyzed, particularly in how these interact discursively with the elected leadership and its considerable youth component.

BRANDT, GESCHE* (*German Centre for Higher Education Research and Science Studies*)

Fathers' parental leave as a matter of negotiation

In 2007, the Parental Allowance and Parental Leave Act was introduced in Germany. The aim of this reform was amongst others to shorten the time span of parental leave taken by mothers and to increase the share of fathers taking parental leave. Despite a rising participation of fathers in taking parental leave, the higher proportion of this time is still used by mothers. What are the reasons and what combination within partnerships supports or prevents fathers from taking parental leave? The distribution of economic resources, family orientation and, occupational frameworks among the partners prior to the birth of their first child effect the use of fathers' parental leave. The utilisation of multinomial logistic regression has shown the probabilities for fathers taking 1) more than two months, 2) only one or two months, or 3) no parental leave. The analysis focuses on dual-income couples and is based on an online-survey of the DZHW-graduate panel studies cohort 2001 surveyed in 2012 (n=864). A higher income of the father as well as a more supportive job environment for his partner and a higher family orientation of his partner are negatively correlated with the probability of parental leave. Positive correlated are a higher family orientation of the father himself and the parental leave rules from 2007.

Changes in Social Networks and Changes in Health: What Drives What?

In the social sciences, there is a plethora of studies on the influences of social networks and their characteristics on different health outcomes. Many of them acknowledge the fact that the opposite direction (health influencing social networks, e.g. in terms of support received or participation in social events) is a very obvious one, some partly control for reverse causality, but not many specifically analyze this influence. Our study considers the complex relationship between health and social networks from a longitudinal perspective. Specifically, the analysis examines network size, composition and social support exchange in relation to self-rated and functional health. The data are drawn from the German Ageing Survey (DEAS), which includes information about health and social networks (using a name generator) of Germans aged 40 and more over a period of 18 years (1996–2014). In a first step, we estimate fixed-effects models to disentangle the influences of changes in social networks on health and vice versa. In the second step, we use a cross-panel design in order to analyze specific connections between different aspects of social networks and health. First results indicate significant effects of health on social networks and vice versa over time, with different (in-)dependent measures leading to quite different substantial conclusions. In particular, social support is important for health when direct and indirect paths between health and social network characteristics are incorporated into the analytical model.

Social Inequalities and Transfers between Generations: An Analysis across 116 European Regions

Family members help each other in case of need but also due to love and concern for each other. Thus, the family can be seen as a safety net, especially in times of crises. We know that most transfers flow between parents and their adult children and functional solidarity is a crucial dimension of intergenerational relations. Until now, however, little attendance has been given to exchange patterns between economically deprived family members within different policy contexts. We thus assess how transfers between older parents, respondents and their adult children are linked to social deprivation and inequality across Europe on the micro and the macro level; i.e. do socially and materially deprived households give less and receive more money and practical help, and do different levels of regional social inequality play a role? Using the material and social exclusion items from the fifth wave of SHARE, we focus the effects of deprivation on exchange patterns between three generations in a comparative analysis. We

distinguish between different kinds and flows of assistance (financial, time, given and received), and consider the possible impacts of regional contexts on the links between solidarity and inequality. Multilevel models indicate that materially deprived respondents indeed give less but need more help from their adult children and thus lose their normal role as providers. Moreover, social policies matter: In regions with higher social inequality and lower GDP fewer transfers of time and money are given and received between three generations. Poor families in regions with low public social assistance are thus especially vulnerable.

Sociology in the Brazilian Press: Florestan Fernandes (1943-1949)

This paper aims to identify and analyze the presence of sociology in the public debate between the 1940s and the 1960s, a crucial period in its institutionalization and legitimation as a scientific discipline in Brazil. To this end, I will map the articles published by sociologists - as well as the news that refer to them - in newspapers and magazines of wide circulation, in order to detect how sociology was present - or not - in the major debates and conflicts in Brazilian society in the last century. My hypothesis is that sociology operated as a kind of meta-language that translated the public debate in sociological categories, providing meaning and motivation to the social actors in their practical and concrete disputes. This analysis of the sociologists' participation in the public debate will be situated within the main cleavages of the period, which can show sociology's diverse political orientations in this context of Brazilian society. This paper shows the first results of my ongoing research, which focus on the presence of Florestan Fernandes in the press between 1943 and 1949, more specifically in the following newspapers: *Estado de Sao Paulo*, *Folha de Sao Paulo* and *Jornal de Sao Paulo*. In this period, Fernandes not only published sociological articles on many topics, but also tried other kinds of public intervention, like literary criticism and political analysis of Estado Novo dictatorship and its institutional legacy. The systematization and organization of this textual material hitherto scattered and underexplored may bring new perspectives on the Brazilian sociology during the mid-twentieth century.

Reflections on Socially Engaged Practice: Between Community Participants and Gallery Spaces

Owing to Stephan Willats' notion that 'art practices operate within an environment of institutions and groups of people who effectivity maintain it as an identifiable activity within society',^[1] this paper seeks to delineate how practitioners collaborate alongside participants, to unpick and challenge the production and exhibition of socially engaged artwork in a gallery space. In doing so, this paper aims to sketch out the process of such work as paradoxically important and problematic.

Based on a recent yearlong residency with two distinct but, geographically connected community groups, the paper questions the role and value of socially engaged photography (art) in public galleries. Reflecting on the project, which was part of an outreach programme commissioned by a national gallery, I argue for a greater emphasis to be placed on the process of such projects rather than the aesthetic outcomes. Whilst images are often read intertextually, often within the discursive frameworks that predominate said society (Rose, 2007) what happens when the images move context or the audience changes? What is the effect on the producers? How do you seek to diminish or maybe heighten their impact? Thus, by foregrounding how the less visible aspects of participation and engagement should and can become the final exhibition as an outcome of itself, the paper will point towards a number of ways in which participants, collaborators and curators work to consider such issues.

Professional Autonomy or Organizational Control in Collaboration Management

A massive trend in public administration latter years is inter-organizational collaboration – but how does it affect professional groups? A solution suggested to solve the complexity in welfare states is collaboration between professionals in different organizations. This challenge the ideal type of welfare-state professionals, assumed to possess substantial power over clients. Having to collaborate with other organizations demands negotiation and compromises between professionals. Hence, it alters the professional-client-dyad in the sense that several professionals become included. Furthermore, differences in professional and organizational cultures as well as praxis create barriers.

Collaboration also challenges organizations, often with the response of increased managerial practices. Professional autonomy changes into standardized services to avoid conflict concerning responsibilities between collaboration partners.

The paper inquires the ties between organisation and profession in relation to collaboration management. It includes analysis from an ongoing research project concerning inter-organizational collaboration between municipal and national-governed authorities in Sweden. It is a comparative case study brought out in three municipalities, including the perspective of professionals and managers as well as clients. A central question is how these changes in public management affect professionals in their daily work. What happens when they, on top of having to take managers and clients into account, have to work together with professionals in other organizations? And what are the long-term consequences, will we see a new form of professionalism based on the skill to negotiate between the mentioned actors? The papers also set focus on asymmetry of power between organizations as well as professionals. What are the possibilities to collaborate with stakeholders, be it organization or profession, who lacks interest or incentive to find reasonable solutions to the challenges facing the modern welfare state?

Professional Representations – a Theoretical Possibility in the Sociology of Professions

A theoretical approach in the beginning of entering the research field of professions is the concept of professional representations - a development of Moscovici's theory of social representations. Professional representations inquire how professionals develop common understanding of their work. But it also enables a dynamic understanding how these representations are constantly changing in relation to the social environment. Two persons sharing profession but working in different organizations will, according to the theory, develop different representations over time. Take two nurses graduating the same year. One starts working at a forensic psychiatric ward and the other in surgery. The two of them will develop quite different understanding of humans in their daily practice - still they share basic professional understanding. Also, two persons with different professions working in the same organization could experience a merge of representations. A social worker becoming a health counselor develops a more medicalized understanding when interacting with physicians. This, while still embracing the professional ethos of social work. These are two examples on how professional representations-theory offers a dynamic and multi-dimensional understanding of professions and what affects them.

The paper has a two-folded aim. First it presents a theoretical multi-level model for analyzing professional representations. The levels, including among else education, profession and age, are examples of sources that could affect professional representations. Second, the paper includes results from an ongoing comparative study between professional groups working in the area of vocational rehabilitation. It is a multi-method design with an exploratory approach. The variables discussed in theoretical part of the paper are tested empirically using multivariate analysis.

The theoretical model enables future multi-level analysis of professionals. It is generic which makes it applicable in different context and enables cross-comparison of different professions.

Is There Emergent Epistemological Unity in Tourism Studies? the Tourism Research Ecosystem and Its Disciplining Dimension

Throughout the academic research ecosystem, there exist modernist, postmodernist and post-postmodernist approaches that frame questions in regard to the legitimacy of science. Collins and Evans (2002) divide the study of scientific knowledge production in 3 waves that frame the conceptualisation of scientific authority, the first approach aimed to defend the authority of science, meanwhile the second aimed at questioning it. The third approach is the one taken here and aims to synthesize insights from both.

The consensus between the modernist and postmodernist position can be found in solving the problem of legitimacy, studying science in action has unveiled that the so called 'scientific method' and the rationale behind it (Latour, 1993) comprise a set of ever evolving and changing norms of a specific epistemic community (Brauer and Dymitrow, 2017). Meeting such postmodern criticism head on is far more interesting than just stating that; 'the scientific method is rationale' or denying rationality in the first place (furthermore, isn't that very unscientific?). The way that it works sociologically is that by acquiring scientific expertise in one particular discipline (e.g. physics, climate science, economics, geology, tourism etc.) you become an expert within that field.

The bachelor degree, the master degree and finally the PhD function as an apprenticeship where the researcher is encultured into a particular framework of how to interpret the world, i.e. they become part of an epistemic research ecosystem. The legitimacy stems from mastery of such craft as to; 'how best to understand reality' in combination with learning the literal traditions of how to best

describe reality (i.e. rhetorical devices). This study aims to explain this process of knowledge creation by using examples from tourism studies knowledge (eco) system (cf. Tribe and Liburd, 2016) and showing different methodological choices of the tribes within the wider research ecosystem (cf. Tribe, 2010).

Is There a School Culture Promoting the Classification of Students Under ADHD Category?

Attention deficit/hyperactivity disorder (ADHD) is one of the most prevalent mental disorder among children, but there is also a large number of them being misdiagnosed (Guay et al. 2009; Kielsing et al. 2014). Inequalities in ADHD prevalence are well documented, except for those observed at the school level. Scarce studies have shown that some schools have a higher prevalence than others, even after taking into account the schools structural characteristics and student composition (Fabiano et al. 2013). Limited by their methodology and their choices of predictors, these studies do not provide good explanation for this phenomenon.

Individual teacher beliefs are at the root of stereotypes about students and are thus involved in the classification of students into different categories. Two beliefs seem especially important for ADHD classification: beliefs about ADHD itself and beliefs about what is a good pupil. The main goal of our study is to get a better understanding of school processes that may be associated with the classification of students under ADHD category. Our hypothesis states that school culture regarding ADHD and the ideal teachable pupil, which originates from shared beliefs from teachers of a same school (Van Houtte, 2004), could be a potential explanation for between-schools differences in the prevalence of ADHD diagnosis.

The current presentation will discuss how ADHD and teachability cultures in school may be associated with inequalities in school-based prevalence of ADHD diagnosis. Results come from a study of about 300 teachers, coming from 20 primary schools located in the province of Québec (Canada). Teachers reported their expectations of each pupil in their class, and were surveyed about their individual beliefs. These were aggregated at the school level. Data were analyzed using hierarchical linear model. Our study will contribute to the discussion about diagnostic culture, by investigating its specificity in the school environment.

Welcome Culture and Democracy in Germany: Refugee Support Initiatives As Site of Active Citizenship and Democratic Learning

Since the "long summer of 2015" (Kasperek/Speer 2015) a new way of dealing with refugees has emerged in Germany. Labeled as Welcome Culture, this new way of dealing is characterized by a marked increase in new volunteer, political activists and associations dedicated to assisting refugees. Due to the large numbers of refugees arriving in a relatively short time period, the existing state infrastructures became overloaded (van Dyk & Misbach, 2016) and volunteers began to show up to help. This outpouring of volunteerism was largely spontaneous, building on neighborly commitment and involvement in Refugee Support Initiatives. Although the euphoria in welcoming refugees has since then faded and we are experiencing now an increase in racist assaults and a strengthening of extreme right political parties, studies concerned with refugee support and activism in Germany (Karkayali & Kleist, 2016; Braun, 2017) show that most of the Refugee Support Initiatives are still committed. Furthermore, they have become important actors both in the material and political support of refugees.

Departing from first insights of a research project in Hamburg, Tübingen and Kassel we will discuss Welcome Culture 1) as a response to and effect of a crisis of state governance, which is connected to a neoliberalization of the welfare state measures, as well as to the crisis of restrictive forms of migration management; 2) as a moment of erosion of democratic consensus, which is constituted by xenophobic attitudes and brutalised discourses, that question the grounds of German democratic values; 3) as a crisis of political representation, in which refugees lack of political rights and where Refugee Support Initiatives claim human rights to be applied, as well as democratic consensus to be defended. In this regard, Refugee Support Initiatives are sites of active citizenship where negotiations of conflicts and processes of democratic learning take place.

BRAUN, MICHAEL* (University of Toronto)

Protests and Populism: The Mobilization of Discontent in South Africa

The Economic Freedom Fighters (EFF) is a populist political party which emerged to challenge the ruling African National Congress (ANC) in 2013, and has found particular appeal among disenfranchised youth in urban areas. The party has attempted to position themselves as the institutional expression of South Africa's 'protest culture', promising economic redistribution, nationalization, and land reform to redress the persisting inequalities in South African society. In doing so they have sought to build and appropriate sites of mobilization typically used by social movements, while drawing in members from these organizations. This paper draws upon electoral data as well as interviews and participant observation conducted in Johannesburg, eThekweni, Rustenburg, and Ekurhuleni municipalities during the 2016 local government elections to explain how the party mobilizes at the grassroots level. Drawing upon social movement theories, I argue that the EFF has used populist framing to attract former members from the ANC Youth League, unions, social movements, and other civic organizations to build structures for electoral campaigning. This was made possible by the political opportunity structure in which generational and factional struggles created divisions within the ANC. During the elections, the party's performance in each of the four research sites can be explained by looking at the mobilizing resources possessed by the grassroots activists that joined from these different organizations. To conclude, I propose that social movement theories may be fruitfully applied to understand the mobilization of political parties, particularly those using populist strategies to compete against the dominant ruling parties that are common in Africa's democracies. In these contexts the distinction between political parties and movements may be eroding as political actors and activists both make use 'invented' and 'invited' spaces to challenge the status quo.

BRAVIN, CLARA BEATRIZ* (*Clara Beatriz Bravin*)

Cuerpo, Emociones y Género En Las Ciencias Sociales. Su Especificidad En El Campo De La Sociología De La Educación.

Existe un vasto conjunto de estudios sobre el carácter intrínsecamente social del ser humano, producto de un proceso socio-histórico-cultural en el que se constituyen las estructuras de la subjetividad/cuerpo. Baste citar conceptos clásicos del campo socio-antropológico: "socialización/ ser social" (Durkheim), "patrones culturales/normalidad/anormalidad" (Benedict), "personalidad social" (Linton), "personalidad básica" (Kardiner) que se suman a los aportes sociológicos menos conocidos hasta hace un tiempo, como los de Simmel y Elias. El constructivismo estructuralista de Bourdieu (1990, 1997) con los conceptos de habitus y campo y la ya clásica obra de Foucault (1989) Vigilar y Castigar (que desarrolla el concepto de poder disciplinario, poder micro-físico factible a partir no sólo del desarrollo de la sociedad burguesa sino también del saber científico-anatómico) dan cuenta también de que el cuerpo, como experiencia y como significado, ha variado en los distintos períodos históricos. Lo mismo puede decirse de los estudios pioneros de Mauss a principios del siglo XX sobre la noción de persona, las técnicas corporales y las emociones junto a otros estudios como los de Boltanski, Le Goff, y Goffman, entre los principales. Todos muestran que la posición social, la cultura, el rango, el sexo y la edad, etc., se encarnan en el cuerpo socialmente tratado.

Las sociedades patriarcales consideran propias y legítimas determinadas funciones y prácticas sociales para los diferentes géneros y la fertilidad femenina parece ser una constante de la dominación masculina. A su vez la escolarización, a través de mecanismos que tienden a naturalizar y reproducir la visión burguesa y patriarcal del mundo, produce cuerpos disciplinados, cuerpos dóciles y útiles, así como un mundo emocional legítimo. Este trabajo apunta a formular un estado de la situación del conocimiento sobre cuerpo (como experiencia y representación) emociones y género en el campo de las ciencias sociales, especialmente en educación.

What Is Belize, Central America, Doing to Address Climate Change Exploring International Transfers and Government Programs

The authors explore in detail the transnational transfers dedicated to climate change in one small but fairly vulnerable country to a changing climate, Belize, Central America (ND Gain Index 114 –Vulnerability 108; Readiness 124 downward trend). As the Paris Accords get underway it may be useful to more fully reflect on previous international transfers to vulnerable countries like Belize, to see how these funds have been used to address climate change. Data collected through on-going fieldwork and online information on development projects reveal unexpected findings. They show that over a 25-year period, 1991 to 2015, Belize received considerable international assistance for climate change under mitigation and adaptation, some seventy projects across various development sectors. More specifically, during this time, Belize acquired over \$100 million (US) under mitigation designations alone, even though the country's GHG emission levels can at best make tiny contributions to total global emissions levels (see Brechin 2016). These and other results suggest the need for greater exploration of international transfers in other countries which might suggest the need for

greater rationalization of international development assistance dedicated to addressing climate change to assure most effective use of scarce development-related resources.

Bodies on the Edge. Approaching a Facebook Photo Album with Images of an "Extreme Weekend"

When looking at images in Social Media, the depiction of bodies plays a major role. They are part of almost every thinkable social context: professional and public up to private and even intimate, even if these distinctions have become blurry. Among these contexts, so-called party-images are an interesting phenomena. They show situations of joy and happiness, but also bodies and faces that do not appear nice at all, indicating drug use of different kinds and showing gestures and interactions 'on the edge'. It is not clear where these situations, which can be seen as a moment of group crisis (Turner), are leading and who is or is not in control of the situation. Dealing with a concrete Facebook Photo Album which was titled by the album producer as 'extreme weekend', I will explore a) what it meant for the situation that these images were made, and b) what it meant to the album producer to show these images to her Facebook friends. A combination of Visual Segment Analysis (Breckner), Figurative Hermeneutics (Müller), and Biographical Case Reconstruction based on a narrative biographical interview (Rosenthal) will be drawn upon in order to answer these questions.

The Visual Field of Biographies. Questions and Conceptual Suggestions

Through digitalization, communication via internet, and especially through Social Media, visual communication and self-presentation has become not only common, but in more and more generations even to some extent dominant. Especially visual communication on Facebook can be assumed to have strong biographical references, since here a 'life' becomes visible over the years even if it was not intended to depict it. How we as biographical researchers can approach these phenomena methodologically? In what way do we need to extend our concepts of biography by thinking of the visual dimensions in which biographies are constructed? How we can combine narrative and text analysis with visual analysis in biographical research? My paper addresses these questions by presenting conceptual and methodological suggestions how visual biographies can be approached, taking different ways of constructing biographies with images in the offline as well as online world into account in combination with spoken and written documents.

I Felt like a Dude: College Women's Accounts of the 2016 Louisiana Flood

As gender and disaster continues to be an increasingly growing field of study, women enrolled at university have been a unique subset of individuals that have been overlooked. College students may face unique impacts from disaster, as they must balance their need to focus on their education—which they or their families pay for in the U.S.—while also helping their families rebuild and recover from disaster impacts. Female students may face differing impacts as opposed to male students due to shifts in gender roles caused by natural disaster. This study focused on female college students' reactions and perspectives on the large-scale flood that affected Louisiana, U.S. in August of 2016, and its impact on their financial and educational responsibilities, family roles, and gender roles. The data are derived from in-depth qualitative interviews with 30 college students, 18 of whom were female, who were either individually affected or their families were affected by the flooding. The female students described multiple ways that the flood changed their roles in the family and responsibilities in work and finances. Results show that these impacts varied, which could be due to differing demographic factors such as living arrangements, amount of damage, and family structure. However, a consistent theme for all female students was family responsibility change, which caused not only a reproduction of typical gender roles, but also caused college-aged women to move into a motherly or wifely role within their existing family structures. This study indicates a need for further research into the multiple effects that natural disaster has on college students and most notably *women* in college.

RC39-690.2BREEN, KYLE* (*Louisiana State University*)MEYER, MICHELLE (*Louisiana State University*)*Staying Above Water: Educational Outcomes of College Students during the 2016 Louisiana Flood*

With recent increased focus on children in disaster, college students have been surprisingly overlooked. College students may face unique impacts from disaster, as they must balance their need to focus on their education—which they or their families pay for in the U.S.—while also helping their families rebuild and recover from disaster impacts. This study focused on how college students' reactions and perspectives on the effect of large-scale flood that affected Louisiana, USA in August of 2016 on their college experience, particularly their educational outcomes. The data are derived from in-depth qualitative interviews with 30 college students who were either individually affected or their families were affected by the flooding. The students described numerous ways that the flood changed their educational experience including attendance, course schedule changes, grade fluctuation, and overall motivation for school and studying. Results show that these impacts varied, which could be due to differing demographic factors such as living arrangements and amount of damage. However, a consistent theme for all students was emotional stress, which may mediate the effects of the flood on educational outcomes. This research indicates a need for further research into the multitude of effects that natural disaster has on college students.

RC12-235.5BREGVADZE, LASHA* (*Javakishvili Tbilisi State University*)*Collision of Global and Local Legal Orders in the World Society: Elements of Critical Systems Theory*

Law without the state is everywhere – both on global and on local levels. Social systems theory has been productively used for describing collisions between functionally differentiated regimes on the transnational level – new type of “conflict of laws” in the world society. However increasing processes of globalization do not exclude the evolution of local legal structures. Functionally differentiated subsystem of law is internally differentiated not only into function-specific sectors, but also due to global and local layers of legal rationality. Indeed new forms of non-state transnational regimes do collide with local spontaneous legal orders, while both operating beyond the state control. Global law of economic markets is in collision with the local law of multiple life-worlds. While anthropologists of law have been exclusively studying alternative forms of indigenous law in confrontation with the state law, and sociologists of global law have been concerned about ideas of emerging global orders beyond the national political control, important interactions between local and global legal rationalities have been left without empirical identification and theoretical generalization. Transnational corporations bringing their “global law without the state” to divergent local spaces, but also the development agencies manipulating with “project law” and intervening within the local social environments are both appropriate target groups for studying the interplay, interactions and collisions between global and local laws. It will be argued in the paper that social systems theory offers much critical potential for elaborating an alternative theoretical perspective, backed by empirical evidence, about the multidimensional character of legal evolution without the state. Freed from political domination, global and local legal rationalities – transnational commercial law vs. local intuitive legal orders – as societal normative orders are colliding and conflicting with each other and these clashes cannot be mediated by state but need alternative forms of societal coordination and steering.

RC33-606.1BREITENBACH, ANDREA* (*University Marburg*)*Reason for the Failure to Replicate Results*

Popper was of the opinion that a theory can only be falsified if “we discover a reproducible effect which refutes the theory” (Popper 2005: 66). Although the replication of empirical results has not been a high priority in empirical social research until recently, a replicability crisis has been recognized for some time. This crisis first began in other sciences and has now reached sociology.

For both research and teaching, replication of empirical analyses is an important tool. Thus, many authors, such as Diekmann or King, refer to the need to replicate studies. Diekmann puts forward the important argument that the error rate when using non-empirical surveys is high, but that it can be greatly reduced by replication. In addition, both researchers and students can learn a great deal from replication.

For these reasons, various studies were replicated in different areas of sociology, for example, family sociology, political sociology and environmental sociology, using alternative data sets and methods. It was found that, in many cases, the results did not match the original study. Often, this was attributable to a lack of information or transparency regarding the operationalization of the variables. If

the operationalization is described in detail, results which are very close to those of the baseline studies can be obtained, even when different data or methods are used. The results of the replicated studies are summarized for this work and examples are presented.

The following approach will be proposed as a solution: For the sake of transparency in research, journals should be provided with information on data and data preparation when publishing empirical essays. This is not for the purpose of criticizing authors' errors, but to allow new perspectives on existing research, and to help reduce errors in the analysis of empirical data.

RC15-JS-72.4BRETONNIERE, SANDRINE* (*Ecole des Hautes Etudes en Sciences Sociales*)*Cancer and End of Life – a Perspective from within the Oncologist-Patient Relationship*

In the field of oncology, the terminal phase of cancer patients is difficult to apprehend, both for patients and physicians. To counter this difficulty, the medical literature underlines the importance of introducing palliative care early on in cancer patients' trajectories (Temel et al., 2010). We conducted a 3-year study alongside cancer patients and physicians to examine their trajectories, in particular this end of life stage. We conducted semi-structured interviews, engaged in participant observation, led a sociological intervention (Touraine, 1978 ; Joly, 2016). Our objective was to understand how cancer patients and physicians, but also nurses, cope with the cancer pathology, from diagnosis to death. Talking about end of life with patients proved difficult ; their hope, at all stages of cancer, was to live, to recover. We did not encounter obstacles when discussing end of life with doctors and nurses, although they also underscored the complexity of articulating hope and (more or less) impending death in their care of patients. In this presentation, we will focus on one particular aspect of the research : the consultation with the oncologist. We observed oncologists' consultations for 18 months in hospital settings. As such, we were privy to the developing patient-physician relationship. We will show how death is rarely discussed in a direct manner, although it underpins every consultation, even those with patients in remission. We will also underline how end of life is most often apprehended by way of considering logistics of care (where a patient will be transferred, under what circumstances, etc.), and how oncology care led by two physicians (an oncologist and palliative/pain specialist) from the onset can – sometimes – facilitate the discussion about end of life between patients and doctors.

RC48-809.2BREWER, ROSE* (*University of Minnesota-Twin Cities*)KATZ-FISHMAN, WALDA (*Howard University*)SCOTT, JEROME (*League of Revolutionaries for a New America*)*Insurgent Black Feminism and the Black Radical Tradition in the U.S. and Beyond*

Racial formation(s) and patriarchy are deeply enmeshed in a transnational, technologically-driven capitalist world order. These are historical formations. Moreover, there is an ideological structure of racialization intertwined with the gender division of labor under global capital. Given these realities, the focus of this analysis is the deep economic and social dispossession of Black working class and poor women in the late capitalist United States and the global capitalist world in which women of Africa and African diaspora are enmeshed. The radical responses to this dispossession are discussed. Black working class women in the U.S. and globally have been profoundly impacted by the dismantling of the social wage, attacks on public education, and state violence, structured by the global politics of accumulation and capitalist crisis. Black women have not sit quietly by during these tumultuous times; nor historically.

The analysis focuses on Black women's historic upsurges such as the Combahee River Collective, the women of the League of Revolutionary Black Workers, and the women led Black Lives Matter movement in the U.S. and across the African diaspora. Linkages have been forged between Black women in the U.S. and women in Africa and the African diaspora. This is especially the case given the impact of Black Lives Matter internationally. Black women in South Africa, Britain, and Canada are building movements through intersectional struggles rooted in race, class, gender/sexuality impacted by Black Lives Matter in the U.S. The emergence of this cross national movement building, rooted in an insurgent Black feminism, is critically interrogated in the discussion.

RC55-908.2BREZNAU, NATE* (*Mannheim Centre for European Social Research*)HOMMERICH, CAROLA (*Hokkaido University*)*The Limits of (In)Equality: Liberalization, Solidarity and Support for Welfare Policy*

Since the 1980s, rich welfare states experienced liberalization in various forms, resulting in increasing wealth inequality, health inequality, and poverty. While a majority in most rich societies experienced losses in income since 1980 and face increasing obstacles to their long-term welfare, we do not see the public unifying in response. Mainstream political parties are thinning government, reducing taxes and increasing private competition for welfare. A general theory of democratic institutions predicts that policymakers respond to public preferences. Public support of mainstream parties thus equates with indirect support of retrenchment. This forces us to consider the hypothesis that the public increasingly favors liberalization, and is not dissatisfied with its outcome of continued inequality growth, i.e., they are not very solidaristic.

Given the complexity of social, economic and political processes across societies, we suspect this hypothesis is overly simplistic. We have as many good reasons to expect the public to become or react more solidaristic after decades of liberalization, meaning increased support of the role of government in counter-acting market forces – even if not visible in political (re)action. We thus construct theoretical arguments and empirical models to test both propositions. We use ISSP, income inequality and liberalization measures between 1980 and 2006 for 13 countries, to analyze changes in public solidarity.

We find that support did not clearly decrease over time, instead increase or decrease depends on the liberalization context (Thelen 2014). In liberal institutional contexts with strong inequality gains since 1980 (mostly English-speaking), increasing inequality leads to increasing social welfare support, suggesting that public opinion reaches the limits of liberalization. In social, less liberalized societies (mostly European) increasing inequality leads to less support suggesting the limits of equality.

A Monumental War: Civil War Narratives Cast in Stone

Public memorials and monuments are visual representations of narratives that are important to a society. Their construction and utilization provide important indicators of the social groups that attain the power to control social discourse and the memorial environment. Monuments located in public space allegedly represent a consensus of collective commemoration. However, differing experiences and perspectives of social ruptures create conflicting narratives that may challenge the commemorative status quo.

The United States' Civil War memorials, ubiquitous in the American memorial landscape, are a focus of conflicting commemorative narratives. Those who support the continued presence of the statues in public space state that they honor Southern history and heritage; those demanding their removal claim that the monuments are racist symbols. This paper examines the role of race and class in the construction and placement of US Civil War Memorials, identifies those "invisible" in the Civil War memorial landscape, and discusses the implications of this ongoing "monumental war".

A Place Called Lockerbie

A Place Called Lockerbie

On December 21, 1988, Pan American Airways Flight 103 (PA103) left London's Heathrow airport on its regularly scheduled flight to New York's JFK airport, carrying 259 people and a suitcase that contained a radio cassette player filled with Semtex. The plane exploded as it approached its cruising altitude of 32,000 feet. The cockpit and front sections of the passenger cabin broke away from the rest of the plane and plummeted to the ground. The rest of the plane continued its forward trajectory for approximately eight miles, its passengers and their belongings raining upon the landscape below. The fuselage and wings landed on Lockerbie, a small, market village in southern Scotland. Eleven of Lockerbie's residents were killed as the flaming debris incinerated their homes. This paper examines the immediate and long-term effects of Lockerbie's individual and collective trauma, the emergence of disaster tourism, and the international political ramifications of the disaster.

Dimensions of Contention: Integrating Theoretical Perspectives on Power through Analysis of Contentious Political Network Field Dynamics

The present paper explains a table of nine ideal-typical theoretical dimensions of influence/power and applies it to the empirical analysis of a social field of dynamic contention. The table systematizes and categorizes in current theoretical terms the widely different types of influence/power relations discovered in an ethnographic study of an environmental protest movement in Japan. The substantive data in the present analysis come from that study. The contentious field consists of the interactions among movements, adversaries and other organizations pursuing the opposed political goals of building or canceling a polluting industrial plant. In this case, the interactions stretch over a 27 year period. The nine dimensions of influence/power nestle in a table described, on the vertical axis, by the degree of malleability (structure/one-way agency/two-way agency) and the horizontal, by the degree of tangibility (material/social/symbolic). Each of the nine cells represents a type of influence/power as it could manifest in the relationship between any two organizations at a point in time in the contentious (27 year long) field. Limited to just those dyads that have some effect upon the final political outcome, the coding of the ethnographic data produces 256 of such dyadic Key Influence Relationships. of the influence/power relationship between any two organizations in the field. Using techniques of network analysis, the findings show that the structural weights of the different dimensions of influence/power paper transform over time as the field process continues. The different types of actors, including the protest movements, also come and go. The transformation pattern offers strategic moments for the exercise of agency by movements and other actors that can affect long term outcomes. This approach, Integrative Structural Analysis (ISA), presents a new way to model the complex dynamics and statics of influence/power in the contentious political process from a multi-dimensional causal powers perspective.

Figurations of Power: Multiplex Political Network Fields in Japan, the US and Germany

The original "social question" of industrial society arose from strife between labor and capital, and how the state should respond. Concerning the governance and outcomes of labor politics (@1988), the USA, Germany and Japan had bent those tensions into very different institutional formations *contestedly* described as business-pluralist (USA), democratic corporatist (Germany) and state-centric (Japan). This paper advances beyond this institutional perspective. It examines the circulation of influence through political networks at the meso, inter-organizational level (about 120 organizations per case). This detailed analysis shows how the distribution of influence and sources of power overflow institutional descriptions and require new theoretical language. Borrowing from Elias and Bourdieu, the three cases can be seen as three distinct *figurations* each composed of interactions among four distinct network *fields*. Each network consists of a distinct medium of relationship: expected reciprocity, vital information, public political support and administrative work for others. Cross-case differences in figurations, fields and interactions indicate influence from surprising angles; for instance, a scatter-shot distribution of information in the US, a prominent reciprocity network in Japan centered on a single ministerial agency, and a breakdown of class divisions in Germany due to legalization of rights. The final section discusses the implications of these findings for the operation of the three cases as governance systems. It also speculates on the social origins of these differences. It concludes that they emerged through an historical process shaped not just by the clash of raw interests, the strictures of formal institutions or situational contingencies (such as the Occupations). Also, they emerged due to the effect of embedded relational schema and network patterns, validated by cultural identities, that shaped the parameters of struggle and the social control strategies of contending parties. The findings highlight the importance, in the investigation of macro-power, of including these latter socio-cultural factors.

Responses to FOOD Crises and Climate Crisis in Norwegian Agriculture. Regime Flexibility and Robustness

According to theory, a policy regime might risk to undergo changes when being hit by exogenous trigger-events. Regimes with a capacity to absorb external shocks are considered robust (Hasenclever et al. 2004), and will stay stable over time (Underdal 2004). In this paper, I study how the Norwegian agricultural policy regime responded to two global shocks – the 2008 food crisis and climate change – by combining a productivist turn with climate mitigation measures in

a new policy approach from 2009 onward. Unlike a traditional understanding of food production and GHG-emission reductions as conflicting goals, the new policy aimed at increasing food production while mitigating climate change at the same time, which is unique in a comparative perspective. This 'climate turn' in Norwegian agriculture was the result of a flexible regime being able to absorb two global shocks, securing its long-term stability through policy entrepreneurship.

Does Homeownership Facilitate the Social and Economic Integration of Immigrant Women? an Analysis of Time Use in the United States, 2003-2015

In the literature on immigrant settlement, scholars commonly refer to rates of homeownership when assessing differential levels of integration; it is often conceptualized as an *indicator* of integration. Yet, how attainment of homeownership shapes immigrant behaviour – its role as a *mechanism* of integration – remains largely unexamined. Using data from the American Time-Use Survey from 2003-2015, we assess how homeownership is related to changes in the time-use of immigrants across different domains of life. We hypothesize that homeownership will be associated with greater gender parity in immigrant time use in the labour market, the household, for recreation, and volunteering. Results indicate that while immigrant time-use tends to reflect more traditional gender norms when compared to non-immigrants, the move into homeownership appears to have a unique significance for immigrants, promoting a greater presence in the public sphere for immigrant women. Homeownership tends to decrease immigrant women's share of household labour compared to men, while having the opposite effect for non-immigrants. Moreover, while homeownership tends to decrease the time spent in the labour market for non-immigrant women, there is no such effect for immigrant women. In fact, female immigrant homeowners spend more time in the labour market on average than non-immigrant women. We conclude with a discussion calling for further study into the role homeownership has as a mechanism of integration for immigrants, and its role in shifting immigrant families away from the traditional breadwinner model and towards more dual-income earner households where women have a greater public presence.

Simmel's Influence on American Sociology Since 1975

With 2018 marking the centenary of Georg Simmel's death, we take the opportunity to reflect on the legacy of his work within American sociology. This is a project which began with the late Donald Levine, who in 1976 published a two-part article in the *American Journal of Sociology* tracing Simmel's influence in American sociology. Building on his work, we explore the continued influence of Simmel in the discipline since. We employ a citation network analysis of all the references to Simmel's work from 1975-2016 among the top sociological journals in America revealing the different clusters of his scholarly use. Our inquiry indicates that while Simmel continues to be an inspiring figure across many fields in the discipline, the content of his influence has fluctuated since Levine's publication. Most notably, Simmel's work has emerged as foundational for network analysis, while also finding renewed application among symbolic interactionists, and informing the 'cultural turn' within the discipline as well. The article traces these various appropriations of Simmel's ideas across different fields since 1975, and concludes with a general discussion on what his legacy has contributed – and continues to contribute – to the discipline overall.

Gender Differences in Career Success of Academics in an Automotive Group

Women are underrepresented and paid less in managerial positions. This is particularly true in Germany's key industry – the automotive industry. We test if unequal investments into human capital (e.g. STEM education) or gender discrimination explain the difference. To control for selection and endogeneity, we focus on career trajectories of over 2000 employees and cross-validate the findings with qualitative interviews. Our results reveal gender-specific differences in human capital. But in addition, women are also more exposed to discrimination than their male counterparts. Employees identify the organizational culture as a major reason why women lower their ambitions and why their chances to reach managerial positions dissolve after a few years. We conclude that companies need

to accept less standardized career trajectories to achieve diversity in leadership. This implies also a shift from a presence culture towards a performance culture.

BROCKMANN, HILKE* (*European University Institute*)

Happy Newcomers? Subjective Well-Being of First-Generation Immigrants in Germany.

First-generation immigrants in Germany are surprisingly satisfied with their life. We test to what extent selection, adaptation, or resilience explains their comparatively high level of subjective well-being (SWB) using Panel data from 1984-2014 and running simultaneous probit and growth curve models. The analysis explains competing mechanisms of subjective well-being and positive integration. We find mixed evidence for health selection: First-generation immigrants are younger but overall less healthy than Germans. Irrespective of selectivity, significant evidence supports purposive adaptation: First-generation immigrants maintain high levels of happiness by using the local German population as a benchmark only to evaluate their economic situation but not to evaluate their family life. Thus, there is economic but not socio-cultural adaptation. Finally, we find some evidence of higher social but not economic resilience among first-generation immigrants than among Germans.

Social Support and Cyberbullying: Implications for Bullying and Victimization

Cullen's (1994) social support theory posits that supportive environments can mitigate one's likelihood of engaging in crime or deviance. Contrasting with deficit-based criminological theories, social support theory therefore suggests that real or perceived supportive societies, communities, friendship networks, and families can create positive conditions that make crime or deviance less likely. Most tests of Cullen's hypothesis have been conducted at the micro level among samples of adolescents, and have found direct effects of social support on both minor and more serious forms of delinquency, aggression, and violence. Generally, however, scholars have not applied social support theory to deviance in cyberspace, including cyberbullying, which is an especially common form of adolescent deviance. Whereas some studies have examined the moderating effect of social support on the well-being of adolescent victims of cyberbullying, little research has considered social support as a factor that may prevent cyberbullying involvement in the first place. In particular, the relationship between peer and family social support and cyberbullying involvement is not well established. Thus, the present study draws upon survey data collected from a sample of middle and high school students to address two research questions: 1) What is the effect of family social support on cyberbullying perpetration and victimization? and 2) What is the effect of peer social support on cyberbullying perpetration and victimization?

Measuring Agricultural 'success': Datasets and the Enabling of Normative Food Politics and Unsustainable Footways

Measuring Agricultural 'Success': Datasets and the enabling of normative food politics and unsustainable foodways

The collection and analysis of large datasets for measuring farm-level systems is a key site for the co-production of environmental knowledge and food politics. Every John Deere tractor now passively collects data on a host of farm-level environmental variables (e.g. soil quality) and feeds these data into an aggregated dataset so big it is thought to produce an unmediated and objective account of nature. Rather than seeing these data as raw, I take a science studies view that such datasets are necessarily partial, selective, and embedded with value commitments. Advancing in the idiom of co-production, I draw on interviews with 20 North American designers of agricultural data collection, storage and analysis artifacts to reveal the enactment of productivist goals and risks (e.g. yield maximization) through technical design. Theory from sociology of standards and food studies is used to support the claim that agricultural big data and its infrastructures measure aspects of nature while at once they reproduce unsustainable foodways and intervene into contested food politics.

Supporting Australian Women's Working Lives Beyond 'Retirement'

The paper examines contextual factors that support a choice made by older Australian women to work on after formal retirement. It analyses the interactions

between public policies and working life arrangements that enable the boundaries of formal retirement to be traversed. Definitions of working past retirement are initially explored, and Australian empirical data on 'post-retirement' employment are presented. Research questions addressed in the paper focus on individual resources which assist in the promotion of career trajectories beyond formal retirement. The paper also addresses the question of whether and how national policies contribute to or contest cumulative inequalities created by working beyond retirement. At the micro-level, the paper explores how working lives and retirement interactions are negotiated within individual identities. Interlinked public policies, organisational and identity issues supporting 'post-retirement' work are examined. The methods employed in the paper interweave qualitative case study data based on 30 interviews with women engaged in 'post-retirement' work and Australian national quantitative data. Ultimately the paper draws inferences relating to inequalities in labour markets structuring women's earlier career trajectories which flow on into post retirement work. These conclusions further expose the reality of the Australian government's advocacy of extending working lives until 70 and beyond, founded in the individualisation of risk. Recommendations are centered on the necessity for multi-level resources which traverse the boundaries constraining the extension of Australian women's working lives beyond 'retirement'.

ZAJAK, SABRINA (*Ruhr-University Bochum*)

Leveraging Labor Institutions Abroad: Why Employers Sometimes Support Labor Activists in Host-Countries.

Why do unions and employers sometimes work together to support labor rights for workers outside the employer's home country? What causes multinational corporations to support host-country labor activists, even when doing so seems contrary to employers' economic interests? Neither IPE theories of global value chains, which emphasize MNCs' pursuit of low wages and labor control, nor CPE theories centered on national institutional frameworks, which tend to treat the international economic context as exogenous, can explain these transnational cross-class alliances. Combining insights from IPE and CPE with international relations theories of transnational activism, however, can explain this phenomenon. We test the hypothesis that an employer will ally with host-country labor activists if those activists can convince a union in the employer's home country of shared material interests and if that home union is embedded in national-level institutions that afford workers access to top management and direct input on corporate practices. Using original data we explore the dynamics of transnational cross-class alliances centered on four Western European corporations: Adidas, H&M, IKEA and Bosch. This paper speaks to ongoing debates across IPE, CPE, and IR about the transformation of employment relations institutions in global value chains, the enduring relevance of national institutions in the global economy, and new forms of international cooperation among non-state actors.

Decolonising and Re-Theorising the Meaning of Democracy: A South African Perspective

The post-2010 global protest wave has seen movements from diverse parts of the world challenge the failures of representative democracy. Both historically and today, movements have often been at the forefront of envisioning the content of democracy. 'Democracy' is, of course, a quintessentially contested concept and measures of democracy vary. In general, however, the theorisation of democracy is often drawn from the canon and experiences of the global North. Contributing to the growing decolonisation movement in the social sciences, this article seeks to unpack what democracy and, therefore, the crisis of democracy means in the South African context. The paper examines how ordinary people conceptualise democracy in 9 of the official languages of the country, excluding English and Afrikaans, as well as examining how democracy is practiced in both movement and community organisations. Through this, a grounded theorisation of democracy in the South African context emerges. It will be argued that the understanding of democracy is rooted both in a collective memory of pre-colonial history and the struggle against apartheid. Crucially, the paper will draw attention to the tensions between grassroots understandings and visions of democracy and that which has been articulated by the African National Congress (ANC) as both a liberation movement and governing party. By rooting the analysis of democracy within local histories, practices and contexts, the paper illuminates how movement and community activists articulate the current crisis of democracy and its possible alternative futures.

Powerpoint Presentation As Organizing Rite: A Durkheimian View on Materiality and Visuality in Embodied Practice

PowerPoint™ presentations are pervasive in contemporary organizations; yet despite popular criticism, theoretical explanations for the phenomenon remain weak. Most scholarship characterizes it simply as "ritual" (routine) behavior or rote-force cognition. This paper offers a fuller account, highlighting the role of material and visual elements in PowerPoint presentations.

Leveraging Durkheim's classic work on *rites* as strengthened with recent extensions of his theory, this paper builds on his definition of rites as "particular modes of action" oriented toward socially meaningful objects. Most importantly, the significance of a rite is in its *efficacy* for establishing certain mental dispositions, shaping participants' consequent behavior and interpretation processes.

As commonly enacted within organizations, PowerPoint presentations are *organizing rites* which afford this efficacy. The power of these organizing rites lies in their being a sociomaterial practice that assembles embodied participants into organizational units together with material artifacts bearing organizationally-relevant visual symbols. Enacting the practice generates collective sentiments which are superimposed onto psychological images of the projected visual symbols. PowerPoint presentations thus comprise a material framing practice through which participants collectively constitute an embodied frame which focuses their collectively organized attention on commonly-shared, organizationally-relevant visual symbols. Emergent outcomes include moral force of (collective) authority and ultimately, categories and concepts anchored in the visual symbols.

