Abstract. The syntheses of BEDT-TTF (ET) derivatives with potential metal ion binding pyridyl, bipyridyl and terpyridyl groups are achieved either by stepwise construction of the organosulfur core or via reactions of hydroxymethyl-ET for which a cheap and efficient four step route is reported. The tosylate of hydroxymethyl-ET, reported for the first time, undergoes nucleophilic substitutions with pyridyl, bipyridyl-and terpyridyl-thiolates to give new donors. The X-ray crystal structures of two substituted ET derivatives show considerable deviation of the organosulfur donor system from planarity by bending about the short molecular axis of the ET group.

The radical cation salts of bis(ethylenedithio)tetrathiafulvalene (BEDT-TTF or ET) **1**, have been extensively studied because of their wide variety of electrical properties,¹ including the occurrence of superconductivity in salts such as $ET_2[Cu(SCN)_2]$ and $ET_2(ICl_2)$.² Substituted derivatives of ET are more difficult to prepare, however a number of mono-, di- and tetrasubstituted materials are now reported,³ and some of their radical cation salts have been studied.⁴ Materials with novel combinations of electrical and magnetic properties are a current theme of research in which a transition metal ion provides a magnetic centre.⁵ The latter may feature in the anion, as in Day's paramagnetic superconductor $(ET)_4[Fe(oxalate)_3].H_2O.C_6H_5CN$,⁶ the Kobayashis' radical cation salts of BETS **2** with FeX₄⁻ (X = Cl, Br) whose electrical

properties can be changed by an external magnetic field,⁷ and Coronado's salts of partially oxidized layers of ET⁸ or BETS⁹ with chromium(III)/manganese(II) oxalate networks as anions, which shows almost independent conducting and ferromagnetic behaviour. Complex anions such as [Cr(III)(phen)(NCS)₄] and [trans- $M(\text{isoquinoline})_2(\text{NCS})_4]^-$ (M = Cr(III) or Fe(III)) have also been used¹⁰ with TTF^{11,12} and ET^{12,13} and other donors.¹⁴ In contrast, attachment of the metal binding group, notably pyridine or bipyridine centres, to the donor has been developed in a number of cases. For example, Ouahab has reported radical cation salts of 3,¹⁵ a TTF conjugated to a pyridine through an alkene. Batail and Avarvari have reported a series of N-pyridyland N-2,2'-bipyridyl-TTF and EDT-TTF-carboxamides such as 4 and 5,¹⁶ and Pilkington has included bipyridyl metal binding sites as bridges in molecules such as 6 which link a TTF to a verdazyl radical.¹⁷ Other metal binding centres utilised include phosphines,¹⁸ as

in the molybdenum complex 7 which has been electrocrystallised to a radical cation salt,¹⁹ both phosphine and nitrogen centres in $\mathbf{8}$,²⁰ and dithiolates as in neutral paramagnetic systems such as $\mathbf{9}$.²¹

We have been involved in attaching the metal binding ligand attached to the ET framework and we have communicated the syntheses of donors such as donors **10-12**.²²

Here we describe the synthetic approaches to donors **13-18** either by stepwise construction of the molecule, or from hydroxymethyl-ET which can be functionalised by either tosylation or substitution or by ester formation. An efficient four step synthesis of hydroxymethyl-ET is also described. Several donors with pyridine rings directly attached to an ET or EOET framework **19-21** have been reported.^{23,24}

Synthesis of ET derivatives.

