Abstract

In our world today, education is important to improving and making life more comfortable. The traditional educational system developed in the last century is not fully capable of delivering effective and borderless learning. With the advent of social networks on the internet, interaction has been improved round the world and the reality of connecting everyone in the world is just at hand. As the use of social networks increases, there are no specific platforms that provide a way of structured learning in a social context. This work intends to make the process of learning in the educational system more effective by providing tools and services in the social networking space. The social network was implemented using a variety of programming languages and tools used for web development such as PHP and MYSQL, HTML, Ajax and JQuery with integration of other frameworks and libraries.