After each enactment of an organizing rite, "re-shaped" individuals return to their more isolated work environments, able to interpret and respond to emails in ways shaped by the organizational frame(s). Recurrent enactment of organizing rites supports organizational sensemaking and other more distributed forms of organizational work.

Each tenet of this argument is illustrated with ethnographic data from an engineering organization. Theoretical and methodological implications are discussed.

BROOKS, RACHEL* (*University of Surrey*)

Constructing and Contesting the 'European Student': Findings from a Six Nation Comparative Study

There are currently over 35 million students within Europe and yet, to date, we have no clear understanding of the extent to which understandings of 'the student' are shared. Thus, a central aim of this paper is to investigate how the contemporary higher education (HE) student is conceptualised and the extent to which this differs both within nation-states and across them. This is significant in terms of implicit (and sometimes explicit) assumptions that are made about common understandings of 'the student' across Europe – underpinning, for example, initiatives to increase cross-border educational mobility and the wider development of a European Higher Education Area. It is also significant in relation to exploring the extent to which understandings are shared within a single nation, between different groups of stakeholders.

The paper draws on an analysis of 16 'policy texts' from each of six European countries (England, Denmark, Germany, Ireland, Poland and Spain). In each nation, the sample comprised: four recent government policy reports (e.g. white papers and other key strategic documents); four government speeches (e.g. by senior politicians, which focus explicitly on HE students); four business/industry documents (which discuss the relationship between graduate employers and HE); and four union documents (e.g. from national students' unions and national employees' unions). The paper argues that significant differences in the dominant construction of students are evident between countries – particularly in relation to the positioning of students as, variously, consumers, political actors, mobile Europeans and 'emergent workers'. The paper also draws attention to important contestations *within* individual nations, by stakeholder group, emphasising both the 'messiness' of policymaking and the ways in which policies mutate as they migrate into new contexts and settings (Shore and Wright, 2011).

'Just the Two of Us': The Exclusion of Primary and Equal Caregiver Fathers from Parent Networks

This paper draws on interviews with 24 UK fathers who had assumed primary or equal responsibility for the care of their children (aged three or under) to explore their social interactions. We show how, in spite of usually feeling positive overall about their experiences, many of the men in the sample had relatively little contact with other parents during the time they were caring for their child/children alone. Although many explained their preference for spending time

alone with their child in terms of their own 'introverted' or 'unsociable' nature, we suggest such individualised narratives underplay the ways in which systemic barriers were constraining their interactions. We argue that such barriers include: the feminisation of many social spaces; a fear of being judged in relation to their gender; the close-knit nature of mothers' groups often established during maternity leave; and the difficulty of meeting other fathers with responsibility for day-to-day care. These, we contend, provide evidence that, even in cases where fathers take on care-giving roles that challenge traditional norms, substantial gender barriers continue to persist with respect to their integration within parenting communities and public space. As well as illustrating the enduring gender-segregation of men's and women's friendships in this sphere, we suggest that the relatively 'invisible' nature of the involved fathering we observed may render it less effective in contributing to the broader undoing of gender ideologies than if fathers were more often in public spaces and integrated into parenting networks. Moreover, the social isolation experienced by some fathers may represent a barrier to more fathers becoming involved in day-to-date care, and, in some cases, have negative implications for the well-being on those who do take on such roles.

Learning to Trust in a 'Paracetamolocracy': Studying the Taken-for-Granted Processes of Trusting in As These Become Exposed amid the Healthcare Experiences of Migrants

Trust theory has long noted the importance of systems and earlier work, especially that of Luhmann, sought to address the taken-for-granted role of systems by drawing on phenomenology. Yet Luhmann struggled to reconcile the lived experiences and understandings of individuals with an analysis of systems and ultimately the taken-for-granted features of trust were 'abandoned' in favour of a more risk-oriented analysis, as recent work by Frederiksen acknowledges. Trust theory has not progressed significantly in relation to systems and struggles to theorise trust amid multiple systems. Möllering, among others, has emphasised the missed potential of studying the taken-for-granted, with trust theory in this area suffering from a lack of empirical insights. Due to their very nature, these taken-for-granted roots of trust have remained overlooked in empirical studies – buried beneath the surface.

In this paper we draw on a pertinent case study to overcome this empirical-methodological problem. We analyse interview data with Italians who have recently migrated to the Netherlands and who have had a range of experiences with the Dutch healthcare system. Their implicit knowledge of Italian healthcare systems suddenly becomes explicit and illuminated when taken-for-granted assumptions no longer apply. Likewise, the unfamiliarity of the Dutch system(s) meant that system knowledge has had to be learned. By studying these participants' narratives regarding experiences over several years, we develop a range of insights into: the nature of taken-for-granted system assumptions; the processes of uncertainty and risk by which system assumptions develop over time; and the powerful ways in which (mis)trust works to reorient practices – gradually reshaping these 'Italians' into 'Dutch' patients. We draw on Habermasian conceptions of lifeworld in developing this theorisation and conclude by relating our contribution to broader theories of trust. We also consider the importance of the taken-for-granted for wider theories of risk and uncertainty.

Logics of Stop-and-Check: Exploring the Social Dynamics of Police Officers' Decision-Making amid Multiple Challenges to Their Authority

Profession(al)s' authority is often seen as declining and this can be connected to an array of interlinked social processes. While challenges to, and the erosion of, a monopoly of knowledge is one common line of inquiry, our case study of police officers draws the analytical focus more towards accountability. While professionals have always been accountable in some senses, their authority has often been depicted as centred on the professional in relation to a particular client. More recent work on authority, legitimacy and governance, such as that of Julia Black, has suggested a more polycentric set of power dynamics, however, by which authority and accountability flow in multiple directions.

This is the starting point of our analysis of ethnographic data collected within one police force in a larger Dutch city. The discretionary space afforded to police officers in order to 'stop and check' citizens has come under increasing scrutiny: from the public prosecution service who require a clear and legal/protocol-based logic for why a particular person was stopped; from the media who have recently been highly critical of practices of ethnic-profiling as a basis for stop and check; and by citizens themselves who are more likely to challenge police officers' authority and, in some cases, to video stop and check interactions.

We analyse the logics by which police officers negotiated this discretionary space amid polycentric lines of authority, emphasising these professionals' vulnerability amidst accountability as much as their power. Gut feelings, as a common decision-bases, had to be rationalised in line with various organisational protocols and norms. In analysing these decision-making logics we draw on Mary Douglas's work on 'thought styles', particularly the ritual mechanisms and institutional ordering which underpin these. This analytical framework helps us understand the enduring presence of ethnicity-oriented logics within decision-making, despite accountability pressures against these.

"It's Not What They Actually Do to You but the Shame You Would Feel By Going." Young Men's Reflections on Shame and Stigma Around Sexual Health Services.

Rates of sexually transmitted infections (STIs) continue to rise in Scotland, and are particularly common amongst younger age groups (16-24 years old). In a majority of cases, individuals infected with STIs do not exhibit symptoms, therefore active screening, particularly for *Chlamydia* (which is the most prevalent STI in Scotland), is an important part of preventive health care services. Men are less likely than women to attend sexual health services for screening tests, a common assumption being that this is because sexual health services are perceived by many men to be aimed at women. Drawing on a qualitative study with young men aged between 18 and 26 years old in Scotland, this paper discusses how stigma and shame influence attitudes towards accessing sexual health services. Participants expressed views about their general health that reflected hegemonic masculinity in terms of self-reliance, physical fitness, and being unwilling to seek help. This was reinforced for sexual health matters by narratives about guilt and shame that compounded the desire to resolve health matters as far as possible by themselves, without accessing formal health care, and while maintaining confidentiality about their sexual health. Young men are unlikely to be proactive in seeking out health information, particularly when they are asymptomatic and therefore see no reason to seek advice or help; because they fear being seen in a stigmatising and shameful place (the clinic), they are unlikely to access sexual health screening as a routine part of their health care. We discuss the implications of these findings for policies aiming to reduce STI rates amongst young people.

BROWNE, CRAIG* (University of Sydney)

Critiques of Identity and the Permutations of the Capitalist Imaginary

In their respective elucidations of the capitalist imaginary, Cornelius Castoriadis and Theodor Adorno emphasize the significance of identity thinking to this social-historical constellation. Adorno contends that the principle of identity constitutes the nucleus of the capitalist imaginary, because it underpins commodity exchange and the formal rationality of bureaucratic administration. Castoriadis associates the logic of identity with the same tendencies, but accentuates the horizon of meaning that animates the deployment of this logic. However, Castoriadis and Adorno recognise that the critique of identity thinking confronts a genuine antinomy. Although it is integral to the capitalist imaginary, the logic of identity is present in every institution of society, and hence critique is itself reliant, to varying degrees, upon it. I argue that Adorno and Castoriadis' appreciation of this complex entanglement significantly shapes their different theoretical orientations and perspectives on transforming social domination and heteronomy. In particular, I show how the critique of identity poses questions about the ontological underpinnings of the value system of capitalist institutions. It likewise leads, I claim, in the case of Castoriadis and Adorno to the positing of distinctive and original conceptions of justice and autonomy. After comparing these profound critiques of identity, my analysis considers two of the reasons why their contemporary salience may be open to dispute. First, it is possible to argue that neither Adorno nor Castoriadis resolved the tension between the methodological format of the critique of identity and the sense of indeterminacy that they each attribute to the imaginary and expressions of social creativity. Second, it might be claimed that the more recent significations of contemporary capitalism as 'flexible', 'networked', 'projective' and 'global' demonstrate the extent to which these two critique of identity were heavily conditioned by models of bureaucratically organised capitalism and that this fixation limits their application.

BROWNE, CRAIG* (University of Sydney)

Sketch for a Social Theory of the Dialectic of Control

My paper explores how the notion of the dialectic of control enables a number of substantial innovations in social theory and addresses some of the

major deficiencies in current sociology. I argue that the notion of the dialectic of control has been present in sociological discussions for several decades without its implications having been systematically developed. Indeed, partly owing to its theoretical genealogy, the notion of the dialectic of control contains the possibility of a synthesis of insights drawn from a number of major theoretical traditions, including critical social theory, structuration theory, classical and contemporary pragmatism, post-structuralism and psychoanalysis. In part, the perspective of the dialectic of control explicates the dynamics of different spheres of social interaction and it will be shown to enable an innovative conception of the constitution and transformation of institutions. By focussing on the nexus between autonomy and dependency, the dialectic of control illuminates modes of resistance to domination and the reconfigurations of social relations, including alterations resulting from reactionary mobilisations in opposition to progressive change. In this way, the perspective of the dialectic of control overcomes the division in social theory between approaches oriented to power and those concerned with the normative content of social integration. Similarly, the dialectic of control can only be properly understood in terms of its practical instantiation and it will be argued that this requirement enhances the reflexivity of social theory. Finally, the social theory innovations deriving from the concept of the dialectic of control clarify important aspects of contemporary social conflicts and their consequences. This is significant because the failure to appreciate the modifications in dialectics of control has sometimes led influential interpretations of the current phase of modernity to overlook and veil the strains and tensions that are shaping institutions.

Construction of New Domains of Knowledge By Southern-Tier Intellectual Workers

The postcolonial critique of Northern hegemony in social science is now well established at a conceptual level. There remains, however, a great need to explore empirically how the global economy of knowledge works, and how relations of centrality and marginality are negotiated. This paper reports from a collaborative study of intellectual workers in Brasil, South Africa and Australia, in three historically recent domains of knowledge – HIV/AIDS, climate change, and gender studies. New domains of research do not in themselves challenge global inequalities of recognition or resources, which easily reproduce Northern hegemony. But they also open spaces for contestation, create counter-dependencies, and generate alternative commitments. These appear in the valorization of local knowledges, in two-track publication strategies, and in the creation of local work forces and institutions with their own concerns and priorities. Multi-centred knowledge production becomes a historical possibility.

BRUIN, MARILYN* (University of Minnesota - Housing Studies)

Planning and Promoting Opportunities for Lifelong Communities

One hundred and forty-five baby boomers completed on-line surveys. Ninety-four percent were homeowners, 65% were married, 18% had a child in the home, and 22% lived alone; median time the neighborhood was 22 years. Fifty-four percent had household incomes over \$90,000 and 32% over \$120,000. Seventy-two percent worked. Among those working, 68% expected to retire by age 68. Sixty-three percent had a pension or retirement account, 62% IRAs, 47% real estate investments, and 54% other retirement savings. A large majority (92%) were satisfied with their housing. Eighty-eight percent wanted to remain in their neighborhood. Concerns about aging-in-place included accessibility and maintenance. Thirteen percent reported chronic conditions that might affect housing; 55% said their current home needed modification to facilitate aging-in-place. Mentioned modifications included ramps, grab bars, and main floor bedroom, bath, and laundry. Sixty-five percent 65% mention another reason to move - less maintenance. Suitable future senior housing options varied between condominiums (25%), single-family houses (24%), townhouses (20%), independent senior community (16%), affordable apartments (4%), a duplex or four-plex (4%), luxury rental (3%), and assisted living (1%). No one said nursing home. This group of urban baby boomers with financial resources and access to housing options realized they might need to make changes to their current housing or move as they aged. They did not think beyond common home modifications; perhaps they were unfamiliar with the wealth of technological options available to facilitate independence and safety. The diversity in their expectations for future senior housing options was amazing. The findings suggested the need for more educational outreach on home modification and a need to develop condominiums, townhouses, and rental units as well as independent and assisted living communities.

Using Institutional Ethnography As a Method of Inquiry for Indigenous Research

In May of 2015, the Truth and Reconciliation Commission of Canada's released its report calling upon post-secondary institutions to play a major role in redressing the educational needs of Indigenous peoples. Emphasizing the need for Indigenous autonomy, self-determination, and community participation in all curriculum and program developments, the report urges "post-secondary institutions to educate teachers on how to integrate indigenous knowledge and teaching methods into the classroom" (7). Since this time, universities across Canada have responded, instituting culturally appropriate policy initiatives including mandatory courses for all students, language classes, and Indigenous strategic plans. While many of these initiatives are exemplary, involving the extensive participation of Indigenous communities, there is no consensus as to what indigenization means or how it is to be achieved. In 2017/18, I carried out research to examine the challenges and successes that Indigenous faculty, students and staff have encountered in their attempts to indigenize the curriculum. An essential principle of Indigenous ways of knowing is to ensure that any academic research undertaken represents and serves Indigenous peoples. As such, my research began with Indigenous communities that are involved in implementing various initiatives to indigenize the curriculum. A research method that is in line with Indigenous methodologies is Institutional Ethnography. Developed by feminist sociologist, Dorothy E. Smith, IE is both a theory and a method that allows us to examine how large scale institutional practices and processes come to shape and organize the work activities of people's everyday lives. This presentation will discuss my use of institutional ethnography in examining the ways in which post-secondary institutional efforts to indigenize the curriculum have influenced the social organization of Indigenous philosophical educational practices and knowledges. I will also discuss how IE provides a means to work with Indigenous communities in identifying how institutional practices are being taken-up and instituted.

Gendered Work-Family Conflict: Long-Distance, Commuter, and Proximal Partnerships

Workplaces have downsized, restructured, and expanded globally. Employees are expected to work longer hours, have multiple skills, be flexible and visible, and are tethered by technology. They are increasingly required to travel, or take short or even long-term assignments taking them away from their families on a weekly or monthly basis. These higher demands at work can lead to employee burnout, turnover, less job satisfaction, and greater job-related stress, impacting work-family conflict (Brumley 2014; Montazer & Young 2016). One situation that may intensify work-family conflict is the "long-distance" experience. Partnerships with children are particularly susceptible. Using a mixed methods approach (i.e., online survey, interviews), we examine the effects of long distance and commuter partnerships as compared to proximal partnerships on work-family conflict in the U.S. In this paper, we present a gendered analysis of sources of workplace stress that may differently impact the effect of each of these commuting types on men and women's experiences of work-family conflict. Although there is a robust body of research on work-family conflict, only a handful of studies have examined it in the context of long distance relationships. By examining partners in long distance, commuter, and proximal relationships, this project extends our theorizing on how work and family demands shape women's and men's experiences, within an environment of intensifying work demands and increasing mobility of individuals in the U.S.

Nuevas Formas De Representación Sindical En España. El Reflejo Del Modelo Asiático-Oriental.

La aparición de nuevas formas de organizaciones salariales alejadas de los sindicatos mayoritarios, denominados de clase, en España es una realidad tangible y evidente en sectores mayoritariamente de servicios, como la telefonía, los transportistas o la hostelería. Todos ellos manifiestan su agrupación como una fórmula de reivindicación alternativa a la propuesta por las centrales sindicales oficiales, al entender que no representan bien sus derechos. Ello se

pudo comprobar en la negociación del convenio colectivo del sector hostelero, en la que el colectivo de camareras de pisos no respaldaba su firma, tal y como si lo hicieron las centrales sindicales mayoritarias.

Situación relativamente similar a la que hemos podido conocer en dos países, como son China y la India, que conforman el denominado Modelo Asiático-Oriental (MAO), si bien sus respectivas situaciones son atribuibles a diferentes causas. En el primero de ellos, varios trabajadores, mayoritariamente del sector industrial, se han revelado contra el sindicato oficial, configurándose en organizaciones autónomas de cara a negociar sus condiciones de trabajo. En la India, por su parte, la realidad de una enorme tasa de la población refugiada en el denominado sector informal (industrial y de servicios), ha puesto en marcha diferentes organizaciones bajo las que representarse colectivamente.

Este trabajo trata de establecer cierta comparación entre estas tres situaciones, al objeto de señalar similitudes y diferencias en cuanto a las actuaciones adoptadas y previstas. Para ello, en el caso español, nos basamos en un análisis cualitativo a través de la realización de una serie de entrevistas semiestructuradas a agentes sociales y académicos radicados en Barcelona, que reflexionan sobre la situación del sindicalismo estatal. Además, para todos los casos realizamos una lectura crítica de la numerosa literatura existente al respecto.

BRUNI, LORENZO* (*Università di Perugia*)

Shame As a Form of Alienation. a Critical Socio-Theoretical Approach

The aim of this paper is to draw a conceptual bridge between shame and alienation. These two phenomena could be associated referring to a common twofold root: they are, at the same time, social events, objectified and exteriorized, and individual events, linked to subjective experience. Both show then further ambivalences: they are necessary to create social bond stabilization, but at the same time they could point out the emergence of social pathologies; they are similar not only in their intersubjective genesis, but also in the social outcome. They could be overcome socially, passing through a reconfiguration of social relations, and not only by an individual determination of will.

To discuss about this similarity, the author focuses first on an original hypothesis about the distinction between two forms of shame. Referring to George Herbert Mead distinction between two components of the Self, the first is called "Vergogna del me" ("Me shame"), the latter "Vergogna dell'io" ("I shame"). In particular, "I shame" will be defined as a social compression of intersubjective recognitive sources of resubjectification.

If this kind of theoretical distinction is valid, next argumentative step will be about discussing how "I shame" hypothesis could be also interpreted as alienation. This interpretation will be developed mainly referring to Rahel Jaeggi's theory of alienation. Jaeggi defines alienation as a sort of disturbance in individual reappropriation of sociality. "I shame" hypothesis and the Jaeggi's definition of alienation seems to share a theoretical similarity. The conceptual bridge between shame and alienation sketched out through hypothesis about "I shame" could contribute to balance Jaeggi's deficit in discussing social aspects of alienation and, at the same time, could help emphasizing the alienation side of shame.

TG08-1013.7

BRUNI, LORENZO* (*Univesità di Perugia*)

Social Reproduction and Critical Subjectification Processes. the Two Faces of Shame

The aim of this paper is twofold: - to mark an original sociological way of access to the study of shame; - to show in which way shame could be related to an ambivalent social outcome, a conservative one, legitimising dominant relations and values, and an amancipative one, leading to a successful resubjectification process.

The main theoretical hypothesis of this work is about the distinction between two forms of shame: "vergogna del me" ("Me shame") and "vergogna dell'io" ("I shame"). The hypothesis will be developed around the idea that shame is bounded to a double kind of significativity: objective and subjective. Referring to Mead's social theory's distinction between two components of the Self, the author will argue that "vergogna del me" ("Me shame") points out a form of shame sociologically relevant, objectivated and socialized, that concern the stabilization of a given core of social significativity. "Me shame" is a sort of shame which is somehow necessary to guarantee social bond length; on the other hand, it could also define an oppressive crystallization of values and meanings. "Vergogna dell'io" ("I shame") points out the subjective dimension of shame. This second form of shame can be shortly defined such as a social compression of intersubjective sources of resubjectification. The author will then focus on a form of "vergogna dell'io" ("I shame") called "vergogna dell'io critica" ("critical I Shame"). Discussing a case study the author will try to emphasize the normative and emancipative role of shame along with the social introduction of this kind of emotion inside the participation to urban social movements in an eviction experience. The aim of the case study is not to offer a strictly empirical check, but to help showing how shame can be a sort of motive in questioning and criticizing typical neoliberal objectification and reification forms.

BRUNO, FERNANDA* (*Federal University of Rio de Janeiro*)

A Brief History of the Electronic Eye: Automation of Perception and Pattern Recognition

In "The Electronic Eye", David Lyon identifies one of the main axes of our surveillance societies: "precise details of our personal lives are collected, stored, retrieved and processed every day within huge computer databases belonging to big corporations and government departments". If these processes were barely noticeable in 1994, when this seminal book was published, today they are patently present in the most different domains and experiences of our daily lives, as well as in the political and economic structure of contemporary societies. Although extremely attentive to the current processes of surveillance culture, Lyon's work has always sought the historical matrices of surveillance, especially those linked to modernity. In line with this historical perspective, in this paper I propose to present a modest and specific history of the electronic eye. This history is motivated by the increasing presence of algorithmic processes for detecting or extracting patterns in several spheres of life: communication, consumption, transportation and urban displacement, health, leisure, education, credit, war, security etc. How are machines trained to recognize patterns in life? What are the goals at stake? According to which aesthetic and epistemological principles? Which elements are privileged in the algorithmic detection of patterns? What kind of images result from this process? To answer these questions we will see how the automated perception of patterns has been legitimized as a model of rationality in the scientific field as well as in the marketing and military fields. Our brief history is composed of three moments which corresponds to three distinct forms of pattern recognition: the illustration of the scientific atlases of the eighteenth century; the composite portraits of Francis Galton in the nineteenth century; and the current pattern of life recognition algorithms used by military agencies.

How Collective Is Collective Efficacy? the Importance of Consensus in Judgments about Community Cohesion

Existing studies have generally measured collective efficacy by combining survey respondent ratings of the local area into an overall summary for each neighborhood, resulting in a substantive focus on variation in its average between neighborhoods. In this paper, we focus on the *variability* in consensus of collective efficacy judgments. To account for differential consensus amongst residents, we use a mixed-effects location scale model, with variability in the consensus of judgments treated as an additional neighborhood-level random effect. Our results confirm that neighborhoods differ, not just in their overall levels of collective efficacy, but also in the extent to which residents agree with one another in their assessments. In accord with findings for US cities, our results show consensus in collective efficacy assessments is affected by the ethnic composition of neighborhoods in London. Additionally, we show that heterogeneity in collective efficacy assessments is consequential, with higher levels of criminal victimization, worry about crime, and risk avoidance behavior in areas where collective efficacy consensus is low.

Human Rights, Technology, and Disabilities: The Right to Benefit from Scientific Progress

Sociologists have raised questions about international doctrines surrounding human rights. One social group that experiences disadvantages when it comes to their human rights, particularly economic and social rights, is individuals who have disabilities. Two critical factors impact this social group: 1) continued medicalization of a condition that is largely socially constructed, and 2) reliance on a neoliberal health care system for realization of health and social needs. This study examines the rights to technology and specialized services that people with disabilities possess within the context of the International Covenant on Economic Social and Cultural Rights (ICESCR). Specifically, article 15 of the covenant identifies the right to enjoy the benefits of scientific progress and its applications.

People with disabilities have significant limitations that can be alleviated with technology and specialized services, greatly expanding a world with persistent environmental and social barriers. Unfortunately, technology can be expensive and is often financially inaccessible to these individuals. Further, many technologies with proven benefits never become universally available because they are not commercially sustainable within the market-based health care system in the United States. Invoking concepts surrounding human rights may facilitate actualiza-

tion of the economic and social rights of people with disabilities. Do people with disabilities have the right to expensive technology that improves integration and participation in society? What are the responsibilities of scientists who innovate, health-care providers who advocate, and health-care policy makers and third-party payers to facilitate technology access? Are private actors and institutions crucial to ensuring the rights to technology of people with disabilities? Using a scenario of neurotechnology access within a challenging technology transfer environment, we explore whether people with disabilities possess rights to life-enhancing technologies, the extent of those rights, as well as the contextual factors that shape the salience of these rights.

Considering Measurement Equivalence in the Assessment of Quality of Life in Immigrants and the Autochthonous Population

Introduction: Health-related quality of life (HRQOL) is an important outcome in health research and a frequently studied social indicator. The SF-36 inventory is one of the most often used instruments for assessing this construct. When HRQOL dimensions are compared between immigrants and non-immigrants, often composite scores are used, calculated as the sum of the underlying item responses. This, however, neglects that groups may differ in their item responses despite having the same position on the latent dimension these items are supposed to measure. This study examines this differential item functioning (DIF) for two frequently used subscales—vitality (VT) and mental health (MH)—of the SF-36 in immigrants and non-immigrants in Germany.

Methods: Data from a representative population-based survey (n=22,050) is used. The measurement baseline model tested by means of confirmatory factor analysis comprised the VT and the MH SF-36 factor. DIF related to immigrant background was analyzed by means of multiple indicators multiple causes models. Additionally, it was examined whether DIF related to immigrant background is moderated by sex, age and socioeconomic status (SES).

Results: 11.5% of the respondents were immigrants. DIF related to immigrant background was observed in 6 out of 9 items. It was both confounded and moderated by sex, age and SES in 4 items. Effect sizes were moderate in size. A comparison of composite scores and latent means revealed significant differences.

Discussion: The comparison of item composite scores between groups may be biased as a result of DIF, leading to under- or overestimation of true group differences as well as of the role of relevant determinants. To obtain valid estimates, appropriate approaches such as latent variable modeling need to be applied. A mixed-method approach can help to identify causes of DIF and can guide appropriate measures aiming to address non-invariance in different phases of the research process.

Capricious Governance: Prisons, Security, and the Fluidity of Rules

In the minds of outsiders, prisons vacillate between visions of regimented order and anarchic disorder. The place of rules in prison sits at the fulcrum between these two visions of regulation. This paper draws from preliminary findings of the 'Alberta Prison Project' - a large qualitative study of 4 provincial prisons in Canada which to date has interviewed approximately 500 inmates and 100 correctional officers about prison life. In this presentation, we detail the variability in how the abundant rules in prison are often enforced (or not), something that results in a regime of what we refer to as 'capricious governance.' In particular, we draw upon our interview and observational data to detail what this looks like in practice, focusing on inmate perceptions, how inmates manage this ambiguity, and also detail some of the reason for this situation as understood by correctional officers.

"When They Start the Smart Factory, We Don't Notice That Here in Production" - the Dispositif of "Industrie 4.0" and the Staging of Digitalisation

"Industrie 4.0" is a label coined by the German government and private sector actors organized in the "Plattform Industrie 4.0". It promotes the introduction of digital technology into industrial production and thereby proclaiming a fourth industrial revolution. A few years after the invention, a massive hype developed around the label in Germany. Additionally, the discussion of the label in international contexts underlines its relevance as a current research area. We researched empirically, how this hype is "performed" in actual industrial production. Therefore we conducted a series of semi-structured interviews with managers and engineers of companies that consider themselves as part

of "Industrie 4.0". Ethnographic fieldwork at a medium-sized company which is proclaimed a "Industrie 4.0" model company allowed additional insights. Based on this material, we argue that, rather than describing a pre-existing technological development, the label "Industrie 4.0", explicitly tries to create the reality it describes as a political program. As the "Plattform Industrie 4.0" is successful in creating a discursive trend, it is establishing a *dispositif*, which forces organisations in the field to position themselves toward it in rejecting or performing its postulates. In our case study, the demands of the *dispositif* were met by *staging* digitalisation: A highly advanced "smart factory" was implemented, which was, however, at one point in time completely detached from production and only used for visitors. Thereby, a process of coupling and decoupling can be observed between the rhetorical promotion and expectation of digitalisation on the one hand and the organisational practices of digitalisation on the other hand. Within this paper, we aim to develop a theoretical framework to analyse the relationship between the discursive and the material elements of the *dispositif* "Industrie 4.0".

BUCHINGER, EVA* (*Austrian Institute of Technology AIT*)

Digitalization and Societal Innovation in a Systems Perspective

Some aspects of digitalization seem at first resemble those of industrialization. For both it is true that technological advancement is linked with deep societal transformation contributing to well-being as well as to class divide. In the case of digitalization the class divide is digital divide, i.e. those who are digitally included and those who are digitally excluded. But a closer look reveals also a big difference in the processes of industrialization and digitalization. Whereas the process of industrialization was mainly shaped by entrepreneurs as producers, the process of digitalization seems to be shaped by a phenomenon called 'prosumer'. Both processes consist of an interplay between producers and consumers but in the latter the consumers are not only users of goods and services provided by the industry but contribute actively. Societal innovation is therefore not mainly reactive as it was in the course of the industrial revolution when the workforce had to be protected by labour legislation, but proactive because millions and even billions of users worldwide produce content (or data-traces for the production of content). In social systems theory terminology the locus of societal innovation is shifting from function systems (economy, science, politics, law etc.) to personal systems respectively digitally connected networks of personal systems. Coming back to the notion of digital divide this means that those who are digitally connected are actively taking part in present societal innovation as 'technobohemians' whereas those who are digitally disconnected are either excluded or only passively involved as 'net slaves' or 'cybertariats', the digital version of former proletariats (Gill). Beyond that, a third locus of societal innovation may emerge via artificial intelligence and autonomous technical systems such as robots and thus create a further form of digital divide. The text will especially discuss the different loci of societal innovation in the digital era.

BUCHOLC, MARTA* (*WFiS University of Warsaw*)

Schengen and the Rosary: Postcolonial Syndrome and Polish National Habitus

In September 1917, a few Catholic NGO-s based in Poland supported by the Polish Episcopate have announced a plan to organize a chain of rosary prayer on Polish borders. Along all the borderlines over a million people divided into 3.5 thousand prayer units were to gather under guidance of thousands of priests. The action, scheduled for October 7, 2017, was to renew the national consciousness, strengthen the faith and reinforce the sense of commitment to national history. I take a brief analysis of this case as a starting point for my discussion of Polish national habitus in Eliasian terms. The need to recreate national borders (to all practical purposes mostly abolished by Schengen Treaty) symbolically and by a Catholic prayer is an evidence of a strong sense of threat. This sense of threat has been a foundation of Polish national habitus as a result of domestic and international developments taking place since the second half of 18th century at the latest and contributed to the emergence and consolidation of what I call "postcolonial syndrome". Those who would be praying for the imminent threat to Poland to be reversed by defending its borders with their rosaries are proponents of a variant of national identity which has become dominant in public discourse and in state practice after the elections of 2015. This group identity is based on twofold sense of danger: external and internal. I will map these dangers as components of a single syndrome, made possible by Poland's preserving a unique and undeniably national experience of both a colonizer and the colonized in its cultural memory.

RC45-760.4BÜDGEN ESCARIO, CHRISTIAN* (*University of Barcelona*)*The Consequences of the Social Contract in Income Inequality: A Comparison Study of Germany and Brazil*

Recently, causes and consequences of inequality have become more relevant than ever. Income inequality rates have steadily been increasing for the past three decades (Milanovic, 2011), however, it was not until the year 2008, the moment that global financial crisis has shown the perverse consequences of these two-speed societies, when most influential institutions have put inequality at the centre of a global debate. On 17th January 2014, inequality has reached the first position as a most likely global risk ranked by the World Economic Forum (2014) for the second year in a row.

The main aim of this study is no other than shining more light and clarifying the role of social contract in inequality rates. This is undertaken through two paradigmatic examples, namely Germany and Brazil whose evolution on income inequality is dramatically different.

If the social contract affects income inequality of individuals and citizens who participate in the social contract, its citizens in a democratic country may possibly have certain margin to affect this income inequality. In other words, Brazilians and Germans are affected by the income inequality of their respective country, however, they have the power to change it. Hence, this logic result is remarkably interesting due to its link with politics. It is paradigmatic how every country acts politically different regarding inequality rates; while in one country with low rates of inequality politicians can be punished, in another one with substantially higher rates of inequality these politicians can be approved by its citizens.

In conclusion, two different models of social contract are being contrasted by this thesis. While social security has been more important for Germany in order to improve inequality levels from the unification process, social expenditure has been more important in Brazil to tackle the systemic and dramatically high levels of income inequality.

RC02-53.16BUDGEON, SHELLEY* (*University of Birmingham*)*The Resonance of Feminism and the Gendered Relations of Austerity*

Gender equality 'is increasingly framed as central to the realization of both modernization and economic efficiency and its achievement presented as a key to good governance. Both rights-based and utility-based arguments have converged to place equality high on the agenda of liberal states and organizations' (Squires (2007:1). The socio-economic conditions forged in the aftermath of the global financial crisis of 2008 provide an important context for assessing the status of gender equality and the practice of oppositional feminist politics in the UK. The wider context for this research is a postfeminist regime in which gender issues can be granted legitimacy on the condition that radical variants of feminism are dismissed as out of touch with contemporary gender relations. The legitimacy granted to equality suggests feminism has been successfully institutionalised, however, many scholars assert mainstreaming has inadvertently facilitated the legitimization of an accommodating, 'moderate' feminism more amenable to maintaining, rather than challenging, neoliberal norms. This paper applies principles of Cultural Political Economy in an analysis of mainstream newspaper representations of austerity during the time of the coalition government (2010-15) during which austerity policy was inaugurated thus threatening the institutionalisation of gender equality. The findings show that a sustained critique of austerity as a threat to gender equality resonated throughout the coalition parliament due to the consistency of moderate feminism with the norms of late capitalism. Insights into the effects on social reproduction of the gender regime within which the financial crisis occurred in the UK are discussed. It is concluded that in view of the complexity associated with a postfeminist gender order what is now required is the development of a feminist analytics in times of inclusion.

RC06-134.2BUDGINAITĖ, IRMA* (*Vilnius University*)JUOZELIUNIENE, IRENA (*Vilnius University*)MARTINKENE, GINTE (*Vilnius University*)*Bridging Goffman's Ideas with 'Family Display' in Analysing Stigmatization of Transnational Mothering*

This paper aims to examine how migration induced changes in mothering become transformed into troubles by bringing stigmatizing portrayals of transnational mothering in mass media and official documents. Basing on the analysis of the selected articles on transnational families published between 2004 and 2014 in national press and internet media portals in Lithuania along with interviews with transnational mothers conducted between 2004-2014, we raise questions, how changes in mothering due to migration come to be constructed as troubles and how it is experienced by mothers who emigrate to work abroad while

their children remain living in the country of origin. The authors bridge Erving Goffman's ideas with the current frame of family display suggested by Janet Finch to extend the understanding about the ways mothers practice motherhood across borders and how the scripts of 'good mothering' displays are transformed through multi-local interactions. The analysis of portraying of transnational mothers in mass media demonstrates how mothering across borders is stigmatized. The cases discussed by the authors show the ways transnational mothers reported that they performed specific mothering practices and claimed that these practices should be acknowledged. The analysis of newly emerging transnational practices gives empirical evidence to the assumption that transnational mothers not simply 'follow' scripts but also shift them and create new stories of mothering.

TG04-977.6BUDZYTE, AGNE* (*Kaunas University of Technology*)*The Risk Perception of Energy Technologies: Perspective of Environmental Challenges*

The growing world economy requires new sources of energy, which ensure stable production of various amenities and facilities. But the perception of risks which comes from such extraction of energy is not fully evaluated. In the case of nuclear energy, the main axis of topic is based on the idea that it is the cheapest source of electricity, compared to renewable energy sources. On the other hand, the disposal of nuclear waste is hard to manage and is way more expensive than disposing of renewable energy waste. Similar issues could be found talking about other sources of energy i.e. oil, coal, gas etc. those resources could be produced to regular consumption, or recycled and used multiple times. Either way these resources create issues like tons of domestic and industrial waste as well as leaves a massive carbon footprint. Environmental impact caused by emission to air, land or sea, also tons of nuclear waste create serious hazards to the entire globe's population. The need of resources combines multidimensional economic, social and political challenges. The demand creates tension between countries, organizations and individuals. Energy export would be a solution for individuals and organizations, but in a government standpoint, that could lead to the dependency of external sources. The investment into local energy sectors creates increased environmental risks in regions and increases tension between countries especially when nuclear power plants are constructed beside the country's borders. It is necessary to discuss the perception of risk among energy sectors in the perspective of environmental challenges. The challenge is to define how do individuals, organizations and governments perceive these risks. Where the uncertainty comes from, and what is the prospect of such perception. What different approaches and various partnerships between countries would lead to improved energy technologies.

RC35-643.2BUENO, ARTHUR* (*Universität Erfurt*)*Capital, Desire, and Neurasthenia*

This paper reflects on the affective implications of capitalist forms of life by exploring the affinities between Karl Marx's *Capital* and Georg Simmel's writings on money and modern culture. Such an endeavor rests on the assumption that, as stated by a contemporary reviewer of *The Philosophy of Money*, many of Simmel's arguments "read like a translation of Marx's economic discussions into the language of psychology." In line with this, I suggest that Simmel's phenomenologically precise description of modern forms of life can be interpreted as a consistent analysis of the affective implications of commodity fetishism. More precisely, this paper develops the idea that money – in particular when it attains the form of capital – is an embodiment of pure, self-referential desire. Contrary to what is often stated regarding the first chapters of *The Philosophy of Money*, this does not mean that Simmel's account relies on a merely subjective theory of value, as in orthodox economics. Rather, such a conception of money and capital as pure desire can only be based on a value theory that is at once pre-subjective, subjective, intersubjective and objective. In the context of this systematic reconstruction, some of the most defining features of affective experience in modernity come to appear as expressions of what Simmel, following the psychology of his time, called neurasthenia, i.e. a continuous oscillation between feelings of hyperesthesia and anesthesia.

RC35-635.4BUENO, ARTHUR* (*Universität Erfurt*)*Reification and the Contradictions of Capital's Life-Process*

The changing relations between critical theory and political economy are made visible in the historical fate of the concept of reification. While Lukács' 1923 essay articulated insights from German sociology with Marx's critique of political economy, this connection has been de-emphasized over time and especially in recent approaches within critical theory. On the other hand, current attempts to make Marx's political economy relevant for the analysis of capitalism's crises have largely moved away from the critique of reification. Against this background, the paper proposes a re-actualization of this concept by addressing two major critiques that were raised against *History and Class Consciousness*. The first

holds that Lukács presents a totalising account of modern capitalist society that would fail to adequately consider the latter's differentiation into a variety of institutionalised domains. Exploring the tensions between the 'pervasiveness-thesis' and the 'differentiation-thesis' in Lukács' essay, I argue that the critique of capitalism as a differentiated social order is fully compatible with the diagnosis of a wide-ranging, though incomplete, extension of the commodity-form beyond the economic sphere. According to a second reproach often raised against *History and Class Consciousness*, the critique of reification would rely on an essentialist conception of authentic life. A close examination of the notions of 'essence' and 'life' deployed in the book demonstrates, however, that this is not the case. The joint consideration of these issues makes room for a concept of reification which is able to grasp the contradictions of capitalist society in their multiple institutional dimensions while drawing its critical potential not from a-historical conceptions of human essence and life, but from these internal contradictions themselves.

Sacred Distinctions: Legal Ontologies of Religion in the Sikh Diaspora of British Columbia

Over the last thirty years, courts across British Columbia, the western most province in Canada, have rendered more than 70 judgments in cases related to the disputed political leadership of local Sikh Gurdwaras. Although the disputes are connected to ongoing disagreements between putatively 'moderate' and 'traditional' Sikh groups, the legal issues addressed in these cases concern the proper administration of religious organizations that have been incorporated as not-for-profit 'societies': the proper compilation of voter lists; election procedures for the society's executive committees; and the notice necessary to hold an annual general meeting. This paper explicates the specific secular logics that courts have invoked to intervene in the internal affairs of Gurdwaras, even as they profess a reluctance to decide matters of religion. The paper pays specific attention to the secular ontologies that are utilized to differentiate matters of religion, which are positioned beyond the pale of legal authority, from matters of political procedure, which figure as objects of legal jurisdiction. Utilizing critical theories of secularism, the paper explains how the agentive status afforded to bureaucratic media blurs and redraws these distinctions to enact unique modes of 'post-racial' governance. By situating these cases in broader changes to the racial state, this paper explains how law has become a mechanism for redrawing the religious, cultural and political boundaries of Sikhism.

The Post-Racial Forms of Vaisakhi Celebrations in Metro Vancouver

Metro Vancouver has become the site of two annual Vaisakhi celebrations that are held on consecutive weekends in April to commemorate the Punjabi harvest season and the founding of the Sikh Khalsa. In recent years, these celebrations have drawn upwards of 600 000 participants to the streets of Surrey and South Vancouver where people can join the parade, receive free food and drinks from the vendors, and watch the dance performances staged around the parade route. In this paper I draw on fieldwork undertaken at recent Vaisakhi celebrations to conceptualize the social and spatial forms of post-racialism that structure the political circumstances of Sikh and South populations in Metro Vancouver. This paper pays particular attention to the unique forms of territorial stigmatization that have remade Surrey into a post-racial suburb. Using Henri Lefebvre's method of 'rhythmanalysis', this paper considers how this transformation of place is evident in the spatial practices that recur during Vaisakhi celebrations, offering unique insights into the multiple routines that condition the intersection of race and space in contemporary cities.

Predictors of Resilience in Adolescents from Canadian Military Families: The Role of Individual and Family Characteristics

Recent research suggests that aspects of the military lifestyle, such as deployment and relocation, may be challenging for some adolescents but not for others. However the specific characteristics that help adolescents from military families overcome and positively adapt to these challenges are understudied. Accordingly, the objective of the present study was to examine various the individual and family characteristics that influence the resilience of adolescents from Canadian Armed Forces (CAF) families. Surveys were sent via mail to 3000 Regular Force CAF families with an adolescent between 14 – 19 years of age. In total, responses were received from $N = 194$ adolescents (77 boys, 117 girls) ($M_{age} = 16.55$, $SD = 1.69$) from families in the Regular Force CAF. Adolescents reported

on demographic characteristics as well as their attitudes and emotional reactions to deployment and relocation, parent-child relationships, peer relationships, coping strategies, self-esteem, and resilience. Individual-level characteristics were grouped into demographic factors (age, gender) and psychological factors (emotional reaction towards deployment, attitudes towards relocation, coping strategies, and self-esteem). Family-level characteristics included parent-child relationships and peer relationships. Results from a hierarchical multiple regression analysis revealed that psychological characteristics predicted adolescents' resilience at the individual-level. Specifically, adolescents' emotional reactions towards deployment, attitudes towards relocation, and avoidant coping negatively predicted adolescents' resilience. Further, problem-focused coping, emotion-focused coping, and self-esteem positively predicted adolescents' resilience. At the family-level, positive parent-child relationships and peer relationships predicted greater resilience. Taken together, these findings are useful for military family service providers in order to develop appropriate prevention and intervention efforts to facilitate the resilience of adolescents from military families.

Not Defined By the Numbers: Distinction, Dissent and Democratic Possibilities in Debating the Data

This paper considers how metrics and standards used to govern food systems are negotiated and challenged by citizens. In situations of risk and uncertainty, metrics are deployed to guide the activities of producers and consumers, categorizing both practices and goods as safe or unsafe, good or harmful, and ensuring the maintenance of a stable and predictable pattern of life. In post-2011 Japan, government efforts to establish safe levels of radiation in food can be seen to participate in this stabilization, which both reproduces the existing economy and the political system following the re-emergence of a radical participant: the anthropogenic radionuclide. Yet, people are not passive participants in their governance, and have established their own ways of navigating food safety in opposition to government standards. This paper argues that those who must live by the numbers may also negotiate their relationship with, and define themselves against, these values. Thus, numbers can be seen to instigate dissent, distinction and deliberation, as participants strive to establish their authenticity beyond reductionist parameters. Taking an assemblage approach to exploring the Japanese government's standards for radionuclides in food, this paper discusses the ways that numbers are actively engaged with to create and vocalize a more emancipatory political subjectivity through the assemblage of deliberative publics.

Religion and Distinction: Cultural Closure in African Societies

Numerous ethnographies have recognized the close relationships between religious belonging, economic orientation and status aspirations in many African societies. However, sociologists have rarely systematically explored how religious belonging operates as a marker of cultural distinction and cultural closure through which economic opportunities are hoarded, social positions reproduced and symbolically expressed. In this presentation, I argue that Bourdieu's theory of social class and cultural distinction is helpful for understanding the dynamics around social inequality and cultural identity in African societies but that it needs to be reformulated to that end. More concretely I suggest that the vectors of cultural reproduction (i.e. the forms of cultural capital such as certificate, authorized judgment etc.) differ dramatically from those Bourdieu envisioned. In my presentation I pursue the role of religion as one vector of cultural reproduction and explore how it impinges upon questions of stratification. I illustrate my arguments by drawing on qualitative empirical research carried out in South Africa, especially in the townships of Cape Town, since 2006.

