Resultant transfer functions

The End

What type of function works best?

$$CE = e^{-a(U)(1 - [\tan^{-1}(b(T_{air})) + c])} \quad (3)$$

$$CE = (a)e^{-b(U)} + c \quad (4)$$

- U is wind speed, T_{air} is air temperature, and a , b , and c are coefficients
- Eq. 4 is defined separately for liquid, mixed, and solid precipitation