The ligands 13^{22} and 14, were prepared initially by syntheses involving typically five steps according to the general scheme developed earlier in this laboratory and illustrated in Scheme 1. The mercaptobipyridine groups were introduced at the third step of the synthesis. Trithione 22 was cyclised with allyl alcohol to give the hydroxymethyl thione 23, which was tosylated using 1.5 equivalents of tosyl chloride in pyridine to give 24 in an overall yield of 62% from 22. The 6-mercapto- and 4-mercaptobipyridines 25 and 26 were synthesized in several steps via the corresponding halobipyridines. 6-Bromo-2,2'bipyridine was prepared by reaction of 6-bromo-2-lithiopyridine with ethyl 2pyridylsulfoxide.²⁵ 2.2'-Bipyridine was converted in two steps to 4-nitro-2.2'-bipyridine-N-oxide which was reacted with acetyl chloride and phosphorus trichloride²⁶ to give 4chlorobipyridine, which was found to be superior to the chlorination of the N-oxide of 2,2'-bipyridine which requires a tedious separation of 4- and 6-chloro isomers.²⁷ The mercaptobipyridines were obtained by heating the halobipyridine with sodium hydrogen sulphide, potassium hydroxide and DMF which, compared with the earlier procedure using hydrogen sulphide as the source of sulphur,²⁷ was much more reproducible, took much less time and doubled the yield to typically 80% for this step. Reaction of tosylate 24 with the sodium salt of each mercaptobipyridine in DMF furnished thiones 27 and 28 in yields of 70-73%. Subsequent exchange of thione sulphur for oxygen using mercuric acetate gave oxo compounds 29 (93%) and 30 (97%), which were cross coupled with the unsubstituted thione **31** in triethyl phosphite at 90-100 °C to give ligands **13** (46%) and 14 (54 %) after separation from homo-coupled products by chromatography. The overall yields of each ligand from the trithione 22 were 18%(13) and 24%(14).

This synthetic route provides oxo compounds **29** and **30** which can be crosscoupled with alternative thiones to give further bipyridine-substituted donors. Nevertheless, it could be more convenient to be able to introduce the metal binding group right at the end of the synthesis, especially if the metal binding moiety is expensive, or difficult to make. In addition, when we tried to make the ligand **15** containing a 4'- mercapto- 2,2':6',2''-terpyridine group by the route above, the final step of the synthesis was problematic. 4'-Mercaptoterpyridine **33** was prepared from the commercially available chloro compound **32** and sodium hydrogen sulphide in DMF in quantitative yield. Constable reported the first details of this compound recently.²⁸ Reaction of the tosylated thione **24** with the sodium salt of the mercaptoterpyridine **33** gave the thione **34** in 69 % yield and this product was converted to the oxo compound **35** in 67% yield. However, purification of the donor **15**, from the reaction of oxo compound **35** with the unsubstituted thione **31** in triethyl phosphite, required several chromatographic separations and gave a very low yield of the donor. Thus, we developed a different approach (Scheme 2) involving nucleophilic substitution on tosyloxymethyl-ET **40** to prepare donor **15**.

Synthesis of HMET and its Tosylate.

We have developed a method of preparing hydroxymethyl-ET, HMET, in four steps from trithione **22** in an overall yield of 44% utilising an acetyl protecting group (Scheme 2). Thus, cycloaddition of trithione **22** with allyl acetate gives the thione **36** (72%) which is converted to the oxo compound **37** in 90% yield. Cross coupling with unsubstituted thione **31** gave acetyloxymethyl-ET **38** in 70% yield after separation from homocoupled products. Finally, hydrolysis of the acetate gave HMET **39** in 96% yield. This represents the most efficient synthesis of racemic HMET reported to date. The preparation of HMET **39** has been reported by Zhu²⁹ and ourselves³⁰ in five step syntheses in which the hydroxyl group is protected with a TBDMS group. The new route is shorter and considerably cheaper, and full experimental details are provided.