Agent-Based Models for Megacities and Social Networks in Disaster

Increasingly agent-based models are being used to study human behavior in response to mass emergencies and disasters. These models have been applied to questions regarding the effects of natural disaster, emergency and humanitarian response, shelter versus evacuation, and crowds and riots. However, developing realistic control populations and the social networks of large-scale urban populations remains a key challenge for research and experimentation. Modelers must balance the need for representative, heterogeneous populations with the computational costs of developing large population sets. These models must also include the social network relationships that influence social interactions

and behavioral patterns in emergencies. To address this we use a set of methods and empirical census data to build a synthesized population with social networks embedded in an agent-based modeling environment of the New York megacity. The methodology and modeling code are available and openly shared. The computational framework provides a laboratory for testing the effects of varying disaster impacts and social networks on the survival outcomes and movement of populations in a Civil Defense emergency.

Historical Challenges to the Idea, Principles and Practice of Insurance

Despite its fundamentally economic character, the business of insurance has historically had to engage in an ideological contest both with other ideas and with alternative means of risk management to establish its principles and necessity. Focusing particularly on life insurance the paper considers continues to do so in parts of the world such as China and the Islamic world, where these run counter to existing practices, ideas and even taboos. Drawing together a range of historical and sociological literature, it will explore the changing character of its challenges and emphasize the defensive character of its engagement and limits of success. In more contemporary terms, the paper will also consider the challenges it faces in its historic heartlands where new technologies and 'big data' question working principles of the pooling of collective risk. In doing so the paper seeks to redirect attention to a neglected sociology of insurance and indicate the useful role it can play reconnected to the sociology of risk, providing a core historical thread that places ideas and their interaction with changing social realities to the fore.

Soccer As a Strategy to Overcome Extreme Poverty? Social Mobility and Sport in Brazil

Sport has been pointed out for many years as a factor of social development for individuals or communities (Loy, 1969; Eisen and Turner, 1992; Coalter, Allison and Taylor, 2000; Collins & Kay, 2002; Kay, 2009; and others). Some researchers analyze this mobility potential more critically (Frey & Eitzen, 1991; Eitzen, 2009; Black, 2010; Spaaij, 2013 and others). In Brazil, the potential of sport in human, social and economic development are constantly exalted, especially in soccer. Millionaire salaries and fame, however, are only reality for a minority of soccer players who effectively experimented vertical social mobility, namely upward mobility by Lipset & Bendix (1992). In a context that places Brazil as the third worst Gini Index in Latin America and the Caribbean (OXFAM, 2017) - the article analyzes whether football can remove children from extreme poverty, as often touted. Through a case study in the Santos Football Club - home of extraordinary players like Pele and, more recently, Neymar - we've conducted semi-structured interviews with youth academy's staff. Also, we've observed the so-called "trials" in which children and adolescents are chosen to pursue a career in the club and interviewed some mothers of young candidates. The results show that despite the common financial difficulties of many families, they can not be characterized as being in extreme poverty, but as a lower middle class. In addition, families who live far from the city, in general, receive support from relatives, friends or local businesses in order to facilitate participation in these "trials", which shows some kind of social safety net. Decisively, we can not point out that Brazilian football is a common overcome strategy for extreme poverty, but there is no doubt that the dream of upward mobility of many poor families goes through crowded stadium and a lot of goals.

BURITY, JOANILDO* (*Joaquim Nabuco Foundation*)

Minority Politics and Transnational Networks of Religious Social Activism

Current forms of public of religion in many parts of the world contrast with received social-scientific wisdom about the (decreasing) vitality and relevance of religions in contemporary, complex societies. In the two-thirds world of former European colonies, such vitality and relevance is coupled with the emergence of religious minorities claiming not just recognition but also political representation of some sort. However, the emerging profiles are far from uniform or cast in terms of an opposition between religious and secular. Long-standing forms of religious transnational activism associated with the ecumenical movement and recent patterns of minority politics have crossed ways, forming a web of religious organisations and social activists that promote radical, grassroots-based forms of local and global policy agendas and collective action. Combining more traditional emphasis on mobilising the poor for social change, this web of religious actors have also strongly endorsed claims to racial, gender, sexual and environmental

justice, through community-, state- and transnational-level repertoires of action. This paper explores, based on comparative research done in the UK, Brazil and Argentina, this pattern of public religion disconnected from claims to self-representation and inspired by repertoires of global activism originating in Christian ecumenism. Organisations, networks and key (bridging) activists operating at least in two of the three countries are studied in terms of the nodes of interaction formed by their various connections and participation in wider mobilisations. The analysis combines elements of Casanova's problematic of public religion, Connolly's concept of minoritisation, Laclau's concept of populism and various approaches to transnational social activism.

BUTZLAFF, FELIX* (*Institute for Social Change and Sustainability, Vienna University of Economics and Business*)

DEFLORIAN, MICHAEL* (*Institute for Social Change and Sustainability, Vienna University of Economics and Business*)

The Shifting Nature of Prefiguration in Social Movements: From Modelling to Expressing Alternatives?

Prefiguration has always been part of the action repertoire of social movements in order to achieve a "new human". The labour movement established an entire parallel structure of consumer associations, health assistance and insurances, educational institutions and sport clubs. Moreover, the environmental movement promoted vegetarianism, agricultural communes and ecological restoration, while the anarchist movement mobilized towards squatting, free-shops and non-hierarchical decision-making. Recently, we can observe a resurgence of interest and engagement in prefigurative practices that are situated in the spheres of everyday life, such as community gardens, food cooperatives, sewing workshops, repair cafés or clothing-swap initiatives. While there is an increasing effort of conceptualizing these practices as a new form of politics, there is surprisingly little theoretical work on why most of these "new urban practices" lack a political-strategic "arm", something that the movements above all included in their tactics. In this paper, we will address this puzzle by drawing on the conceptual traditions of political sociology, new social movement theory and late-modern sociology. We argue that modernization processes have fundamentally changed the relationship between the strategic and prefigurative action repertoire of social movements. In the beginning of the 20th century, prefiguration was sought in order to pre-model a society that was to be created through party politics. Today, new urban practices allow to construct, experience and express a self that cannot be represented through conventional forms of political participation anymore. At the same time, political parties as strategic actors often remain devoid of prefigurative societal backgrounds. While this mirrors a change in the relevance and quality of individual identity in mobilizing for social change, the transformative potential of new urban practices remains unclear.

BUXTON-NAMISNYK, EMMA* (*Domestic Violence Death Review Team, NSW, Sydney*)

CONDRIY, RACHEL (*University of Oxford*)

Inclusive Approaches to Investigating the Victims of Femicide

This paper draws upon current research conducted by the authors using domestic homicide reviews and other sources of homicide data in Australia and the UK. The paper considers what we know about the state response to victims of femicide, focusing on two particular categories of victim that tend to receive less attention: those killed by their own children, and those from Indigenous populations. In the drive to recognise and respond effectively to domestic violence, state responses tend to focus on the largest and most visible category of victims, women killed by intimate partners. This approach can be homogenising, painting a very particular picture about the nature of female victimisation, and can neglect the specificities of victim histories, cultural context, characteristics, and kin relationships. Victims of domestic homicide are not a homogenous group and blanket responses miss opportunities for specifically tailored risk assessment and effective prevention, investigation, and prosecution. This paper considers how particular social processes, structures, and relations fuel the neglect of, or indifference to, certain categories of victim, including the construction of kin relationships and the neglect of filial violence in all its forms, and also highlights the importance of taking into account intersectional considerations in studies of femicide. The authors reflect on their attempts to design research projects investigating domestic homicide that are sensitive to familial and cultural context, that are inclusive in approach, and that give primacy to the voices of those affected by it.

BUYS, REBECCA* (*Deakin University*)

Understanding Encounters in Relational Theories and Implications for Empirical Relational Research

This paper first explores the ways in which key relational theories conceptualise encounters. It questions how encounters can be understood through the theories' conceptualisations of knowing (of oneself and The Other) and the operations of power. The exploration reveals on-going contestations around the concept of entities, and thus relationality itself. The methodological implications of this for empirical research is considerable. I argue engaging a deeply relational notion of encounter, informed by Karen Barad's notion of intra-action, enables an understanding of entities which aids the development of a relational methodology that allows a more fluid, relational world to reveal itself. Specifically, informed by my research on the relationalities of activists campaigning against gender-based violence engaged with government processes in Australia, I explore the implications of relational feminist intersectional and decolonising methodologies, alongside Baradian thought, for the possible development of an intersectional relational research methodology.

A Personal Account of Struggle for Democratization and Purge in Turkey

Although I graduated from one of the top mechanical engineering faculties – Boğaziçi University- in Istanbul I chose to become a social activist and to teach English in working class districts. As I was teaching at state schools, I was also making a great effort to organize informal, precarious workers. I and my comrades established "DayanismaEvleri (Houses of Solidarity)" to create a safe haven and a locus of organization for the precarious workers. In the meantime I got my MA in Industrial Relations and Labor Economics. Although I was a civil servant, because of my political activities I was arrested and tortured many times in the late 90's. I then became a member of board in Eğitim Sen, I and my friends founded a grassroots network called "Member Initiative" against the dominant political cadres of the union. We struggled against bureaucratization which caused a serious leak to debilitate the organization. After that I started my PhD studies in Political Science in Yıldız Technical University. I am still studying on my thesis which is a comparative work titled "Historical Institutionalism and Regime Change in South East Asia". I also took responsibility in the election periods as a cadre of HDP. My expectations turned out to be true on June 7th 2015, when the elections resulted in a hopeful opportunity for change towards democracy and abolishing of the AKP-led authoritarianization process.

Things dramatically changed after that. My part in the total cost is losing my job, my students and my faculty. I was dismissed by a government decree without any investigation. Also my dissertation advisor was dismissed, too. I and my family are prevented from leaving the country so I cannot benefit from the PAUSE2 support provided by the Nantes University.

I am proud to be a part of the struggle.

BYFIELD, NATALIE* (*St. John's University*)

Surveillance, Algorithms, and Democracy

Marx (1988) and Lyon (1994) have noted for decades the significance of surveillance as an important element in modern states. As such, some of the most relevant questions in surveillance studies are ones that focus on how it proliferates and the impact of its proliferation. Lyon (1994) argued that surveillance expanded with democracy and is likely "the other side of the coin of democracy" (1994:26). Foucault's (1995) work has articulated the relationships between the state's surveillance gaze, the sorting and counting of people, and discipline and power. The field of surveillance studies has focused on policing over these same decades that policing, particularly the policing/surveillance of people of color, has risen exponentially. Thus Simone Browne's (2015) work to put studies of slavery and the construction of blackness at the center of surveillance studies and treat them as part of the "constitutive genealogies" of the field is powerful. This paper builds on the work of Marx, Lyon, and Browne to explore the changing relationship between the state and the private sector as the use of algorithms in policing proliferates. Since 2012, the New York Police Department (NYPD) has contracted with Palantir Technologies to do crime analysis. The company argues that while the data and crime analysis are available to the NYPD, the algorithms it developed are proprietary. As the NYPD reportedly tried earlier in 2017 to move this work in-house—or to another platform—a legal fight erupted between the two institutions. The paper asks the questions, what are the implications for 1) the relationship between the state and the private sector and for 2) freedom and justice when the private sector often outpaces the state in the development of surveillance technologies, often used by the state for the control of and/or the oppression of members of society, particularly racial minorities.

RC54-JS-38.4BYRNE, ELLIE* (*Cardiff University*)ELLIOTT, EVA* (*Cardiff University*)*Using Culture and Heritage to Heal Ruptured Place Identities in South Wales, UK*

This paper looks at the role that culture, arts and heritage play in developing a shared identity in a region of South Wales in the United Kingdom. This region is historically divided, with deep ruptures and tensions between different localities and communities. These are exacerbated by the geography of the region, which is a series of distinct Valleys, all flowing down to the City which was historically one of the most important industrial global ports for iron, coal and steel. The Valleys communities which served the City became populated due to the rich natural resources and resulting industrial exploitation of the land. The large and prosperous City, which is now the Capital City of Wales, only exists because of the industry and wealth created by the riches contained in those Valley communities. Poverty, ill health and economic decline have besieged many of these communities whilst the capital has been seen to benefit from increasing investment and wealth, attracting people away from the Valleys into employment. Simultaneously, poverty and ill health exist in certain communities within the City, adding to the divisions and ruptured identity the region as a whole suffers.

This paper explores some of these historic divides, and asks how heritage, culture and the arts might facilitate the development of a shared sense of place-identity across the City Region, up to and including the Valleys communities and those communities within the City that feel underserved by the wealth flowing into and out of the Capital. We draw on a number of studies and activities supported by Cardiff University's Strong Communities, Healthier People project, and a new Cultural Participation Research Network to emerge from this work.

C**WG05-947.2**CABALLERO, HILDA* (*Universidad Nacional Autonoma de Mexico*)*Desaciertos En Las Políticas De Combate a La Pobreza En México. Desde Las Concepciones Teóricas Hasta Las Mediciones Empíricas (a propósito de los resultados sobre la disminución de la pobreza en 2016).*

El **objetivo** de este trabajo es contribuir a la reflexión crítica en torno a los discursos y prácticas que inciden en las políticas de combate a la pobreza en México, desde la totalidad social.

El documento aborda aspectos teórico-metodológicos que van desde las concepciones teóricas, a partir de las que se definen las causas de la pobreza, hasta los aspectos técnico-metodológicos que intervienen en la definición de indicadores y el tratamiento de los datos para su medición, pasando por las propuestas de solución, expresadas en discursos y prácticas que orientan la acción gubernamental y las políticas para su "combate".

El análisis se desarrolla desde la teoría de la Descolonialidad del Poder, propuesta teórica que permite sostener que las políticas de "combate a la pobreza" no inciden en las causas histórico-estructurales que la generan y propician su reproducción; además brinda elementos para mostrar los propósitos reales de éstas políticas: legitimación, manejo político electoral, asistencialismo, desmovilización y atomización social, aspectos que se evidencian en el debate a propósito de los resultados sobre la disminución de la pobreza en 2016.

TG06-990.4CABIN, WILLIAM* (*Temple University*)*Phantoms of Home Care: Medicare Treats Alzheimer's Disease Clients As Deviants*

The presentation is based on a May 2016-June 2017 Institutional Ethnography in one Medicare-certified home health agency in New York City. The study explores the lived experiences of 16 Persons with Alzheimer's disease (PWAD) and their caregivers, 6 home care nurses and 3 social workers involved in their care, and 4 agency managers. The focus is an exploration of the how the illness and disabilities status of the PWAD affects their assessment, plan of care, treatment, discharge planning, and meeting their physical and psychosocial needs. Results indicate the confluence of Medicare regulations and organizational policies, as interpreted by managers, nurses and social workers, result in the PWAD and their caregivers feeling they: do not receive necessary psychosocial services; are discharged with significant unmet needs, often resulting in frequent readmissions; are treated more as ghost clients than actual clients; and are deviants with significant psychosocial and physical health needs who are not normal home care patients. Methods of analysis to distill the major themes and implications for practice and policy reform are discussed.

RC15-JS-83.6CABIN, WILLIAM* (*Temple University*)*Unequal By Condition: Medicare's Planned Neglect of Chronic Care in Home Health*

The presentation is based on a study conducted from July 2016-August 2017 in two Medicare-certified home health agencies in the metropolitan Philadelphia area. The study is the first to compare care for Medicare home health patients with chronic conditions (Alzheimer's disease, Multiple Sclerosis, Parkinson's disease, Cancer, Diabetes, and chronic respiratory and circulatory conditions) to patients with acute care conditions (wound care; physical, speech, or occupational therapy-based rehabilitation post-surgery; non-chronic diabetes; acute musculoskeletal conditions). A mixed method methodology was used. A sample of 23 chronic care and 26 acute care patients were randomly selected as the sample. Patient care was compared based on: assessed needs; length of stay; type and volume of services delivered; and outcomes using agency data. All subjects were interviewed on their perceptions of actual care delivered matched their needs; remaining unmet needs; and consequences for their life activities. Results found a consistent bias toward acute care patients based on all criteria examined and patient interviews of unmet needs.

RC12-239.1CADEMARTORI, SERGIO* (*Unilasalle*)MIRANDA, JOSÉ ALBERTO (*Unilasalle*)*La Democracia Latinoamericana Entre Hiperpresidencialismo y Populismo Constitucional*

La presente ponencia propone una investigación en dos etapas: la primera, básicamente conceptual, intenta establecer, a partir de conceptos bien definidos, la diferencia entre tres categorías de la sociología del derecho, extraídas de la sociología jurídica: se trata de los fenómenos del *populismo*, examinado a partir de sus características histórico-políticas; del así llamado *hiperpresidencialismo latino-americano*, concepto que si bien muy reciente permite sin embargo un análisis fecundo de algunas prácticas políticas en el sub-continente; y por fin del *constitucionalismo popular*, categoría elaborada por Mark Tushnet y sus seguidores. En la segunda etapa, de carácter normativo-descriptivo, se trata de, bajo la luz de las conclusiones obtenidas en la etapa anterior, lanzar una mirada a los regímenes políticos de la actualidad en Latinoamérica, con la finalidad de enriquecer un análisis que permita elaborar una crítica más efectiva a tales fenómenos políticos. Con ello, se pretende ofrecer algunas propuestas con la intención de contribuir al debate que busca mejorar la calidad de la democracia en la región.

PUGA, CRISTINA (Autonomous National University of Mexico, Mexico)

From Rescuing Earthquake Victims to Reconstructing Mexican Polity

The September 19th, 2017 earthquake in Mexico City, brought together thousands of students and neighbors with the armed forces in unusual cooperation in order to rescue earthquake victims trapped under the fallen buildings. This social mobilization occurred in a moment when the federal government suffers a severe legitimacy crisis, several state governors are investigated under corruption charges, and there is a widespread sense the Mexican democracy is not working, the law is poorly enforced, and violence and human rights abuses are rising. Drawing on Goffman's (1959, 1974) dramaturgical and framing perspective, and on recent scholarship on politics and performance (Alexander 2011, Doerr et al. 2015, McAdam 1996, Sward 2017, Tilly 2008), we analyze dramatic and emotional moments during the rescue efforts that created new symbols, gestures, and performances. Rising a clenched fist, once a symbol of protest and defiance, was re-signified as symbol demanding silence so the rescue teams could listen to the earthquake victims trapped in the rubble, stressing the importance of both, listening and life. This massive social mobilization of September 2017 happened just a few months before the beginning of the 2018 electoral campaigns, and built over previous mobilizations such as the protests raised to condemn the forced disappearance of the 43 students in Ayotzinapa, and the anticorruption movement. Protests and social mobilizations are increasingly demanding the enforcement of the law against state actors' resistance. Based on our own previous research on collective action and participation, we draw from several sources in order to analyze the emergence of strategic dramaturgy, of sometimes less willed performances, and the unpredictable symbolic interactions that make performance and politics co-constitutive. The social mobilizations we analyze brought together different actors in a common effort that began rescuing earthquake victims and now are trying to reform the Mexican polity.

Nonviolence in a Violent Country. Mexico in the XXI Century

Since the turn of the Century, there has been an increase in the amount of violence in Mexico related to organized crime and the governmental strategies to enforce the law through the use of the armed forces (Army and Navy), since the police has been infiltrated or overpowered by the criminal organizations. This has provoked an increase in human rights violations and protests against violence coming from both criminals and armed forces. This paper analyzes, a) the protest events in which some kind of violence occurs; b) the non-violent strategies of several social movement (SMOs) and non-governmental organizations (NGOs) in México; c) their experiences and consequences for social mobilization and peaceful solution of conflicts. Information from violent protest events comes from the LAOMS data base. The social movement organizations studied are: Movimiento por la Paz con Justicia y Dignidad (MPJD), the Consejo de Ejidos y Comunidades Opositoras a la Presa La Parota (CECOP), en Guerrero, and the Frente de Pueblos en Defensa de la Tierra (FDPT), in the state of Mexico. The NGOs studied are: Servicios y Asesoría para la Paz (SERAPAZ), Centro de derechos Humanos de la Montaña Tlachinollan, and Centro Nacional de Comunicación Social (CENCOS).

From Songs, Stories and Language to Political Leadership: Indigenous Youth Hybrid Environmental Knowledge in Northern Rural Governance

Indigenous rural youth often express frustration over their lack of voice, and absence of involvement and power in decision-making processes involving natural resources and more broadly, environmental governance. Moreover, while Indigenous youth in northern communities are expected to engage as future leaders in new forms of action in response to growing environmental concerns, a key problem is that little is known about how youth in rural and isolated communities perceive their natural environment or view their role in sustaining the natural environment for future generations. Currently, little focused research explores the knowledges, that exist and are developing within youth cultures, required to face new social and environmental challenges including resource over-exploitation, climate change, conservation measures, and potential for tourism. I draw upon recent field research in cross cultural youth leadership camps, interviews, and focus groups with Dene youth in the Northwest Territories of Canada where Land Claims are established and Indigenous Self Government is currently underway. I examine the hybrid and blended forms of knowledge that consist of the ways of learning and teachings by elders, family, 'land' and broader community sources, and the scientific knowledge gained from the formal institutional education system. In this presentation, I extend post-colonial thinking about hybridity and hybrid forms of knowledge to conceptualize how Indigenous youth within the formal education system understand and utilize their unique knowledge that is simultaneously derived from traditional knowledge and school-based knowledge, in the context of Indigenous co-management of natural resources. For remote rural communities to survive in the face of growing challenges, new technologies and social media are valuable tools used by youth but are not key drivers in environmental knowledge. This research shows how Dene practices and knowledge systems are conceptualized and interwoven in Indigenous youth environmental knowledge, empowering future decision making and strengthening environmental governance.

Contested Experiential Spaces in Urban Destinations: A Case Study from Barcelona, Spain

This article examines the social conflict between the stakeholders and visitors in Barcelona, Spain. Receiving more than 30 million visitors annually, Barcelona, a city of 1.6 million residents, has been reported broadly in the (inter) national media with the protests by its residents. The study takes its theoretical departure in Emerson's social exchange theory and focuses on the contested experiential spaces of residents and visitors in an urban context. In line with an emic ethnographic approach, interviews with visitors and local stakeholders were held in order to identify their experiential meanings towards the urban spaces in the city. In addition, visual materials including photographs and films were collected and analysed. Findings demonstrate the existing complexity of an overall sentiment of invasion, widely perceived by the residents of the city. The study proposes a model that deconstructs the sentiment into three interrelated levels of perceived invasion, namely physical invasion, capital invasion, and socio-cultural invasion, and suggests a three-step plan to the urban policy makers to prevent the insurgence of a possible sentiment of invasion among the residents and stakeholders in a city.

Is Successful Aging 2.0 the Way for the Future?

In 2015, and to great fanfare within the U.S. flagship gerontology journals, John Rowe and Robert Kahn (2015) published their update to Successful Aging (SA), "Successful aging 2.0: Conceptual Expansions for the 21st Century." While their original formation has proven popular, a small number of scholars have critiqued SA itself for its individual focus, neoliberalism, neglect of social inequalities, and implicit ageism.

The goal of this presentation is to review these critiques, and then explore the extent to which SA 2.0 addresses these. I find that although Rowe and Kahn mention social factors, these remain at the individual level in discussion. Such status characteristics as gender remain at the level of personal characteristics. Of note, social inequalities continue to be neglected, including those based on age, with the result that ageism is also not addressed. Indeed, they reproduce the (unfounded) intergenerational conflict perspective in their essay, and their discussion of the life course is based on a white, middle-class, male standard. While some critiques of the previous model have argued for an expansion to include more voices, I conclude by advocating that the time has come for scholars and practitioners to stop using the SA framework, and instead think about diverse modes of aging.

CALBET ELIAS, LAURA* (*Leibniz Institute for Research on Society and Space*)

Housing Developers in Financial Times

In many cities that experience increasing housing prices, stimulating the construction of housing has become a common strategy. Within this logic, private developers are seen as important actors to counteract the housing question. Since the subprime-mortgage crisis, increasing housing prices in several geographies have been interpreted as part of financialization tendencies, relating the global housing crisis to finance oriented accumulation patterns. Nevertheless, analogous to the general lack of research on real estate supply actors, the financialization discussion has mostly ignored the role of developers in arrangements that enable the use of real estate as source for financial profits. Yet, given the political confidence, private developers will contribute to improve the provision of housing, it seems important to question if tendencies of financialization can be also observed in the property development industry, and how do they may affect social urban development and housing supply.

For a newly built inner-city quarter in Berlin I examine how building attributes, actor constellations and business strategies have changed in favor of the return expectations of financial investors. The case reveals how coinciding with rising residential prices, real estate developers arrange with financialized actors in order to implement high profitable projects. The case reveals how coinciding with rising residential prices, real estate developers use deregulated planning principles and market oriented housing policies to create high profitable investments, and arrange with financialized actors in order to implement their projects. The increasing use of alternative investment vehicles for the financing of housing production indicates the existence of financialization processes in property development.

Using empirical evidence based on planning analysis and corporate research, the presentation contributes to the integration of property development issues in the academic debate on the financialization of housing. Furthermore it claims to consider the consequences of financialization processes by policies that stimulate private housing construction.

Urban Governance of Migration. Discourses and Practices in Manchester and Germany

In the context of new migration dynamics, cities are redefining their role in the governance of migration. A propitious field to conduct new municipal migration politics seems to be urban regeneration, where attempts to deal with diverse communities at neighborhood level and also integration politics have a long tradition.

The paper compares examples of 'migration-led regeneration' in Manchester and Germany with focus on housing (re-)development.

CALDERÓN-VÉLEZ, MILTON* (*Facultad Latinoamericana de Ciencias Sociales*)

A La Sombra Del Árbol: Racionalidad Heterogénea En Medio De La Educación Popular, El Desarrollo y El Sur Global

Las prácticas educativas concretas de las escuelas de la red Fe y Alegría en el Chad, África, permiten observar tensiones entre dos diferentes perspectivas: por un lado, el discurso del desarrollo como ascenso al progreso desde el paradigma occidental y por otro, la mirada que propone la búsqueda de la transformación social, dando como resultado un tipo de racionalidad de carácter heterogéneo –en tanto lógica de funcionamiento afín a las dos miradas. En el caso concreto, las tensiones se visibilizan entre la cooperación para el desarrollo y la injerencia en el país de parte de las organizaciones globales; y la educación popular que, surgiendo en los procesos de resistencia de América Latina, se injerta en los pueblos del corazón africano.

Organizaciones como Fe y Alegría, que mantienen dentro de sí elementos propios de cooperación Sur-Sur, y que visiblemente se expande por los países más empobrecidos del globo, es un caso particular para la comprensión de esta racionalidad, dado que ella misma traduce aquellas tensiones.

La ponencia abordará los resultados de la investigación que permitió comprender dicha racionalidad y sus tensiones discursivas: 1) la necesidad de un sujeto afín a la mirada del desarrollo logrado gracias al aporte de la cooperación, especialmente en el terreno educativo en el Chad; 2) la perspectiva de la educación popular que se inserta en el territorio africano en medio de un contexto notablemente matizado por el discurso desarrollista, tensionando las prácticas educativas a nivel teleológico, político, biocultural, cultural y pedagógico; 3) la existencia de las mencionadas tensiones al interior de Fe y Alegría que, como organización transnacional, instala la red educativa en el África; y 4) la existencia de

una racionalidad heterogénea que surge como materialización de las tensiones en las prácticas sociales micro, desde la escuela, y macro, desde la perspectiva del Sur Global.

Does Moving Matter? Measuring Residential Mobility on Children's Mental Health Outcomes

Residential mobility plays a significant role in the mental well-being of children. Children that are highly mobile sustain a breakdown of social support both in familial ties, as well as among peer groups. Since residential mobility is almost always linked with school mobility, this adds an additional layer of complexity in understanding child outcomes (Qin et al, 2009). Previous research indicates that the sociodemographic characteristics of the family play a role in militating the costs of migration. Single-parent families and individuals from lower socioeconomic status (SES) tend to be more mobile than individuals from two-parent households and families with higher SES (Mok et al, 2016). Therefore, controlling for parental SES and family structure is crucial in understanding the role of residential mobility on child mental health outcomes. Further, research indicates that children who grow up in affluent neighbourhoods are more likely to do better in school, have better mental health outcomes, and engage in less risky behaviours. Thus, children that experience mobility or remain in high-poverty neighbourhoods may have limited access to good schools, poor social networks, and the lack of economic opportunity, which can lead to poorer outcomes over the life course (Keels, 2008). Using data from all 8 cycles of the National Longitudinal Survey of Children and Youth, this paper examines the effects of residential mobility on children's mental health outcomes. In particular, we are following a cohort of children at age 10 and tracking their mental health up to the age of 25. Through this analysis we are comparing children that remain in low-income neighbourhoods versus those that move into more affluent neighbourhoods. This paper furthers our understanding of the mental health outcomes of Canadian children while controlling for socioeconomic and demographic factors such as social support, parental economic, social and cultural capital, family structure, and SES.

Life Satisfaction in Europe: Long Term Trends Explained

In our earlier research based on Eurobarometer micro-data for eight European countries/regions we have found that in Flanders net time trends for life satisfaction are more important than life cycle or generation effects. With each of the three temporal dimensions considered (trend, birth cohort and life cycle), one can associate different economical and/or sociological explanations.

In this paper we focus on the explanation of long-term life satisfaction trends across Europe. We do so by enriching Eurobarometer micro-data (1973-2015) with different macro-level time series (unemployment rates, gdp, ...) and applying Multilevel Hierarchical Age Period Cohort analysis techniques to test various economical and sociological explanations (Easterlin-paradox, absolute income hypothesis,...). The findings are tested for robustness by comparing the results for alternative (hierarchical) models and different variable specifications.

CALLEROS-RODRIGUEZ, HECTOR* (*University of Bucharest - ICUB*)

Is Brexit a Case of Parliamentary Sovereignty Vs Judicial Review?

In a referendum, the people of the United Kingdom (UK) voted to leave the European Union. The terms of Britain's departure are part of an ongoing public, governmental and parliamentary debate; these terms have also been the subject of judicial review. In trying to understand the role of judicial review in Brexit (the British exit from the European Union), this paper examines the role of the UK's Supreme Court. Particularly, it analyses the situation where judicial opinion has been expressed on an issue where citizens had already expressed theirs -through a referendum - prompting a public discussion on the legitimacy of the Supreme Court, and on its members, to conduct such a review. Moreover, the paper analyses judicial review as an opinion on a dispute regarding the division of powers: whether the government has the authority to give notice of the U.K.'s withdrawal from the EU as in the terms of Article 50 of the Lisbon Treaty (Treaty on European Union) without prior legislation passed by Parliament and assented to by the Monarch. This paper does not analyse the arguments of the Supreme Court on the matter of the authority of provincial governments (Scotland, Wales and Northern Ireland) with regards to Brexit. Empirically, the British separation from the EU presents useful evidence to understand the counter-majoritarian function judicial review has in the British polity; similarly, it presents evidence useful to revisit the debate on the democratic legitimacy of judges conducting the function of judicial review. The paper is based on a qualitative analysis of parliamentary

debates and judicial rulings, as well as on-line version of newspapers and relevant documents.

RC16-320.2

CALLES-SANTILLANA, JORGE* (*Benemérita Universidad Autónoma de Puebla*)

Post-Truth: Knowledge and Politics in Contemporary Society

Post-truth has turned to be the most relevant political phenomenon in the last years. Defined by Ralph Keyes as any statement in which objective facts are less influential in shaping public opinion than appeals to emotion and personal beliefs, post-truth is perhaps one of the most serious threats to both democracy and civilized life. Politicians and journalists, who are concerned with its devastating potential, have suggested fact-checking as a post-truth antidote. Thus, the debate on this phenomenon has been set on an ethical-rational basis. On the one hand, the lack of ethical principles is attached to journalists and, on the other hand, the non-critical reception of information is assumed to be the feature of receivers.

This paper is aimed to propose theorizing post-truth on a theoretical framework wider to that based on ethical-rational concepts. Even if it is partially true that non-ethical journalistic practices and non-critical reception habits make post-truth possible, the dominance of this pattern remains unexplained. Post-truth must be studied as a particular phenomenon of the production of social knowledge in contemporary society. It must be understood as the result of the articulation of, at least, three social practices. First, news making as a professional practice based on immediacy, spectacle and the media's need for reaching wide audiences. Second, political practices aimed to impact public opinion rather than to attend public needs and transform political and social structures. Third, information consumption based on incredulity, disenchanted representations by the audiences on politics and their need for easy and immediate solutions. This approach will be built on Anthony Giddens' theory of structuration, Cornelius Castoriadis' concept of social imaginary, Bruno Latour's actor-network theory, Stuart Hall's theory of articulation, and Serge Moscovici's and Hall's theories of representation.

TRUST and the Regulation of the Medical Profession in the Health System in India

The general intention of systems of regulation is to control the practices of actors to achieve a variety of economic and social objectives in the public interest. This paper examines the current regulatory regimes and practices in the health system in India using the trust/control duality as an analytical frame. In doing so it critically reflects upon the stewardship and governance of the health system, exposing the limits and fragilities of the current regulatory approach to controlling

health system actor's behaviours and practices. It draws on evidence from an exploratory study of trust relations carried out by the authors in one region of India. Evidence and insight from this analysis are used to depict the nature of trust relations and regulation in the health system, and the problems therein, and to explain why they take that shape. The final part of the paper outlines possible strategies for effective stewardship and governance of health systems, and concludes with identifying gaps in the research evidence.

Going Private in the Public Sector: Understanding Commissioning Decisions in the English NHS

One popular approach to understanding decision-making in healthcare organisations is the internal/external pressure framework (Pettigrew *et al.*, 1992). It draws on political science and sociology and is favoured as it attempts to take on board national policy directives at the system level and their interaction with more local organisational and professional interests in shaping decision making. The value of this framework was examined in a study which explored the implementation of new commissioning arrangements under the Health and Social Care Act (2012) in the English NHS. This paper specifically examines what influences the decisions of commissioners in the selection of providers and whether they choose public or private providers.

This paper presents findings from a comparative ethnography, which followed the commissioning processes in two CCGs. This ethnography involved interviews with key informants and observation of committee meetings at both CCGs. Throughout, separate specific services, with different histories of private provider involvement, have been traced and examined. Findings suggest that commissioners have much less autonomy to select providers than initially expected which is explained, primarily, by the influence of individual financial situations at each site. Evidence of privatisation is limited in the NHS, with commissioners generally opting for public providers. However, there appears to be an increase in how marketised the service has become, with commissioners making extensive use of market mechanisms to select providers, which resulted from new rules set out by the Health and Social Care Act (2012). The explanatory power of the internal/external pressure framework will be assessed in light of this evidence, concluding with a discussion of the policy implications of this research consisting of how commissioning may change in the next few years and providing a suggested agenda for future research.

A Gender Approach to the Association between Retirement Timing and Functional Health in an Emerging Economy

This study uses a gender approach to examine differences in the health effects of retirement timing. Extant literature frequently overlooks gender differences, is narrowly focused on early retirement, and uses data from high-income economies. However, gender differences and late retirements are more salient in emerging economies. The present study contributes to this literature by exploring gender differences in the association between retirement timing and functional health in Chile. Chile shares the context of traditional gender norms, high prevalence of late retirements and poor job quality with many other emerging economies. In addition, Chile is an interesting case study because its retirement age varies greatly for both men and women and its privatized pension system has been replicated worldwide. Using fixed-effects regressions on Chilean Social Protection Survey panel data for 2,645 individuals age 50 and over, in the labor force at baseline, and who did not retire because of health reasons, we assess gender differences in the relationship between retirement timing and the number of limitations to perform activities of daily living (ADLs). We find that retiring too early is detrimental to the functional health of both men and women, but there are important gender differences in the benefits of continued employment. These results are robust to different model specifications and suggest that, in the context of emerging economies, forcing longer working lives can be detrimental to the functional health of men, while promoting a voluntary extension of careers can benefit women without damaging men. We discuss potential socioeconomic and psychosocial mechanisms underlying the gender-specific nature of the relationship between retirement timing and functional health in emerging economies.

RC12-245.14CALVO-GARCÍA, MANUEL* (*Universidad de Zaragoza*)*The 2015 Reform of the Spanish Law on Protection of Public Security: A New Turn on the Security of Rights*

In 2015 was promulgated in the Spanish Official Gazette the new Spanish *Public Security Law*, which came into force on July 1, 2015.

This law, nicknamed the "gag law" ("ley mordaza") by critics, is one of the most controversial laws in Spain and would have meant a new turn to "the security of rights". The reform made was an important step forward in extending the regulatory mechanisms for the control of public safety in the control of "public order". As a result, the risk for the violation of rights is being increased.

More specifically, this paper will focus on the changes promoted by the reform of the *Public Security Law* in 2015 and will analyze the first available data on the application of the Law. Secondly, we will address a specific issue that we consider crucial from the point of view of the protection of guarantees and freedoms, the problems raised by police discretion in the security society. To conclude, finally, it will be develop some cautions and the need to put limits to authoritarian and restrictive interventions in the preventive control of public security to guarantee the protection of fundamental rights.

RC12-245.10CALVO-GARCÍA, MANUEL* (*Universidad de Zaragoza*)*The Treatment of Gender Violence in the Spanish Administration of Justice. Implementation and Effectiveness of LO 1/2004*

The objective of this communication is to evaluate the efficiency and effectiveness of the successive legal reforms on gender violence including the Spanish Ley Orgánica 1/2004, of 28 December, on *Integral Protection Measures against Gender Violence*. A perspective of 12 years from the passing of the LO 1/2004 will assess the progress of its implementation, in particular its effectiveness in the fight against gender violence. More specifically, the paper will address the evolution of data related to the treatment of gender violence in the Administration of Justice from a comprehensive approach that will integrate both judicial decisions and the activity of the various organizations and people that work in the implementation of the law in this area.

With regard to the methodology, the approach will integrate theory and empirical research. In relation to this latter dimension, both quantitative and qualitative methods will be used. In relation to the quantitative methods I will re-analyze the data of previous research (1999 to 2006). That information will be supplemented by data from secondary sources, since statistical progress in the evaluation of gender violence in recent years has been considerable (CGPJ, *Observatorio Estatal de Violencia contra la mujer*, etc.). Qualitative research will be completed with 2 focus groups and 8 semi-structured interviews.

RC41-709.2CAMARENA-CORDOVA, ROSA MARIA* (*Universidad Nacional Autonoma de Mexico*)*The Death of Young Children: An Expression of Social Inequality***The Death of Young Children: An Expression of Social Inequality**

One of the most important social and demographic achievements of Mexico in recent decades has been the sharp drop in mortality, especially in the first years of life. However, the decline in early childhood mortality -the occurrence of which is strongly associated with poverty and marginalization, and whose causes can be largely avoided-, has occurred at different paces and intensities among the several regions and population sectors of the country, still prevailing today strong inequalities between the socioeconomically more and less favored population segments.

Historically the Mexican indigenous population has remained in a position of acute disadvantage and social precariousness compared to the rest of the country's inhabitants, residing very often in small, dispersed and isolated rural localities or in the marginalized areas of medium and large cities, generally in a situation of poverty, with great deficiencies in their living conditions and difficulties to access quality basic services, including those related to education and health care.

The objective of the paper is to analyze the inequality existing in the death of children under five years of age between indigenous and non-indigenous mothers, distinguishing in both cases between mothers living in rural and urban areas. To analyze the evolution of this inequality and the possible changes in the factors influencing the mortality of children, a cohort analysis of mothers is carried out and the incidence of different factors is explored through the use of multivariate statistical methods.

Data used come from the National Survey of Demographic Dynamics (ENADID) carried on in 2014, which collected longitudinal and retrospective reproductive and maternal data for a sample of about 68 thousand indigenous and non-indigenous mothers aged 15 to 54.

RC30-JS-2.8CAMARENA-CORDOVA, ROSA MARIA* (*Universidad Nacional Autonoma de Mexico*)*Youth Work in Mexico: Current Situation and Challenges*

The problem of youth work has taken on an unprecedented relevance and visibility at the global level in recent years, largely due to the high and rising levels of unemployment that afflict an increasing number of young people.

However, the problem is not limited exclusively to a shortage of jobs, but goes much further, manifested in a continued quality deterioration of existing jobs, with important implications for workers, especially the younger. In this regard, it should be remembered that work has historically been one of the main channels of inclusion and social mobility, constituting not only the source to obtain resources for the daily survival but of access to a large part of social services and benefits, a status or social position, the development and realization of individuals and, in general, the creation of living conditions.

For the stage of life in which the young are, work acquires additional dimensions. It is a pathway to social life, to the creation of networks and social relationships and to the deployment and demonstration of personal capacities, playing a key role in defining and reaffirming self-esteem and personal identity, creation of perspectives and expectations of future and the achievement of independence and autonomy in different orders of life.

The paper analyzes the current situation and work dynamics of Mexican young. For it, I carry out a longitudinal follow-up of work characteristics of a both sexes panel of young aged 14-24 years interviewed over five trimesters (2016-2017) by the National Survey of Occupation and Employment (ENOE). My interest is on addressing several aspects that give account of job opportunities and the precarious conditions in which young people currently work, so as the continuities and changes throughout the period analyzed. Analysis is performed using some tools from Event History Analysis and of Sequence Analysis.

RC57-925.2CAMBRE, CAROLINA* (*Concordia University*)*The Revenge of the Ineffable: Evaluating Visual Methodological Work*

Like other qualitative methodologies, visual approaches often wrestle with the questions of how to incorporate different ways of speaking to/with the object and still provide coherence while allowing the results to be emergent? Those wrestling with this problematic and conducting visually informed research, sometimes fall subject to the vigorous critiques offered by scholars such as Dr. Fuyuki Kurasawa (2013) who accuse visual methodologies of being either too descriptively oriented or too anecdotal; either too content focused (deterministic), or too centred on the networks of production and political economy of images bypassing the meaning potentials of the visuals themselves. Kurasawa complains of a lack of systematicity in process (reflexive follow-through), balance, and anecdotal tendencies in visually oriented or visually informed research particularly when it comes to analysis of large image collections. Systematicity attends to continuities, discontinuities and ruptures to address overemphasis on anecdotal evidence. Evaluation consists of addressing the approaches too focused on inner content, on the one hand, and on approaches focusing heavily on networks of production (political economy) on the other. If we take as a starting point however that: Visual methodological concerns contribute to affect and practice when they honour and recognize aesthetic and sense-based epistemics: we can say they are already post-disciplinary and "against method." And thus require, in fact demand, other strategies of implementation and consequently of evaluation. This paper proposes then to take seriously Erin Manning's (2016) idea that method, "an apparatus of capture," works "as a safeguard against the ineffable" (p. 32) in order to mobilize the concept of "visuality" (Shields 2003) to provoke encounters with the ineffable in visual sociological research. Visual methodologies demand a evaluative strategies that work topologically across the interdisciplinary concerns reflecting in visual sociological work, in ways that must be considered, at this point, post-disciplinary.

RC57-935.5CAMBRE, CAROLINA* (*Concordia University*)*Topological Views of Visual Pedagogy: Towards Nomadic Processes*

Twenty years have passed since Elizabeth A. St. Pierre (1997) wrote so eloquently about holding tight to the "possibilities of nomadic inquiry" (379) in the context of writing about ethnographic practice in the field, and feminist sensibilities. This paper takes up these ideas rooted in one of Guattari and Deleuze's central themes in *A Thousand Plateaus (ATP)* in their chapter on "Nomadology: The war machine" to ask *what if* the times and spaces of visual pedagogy were conceptualized in such ways as to resist territorialization into political and ideological ends. As Paul Virilio comments when interviewed by John Armitage (1999), that "images have turned into ammunition" (re.. logistics.. front line etc) ... a logistics of perception" (45), and "if you look at the Second World War, there was no bombing without

photographs ... We have, therefore, now entered a type of war about directing images...the image is right in the middle of the mechanism" (46).

If we ascribe to the interest of *ATP* in achieving a liberating effect from a certain kind of academic discourse, then a "nomadological" understanding of the world, that the world is constantly on the move, "without departure or arrival" (Deleuze & Guattari, 1987, p. 353) is useful for conceptualizing a refusal to assign an address, or to ask directions in order to *locate, fix, or determine* the "what" and "how" and "for what purposes" of visual pedagogies. What this paper will attempt to conceptualize then, is a topological approach focusing on the not knowing when/where of visual pedagogies as visual/temporal practices, or "practices of space" (Game 1991, p. 148) without romanticizing the idea of the nomad as homeless, exile, or placeless. Deleuze and Guattari (1987) show nomads do not inhabit/hold space and so are not defined by movement, but rather permit a deterritorialization of thought.

