# ANOTHER PROOF OF BEAL'S CONJECTURE 

JAMES E. JOSEPH AND BHAMINI M. P. NAYAR

#### Abstract

Beal's Conjecture: The equation $z^{\xi}=x^{\mu}+y^{\nu}$ has no solution in relatively prime positive integers $x, y, z$ with $\mu, \xi$ and $\nu$ odd primes at least 3 . A proof of this longstanding conjecture is given.

Beal's Conjecture: The equation $z^{\xi}=x^{\mu}+y^{\nu}$ has no solution in relatively prime positive integers $x, y, z$ with $\xi, \mu$ and $\nu$ odd primes at least 3. A history of this problem can be found in [1].

Suppose $z^{\xi}=x^{\mu}+y^{\nu}$ is true for any relatively prime positive integers $x, y, z$ and odd primes $\xi, \mu$ and $\nu$ with $\xi, \mu, \nu$ at least 3 . When $x, y$ and $z$ are relatively prime, $\left(z^{\xi}\right),\left(x^{\xi}\right)$ and $\left(y^{\xi}\right)$ are also relatively prime. Then $\left(z^{\xi}\right)^{\xi}=\left(x^{\xi}\right)^{\mu}+\left(y^{\xi}\right)^{\nu}$. That is, suppose $\left(z^{\xi}\right)^{\xi}=\left(x^{\mu}\right)^{\xi}+$ $\left(y^{\nu}\right)^{\xi}$.

## The Proof.

It is clear that if $\left(z^{\xi}\right)^{\xi}=\left(x^{\mu}\right)^{\xi}+\left(y^{\nu}\right)^{\xi}$, then either $x^{\mu}$ or $y^{\nu}$ or $z^{\xi}$ is divisible by 2 . Suppose $z^{\xi}$ is divisible by 2 . Then $x^{\mu}$ and $y^{\nu}$ are odd.
Since $\left(z^{\xi}\right)^{\xi}=\left(x^{\mu}\right)^{\xi}+\left(y^{\nu}\right)^{\xi},\left(z^{\xi}\right)^{\xi}$ is $2^{m \xi}$ times an odd integer, where $m$ is an integer, and $\left(x^{\mu}\right)^{\xi}+\left(y^{\nu}\right)^{\xi}=\left(x^{\mu}+y^{\nu}\right)\left(\sum_{k=0}^{\xi-1}\left(x^{\mu}\right)^{k}\left(y^{\nu}\right)^{\xi-1-k}\right)$, by prime factorization, $x^{\mu}+y^{\nu}$ is even. Hence,

$$
\begin{equation*}
x^{\mu}+y^{\nu}=2^{m \xi} . \tag{1}
\end{equation*}
$$

Also,

$$
\begin{equation*}
x^{\mu}+y^{\nu}-z^{\xi} \equiv 0(\bmod 2) . \tag{2}
\end{equation*}
$$

So,

$$
\left(x^{\mu}+y^{\nu}-z^{\xi}\right)^{\xi} \equiv 0\left(\bmod 2^{\xi}\right) ;
$$

and

$$
\begin{equation*}
\left(x^{\mu}+y^{\nu}\right)^{\xi}-\left(z^{\xi}\right)^{\xi} \equiv 0\left(\bmod 2^{\xi}\right), \tag{3}
\end{equation*}
$$

Key words and phrases. Beal's Conjecture.
since, by expanding $\left(x^{\mu}+y^{\nu}-z^{\xi}\right)^{\xi}$ using binomial expansion,

$$
\left(x^{\mu}+y^{\nu}-z^{\xi}\right)^{\xi}-\left(\left(x^{\mu}+y^{\nu}\right)^{\xi}-\left(z^{\xi}\right)^{\xi}\right)=\sum_{k=1}^{\xi-1} C(\xi, k)\left(x^{\mu}+y^{\nu}\right)^{\xi-k}\left(-z^{\xi}\right)^{k}
$$

Hence, in view of equation (2) and (3),

$$
\begin{align*}
& \left(z^{\xi}\right)^{\xi}-\left(x^{\mu}\right)^{\xi}-\left(y^{\nu}\right)^{\xi}=\left(x^{\mu}+y^{\nu}\right)^{\xi}-\left(x^{\mu}\right)^{\xi}-\left(y^{\nu}\right)^{\xi} \\
& =\sum_{k=1}^{\xi-1} C(\xi, k)\left(x^{\mu}\right)^{\xi-k}\left(y^{\nu}\right)^{k} \equiv 0\left(\bmod 2^{\xi}\right) . \tag{4}
\end{align*}
$$

So, $y^{\nu} \equiv 0(\bmod 2)$ and $x^{\mu} \equiv 0(\bmod 2)$. That is, if $z^{\xi}$ is even, $z, x$ and $y$ are even.

Now assume that $x^{\mu}$ is even and we have $\left(x^{\mu}\right)^{\xi}=\left(z^{\xi}\right)^{\xi}-\left(y^{\nu}\right)^{\xi}$. Since $x^{\mu}$ is even, $z^{\xi}$ and $y^{\nu}$ are odd; $z^{\xi}-y^{\nu}=2^{n \xi}$ for some integer $n$ and hence

$$
\begin{equation*}
z^{\xi}-y^{\nu}-x^{\mu} \equiv 0(\bmod 2) \tag{5}
\end{equation*}
$$

So,

$$
\begin{equation*}
\left(z^{\xi}-y^{\nu}-x^{\xi}\right)^{\xi} \equiv 0\left(\bmod 2^{\xi}\right) . \tag{6}
\end{equation*}
$$

Also

$$
\begin{equation*}
\left(z^{\xi}-y^{\nu}-x^{\mu}\right)^{\xi}-\left(\left(z^{\xi}-y^{\nu}\right)^{\xi}-\left(x^{\mu}\right)^{\xi}\right)=\sum_{k=1}^{\xi-1} C(\xi, k)\left(z^{\xi}-y^{\nu}\right)^{\xi-k}\left(-x^{\mu}\right)^{k} \equiv 0\left(\bmod 2^{\xi}\right) . \tag{7}
\end{equation*}
$$

So,

$$
\begin{equation*}
\left(z^{\xi}-y^{\nu}\right)^{\xi}-\left(x^{\mu}\right)^{\xi} \equiv 0\left(\bmod 2^{\xi}\right) . \tag{8}
\end{equation*}
$$

Hence,

$$
\begin{aligned}
& \left(x^{\mu}\right)^{\xi}-\left(z^{\xi}\right)^{\xi}+\left(y^{\nu}\right)^{\xi}=\left(z^{\xi}-y^{\nu}\right)^{\xi}-\left(z^{\xi}\right)^{\xi}+\left(y^{\nu}\right)^{\xi} \\
& \left.\quad=\sum_{k=1}^{\xi-1} C(\xi, k)\left(z^{\xi}\right)^{\xi-k}\left(-y^{\nu}\right)\right)^{k} \equiv 0\left(\bmod 2^{\xi}\right)
\end{aligned}
$$

So, $z^{\xi} \equiv 0(\bmod 2)$; and $y^{\nu} \equiv 0(\bmod 2)$ and hence $z$ and $y$ are even.
The case when $y^{\nu}$ is even is similar to the case when $x^{\mu}$ is even. So, if either $x$ or $y$ or $z$ is even then, all are even which leads to a contradiction of the equation. Hence Beal's Conjecture is proved.