Tosylation of HMET was only possible by use of a large excess of tosyl chloride in pyridine over 20 hours which gave the product **40** in 85 % yield. Use of just two equivalents of tosyl chloride gave no product after 24 hours, and at least seven equivalents are necessary for this reaction to succeed. We measured the X-ray crystal structure of this tosylate to look for any feature which might give clues to the difficulty in the tosylation. In fact the structure is particularly unusual, since it shows that the tosyl group is bent back over the ET system (Figure 1); the closest intramolecular contacts between the ET and tosyl group (*ca* 3.5-3.6 Å) involve the methyl carbon and sp² carbon atoms of the unsubstituted "half" of the ET system. However, there is no charge transfer interaction; the crystal colour is typical for an ET derivative, and in solution the UV/visible spectrum shows no remarkable features. Both tosyl and ET units are involved

Scheme 2.

in the molecular stacking (Figure 2): the phenyl rings stack face to face (separation 3.44 Å) and these pairs then stack with some overlap between their ET moieties (separation 3.80 Å). There is one rather close intermolecular S....S contact between dithiole rings of 3.3884(17) Å. The ET moiety is significantly non-planar even in the heterocyclic core of the molecule. Thus, the best planes defined by the sulfur and sp² carbon atoms of the two dithiolodithiin units lie at $33.75(5)^{\circ}$ to each other. The substituted dihydrodithiin ring adopts a half chair conformation while for the unsubstituted ring both sp³ carbon atoms

deviate to the same side of the ring plane. There is some disorder in the structure with ca. 13% of molecules preferring a slightly different conformation; the ET and methylphenyl groups occupy similar positions, but in the minor component the tosyloxymethyl sidechain is attached to the other carbon of the ethylene bridge. In both structures the sidechain adopts a pseudoaxial orientation with respect to the ET group. The sluggishness of the reaction between HMET and tosyl chloride may just be due to the HMET molecules being stacked in solution and so access to the hydroxyl group is hindered. There is no similar difficulty in tosylation the hydroxymethyl thione 23.

Reaction of the sodium salt of 4'-mercaptoterpyridine 33 with the tosylated donor 40 in DMF over 48 hours at room temperature gave the terpyridyl-ET derivative 15 in 65 % yield after chromatography, and thus avoiding the difficulties of the previous synthesis. Ligand 14 was also prepared by reaction of the appropriate bipyridinethione 26 with the tosylated HMET in a yield of 65%. The overall yields of 14 from trithione by this route or the stepwise route discussed earlier are very similar. However, when a range of derivatives is being made, it may be simpler to make a large amount of the tosylated donor, and then react it with the required nucleophiles. The tosylated donor was also reacted with the sodium salt of 2,6-diacetyl-4-mercaptopyridine, to give the pyridyl substituted donor 41 in 70% yield. The X-ray structure of 41 is shown in Figure 3. The pyridyl group is not bent back over the ET moiety as in the tosylate, but the sidechain is extended away from the ET to which it attaches by a pseudo-axial connection. The pyridyl substituent remains roughly parallel to the ET grouping. The latter shows some deviations from planarity (Figure 4); the planes of the two dithiolodithiin sections, as defined by their four sulphur atoms, lie at $24.18(1)^{\circ}$. In the substituted dihydrodithiin ring both sp³ carbon atoms are displaced to the same side of the plane defined by the other four atoms, the substituted atom carbon by less than the methylene carbon atom (0.543)cf. 1.151 Å). In the unsubstituted dihydrodithiin ring only one of the sp^3 carbon atoms is strongly displaced from the plane of the four other atoms (by 0.711, cf. -0.107 Å). Further substitution reactions on tosylated HMET will find applications for preparing a range of substituted ET derivatives.

Figure 4. X-ray structure of 41

The facile synthesis of HMET **39** now opens up access to further functionalised derivatives e.g. by esterification. Thus, DCC coupling of HMET with pyridinecarboxylic acids gave new donors substituted with binding groups, **17** and **18**, in reasonable yields (ca. 50%), with considerable potential for preparation of further materials. Furthermore, this route was taken to attach other heterocyclic moieties e.g. a thiophene in **42** which could also be used bring additional electrical properties on polymerisation.

In summary, routes to the synthesis of a number of ET derivatives with metal binding groups are described. The approach via HMET in particular has the potential for preparing substrates for multifunctional materials by attachment of the ET unit to molecular systems bringing additional properties. We are currently studying the coordination chemistry of the new donors reported here.