Categories and Queues: The Structural Realities of Gender and the South African Asylum System

South Africa is the only country on the African continent that not only recognises but also constitutionally protects and offers asylum to transgender-identified individuals. In light of this in recent years it has seen a marked rise in the emergence of this category of person within the asylum system. Drawing on research carried out between 2012 and 2015 this article argues, that transgender identified refugees/asylum seekers, living in South Africa, rather than accessing safety and refuge continue to experience significant hinderances to their survival. On entering the country, an individual has fourteen days to report to a Refugee Reception Office and apply for asylum. To access a center, asylum seekers are required to queue. Faced with two separate lines, one for men and one for women—much like the issues surrounding transgender access to public bathrooms— transgender refugees approaching the South African state for asylum are immediately forced to make a choice. This queue also creates the conditions for surveillance, particularly as different regions are serviced on different days, which brings together the same asylum seekers from similar regions on the continent. This can make life for those who transition in South Africa doubly exposing, as they possibly move between queues witnessed by local communities. This article questions the necessity of an ever-ubiquitous system of sex/gender identification in the lives of asylum seekers, noting current developments internationally, regionally, and locally in relation to the development of third- gender categories, "X" category passports, the suppression of gender markers, and wider debates about the removal and necessity of sex/gender identifiers on documents and their impact.

Italian Second Generation in Germany: Forms of Ethnic Discrimination at School

The relationship between racism and education is a challenging perspective in order to investigate the characters of contemporary racism inasmuch it affects not only social representations but also everyday practices already in the socialization processes. Forms of discrimination and racism in children's and young people's educational path are often characterized by violence – psychological and symbolic – and are the expression of a power asymmetry perpetrated by a social institution whose purpose, instead, should be of forming a good citizen within liberal democracies. These forms have a particular relevance when pupils and students have foreign origins and, what is at stake, is the elaboration of effective integration policies supporting a pluralistic society. Does school foster racism in spite of representing the arena for equal opportunity and democracy? Which are the effects of an early discrimination based on ethnic diversity on second generation's sense of belonging? Which is the relationship between an early discrimination based on ethnic diversity and the political participation of the second generation? How do migrants' descendants manage early discrimination and their formal citizenship in host societies?

In order to tackle these questions, my presentation will move from the preliminary results of a qualitative research on the Italian second generation in Germany and its (still difficult) integration path. Having the German educational system a selective character, children (very often migrants' children) with linguistic and learning problems are directed, in some *Länder*, to attend special schools (*Sonderschule*), compromising their future careers and their social recognition. This can be seen as a form of early discrimination based on ethnic diversity. The effects of such an early discrimination is analysed in relation to Italian second generation's ambivalent sense of belonging and its disaffection towards public life and civil-political engagement, though many Italian descendants are formally German citizens.

Youth Mobility and Cosmopolitan Citizenship. the Italian Case

People's increasing mobility is one of the most evident implication of ongoing globalization processes (Urry and Sheller 2006). Mobility characterises not only many adults' course of life but also numerous young people's biography. Youngsters' increasing mobility – not yet largely analysed (Gabriel 2007; Skrbis et al 2014) – asks to be investigated as a key aspect of contemporary youth condition, traditionally analysed from two different perspectives – 'transitions' and 'cultural' (Furlong, Woodman, and Wyn 2011; Woodman and Bennett 2015). Mobility represents a fertile category to connect these two perspectives inasmuch mobility constitutes both a marker in many young people's transition to adulthood, and a distinctive character of contemporary youth culture.

Nowadays, mobility is a condition experienced both as an abroad educational exchange (more and more widespread) and as a job opportunity to tackle high degree of unemployed young people in our contemporary society (even in the Global North). On one hand, moving and residing abroad for a long time it embodies an opportunity to fuel the process of transition to adulthood (Thomson and Taylor 2005) and a reaction to the 'presentification' of young people's biographies (Leccardi 2005), and, on the other, an occasion to experience (ethno)-cultural diversity and exercise a cosmopolitan gaze. This emerging scenario reshuffles the sense of belonging of young people on the move, who would embody new citizens, namely cosmopolitan citizens.

The paper will present the preliminary results of an ongoing qualitative research on Italian young people – aged between 24 and 34 - who moved abroad in search of job opportunities, new life experiences and social recognition. The focus will be on their motivations for mobility, their expectations for the future in terms of being considered active and conscious subjects as well as fully citizens.

CAMPA, RICCARDO* (*Jagiellonian University at Krakow*)

The Turn to Technological Unemployment: A Paradigm Shift in Economic Forecasting

By adopting the perspective of the "sociology of socio-technical expectations," this paper analyzes recent reports on the future of work and argues that we are in the midst of a turn in economic forecasting in relation to technological unemployment. The problem of technological unemployment has usually been denied by mainstream economics, in particular by the so-called marginalist or neoclassic school, and sometimes dismissed as "the Luddite fallacy." The narration of economists has typically been based on the axiom that "for every job destroyed by automation, a new and better-paid position will become available." Sociologists of work, futurists, and Keynesian economists have sometimes challenged this view by calling it a "myth," but their scenario analyses have been largely ignored. Recently, however, prestigious institutions, usually promoting the neoliberalist paradigm, or at least not hostile to it, are beginning to consider massive technological unemployment as a possible threat. Reports by institutions such as the McKinsey Institute, the World Economic Forum, the Bank of England, and Oxford University, predict that about half of present jobs could disappear within the next two decades because of automation and artificial intelligence. While it is true that new jobs will be created, no existing socio-economic mechanism can guarantee full employment. Outstanding scientists and businessmen (i.e. Steven Hawking, Bill Gates, Elon Musk) have added their voices to the debate by reinforcing the idea that without the intervention of governments, a future of mass unemployment is waiting. In other words, the new narration is based on the axiom that "for every job created by automation, several more will be eliminated entirely," and that the reduction of working hours, or the implementation of a universal basic income, could be answers to this problem.

Japanese Women in Brazil: Gender, Race and Nationalism in the Aftermath of World War II

Mainstream historiography of Japanese Immigration to Brazil pays little attention to women's experiences and their role in key historical events. In the aftermath of World War II, the Japanese-Brazilian community was struggling with the social and economic consequences of President Vargas' authoritarian regime Estado Novo (1937-1945) and its repressive measures against foreign populations associated with the Axis powers. The outcome of the war triggered a major conflict within the Japanese-Brazilian community between "makegumi" (or "defeated", those who accepted Japan's defeat) and "kachigumi" (or "victorious", those who preached the war had not been over or that Japan had won). In the midst of outbursts of violence against Japanese immigrants (by rural Brazilian populations and a "kachigumi" extremist organization called Shindo-Renmei), Japanese-Brazilian women promoted dance performances, popular theater presentations and clubs to raise money for war victims in Japan and "to mend

community ties". This presentation aims to demonstrate how their practices and discourses, embedded in a rhetoric of domesticity and racialized femininity, are pivotal to understand the situation of Japanese-Brazilians in the complex interplay between race, gender, class and political activism in Brazil during the Cold War era.

Their Stories – Technology through the Eyes of Youth

Technology, and in particular social media, are ubiquitous in the lives of young people. At the very least, an email address and internet connection are required just to search and apply for a job. However, it is their immersion in social media which most impacts the day to day lives of youth. In focus groups and workshops with first year university students in Atlantic Canada, I explored with them the impact of social media in their lives, their feelings about technology, and ethical practices for both living and being researched in their online spaces. Through digital storytelling, they provided thoughtful and insightful glimpses into their online worlds. This presentation outlines the ways in which youth understand the ruling relations of technology use and their conflicted relationships with their apps. Hear Adrienne's frustration with using unfamiliar technology and Akinad's story of her attempt to protect her privacy within her social media platforms.

Understanding Young People's Use and Experience of Digital Media: A Multi-Modal Approach

Digital media is a fact of life for many of today's youth. The *Digital Media and Young Lives over Time Project* examined the ways in which youth spend their time engaging with digital media as well as their complex relationship with the media. Following McLuhan (1994) we feel it is an understanding of young people's experience with technology that is of value - "the medium is the message" (p.7). Key to this understanding is the concept of digital capital, a complex set of social processes and relations grounded in digital cultures, but which has yet to be fully examined as it relates to digital media and young lives over time. This study was designed to comprehensively examine the use and experience of digital media among youth aged 16-19 years in Canada, Scotland, and Australia and understand how engagement with digital media translates to digital capital. We employed a multi-modal design which included video-recorded face-to-face interviews with 145 youth participants, a demographic survey, and the capture and analysis of images and text from participants' digital media activity on platforms such as Facebook, Instagram, Twitter, Pinterest, and Tumblr. Data from videos, surveys, and social media platforms were integrated to create a "digital portrait" in both narrative and video form for each participant. Preliminary analysis reveals the paradoxical nature of the relationship youth have with the digital media they feel compelled to interact with on a perpetual basis. This paper will highlight the decision-making processes and challenges required to collect, integrate, analyze, and translate data from multiple modalities within a strong ethical framework.

The Emergence of the "Widows' Village": Examining the Socio-Spatial Reconfiguration of a 'post'-Disaster Community in the Aftermath of Typhoon Haiyan in the Philippines

Disasters are widely regarded as events that result in loss, destruction and disruption of social life, organization, and institutions. Although this has led to a growing understanding of the social impacts of disaster, there is less attention given to what new landscapes of social relations and family life are produced in their aftermath. In this paper, I examine the case of *Barangay 88* in Tacloban City, Philippines, an urban area that was heavily devastated by typhoon Haiyan in 2013. *Barangay 88* is a populous village incurring the highest number of fatalities, most of which are men who stayed behind to secure their houses and property as storm surges destroyed the city. Thus, *Barangay 88* is also known as "the widows' barangay (village)", alluding to the rise of households headed by widowed women who survived the disaster. Here, I investigate how gendered subjectivities, ideologies and identities are produced, contested, and employed through the socio-spatial reconfigurations of this 'post'-disaster village. Specifically, the paper asks how the foregrounding of the "widow/woman" identity influences the deployment of 'technologies of recovery' by state and non-state actors; and how widow/women negotiate their social positions within their community, access disaster assistance, and mobilize their resources to rebuild their lives following

the disaster. In doing so, the paper attempts to explore not only the new spaces of vulnerabilities that widow/women occupy in a post-disaster context, but also the spaces of opportunities for a more transformative recovery facilitated by changes in socio-spatial relations. By utilizing a feminist lens, drawing on an understanding of the intersectional, political, and spatially-situated natures of vulnerabilities and capacities, the paper endeavors to make visible women's narratives of recovery that challenge the appropriation of fixed notions of vulnerabilities that run the risk of perpetuating gendered inequities within and beyond the disaster context.

Does Fathers' Time in Childcare Matter for Child Cognitive Development?

Fathers' involvement in childcare has for a long time been theoretically considered as a boost for children's cognitive skills development. We empirically test this widely spread hypothesis using rich time use panel data from three waves of the *Longitudinal Study of Australian Children* (n=6,173 observations). We draw in developmental psychology's theories to deduct our hypotheses as well as on recent dynamic models of intergenerational transmissions to test them. We examine how fathers' time in childcare affect children's cognitive achievement at ages 4 - 8. We test two different component of father-child time —the quantity and the content of that time. Then, we consider the effect of heterogeneity by paternal education. We find that fathers' quantity and content of time have a positive effects for cognitive outcomes, being educational time the most productive input. In addition, we do not find differences in educational time inputs' effect for child's cognition between high and low educated fathers. The later finding suggests that children from high educated fathers are exposed to higher quality of inputs during non-parental time. Finally, we find that media time with fathers have a positive effect for children in high educated households while it has not for low educated ones. This result suggests that the content of the media, which we cannot observe in our data, differs among educational levels, being those children from high educated fathers exposed to more cognitive stimulating contents during media time. The findings from this paper contribute to the debate about the benefits of men's involvement in family life and the social reproduction of inequality. Implications are that policy makers must take into account effects of fathers' time on child development.

Men's Childcare Involvement before and during the Great Recession: The Case of Spain (2002-2010)

In the last decades in Western societies the gender wage gap has increasingly being reduced while wage gap among socioeconomic statuses (SES) have followed the opposite pattern. The trends towards the widening/narrowing of gender and SES inequalities in the labor market have been accentuated during the late 2000s and beginning of 2010s, due to the Great Recession. However, little is known about how changes in gender and SES gaps in the labor market during the recessionary period have been translated in a critical dimension for the social reproduction of inequalities: time with children. This study aims to analyze whether the widening/narrowing trends of gender and SES inequalities in paid work have followed a similar pattern in the childcare time before and during the Great Recession, focusing on the fathers' perspective. To do so I use two waves of the Spanish Time Use Survey carried out before and during the economic recession. I model the data using Ordinary Least Square regressions to see variations over time and across families, and Oaxaca-Blinder decomposition to explore to what extend variations are driven by behavioral or compositional changes. Preliminary results show that, on the one hand, the gender gap is being reduced, especially in the more time-inflexible and physical demanding part of childcare. This change is mainly driven by compositional changes like the rise of amount of fathers out of the labor force with greater availability of time. On the other hand, we find that the gap between high and low educated fathers has not been widened by the Great Recession.

The Dinamic of Women Theologians in Italy: A Sociological Analysis

The paper on "The dinamic of 'women theologians' in Italy: a sociological analysis" approaches the theme from a theoretical and empirical point of view. It focus, at the beginning, on the role of the 'observers women' present at the Vatican II Council and on others who, from the outside, influenced the debate on women, church, modernity and secularism in the West. The focus of reflection is on the consequences arising in 'feminist/female theology' today through the data

of 'survey' which deals with the universe of Italian Christian women theologians (Catholic, Protestant, Orthodox, etc.).

This paper explores the dynamic of relation between gender, ('women theologians'), and religion, as important dimensions of church's constructed lives. Especially the contribution tries to explore the complex approach to the interactions between religion, gender, and the space of religious intellectuals in the Italian society. Through data of survey understands the contribution of the 'women theologians' in the context of contemporary secularism in Italy.

From a methodical point of view the empiric method used in the survey is a quantitative one by means of a questionnaire with multiple closed.

The questions (hipotesys) are many. When was feminist theology born? What is the rapport between the genders in the Christian Churches? What is the future of women in the Roman Catholic Church and the role of women in the Catholic Church in Italy? What's the role of 'women theologians' in Italy today? There is a discrimination in the Churches (compared to priests and men theologians) and in the societies? What do women theologians think about women priests? The What is their 'dream'? I will try to offer a response to these questions.

Rights Protection for China's New Generation of Rural-Urban Migrant Workers

As the *Hukou* System (residence registration system) became loosened and the inter movements became easier, China has been experiencing a largest population movement in the world. Moreover, as the structure within rural-urban migrant worker group changed, the new generation migrant workers who were born after 1980 have become the main part of the migrant workers, and appear to have new problems and demands compared with the previous generation. Having been directly influenced by China's rapid economic growth and recent socio-demographic policy changes, this cohort of rural-urban migrants have different migration motivations compared to their father's generation, and demonstrate interesting migration patterns.

According to the first-hand interview data collected in March 2017 and August 2017 in Beijing rural area and Guangzhou city and combined with related census statistics of State Statistics Bureau, this paper analyses resettlement projects in relation to 1) *Hukou* System, which no longer prohibits rural labor migration, but still restricts migrant workers' access to public health care, pension system, legal aid, social services, etc. 2) In comparison to older cohorts, new generation of migrant workers is better educated, more aware of workplace rights, and more likely to demand employment protection and decent work, and they are supposed to rely on themselves to struggle for legal rights.

Confidence in the Police By Race: Taking Stock and Charting New Directions

The current study reflects a narrative mega-review of confidence in the police by race. This mega-review has led to two conclusions. First, blacks and whites have different levels of confidence in the police, but the difference between races is a matter of degrees. Second, race is not the strongest predictor of confidence in the police in most multivariate analyses. When variables, such as police contacts and concentrated disadvantage, are controlled for, the effect of race tends to be attenuated and/or sometimes disappear. These results prompt us to urge scholars to chart new directions for future research: fairness and its flip side – injustice – rather than race should be the focus of empirical and analytical gaze. The practical implications derived from this review are twofold. First, central to improving minority confidence in the police is to treat people of all racial groups fairly and equitably. Second, the police and the policed must come to terms and have faith in our democratic system and reform. This meta-review is the first of its kind. We conclude by proposing a template of explaining confidence in the police by race with fairness as the tying knot.

Italian Migration Policies in Times of Crisis. the Policy Gap Reconsidered

Existing studies suggest a persistent gap between restrictive immigration policies and expansive inflows; however how such a gap is reconfigured in times of crisis has not been the object of reflection so far. Focusing on how migration policies have evolved in the 2007-17 decade in Italy in response to the economic crisis that started in 2008 and the migration/refugee crisis that started in 2011, this paper aims to assess how the policy gap underlying migration policies in this country since the early 1990, has been affected by overlapping crises. Our analysis suggests to reconsider current hypotheses on the policy gap—namely the 'client politics' and the 'embedded liberal' hypotheses. While the economic crisis resulted in more restrictive policies and border controls, the migration crisis played a major role in the relaxation of these policies. Yet, both immigrant stocks and migration flows have undergone a moderate increase throughout the decade; furthermore, a relevant aspect characterising new inflows is the declining number of migrant workers and the sharp increase of asylum seekers. This reconfigured policy gap, we argue, is not the result of the pressure by traditional economic actors and civil society organisations, who had been particularly influential in pushing the state to be more permissive policies in the past. It rather reflects contradictions within the institutional sphere, and more specifically between political actors, administrative actors and EU institutions.

Migrant Workers Vs. Brides: The Care Crisis in Southern Europe and East Asia

Existing studies on the link between migration and care regimes have focused on Europe and emphasized the centrality of the care regime in shaping different types of migration flows (e.g. Williams 2012). Recent attempts to go beyond Europe have focused on familialist welfare states in North America and South East Asia (Michel and Peng 2012), highlighting the importance of different notions of citizenship (civic vs. ethnic). Our paper seeks to explain very different patterns of female migration into five countries – Italy, Spain, Japan, South Korea and Taiwan. They are all familialist welfare states, which traditionally relied heavily on the family for welfare provision. Today, these countries all face similar challenges: increases in women's educational investment and labor force participation combined with demographic aging have led to acute care shortages. Italy and Spain embraced the 'immigrant-in-the-family' model by relying on female migrant care workers (Bettio, Simonazzi & Villa 2006), while Japan and Korea relied more on international marriages involving foreign wives from poorer Asian countries (Piper and Roces 2003). Taiwan is an intermediate case as it relies both on female migrant care workers and foreign brides from poorer countries. We explain these cross-national variations in terms of different 'migration regimes.' We define "migration regime" in terms of three sets of rules: (i) availability of employment visas for low skill work and the rights attached to such visas; (ii) the rights of undocumented migrants; and (iii) availability visas for family members and spouses and the rights granted to family members and spouses.

CAPPELLO, GIANNA* (Department of Cultures and Society - University of Palermo)

Digital Labour and the "Social" of Social Media: A Marxist Critique

The Web 2.0 has certainly made it easier for amateur/grassroot/DIY culture to reach unprecedented levels of visibility and creativity. What was once a "piece of work" shared within the restricted face-to-face circles of amateurs and circulated only via traditional forms of mailing, is now boosted into the virtually unlimited digital communities of social media. Not only that. The creativity process itself is changing as its social/collaborative dimension is growing in unprecedented ways too. Of course, acts of creativity (however you define them) have always involved some kind of connection with other people, either directly (in the actual "crafting" of the piece of work) or indirectly as a form of cultural influence. With the emergence of social media this connection is further developed into ever-new forms, means and modes of collaboration, both offline and online. While the positive aspects of this process are undeniable (access to and use of social media are typically free or little expensive; interfaces are typically "friendly" and intuitive;

the commenting and sharing they allow is crucial to build people's self-esteem and expertise, etc.), this contribution intends to offer a critique of it by arguing that the various forms of cultural production being created and circulated in/by social media are in fact a form of unpaid digital labour and that Marxist theory may give some interesting insights to counteract the hyper-enthusiastic and populist myths that often accompany discussions (both at academic and popular culture level) about the "social" of social media.

CAPPELLO, GIANNA* (*Department of Cultures and Society - University of Palermo*)

Turning Leisure into (Unpaid) Labour. a Marxist Critique of Television "Watching" in the Web 2.0.

Watching television has been typically one of the most important leisure activities in people's everyday life. In the contemporary convergence culture, where old media and new media collide (Jenkins 2006), this activity is being reshaped in quite new and unprecedented ways. Connected to and "watched" through mobile devices and social media, television screens are today sophisticated means of entertainment bringing to a radical change both at the level of consumption and production. Broadcasters are rapidly changing their productive and marketing strategies to tune in with the multiples places and practices "networked publics" (boyd, 2010) inhabit and share. While the "augmented" experience of television watching in times of Web 2.0 is undeniably symptomatic of an "active" audience, a Marxist critique of it, as developed in this paper, may give some interesting insights by arguing that in fact it may also be seen as a form of exploitation by a capitalist industry in search of ever-new markets and unpaid digital labour.

KELLY, PETER* (*School of Education, RMIT University*)

Global Grammars of Enterprise/Entrepreneurship

In the context of long run historical transformations in globalising labour markets, the emergence of a so-called 'digital disruption'/'Third Industrial Revolution', and the still unfolding aftermath of the 2008-09 Global Financial Crisis (GFC) *precarity* has become the key characteristic of the contexts in which many young people in the liberal democracies of the OECD/EU seek some 'solution' to the challenges and opportunities of making a 'transition' to adulthood. At the same time that this diffuse and ambivalent, symbolic and material, form of violence (precarity) is profoundly altering young people's working and living conditions, government agencies and departments, educational institutions, businesses and NGOs (for example, regional and national governments, the OECD, UNESCO, EU) are developing and promoting different enterprise/entrepreneurship programs as the primary mechanism to deal with young people's marginalisation, exclusion and unemployment.

Grounded in two on-going research projects related to self and social enterprise/entrepreneurship in Europe and Australia the paper will introduce the analytical concept of *global grammars of enterprise/entrepreneurship* to identify, examine and analyse a number of things, including:

- the shifting, unstable, always strategic power relations between governmental discourses/rationalities of 'enterprise'/'entrepreneurialism' —that can usefully be situated in what Foucault would call a neo-Liberal apparatus that seeks to individualise and responsibilise 'entrepreneurship';
- and the performances and actions of enterprise, the enterprising behaviour and dispositions of persons and groups, the 'vernacular', local, particular, 'translations' of the ideas of enterprise/entrepreneurship that organisations and young people enact in places such as the Basque country (Spain), Melbourne (Australia), and in other contexts where our research 'touches down', including Scotland and San Francisco.

The 'metaphor' of *global grammars of enterprise/entrepreneurship* is suggestive of an analysis that highlights and acknowledges young people's situated, unstable, shifting and fluid performances and enactments of enterprise amid the violence of globalising precarisation.

New Forms of Collectivity Among Youth in the Basque Country (Spain): The Phenomenon of "Youth Premises"

In the last decades, groups of youths in the Basque Country (Spain) have been renting former commercial premises as spaces for leisure and sociality. According to recent data, at least the 20% of young people of the Basque Country is member of this kind of collectivities. The negative image of this phenomenon produced by the media relating them to risk practices and accidents, drug consumption and coexistence problems with the neighbours has increased the political

concern about it. In this sense, most of the city councils of the Basque Country are developing different regulations to standardise this rising phenomenon.

Grounded on two quantitative broad research produced by the Basque Youth Observatory and a qualitative research I coordinated for the city council of Vitoria-Gasteiz, the objective of the paper is to go beyond its definition as a social problem and to offer a socio-anthropological view of the phenomenon. Thus, it will be posed that the institutionalization of these forms of collectivity is closely related to processes such as: a) urban transformations; b) the extension of youth; c) the precarisation of labour and housing markets; d) the implementation of some regulations over the uses of public spaces in the last decade and; f) some cultural features of the Basque Country.

In that frame, the phenomenon takes the form of a collective and creative response that enables young people more affordable leisure and consumption far from the adult-world surveillance. Furthermore, the premises emerge as autonomous social spaces where different learnings such as sharing and managing common goods, or making collective decisions take place. Lastly, the paper seeks to contribute to the session with some developments to the on-going debate in Youth Studies around structure and agency, contemporary forms of govern, the reproduction of youth cultures, and the complex relations between individuals and collectivities.

CARDIEL, JORGE* (*National Autonomous University of Mexico (UNAM)*)

The Use of Technological Concepts and Analogies in Sociological Thought: A Cybernetic Genealogy

Since its foundations, cybernetics and systemics have been interested in recognizing forms and patterns present in biological, technological, social and psychic entities. Both approaches offer a diversity of ontological conceptions; some treat these four entities as systems closed in their operations to each other (as in Niklas Luhmann's proposal), others merge them together (e.g. the biomechanical and the psychosocial individual, as Bernard Scott does). Since the beginning, sociological thought has been occupied with the task of defining its object of knowledge. Far from being clarified, «the social» remains a black box. Depending on each theoretical point of departure, this black box is diversely articulated. However, technological metaphors and analogies have been continuously used in the design of sociological observing systems (to observe the social). Some paradigmatic examples —among many others— are: Émile Durkheim's distinction between «mechanic» and «organic» solidarity, Karl Marx's conception of class struggle as «motor» of history, Michel Foucault's suggestion that humans develop different «technologies of the self» and his investigations of «dispositifs» that produce subjectification, Gilles Deleuze's understanding of humans as desiring «machines», Giorgio Agamben's genealogy of anthropological «machines» and Luhmann's conception of trust as a «mechanism» for the reduction of social complexity. As it can be clearly appreciated in Luhmann's work, the use of technological concepts is often accompanied by transpositions of theoretical biology (e.g. system/*Umwelt*, autopoiesis, symbiotic mechanisms, morality as the immune system of society). I will discuss the genealogy of the use of «system», «machine», «dispositif», and «mechanism» as sociological concepts through some extracts of sociological thought. As cybernetics has shown, the design of systems (and systems for observing other systems) influences the construction of realities. Because of this entanglement, a cybernetic genealogy —which can show how the social is not merely contemplated but also re-constructed by the intervention of the observer— is needed.

CARDIEL, JORGE* (*National Autonomous University of Mexico (UNAM)*)

What Is an Event? Constructing Genealogies and Recognizing Discontinuities in Social Phenomena

The concept of event is central both to critical theory and systems thinking. In Niklas Luhmann's theoretical proposal, a system's ability to maintain and reproduce itself depends on its capacity to link (Anschlussfähigkeit) processed or past events (operations) with actual events (operations). Though Michel Foucault, Gilles Deleuze and Slavoj Žižek, among many others, use it as a philosophical basis for their work, there exists no univocal understanding of it. I will discuss two main epistemological problems —particularly relevant for sociocybernetics— regarding events: 1) The retroactive effects that an event generates on preexisting and ongoing conversations (and their observations via other conversations: second-order cybernetics); and 2) The observer's capacity to distinguish between events in a genealogical timeline, classify some as effectors of continuity and attribute others a disruptive or paradigmatic potential. As in the quantal wave-particle duality, divergent classifications depend on the observer's use of her/his system of observation. As in Heisenberg's uncertainty principle, the processed event —its existing descriptions (and conversations)— is modified by second (or third) observations of the event. To deal with these two challenges, I propose to conceive the interaction between events in coexisting fields of power in spacetime. Inside fields of power, discourses and dispositifs mediate the interrelatedness of events. I will address some of the consequences

when analyzing social phenomena in divergent (but complementary) approaches to the concept of event. Whereas for Luhmann the function of politics lies in its capacity to bind collective decisions (events), for Žižek the political event consists in creating new positions in a given field of power. In the first case, the functional performance of the event is accentuated (as a vehicle for the system to reproduce itself); in the latter, the performative effect of the event (and the openness of the floating signifiers in a field) is emphasized.

Digital Mobilization and Social Movements in Southern Europe Under Austerity

In Europe, southern countries witnessed a great upsurge of protests. Our own transnational online survey (Networked Cultures Survey 2016) found that approximately one third of Greek respondents participated or were present in global protest actions or demonstrations against austerity, followed by 23.8 per cent of Spanish respondents. This may well mirror the sustained period of struggles closely related to austerity and the ability of relevant new parties (Syriza and Podemos) to capitalize on discontent and their involvement in anti-austerity movements. Key aspects of those protests include the role of new media as instruments of mobilization; the combination of material, political and identity claims, and the proposal of new forms of organization, especially horizontal, and of decision making and representation. In this emergent ecology, the borderlines between different types of protest have become less defined and there is a growing cooperation between different actors. Our data suggests that significant proportions of demonstrators, especially from Italy, France and Portugal, were not mobilized through traditional political institutions (unions, parties and NGOs). Furthermore, the crisis and austerity have also had dramatic effects at the level of institutional politics, mainly in the case of the group of countries referred to as the PIIGS. In 2011, Portugal, Ireland, Italy, Greece and Spain, the countries most affected by the crisis, changed their governments before the end of the parliamentary term. Although the ongoing processes of political change in Southern Europe may be shaping up in different ways, one common background condition can be distinguished, namely, the growing importance of modes of engagement through connective types of action (Bennett and Segerberg 2012), that might generate original alternatives to exercise (individually or collectively) autonomous action. Our argument is that communicational changes, specifically in the current context of the networked communication model (Cardoso 2007), also strongly contribute to political transformation.

On Demand Workers and Port Workers in Brazil - Labor Rights Beyond the Employment Relationship

The paper intends to investigate the new forms of work organization, from the case of Uber as a model of work by demand, that expands by other companies whose applications offer the services to users. There is a need to seek legal protection for the workers employed in these businesses, as well as the debate about the existence or not of the employment relationship, according to the interpretation of the gray zones of employment (Azäis, 2004). With the purpose of analyzing the need to guarantee legal protection to workers, it is intended to address the origins of Labor Law, the process of choosing its object and the parallel development of another form of work as the category of "single port workers" to which demonstrates strength from its social movements of claim and demonstrates the need to obtain the same protection that that typical form of work, culminating with the constitutional isonomy conquered in Brazil in 1988. Thus, it is intended to investigate the similarities and dissimilarities of the two forms of work organization cited and to verify the possibility of overcoming the debate about the existence of the employment relationship between the workers and the companies that intermediation of the provision of services with the use of technological tools such as applications, while at the same time guaranteeing legal protection by Labor Law, reflecting the expansionist tendency of the Labor Law frontiers (Davidov, 2017).

Uber Drivers in the Grey Zone As a Public Space: Brazil and France

The employment grey zone is not just the result of "difficulties determining the employer's power in production systems", but more fundamentally of the destabilization of categories rooted in the existence of class. That is how legal systems determine in the courts whether Uber drivers are subordinated or not, how governments determine what rights it will grant them. We propose to study the underlying conceptions of class in recent political treatment of on-demand drivers in Brazil and in France. Brazil because it is in the forefront of legal classification of drivers as employees (Carelli, 2017). France because, with the United States, in a context where declining labor organizations and institutions, it is a foremost example of how the employer offensive is displacing the labor question into the "public space" (Azais, Dieuaide, Kesselman 2017).

The importance of a deeper look at the Uber question goes beyond the limits of its dispute with taxi drivers, since it can be seen as a new model of work organization that may be spread to virtually all sectors of the economy, causing serious problems of regulation and acquisition of rights by the workers, as they are – at least formally by companies like Uber – considered as "partners", "independent contractors" or "entrepreneurs".

And it is not just a model of work organization, but raises fundamental issues of the relationship between work, the worker and society from a global perspective.

"Living in Indigenous Sovereignty" As a Way of Being for Non-Indigenous Supporters of Indigenous Resistance and Resurgence Movements

This paper explores the question: *How can non-Indigenous, or settler, peoples engage ethically and accountably with Indigenous resurgence, decolonization work, and anti-colonial activism?* It advances the ontological orientation of *Living in Indigenous sovereignty*, which is defined as living in accordance with an awareness that we are on Indigenous lands containing their own protocols, stories, obligations, and opportunities which have been understood and practiced by Indigenous peoples since time immemorial. Understanding ourselves to be living in Indigenous sovereignty can reframe the ways settlers engage with Indigenous peoples, Indigenous lands, Indigenous knowledges, and Indigenous resurgence. Within this framework, settlers exercise self-restraint based on respect and acknowledgment of the First Peoples on whose lands we reside, and we become accountable to the natural laws of these lands as articulated and practiced by the peoples Indigenous to these lands. I argue that this orientation prepares us to work in more ethical and accountable ways that better complement Indigenous resistance and resurgence and respond to what Indigenous peoples are asking of us.

Baptist Sociology and the Social Gospel in Canada

Helmes-Hayes (2016) has documented a generation of 'social gospel' influenced sociology (1889-1921) in Canadian Protestant universities and colleges prior to the conventionally noted establishment of the first Canadian sociology department at McGill in the 1920s. This paper provides additional documentation and detail to this account on the basis of archival research at Acadia University and Brandon University, two Baptist colleges, now universities, both with traditions of sociology beginning before McGill's departmental founding. The paper discusses early 20th century connections between these provincial colleges and their urban Baptist big brothers, the University of Chicago and McMaster University, via biographical sketches of early significant figures such as Shirley Jackson Case, Duncan MacGibbon, W. Burton Hurd, and Peter George Mode. Finally, the paper critically assesses some links between sociology and the social gospel as these developed throughout the 20th century.

The critical assessment of the relationship between early Canadian sociology and the social gospel is divided into two parts. First, the paper discusses the 'social gospel' content (or lack thereof) of early (1900-1930) course offerings and reading lists, as well as the publications by the instructors for these courses. Second, the paper discusses connections between early Canadian sociology and two specific political events, the 1919 Winnipeg General Strike, and the involvement of Brandon College alumni Tommy Douglas and Stanley Knowles in the 1930s founding of the Co-operative Commonwealth Federation (now the New Democratic Party of Canada).

RC54-889.1CARNEGIE, ELIZABETH* (*University of Sheffield*)*Written on the Body: Exploring Risk, Danger and the Memorialisation of Fishing Communities through Tattoos*

Following on from exploratory fieldwork with former elderly seafaring men in Hull, this paper focuses on the role that tattoos played in developing and shaping individual and workplace community identity, within seafaring communities and their lasting role as memorials to loss and change. I argue here that the individual body also reflects the collective, 'community body', even the 'global body' within this selected profession, where the body is a 'tool of the trade'. Although fishermen were considered 'rough' and tattoos on fishermen were associated with roughness, meaning they potentially carried a social stigma, associated with a 'tainted' profession all of the men interviewed for this study were tattooed despite knowing this to be the case. Seamen's lives revolved round a cycle of risk and work based danger, punctuated by leavings and (hopefully) returnings. Tattoos were routinely used to identify the bodies of those lost at sea. (Hull has a book of tattoos in the City Archive that were used to identify drowned sailors). Sea-faring men might consciously get 'marked' to aid identification, but also some tattoos associated with fishermen were talismans, worn on the body to offer protection and often drawing on the twin pillars of religion and superstition, or family or the names of vessels. Tattoos were often garnered like souvenirs, a passport stamp on the body, when boats docked overseas. Poor hygiene and basic equipment could result in a more painful, even dangerous experience. This paper examines former fishermen/seafaring communities' tattoo tales as symbols of a sunken and fast vanishing way of life. I additionally examine how such tattoos reflect individual and community loss within a time of rapid change.

RC30-548.2CARNEIRO, BIA* (*Centre for Social Studies/Faculty of Economics, University of Coimbra*)*Social Media As a Strategy for Trade Union Renewal: A Comparative Analysis of the Facebook Presence of Trade Union Congresses in Europe and the Americas*

While the importance of organised labour in securing worker's rights across the globe is undeniable, the rise of neoliberal globalisation has caused significant changes to the labour market, and trade unions have had to respond and adapt to this new reality in order to maintain membership levels, ensure succession and retain their influence. As such, the increasing ubiquity of the Web 2.0 – and, more specifically, social media – in people's lives stands as a possible path to facilitate relationships, strengthen networks, and stimulate trade union renewal. Based on this context, this research uses the Digital Methods and discourse analysis approaches to investigate the presence of organised labour on the social media platform Facebook and the relationships forged with trade union membership, other social movements and the public at large. Specifically, it analyses the main trade union congresses of four countries with distinct social and institutional contexts: Brazil, Canada, Portugal and the UK. While they all have expressive trade union representation, the different trajectories, forms of organising, and economic pressures, among other factors, have resulted in varying communication strategies. A typology for assessing these institutions' use of Facebook as a tool to influence trade union renewal in areas such as democratisation, representation, innovation, and mobilisation will be proposed.

RC23-436.4CARON, CECILE* (*EDF R&D*)*Smart Meters By Domestic Households Receiving: The Weight of the Privacy Controversy*

This communication proposes to explore the links between digital technologies and social life based on the analysis of the controversy around smart meters for the protection of personal data. It is based on investigative work conducted among homes with meters Linky (50 interviews and observations at home) on the territory of Lyon. The smart meter Linky is the object of an industrial program designed the installation of 35 millions meters from here to 2020 in France. The installation of smart meters is accompanied by heated controversy. These controversies are a plurality of issues - health, ethical, economic, safe and environmentally friendly (Danieli, 2016). The results of previous research conducted in North America (Hess, 2014) attributed to the health concern structuring scope in the controversy over smart meters. In France, the question of health play a structuring role in the media coverage of the controversy Linky, including under the leadership of associations and groups campaigning for the protection of electrosensitive people (Draetta, Tavner, 2017). It appears that the controversy surrounding the protection of privacy take certain categories of domestic customers via the contestation of its intrusive nature or ecological efficiency, dimensions that echo the 'energy project' homes (Caron, Durand-Daubin, 2015). The installation of the meter is experienced as an intrusion into a space intimate by customers (often

housed in collective housing and belonging to the small lower middle classes) is recognizing in an energy project focused on comfort and individual freedom. The controversy surrounding the protection of privacy is another category of customers defending a sober energy and digital project (middle classes is sensitive to the issues of environment and health). It is in the social life is rooted the adoption or the challenge of digital technologies and make sense debates, such as the protection of privacy that accompany their dissemination.

Chez les milléniaux, l'utilisation de la plateforme Instagram est très fréquente, notamment en ce qui a trait à la consommation alimentaire, la nourriture et les plats. Notre présentation porte sur les étiquettes des publications Instagram sur l'alimentation. L'étude des mots-clés sur Instagram nous amène à une meilleure compréhension de la socialisation à la norme santé. Le vocabulaire et les expressions d'usage associés à l'expérience de la consommation alimentaire associés à l'image sont-ils porteurs de normes « santé »? Ces mots-clés constituent-ils un encadrement de lecture de l'image et un comportement normé d'une consommation alimentaire? Quel champ lexical peut être associé à la santé dans le contexte de la consommation alimentaire? L'échantillon est constitué à partir d'un corpus de 500 publications Instagram relevées à la suite d'une requête par mot clé évoquant la nourriture ou les aliments ou leur consommation. Un mot-clé sur 5 a été retenu pour un total de 1200. Les étiquettes ayant une vocation commerciale n'ont pas été retenues. L'analyse de contenu a permis de relever un champ lexical constitué des aliments et de leurs attributs, du contexte et des comportements sociaux, des relations sociales et de diverses composantes du bien-être physique, mental et social. L'édition des étiquettes permet d'identifier le filon du circuit d'indicateurs sur lesquels l'instagrammeur s'appuie pour véhiculer sa norme. Quel message l'instagrammeur veut-il transmettre à ses interlocuteurs sur son comportement alimentaire et ce qu'il ressent? Le partage de ces informations à de nombreux abonnés fédère un message normatif certain inscrit dans des modes de vie des milléniaux.

RC15-282.9CARON BOUCHARD, MONIQUE* (*UQAM (Université du Québec)*)*Shaping Food Consumption on Instagram Among 18-34 Young Adults***Shaping food consumption on Instagram among 18-34 young adults****Summary**

Instagram is one of the social applications most used by millennials to broadcast photos, short videos, comments and appreciations on a variety of topics. Food is one of the most popular hashtag use on Instagram. Our paper explores the axes of producing and disseminating of Instagram posts related to the topic of food.

The norm of food consumption is transmitted by family tradition and, among others, by the media and their social environment. What are the standards related to food consumption, throughout the Instagram network? What norms are shaped by young adults to affirm their food choices (products, behavior, staging)? What are the components related to eating behavior, what diet is privileged? The corpus consists of 500 photos published on Instagram by young adults. These were collected in 2015-2017. The sample was drawn from "#hashtags" evoking consumption of food products. Institutional and corporate Instagrammers and other professionals are excluded from this research. The sample is derived from the following variables: gender, social grouping, context and geographic locations.

Our findings reveal that on the Instagram platform, food consumption comes in a variety of contexts and forms: festive meal, celebration of an important life event, social meeting (with family, with acquaintances, friends, co-workers, etc.). It is adorned with a cultural expression of identity, conveying modal standards of an adopted lifestyle. Normative diet trends favored by young adults illustrate both healthy and non-healthy food. We analyse the argument sustaining the content of pictures on Instagram, the food, the attributes of presentation, different contextual factors and their attributes. We discuss how Instagram is a new *locus* of intersection of food consumption engaged by the millennials and its potential for on-line health promotion.

RC15-295.5CARPIER, GEOFFROY* (*Université de Rouen*)COHEN, PATRICE (*Université de Rouen Normandie*)*'Integrative Health' As a Political Project: Institutional Arrangements Towards CAM at the Federal Level in the U.S.*

In 2015, the *National Institutes of Health* (NIH) centre dedicated to medical research on CAM, formerly the *National Center for Complementary and Alternative Medicine* (NCCAM), changed its name to the *National Center for Complementary and Integrative Health* (NCCIH). Instituting CAM as adjuncts rather than alternatives to conventional care, the political decisions behind this semantic shift reveal processes of re-legitimation after crises as well as the critiques and controversies federal institutions had to face in the field of medical research on CAM from the 1990s until today.

These re-legitimisations at the federal level now revolve around the emerging project of 'integrative health' in the U.S. in answer to non-federal and multiform configurations taken by the promotion and practice of 'integrative medicine' (consortia, academic hospitals and research units, private clinics, professional groups, etc.). 'Integrative medicine' has already been through processes of legitimisation since the 1990s (such as evidence-based and standardised practices). In 2008, 'integrative medicine' became an official physician specialty. In fact, both federal and non-federal legitimisations towards integration are now being articulated together.

Based on a networked ethnography of those institutions and their related network of interactions, this presentation will show how those double processes of legitimisation are still set in place through interactive institutional arrangements. Nonetheless, this double legitimisation towards 'integrative health' does not always meet the general consensus and is confronted by oppositions and resistances from both federal and non-federal agents and institutions, notably when cancer is concerned. These institutional arrangements bring into question not only conflicting places assigned to CAM within the American health system but also the construction of various CAM categories and the particular place assigned to them within research protocols and their translationality, thus fostering new challenges to medical research.

CARREIRA DA SILVA, FILIPE* (*ICS, University of Lisbon*)

Rethinking Populism

This paper advances a new understanding of populism, its origins, how it relates to democracy and how it functions. It begins by discussing the existing approaches to populism. In section 2, it addresses the Janus-faced character of democracy as the most inclusive and the most exclusionary form of government and considers democratic resentment as a necessary result of this exclusionary dimension. This is followed, in section 3, by an analysis of how populism constitutes a dimension of political culture associated with democratic resentment: rather than an immanent transcendental logic à la Laclau, the populist logic of resentment is seen as a dimension of political culture. To understand populism is to understand how the logic of resentment can be articulated in the name of 'the people' against an internal enemy. In the conclusion, the paper enumerates the advantages of this approach to populism vis-à-vis existing ones and points to future avenues of research.

The Gender Regime of International Security: Revisiting the Gap between National and Global Policies

More than one and a half decades after being launched, the 'Women Peace and Security' agenda that ensued from the approval of UNSC Resolution 1325 in 2000, has been evaluated as lagging behind its initial promise. Reports from the UN, NATO, the EU or OSCE have highlighted a variety of challenges that still hinder the effective implementation of the resolution and the ones that followed. Among these are a lack of awareness and slow progress concerning the development of a gender perspective in international operations and the still limited inclusion of women at the various levels of conflict management and peace processes. In this presentation, I review those various challenges and focus on one critical factor: the articulation (or the gap) between national policies on gender mainstreaming and integration in military forces and the gender policies of international security organizations. Based on available empirical information from a variety of case studies and more general reports, the paper puts forward the idea that the disjuncture between these policy levels explains, to a large extent, the problems that have been identified. Accordingly, it calls for greater attention being attached to national state policies and the need to strengthen tools and mechanisms for effective articulation between global goals and national policy-making.

Golden Cages to Poor Children

This paper emerged from the doctoral research: The mothers, families and children of the south: Ethnographic views of child protection in the city of Bogotá. The research aimed to examine struggles of institutional child protection involving local and national institutions who are responsible for the safeguarding of poor

children, that in their judgment are not well taken care of. The study highlighted the intervention practices and representations of public servants – responsible for children under protection –, children and their families. One part of the ethnographic field work was carried out in a centre of child protection, where children were 'confined' as a modality of legal institutional protection.

In this centre, as in other children's education settings, the modulation of the voice and the body of the 'child' was only given meaning and recognition through the subject recognised as an adult (Milstein and Mendes, 1999). Thus, different ethnographic activities were carried out to hear the accounts of 'confined' children about social and institutional control exercised on themselves, their mothers and families. A theatre play was one of the spaces in which children expressed the social suffering they experienced when they became 'subjects of institutional protection'. Children expressed anger toward their condition of being institutionalised and they confronted those who mistreat them. At the same time, children demonstrated strategically their compliance with dominant ideas of institutional justice, which was performed as revenge.

The analysis of this play revealed children's implicit knowledge (Taussig, 1989) of institutional and legal practices from which they are subject to. Children conjugated sarcasm, critique and euphoria to perform the power exercises of civil servants toward the domestic units, the way in which care practices and family relations are impugned and the privation of freedom as a privileged way of justice.

Labor Strikes in the News

A qualitative content analysis has been applied to a sample of news related to labor strikes from three major newspapers in Spain. Results suggest that news media mainly focus on the immediate negative consequences of the strikes rather than on causes and further explanations. Strikes are portrayed as isolated occurrences that happen because of disagreements between specific companies and workers. The attention is put on events (demonstrations, disorders, economic losses, etc.) and not on the structural causes of the strikes: the contradiction between capital and labor and the consequent tension among social classes. As a result of the frame applied, strikers and their organizations are delegitimized and therefore isolated from public opinion.

Democratización Subnacional y Control De Las Decisiones Sobre Los Asuntos Públicos: Análisis Comparado Del OP En Porto Alegre, Brasil y La Amp En Cárdenas, Cuba

El presente trabajo tiene como objetivo comparar la experiencia del Presupuesto Participativo (OP) en Porto Alegre, Brasil y la Asamblea Municipal del Poder Popular (AMPP) en Cárdenas, Cuba, en lo referente a sus respectivas contribuciones para democratizar las decisiones sobre los asuntos públicos.

Con ese propósito se analiza la forma en que ambas experiencias facilitan la incidencia de la población en una de las áreas fundamentales asociadas a los procesos de democratización. En este caso: el control de las decisiones sobre los asuntos públicos, por parte de los residentes en dichos territorios.

En términos metodológicos, el estudio se desarrolló a partir de una metodología cualitativa, sustentada en una comparación sincrónica orientadas por casos diferentes. Los principales métodos empíricos utilizados fueron: entrevistas semiestructuradas (para especialistas en las temáticas tratadas en ambos países, actores gubernamentales y ciudadanos) y el análisis de documentos. Los resultados obtenidos demuestran, de forma reflexiva, algunas de las semejanzas que presentan tanto el OP cuanto la AMPP, en cuanto a limitaciones como experiencias de democratización, que dicen a respecto de sus tendencias al pro-desarrollo y a la revitalización del territorio. Eso todo, a pesar de las diferencias (económicas, políticas, culturales) en las cuales se han desarrollado ambas experiencias participativas.

Developing New Forms of Sociability in the City: Analysing the Neighbourhood Experience in Porto Alegre

The article analyses how groups of people are organizing themselves in order to promote sociability in the urban context of Porto Alegre, a Brazilian town over one and a half million inhabitants. The chosen methodological to do the research was a qualitative approach through the case study of the "Neighbourhood Project". The Neighbourhood Project is an experience going on in a middle class area of the city of Porto Alegre, which aims the development of social relations based on values. It has as strategie, the promotion of "public parties" where common

citizens presents gastronomic, cultural, educational, recreational, sports, nature and music activities. The principal means of dissemination used to invite the community to participate of those meetings, are social networks, as well as "body calls the body" and the distribution of printed material in the vicinity that it is supposed to receive the "happning". This initiative is an invitation to encourage fraternal coexistence between neighbors based on intersubjectivity exchange, as conceived by Habermas, in order to overcome the anomie of contemporary urban life of life.

Regime of Obstruction: How Corporate Power Blocks Energy Democracy

This paper reports on an interdisciplinary research partnership that probes the multifaceted ways in which the organization of corporate power in and around Canada's carbon-extractive sector blocks a transition from fossil capitalism to energy democracy. Our approach is centred upon a family of techniques that *map* the organization of power, socially, economically, politically and culturally. These include analyses of (1) the social networks through which power and influence flow, (2) the commodity chains along which carbon extraction, processing and consumption occur, and (3) the discursive structures that frame issues and narratives in the struggle to persuade publics, governments and communities as to the desirability or inevitability of fossil capitalism as a way of life. After presenting a conceptual framework for understanding the distinct modalities of corporate power the paper presents findings from three research streams of the partnership. The first stream highlights the structure and dynamics of Canada's carbon-capital sector, its various linkages to regional, national and transnational capitalist structures and agencies, its extractivist logic of accumulation by dispossession and the business strategies carbon-extractive corporations are adopting in the current era of chronically low fossil-fuel prices and the increasing risk (to fossil-capital investors) of stranded assets. The second stream focuses on the struggle for hearts and minds – i.e., the networks and practices through which carbon capital strives to secure popular consent and to coopt, disorganize or marginalize dissenting perspectives. This includes, significantly, the reach of corporate power into Indigenous communities whose land claims and collectivist traditions often stand in the way of oil and gas infrastructure (and who have suffered the worst environmental and health impacts from carbon extraction, as part of ongoing colonization). The third stream considers emergent forms of resistance and counter-power, some of which point beyond fossil capital, to alternative energy futures.

Reconceptualizing Resilience and What It Implies for CCA, Drr, and Sustainability Development: A Sociological Pespective Stressing Socio-Cultural Dimensions, Human Agency, and Innovatiioin

The use of the term *resilience* has virtually exploded in the past decade, yet its usage points to wildly differing meanings and applications. Among the most widely used definitions, it is defined as the capacity of a [system](#) to respond to a perturbation or [disturbance](#) by resisting damage and recovering quickly (this is among several definitions critically discussed in the paper). Interdisciplinary theoretical discourses on resilience now include consideration of the interactions of humans and ecosystems by means of models of socio-ecological systems, and entails a shift from the [maximum sustainable yield](#) paradigm to [environmental resource management](#) that aims to build ecological resilience through [adaptive resource management](#) and [adaptive governance](#)".

The paper criticizes the mainstream conceptualization of resilience for its flat portrayal (and all-too-often neglect) of socio-cultural dimensions, the role of human agency, and innovative and creative activities. Drawing on a wide range of relevant sociological research, the paper offers an alternative conceptualization. It emphasizes: (1) the socio-cultural and institutional context of resilience processes; (2) the socio-political capacity of entrepreneurs to mobilize human agents and resources (including economic and technical resources) in response to systemic disturbances; and (3) the capacity to initiate innovation processes and produce creative responses and adaptations to systemic disturbances. Cases of municipalities and local communities are presented and analyzed in this new perspective.

The paper concludes by discussing the implications of the reconceptualization for CCA, DRR, and Sustainability Development.

BURNS, TOM R (Uppsala University)

The Theory of Public Policy Paradigm Shifts -- Application to Selected Environmental Policies: A Social Systems Theoretical Perspective

This paper conceptualizes public policy paradigm shifts in areas of environmental policy. Drawing on earlier work utilizing a social systems approach (ASD), the paper specifies the architecture of public policy paradigms and the mechanisms that contribute to shifts or reforms in paradigms. The theory is applied to major paradigm shifts in international agreements aimed at environmental protection, in particular, bio-diversity policies. The shifts entail a reformulation from protecting specified individual species, locations, or environmental features to a more systemic perspective that emphasizes ecosystems, biodiversity, and system interactions that include people. In short, it is a shift from a very particularistic, differentiated view of nature in terms of individual flora and fauna to a much more holistic view. The research presented (theory and empirical cases) indicates that such shifts consists of multiple changes: in goals, responsible agents, expert groups; also, changes in problem definitions, conceptualizations/models of the problems, the solution complex, the particular methods and technologies to be used in solutions. The article applies the theory to Nordic area cases of major policy shifts in the regulation of the use of water resources and wetlands as well biodiversity generally.

Agency in a Digital Society

Digital technologies are currently part of greater transformations of society. A range of sociological analyses focus on the related intensification of economic and political power relations, note the establishment of new regimes of surveillance, self-disclosure, (self-)exploitation, discipline, and control, and consider digital technologies to be neoliberal and governmental tools. Reasons cited for these negative scenarios are the power of the large internet companies; the scope of platforms, bots, robots and algorithms which increasingly shape human actions; and self-tracking apps which lead us to a new stage of monitoring and self-control. Furthermore, digital technologies are ubiquitous and thereby often invisible, producing data continuously.

These approaches address important sociological issues. However, it would be inappropriate to consider the use of digital technologies only as a practice of subjection under these new demands. Neglected in these are perspectives asking for individuals' own strategies and how individuals contribute to and shape digitalization. Using data from a number of empirical projects on the use of digital technologies at work, in everyday life, and for political activism, I would like to further develop a concept of agency in the digital age. My interviews and observations show a variety of practices which reveal obstinate or resistant adoptions of new technologies. Alongside a range of productive usages which strategically try to meet the requirements of digital technologies, we can observe different ways of personally evading digital demands. Furthermore, it becomes obvious that the technologies are often reason for struggles, modifications and negotiations.

This paper will develop a micro-sociological perspective on these digital transformations, focusing on the room to maneuver within the process of digitalization. I will conceptualize the questions of how individuals contribute to digital transformations, how they negotiate technological and social changes, and in how far they become obstinate, passionate, stressed, dismissive, or resistant actors of digitalization.

CARSTENSEN, TANJA* (LMU Munich)

New Relationships between Work and Family through Digitalization?

Working conditions are currently shaped by a variety of new digital technologies, especially mobile and smart devices, social media, and collaboration platforms, which have changed the organization of work times, spaces, tasks and demands. The increasing professional use of these technologies establishes the normalization of a new kind of flexible work: Nearly every time and every place, such as weekends, evenings, hotel rooms, trains, living rooms, and playgrounds, can be used for dealing with work tasks; every moment becomes a possible work situation.

For a long while, new technologies and the flexibilization of work have been connected with hopes of new arrangements of job and family life. This issue has

to be posed anew in times of digitalization. I would like to pursue the question of how far this new working "any place and any time" is changing work-family relations. My paper is based on the first results of an empirical study ("Transformations of Gender Relations through Digitalization", LMU Munich), which refers to case studies in German companies which offer digital, mobile, and flexible work arrangements. I would like to consider how arrangements between job and care demands have changed with digitalization, as well as examine to what degree new facilitations and burdens have arisen. When, where and how do employees use digital technologies for work, and how do they organize their everyday lives with them as helpful tools? An assumption I will investigate is that with new technologies the challenge to balance job and family is solved by individualized multitasking, by working "here and there," and by a range of optimizing tasks which, ultimately, make the high demands found in both areas more invisible than visible. In all probability, the unequal and gendered division of work and family tasks will not be affected by digitalization.

The Continued Importance of Marriage in the Family Life Course

Recent sociological research in the UK has increasingly emphasised de-centring the couple relationship, with authors insisting on the importance of friends and significant others, children, being alone, and even pets. Indeed, the turn towards 'personal life' was a response to a perceived over-reliance on notions of 'family' and 'couples' that have problematic associations in politics and policy, which view 'family life' as static and homogenous. Alongside this critique of 'family', sociological research has also pointed towards significant changes in family life, heralded by individualism and the 'transformation of intimacy' and evidenced by growing cohabitation rates, increasing numbers of births outside marriage, and the identification of living apart together (LAT) relationships. There remains, however, somewhat of a mismatch between these trends which suggest the breakdown of secure life pathways, and attitudes reported in British national surveys which continue to show attitudinal support for marriage, co-residence and monogamy. Thus, despite both the sociological turn in family studies, and the perception of change in family life, there appears not to have been a simultaneous shift in public discourse; 'family' and coupling still hold significant meaning for individuals, both discursively and materially. This paper will, therefore, aim to answer the following questions: why is marriage still important to people, despite the changes and perceived insecurities in family life? And in what ways has the decision to marry changed in the life course? These questions will be addressed using a qualitative interview study with young women. These accounts demonstrate that despite, or perhaps because of, the changing social landscape in which their relationships played out, marriage re-emerged as a stable anchor in an unstable context. Thus marriage now represents a choice to commit to a sense of stability rather than the required entry to adulthood and independence marriage represented for preceding generations.

Public or Private? Daytime or Nocturnal? Which Field of Study? How Did Blacks and First Generation Students Accessed Higher Education in Brazil between 2000 and 2010.

Between 2002 and 2014 the Brazilian higher education system had a growth of 80% in its conclusion rates. The system grew from 466,200 to 837,000 students. During the period, several public policies were implemented to foster access in HE, both in the public and private sector. The purpose of these policies was to make the system more permeable for blacks and students of low socioeconomic status. The scope and speed of these changes makes Brazil an ideal case to evaluate how race and socioeconomic status shape the access of historically excluded groups in access to the higher education system in the country. Our aim in this paper is not only to investigate if access was broaden, but also *where* it occurred, mainly through the incorporation of field of study and two other crucial dimensions that structure the horizontal inequality in the Brazilian higher education system: sector (public or private) and shift (day or night). Through a conditional logit modeling strategy, we incorporate these institutional characteristics to understand how ascriptive characteristics (SES and race) operate differently to allocate students in the previously mentioned dimensions at two points in time. We use six databases constructed by the Brazilian Ministry of Education that are representative of students who finished higher education in 2006-2009 and 2014-2016, pre and post expansion contexts. Our empirical strategy will allow us to understand the heterogeneity of racial and socioeconomic effects across time taking the institutional characteristics of the Brazilian higher education system into account. In dialogue with the international literature, we can evaluate if Brazil is a case that fits the pattern of effectively maintained inequality or if redistributive initiatives such as the policies mentioned above operate in order to change the direction of inequality of opportunities in the country.

Naturalisation and the Birth of 'new' Citizens - Assessing What Is to be a National Citizen from the Perspective of Naturalised Citizens in Portugal

This paper derives from a project (Pluridemos) that aims, among other goals, to assess how the new Portuguese citizens of migrant descent experience their full citizenship; to map their visions about the meanings of Portuguese national identity, and to reflect on how such meanings may collide, complement, change or reaffirm the common visions that tend to be more common about Portuguese national identity. The Portuguese Nationality Law, defined in 2006, has been considered one of the most progressive in Europe and is often evaluated as the best example in integration policies (Huddleston et al 2015). Following one decade of its implementation, thousands of persons acquired Portuguese citizenship. According to Oliveira and Gomes (2016) between 2007 and 2014, Portuguese nationality was granted to 310,693 individuals, with a refusal rate of 5.7%, which contrast with 14,865 concessions with a 30% rejection rate in the period between 2001 and 2006. The paper explains, first, that the country's bailout did not have a negative outcome on the legal frame and on the rates of those interested in acquiring Portuguese nationality. In other words, the Portuguese Nationality Law still keeps its initial glamour that attracted thousands of new Portuguese citizens. Second, the paper addresses the question: what is to be a "Portuguese citizen" from the perspective of the new citizens; what is that they value most in their identity definition; and, most in particular (following previous research interests) we assess how they describe and evaluate their own citizenship experiences regarding political rights in Portugal. We deem these questions as very important in order to understand the role that "new citizens" may have in the active and continuous making of "national identity" as a collective, dynamic, and non-fixed project. Hence also our choice for this Session as the best to accommodate our work.

Family Support and Youth Transitions to Adulthood: Unveiling Its Impact, Interdependence, and the Role of Young People

Changes in transitions to adulthood have been associated with changes in families and in the support parents provide young people. Studies have stressed extended parenting and its role in enabling young people to experiment their education, labor, and life-style pathways with fewer risks. But research in this area has been insufficient. Youth and family support has been mainly focusing on housing provision in the parental home, rendering invisible many other forms of instrumental and emotional support, such as monetary transfers, advice, companionship, household chores or general caring. Studies have mainly looked upon this support in a unidimensional direction, with young people as receivers, and thus support provided from young people to their parents or family has not been addressed. Finally, although a life course perspective has been increasingly adopted to study youth trajectories, its linked lives nature has not been fully explored.

Using quantitative (n=2942) and qualitative (n=70) data from a cohort study on young people born in 1990 in Portugal (Porto), assessed at age 13, 17, 21 and 24, the aim of the paper is to explore and challenge understandings of intergenerational support during transitions to adulthood. Data regarding leaving parental home and its reasons, as well as financial and social support received and contributed by young people, will be presented. Moreover, case studies that illustrate the role of young people in family support will be shown.

Overall results stress: i) the need to further explore conceptualisations around intergenerational family support; ii) how this support can stress the impact of family background and reproduce inequalities on transition to adulthood pathways, especially in contexts where other support mechanisms are scant; iii) the interdependence of family and its members, especially in contexts under economic crisis; iv) and, the recognition of young people also as an active agent in providing family support.

Militarism, Order and Violence: Historical Aspects of the Dictatorial State in the Construction of Democracy in Brazil

The military coup of 1964 and the twenty-one years of dictatorial rule that followed in Brazil generated profound marks in the national institutions, with strong repercussions in all spheres of Brazilian society, such as the economy, politics and education.

The New Republic project, especially demarcated after the 1988 Constitution, did not break with the governmental model impregnated by the practices of per-

sonal favoritism, social exclusion of participatory processes and State violence, largely carried out by the Military Police.

The present work intends to investigate these complex relations of continuities between the recent past and the present, the resistances and the social representations of order in the daily life of Brazilian democracy.

Europeanisation and the Emergence of 'New' Knowledge-Based Occupations

The so-called knowledge society and knowledge economy can be interpreted as a meta-narrative or as a governance tool to accomplish European integration. A chronological analysis of the emergence of knowledge society/economy as a governance tool takes us to the Lisbon Council (CEC, 2000) as the pivotal point, for the consolidation of the discourses that set the policy direction for the subsequent period based on the idea of knowledge society. The emergence of knowledge society notion as a meta-narrative for EU governance leads to a paradoxical position of the EU. While, along with European Central Bank and the International Monetary Fund, EU has identified regulations of professions as one of the main causes of the economic crisis (European Commission 2014: 56), it simultaneously promotes the emergence of 'new' professional group associated with knowledge production.

The overall aim of this paper is to discuss the possibility of the emergence of researchers as a professional group in the framework of the knowledge society and the European Research Area (ERA). To be a researcher in Europe is something quite vague, hardly linked to the concept of a 'profession'. To discuss this further we will approach the general concept of what can be defined as a 'profession', using the contributes of the sociology of professions (Freidson, 1986; Johnson, 1972; Larson, 1977) and assuming that professional groups are different from occupational groups. Using the Portuguese case as an example, based on content analysis of public policies and national statistical data, the paper sustains that competition is the main value underlying the creation of this profession and precariousness questions the idea that knowledge legitimates a differentiate statute and privileges of a professional group in society.

Field Movements, Mining, Social Transformations and Everyday Resistance in Rural Communities of Minas Gerais

This work aims to analyze the everyday resistance of peasants impacted by the largest mining project in Brazil, the Minas-Rio iron ore pipeline. In the face of the rupture of traditionally existing social relations, the aim is to show the analytical relevance of mobility, honor and everyday resistance in the violent expropriation of peasants by mining. This analysis is based on the main categories of the composition of memories of the *social myth of the golden age of the village community*. That is, the set of social representations of the peasants, according to their experiences of social organization, of a *subsistence ethic* and its interpretations, handled before the deep feeling of destitution that they were submitted. Through the displacements of the peasants, to produce their subsistence, between the farms and the lands of family inheritance, in the so-called *field movements*, it constitutes the synaesthetic universe of sounds, cold, reciprocal gifts, obligations and customary notions of law that the peasants mobilize as an expression of their dignity, pride and honor of *life in the field*. *Life in the field* thus becomes a category that represents a moral network of obligations - give, receive and reciprocate - that reveals a know-how of their cultivation techniques, the organization of time and spaces. In the social structure in which they find themselves and in the face of the repression they live under the taking of their inheritance lands, the loss of parcels of land they produce on large farms, family conflicts and neighborhood conflicts caused by the mining *ethos*, barriers to claims by roads formal and profound sense of destitution, the mobilization of such a category becomes the main weapon of the peasants and marks a form of everyday symbolic resistance, more specifically a resistance of the honor of life in the field.

CASANOVA, JOSÉ LUIS* (*CIES-ISCTE-IUL*)

Climate Change and Human Values – a Transnational and Cross-National Analysis

A significant amount of literature demonstrates a clear relation between values and engagement on environmental issues, and a recent publication by Corner, Markovitz and Pidgeon underlines the relevance of studying the specific relation

between Human Values and public engagement with climate change and makes a review of the research under this topic.

Previous empirical research also shows a systematic gap between values and practices related to climate change, with most people frequently valuing concerns about climate change but not always acting accordingly.

The objective of this paper is to contribute for this work by updating results on the relation between Human Values and public engagement with climate change, and examining that gap, introducing transnational and cross-national analysis of the data of the last round (2016) of the *European Social Survey* that includes a module on "Public Attitudes to Climate Change".

The transnational analysis is focused on the relation between Human Values (as defined by S. H. Schwartz and operationalized by a set of 21 indicators in the *European Social Survey*) and public attitudes to climate change. Here we also investigate which Human Values associate with a smaller gap between values and practices related to climate change, and if the association between Human Values, social class and socio-demographic characteristics helps to understand that gap. To operationalize social class we use indicators also available on the *European Social Survey* (mainly occupation, education, and income as a supplementary variable).

Cross-national analysis allows us to compare public attitudes to climate change in different countries, to evaluate distinct gaps between values and practices among countries and to verify if 'national culture' is stronger than Human Values in its relation with attitudes to climate change.

CASANOVA, JOSÉ LUIS* (*CIES-ISCTE-IUL*)

CARVALHO, MARIA (*Centre for Research and Studies in Sociology - Portugal*)

Climate Change Mitigation and Civic Education

Literature demonstrates that social class and education in particular differentiate attitudes towards climate change, and people most involved in mitigation of climate change are professionals and those with extended schooling, but some studies show that the most involved are not necessarily those with higher income or with a university degree.

Research also shows a systematic gap between values and practices, with most people frequently valuing concerns about climate change but not always acting accordingly. And this gap doesn't seem to vary significantly with social class and education.

In this paper we analyse if this gap, consistent involvement in climate change mitigation and activism depends not so much on class in its broad sense and on years of schooling but above all on the type of education, specially on civic education and its manifestation on fields of study in tertiary education, occupation, values and civic action.

For this purpose, we present a transnational analysis with data from the last round (2016) of the *European Social Survey* that includes a module on "Public Attitudes to Climate Change" and indicators of education, occupation, income, human values and civic action. Since empirical studies show that attitudes towards climate change also vary among nations and this database allows for cross-national comparison, we integrate cross national-comparison in this paper testing if those variations among countries are associated with prevalent national types of education.

This cross-national comparison also uses the *IEA International Civic and Citizenship Education Study* (1999-2016) that directly compares civic education among different countries, the *Environmental Performance Index* that encompass high-priority environmental policy issues, and *OECD Reports* "Education at a Glance", "Social Indicators, Household Income", and "Society at a Glance" that contain information on tertiary education, fields of study, and income.

CASEY, CATHERINE* (*Loughborough University*)

Organizations and Democracy: Contemporary Conditions, Recurrent Demands

Decades of neoliberalism as the dominant economic ideology influencing much of the world have seen many accomplishments of democratic societies erode and decay. Critical academic debate frequently focusses on crises of capitalism and on concerns for a post-democracy emerging under the rise of super-powerful multinational corporations and their markets that dominate politics and societies.

Macrosociological analyses currently set a lead in documenting bleak, counter-social trends in advanced capitalism. Yet they suggest, too, that the various crises confronting societies propose a new indeterminacy in social relations. That indeterminacy may worsen risk or open new horizons for social futures.

In this paper, we take a view that social institutions are capable of renewal and transformation even as they are susceptible to decay and regression. Apparent macro trends may be diverted and plural outcomes forged by different constellations of social actors in various social settings. We proceed, in accordance with sociologists since Weber, to recognize organizations are core sites of social action. What goes on in economic organizations can, and does, shape the social world in which we live.

This paper considers contemporary conditions and demand for forms of industrial, organizational, and workplace democracy. It discusses research in organizational and employment relations studies in different national settings that proposes that organizations can be, and are, enacted in ways that mitigate and may redress the trajectories observed of an increasingly fragile global capitalism. We focus on demands and programmes for employee and management participation and their outcomes. The paper further explores a proposition that widening political recognition of social inequalities and unfairness may stimulate multi-level social responses that may catalyze organizational and social change. Demand for innovative and progressive democratic regulation may take shape at the organizational level of society.

Weaknesses in the Recovery of Unpaid Wages in Ontario and Options for Reform

The recovery of money owed to employees is a central function of the complaints system established under Ontario's Employment Standards Act. Yet, the Ministry of Labour continues to experience difficulties recovering unpaid wages from employers who have engaged in wage theft and are issued an Order to Pay Wages. Indeed, only a minority of such employers comply with such orders. The low rate of recovery is deeply problematic because it leaves employees with little more than unenforceable paper victories, and implicitly suggests to employers that they will not face consequences if they choose to ignore the Ministry of Labour. Drawing on an analysis of administrative data, this paper analyses the driving factors behind low rates of wage recovery from employers who have been issued Orders to Pay Wages and who are solvent. Based on a scan of recovery mechanisms in place elsewhere, the paper also explores options that may enhance the recovery of unpaid wages including the introduction of a government-run wage protection fund, wage liens, business license revocation and other measures that make non-compliance with orders costly.

BAILEY, SIMON (*University of Manchester*)

PIERIDES, DEAN (*University of Manchester*)

The Good of the UK National Health Service, As Such

The question of how to coordinate the UK National Health Service (NHS) has been answered by drawing on a variety of discourses which constitute it as a *system*, *institution*, or, more recently, a *brand*. The formal organization that follows these conceptions is rarely considered with respect to organizational conduct because academics and politicians often assume, implicitly or explicitly, that organizational forms will adequately reflect and advance a particular set of values commonly held at any given time. These assumptions often demonstrate themselves to be problematic when one or another set of values becomes threatened by supposedly targeted reforms. For example, the introduction of a new legislation can be perceived to disrupt and fragment professionalised bureaucracies, or a national IT program can put into question the meaningful existence of a single 'NHS organization'. In analysing contemporary political reforms to the NHS, we build upon Chester Barnard's contrast between *lateral* and *scalar* formal organization, in order to shift the discussion about coordination of the NHS from a fixation on the successive ills identified in its history and present, to an elaboration of the forms of conduct appropriate to each kind of organization, and the dysfunctions inherent within each, which one should expect, and seek to govern by appropriate means. Barnard's thinking allows us to show how the surfacing of inherent tendencies toward self-destruction in different systems of organization have not only been used to justify successive 'knee-jerk' reforms at the expense of "the good of the organization as such", but also that the good can be better realised by adopting a pragmatic stance that treats the NHS as an object of ongoing coordination and cooperation.

Interviewers' Comments and Invisible Violence about Home

During the data collection processes using questionnaires, space for comments may be provided. It can be related to the evaluation of the process in order to assess the reliability of the answers, but also it can be related to answer details, for example in order to explain the content of the "other" category, which may be chosen among other defined categories. While the purpose of these comments may be clarified while designing the survey, sometimes the delimitation of their

content is blurred, in the sense that interviewers may add all the elements they would find useful.

The aim of this article is to analyze this sense of usefulness and its relationship to contemporary power issues. In the 2006-2007 edition of the Housing Quality Survey in Wallonia, such a comments box was available. Overall, it was filled for 1500 questionnaires out of 6018, i.e. 25% of all the questionnaires. They shed light on what interviewers think it is worth and important communicating beyond the content of the dataset. Which is the voice that can be formed on this basis?

These comments may be related to three issues. First, they may be indeed related to precision regarding the survey process. Second, they may be redundant with the content that was coded. Third, they may be judgmental. Beyond this classification of interviewers' voice, its content reveals an invisible violence of interviewers about the interviewees and their home, while being inside their home.

Researching Home and Identity. Insights from an Educational Field Research

Since the end of the 1960s, the Department of Sociology of the University of Strasbourg established educational field research for students to learn doing research while being confronted to a thematic they are involved in. Several thematic are offered, and students may keep the same during several semesters, which enables them to build them as a sociologist through an expertise already since their undergraduate years. For teacher and researcher, this is a unique opportunity to transmit research methodologies, and reflect upon them while advising students researching. The "Housing, identity(ies) and work" educational field research was launched in September 2017. Students may choose qualitative, quantitative or mixed-methods according to how they appropriate the thematic.

In this presentation, we conduct a *mise en abyme* analysis of housing and identity research. Indeed, we may first observe how students experience researching home in relation to identities: we conduct a meta-analysis of the various ways they enter in the field. Second, our analysis is also informed by own field research entering home in relation to the link between housing and identity(ies). The grounded-analysis aims to shed light on empirical research conditions and results in relation to researching home and identity at home.

CASTAÑEDA SABIDO, FERNANDO* (*Universidad Nacional Autonoma de Mexico*)

Universalism, Particularism and Populism

Universalism, Particularism and Populism.

Classical sociological theory distinguished modern societies by the universality of its institutions.

For the classics modern societies were universal in at least three aspects: by their space / time reach, they tended to convert the world according to their forms; because everything was socially mediated, even the most basic needs of human beings depended on society; because modern social institutions were capable of processing social and human diversity as no later institution.

Unlike the classics, Niklas Luhmann considered that modern systems are universal and inclusive but at the same time are partial and exclusive.

The truth is that in all Western and non-Western societies there is a tension between universalism and particularism that is the product of modernity. This has happened in the past and occurs in the present and one of its consequences is the strengthening of authoritarian, personalized leadership that violates the formal, abstract institutions of modern societies. There are corporate forms of inclusion and religious, ethnic, national references replaces or give new content to the abstract institutions of modernity.

The emergence of nationalism, ethnic and religious strife, are not a simple reproduction of the past is a new expression of this tension between universalism and particularism. The new coordinates of the tension between universality and particularism are: globalization, the formation of a new world public opinion, the failure of the current world economic model to include. Social and cultural diversity grows faster than the possible inclusion of abstract modern institutions. In their place grow patronizing and discretionary forms of power.

Luhmann once wondered whether the latter was the future of modernity. The objective of the paper is to explore this hypothesis.

Claiming (again) to Represent Otherwise: Morena As Not-the-Prd, Which Emerged As Not- the-PRI

Political representation is produced by contesting, as well as propositive, discourses, not only regarding policies, but also concerning the very ways of representing. Especially in political regimes where political distrust and disaffection with traditional parties are widespread, constructing new electoral and organizational options requires that alternative ideals of representation itself be offered. In this paper, we study the representative claims at stake in the two breakoffs that have reshaped Mexico's party system very significantly in less than three decades. The first split was the result of a group of prominent dissidents from the once hegemonic Revolutionary Institutional Party, PRI, to form the Democratic Revolution Party, PRD, which came to encompass a plurality of small leftwing parties and social movements. This allowed the previously minority National Action Party, PAN, to be comparable in vote share to both, the old PRI and the new PRD, thus creating a system with three big parties. The second one was a detachment from this PRD, instigated by its most charismatic leader and a group of very loyal followers, which gave rise to a party called National Regeneration Movement (MORENA). This has resulted in four relatively big parties, the smallest now being the PRD. In the analysis, we discuss the political circumstances that influenced the divisions at the elite level, the programmatic or ideological stances taken by the emergent parties, and both the opportunities and challenges they currently face to strengthen political representation in a defective democracy.

To be a Member of the Club: How Japanese Press Reporters Closed Their Market

This presentation will deal with an important paradox of the journalistic profession: its opened access to everyone considering its democratic origins on the one hand, the tendency to close found in almost all the professions on the other.

We will focus on the case of Japanese journalism within which, reporters have been able to closed their labor market without the use of any certification system or specific diploma.

In Japan, the access to *official sources*, which are the most important raw material of news production work, depends on whether a reporter is employee of a news organization or not.

Indeed, the status of *salaried reporter* is the access key to the *press clubs* which are the physical place where reporters are authorized to cover the main institutions like local police stations, public administrations or major companies.

First, we will show how the monopole of *salaried reporters* on official sources has eventually limited the access to the profession to other news workers.

Second, we will examine how the use of *press club* system is in fact strongly linked with the organizational pattern structuring journalism in Japan.

Third, we will explain how the recent transformations of sources communication practices as well as economic difficulties of newspaper organizations are jeopardizing this monopole.

This work is part of a Ph.D. research. The key findings that will be presented have been obtained through a qualitative survey carried out in Japan between 2013 and 2016. We conducted ethnographic observations in several national and regional newspapers and performed interviews with more than sixty reporters.

Child Sex Tourism in the Context of the 2014 FIFA Football World Cup: The Case of the Host City of Recife, Brazil

This study aims to analyse the issue of child sex tourism (CST) and its correlation with sporting mega-events, taking into consideration the implementation of preventive public policy in the host city of Recife (located in the north-east of Brazil), during the 2014 FIFA Football World Cup. Through a qualitative approach based on a three-year longitudinal study – using interviews, observation and photographs – the theme will be analysed by considering the involved social issues, and the implications for excluded sectors of society in the organization of so-called mega-events. A total of 36 interviews were conducted with 22 individuals, who were divided into three groups: project managers, local population and children abused. CST does not occur in a vacuum and cannot be disconnected from more general social, economic and cultural concerns, which are often overlooked in analyses. Although this study is based upon a short-term timescale, the results obtained in the analysed projects have been satisfactory, but over the long term, effective social and educational measures must be prioritized in order

to improve the situation for the actors involved. As part of a sporting mega-event, the topic of child sex tourism remains marginal, particularly in countries where social inequality persists.

GOMES, CHRISTIANNE (*Universidade Federal de Minas Gerais / CNPQ / FAPEMIG, Brazil*)

The Hospitality of the Brazilian Population in the Host City of Manaus in the Context of the 2014 Football WORLD CUP

The aim of this research is to analyze the question of the hospitality of the Brazilian population in the host city of Manaus through the "gift" theory, built by the anthropologist Marcel Mauss, in direct association with the theory of contemporary hospitality. It is claimed to discuss the hospitality of the local population under the aegis of the Brazilian cultural formation and the use of this characteristic - real or invented - of the population by the organizers and politicians involved in the 2014 World Cup (2014 WC). By means of qualitative research - interviews, observations, documentary analysis, photography - carried out in three different moments, this theme was discussed so that the two main research questions could be explored: Taking into account the theoreticians of the cultural formation of the country, is it possible to discuss the construction of a national hospitality, especially with regard to the foreign visitor? How has this characteristic been manipulated by organizers / politicians? When analyzing the hegemonic discourse of the actors, we perceive the use of local hospitality as a prerequisite for the success of the sporting event. Although the tangible and intangible legacies of the 2014 WC are in constant debate, the Brazilian population has been "escalated" to receive and entertain foreign visitors. Shortly after the event, the former FIFA president said the 2014 WC had been a success, notably the warmth of the local people. In Manaus, it was possible to analyze the participation and hospitality of the population with foreigners and the manipulation and use of this feature by the organizers. In addition, one can also see the direct consequences of local festivities and hospitality in the development of tourism in the following years in Manaus.

Perceptions and Preferences about Meritocracy in International Comparison

Meritocracy is a concept commonly used to characterize groups and societies in terms of allocation of rewards according to effort and talent. In this sense, the principle of merit has been related to the legitimization of inequalities in modern societies. Nevertheless, the conceptualization of merit is far from clear in the literature, having as a consequence that the few attempts dealing with the empirical study of meritocracy in terms of individual attitudes and beliefs are rather inconsistent among themselves. Based on a systematic review of the extant literature, we propose a conceptual framework for the empirical study of the subjective dimension of meritocracy which is then empirically tested by using data from available indicators of the International Social Survey Programme 2009 survey. The results of confirmatory factor analysis and measurement invariance models indicate that it is possible to identify two dimensions of meritocracy that are usually confused in the literature: perceptions and preferences. Furthermore, these two dimensions are composed of meritocratic and non-meritocratic elements which are not necessarily the ends of a same continuum. The implications for future research on meritocracy are discussed, particularly in relation to preferences towards redistribution.

Seniors and Digital Technology: A Qualitative Approach to Uruguay's One Tablet-per-Retired Low-Income-Senior Policy (Plan Ibirapitá)

This project is a study of a public policy that is taking place in Uruguay: the one tablet-per retired-senior program called Plan Ibirapitá. The general objective is to study how the tablets are affecting the life of seniors and changing their practices and identities. In this project, I look at the relation between seniors and tablets through the lens of the social construction of technology, technological mediation, and the philosophy of technology. Through these theoretical standpoints, I examine how the tablets mediate seniors' realities and assess in what ways they are both co-constituted in their interaction. I also engage with previous literature on the non-use of technology. Data was gathered utilizing in-depth interviews and performing observation at tablet-use training facilities in the city of Minas, located

at the center-east region of Uruguay. Agreeing with previous literature, in this research I suggest the need to look at seniors as active agents in their relation to technology, and thus the need to distance from deterministic standpoints. In this sense, using some approaches from the philosophy of technology, I propose an 'existential' perspective to understand the relation between seniors and technology.

Corporalidad y Moral En La Formación Militar En Brasil y Argentina

La presentación está basada en dos investigaciones realizadas en escuelas de formación de oficiales del Ejército (la del autor, en Brasil y la de Máximo Badaró, en Argentina) entre 1987 y 2004. El objetivo es destacar la asociación entre corporalidad y moral en la formación de la identidad militar y los mecanismos simbólicos que accionan para diferenciarse del "mundo civil". Los rituales de iniciación militares serán analizados teniendo el cuerpo como elemento central, tanto en relación con la destrucción de un cuerpo "civil" anterior en cuanto a la construcción del "cuerpo militar". También se señalan cuestiones relacionadas con cambios recientes en la profesión militar, principalmente derivados del ingreso de mujeres en esos establecimientos. Finalmente, se hará un ejercicio de reflexividad en relación con la propia situación de investigación de campo realizada por investigadores "civiles" en un ambiente marcado por características fuertemente jerarquizantes y disciplinadoras.

The Research As a Totem: How an Academic Book Became the Patrimony of a Generation of Officers

The purpose of the presentation is to discuss how my book on the professional socialization at the Brazilian Army's Military Academy was received and appropriated by the "natives" in two moments. First, when the book *O espírito militar* ("The Military Spirit") was published in 1990, the impact of the novelty of being the first work of its kind done in the Social Sciences in Brazil - it is also important to keep in mind the historical context in which the publication occurred, a few years after the end of a long military regime. Two decades later, the book becomes a "patrimony" for a generation, a kind of a "totem", an identity emblem for the cadets or young officers of the time.

CASTRO, MARIA PIA* (*University of Catania*)

Organizational Professionalism and Measures to Combat Poverty: The Role of the Social Worker

In the last years new theoretical approaches are developing about professions, mainly distinguishing two different forms: occupational professionalism, as a discourse concerning professional occupational groups, discretion and occupational control of the work; organizational professionalism, which also includes a control by managers in work organizations. According to the second one, the organizational context is crucial for professions in that the organizational aims, the procedures and the organizational constraints affect both the traditional professional autonomy and the professional jurisdiction.

Today most professional work take place into organizations. However, for "traditional" professions (lawyers, physicians,...) this is a step following their professionalization process and the consolidation of an exclusive jurisdiction, while other professions (such as the social workers) have always worked within organizational contexts, and both their jurisdiction and ways of work has always been affected by the organizational aims and rules.

In this period of profound economic and social changes, the organizations where social professionals work are redefining the ways of providing social services, to meet adequately and cheaply the new social needs. This leads to further changes in jurisdiction of social workers, which through their "professional" action should in turn affect the orientation of the organizational development.

We carried out a systemic analysis of the social worker's role in the management of the recent measures to combat poverty, in Catania (a city in the South of Italy). The analysis reveals that within a unique and innovative national framework on the measures to combat poverty, the effective professional action of the social worker profoundly affects the outcomes locally, contributing to consolidate an administrative routine increasingly out of touch with new social needs, or rather an innovative organizational development in line with an adequate analysis of the current social changes.

The Crystal and the Landscapes: Sensorialities and Displacements.

In times of acceleration and simultaneous information, cultivating spaces of focus and depth are constant challenges, especially when regarding approaches about creative processes. How to activate inner listening and subtler perceptions of the body in the midst of everyday chaos?

It is intended to enter, in a more extended time, from the approach of the *seit-ai-ho*, Japanese corporal education that aims to rescue and maintain the sensitive body, particularly accessing the principles of *do-ho*, *do* - means movement and *ho* - technique.

From these principles it is proposed to reflect on performances realized with a crystal in different landscapes and atmospheres, such as Jalapão in Brazil, Atacama in Chile and Kyoto in Japan. A crystal is placed on the head, in the seventh chakra, which acts as a mediator and igniter of actions and movements for the performer, a stimulus for listening and readiness states in interaction with the ambiances with their singularities.

After the performances being registered with video, comes the questions: How to create fields of experience for the other? How to provoke displacements and subversions in everyday life? As an exchange experiment with the other, stones are placed at strategic points in the streets and small projections are made on the textures of stones associated with specific sounds, in dialogue with the images. The stones, with their textures and singularities, act as supports for the projections. With the poetic action promoted by the experience and transmuted in an expanded scene, the research deals with the scope of a micropolitics of daily life, with small moments of rupture for the man who lives in the cities. It is intended to show in a video, a synthesis of the performative experience that occurs in a dilated time-space, propitiator of verticality and more subtle connections.

CASTRO JAIMES, ALBERTO* (*Universidad Nacional Autónoma de México*)

La Exclusión Social Como Marco Para El Debate Actual De La Pobreza En América Latina

Entendiendo el desarrollo de América Latina como un proceso de modernización industrial, los actores de esta modernidad participaron de un sistema de lealtades y recompensas que edificó el sistema político vertical corporativista. A partir del cambio estructural que sobrevino desde las décadas de los setenta y ochenta en forma de ajuste, la transición de los mecanismos de interlocución política no fue sustituida por una figura de ciudadanía amplia.

La acción pública estableció criterios focalizados de intervención a partir de una ciudadanía clasificada en clave binaria: vulnerable - no vulnerable. Además, con el entretimiento de tecnologías de información y procesos culturales globales, las minorías ahora organizadas representan grupos de presión que exigen el reconocimiento y diferencia. A la par, las instituciones enfrentan retos para responder con oportunidad y flexibilidad. Actualmente la pobreza es amplia y profunda, y por 40 años de transformaciones no se acierta a reducirla contundente. Lo cual, además contrasta con los montos dedicados al gasto social. Al contrario, las vulnerabilidades se acumulan conforme se determinan características sociodemográficas. Por ejemplo, es mayor el porcentaje de hogares pobres si son encabezados por mujeres; y aún mayor si éstas son jóvenes e indígenas.

Lo que fundamenta esta incapacidad de incidencia, se argumentará en la exposición es un proceso de exclusión social y no sólo un cruce de características. Usando el entramado conceptual sobre la neutralidad de las instituciones (Taylor, 1999) y de "racialización de relaciones sociales" (Margulis, 2003) se explorará una evaluación de la política social sujeta a dinámicas de exclusión social. Lo anterior es relevante para la evaluación de eficacia de programas sociales; para reconocer si ello limita el incremento de productividades y para señalar puntos aún no cuantificados de pérdida de eficiencia del gasto público por la definición de metas sin considerar la dinámica de exclusión.

CATANO, GARY* (*Memorial University of Newfoundland and Labrador*)

The Embodied Work of Wilderness

This talk considers how, for natural and cultural resource managers employed by the United States National Park Service (NPS), the construction of "resources" - the transformation of plants, animals, geologies, and artefacts into quantifiable and useful institutional objects - is an embodied practice, one that brings workers into textually and technologically mediated contact with non-human nature as a fundamental aspect of the labour process. Social-scientific treatments of national parks, monuments, and protected areas focus heavily on visitation and the conceptual facets of park-making. These approaches neglect the everyday and increasingly precarious realities of parks as workplaces, and of resource management rangers as workers. Drawing on interview and participant observation data collected during twenty-two weeks spent living and working

with NPS employees at Lava Beds National Monument, my research addresses this omission by examining how the work of parks gets done through the voices and experiences of park workers themselves. Through an analysis of acoustic bat monitoring and archeological survey projects conducted at Lava Beds throughout the summer of 2017, the processes by which institutionally meaningful natural resources emerge out of scientific practice, and the ways in which humans come to know, care about, and relate to the world through their labour will be explored. I also consider how local, park-specific texts, and translocal federal directives influence and exert power over these bodies at work – both human and non-human. Institutional ethnography reveals how texts such as research protocols, standard operating procedures, and the Organic Act of 1916 work in concert to shape reality for park workers, informing their relationships to power, and potential paths to resistance. I argue that a focus on the body, a focus on the pleasures, pains, and disappointments of resources work has the potential to build alternative worlds of interspecies care, knowledge, and place based resistance.

CATTACIN, SANDRO* (*University of Geneva*)

De La Recherche Sur Les Migrations à La Recherche Sur La Mobilité Humaine: Un Défi Politique Et Analytique

Le déplacement de l'approche de la migration vers la mobilité ne permet pas uniquement de gagner en précision analytique, mais également de renouveler les perspectives de régulation de la politique. Car si la mobilité devient la normalité, la politique doit répondre à des défis tout autres que dans les sociétés sédentaires. La recherche sur la mobilité décrit ces défis de plusieurs points de vue allant, par exemple, de la micro-perspective des dynamiques des familles et de l'éducation, en passant par la meso-perspective de l'organisation - qui se conçoit comme un réseau multi-territorial (et multi-national) d'une entreprise, à la macro-perspective de la pluralisation sociale et au déclin de la régulation nationale des appartenances identitaires). Cette présentation approfondira ces défis analytique et les conséquences pour la politique migratoire.