Experimental

General. NMR spectra were measured on a JEOL JNM-EX270 spectrometer at 270 MHz for ¹H and at 67.8 MHz for ¹³C using CDCl₃ as solvent, and measured in p.p.m. downfield from TMS, unless otherwise stated. IR spectra were recorded on a PerkinElmer Spectrum RX 1 FT-IR spectrometer in cm⁻¹. Mass spectra were recorded at the EPSRC National Mass Spectrometry Centre at Swansea University. X-Ray diffraction datasets were measured by the EPSRC National Crystallography Service at Southampton University. Chemical analysis data were obtained from the Microanalytical Laboratory, University of Nottingham. Flash chromatography was performed on 40-63 silica gel (Merck).

5,6-Dihydro-5-(hydroxymethyl)-1,3-dithiole[4,5-b]-1,4-dithiin-2-thione 23²⁹

A suspension of allyl alcohol (15ml, 0.22mol) and trithione **22** (27.8g, 0.14mol) in toluene (600ml) was heated to reflux for 4 h. After cooling to room temperature the reaction mixture was filtered, and the solid washed with ethanol. Combined washings and filtrate were evaporated and the residue purified by flash chromatography (SiO₂, EtOAc) to furnish **23** as an yellow oil (26.7g, 73%) which solidified on standing, δ_{H} : 3.96 (2H, m, CH₂OH), 3.84 (1H, m, 5-*H*), 3.39 (1H, dd, J = 13.4, 2.8 Hz, 6- H_{α}), 3.32 (1H, dd, J = 13.4, 6.7 H_z, 6- H_{β}), 1.80 (1H, br, OH), δ_{C} : 210.2 (C=S), 125.5, 123.7 (3'a- & 7'a- C), 64.4 (CH₂OH), 39.8 (5-C), 33.1 (6-C).

5,6-Dihydro-5-(4'-methybenzenesulfonyloxy)-methyl-1,3-dithiolo-[4,5-b]-1,4-dithiin-2-thione 24

Alcohol **23** (10.00 g, 39.4 mmol), tosyl chloride (11.23 g, 59 mmol) and dry pyridine (40 ml) were stirred overnight under nitrogen. The solution was added to ice water (200 ml) and filtered. The solid was dissolved in DCM and washed with water (200ml), 4M HCl (3x200ml), brine (100ml) before being dried over MgSO₄. Concentration in *vacuo*

yielded the product **24** as a brown solid, (13.65g, 85%), m.p. 114-116 °C, δ_{H} : 7.80 (2H, d, J=8.2 Hz, 2'-,6'-H), 7.32 (2H, d, J=8.2 Hz, 3'-,5'-H), 4.30 (1H, dd, J = 10.4, 9.7 Hz, CH_aO), 4.12 (1H, dd, J = 10.4, 6.2 Hz, CH_βO), 3.91 (1H, m, 5-H), 3.28 (2H, d, J = 3.7 Hz, 6- H_2), 2.41 (3H, s, CH₃); δ_C : 207.0 (2-C), 145.3 (1'-C), 132.0 (4'-C), 130.1 (2'-, 6'-C), 128.0 (3'-, 5'-C), 122.2, 121.1 (3a, 7a-C), 68.5 (CH₂O), 40.2 (5-C), 30.5 (6-C), 21.7 (CH₃); v_{max} (KBr): 1594, 1482, 1359, 1191, 1122, 1001, 999, 965, 824, 809, 790, 665, 567, 549, 516; found C: 38.4, H: 3.0%, C₁₃H₁₂O₃S₆ requires C: 38.2, H: 3.0%.