Towards a Critical Strategy of Data

This paper analyses the possible impact new data technologies, such as Big data and machine learning, have on strategy. It covers how opportunities available with new ways of knowing relate to recent vulnerabilities. The paper also attempts to qualify this new rationale through the prism of digital data. Following a survey conducted on the expectations recently arising in military circles concerning such new tools, it questions the very notion of "data" in defining a strategy as it goes beyond a strictly technical framework. The aim is to highlight the nature of such issues and the human choices decision-makers are now facing.

Local-Global Relations and Geographical Indication in Latin American Agrarian Regions. Cases from Brazil and Argentina.

The paper focus on Argentinean Río Negro and Neuquén Valleys on the one hand, and the Brazilian San Francisco Valley region, on the other hand, tailored to produce fruit for export, although starting at different stages, early on they attracted capital and migrants. New State development projects supported by public policy and capital mobility transformed agriculture and labor relations in the regions. Peasants and rural labor saw in these projects opportunities to improve their conditions for social reproduction, work and life. At the end of the last century, mechanisms related to traceability and certification of production. Conversely, others elements were strategically used by local institutions, such as geographical indication. Little by little, local production and paths of local development came to depend on global corporations. Big effort to adapt to new ways of work as well as to maintain the local traditions were, nevertheless, used by global corporations to give visibility to their new fruits for export. These various processes attracted the attention of Brazilian and Argentinean researchers who directed the focus of observation to transformation of local relations and to their linkages to various processes in the global order. For this, they form new research institutions and postgraduate training. Subsequently, new partners came to the original nucleus; others were associated in favor of an agenda of training and research projects. Through research networks, it became possible to understand the conditions of work, rural development, and the way in which Geographical Indication came into the process; and to increase the number and quality of publications and strategies to disseminate Sociological knowledge. These experiences contributed to other successful ones, amplifying the focus of study to other countries, through research groups supported by CLACSO, American and

European development agencies, to highlight just a few. We will analyze those experiences in the presentation.

CAVALCANTI, JOSEFA SALETE B* (*Federal University of Pernambuco*)

Scientific Knowledge and Technological Change. Cases from Latin American Agrarian Regions.

The aim of the paper is to understand the general process of innovation and technological development on the making of global regions. The premise is that: the development of those regions is linked two major factors: the role of the state, local development and the role of the market with local institutions. By bringing about the cases of these two major regions, we expect to throw light on the general process of social change. As it is well known, the Argentinean Patagonia and the Northeastern San Francisco Valley have some proximities in which refers to climate and physical environment. Hydraulic works and dam construction transformed these semi-arid regions by bringing in technological innovations that allowed for profound changes in land and water use. These actions ensured the irrigation of vast areas of their territories, the increase of local production and, the export of fruits. Critical aspects already seen make known the complexity of the process. Therefore, here, I will focus on the technological and educational implications of those macro processes, by bringing about the academic experience developed by a consortium of national and regional universities to contribute to the overall understanding of these developments. It was through bilateral partnership carried out by the Federal Universities of Pernambuco Brazil and the Comahue University that a strong relationship developed among Sociology Graduate Programs and agrarian social studies centers to investigate the whole process. Therefore, a consortium of professors, students and researchers develop comparative research and generate a common knowledge about the regions; and made known in international seminars and made public to international colleagues and other researchers from institutions, such as, Argentinean and Brazilian corporations for Technological Innovation and Agricultural research, INTA and EMBRAPA. These problematic aspects of science and technology relationship are analyzed in this presentation.

CAZARIN, RAFAEL* (*Department of Sociology, University of the Basque Country UPV/EHU*)

The Pentecostal Architecture of Belonging: From Microdiversity to Layered Integration

Every week, Pentecostal churches worldwide undertake multiple activities aimed at integrating worshippers into the so-called Kingdom of God. At every event, born-again Christians are invited to share similar practices that shape ways of being and feeling, while helping believers to navigate a social world often marked by xenophobia, distrust and marginalization. In this paper, I intend to examine these 'ways' by drawing upon fellowships encounters observed in African Pentecostal churches located in Johannesburg (South Africa) and Bilbao (Spain). I am concerned here with articulating the notions of belonging and integration as circumscribed at the activities organized by pastors and attended by migrants, according to particular social categories. As will be evidenced, the 'breaking down' of the congregation into smaller groups seems to rearrange the diversity of social and cultural backgrounds of worshippers under the auspices of African and Pentecostal 'features'. In other words, existing social categories are reworked through inclusive and exclusive religious terms, such that one is able to experience belonging to the Kingdom of God, no matter where he or she is settled.

'Do No Harm': An Analysis of a Gender Transformative Programme with Faith Leaders in Africa.

In the past decade, a growing number of organizations focusing on sexual and gender based violence have aimed their programmes towards men and boys as those who often hold decision-making positions in their communities. Yet, in highly religious settings they face the difficult task of combining secular and religious concepts to promote values of gender justice and equality among beneficiaries while turning them into potential 'activists' for the cause. This paper examines such gender transformative interventions carried out by a non-religious NGO with faith leaders from various Christian denominations. The data collected comprises workshop reports, participant observations and interviews with stakeholders (NGO experts and faith leaders), conducted on the past six months in 9 African countries. The paper shows how particular sessions that challenged gender socialization and values of masculinity have led faith leaders to initiate a process of gender awareness in the 'front stage'. This process redefines particular

emotions, psychosocial responses and vocabulary surrounding the notion of a 'transformed masculinity'. Along this way, stakeholders seem to 'heal' their lived experiences of gender violence rather than reviewing harmful gender values at the religious and cultural domains. Finally, I critically engage with the gaps and potentialities of this outcome in the quest of gender justice activism.

The Effect of Birth Weight on Cognitive Performance: Is There a Social Gradient? Is There Compensation?

Demography has traditionally been interested in birth weight as one of the main indicators of infant health. Specifically, low birth weight (LBW) is known to correlate with adverse health and cognitive outcomes during infancy and adulthood. In this paper we use data from the Chinese Family Panel Study (2010 wave), a large-scale representative sample of Chinese households, to model the effect of LBW on standardized scores among Chinese children aged 10-15. The paper shows a clear gradient in the prevalence of LBW by family background, with children with more socioeconomic resources having higher birth weight and a lower probability of experiencing LBW. Our evidence confirms a significant negative effect of LBW on the results obtained by children in mathematics and Chinese language, two important competences for school success. Our results also imply that highly educated mothers can actually compensate the disadvantage that LBW represents in terms of cognitive performance.

The Interplay between Maternal Resources and Environmental Stressors: The Effects of an Earthquake on Birth Outcomes

Birth outcomes are known to be affected by maternal health and lifestyles, and generally speaking babies born in families with more socioeconomic resources tend to display better perinatal health. In this paper we focus on one relevant indicator of perinatal health, namely birth weight, which is highly correlated with later health and cognitive outcomes. Although medical research has extensively analyzed the maternal determinants of birth weight, less is known about environmental influences and especially about the interplay between mothers' characteristics and exogenous factors. In this paper we exploit an exogenous shock, an earthquake that took place in the municipality of Lorca (region of Murcia, Spain) in 2011, and the availability of the universe of birth certificates in the country in that year, to test: (a) whether there is an association between (degrees of) exposure to the earthquake and lower birth weight, and (b) whether this adverse impact is homogeneously distributed across social classes.

Feminist Gift Economy & Indigenous World Views: Understanding Institutionalization and the Social Construction of Motherhood

Critical social analysis helps us to understand the ways that institutional practices and policies reproduce power imbalances to serve the interests of the elite. However, very little critical theorizing addresses the life-alienating characteristics of these systems. I will discuss the ways feminist gift economy and Indigenous world views allow for a deeper analysis of the ways institutions disrupt, subvert, and deny life-processes. With reference to my own engagement with education, welfare and court systems as a young, poor, single mother, I explore mother-child relationships as an expression of institutionalization and resistance.

Gender Display in Sensorial Terms. Reflections on Menstruating Bodies in a Group of Mexican Girls

This paper aims to draw the way in which a group of girls from Mexico City have used the body senses (in particular, smell and sight) in the gender display that they carry out in front of their peers, regarding the menstruation as a significant event during puberty. The work will address three specific aspects: a. the sensory and cognitive meaning attributed to the menstruation by the adolescents, as well as the main sources of information on this subject (peers, relatives, teachers, etc.) b. the "corporal techniques" (Marcel Mauss and Pierre Bourdieu) that implies a menstruating body and against which the adolescents are interpolated during their interactions with their peers, within the framework of their friendly and familiar

relations and c. the type of gender display (Goffman) that entails such techniques during interactions. Altogether, such an analysis will allow me to reconstruct significant aspects of perception schemes (both sensorial and cognitive terms) around menstruation as well as the daily practices and strategies with which this group of girls faces this phenomenon, as well as relevant analytical keys for the study of sensitivity in the "order of interaction" (Goffman). It is worth noting that this paper is part of a wider research: my doctoral thesis entitled "Affectivity and gender asymmetries. On the subject of the learning of the identities and modes of relation between the sexes in the family dynamics whose main objective is to analyze the familiar socialization modes that contribute to the definition of gender identities in a group of adolescents of middle class in the city of Mexico.

CELEDON, JAVIER* (Universidade Federal do Rio de Janeiro)

Rainbow Catholics: Case Study of a Brazilian Catholic LGBT Group

In the last three decades, various lesbian, gay, bisexual and transgender (LGBT) Catholic groups have emerged. Currently, forty-two (42) of these groups are members of the "Global Network of Rainbow Catholics" (GNRC), established in 2015 to work "for the inclusion, dignity and equality of this community in the Roman Catholic Church and society", as their mission statement declares.

In this paper will be presented the results of a two-year fieldwork with the group *Diversidade Católica*. This group is a member of the GNRC and the eldest Brazilian catholic-LGBT association. Based on ethnographic methods and semi-structured interviews, the study analyzes how and why these people decide to publicly identify with a religious institution that has historically condemned and punished their ways of constructing gender and sexuality. In essence, why do these rainbow Catholic groups exist in the opinion of their members? How do they understand and define their institutional belonging as both Catholic and rainbow?

The above questions serve to show the key finding predicted in this paper: which is that the group has chosen a non-combative way of acting within the ecclesial space. This is a significantly different strategy to that of many other Catholic groups, such as Catholics for Choice, who have a more conflictual *modus operandi*. The paper will discuss the reasons and the extent of this decision as analyzed during the fieldwork.

Finally, this work fills a gap within the sociological literature with respect to this subject. Most of the research done in the Latin-American context has been focussed on the experience of LGBT Evangelical Christians. It is this lacuna in research and reflection that this paper offers.

An Analysis of the Development of Turkish Sociology through a "Southern Sociology" Perspective: Historical and Empirical Findings

The rich contributions to the development of a Southern Sociology perspective have enabled sociologists in various countries to rethink and reassess the development of sociology discipline in their countries. This paper firstly, aims to identify the main theses of the scholars contributed to the Southern Sociology perspective such as Connell, Burawoy, Comaroff and Comaroff, Bhambra, Rosa, Maia etc. and then applies these to the historical development of Turkish sociology. The author selectively focuses on two periods, the 1930s-1950s and the 1970s-1980s, which would, he believes, be a valuable contribution from Turkey to the ongoing development of Southern Sociology perspective. The former period was remarked by the re-establishment of sociology at the Turkish universities with the contribution of German migrant scholars, who had to escape from the nationalist-socialist regime in Germany at those years. This period exemplifies a continuity of the Eurocentric development of sociology that extends and partly challenges the periodization of the development of sociology by Connell. The latter period was remarked by the contribution of Turkish scholars and intelligentsia to the international debates on the "Asian Type of Mode of Production" and "Petty Commodity Production", which in turn exemplifies a Southern production of knowledge and engages with Burawoy's arguments on Southern Sociology. The paper secondly, problematizes the hegemonic construction and structure of the discipline at Turkish universities and focuses on the teaching of 'Contemporary Sociological Theory' Courses. The author presents empirical findings of the content analysis of course syllabi and reading lists at 16 sociology departments and qualitative analysis of in-depth interviews with 14 sociologists teaching this course.

Behind the Circumcision: Kinship, Gender and Religion in the Life Stories of Mixed Couples with an Arab-Muslim Partner

Based on the life stories of mixed-status couples formed by an indigenous partner and a partner from majority Muslim countries in Italy and in France, the paper explores the meanings of circumcision and its social implications in a context that still stigmatises these kinds of couples. For them, the choice of circumcision is often controversial, as it causes tensions between the spouses and conflicts with the enlarged families, involving gender, generational, religious and cultural issues. In Islam, male children's circumcision is not a religious precept in the strict sense, but rather a "recommendation" by Prophet Muhammad. Nevertheless, this practice is traditionally rooted and remains one of the most common within Muslim communities (and not only) all over the world. As circumcision represents a rite of passage symbolising the public entrance in the Muslim community and in the male adult society, the practice does not represent only a religious belief for believers. Its investigation highlights the imbrications of religion, culture and social inclusion/exclusion and renews questions about "body" and "visibility/invisibility" in the contemporary debate on Islam, permitting to fulfil the gendered lacuna in the literature. In fact, while a great amount of researches has focused on women body and their visibility in the public space through issues such as the wearing of the veil, the question of the male body still remains underexplored. Accounting for these gendered and kinship questions, the choices concerning circumcision in mixed families are discussed in relationship with the gendered-educational partners/parents approach to the practice, the attitudes of the partners' families of origin, and the hegemonic social context of residence.

Narcocorrido: Análisis De Un Discurso Musical De Violencia y Poder

Una de las facetas más complejas dentro del ya imbricado asunto del narcotráfico en México se presenta en su dimensión cultural, en la producción de distintos bienes culturales como libros, películas, series de televisión, entre otros; que generan un imaginario colectivo en torno a esta actividad delictiva. Entre todos estos productos, destaca el género musical conocido como narcocorrido. Heredero de la vieja música popular mexicana conocida como corrido, su popularidad ha trascendido ya la zona norte del país -donde se pueden situar sus orígenes- y se ha extendido no sólo en México sino también en el sur de los Estados Unidos y algunos lugares de América Latina, principalmente en Colombia. En el estudio social de la música, se debe reconocer su fuerte capacidad para moldear identidades a partir de sus características artísticas y simbólicas, aunado a la gran capacidad para convocar masas, lo que termina por redondear una poderosa herramienta ideológica. Todo ello da cuenta del poder político de la música, por lo que resulta pertinente preguntarse por el discurso ideológico de la música, en este caso de un género muy controversial, por su fuerte contenido de violencia y fuerte popularidad entre los jóvenes. Cabe aquí preguntarse si la música del narcocorrido es un medio para motivar y difundir la violencia, o bien, es un reflejo del entorno de violencia en el que se desarrolla. Más aún, cabría preguntarse cuáles son los poderes que movilizan el discurso detrás de la música del narcocorrido. Nuestro trabajo pretende profundizar tanto en las funciones identitarias y políticas de este género, indagando en sus formas de discurso, su ideología y los poderes que mueve y promueve a través de su escucha e identificación, principalmente entre los jóvenes.

Redes Sociales Digitales Durante El Sismo De México De 2017: Hacia Nuevas Formas De Gestión De La Emergencia

El 19 de septiembre de 2017 se suscitó en el centro de México un fuerte sismo de 7.1 grados en la escala de Richter que generó severos daños en distintos lugares del país, como la Ciudad de México, el Estado de México, Morelos, Puebla, Guerrero y Tlaxcala. Los derrumbes y afectaciones se presentaron en un extenso radio geográfico de gran diversidad social. Mientras la Ciudad de México presentó derrumbes de grandes edificios de apartamentos de varios pisos, en las zonas rurales afectadas cayeron pequeñas casas de adobe donde moraban familias pobres dedicadas al campo. Es importante destacar que el país se encuentra en zona sísmica, y que un evento similar se había presentado en la Ciudad de México 32 años antes, cuando Internet no era un medio de comunicación común para el ciudadano común. Mientras que en 1985, la emergencia fue cubierta a través de la radio; en esta ocasión se generó un vasto y veloz flujo de información a través de las redes sociales, permitiendo que la participación ciudadana fuese sumamente eficaz en las medidas de rescate, remoción de escombros, formación de albergues, recolección y distribución de víveres y otros bienes de primera necesidad. Esta extendida gestión ciudadana mostró un Estado rebasado por la situación, ineficiente y motivo de profundas desconfianzas entre la población. El presente trabajo pretende analizar el papel que tuvieron los medios digitales, principalmente Facebook, Twitter y WhatsApp en la organización ciudadana para el manejo de la crisis humanitaria producto del sismo, y su impacto en la generación de nuevos vínculos sociales entre los ciudadanos participantes en la emergencia, generando nuevos tejidos sociales de organización que pueden

devenir en nuevas estructuras políticas que hagan contrapeso al monopolio político ostentado por los partidos políticos mexicanos durante los últimos años.

Transgressive Sexual Policies: Institutional Designs for Attention to Sexual Diversity in Mexico

It is an exploration of the first subnational governmental experiences on sexual diversity in Mexico. We call "sexual policies transgressive" to the new discourses and governmental actions against heteronormative and reproductive sexual binarity that prevails in the state discourses of the gender perspective but also they are constituted like new devices of control and discipline that produce practices and determine which are the Ways of living that are possible and desirable, even within the community of sexual diversity itself. The cases analyzed will be the public policy directions of the sexual diversity of Santiago Niltepec, Tehuantepec and Unión Hidalgo de Oaxaca. These municipalities are of mostly indigenous population and are characterized by the recognition of the "muxe" identity (transgendered women). It will analyze the network of social and political actors that promote the governmental agenda that allows the creation of specialized organizations within the subnational governments; the institutional design of the areas; actions planned and implemented; main achievements and challenges. The theoretical lines guiding the research are: 1) that the gender perspective of current policies reproduces the discourse of the binarity of the sexes, heteronormativity and reproduction. 2) that LGBT-TTI dissident global identities influence national and subnational contexts but enter into an adjustment / adaptation dynamic according to economic, political, regional and ethnic contexts. 3) Criticism of essentialist identities woman / man, heterosexual / homosexual and other groups whose practices and discourses produce new abject, bodies that do not fall into these sexual categories. Transgressive sexual policies could be seen as state control and discipline devices, masquerading as negotiation and steady strategic government actions.

Citizens' Engagement in the Health Sector Decision-Making across Europe

Health care systems in developed countries face a series of structural challenges over the next decade. These systemic pressures - at economical and social level - are well documented, as well the strategies adopted to face with them. The paper will focus on one of them, the new forms of participatory regulation in policy decision-making (citizens' engagement in network governance), which are presented as exit strategy, together with the spatial rescaling, from the democratic deficit in health-care. However, that this goal has been reached cannot be taken for granted, especially when one considers that these practices are often promoted by dominant players in the field.

In my research I've analysed the concrete applications to the concept of network governance, as a fruit of symbolic struggles among the various actors in the field of health to maximise their own position through the accumulation of capital. If over the last few years the legitimacy of the patients and public to have power has gained terrain, it is equally true that more often than one would like to admit these claims are used by the traditional holders of decisional power to strengthen their position.

By this perspective, the translation of the definition of participation in concrete forms can be taken as a dynamic account of the distribution of power within that certain field. The research analyses in a comparative way the practices adopted in European Countries - Denmark, France, Germany, Great Britain, Italy, Netherland, Spain and Sweden - comparing the structure of the networks and the "rules of the game" which, by defining the balances of power and reconciling various interests, function as filters for the subjects and modalities of policies.

Dissonant Harmony: Challenges of Professionalization of the Work of Musicians in St. John's, Canada

Professions literature has addressed common traits of established professions, including the acquisition of expertise and licensure and the practice of social closure as means of safeguarding access to labour markets for formal membership. More recent literature brings attention to occupations (i.e. semi-/para-professions), such as dental hygienists and software engineers, which are likewise moving towards social closure to form new professions but facing interprofessional conflict. We argue this literature also requires consideration of contextual factors - namely the precarious labour market and the place where the process of professionalization takes place. This paper focuses on the

challenges of professionalization of local self-employed musicians in St. John's – Canada's easternmost city with a population of 200,000 in the geographically isolated province of Newfoundland and Labrador. Our interview with 54 local income-dependent musicians shows musicians who earn some or all of their livelihood from performing often refer to themselves as professionals, as a means of distinguishing their work from that of their unpaid fellow musicians. The unpaid are variously referred to as casual, community or amateur musicians. While they might accept remuneration for performing, they do not depend on this work for income to the extent of self-proclaimed professional musicians, yet they participate in the same employment field. Restricted to local communities, intra-professional conflict may be one outcome of such delineation. This study contributes to existing literature by drawing attention to this underexplored open work, including individual and collective tendencies to publicly uphold professional traits in an effort to safeguard jurisdiction over fragile labour markets amidst austerity and economic restructuring in a remote mid-sized city.

The Bond Note Is Equivalent to the US\$ Zimbabwe's Unending Currency Woes

'The Bond Note is Equivalent to the US\$': Zimbabwe's Unending Currency Woes

By

Tapiwa Chagonda (University of Johannesburg)

The Zimbabwean economy has been in dire straits since the turn of the century when in 2000, the country embarked on a controversial and haphazard land reform programme which resulted in the country's agricultural sector, which was then the mainstay of the economy, going into comatose and sanctions also being imposed on the country by the West. By 2008, hyper-inflation had ravaged the Zimbabwean economy, peaking at a stupendous 89.7 sextillion (sextillion has 21 zeroes) percent by November 2008. With the unsustainable hyper-inflation, the country decided to shelve the worthless Zimbabwean dollar in 2009 and put in place a multiple currency regime which was largely dominated by the United States Dollar. However, with the country's key formal sectors such as agriculture, manufacturing and mining failing to produce much for exports, the United States Dollars in circulation where always limited, thereby creating a cash crunch. To ease, the cash squeeze which the country has been facing since the shelving of the Zimbabwean dollar, the Reserve Bank of Zimbabwe decided to introduce a surrogate currency which has been christened, the 'Bond Note'. This paper argues that these Bond Notes have failed to ease Zimbabwe's currency woes, as forex barons have been hoarding both the United States dollars and the Bond Notes for speculative purposes, which has resulted in Zimbabwe's economic situation to remain in the doldrums.

Adaptation of Immigrant Women Living in Smaller Communities to the Challenge of English Language Barrier

In this presentation, we examine how the lack of the English language proficiency affects settlement experiences of immigrant women in a small city, Red Deer, and its surrounding rural communities in Alberta, Canada, and how these women adapt to the language barrier through various means.

Immigrants living in smaller cities such as Red Deer experience a different set of challenges compared to immigrants who live in larger cities (Krahn, Derwing and Abu-Laban 2005). In this Photovoice (Wang 1999) research conducted in partnership with the Central Alberta Immigrant Women's Association, 36 immigrant women hailing predominantly from non-English speaking countries told their settlement stories through the use of photographs.

Many of these immigrant women came to Canada as dependents or refugees. Upon their arrival in Canada, they often found themselves in a new social environment where their limited command of English language led to social isolation, occupational downgrading, and diminution of self-esteem. Their efforts to overcome the language barrier are crippled by role conflicts and lack of access to educational upgrading partly as a result of, ironically, lack of English language proficiency. However, our analysis points to resilience and adaptability of immigrant women in the face of ongoing struggle to build a new and successful life in Central Alberta.

The research on which the presentation is based informs community organizations and policy makers of the availability and effectiveness of programs and services used by immigrant women in Central Alberta, and incites a critical reflection

on the challenges and opportunities that immigrant women encounter as they settle in a new society.

"Affecting" Change through Participants' Images of Their Settlement Experience in a Small Canadian City

This presentation discusses the visual component of a community-based research project examining the settlement experiences of recently-arrived, racialized immigrant women settling in a small city, Red Deer, Alberta, and its surrounding rural communities. The focus of the research is on the services and supports available to newcomers, evaluated from the perspective of the women who use them – with the goal of informing service development and settlement policy in the region, and more broadly, helping the host society do a better job of welcoming and integrating newcomers. In addition to a survey of 154 women, the research involved a Photovoice component in which 36 women, most had participated in the survey, made images that represented crucial aspects of their encounters with the natural, built, service, and social environments in their new communities.

A primary goal was to generate images and texts that could be used in exhibitions and materials for the general public as well as service providers and policy makers. Here the idea was not simply to provide interesting information about newcomers, but to invite viewers to reflect on the spaces and practices of their community as a site of settlement. To that end we are working with the images and interview texts to develop a public exhibition that will occur in spring 2018; there will also be an online version.

In this presentation we discuss the tensions, challenges and possibilities of working with these images (e.g., non-professional, sometimes blurry, apparently banal) in order to make a powerful exhibition that works artistically and affectively as well as informationally – and that does justice to the intents and purposes of the participants. We also reflect on the strengths and limitations of Photovoice methodology for this kind of project.

Economic Insecurity Among Sexual Minority Men: Evidence from the 1991-2016 U.S. General Social Survey

Although a sizeable body of research has examined earnings differentials among sexual minority men, results remain mixed with studies presenting estimates of earnings disparities ranging from non-significant to as large as 32%. In this study, we ask: First, why do existing studies find few consistent results regarding sexual minority men's labor market outcomes? Second, in assessing disparities in the most recent 1991-2016 U.S. GSS data, do sexual minority men still experience disadvantages in the labor market? Third, do any apparent disadvantages extend to economic insecurity more broadly? We find that the large earnings penalties found for gay men in previous studies were likely attributable to their combination with bisexual men. In our results, gay and bisexual men earned 8% and 13% less than heterosexual men, respectively, but bisexual men experienced greater economic insecurity than heterosexual men. In addition to addressing mixed findings across previous studies, this research contributes to the literature on inequality, economic insecurity, and, potentially, employment discrimination.

Cellphone Use and Happiness Among Older Chinese Adults: Does Urban/Rural Residence Status Matter?

The number of older adults who use cellphones is increasing in both urban and rural China. Existing studies have indicated that the use of information and communication technology is associated with higher levels of happiness among older adults in Western societies. However, the role of such technology, particularly the impact of cellphone use on happiness and well-being of older adults has not been explored in China. To fill the gap in the literature, we use the 2010 China Family Panel Studies, a nationally representative data set. We employ logistic regression model and explore the relationship between cellphone use and self-reported happiness among the older Chinese population. We also examine whether the association differ for urban and rural residents. Results show that cellphone use is associated with seniors' self-reported happiness level (OR=1.283; $p < 0.001$). When an interaction term between cellphone use and residence status

was included, results indicate that rural older adults felt happier when they had used own cellphones compared to their urban counterparts ($OR=1.616; p < 0.001$). For the rural senior population, cellphone use could improve the likelihood of feeling happy by a significant margin ($10.2\%; p < 0.001$). Findings indicate that the positive relationship between cellphone use and happiness is stronger for rural adults than their urban counterparts.

Public Interest Litigation, Religion and the Question of Secularity in Contemporary India

This paper traces the concept of secularity in the Indian context through judicial intervention in religious practices by focusing on a unique jurisdiction of the Indian appellate judiciary known as Public Interest Litigation (PIL). I will take two contrasting PIL cases in recent times where religious practices and institutions have been subjected to judicial scrutiny by invoking PILs. The first case analyses a PIL for banning the Islamic or sharia courts in India. The second case involves a *suo moto* PIL brought by the Supreme Court of India on the issue of triple *talaq* (instant divorce) and polygamy permitted under Muslim Personal Law. The question at stake was whether such practices violated the dignity and fundamental rights of Muslim women. The Muslim Personal Law has been at the cynosure of an embattled debate along the lines of gender rights and national integration, premised on the demands for a Uniform Civil Code (UCC) for the nation. Exploring the trajectory of the two PIL cases, the paper shows how the concept of secularity in India is embedded in the perception of the state as the bulwark of social as well as religious reform. Unlike in the western context, here the concept of secularity primarily works through the guiding principle of multiculturalism. Consequently, the judiciary often performs a balancing act between different religious groups, often upholding group rights as opposed to individual rights. It has been also noted how the category of religion has been produced through constitutional law and judicial practices where secularism has been an issue of active judicial intervention in religious affairs. This paper shows how in the current public discourse, the concept of secularity works as 'subjection of religion to the rule of law', deftly manoeuvred and articulated through PIL jurisdiction.

Combating Terrorism and Counter-Terrorism: Issues and Challenges in Human Rights Perspectives

Terrorism has a direct impact on basic human rights and the protection of individual right to life, liberty and physical security. The concern for the destructive impact of terrorism on human rights and security is discernible at United Nations General Assembly, Security Council and the new Human Rights Council. The terrorist activities threatens the dignity and security of human beings everywhere. Terrorism endangers or takes innocent lives, creating an environment of fear that destroys individual freedom. It undermines pluralistic civil society and aims to undo the democratic basis of society. It is also revealed that terrorism has links with transnational organized crime, drug trafficking, money laundering, trafficking of arms and also transfer of nuclear, chemical and biological materials.

A fundamental obligation of states, therefore, is to protect the basic human rights of their nationals and others by taking positive measures to protect them and bringing the terrorists to justice. However the measures adopted by some States to counter terrorism have themselves often posed serious challenges to the issues of human rights and rule of law due to infliction of torture and ill-treatment to counter terrorism in spite of availability of legal and practical safeguards to them. Thus there are some specific human rights challenges in the context of terrorism and counter-terrorism; such as, questions of prohibition against torture, liberty and security of the terrorist, due process of law, right to fair trial, freedom of expression, freedom of association, surveillance of data protection, right to privacy, economic, social and cultural rights. This paper is an attempt to strengthen understanding of the complex and multifaceted relationship between human rights and terrorism.

Populism Under Hegemony: Competition Fields and Protagonist Populists in Ecuador, India, South Korea, United States, and Venezuela

This research provides comparative outlook on populist political phenomenon across five cases (Ecuador, India, South Korea, United States, and Venezuela),

based on the Gramscian critical theory. By doing so, the authors aim to offer a novel framework to comprehend the modern populism, debating with the existing literature, especially with Ernesto Laclau. While Laclau, through his series of theorization attempts, puts forth a mobilizational potential of the populism, the authors concentrate more on the state power gradually hegemonizing lived-experience of the people. Gramscian notion of 'passive revolution' has been rather universal phenomenon in phases of state formation in many countries. Intensive social maneuver occurred during the early state entrenchment periods, and these led to ensuing development of institutions. The state institutions hegemonized the people's lived-experiences, essentially through creation of the 'competition fields' theorized in this research. The competition fields comprised not only stratification of wealth but also cultural signification of certain population categories identity-wisely. Incentives for competition involvement were substantive while subalternized 'others' who resisted. With this intrinsic logic of the competition fields, 'war of position' encroached individuals' livelihoods and has been reproduced by signification of the 'symbol' over time. The symbol essentially represents the desirable image that people 'should' pursue and it is sustained by feeding certain collective memories. In this context, the authors argue that the modern populist phenomenon is the politically intensified 'war of position' in contrast to Laclau's proposition spotlighting democratic 'war of maneuver'. The authors have conducted contents analysis on manifestoes of Rafael Correa, Narendra Modi, Myung-Bak Lee, Donald Trump, and Nicolás Maduro, with supplementary historical analyses on the ascending competition fields in each of the five cases. The novel framework calls for distinction of 'hegemony-protagonist' and 'hegemony-antagonist' politics and rethink common notions (e.g., Canovan 1999; Kaltwasser 2012) highlighting innateness of populist potential in liberal-democratic polities.

Methodological Considerations on Intersectional Perspectives on Life Histories, Practices and Strategies in Contexts of Family and Migration

Intersectionality is an important perspective of analysis and a valuable sensitizing concept with regard to power relations (cf. Davis 2008; Phoenix 2010; Riegel 2014). In our paper we would like to discuss methodological considerations on how intersectionality as a perspective can be utilized in biographical research: As a contextualizing framework of analysis as well as with the potential to critically question dominant constructions of difference. With this, it becomes possible to delineate the empirical interplay of different contexts of power and inequality, of asymmetrical gender, class, ethnicity and body contexts in a globalised capitalist world, and to portray the different social levels on which these become relevant. The objective scope of possibility with its societal and social contextuality as well as the subjective perspective and assessment of one's own potentials and agency in these social contexts can be analysed in its relevance in the biography. Here, changes and shifts of the specific social positioning and their importance for the actions of a person during the biographical span and on the background of their experiences can be looked at. A set of questions of intersectional perspectives of analysis has been developed (cf. Riegel 2016) and will be discussed, followed by an illustration of analyses conducted within the framework of an international research project on life histories, practices and strategies in contexts of family and migration in marginalised neighbourhoods in Germany, Austria and Switzerland. Based on this, we would like to discuss potentials as well as challenges connected with an intersectional perspective on biography.

CHAMBERS, DONNA* (*University of Sunderland*)

'dear White People': Your Race Matters in Tourism

In this presentation, I critically explore the concept of whiteness and its relevance to an understanding of the location of power in tourism. I contend that in tourism studies there has been little if any problematisation of the way in which whiteness shapes ways of knowing in tourism (epistemology) and ways of being in tourism (ontology). Indeed, I argue for an alternative methodological approach to our interpretations of exploitation and subjugation in tourism which does not focus predominantly on non-white 'Others'. That is, I suggest that in tourism studies, by focusing on racial *disadvantage*, we have failed to adequately theorise the power that comes from racial *privilege*.

It was Ruth Frankenberg (1993) who used the term 'whiteness' to describe a set of three interlinked dimensions – (1) a location of structural advantage (2) a standpoint or place from which white people look at themselves, others and society and (3) a set of cultural practices that are usually unmarked and unnamed (1993, p.1). She suggested further that whiteness is not an empty signifier, but is instead a 'daily experience of racial structuring' (ibid). I extend this argument to contend that whiteness thus becomes normalised and is rendered invisible in contemporary quotidian tourism practices and theorisations of power in tourism.

A soft science research approach in tourism should undertake a methodological unpacking of power in tourism through the lens of whiteness to provide an interpretation of structural *advantage* that is occasioned by race. Whiteness urges white people to (re)consider myopic understandings of racial power in tourism by refracting their epistemological lens onto themselves. Whiteness implores white people to reflect on their own racial identities and cultures, the privileges that accompany them, and how this serves to legitimate racial inequalities in tourism.

CHAN, ANITA KIT-WA* (*The Education University of Hong Kong*)

Transnationality, Mobility and Belongingness of Chinese Cross-Border Students

While globalization has facilitated massive transnational movement of goods and information, human cross-border flow remains heavily regulated and controlled. However, Chinese cross-border students is an anomaly. Since the turn of the twenty-first century, substantial numbers of young children – who are Hong Kong residents but live in the mainland, have been traveling across the border to school. Being the physical embodiment of transnationalism, these children navigate constantly two social spaces – Hong Kong and mainland China – that have different social, political, economic and jurisdiction systems. Based on in-depth interviews with 16 cross-border students aged 10 to 12, this paper explores how young children negotiate belongingness – preferred place of residence and identification – amidst their mobility experience. The findings reveal that child migrants are active agents who displayed subtle considerations when negotiating complex physical and emotional needs. Their narratives also illuminate a transnational space which is characterized by closer socio-economic ties between the two societies, the rising prominence of China, and not least the social and spatial hierarchy between Hong Kong and the mainland. Moreover, their identification, dis-identification and ambivalence with the identity of 'Hong Konger' clearly shows that parents' socio-economic, (illegitimate) migration and marital status have impacts on cross-border students who have to actively grapple with stigmas and marginalization. The discussions will illuminate the importance of power and inequalities in relation to border-crossing and of intersectionality when understanding the experiences of migrant children.

CHAN, ANNIE* (*Lingnan University*)

Transnational Transformations: Theorising Female Professional Lead Migrants in Hong Kong

Research on transnational migration tends to focus on migrants in the lower echelons of the social hierarchy and those migrating from less to more developed countries. The situations of transnational professional workers are under-studied by comparison, particularly that of female non-single (i.e. married, partnered, and/or with dependent children) transnational professionals who are 'lead migrants' – i.e. initiators of the migration. In addition, existing studies rarely differentiate between transient and settler transnational migrants in their analyses. In recognising that transnational migration is an important site for personal and social transformation, this paper seeks to answer these questions: how do transnational contexts shape professional men and women's subjectivities and everyday lives? How do family and marital status affect the life choices and strategies of transient transnational professionals? What are the constraints and possibilities for personal and social change arising out of such contexts? To what extent and under what circumstances can transnationalism offer transformative possibilities for the personal and the social? How do intersections of gender, class, ethnicity and family status affect such possibilities? Based on a qualitative study of female non-single, professional lead migrants who have moved to Hong Kong, we aim to engage with mainstream theories of migration, gender and intersectionality.

Precariousness and Reciprocity at Work: Interethnic Labour Relations at Times of Uncertainty in Santiago

Chile's migrant population has more than doubled in the last decade, where people from diverse ethnic backgrounds are increasingly visibly participating in the social, cultural and economic life of diverse commercial neighbourhoods of Santiago, Chile. Simultaneously, divisive xenophobic social discourses regarding difference and concerns about the "illegality" of migrants and their labour have only recently been publicly and politically deployed. Echoing broader sociopolitical processes taking place in many countries worldwide during this Brexit/Trump era, discourses about migration in the Chilean context push for more migration restrictions in terms of the issuing of work permits and visas. Moreover, such

stances inform daily interactions and stereotypes about the migrant and ethnic groups that participate in Santiago's multicultural commercial areas. Within this context, this paper critically contributes to research on precarious migrant labour. Such work has typically constructed migrants' vulnerability in terms of labour exploitation and "illegality". This paper takes a different approach by attending to the possibility of reciprocity—despite unequal power dynamics—involved in all labour relations, particularly when workplaces are small, relatively intimate, and involve daily interactions between workers and employers. Methodology is based on ethnographic observations in small retail shops and restaurants owned by ethnic Chinese migrants in Santiago, and interviews with Chinese employers and their employees of diverse ethno-cultural backgrounds and nationalities (e.g. Peru, Haiti, Colombia). Through the concept of "precarious labor relations", we examine the independent and shared uncertainties constituting labour relations between migrant employers and workers who are differently marginalized in a broader socio-political context. Analysing narratives of fear, trust, care, and indifference in how migrant employers and employees daily negotiate otherness and mutual forms of precarity at work, this paper further complicates dichotomies of exploitation and resistance in scholarship on migrant labour, by foregrounding relationality, trust, and the employer's humanity in the equation.

CHAN, CHRIS* (*City University of Hong Kong*)

Localist Populism and Generational Shift: The Consequences of the Umbrella Movement in Hong Kong and Its Implications for Labour Movement

Labour and working class organisations played a significant role in democratic movement around the world. In 2014, global attention has been paid to the 79 days long occupy movement in Hong Kong which has been called 'Umbrella Movement' (UM). More than 200,000 citizens took to street demanding the universal suffrage in this former British colony and China's Special Administration Region (SAR). According to surveys, most of the participants came from the lower middle class or lower class/grassroots. However, trade union only played a supportive role in this students and intellectuals-led protest. This paper evaluates the causes and consequences of the UM and its implication for labour movement. The author suggests that the movement has led to the rise of localist populism and generational shift in politics. The consequences have created challenges for democratic labour movement in Hong Kong with a mission to build solidarity with mainland Chinese labour movement and alliance with broader social and democratic movement. The author reflects why the labour movement was marginal in the most significant democratic movement in the history of Hong Kong and how the difficulties can be overcome in the long run.

Body-Power: The Lived Body and Youth Work Practice in Hong Kong

The study of body has become the buzzword for over two decades and it has been expanded in different disciplines. However, most youth workers often work with young people who experience painful, traumatic or other kinds of bodily experiences, or even direct and manage different bodily conditions through day-to-day practices; it is yet to develop as the key domain in youth work. Even though the development of youth work has been developed over half of a decade, youth work practice with body issues has not been transcended the actual physical perspective to reflect how bodily knowledge are being defined, interpreted and managed, and then affect the working approach on youth work practice.

This paper aims to explore youth workers' body sensitivity, the understanding of different kinds of body issues, and their youth work practice with body issues. The qualitative method adopted in this study. Twenty youth workers who are working in different youth services settings shared their intervention skills when engaging with young people in different bodily issues such as sex, sexuality, drugs, sex work and self-harm behaviors. This study revealed that most youth workers do not have a strong sensitivity on body and they are found to have faced different struggles and difficulties when intervening in body issues with young people. Some of them even implicitly use their professional knowledge and power to regulate body comportment and bodily care of young people.

This study attempts to relink the strong relationship between body and youth work. It contributes to address some questions and limitations when working with young people under the dominant discourse on biological body in youth work. It also opens the discussion and provides an alternative way to examine the potentials of youth embodiment under the climate of body-insensitive in Hong Kong social context.

CHAN, KA KI* (HONG KONG BAPTIST UNIVERSITY)

Revisiting the Pattern of Youth Transition: The Interrelationship between Labor Market Insecurity and Residential Autonomy Among Young Working People in Hong Kong

Leaving the family of origin and setting up one's own household is one types of youth transition (GoCorijn & Klijzing, 2001; Manzoni, 2016; Nico, 2016; Settersten, 2012), and represents one of the key indicators of the transition from youthhood to adulthood. Domestic transition not only implies financially independent, but also reaching the greater social autonomy for young people.

The striving for residential autonomy is hindered by a lack of sufficient financial resources. Most underclass youth in Hong Kong are suffering from precarious employment. Several structural conditions have been identified in the transitional process from family of origin to family of destination, and from residence with parents to living away from parents (Chisholm 1993), including, flexible specialization in workplace, insecure employment, and families' cultural capital in a time of labor uncertainty. It is found that those impacts not only reshape the experiences in youth transition, but also make domestic transition become more delayed and highly fragmented.

Against the above social backdrop, this research aims to investigate how labour market exclusion and job insecurity affect the transition out of the parental home for young people in Hong Kong, and investigate how labour market conditions influences the attainment of housing autonomy, several dimensions are particularly examined: gender, type of employment, monthly income and occupations.

The research conducted as quantitative study and used the telephone survey to collect data. 1000 young people aged between 20 to 34 years old with Hong Kong permanent residential status and full-time employment status were targeted. This research contributes further studies on youth, particularly in the field of youth transition in pan-Pacific regions. The similar research topic is underdeveloped in East-Asia countries. It is worth further extending as a comparative research to compare the patterns of youth transition between Europe and East Asia countries.

CHAN, WENDY* (Simon Fraser University)

Access to Language Interpretation and Culturally Sensitive Services for Abused Immigrant Women in Non-Urban Centers of BC

Access to interpreters for abused immigrant women seeking community services in non-urban centers of BC is one of the most significant barriers they encounter. Without interpreters, abused immigrant women living in rural and small communities must navigate the service landscape where miscommunication and misunderstanding about their problems and needs can exacerbate their situation and delay their access to support services. This paper explores why access to interpreters for abused immigrant women is limited or non-existent in many regions of this province, and how this is connected to broader questions of racial equality and inequality. Drawing on 30 interviews with criminal justice, immigration and family law service providers in four regions of British Columbia, this paper highlights the key barriers for abused immigrant women as a result of having no access or limited access to interpreters and culturally sensitive services. I argue that equitable access to domestic violence services for women of all cultural groups is an important goal if the safety of all women matter. Critical scholars have long pointed out that formal equality, or uniform services in a multiracial society, will not ensure equality of access. Given that language barriers in situations of domestic violence can potentially lead to tragic outcomes, there is a need to recognize the importance of providing equitable treatment for all women experiencing domestic violence in BC.

To be or Not to be Governed: Symptoms of Transformation in Urban-Rural Landscapes of West Bengal, India

The discourse around "right to the city" and "leaving no one behind" fail to acknowledge wider regional dynamics and transformation beyond the defined urban core. Urbanisation in many parts of India is not concentrated in cities but in regions that mix urban and rural characteristics. These such hybrid regions feature a persistence of rural economies, high-frequency shorter-term commuting, loosely regulated development. Road development connecting the urban cores of the country affect broader and diverse scape which lead to hybrid forms of urbanisation. Questioning the unpreparedness of large regions governed locally in the reverberation of urbanisation brought by catalytic actions of road development.

This study examines these hybrid regions in the state of West Bengal which supports a large, dense rural population that is socio-economically dynamic and youthful. Using symptomatic reading methodology, the study identifies irrepress-

ible and recurring spatial symptoms of transformation in habitations with introduction of all-weather road access to arterial network within the region. The symptoms of transformation observed are in housing construction, education demand and mode of travel; showcasing change from vernacular choices towards globally acknowledged solutions. This process of transformation is leading to population densification, dependence and demand of goods and services in rural classified areas of West Bengal. Rural classified areas in India come under self-governing village system called Panchayati Raj, unequipped in spatial and governance solutions that could support the undergoing transformation.

An urban bias underpinning road development and planning policies in India, downplays or ignores altogether this hybrid urban-rural condition, resulting in unprepared local-bodies of governance in rural areas. As a consequence, there is a sharp unplanned and uneven form of urbanisation along these corridors of development. This condition opens towards the question of development agendas failure to address broader and diverse scape, leaving rights of large population behind to 'sustainable' development.

Construction of Modern Childhood through Children's School Education in Digital Age: Setting of Global Vision or Realization of Local Needs of Children?

The contemporary childhood is a construct of modern technologies and modern education system which is equipped with scientific temperament and rational thinking. It has been observed that children enjoy more freedom of expression and greater degree of choices in their daily lives. The State has also developed more laws of protection of children; social control of children has also been modified through new laws and compulsory education. The consequences of this change towards modern childhood is that children are more and more exposed to new world of technologies and placed into schools which is like a waiting room for these children before entering into the world of work. In this backdrop, a study has been conducted to explore two basic questions in the context of 'children's school education' and the 'new construction of their childhood': First question was to see how far children receive the basics of modern education - reciprocity and freedom in communication; openness and rationality in the process of learning in the class room environment; participation in the learning process; safety of children within the school system; space for children's agency in the school settings, etc. The second question was to probe the boundaries of children's childhood which was shaped by basic needs of their families and/or their communities. The study found that children who receive the modern education in their schools face a dilemma. On the one hand they adapt the new and relatively more open value system in which they develop a logical rationale for their each and every action. They argue; they challenge; they propose alternatives etc. On the other hand they have to follow the traditional arguments and logic of their parents and community people as they have live with them as well. Children are sometimes in conflict what to choose and what not.

Domestic Violence Against Married Women in India: A Study in Religion and Cultural Context.

Abstract: Documented experiences of women indicate that Inequality and the result discrimination on the ground of sex are common in all societies. Though women have proved equal still they are being abused. Violence against women reflects the reality that woman are not safe either at home. In India gender discrimination and the resultant forms of Domestic Violence or s familial abuse still remains more often it is latent. According to 'United National Population Fund Report' 2007, around two-third of married Indian women are victims of Domestic violence.

In this background, this study is conducted in Belgaum city of Karnataka state, India. The empirical data were collected by 200 respondents through interview. The study analyzes the domestic violence against women in the Hindu Religion and Indian cultural background. The study justifies Social learning theory. Dependency theory and feminist approaches. The finding of the study reveals that, highest frequency of Domestic Violence is observed in the middle class nuclear families. Economic, financial, social dependence and lack of social support are the main causes for Domestic Violence. The Indian culture and Religion perpetuate that a woman is supposed to be submissive, tolerant and approachable to the situation. Due to lack of alternative support system and habitual tolerance forces women to remain in the spouse's family. Most of the times they don't share their problems and experiences with any of their friends, neighbors and family members. The law has tried to check the Domestic Violence, and the amendments are made but it has failed on account of solution. The study emphasises the need to reduce the incidences of Domestic Violence against women by changing the attitudes of men towards women and to create awareness to fight against violence.

(Key words: Domestic Violence, Hindu Religion and culture, Social learning theory,

Dependency theory, feminist approach.)**RC20-381.4**CHANG, HSIN-CHIEH* (*National Taiwan University*)HUANG, KUAN-HAO (*Academia Sinica*)*Change and Continuity in Gender Ideology across Different Fertility Contexts: Comparing Japan, Poland, Spain, Sweden, Taiwan, and the United States*

In ultra-low fertility societies, persisting traditional gender ideologies may continue to discourage educated women from having children or having to choose between career and marriage. We examine trends and changes in the sociodemographic patterns of gender ideologies across Japan, Taiwan, Spain, Poland, Sweden and the US. Each country exemplifies different stages of fertility change, cultural contexts of marriage and family, and socioeconomic development and inequalities. Using 12 statements on attitudes toward marriage, gender roles, and alternative family forms from ISSP 2002 and 2012 data, we identified four gender ideological classifications with Latent Class Analysis, capturing changes by gender and education from 2002 to 2012. The four classes are: Liberal (class 1: 22%), Strict motherhood (class 2: 16%), Pro-marriage and pro-work (class 3: 33%), and Traditional (class 4: 29%). Class 2 puts less value on marriage but believes that working mom harms the wellbeing of family and pre-school children; class 3 highly values marriage especially for women, but holds paradoxical beliefs that being a housewife is fulfilling while both husband and wife should work. The results indicate that higher education is an important determinant for the increase of more liberal gender ideologies in transition economies like Taiwan and Poland for both genders. Yet there appeared little changes in post-industrialized Japan and US. Multilevel mixed-effects logistic models further show that more seats held by women in national parliaments and less wage gaps significantly predict more liberal gender ideologies. We end the discussions over the importance of offering a "choice" framework for women, and the dual-earner/dual-carer ideology that may boost fertility and increase population wellbeing in ultra-low fertility contexts like Taiwan and Poland. From a comparative perspective, this paper contributes to the gender and reproductive behavior literature in showcasing the individual- and country-level correlates that may draw fertility and family policy implications.

RC31-573.5CHANG, HSIN-CHIEH* (*National Taiwan University*)*Social Integration and Post-Divorce Wellbeing Among Female Marriage Migrants in New Immigrant Destinations*

One common trend observed across new immigrant destinations in Asia is the high prevalence of divorce among intra-Asia transnational marriages compared to marriages between the locals. Taiwan and South Korea are no exceptions. Some migrant divorcees might have returned to their home countries, yet many have chosen to remain in the host societies to pursue better life prospects for themselves and their bi-ethnic children. Using mixed-methods including 22 in-depth interviews with Vietnamese migrant divorcees in Taiwan and Korea that I conducted between 2011 and 2017, and a large-scale survey containing 2,435 divorcees from China, Vietnam, the Philippines and other Asian countries who were residing in Korea in 2009, I examine different patterns of social integration and wellbeing among female migrant divorcees. The survey results show that migrant divorcees' self-rated health and life satisfaction are significantly worse than the average of marriage migrants. Furthermore, migrant divorcees maintain less social relationships with Koreans and are more likely to report discrimination in daily lives. Importantly, being employed links to better health after controlling for socioeconomic factors, immigrant characteristics, and key covariates. Multivariate analyses show that more types of social relationships with Koreans contribute to migrant divorcees' better wellbeing, yet discrimination is associated with worse wellbeing. With the mean age of thirty-four among 22 divorcees, the mean years of marriage were 7.3 (9 in Taiwan and 6 in Korea). Findings from the interviews were used to illustrate the processes of getting a divorce among Vietnamese marriage migrants who reside in both rural and urban settings, and the sources of support they obtain from different types of friendship networks at various stages of the divorce processes. For migrant divorcees who are often lack of support networks in the host societies, both quantity and quality of social interactions with the native population matter for their wellbeing.

RC05-JS-63.4CHANG, JUHUI* (*National Taitung University*)WANG, CHIEN-LUNG (*Department of Education, National Taitung University*)*Crossing Race and Gender Borders: The Cultivation of Intercultural Competence for Undergraduate Students*

Critical Indigenous feminism focuses on the oppression of racial and patriarchal colonization, and the empowerment of women. It is not exactly associated with White feminism but with the Indigenous culture. Many Indigenous tribes were egalitarian, and women elders were chosen leaders and had a voice in decisions important to the tribe's livelihood. In Taiwan, Indigenous peoples belong to the Austronesian language-speaking groups rather than the mainstream Han-Chinese people in Taiwan. The Puyuma, one of the ethnic groups in the Indigenous peoples, is close to a matriarchal society and has bilateral descent. The "Mugamut" (Women's weeding festival) represents the tradition of women as tribal leaders and the mutual respect between males and females. This study tried to cultivate the intercultural competence of non-Indigenous undergraduate students majoring in digital media through the creation of electronic picture books about the "Mugamut" (Women's weeding festival). The research methods include participant observation in the tribe and classes, personal and group interviews, and analysis of the electronic picture books the students created. The research found these undergraduates developed intercultural competences in the following five dimensions, including attitudes, knowledge, skills, external outcomes and internal outcomes. They performed well in the first four dimensions. For example, they broke racial stereotypes, and respected and valued Puyuma culture; they were open-minded and self-aware about cultures; they showed curiosity and the ability of listening, observation, evaluation and communication in the tribal field. However, on the dimension of internal outcomes, they still had difficulties in forming and shifting the frame of gender and cultural references between cultures.

RC48-JS-25.3CHANG, JUNGMIN* (*BK21PLUS program in Embodiment: Health-Society Interaction, Korea University*)*Gender Based Violence Law in South Korea: A Narrative Policy Framework Analysis*

Gender based violence has increased by more than 4.5 percent in South Korea over the past five years. New offenses of digital sexual violence has given rise to prominent societal problems massively dropping crime safety index for women from 76.4 points in April to 54.6 points in June 2016. Although voices calling for awareness and legal system reform have existed for two decades, law enforcement against gender violence has continuously failed to meet the agreement of the National Assembly.

However, policy context of gender violence policy has recently changed in direction and a new government is committed to enactment of gender violence prevention laws. This study aims to understand the policy change using the policy narratives focusing on the role of policy narratives and strategic construction and communication of policy narratives by coalitions. The research questions are 1) How does each coalition construct its narratives in terms of stance, characters, plots, solutions and causal mechanism? 2) How does each coalition use narrative strategies in terms of scope of conflict, angel-devil shift, policy surrogate and policy belief?

To explore the research questions, we use the meso-level Narrative Policy Framework to provide systematic empirical analysis and employ content analysis of policy narratives generated in gender based violence policy subsystem over a 10-year period between 2008 and 2017. Empirical research examines narrative elements, strategies and policy belief differences within and across coalitions, the Pro-Gender based Violence Law coalition and Anti-Gender based Violence Law coalition.

We expect that the Pro-Gender Violence Law coalition is disposed to expand the scope of conflict attributing the problem to society. On the other hand, the opposite coalition contains the scope of conflict. Furthermore, relative stability, strength, and cohesion of policy belief are quantified and measured to determine whether a subsystem is collaborative or adversarial.

RC16-314.2CHANG, KYUNG-SUP* (*Seoul National University*)*Complex Culturalism Vs. Multiculturalism: The South Korean Approach to Cosmopolit(an)ization*

The literally explosive growth of transnational marriages between Korean men and poorer Asian women seemingly signals that South Korea has entered a genuinely new epoch of cosmopolit(an)ization. This unprecedented phenomenon has drastically reconfigured diverse corners and peripheries of South Korea into manifestly multiethnic entities. The national and local governments have been quick in initiating a comprehensive policy of "multicultural family support" whereas various civil groups, media, and even business corporations have echoed the governmental drive with their own multiculturalism initiatives. As agents of what I define here as *complex culturalism*, South Korean institutions and citizens have instrumentally, selectively, and flexibly incorporated into themselves various historical and civilizational sources of culture in order to expediently consolidate the postcolonial sociopolitical order and then to maximize socioeconomic development. It should be noted that this complex cultural system used to be embodied in the South Korean nation or population as a

supposedly homogeneous racial entity (dubbed *danilminjok*). The mass presence of “multicultural brides” seems to have further reinforced complex culturalism by enabling South Korean citizens and institutions to conveniently interpret that their open accommodation and active support for the marriage migrants help make their cultural complexity a more self-contained civilizational property. However, the more their multiculturalism as part of their self-centered globalism is framed through arbitrarily staged experiences, the more the Asian marriage migrants will remain differentiated, if not discriminated, from native Koreans. What nevertheless remains to be seen is if the foreign brides themselves could or would ultimately accommodate South Korean culture (and even South Koreans’ self-centered globalism) and thus sustain the nation’s cultural status quo or if they would permanently be asked or forced to preserve and display their home-country cultural characteristics as an indispensable condition for native South Koreans’ still elementary multicultural experiences and feelings.

Internal Multiple Modernities: The Korean Aperture

Modernity has usually been conceived as the civilizational state of affairs in a national society. When postcolonial nations, upon liberation, embarked upon modernization often as a state-driven project of material, cultural, and institutional transformation, many of their respectively incumbent states were not able to justly represent or fully incorporate people(s) and society (societies) under their supposed jurisdictions. Within loosely, hastily and/or coercively defined national boundaries, certain regions, ethnicities, classes, professions (military in particular) or civil society have frequently challenged the rule of the often self-established states by envisioning and pursuing alternative lines of modernization. At the micro-social or private level, individuals, families, and other intimate groups often implicitly defy the rule of any ineffective and/or authoritarian state in similar ways. Modernity – and the process of modernization – can be plural not only across different national societies, as persuasively indicated in Eisenstadt’s “multiple modernities” thesis, but also within each national society. Such internal multiplicity of modernities/modernizations is critically predicated upon the varying complexities of time-space (era-place) compression across different units of (inherently compressed) modernity. Internal multiple modernities can be seen as complexly localized instances of Appadurai’s global “scapes” in postcolonial modernization. In a major historical irony, the internal plurality of modernizations/modernities was manifested with particular intensity under the political and ideological influence of the Cold War, which helped enthrone certain political factions into state power against broad local social ideals and interests. Beneath the coerced uniformity of liberal capitalism under the authoritarian Cold War states, paradoxically diverse aspirations for liberation and happiness nurtured multiple competing axes of modernities/modernizations. On the other hand, under multi-faceted globalization defying national particularities and regional barriers, the 21st century is quickly becoming an era of universalized internal multiple modernities. In this paper, the Korean experience is examined as a most pertinent case in point.

Insurance Risks As Fictitious Commodities: The Ongoing Construction of the Cyber-Insurance Market in North America

This paper introduces a new framework in the emerging field of sociology of insurance, one of the most dynamic branch of sociology of risk and uncertainty. Building on the sociology insurance literature shedding light on the epistemic, calculative and cultural construction of private insurability, this paper shifts the analytical focus towards the political-legal and non-competitive constitution of insurance markets. Following Karl Polanyi’s institutional analysis, it analyses the political construction and maintenance – or institutional constitution – of private insurability. It defines insurance markets as institutions designed for the capitalization of substantive, empirically experienced uncertainties into fictitiously commoditized insurance risks. Insurance risks can be conceptualized as fictitious commodities since private insurers, despite the powerful set of incentives and controls provided by insurance business governance, cannot autonomously ensure the stable and profitable commoditization of the underlying uncertainties they capitalize as risks. Moreover, insurers face no financial incentives to completely remove these uncertainties. This explains why the insurance industry depends on policy-making, legislation, regulations, the state as the “ultimate risk manager” and others non-competitive arrangements. Following a discussion of the Polanyian theory of the institutional constitution of markets and the concept of insurance risks as fictitious commodities, this paper presents the case study of the ongoing construction of the cyber-insurance market in North America. With the growth of organizational network infrastructures, e-commerce and big data the insurance industry now offers cyber-insurance to organizations seeking to cover the potential losses and liabilities stemming from cyber attacks and data breaches. Industry insiders suggest that the insurability of cyber risks cannot

expand significantly until enough information is collected leading to robust actuarial data. This paper argues that analyzing cyber-insurance risks as fictitious commodities contributes to a better understanding of why the cyber-insurance market is paradoxically rapidly expanding despite facing major obstacles and uncertainties.

Épreuves sociales constitutives du processus de construction identitaire de jeunes adultes en situation de pauvreté dans un contexte de raccrochage scolaire

L’approche biographique est une méthode de recherche en sciences humaines qui permet d’étudier les liens dialectiques entre les individus et les groupes dont il fait partie (Desmarais, 2009). L’approche biographique consiste à écouter, puis comprendre le sens des expériences humaines (ibid.) et en ce sens elle est très cohérente avec les bases humanistes et herméneutiques de la sociologie clinique (Sévigny, 1993). Dans cette communication, nous proposons de rendre compte d’une recherche doctorale menée dans ces paramètres et ayant pour objet le processus de construction identitaire de dix jeunes adultes en situation de pauvreté dans un contexte de raccrochage scolaire. Le concept d’épreuve sociale permet de cerner les « défis historiques » (Martucelli, 2006) que ces personnes ont dû affronter dans leur position sociale, c’est-à-dire l’ensemble des rapports sociaux constitutifs de leur personnalité biographique (Sève, 2008). Dans cette communication, je propose de présenter les concepts qui définissent ces épreuves sociales.

RC05-119.4

CHARLES, CARLO* (*York University*)

The Intersection of Nationalism and Anti-Blackness in the Reception of Haitians in Canada

In January 2018, the Canadian PM Justin Trudeau responded to Trump’s immigration ban by stating: “To those fleeing persecution, terror & war, Canadians will welcome you... Diversity is our strength”. Although this message was not directed to Haitians, undocumented Haitians who were living in the U.S. under a TPS represented 80% of the 21 695 asylum claims made in Canada from January to July 2017 (IDC Quebec, 2017). This “massive flow” of Haitians, described as a “refugee crisis” by the right-wing media and white nationalist anti-immigrant protesters, has forced the Canadian government to shift its welcoming message to a strictly admonishing and policy-related discourse aiming that “economic refugees” are not entitled to Asylum. Such a shift contradicts the international image of Canada as a multicultural and inclusive “heaven” for refugees and it places Haitians within a field of representations and policy framework level, which operationalizes distinctions between “economic migrants” and “refugees” informed by primitivist and orientalist racisms (Kyriakides 2017). While primitivist racism in the Global North relies on biological determinism and ideological construction of black people as “problem population” to categorize Haitians as “economic migrants” (Hall 1986; Eglash 2002), orientalist racism depicts brown people like Syrians admitted as refugees in the West as “non-threatening victims to be saved”, (Daniel and Knudsen, 1995; Behrman, 2014; Kyriakides 2017). By focusing on racialization in reception contexts, methodological nationalism and geopolitical framework, I draw attention to how the Canadian context operationalizes the two different types of racism when it comes to the reception of refugees from the South and the East. More importantly, I seek to understand how primitivist and orientalist racisms shape the way Haitians are represented in juxtaposition to the notion of model minority in the Canadian racialized vertical mosaic (Porter 1965, Portes & Zhou 1993, Hollifield & al. 1994, Ngo 2016).

No Food Sovereignty in Thailand without Land Security

In Thailand, half of the land is agriculture land. This land is important to farmers’ livelihoods, yet they face landlessness and lost of access to land. This study explains the linkage between food sovereignty and land security. The central question asked here was how food sovereignty can be established in Thailand. Rural villages in Northern Thailand were selected as a case study. We found that land and access land is a significant point for farmers to secure life. The data further shows that problems regarding landlessness among farmers. These problems were connected with land security and farming patterns. Farmers increasingly become landlessness which is due to economic problems that are rooted in farming patterns and the market. Another reason for land insecurity is that farmers lack rights in land and cultural rights have been denied resulting in a loss of access to land. Further neoliberal agriculture and policies have forced farmers to change their farming patterns. Combined with an imbalance between the cost of production and market prices, farmers are trapped in poverty. The lack

of land security has heightened this situation further. It has to be concluded that food security is inextricably linked to land security. Thus, land rights need to be reformed in order to empower farmers and achieve food Sovereignty. For there can be no food sovereignty in Thailand without land security.

Virtual Mobility Among Highly Skilled Migrants in Thailand

This article aims to demonstrate the limitation of an approach of movement of the highly skilled within the framework of migration studies. This study has proposed an alternative framework of virtual mobility which is believed to have allowed us to see two different kinds of movements. First, the highly skilled can exert influences from remote, whilst they stay put, that their socioeconomic impact can be felt within a specific system of mobility. Second, the highly skilled who move, when they do they have power to modify their destination such that their movement requires minimal adjustment. This is incomparable to the level of adjustment of the movement of the powerless, e.g. refugees, asylum seekers and illegal labor migrants. For these reasons, I thus propose that conceptualizing highly skilled migration should be considered in line with *mobility paradigm*, which has greater advantage in providing us with perspective of the first kind of mobility mentioned above, I shall use the term virtual mobility for it. The second form of mobility, I use the term mobile virtuality.

These forms of mobility will be illustrated through a case study of highly skilled migration in Thailand, focusing specifically on the case of Japanese highly skilled who moved through international networks of oversea corporations. This study will also demonstrate that to study mobility of the highly skilled, migrants should not be an exclusive focus for the reason that movement did not stop when they have reached their countries of destination. On the contrary, transformation of destination cities, networks of people, things, communication and infrastructure that transcend borders are parts of the mobility system that we should consider. Such perspectives will provide us with more concrete view on how mobility has actualized.

Family Violence Against Girls and Boys in France: Measuring Generational and Gender Differences with a Quantitative Survey

We know that the gendered norms affect all forms of family violence, and that the category 'violence against children' has expanded in research fields since the 20th century. However, because of the lack of survey before 2015 in France, little sociodemographic research has examined perceptions of psychological, physical and sexual violence since birth in the family. My communication focuses on family violence against girls and boys from a generational and gender perspective. I analyze the data of the french survey *Violence and Gender Relations* (Virage). Virage is a national general population survey carried out in 2015 by the French National Institute for Demographic Studies (INED). The survey questionnaire contains questions on interpersonal psychological, physical and sexual violence experienced since childhood in the family sphere or among close friends, their frequencies, subjective seriousness, age of beginning and duration, perpetrators, and impacts on trajectories. Information was collected from a representative sample of 15,556 women and 11,712 men aged 20-69 living in metropolitan France. In this contribution, I describe the violence experienced at early age within the family (forms, repetition, familial relationship between the perpetrator and the victim, subjective seriousness of violence). Both girls and boys are subjected to various forms of violence, but violence takes different forms, frequencies and is perceived differently according to gender and the age of the respondents. The acts classified as violent by the researchers are not always identified as violence by individuals. Then I examine the short-term and longterm consequences of family violence on the life course of respondents. I suggest that the effects of childhood aggression are different on women's and men's trajectories.

CHARTIER, GAËLLE* (*Université Paris 13*)

From Fun to Pain. Observations of Interactional Qualifications of Violence.

This contribution examines the interactional process during which individuals are led to cognitively qualify other's behavior as violent.

This contribution relies on observations and recordings of the last *Pillow Fight Day* (PFD) in Paris, which took place in April 2014 and consisted in a flash mob of among 1.000 young people (aged from 20 to 30) who enjoyed a pillow fight for 30 minutes. I analyze sequences of gestures that were qualified as violent by participants themselves.

After presenting the theoretical and empirical frame of festive violence as a breaching experiment (Garfinkel 1967), I present the observations I recorded during the PFD. I then demonstrate that cognitive qualifications of violence occur

when the metacommunicative properties of a social frame blur. Indeed, gestures, postures and gait are *representational re-descriptions* (Cicourel 2006) for a social frame, and, given this attribute, they can also break *attentes* (Mauss 1924) when they excessively divert from an anticipation zone, i.e. from an expected repertoire of attitudes (Chartier et al. 2017). Consequently, I propose that violent acting lies in the contestation of the stability of an initial social frame and in the rigid assertion of metacommunicative rules to set a new stabilized social frame. Eventually, I discuss Collins' situational hypotheses on violent gestures (Collins 2008).

The Neural Correlates of Killing? a Critical Review of Social Neuroscience of Violence

This contribution analyses social neurosciences and their studies of violent behaviors.

Following the development of neuroscience, this specialized field of inquiry has developed in the United States from the beginning of 2000 with the objective of establishing biological explanations of social life. Violent behaviors are in its scope of interest as they question the relations between cognitive functions, emotional expressions and social interactions.

Investigating these neuroscientific studies on violence is relevant to the sociology of science and technology for at least three reasons: first, it highlights neuroscientists' representations about violent situations and violent behaviors. Then, it questions how the neuroscientific research program appraises the "social": critical neurosciences (Choudhury, 2012) have pointed the role of technologies (Dumit, 2004), scientific routines and moral concepts (Vander Valk, 2012) in the production of neuroscientific knowledge. Finally, it challenges the physiological assumptions that are admitted in sociological studies on violence, such as in the works of Collins (2008) on violent interactional processes.

This contribution relies on a lexicographic study of academic articles on violence published in two scientific journals dedicated to social neuroscience: *Social Cognitive and Affective Neuroscience* and *Social Neuroscience*. After presenting this field of inquiry and its research program, I qualify its appraisal of violent behaviors – what social situations are studied? By which disciplines and according to which methodologies? I eventually stress the conceptual differences that appear between the analyses of individual and collective violence in order to initiate a critical dialogue with sociology.

Arbitrating in the Shadow: A Sociolegal Study of Labor Arbitration in Brazil

This proposal intends to analyze a specific case of dispute resolution: arbitration regarding labor issues in Brazil.

Brazilian Arbitration Act's approval in 1996 can be understood as part of a broader movement that sought to establish a transnational arbitration system. The growing of the international commercial arbitration market led to reforms of the domestic legal systems that aimed their integration to the transnational legal order.

During the two decades that followed this approval, the use of arbitration in Brazil grew exponentially and a new ADR (alternative dispute resolution) field was built around the institutions the work with it. My survey found 30 chambers practicing arbitration in São Paulo (the country's biggest urban center) which I clustered into three different profiles. This mapping revealed that more than 50% of the chambers are not working with commercial issues, like the legislators had expected, but rather with consumer or labor cases.

Concerning the labor cases, the situation is analytically interesting. There is an ongoing struggle between the practicing institutions and part of the judiciary that doesn't accept the use of arbitration as a way of labor conflict resolution. They battle over whether labor rights should be considered "not disposable", that is, if they can be freely abnegated or not. Judges usually establish that these rights are under public protection and thus command the suspension of those chamber's activities. Likewise, the arbitrators situated in the most prestigious positions also refer to the labor chambers as "not taintless" institutions.

The focus of this proposal is to analyze this specific ADR universe. The field work allows us to understand how labor arbitration work, what are the representations shared by the agents involved and which are the practices that dominate this activity, as well as to investigate the conflicts that have been growing in this field.

Special Courts in Brazil: Legal Transplants, "Innovation" and Its Impacts on Access to Justice

This proposal aims to present an analyses about the way by which Brazilians' Civil and Criminal Special Courts operate. Oriented by the principles of orality, simplicity, informality, economy of proceedings and celerity, these courts can be considered the first Brazilian national experience related to the justice informalization. They resemble north-Americans' Small Claim Courts and Lower Criminal Courts and its creation can be interpreted as a case of legal transplant, which is relatively common among the attempts of institutional innovation that happen in the field of access to justice in Brazil.

The movement that led to its creation resorted from the "innovation" discourse by arguing that its characteristics would wider access to justice. Since their creation, however, the Special Courts deal with a tension between two orientations that live together inside the institution until nowadays: the pursuit of wider access to justice and the relief of the regular court overload.

This research profits from ethnography in order to verify how these two types of courts reflect this tension. By following the courts audiences as well as the institutions routines, we observed the way by which the cases are processed and the agreements are built.

In Brazil, the literature about the issue usually analyses the impact of these innovations separately in civil and criminal arenas. Notwithstanding, we could verify that a transversal analyses of the different kinds of small courts amplifies a broader understanding of the experiences of justice informalization. Both of the areas are marked by the acceleration of judicial service and the offering of a minimalist justice – where there is no space for a substantive law discussion –, as well as by a series of elements resulting from the asymmetry between the parties in dispute.

It's Time We Paid Attention: The Geopolitics of International Higher Education and Study-Migration

The number of foreign tertiary students worldwide increased by a striking 50% between 2005 and 2012 (Organization for Economic Cooperation & Development [OECD]). Large concentrations of the world's mobile students are found in major higher education destinations of the West, most prominently in USA,

UK, Germany, Australia, Canada and France. According to 2015 statistics of the OECD, close to 53% of these students originated in Asia. These are not disparate statistics, rather a close approximation of postwar, postcolonial global migratory patterns. Theorizing the spaces and patterns of contemporary student migration (See Raghuram, 2013), in this context, and also the historic context of Western universities being sites for colonial domination and imperial expansion (Bu, 2012; Mignolo, 2009), is a pressing task. And yet, scholarly discussions are dominated by the explicit instrumentalities of student migration, focusing largely on attracting more students, the quality of their student experience, and their post-graduate labour outcomes (Bang and Montgomery, 2013; Wang, 2016; Arthur and Flynn, 2011). Drawing from a recently conducted cross-country (UK, USA, Australia, Canada, & Germany) review of study-migration policies and accompanying discourses, the authors embark on the timely task of theorizing the phenomenon of student migration from within the lens of geopolitics of contemporary international education and migration.

Social Movements and Digital Conflicts

When needs are institutionalized over a period of long time facing generations of trials institutions gain the status of an assembly line of normative satisfaction. When solutions are ignored or lost by the institutions be they political, economic or other kinds thus leaving the social conflicts unresolved, social movements ensue. India has witnessed many social movements against corruption in public life (for ombudsman, bring back black money from foreign), rape and murder (Nirbhaya tragedy), ideological battle in campus, and eve teasing (security of female students) to cite major ones. The majority of participants belonged to students and youth of urban middle classes attracting media attention, debates on electronic media, and culminating in candle marches, processions, sit ins (Dharna), demonstrations. But how did this happen so successfully?

however, belonged to students and youth of urban middle classes attracting great media attention, debates on electronic media, and culminating in candle marches, processions, sit ins (Dharna), demonstrations. But how did this happen so successfully?

The paper attempts to chronicle the series of events that happened in leading social movements and takes samples of posts and responses on popular mode of social media in India. The data are from media reports and social networking sites. The paper concludes that in most emotional tragedy of Nirbhaya case people on social media and on site launched cohesive collective action forcing the political institutions of the then government to respond quickly and of course they raised their voice in chorus against the corruption but in campus circumstances, social movement was encountered by parallel group formation on the basis of political ideology as also on pro and anti establishment stance. The most expressive was digital conflicts between warring groups. Social media became the main battle ground where abuses were hurled and falsification became the order of the day.

SADEGHIAHANGAR, MASOUMEH* (*Banaras Hindu University*)

Visualitics and Evaluation

In looking glass self, glass is not an objective phenomenon; it is one's own visualization. Signs are not the limits of perception. Visual sociology qualifies for 'visualitics' if we explore the process as visualizer and visual to elaborate the discussion launched by Saussure. Not much of philosophy, however, is available on visual thus making clear turn to empirical perspective of visual data. The paper explores the reciprocity of networking from eye to thing and from thing to eye. Is it not an image that we carry, it is interactivity that burdens a viewer with self image. Self is conscious self but if self is totality of consciousness, it sure needs sensory capability. Where entre power in this? Power is that tool which is created over the instruments to be used for visual data collection. Technology provided us extension of senses and accuracy of visuals often independent of projected self in the image and thereupon expression. Instruments in this context are evaluator too. The paper is inconclusive in the sense that even methods and instruments of data collection in the domain of visualitics are misused (e.g. Photoshop) hence evaluation technology of visual referents shall also cross check the reciprocity between visualizer and visualized.

CHATZICHRISTOS, GEORGIOS* (*University of Aegean*)

The European Political Framework for Rural Development and Social Entrepreneurship

The endeavour of social entrepreneurship inside the European framework appears problematic, still even from the identification of a common

conceptualization. Extensive researches show that this might be due to the fact that social entrepreneurship is an immanently subjective form, inextricably interwoven with the specific social context and geographical and historical peculiarities (Steyaert and Katz 2004; Smith and Stevens 2010; Bacq and Janssen, 2011; Somerville and McElwee, 2011).

The present paper will seek to investigate the development of social enterprises and rural areas, inside a European political framework that appears threefold: European, national, regional. The fragmented framework articulates an understanding about social enterprises that "differs substantially across (and sometimes even within) countries" (European Commission, 2014, p.15). Thus, the common discrepancy between the local claims and concerns, and the externally imposed i) concept of social entrepreneurship and ii) Rural Development Programs (RDPs) will be investigated via a survey that will question the policy makers' assessments and opinions about social enterprises and RDPs.

Significant divergences between the opinions of policy makers of different regions (inter-national), will indicate the cross-national and cross-regional diversity of member states and will enhance the assumption that common European goals are difficult to be articulated -social entrepreneurship and RDPs should be developed closely related to geographical and historical peculiarities. Significant divergences between the replies of the policy makers in the three political levels (intra-national) -European Commission, National Government and the Local Government- will indicate that the top-down approach has a weak appeal to the lower political levels -potentially a more bottom-up perspective could be elaborated.

Eventually, what should be underlined, is that the research should take into serious consideration timely, sociopolitical phenomena (for example Euroscepticism) that trigger significant externalities that might not be correlated to the rural actions *per se*. The longevity of such external phenomena remains controversial.

Digitised Swasthya: Technology and Healthcare As Sociotechnical Ensembles in Rajasthan, India

Over the last few years, the phenomenon of digital healthcare has emerged as a key dimension of contemporary healthcare policy and delivery in many countries. However, the rapid changes brought by digital healthcare technologies, particularly the newer technologies associated with Web 2.0 innovations, have only just begun to be documented and analysed in the academic critical social scientific literature. In that effort, most research has been conducted without much acknowledgement to the sociocultural, ethical and political implications of their use. This becomes problematic as no technological experience typically exists independent of human experience. In addition, no human experience operates in vacuum but as *mutually constitutive of every person's intersectional position*. That is, experiences are guided by the combined effects of axes of differentiations such as age, gender, ethnicity, migration, socioeconomic status, religion, and education, to name a few. Research on digital healthcare technologies associated with Web 2.0 using the sociocultural, *intersectionality* lens has remained in the blind spot of scholarship, and hence, unexplored. This study engages in an in-depth and nuanced qualitative analysis of one such digital healthcare technology, *digital reproductive healthcare*, in Rajasthan, India. The study introduces a *scaled intersectional approach* to analyse how digital reproductive healthcare practices operate to construct various forms of subjectivities and embodiments and participate in the configuring and reproduction of intersectional power relations through various usage patterns. In this study, healthcare is dealt with as an arena in which informationalization, or the process through which information generation and transmission become the fundamental resources of productivity and power, is increasingly central to user experience and decision-making. The study is multi-modal (across digital platforms), and multi-scalar (across geographic and social scales), and is designed on the principles of Constructivist Grounded Theory Method.

Emerging Meta-Organisation in Global Climate Change Regimes: The Work of Intermediaries

Background and arguments

Climate change is now widely recognized by scientists and most policy-makers as one of the critical global threats. The urgency for global coordinated action with national applications birthed the United Nations Framework Convention on Climate Change in 1992 (UNFCCC), a 'meta-organisation' with 165 signatory countries. There is too little research on how the member organizations in a meta-organization regime interact within a common framework (set by meta-organisation), innovate, manage interdependency and information flow that produce capacity, develop aims and objectives, and recognise pivotal points. We focus on the role of intermediary actors that 'connect' across broad organizational communities in national regimes:

- What are the intermediary agencies becoming visible in the transnational meta-organization but also in country-specific regimes? What do they do and how do they connect with the wider meta-organization?
- What kinds of challenges and ambiguity do these organizations confront, and what are typical solutions they use – either structural connections, organizational forms, brokering or information gathering and sharing, and/or others?

Research strategy and discussion

We make use of original data from the first author's dissertation on the organization of climate change adaptation in countries in Africa and Asia (Chaudhury et al 2016, 2017), including surveys, field work, and network analysis. We augment these data with key interviews with leading agencies and policy elites to map the terrain of intermediary organizations working to set standards, define and resolve ambiguity in process and outcome, and sort conflicts across policy levels. We use a network-informed understanding of meta-organization and component organizational elements (Chaudhury et al). Meta-organisations across a policy continuum provide intermediary information, standards, and solutions. We focus on the ways that intermediaries agencies 'translate' and 'do the work' to support component countries in the meta-organization.

Class Based Leisure Patterns of the Aged: Analysis of Leisure Among Old Age People in India

Class Based Leisure Patterns of the Aged: Analysis of Liesure among Old Age people in India

Prof. S.K. Chaudhury,
Department of Sociology
University of Lucknow,
Lucknow-226007
India

Leisure has become crucial to the existence of human being today in every society. Unless people have leisure in their work schedules there cannot be proper social development. Proper social development leads to a better quality of life. The aged are no exception. For the old leisure activities are also supposed to be a type of engagement in their day to day life. Here those people are referred to who are not doing any routine work or activities for earning a livelihood, those who are retired from their occupation. It is obvious that people from different classes have different types of leisure activities in India. Rural India leisure pattern differs from urban India.

Under this backdrop, the present paper would focus on leisure pattern among the aged in Urban India. Traditionally watching movies, listening to music, walking, travelling, attending spiritual meetings or going for pilgrimage were the main leisure activities. Today it has not changed drastically in India. However, there has been some transformation in the leisure pattern found among the urban aged because of better transportation and communication facilities. In light of this the paper would also try to analyse how these above facilities have been helpful for the aged to find out a healthy life.

Gender, Religion and Settlement Problems: The Rohingya 'Immigrants' in Jammu (India)

Rohingya Muslims are regarded as the 'world's most persecuted community'. Over 400,000 of them fled Myanmar due to torture by the State government. More than 40,000 have sought refuge in India. The estimated data from various sources suggest that between 6,000 - 14,000 Rohingyas live in the State of Jammu and Kashmir (J&K) in India. The Indian government consider Rohingyas as 'illegal immigrants' (not refugees) and has decided to identify and deport them, allegedly for being threat to national security and exhausting resources. This has generated debate across the country and in the world about their status as 'immigrants'. In J&K, though they were given shelter and treated well initially, in recent years a hostile climate is created. Even if some NGOs and associations are working for them, there are various groups and political parties, including the present BJP government at the Centre and the State (coalition) which have taken arms against the Rohingyas and want them to 'quit' J&K. The problem of settlement has been tremendous for the people and Rohingya women suffer a much larger brunt due to their gender, religion and poverty. Feeding the family, doing household chores and working for livelihood have all been a part of their everyday struggle. They live in camps, small houses or shanties in poor condition, are denied basic human rights and work as labourers, rag pickers, scrap dealers and sweepers. This paper looks into the predicament of Rohingya Muslims in the process of settling down as immigrants and how Rohingya women negotiate their identity of gender, religion, class and nation in their everyday life and adapt strategies for their survival. The study is carried out in two sensitive border districts of J&K - Jammu and Samba and is based on the case studies of Rohingya Muslim women.

RC14-279.2CHAUHAN, ABHA* (*University of Jammu*)*Modernity, Information and Communication Technology and Indian Weddings*

The pervasive use of technology in communication is an important characteristic of modernity. The two important properties of modernity according to Anthony Giddens are: (i) disembeddedness from time and space; and (ii) reliance on expert systems which we must trust even if they are not present in time and space. Though there is uncertainty in modern societies, the reflexivity and re-embedding mechanisms help in utilization of rules and resources that constitute a social structure. The structures then become flexible to accommodate changes in the condition of modernity. It is here that information and communication technology (ICT) find space for its maximum utilization. In modern societies, ICT is omnipresent, with over three billion people having access to the Internet. In 1990s, the Internet became one of the most powerful trademarks of ICT with immense reach and wide acceptance across the countries within a short span. The world indeed became closer and shorter with almost merging of time and space that revolutionized many aspects of social life in Indian society, weddings being the most important one. The media became active and several sites were opened up that offered matrimonial alliances. Information on wedding places, decoration, designer clothes, jewelry, food etc. began to be shared through communicative technology. The traditional rituals and ceremonies acquired a modern form. This paper explores the use of ICT for Indian weddings in the context of modernity through 'Content Analyses' of some of the important matrimonial and related sites. It focuses on the changes that have come about in the Indian weddings by analyzing the process of mate selection, marriage functions, ritual performances, wedding dresses and food preparation.

RC14-263.2CHAUHAN, ARVIND* (*Department of Sociology, Barkatullah University, Bhopal, (M.P.), 462026, India*)*Globalization, Social Media and the Culture of Virtual Reality: Some Sociological Challenges and Formulations*

In the era of globalization the role of social media has of gained an important place and this trend is irreversible. The researches in the field of social media have indicated at least two important trends, one, the number of users of social media has grown exponentially and two, the creation of virtual reality has become a phenomena as well as a cause for the creation of new forms of relationships. This changing scenario in the entire world has put forward some challenges before the sociologists for its theoretical and conceptual comprehensions. The emerging trends have been analyzed from social media like face book, You Tube and Quora and some interpretations are offered. Additionally, an effort has been made to address to the sociological challenges and the concepts like gratification consumerism, depression and social networks have been re-examined. Some of the main findings are discussed towards the end of this paper like : (i) the emergence of social media has put forward some new challenges for its sociological comprehensions; (ii) the educated youth has come up with some questions which were tabooed to have been asked otherwise ; (iii) the answers given to some of the questions indicate frankness and openness which was hitherto not seen earlier; (iv) The social media its self is undergoing transformations in the era of globalization and (v) the social media has thrown up ample opportunities for its conceptualizations in sociology.

RC52-866.4CHAUHAN, ARVIND* (*Department of Sociology, Barkatullah University, Bhopal, (M.P.), 462026, India*)*Transformation and Restructuring of Complimentary and Alternative Medicines in India: An Historical Perspective*

Title of the paper: Transformation and Restructuring of Complimentary and Alternative Medicines in India: An Historical Perspective

This paper attempts to examine and discuss the questions related to the transformation and restructuring of complimentary and alternative medicines (hereafter CAM) in India during the era of globalization. Following have been the main research questions: (i) how to locate the entire question of CAM in an historical perspective in India?; (ii) what has been the scenario of CAM in its heydays in India?; (iii) how the allopathic system of medicine made its headway in the Indian society?; (iv) how both the systems of medicine namely CAM and allopathic medicine exist parallel to each other and (v) what has been the response of the patients to both the systems of medicines?. The current scenario of medical-systems and its operationalization in the Indian society has posed some questions which are very complex in nature. The stratified nature of society has compelled to go for the limited available choices. In India the system of AYUSH has now got the support of GOI and it is challenging the mainstream system of medicine. The main conclusions of this study are like the following: (i) in order to understand the system

of medicine in India it seems necessary to opt for an historical perspective; (ii) patients from high-, middle-, and lower- classess have given importance to CAM; (iii) the notion of belief-system has been found useful to understand systems of medicine in India; (iv) the future trend of CAM systems in india seems as bright and (v) there seems to be an immense potential for research in the area of CAM in India.

RC28-513.1CHAUVEL, LOUIS* (*University of Luxembourg*)BAR-HAIM, EYAL (*University of Luxembourg*)*Intergenerational Wealth Inequality*

Studies of intergenerational wealth mobility focus on the impact of wealth transmission from parents to children on the social stratification and inequality of opportunities. In contrast, studies of wealth inequality focus on the unequal distribution of wealth in a society. The current paper wish to study the effect of the potential intergenerational wealth transmissions on the unequal distribution of wealth. We regard the wealth the parents and the children combined as a "potential" intergenerational wealth. We calculate the difference between the inequality of the intergenerational wealth and the actual household wealth. Two competing hypothesis are proposed. (A) Since wealth inequality increased for the last generations, the intergenerational wealth inequality will be lower than household wealth inequality. (B) Due to the association of parents and children's wealth, intergenerational wealth inequality will be higher than household inequality. Employing the PSID data and using the ISOGRAPH – a tool to measure local inequality over the wealth distribution in comparison to the median wealth, we are able to affirm hypothesis B: intergenerational wealth inequality is higher than household wealth inequality especially above the median wealth. The impact of parental wealth is more pronounced at upper-middle class, where the it serve as a buffer that enable children to increase their gap from the middle and the lower middle class.

RC02-60.5CHAUVEL, LOUIS* (*University of Luxembourg*)*The Nexus of Social Class and Social Generations in the Global System*

It had long been claimed that social generations are replacing social classes (Thurow, Kotlikoff): the elder generations hoarding (retirement, property rights, cultural domination in the dominant culture) might mean a new global context of "déclassement social" (downward social mobility) and precarity for the young. If some facets of this diagnose can be relevant, as such it is indeed mistakenly naïve and ignores important dimensions of the interaction dynamics of class and generations in the global system.

A better synthesis of history is in the interaction between Karl Mannheim, Karl Marx and Karl Polanyi (alphabetic order). For Mannheim, generations are certainly actors of social and cultural change, but are also a vector: when the young generation is scarified, it is not simply a social group, but our future that we harm. For Marx, and Piketty, social classes are back, objectively, in our recent history as a hierarchic system of social groups engaged in empirically extreme antagonist positions, even if class consciousness remains surprisingly weak. For Polanyi reloaded until today, we live the rebirth of the liberal creed, with the recommodification of money, labor, land and life.

The 3K interaction helps understand two centuries of history: the generations of the Belle Époque of extreme capitalism were fantastically polarized between the Western capitalists and the rest in a context of extremely strong political identities. One century ago, the conflagration of the liberal order had meant also the generational replacement of the old class system with a new class configuration, smother and weaker, with a massive wage earner middle class based on collective property of social rights (Castel). We now experience the new rise of an unconscious class configuration, in a new global capitalist system. For the new frustrated generations this means a new age of extremes. These changes are empirically documented.

RC55-903.8CHAVEZ MOLINA, EDUARDO* (*Instituto de Investigaciones Gino Germani*)SOLIS, PATRICIO (*El Colegio de Mexico*)*Distribution of Income and Social Inequality, in the Structure of Classes in Latin America*

Los estudios comparativos internacionales sobre la estratificación social y la movilidad de clases se basan en esquemas de clases concebidos para los países industrializados. Uno de estos esquemas, el esquema de EGP desarrollado por John Goldthorpe, se ha convertido en un estándar en el campo. El uso de este esquema en otras regiones del mundo, incluida América Latina, ha sido crucial para el análisis comparativo. Sin embargo, este esquema puede no reflejar desigualdades en las relaciones laborales predominantes en los países

en desarrollo, donde los empleos asalariados y los autoempleados están segmentados en sectores de alta y baja productividad, con condiciones de trabajo y remuneraciones heterogéneas.

Proponemos una adaptación del esquema EGP para dar cuenta de la heterogeneidad estructural en América Latina. Con base en esta adaptación, utilizamos datos de encuestas nacionales de hogares en ocho países latinoamericanos, caracterizamos sus estructuras de clase y analizamos la asociación entre la pertenencia a la clase, ingresos y distribución de los mismos, expresada a través del cálculo de dólares PPA. Nuestros resultados indican que esta versión modificada del esquema de clases de EGP mejora la caracterización de las estructuras de clase, así como nuestra comprensión de la asociación entre la clase social y las condiciones de vida en América Latina.