6-Mercapto-2,2'-bipyridine 25

6-Bromo-2,2'-bipyridine²⁵ (1.24g, 5.28 mmol) and solid KOH (0.87g, 15.5 mmol) were added to a suspension of sodium hydrogen sulfide (3.1g, 55.2 mmol) in DMF (80 ml). The mixture was heated to reflux under nitrogen atmosphere overnight. After cooling to RT, the mixture was filtered and the filtrate was concentrated under reduced pressure to give a yellow residue. The residue was dissolved in 50 ml H₂O, and neutralised with diluted HCl (2M). The yellow precipitate was collected and re-dissolved in CH₂Cl₂, and washed twice with H₂O. The organic phase was separated and dried over MgSO₄. Removal of solvent afforded 6-mercapto-2,2'-bipyridine as a yellow solid (0.77g, 78%). δ_{H} : 12.28 (1H, br, N*H*), 8.61 (1H, d, J = 4.7 Hz, 6'-*H*), 7.79 (2H, m, 4-,4'-*H*), 7.48 (1H, d, J = 8.7 Hz, 3'-*H*), 7.28 (2H, m, 3-,5'-*H*), 7.14 (1H, d, J = 8.2 Hz, 5-*H*); δ_{C} : 179.5 (6-*C*), 149.5 (2-*C*), 146.7 (2'-*C*), 144.3 (6'-*C*), 138.3 (4'-*C*), 137.8 (4-*C*), 133.3 (3-*C*), 125.7 (3'-*C*), 121.3 (5'-*C*).

5,6-Dihydro-5-(2',2''-bipyridin-6'-ylthiomethyl)-1,3-dithiolo-[4,5-b]-1,4-dithiin-2thione 27

Sodium hydride (0.31 g, 50% dispersion in oil 6.5 mmol) was added to a solution of 6mercapto-2,2'-bipyridine (1.23 g, 6.5 mmol) in dry DMF (20 ml). After 40 minutes stirring a solution of tosylate **24** (2.60g, 6.5mmol) in dry DMF (10ml) was added and the resulting mixture stirred under nitrogen for 25 h. The solution was concentrated in vacuo, and the residue partioned between DCM and water. The organic layer separated and dried over MgSO₄. Purification by flash chromatography on silica (8:1 cyclohexane: EtOAc) yielded **27** as a red solid, (1.88g, 70%), m.p. 117-120^oC, δ_H (400 MHz): 8.58 (1H, d, J = 4.7 Hz 6''-*H*), 8.20 (1H, d, J = 7.9 Hz, 3''-H), 8.06 (1H, d, J = 7.8 Hz, 3'-*H*), 7.76 (1H, dt, J = 7.8, 1.7 Hz, 4''-*H*), 7.52 (1H, t, J = 7.8 Hz, 4'-*H*), 7.18 (1H, dd, J = 7.4, 5.0 Hz, 5''-*H*), 7.13 (1H, d, J = 7.9 Hz, 5'-*H*), 4.07 (1H, m, 5-*H*), 3.84 (1H, dd, J = 14.1, 4.7 Hz, 6-*H*_a), 3.48 (1H, dd, J = 14.1, 9.6 Hz, 6-*H*_β), 3.40 (2H, m, 5-C*H*₂Sbipy); δ_C (100 MHz): 207.4 (2-*C*), 155.7 (2'-,6'-*C*), 155.1 (2''-*C*), 149.1 (6''-*C*), 137.2 (4'-*C*), 136.9 (4''-*C*), 123.9 (3a-*C*), 122.5 (5''-*C*), 122.4 (7a-*C*), 121.6 (5'-*C*), 120.7 (3''-*C*), 117.3 (3'-*C*), 41.9 (5-*C*), 33.7 (5-*C*), 32.7 (*C*H₂Sbipy) ; v_{max} (KBr): 1576, 1555, 1480, 1443, 1419, 1140, 1061, 983, 773, 740; *m*/*z*: (EI) 425 ([M+H]⁺, 100%); *HRMS*: (EI) found [M+H]⁺ 424.9403, C₁₆H₁₂N₂S₆ requires 424.9402.