También, visualizar los procesos distributivos entre cada país y entre cada clase, mostrando la evidencia empírica de desigualdades de ingresos, donde la particularidad de la heterogeneidad estructural parece ser un factor explicativo de mayor peso que el lugar de los individuos en la estructura social. Para ello se trabajó y armonizó 8 bases de datos de hogares de los países en los cuáles sus datos pueden ser homogeneizados: Argentina, Brasil, Chile, Uruguay, Perú, Ecuador, El Salvador y México.

CHAVEZ-RODRIGUEZ, LIBERTAD* (CIESAS)

Household Risk Perception and Vulnerability to Floods in Urban Contexts in Monterrey, Mexico

The paper discusses the convenience of taking into account diverse stages of the domestic cycle approach to observe and analyze differences in the social vulnerability to floods, as well as to explain aspects of place attachment connected to decisions of settlement, relocation in non-flood-prone areas and re-settlement in flood-prone areas. This approach incorporates the idea of the household as a dynamic unit that changes over time – going through (nonlinear, not discrete) stages of expansion, consolidation, and dispersion. Resulting household changes in terms of their resources and of their access to structural opportunities to deal with with hazardous events such as floods are of particular interest. Through ethnographic work in Monterrey, Mexico, I examine points of view of directly impacted people, still living in flood-prone areas, around those decisions. I carry this out by focusing on their subjective risk perception, meanings and own framing of their everyday exposure to risks, recurrent waterlogging and flood experiences. The study of household vulnerability to floods points out to the understanding of differences in the social vulnerability to floods by looking at the differential impact of hydro meteorological events in the vulnerability of affected domestic units, their livelihood changes and life trajectory changes. Furthermore, it intends to distinguish household's short-term and long-term practices regarding emergency management, hazard risk reduction measures and settlement decisions. With this, I try out the suitability of the domestic cycle approach as research strategy for the study of social vulnerability to floods in socio-spatial segregated urban contexts such as Monterrey, taking a step towards the introduction into disaster risk research of an approach that has been otherwise used in social anthropology studies on livelihoods and poverty dynamics (cf. González de la Rocha et al.), which are in turn in several ways linked to life course sociology (Elder, Johnson & Crosnoe).

CHELLAN, NOEL* (UKZN)

Interpreting Marx from an Energy Perspective

The 2008 financial crisis has come to be known as the Great Crisis. Just when the world thought that with the Fall of the Berlin Wall, Marxism would die and be buried, the Great Crisis of the first decade of the 21st century, has triggered a renewed interest in Marxism. With the capitalist economy taking repeated beatings since 2007–mainstream economic science—is also under critical scrutiny for the unpredictable manner in which it has thus far analysed the global capitalist system. The invisible hand and self-interest thesis of Adam Smith and his adherents, are proving to be unworthy of their 250 year ideological grip on humankind and the natural environment. The 500 year old capitalist system itself is showing signs of wear and tear, and so are its sciences that have thus far attempted to analyse it, if not uphold it. With the growing acknowledgement of energy as a central entity in all of aspects of life, disciplines such as economics are giving rise to interdisciplinary sciences such as econophysics. I will look at Marx's seminal work *Capital, A Critique of Political Economy* from an energy perspective. By combining the thoughts of this great thinker with those of the scholars on energy, I seek to enhance the scientific thought of Marx, by using energy as a conceptual and analytical tool. By looking at Marx's thoughts from an energy perspective, I intend to provide a fresh look at the physical workings of the capitalist economy. Hence concepts such as labour-power, commodity, money, time, etc. will be viewed through the energy lens. The relevance of the laws of energy will also be applied to the following examples of Marx's thought: commodities and exchange, capital and labour-power, the labour process and the production of surplus-value, the division of labour, machinery and modern industry, etc.

CHEN, CHI YUAN* (Chinese Culture University)

Studying the Changes of Teacher-Student Relationships in Taiwan's Higher Education Due to Globalization and Changes in Social Culture

Establishing good teacher-student relationships is one important part of teaching professionalism. Sometimes teachers encourage students to learn effectively through establishing good relationships with students. In the traditional Chinese society, profession of teaching was firmly respected, and teachers were always honored and respected because of their identity. However, this traditional culture and attitude of respecting teachers has changed, especially in the field of higher education. According to our prior study on professors' perceptions of the changing academic environment in Taiwan, up to 65% of the participants felt the quality and learning attitude of college students became worse, and quite a few teachers felt students did not respect their teachers as the students used to. The changes between teacher-student relationships may result from the following factors: (1) the changes of social culture; (2) the progress of technology and the internet, which expand the education channels and alter the ways of learning; and (3) globalization, which emphasizes the accountability in higher education and encourages the universities to use evaluation systems to force teachers to improve their teaching quality. To face these challenges mentioned above, teachers in higher education start to please their students by lowering requirements to increase the scores in their teaching evaluation. The purpose of the study is to explore the changes of teacher-student relationships in higher education in the background of globalization and changes in social culture. We will define the differences of teacher-student relationships between higher education and other education stages, and explore and analyze the changes of teacher-student relationships in Taiwan's higher education in recent decades in the background of globalization. Finally, we will offer some suggestions based on our results.

CHEN, FUWEI* (Department of Humanities and Social Sciences, National Chiao Tung University)

Framing "the First Street" in Taipei: Material and Representational Community Practices in Urban Community Building

Community building has been viewed as a means to reduce negative impacts of urbanization on individual well-being, living environment and social justice, and has considerably increased local capability in urban governance in Taiwan. Relatively few studies have focused on the agency of cultural objects and streetscape which offer people a way to understand the everyday places they live and recognize a sense of community. This paper examines the folk materials-based mobilization strategies for community building and draws on the fieldwork surrounding the neighborhood of Guiyang Street, Taipei. It aims to explore how folk material resources, including historical built environment, religious instruments and practices, and local industrial products and services, and the way of "revisiting" the material aspects of folk culture help to make sense of place under the framework of urban community building.

It is believed that community building is hardly pushed forward in urban neighborhoods, given that people living in apartment buildings may not have shared experience, background, values and religion. However, there is still some tacit knowledge and "indigenous category" that rules cultural practices in the old town of Taipei City, which is largely populated by families that have lived there for generations, and being an integral part of local people's identity. By analyzing the process and preliminary outcome of community development of the city block of Guiyang Street, I explain how folk materials, as cultural symbols, contribute to bring together fellow community members who normally have little contact, facilitate the collaboration among state, local stakeholders, and the "outsider" volunteers on revitalizing this neighborhood, and encourage the folk to work together with rising issue-driven communities.

CHEN, HON FAI* (Lingnan University)

The Interpretations of "Culture": American Conceptual Influences in the Formation of Chinese Sociology, 1929-1949

In both intellectual and institutional terms, there has been a strong American presence in the development of Chinese sociology ever since its inception. Such was the case in the formative period of 1930's-40's, when leading Chinese sociologists such as Sun Benwen and Wu Wenzao drew upon the works of their American counterparts to build up a more rigorous and coherent foundation of the discipline. The concept of culture in interwar American sociology played a pivotal role here, as it was appropriated and adapted to various academic projects. These included the attempt to work out a theoretical synthesis, the formulation of a scientific approach to social problem, the deployment of sociological knowledge

in public discourse, the articulation of "culturology" as an interdisciplinary field, and the renewal of social survey as a viable research programme of community studies. This paper sets out to examine these competing projects and the manifold ways in which Chinese sociologists interpreted the relevant works of William Ogburn, Robert Park and other American sociologists in accordance with their emerging perspectives on culture and society. On the whole these interpretations and applications were equally tenable. But the restructuring of the national university system under changing conditions of state-building and war-making shifted the balance away from sociological theorizing in favor of anthropological fieldworks. By pinpointing how institutional factors and historical contexts shaped the strategies and outcomes of intellectual competition, this paper contributes to a deepened understanding of the global diffusion of social scientific knowledge and the formation of national sociological traditions.

An Analysis of the Ethical Dilemma of a Case in Family Social Work

Abstract: A family is a basic unit of a society and the first school of life, so the importance of the family is self-evident. Social work is a work that makes oneself improvement by helping others, prevents and solves social problems. A social worker will encounter a variety of ethical dilemma which it need to be made a decision when he/she practices, especially dealing with the case of family cases. Which family member should be argued to consider with a priority by a social worker making ethical decisions in order to make the relationship of the whole family becomes more harmonious?

Based on analysis of the family case in social work, this paper put forward the decisions to deal with ethical dilemma as follow: social workers should (1) comply with the guidelines for ethical decision-making recommended by Professor Ralph Dolgoff when we encounter the ethical dilemma in professional practice; (2) enhance our quality in all aspects through sustainable study by ourselves, and (3) make the social work localized by means of integrating theories with local practice. In other words, these conclusions have been summarized in accordance with the empirical research method in this paper.

Therefore, the social worker should fulfill above-mentioned methods to cope with the family case in professional practice in order to assist the client and ourselves to improve jointly.

Key words: Social work, Family case, Ethical dilemma, Localization.

Living Environment and Well-Being of in-Situ Urbanized Rural Residents in Chinese Cities

China's urbanization is unprecedented in human history and the National New-Type Urbanization Plan (2014-2020) clearly features a new era of development. Under such circumstance, we are developing a policy-driven quasi-experimental household survey that takes advantage of the implementation of the 2014 National New Urbanization Comprehensive Pilot Program. The survey targets residents of newly urbanized areas in 32 township-level administrative units (zhens and jiedaos) under county-level cities and urban districts. Half are drawn from the 'treatment' group (i.e., jiedaos, zhens, and xiangs listed in the 2014 National New Urbanization Comprehensive Pilot Program). The control group consists of 16 cases that are chosen using the Coarsened Exact Matching (CEM) technique.

We are particularly focusing on the living environment and health status and socio-psychological well-being of in-situ urbanized rural residents' experiences and compare them to the experiences of rural-to-urban migrants and established urban *hukou* residents residing in the same areas:

- Living environment—to discover the housing conditions, the living environment changes, and the extent to which in-situ urbanized rural residents have adapted to the new urban life style;
- Health status and socio-psychological well-being—to gain an understanding of the in-situ urbanized rural residents' general health status, mental problems, perceived social position, perceived discrimination, sense of identity, and sense of urban citizenship.

This study offers a comprehensive and nuanced examination of the changes in the living environments and lifestyles of in-situ urbanized rural residents, and the effects of such changes on their well-being. With the policy-driven quasi-experimental survey design, the study yields rich materials for analyzing Chinese urbanization and also makes a valuable contribution to other related policy reforms.

Unequal Sexual Migration across Taiwan Strait: Illicit Migration of Chinese Migrant Sex Workers in Taiwan and Taiwanese Sex Buyers in China

The paper conceptualizes those transnational movements surrounding commercial sex as sexual migration to problematize the ways in which mainstream migration studies neglect the existences of both (undocumented) migrant sex workers and transnational sex buyers. In fact, it is downplaying this kind of sexual migration that makes (undocumented) migrant sex workers are left out of the entire migration studies and thus wrongly levelled as 'illegal immigrants', 'sexual criminals' or 'victims of trafficking in women'. Similarly, transnational sex buyers are frequently conceptualized as sex tourists who engage in conspicuous consumption and foster global trafficking in women and girls, particularly when child prostitution is involved. This literature hardly pay attention to analyze how sexuality intersects with gender, class, nationality and global economic hierarchy to shape the transnational movements of sex buyers.

Locating the transnational movements of sex sellers and sex buyers across Taiwan Strait, the paper aims to reveal the material bases of sexual migration across Taiwan Strait. Basing on interview and ethnographic data on (undocumented) Chinese migrant sex workers in Taiwan and Taiwanese men who travel to China to buy sex, I would argue that this bilateral sexual migration is indeed an *unequal* sexual migration in which men's sexual migration is well-packed and developed in terms of global tourism, while sex workers' migration is surrounded by anti-trafficking discourses and criminalized. In addition, although the bilateral sexual migrations of undocumented Chinese sex workers and Taiwanese sex tourists are linked to or driven by sexuality, this however cannot be reduced to 'sexual' and isolated from the broader socio-economic, political and cultural context in this region. Furthermore, drawing on insights from the intersectional approach, I would reveal how the bilateral sexual migration across Taiwan Strait is constituted at the intersection of gender, sexuality, class, nationality and migration.

Configurations of Innovations: Examples of Biomedical Patents in Taiwan

This paper uses the concept of configuration (or figuration) of Norbert Elias to examine biomedical patent applications in Taiwan. By analyzing two categories of Taiwanese patents: IPC C12N and C12Q, during the period of 1980-2014, I find that domestic applicants had an average of two-year lead to gain patent right. Demanding foreign priority, a strategy that can earn a longer period of patent right in patent application, was rarely utilized by domestic applicants, except for few 'star' scientists from prestigious research centers. However, the applications that claim US priority have no significant advantage to be patented. Following the findings, the paper gives a case study of two patents applied by a Taiwanese scientist, trained professionally in the US for years. When he just returned to Taiwan, he gave birth to a first patent, with his still strong connection to the US. Several years later, he had his second patent, a purely domestic product. The two patents have different 'configurations,' that is, they are produced in different heterogeneous networks, thus contributing to their different fates.

The paper proposes three different modes of patents: domestic, forward and reverse mode. Each mode stands for a specific configuration. Most academic scientists need patents of the domestic mode to enrich their research profiles, regardless of patent values. Patents of this mode cannot produce a high industrial value. The forward mode aims at foreign technological markets, with more considerations on industrial applications. However, these patents are not that compatible with mainstream bio-economy. The reverse mode are similar to patents produced in the US, with a major consideration on the US market. Since few Taiwanese patents belong to the reverse mode, most patents become a kind of inaccessible asset.

CHEN, TZUNG-WEN* (*National Chengchi University*)

Oeil Sociologique: A Case Study on Manet's Chemin De Fer

This paper uses Edouard Manet's work *Chemin de fer*, also known as *Gare Saint Lazare*, to discuss the concept of *oeil sociologique* (sociological eye). *Chemin de fer* was finished in 1872, when Manet was 40 years old, just two years after his time in the Franco-Prussian War. Although selected for and displayed in the Salon of 1873, *Chemin de fer* was very different, in subject, style and even size, from other paintings displayed in the Salon, such as that of Gérôme's *Eminence grise*.

Manet has been a popular research subject for social scientists such as Bataille, Foucault and Bourdieu. However, Manet's vision of the world was rarely studied in comparison with sociological knowledge. With an *oeil sociologique*, Manet saw, un-

consciously and spontaneously, 'problematic' dimensions in ordinary scenes, for example, two symbolically contrasting females, without any interaction, standing in front of a train station. The picture prepares a good starting point for sociological research on the railway's impact on modern life. As Manet said, "I paint what I see," and we can find in *Chemin de fer* an extraordinary arrangement of symbolic elements that come from Manet's *oeil sociologique*.

The idea of *oeil sociologique* is neither the 'period eye' of Baxandall nor 'sociological imagination' of C. Wright Mills. *Oeil sociologique* is available only when sociological thinking emerges in a pre-sociological stage before the consolidation of a discipline called sociology or the initiation of a sociological study. By analyzing *Chemin de fer*, alongside Manet's career, I propose that personal characteristics, social origin and historical contingency are potential contributors to the *oeil sociologique*. Manet's case was a non-reproducible historical experiment that occurred in an age when sociology was about to emerge. However, the conditions and situations that contribute to Manet's *oeil sociologique* are heuristic for us in this age of sociology in crisis.

Racial Differences in Educational Pathway in the Making of Income Inequality: A Case of Washington State, USA

Is college a worth investment for all? Does college return to education alleviate income inequality along racial and ethnic line? Recent years, research has found rising income inequality between race/ethnicity in the United States. A mounting scholarship on return to education has demonstrated that income disparity comes from college major- college graduates with degree in Science, Technology, Engineering, and Math (STEM) major earn relatively higher wage than other majors. The determination of college majors comes from not only educational opportunity, progress, and choices at college level, but also from high school preparation in transition to college. However, little is known whether racial/ethnic income inequality is attributable to the racial disparity in educational pathway from high school to college, in the selection into and persistence in college majors in a series of economic contexts. Understanding the trends of racial/ethnic income inequality through educational pathway in past decade impacted by the Great Recession (GR) is an important but unaddressed question.

This study analyzes the case of Washington State, which, in past few years, has experienced a rising demand for STEM human capital to meet the need from fast-growing high-technology industry. Using statewide longitudinal data system (WA SLDS), American Community Survey, as well as a state-sponsored-and-privately-run STEM program, I portray high school graduates' educational pathway, through course-taking and college major to college degree completion, and their racial income disparity from 2008 through 2017 by three graduation cohorts - before-, during-, and post- GR. To estimate the net effect of racial educational pathways on income, I use fixed-effect and spatial autocorrelation models to control for selectivity from contextual factors from institution over space and time. Policy implications, echoing to the state policies related to educational equity and equality under the development of high-stake accountability, will be addressed. Data quality issues will also be discussed.

Emerging Market Youngsters Experiencing Dual Mobility and Their Perception of Cosmopolitanism

Studying abroad is a motivated, voluntary, fix-term relocation to one foreign country out of deliberate choices. Such traits differentiate international students from other mobile individuals such as migrants, global citizens, global nomads, expatriates, sojourners, business travelers, and tourists. This study examines the craze for overseas education in emerging markets through Chinese students' pursuit of undergraduate or postgraduate degrees in the U.S. These youngsters embody dual mobility trajectories consisting of upward mobility driven by higher education and horizontal mobility caused by geographical, cross-cultural relocation.

Research data were collected through in-depth interviews with twenty-seven first-generation international students from China who are currently enrolled in a major U.S. university. In 2016, 544,500 Chinese students went abroad for education, and 91.49% among them were self-funded. About one-third of the 1,043,839 international students currently in the U.S. were from China, which constituted the largest international student population in the U.S. by country-of-origin.

Two themes emerged from the data.

First, while the informants were aware that the overseas qualifications may no longer guarantee better salaries and employment, the drive for upward mobility in a traditional sense, they employ an alternative framework to develop overlapped definition of upward mobility and outbound mobility. They believed that they were "moving ahead/up" because of acquiring cosmopolitan capital during their geographical relocation.

Second, these emerging market youngsters performed westernized practices to signal their cosmopolitanism, but their acquisition of such values and acts were not from the immediate, local community in the U.S. Instead, they referred to their Chinese networks and native cultural context to ensure that they were pursuing the legitimate, popular "West," which has already been familiar to, and endorsed by, the Chinese society.

The findings illuminate how emerging market youngsters negotiate with their global, transitional identities, and how their mobility experiences are leveraged to set boundary and signal distinction.

Causal Analysis on Formation of Pro-Environmental Behaviours in China, Japan and South Korea: From a Perspective of Demographic Factor

The influences of demographic factors on pro-environmental behaviours have been subjected to substantial empirical studied. The main conclusions derived from previous research are that younger generations, women and those of a higher social class (indicated by higher education, income and occupational prestige) are more inclined to behave environmentally. However, these conclusions were argued as "based on Western culture and on period varying between 1970s to 90s" and "different outcome can be expected from different culture and historical context". This paper aims to clarify the influences of demographic factors on the formation of 4 kinds of pro-environmental behaviours and to verify these associations in the social background of East Asia. The data analyzed in this paper come from a cross-national survey entitled as "The East Asian Survey on People's Sense of Culture, Life and Environment". Based on the analysis of the data collected in Japan (n=894), South Korea (n=1000), and two cities of China including Beijing (n=1000) and Hangzhou (n=1011), the following results were indicated: in Japan the elderly tend to have pro-environmental behaviours whereas in China are those with younger age; education level has significant and stable influences on the formation of pro-environmental behaviours in all three countries; in Japan males and people who have religious faith or belief tend to have pro-environmental behaviours whereas gender and region have no significant influence in China and South Korea; Income were proved to have no significant influence on the formation of people's pro-environmental behaviors in three countries.

Building Accountable Local Level Nuclear Governance -the Case of Nuclear Safety Monitoring Council in New Taipei City

Since Fukushima accident in 2011, Taiwan's nuclear safety system has been paid great amounts of attention. Particularly local government of the New Taipei City, in which three nuclear plants and possible future interim nuclear waste repository sites are located, has showed its interests in monitoring those facilities. However, in Taiwan's nuclear governance system, local government has long been deprived from the rights of participation and monitoring. In order to effectively be a part of the governance, the New Taipei City, for the first time in the history of Taiwan's local governance, has established its own monitoring council to review safety issues of those facilities.

This article, by adopting content analysis and in-depth interviews, aims to examine the effectiveness of this council from the perspective of "accountability" on Tai-Power. With the parameters of "transparency", "justification through deliberation", and "capacity to sanction", this paper concluded that: despite this council encountered legal constraints in the beginning phase, through collaborating with anti-nuclear civil organizations, the local government was able to integrate the creativity and momentum from the civil sector. In three parameter of accountability, the council managed to evolve through learning, to deepen discussion, and to exercise its administrative leverage. By grabbing predominant position in the agenda setting process, eventually the New Taipei Government gained substantial power to veto and monitor local facilities. From this case, the local governments were expected to play more important roles in Taiwan's nuclear safety governance.

Ten-Year Changes of Attitudes Toward Gender Role and Patriarchy in Four East Asian Societies

Gender structures the situation of men and women in all societies, yet varies in shape and dynamics. In East Asia, the social system has long been regarded

as patriarchy in which the role of the father is central to social organization and the male head of the household holds extensive authority over women, younger family members, and property. However, there had been significant social and economic changes over the past decade. In reality, no region of the world today is more dynamic than East Asia. Women's higher education attainment and increasing ties to the labor market have helped to enhance their equality and reduce their oppression. Does the expanding economic role of women change people's attitudes toward breadwinner-caregiver stereotype in the patriarchal system?

This paper aims to explore, under similar external dynamics, how difference social contexts engender different articulations of gender in the East Asia region. Four societies (China, Japan, South Korea, and Taiwan) are selected for analysis because of the availability of nationally representative survey data. The EASS (East Asian Social Survey) project establishes common questions based on issues and concerns unique to East Asian societies, and attempts to conduct cross-national analyses. Analyzing the data collected in 2006 and 2016, the goal is not only to gain insights to gender ideology in East Asia but also to extend our understanding of the dynamics of gender in the contemporary world. Through detailed comparative study, the authors wish to show the extent of distinction of gender roles and patriarchy in four societies and to test the idea of a coherent Confucian East Asia.

The Dialectics between Excellence and Equity of Teacher Education in the United States

In order to develop and increase the quality of school teachers, countries all over the world start to reform their educational systems since the year of 1990. There is no exception in the United States. The former Secretary of Department of Education, Margaret Spellings (2006, p.1) emphasized that teacher quality is the foundation of students' achievement so how to recruit high quality college students for teacher education, how to ensure every teacher education institution could provide high quality pre-service teacher education programs, how to make sure that every state could be a good gatekeeper for highly qualified teachers, how to increase the teachers' professional development through teacher evaluation and accreditation, and finally how to make highly qualified teachers in every classroom have become the most crucial issues that teacher education policies need to encounter and solve during the last two decades. In this research article, the principal investigator conducts a series of document analysis including No Child Left Behind (NCLB) in 2001, Race to the Top in 2009, Common Core State Standard (CCSS) in 2010, and Every Student Succeed Act (ESSA) in 2015 along with the recent Teaching and Learning International Survey (TALIS) in 2013 to figure out the dialects between excellence and equity in the context of the United States.

'Concerted Cultivation' in a Confucian Context: A Study of Volunteer Mothers in Taiwan

Past research has highlighted the significance of social class and national culture in shaping parental educational beliefs and practices. On the effect of social class, studies conducted by Annette Lareau (2000, 2003) in the U.S. provide an illuminating example of how social class differentiates the cultural logic of parenting. On the other hand, unique characteristics of national culture also exert profound mediating effect on parental and institutionalized educational practices. Through in-depth interviews with volunteer mothers and school administrators from two primary schools in Taiwan, this study explores how the commonly assumed middle-class approach of 'concerted cultivation' conceptualized in the West is practiced in an Eastern context. In addition, the study highlights the significance of Confucianism as an embodied cultural reservoir that shapes how volunteer mothers deal with school authorities, define their involvement, and strategize on educational-related matters. In Taiwan, the high drive to succeed academically—within the context of nationally standardized school curriculums and government funding—presents an intriguing juxtaposition to the conceptualization of 'home to class' force in the Western context. The findings reveal several key patterns that intersect an important (national) cultural dimension in understanding the link between social class and parental educational beliefs and practices. Despite the similar high educational involvement as revealed in the studies conducted in the West, ways through which Taiwanese volunteer mothers perceive their roles, fulfill their responsibilities, and realize their goals are largely mediated by the immediacy of their cultural environment, which are quite distinctive from their western counterparts. The link between social class and parenting beliefs and practices may be resilient across nations, but distinct characteristics of national cultures mediate such expressions.

CHEREDNICHENKO, GALINA* (*Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences*)

Educational and Status Positioning for 10 Years after Graduation from Secondary Educational Institutions

On the basis of the longitudinal research, there are compared the educational and status positions, which during ten years were occupied by three groups of young people: those who had graduated at the start from Secondary school, College, Vocational school. The latter two teach the profession and give a secondary education. Over the course of 10 years, four surveys of the same young people were carried out and 62 people representing groups of typical trajectories were interviewed in the finals.

The type of the starting secondary educational institution differentiates not only the first choice, but also all further accumulation of educational capital; it inertially influences the subsequent positions in education and the statuses. Even after reaching the same level of education after ten years, more advanced statuses are acquired by those who have higher capital of the starting secondary education and the accompanying better quality of the subsequent one.

Those who return to the educational system in the course of their working career, resort to this for the sake of access to the required specialty or position, and also (part of the surveyed workers) in order to legitimize the level of qualification or specialization in the already actually occupied workplace. This is especially true for jobs that require higher education. The respondents themselves explain that they turn to education only for the sake of its instrumental value.

The mass is the practice of recruiting for work not in a specialty of education. The possibilities of its conversion are different for those who received education in university, and in college. The first, as a rule, receive a workplace corresponding to the level of qualification of a professional. The second are less likely to receive jobs that require the qualification of a middle employee, some move down the hierarchy of social statuses.

CHERESHEVA, IRINA* (*University of Leicester*)

Different Chores, Different People: The Construction of Maternal Subjectivity and Children's Autonomy in Post-Socialist Bulgaria and Hungary

In line with recent trends across much of the global North and beyond, there has been a contemporary intensification of parenting and a reconceptualisation of childhood as a central period of one's subjectification throughout a number of post-socialist countries. This intensification has led to the care work of parents being increasingly emphasised by childcare experts and policy makers alike. This paper looks at how the mothering practices of middle class women on parental leave in two post-socialist cities (Budapest, Hungary and Sofia, Bulgaria), conceptualised as performative, discursive and contextual, become structural to these women's maternal subjectivities.

Primarily, I focus on how my research participants incorporate the changing knowledges about personal autonomy into their everyday care work. Autonomy within personhood is central to western understandings of the subject, despite being problematized by feminists, post-structuralists and psychoanalysts alike. Within the post-socialist context the concept of autonomy occupies a contested space, where notions of the subject often oscillate between communitarian and hyper-individualistic. These contrasting understandings are not only mediated by a change of political regimes, but are lived and experienced by classed and raced maternal bodies.

This paper applies the principles of feminist intersectionality to analyse the narratives 40 middle-class women from Budapest and Sofia created about the ways their childcare practices fostered autonomy in their children. Despite the differences between the mothering styles of my interviewees, a clear majority listed their children becoming happy, independent individuals as their number one priority as mothers. Nevertheless, the technologies of care through which they expected to achieve this result were almost contrary in the two research locations. Looking at childcare historically well into the state-socialist era, I try to provide a critical reading of the striking dissimilarities between the mothering practices of post-socialist women, often mistakenly described as uniform across (western) academia.

From Past to Present: Children's Exposure of Domestic Violence and Subsequent Experience of IPV in Adulthood Among Women.

Intimate partner violence (IPV) is a serious social problem that affects the health and wellbeing of millions of women worldwide. Previous studies demonstrate that witnessing IPV in childhood is strongly associated with IPV. Specifically, findings from Kenya, Turkey, Bangladesh, Thailand, Russia, Moldova, Ukraine, and Azerbaijan demonstrate that witnessing IPV in childhood increases the risk of experiencing later physical abuse in an international lens. Research suggests that witnessing parental violence may lead to acceptance of IPV as normal method of conflict resolution. Thus, utilization of violence becomes the behavioural model: men who witnessed parental violence are more likely to employ physical violence against their female partners whereas women who observed IPV in their family-of-origin learn to tolerate aggressive behaviour and become victims of IPV. However, other studies have found no significant association between witnessing IPV in childhood and subsequent experience of IPV. Therefore, the association between witnessing IPV in family-of-origin and experience of IPV in adulthood requires further attention.

The objective of this research is to compare the prevalence of physical IPV (e.g., hitting, pushing, slapping, etc.) and whether witnessing IPV in family of origin is associated with women's experience of IPV in adulthood in ten developing countries in different regions: Mali, Haiti, Jordan, Peru, the Philippines, Pakistan, Cambodia, Egypt, the Dominican Republic, and Nigeria. The data used for this research are derived from the Demographic and Health Surveys conducted in the above-mentioned countries in 2012-2015.

The results of this study indicate that having witnessed IPV in family of origin significantly (by 50-500%) increases the likelihood of experiencing later abuse for respondents in all countries. Furthermore, it was found that some of the control variables (e.g., education, number of children, and wealth) are correlates with IPV in some countries under investigation while are not associated with IPV experience in some other.

CHERUBINI, DANIELA* (Ca' Foscari University of Venice)

Gender-Based Violence, Violence Against Women at Work, and the Transnational Movement for Paid Domestic Workers' Rights

The paper will focus on the transnational movement for paid care & domestic workers' rights, as a key social movement that addresses structural violence and intersecting inequalities embedded in the unfair distribution of care and reproductive work, at the local and global level.

The analysis will draw on the comparative research project "DomeQUAL: A global approach to paid domestic work and social inequalities" (2016-2020), which explores the transformations in the rights and the collective actions of paid domestic workers in nine countries (Spain, Italy, Germany, Colombia, Ecuador, Brazil, India, Philippines and Taiwan), from the 1950s up to now.

Drawing on the first empirical findings, we will discuss how the issues of gender-based violence and violence in the workplace are addressed by the paid domestic workers' organizations in different countries and at the transnational level. We will look at different strategies aimed at overcoming the invisibility of PDWs as objects of systemic violence, based on hierarchical power relations and on the subordination of racialized, gendered and sexualized subjects and bodies. We will also look at the alliances, or the gaps and silences, taking place between paid domestic workers' movements and feminist movements, across different settings.

The "domestic" and the "work" spheres are often framed as separate fields in the academic and political discourse on violence against women. The voice of paid domestic workers' organizations, as well as the new visibility of the issue in the agenda of international organizations (e.g. the International Labour Organization roadmap towards the Convention on violence and harassment at work) are blurring this line, suggesting the need for further analysis on these issues.

Intersectionality Applied to Transformations in Care and Domestic Work: A Global and Comparative Perspective

The paper looks at how the changes in the social position of paid care and domestic workers are affected by intersecting social inequalities, in terms of gender, class/caste, race/ethnicity, age, etc. To this aim, it presents the first results of the project "DomeQUAL: A global approach to paid domestic work and social inequalities" (2016-2020), a mixed-method study that compares the recent transformations of paid care and domestic work between nine countries in the Global North (Germany, Italy, Spain) and Global South (Brazil, Colombia, Ecuador, India, Philippines and Taiwan). The evolution in the social position of paid care and domestic workers and the intersectional composition of this workforce are here approached by considering different socio-cultural contexts, legislative and political interventions, changes in provision and regulation of care and welfare, as well as the broader transformations in the structure of social inequalities at the local and global level. In the end, the paper will highlight major methodological and conceptual challenges in practicing intersectionality in comparative sociological research, integrating qualitative and quantitative methods.

CHESHIRE, LYNDIA* (The University of Queensland)

Administrative Mediation Data As a Naturally Occurring Record of Disputes with Neighbours and the Un-Making of Home

The dwelling as home is a place imbued with specific meanings for its inhabitants where particular kinds of social relationships and activities take place. In recent decades, researchers have pointed to a growing emphasis on the security, privacy and protection of the home from unwanted intrusions, yet the home remains connected to, and implicated in, a broader network of social and spatial relations that influence how it is experienced and the meanings attached to it. Once such influence is the relationships and interactions that take place among those whose homes are physically proximate – i.e. neighbours. Where good relations between neighbours are associated with a range of positive individual and collective outcomes, far less is known on how poor relations with neighbours might undermine people's sense of home. This paper begins to address this omission. Conceptually, it argues that problematic relations with neighbours can lead to a form of 'home-unmaking' whereby the 'material and/or imaginary components of home are ... divested, damaged or even destroyed' (Baxter and Brickell, 2014). Empirically, it shows that accounts of neighbour disputes give special insight into the forms of home-unmaking that occur when problematic neighbourly interactions undermine the privacy, security, freedom and opportunity for self-expression that the home usually affords. Methodologically, it shows how such accounts can be accessed in their naturally-occurring form via qualitative administrative records collected by agencies such as dispute resolution centres. Drawing on 3,334 cases of neighbour disputes in Queensland, Australia from 1999-2014 provided by Queensland's Dispute Resolution Centres, the paper illustrates the opportunities afforded by administrative records as naturally-occurring sources of data on everyday experiences of home and its un-making, as well as the challenges that arise from using datasets that were never intended for research purposes.

Balancing Privacy and Community in Design: Competing Tensions in Multi-Unit Housing for People with Mental Health Challenges

While architects and planners have long sought to enhance community through neighbourhood design, individual buildings can also have an influence on local community relations, as in apartment and other multi-unit dwellings. At a broad level, multi-unit living is becoming more prevalent across cities, but it is also used to accommodate some of society's most vulnerable and hard to house populations, including people with severe and persistent mental health challenges. In such cases, the creation of living spaces that allow for community interaction and incidental encounters between residents are important for facilitating social inclusion, reducing loneliness and providing peer-support. At the same time, however, the need for private and safe spaces into which residents can retreat from the world; the desire to avoid any appearance of congregation or institutionalisation of disadvantaged people; and the requirement to keep building costs low by reducing communal spaces creates tensions in the realisation of this community ideal. These tensions are illustrated through a case study of a new multi-unit housing project for people with severe and persistent mental health challenges in Brisbane, Australia, known as Clear Breeze Apartments. A co-design process that encouraged tenant input into the architectural design of the project led to an emphasis on embracing community, promoting well-being, providing safe and secure homes, and encouraging independence as key design principles that sought to balance tenants' needs for both privacy and community. Drawing on architectural plans of the complex, records of co-design workshops and tenant interviews before and after their move into the complex, this paper reports on the way this balance – and tension – of privacy and community is experienced and managed by tenants and the compromises that are made when one component takes priority over the other.

Public Participation and the Quest for Social Justice in South Africa

The paper examines the form and content of Public Participation initiatives in South Africa post the onset of democracy in 1994. The gap between real and actual participation and that envisaged by Constitutional, legal and other mechanisms is then evaluated in the light of the adoption of neo-liberal economic policies adopted and defended by the ANC government. Public protest, often violent, and an equally violent state response to "unrest" that threatens the stability of processes of capital accumulation is then analysed within the context

of inadequate social service delivery, capital flight, croney capitalism and the social concomitants of xenophobia, increasing racial polarisation, crime, violence against women and children, unemployment and social inequality. Durban is used as the case study highlighting youth unemployment in particular as the real challenge which the best public participation policies are not able to undermine.

CHEUNG, SIN YI* (*Cardiff University*)

Black and Asian Minority Ethnic Groups in Britain: Class, Income and Property

Rapid socio-economic transformation and the growth of the service-sector dominant economies has led to an expansion of the middle classes in many post-industrial societies. At the same time, soaring house prices since the late nineties has meant that many young people, including young professionals, are being priced-out of the property market. Stratification and inequality research rarely pays attention to consumption, and property is among the most expensive purchase people make. This paper aims to bridge this gap by investigating the relationship between class attainment, income and property ownership among Black and Asian Minority Ethnic (BAME) groups in Great Britain. Using data from the Quarterly Labour Force Surveys, it compares the odds of home ownership of the foreign-born to that of British-born BAME groups, controlling for qualification, gender, age, marital status and number of dependent children. It also aims to track changes over time, if any, by comparing the pattern of home ownership and class positions amongst BAME groups in the 1990s to those since 2000 and 2010. It asks if BAME middle class are under-represented among home owners, if foreign-born BAME groups are more or less likely to be home-owners than their native-born counterparts. It discusses the implications of the kind of 'middle class' experience for these groups, especially among BAME families with children who cannot afford to buy their homes. It concludes with some methodological reflections on investigating the middle classes in contemporary societies, characterised by transnational migratory flows.

CHEUNG, YANNIE* (*Global Studies Programme, Faculty of Social Science, The Chinese University of Hong Kong*)

What Counts As Global and Regional Excellence: The Expansion and Organization of Higher Education Strategic Plans in Asia, 1990-Present

The paper examines a global process through which nations or semi-autonomous regions incorporate prevalent educational protocols in the world to their local higher education organizations. Global and regional rankings are useful to higher education organizations in making statements of the rise and decline of knowledge specialties in global comparisons (Hazelkorn 2015; Marginson 2006). Drawing on strategic plans of higher education organizations in Asia, key actors formulate goals to inform diversified audiences in global, regional, and local settings. Expansion and organization of goals in these plans are themselves active responses to external classifications (Ramirez and Meyer 2013; Schofer and Meyer 2005). The main question of global and regional excellence addresses in what ways the organization of higher education goals as a competing effect of an intensely competitive platform responsive to local patrons or an integrating effect of a highly institutionalized protocol agreeable to global auditors. To examine the extent that higher education as a powerhouse or as an institution, formal documents of mission statements and strategic plans are to be collected for data analysis. The findings shall explicate that local actors in Asia incorporate new sets of goals with keywords from prevalent protocols such to target impacts contributing to global comparisons. At the same time, detaching actual operations and creating new emphasis on regional and disciplinary comparisons have been identified from formal documents on higher education goals showcased by local players in Asia across two time periods. The expansion and organization of higher education goals imply an active and participatory project of global citizenship has begun to emerge and take shape in Asia.

Analysis of a Sociopolitically Progressive and Peer Produced Mass Entertainment Form: Injustice Framing in Chinese Web Novels

This study analyzes the progressive sociopolitical characteristics of a mass entertainment form, Chinese web novels (CWNs). CWNs are commercially successful, gaining a global audience, and peer produced. Through analyzing the coded plots of novels written by a sampled group of 200 influential authors, this study finds that 'injustice frames' are abundant in CWNs (Gamson 2013). These injustice frames feature protagonist fighting against class inequality, authoritarianism, and rural-urban discrimination. Contrast is made with other

successful mass entertainment genres such as superheroes, fantasy, and crime, where injustice frames are seldom found. This study has five research objectives. Firstly, it challenges dominant understandings of the sociopolitical characteristics of mass popular culture. The Frankfurt School argues that mass popular culture is sociopolitically conservative. In opposition, cultural studies scholars find progressive meanings in non-mainstream popular cultural texts and argues that audiences proactively use mass popular cultural texts in a sociopolitically progressive way. The case of CWNs shows that mass popular culture can be sociopolitically progressive if it is peer produced. Secondly, this study offers new evidence to support evaluating online-based peer production as sociopolitically progressive (eg. Benkler). Current studies focus on peer production in information technology, this study's extension of investigative scope to mass entertainment substantively strengthens this evaluation. Thirdly, this study develops an innovative method (ie focusing on injustice frames) that partly solves the 'two cultures' dilemma in contemporary sociology of literature. It retains classical sociology of literature's emphasis on sociopolitical interpretation but also maintains empirical methodological rigor. Fourthly, this study formulates a fresh take on the ongoing debate on whether to characterize the Chinese internet as mainly a platform for democracy or 'entertainment highway'— the success of CWNs suggests that the two characterizations are not necessarily mutually exclusive. Fifthly, this study critiques current research on CWNs for ignoring or misinterpreting these CWNs' content.

Transnational Popular Cultural Consumption, Culture Capital, and Cultural Process of Inequality: The Case of Breakdance in Hong Kong

This study examines transnational popular cultural consumption by theoretically borrowing from theories of cultural capital and 'cultural process of inequality' (Lamont et al. 2014). It analyzes qualitative data (from interviews and participant observation) on the field of breakdance consumption and consumer groups in Hong Kong. Current studies on global hip hop find that as transnational diffusion of hip hop progresses, innovative localized hip hop music styles emerge, local meanings of authenticity are defined, and activism of marginalized local groups are encouraged. The first part of this study maps out Hong Kong's field of breakdance consumption and demonstrates its divergence from current findings. Five types of consumers are identified in the order of their knowledgeability of hip hop: 1) dedicated b-boys and b-girls, 2) dancers, choreographers, and producers who specialize in commercialized hip hop dance, 3) youths who join college street dance crews or the social welfare based breakdance community, 4) clubbers who love hip hop music and dance, and 5) fans of Korean-pop and global hip pop. None of these groups takes breakdance as a platform for progressive sociopolitical pursuits. Claims to authenticity are highly contested (eg. both group 1 and 4 strongly dismiss other groups as inauthentic). The more knowledgeable groups are not recognized as having higher cultural capital than the less knowledgeable ones. The second part of this study construct an explanation for this field's characteristics. It focuses on identifying an (unintended) cultural process of inequality that often occur when transnational popular culture diffuses from the center to periphery. Even if a popular culture is counter-mainstream, minority cultural, subversive, and/or grassroots, it can acquire mainstream and/or middle-class characteristics through such diffusion because elite local groups (eg. cosmopolitan and educated Hong Kongers composing groups 3, 4, and 5) are more well-positioned to consume transnational culture than marginalized local groups.

Body, Ritual and Religious Taste

The concept of 'taste' plays almost no role in sociology of religion. One cannot find any link between 'taste' and religion, neither in classical nor in modern sociological theory. The main reason is that sociology of religion, established under the viewpoint of Christian culture in the Occident, often overemphasizes the role of 'belief' and downplays 'ritual.' Ritual is, in a broader sense, the process of bodily manipulation, wherein habitus, taste, disposition and embodiment matter. In this paper I would like to discuss what religious taste is and explain why it matters by referring to the context of popular religion in Taiwan. Taiwanese popular religion is characterized by ritualism, which creates one other picture about 'religion' than those proposed in sociology of religion. Although the topics like ritual practice, embodiment etc. applied in religious issues, have been more discussed and developed in the discipline of anthropology, this paper aims to show why and how the issues of religious taste and embodiment are relevant in the sociological research of religion.

From Framing to Normalized Pedagogy: An Empirical Study on the Interaction between Teachers and Students

The code theory, developed by Basil Bernstein, indicates that framing can be viewed as the core element in constituting the phenomenon of cultural reproduction because it is able to regulate the transmission of pedagogical information. Strong framing tends to reinforce the isolated boundary of disciplinary knowledge that can be conceptualized as a vertical discourse because of its systematic knowledge structure. This study assumes that strong framing should be deeply interwoven instrumental rationality. This connection could deprive most teachers' critical minds so that they would view the normal distribution bell curve of students' academic performances as a natural outcome. In order to examine the interplay between framing, instrumental rationality and pedagogical action, questionnaires were completed by over 5,000 primary school teachers in Henan province, China, who were stratified sample. The statistical results show that most teachers adopted psychological concepts to evaluate students' academic performances and, in turn, educational inequity was legitimized as a natural outcome in the efficiency-led approach. Such efficiency-led minds made them as the agent, producing normalized pedagogy that refers to the connection among psychological concepts, pedagogical actions and cultural reproduction.

When Would Intergroup Contact be a Blessing? an Evolutionary Simulation Model

Intergroup contact theory—one of the landmark paradigms of modern social psychology—argues that social contacts across group boundary help mitigate prejudices toward an outgroup person. A meta-study over decades of empirical research recently confirm the hypothesis (Pettigrew and Tropp 2006). Despite a strong empirical support, the underlying mechanisms that facilitate the effect remains unclear. We propose an evolutionary model to fill the theoretical gap. Actors of different social groups play a trust game against one another in the model. They use different strategies to decide whether or not to trust an ingroup or outgroup partner. We incorporate network transitivity is the formation of a strategy: A trusts B because A trusts C and C and B are of the same group. We present an agent-based simulation to show the circumstances under which intergroup contact leads to intergroup trust (or even global trust) that was found in empirical social psychological research.

The Effect of Parental Involvement in Different Educational Systems: A Natural Experiment in Taiwan

What is the fairest way to select students? Scholars show that, regardless of the selection method, students from wealthier family backgrounds consistently have advantaged educational outcomes across societies (Shavit and Blossfeld 1993). One mechanism that explains children's (dis)advantages across educational systems is parent' class-based involvement patterns (Hung 2005; Muller 1995; Lareau 2011; Park et al. 2011). However, educational systems have differential rewards to parents' class-based practices (Park 2008). This suggests that, while student selection may be inevitably associated with family background, certain educational systems can be relatively free from family influences than others systems.