5,6-Dihydro-5-(2',2''-bipyridine-6'-thiomethyl)-1,3-dithiolo-[4,5-b]-1,4-dithiin-2-one 29

To a solution of thione **27** (0.30g, 0.71mmol) in chloroform (5ml) was added glacial acetic acid (2ml) and then mercury(II) acetate (0.57g, 1.78mmol). This was stirred for 2h before being filtered. The filtrate was collected and diluted with water (20ml). The solution was neutralised with sodium bicarbonate and the organic layer separated and dried over MgSO₄. Concentration *in vacuo* yielded **29** as a beige solid, (0.27g, 93%), m.p.120-123 °C, δ_H (400 MHz): 8.61 (1H, dm, J = 4.6 Hz, 6''-*H*), 8.27 (1H, dd, J = 7.9, 1.0 Hz, 3''-*H*), 8.11 (1H, dd, J = 7.6, 1.0 Hz, 3'-*H*), 7.78 (1H, dt, J = 7.8, 1.7 Hz, 4''-*H*), 7.59 (1H, dt, J = 7.9, 1.0 Hz, 4'-*H*), 7.26 (1H, ddd, J = 7.6, 5.0, 1.3 Hz, 5''-*H*), 7.17 (1H, d, J = 7.8 Hz, 5'-*H*), 4.11 (1H, m, 5-*H*), 3.97 (1H, dd, J = 14.0, 4.4 Hz, 6- H_{α}), 3.55 (3H, m, 6- H_{β} , CH₂Sbipy); δ_C (100 MHz): 188.5 (2-*C*), 155.9 (6'-*C*), 155.8 (2'-*C*), 155.3 (2''-*C*), 149.2 (6''-*C*), 137.3 (4'-*C*), 136.9 (4''-*C*), 123.9 (5''-*C*), 122.5 (5'-*C*), 120.7 (3''-*C*), 117.3 (3'-*C*), 112.2, 112.1 (sp² *C*), 43.6 (5-*C*), 33.8 (6-*C*, CH₂Sbipy); ν_{max} (KBr): 1656, 1618, 1558, 1556, 1529, 1506, 1433, 1384, 1260, 1212, 1145, 1097, 1020, 861, 804, 774, 462; m/z: (CI) 409 ([M]⁺, 100%); *HRMS*: (CI) found [M+H]⁺ 408.963, C₁₆H₁₂NOS₅ requires 408.963.

(2",2"'-Bipyridin-6"-ylthiomethyl)-ET 13

A suspension of oxo compound **29** (0.34 g, 0.83 mmol) and unsubstituted thione **31** (0.36 g, 1.60 mmol) in dry triethyl phosphite (15 ml) was heated to 90°C under nitrogen for 6 h. The solution was allowed to cool and concentrated in vacuo. The residue was purified by flash chromatography on silica (1:6 EtOAc: cyclohexane) to yield **13** as an orange solid, (0.53 g, 46%), m.p. 100-103°C, δ_{H} (400 MHz): 8.60 (1H, ddd, J = 5.0, 1.7, 1.0 Hz, 6'''-H), 8.28 (1H, td, J = 7.9, 1.0 Hz, 3'''-H), 8.10 (1H, dd, J = 7.8, 1.0 Hz, 5''-H), 7.78 (1H, dt, J = 7.7, 1.7 Hz, 4'''-H), 7.58 (1H, t, J = 7.8 Hz, 4''-H), 7.25 (1H, ddd, J = 7.5, 4.7, 1.2 Hz, 5'''-H), 7.12 (1H, dd, J=7.9, 0.7 Hz, 3'''-H), 4.02 (1H, m, 5-H), 3.86 (1H, dd, J = 13.9, 4.5 Hz, 6- H_a), 3.39 (1H, dd, J = 14.0 9.7 Hz, 6- H_β), 3.33 (1H, dd, J = 13.5, 5.2 Hz, CH_a Sbipy), 3.24 (1H, dd, J = 13.5, 3.2 Hz, CH_β Sbipy), 3.22 (4H, s, 5'-,6'- H_2); δ_C (100 MHz): 156.2 (2''-C), 156.0 (6''-C), 155.5 (2'''-C), 117.2 (5'''-C), 137.3 (4'''-C), 137.1 (4''-C), 124.0 (3''-C), 122.5 (3'''-C), 120.9 (5''-C), 117.2 (5'''-C), 113.9, 113.9, 113.3 , 112.8 (sp² C), 42.5 (5-C), 33.9 (6-C), 33.4 (CH_2 Sbipy), 30.2 (5'-,6'-C); v_{max} (KBr): 2920, 1654, 1575, 1508, 1410, 1246, 1137, 770; m/z: (APCI) 585 [M+H]⁺ (57%), 425 (45%), 156 (100%) . *HRMS*: (EI) found [M+H]⁺ 584.8881, C₂₁H₁₆N₂S9 requires 584.8878.

4-Mercapto-2,2'-bipyridine 26

Sodium hydrogen sulfide (4.95g, 88.4 mmol) was suspended in DMF (50 ml), to it was added 4-chloro-2,2'-bipyridine²⁶ (1.61g, 8.43 mmol) and solid KOH (1.39g, 24.8 mmol). The mixture was heated to reflux under nitrogen atmosphere overnight. After cooling to RT, the mixture was filtered and the filtrate was concentrated under reduced pressure to give a yellow residue. The residue was dissolved in 50 ml H₂O, and neutralised with diluted HCl (2M). The yellow precipitate was collected and re-dissolved in CH₂Cl₂, and washed twice with H₂O. (2",2"'-Bipyridine-4"-ylthiomethyl)-ET 14 (from 40)

Sodium hydride (0.058g, 50% dispersion in oil, 1.21 mmol) was added to a solution of 4mercapto-2,2'-bipyridine (0.22g, 1.17 mmol) in dry DMF (10 ml). After stirring for 40 min, a solution of tosyloxymethyl-ET (0.68g, 1.20 mmol) in dry DMF (15 ml) was added and the mixture was stirred under nitrogen for 48 h. Solvent was removed under vacuum and the residue was portioned between CH_2Cl_2 and water. The organic phase was separated and dried over MgSO₄. Removal of solvent afforded a brown residue which was purified by flash chromatography on silica ($CH_2Cl_2/MeOH$: 9.5/0.5) to give the product as a yellow solid. Yield, 0.44g, 65%.

4-Mercapto-2,6-diacetylpyridine

4-Chloro-2,6-diacetylpyridine³¹ (0.57g, 2.88 mmol) and solid KOH (0.48g, 8.6 mmol) was added to a suspension of sodium hydrogen sulfide (1.56g, 28.0 mmol) in DMF (50 ml). The mixture was heated to reflux under nitrogen atmosphere for 62h. After cooling to room temperature, the mixture was filtered and the filtrate was concentrated under reduced pressure to give a brown residue. The residue was dissolved in H₂O (15 ml), and neutralised with diluted HCl (2M). The yellow precipitate was collected by filtration and re-dissolved in CH₂Cl₂, and the bright yellow solution was washed with H₂O and brine respectively. The organic phase was separated and dried over MgSO₄. Removal of solvent afforded the title product as a brown solid which was used for next step without further purification (0.40g, 70%). m.p. 92-95 °C. δ_H (400 MHz): 7.95 (2H, s, 3-,5-*H*), 3.80 (1H, s, S*H*), 2.70 (6H, s, 2 x CH₃); δ_C (100 MHz): 199.0 (2 x C=O), 152.5 (2-,6-*C*), 147.1 (4-*C*), 123.3 (3-,5-*C*), 25.6 (2 x CH₃); ν_{max} (KBr): 1699, 1571, 1412, 1360, 1308, 1230, 892, 806, 608, 499; *m/z*: (ES⁺) 196 [M+H]⁺, 218 [M+Na]⁺; *HRMS*: (CI) found 196.0428 [M+H]⁺, C₃H₁₀NO₂S requires 196.0427.

(2",6"-Diacetylpyridine-4"-ylthiomethyl)-ET 16

Sodium hydride (0.023g, 50% dispersion in oil, 0.48 mmol) was added to a solution of 4mercapto-2,6-diacetylpyridine (0.09g, 0.46 mmol) in dry DMF (4 ml). After stirring overnight, a solution of tosyloxymethyl-ET (0.27g, 0.48 mmol) in dry DMF (7 ml) was added and the mixture was stirred under nitrogen for 6 days. Solvent was removed under vacuum and the brown residue was partitioned between CH₂Cl₂ and water. The organic phase was separated and washed with brine, dried over MgSO₄. Removal of solvent afforded a brown oily residue which was purified by flash chromatography on silica eluted with CH₂Cl₂ and **16** was obtained as an orange solid (0.19g, 70%), m.p. 180-183 °C, $\delta_{\rm H}$ (400 MHz): 8.00 (2H, s, 3"-,5"-*H*), 3.75 (1H, m, 5-*H*), 3.52 (1H, dd, J = 12.8, 5.0 Hz, 6-H_α), 3.45 (1H, dd, J = 12.8, 7.8 Hz, 6-H_β), 3.32 (2H, d, J = 4.2 Hz, CH₂S), 3.28 (4H, 5'-,6'-*H*₂), 2.75 (6H, s, 2 x CH₃); δ_C (100 MHz): 199.0 (2 x C=O), 152.6 (2"-,6"-*C*), 150.5 (4"-*C*), 121.4 (3"-,5"-*C*), 113.8, 112.9, 112.6, 112.5, 101.8 (sp²-*C*), 41.1 (5-*C*), 34.9 (6-*C*), 33.4 (CH₂S), 30.1 (5'-,6'-*C*), 25.6 (2 x CH₃); ν_{max} (KBr): 1696, 1570, 1408, 1359, 1304, 1260, 1228, 800, 732, 606; *m/z*: (ES) 591 [M]⁺; found C: 38.9, H: 2.8, N: 2.1 %. X-ray Crystallography for 16 and 40.

Data was collected by the EPSRC National Crystallography Service on a Bruker-Nonius FR591 diffractometer equipped with a rotating anode source and CCD camera using MoK α radiation at 120 K, and structures were solved and refined with SHELXS-97 and refined with SHELXL-97.³²

Crystal data for **16**: C₂₀H₁₇NO₂S₉.0.5CH₂Cl₂, M_r = 634.35, triclinic, a = 7.8542(1), b = 11.9820(2), c = 14.1992(3) Å, α = 90.439(1), β = 92.745(1), γ = 101.822(1)°, V = 1306.2 Å³, Z = 2, Pī, D_c = 1.61 gcm⁻³, μ (MoK α) = 0.89 mm⁻¹, T = 120 K, 5986 unique reflections, 5172 with F_o > 4 σ (F_o), R = 0.038, wR = 0.084. Orange x-ray quality single crystals were obtained by layering hexane onto a concentrated solution of the compound in dichloromethane. A molecule of the latter solvent is included in the crystal structure, and lies near to a centre of symmetry which relates the two chlorine atoms. The position of the methylene group is disordered.

Crystal data for **40**: $C_{18}H_{16}O_{3}S_{9}$, $M_{r} = 568.85$, triclinic, a = 6.2490(1), b = 11.0486(3), c = 16.4757(4) Å, $\alpha = 82.167(2)$, $\beta = 82.328(2)$, $\gamma = 87.627(2)^{\circ}$, V = 1116.5 Å³, Z = 2, Pī, $D_{c} = 1.69$ gcm⁻³, μ (MoK α) = 0.91 mm⁻¹, T = 120 K, 5118 unique reflections, 4486 with $F_{o} > 4\sigma(F_{o})$, R = 0.039, wR = 0.107. Light brown x-ray quality single crystals were obtained by layering hexane onto a concentrated solution of the compound in CH₂Cl₂. The structure is disordered 87:13 between two structures in which the ET and 4-CH₃C₆H₄ fragments occupy similar positions, but with the different points of attachment of the tosyloxymethyl sidechain to the ethylene bridge of the ET moiety.
