

Huge Data Analytics with Transparent In-Network Memory Computing

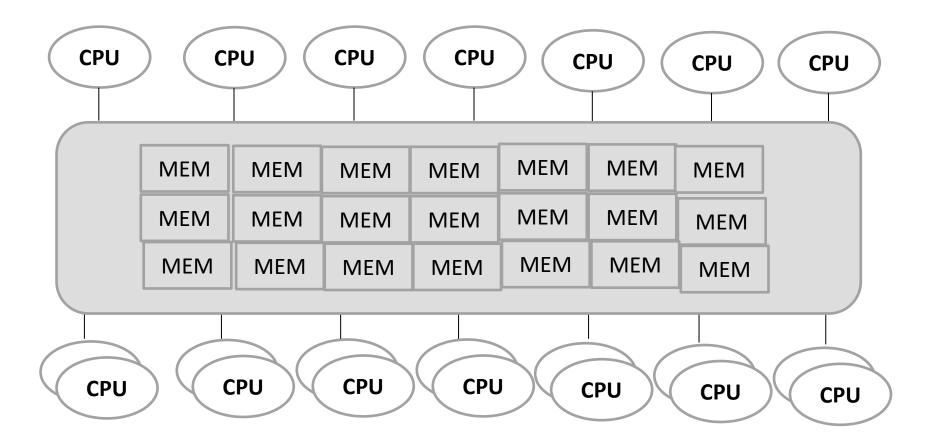

Ling Liu, James Bae, Wenqi Cao^{*}, Semih Sahin^{*}, Yanzhao Wu, Qi Zhang^{*}

> Professor Distributed Data Intensive Systems Lab School of Computer Science College of Computing

*Wenqi Cao (facebook), Semih Sahin (google, USA) and Qi Zhang (IBM TJ Watson) contributed to this umbrella project when they were PhD students at Georgia Tech.

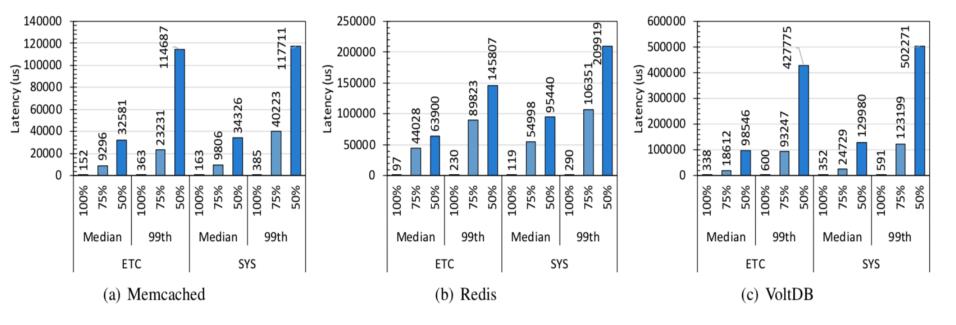

Transparent In-Network Memory Centric Computing

Cluster Computing Performance Observation

The peak memory that can fit the full working set is measured for Memcached, Redis and VoltDB, which are 25GB, 29GB and 30GB respectively.

75% configuration:

- \rightarrow median latencies worsen by 61x, 462x and 70x respectively
- \rightarrow 99th percentile latencies are worsened by 104x, 391x and 208x respectively.

50% configuration:

 \rightarrow median latencies are worsen by 214x, 802x and 369x respectively, and

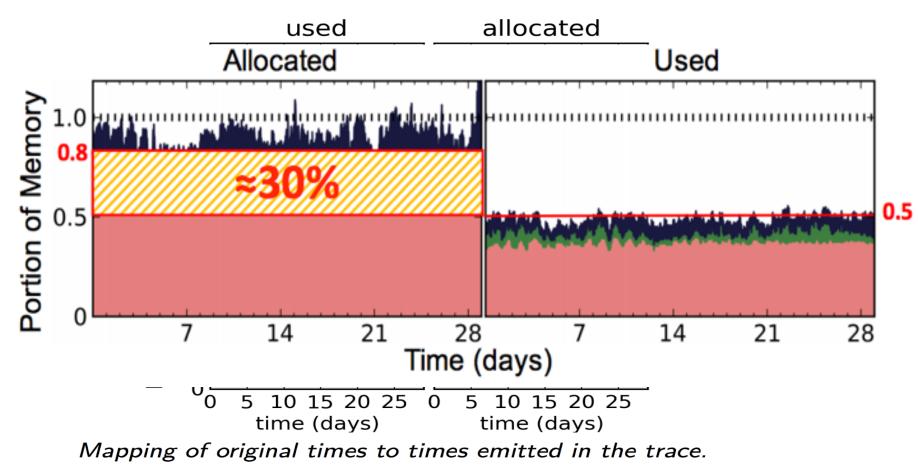

→ 99th percentile latencies are degraded by 316x, 724x and 850x respectively.

Memory Allocated vs Used

Vanilla Linux v.s. XmemPod Linux

NoSQL bigdata system performance comparison (larger time scale for Linux measurement, 5x ~ 649x improvement)

Machine learning workload performance comparison (larger time scale for Linux measurement, 8x ~ 36x improvement)

TRANSPARENT IN-NETWORK MEMORY CENTRIC COMPUTING

Transparent Host-Remote In-Network Memory Disaggregation

Memdached Redis ■ VoltDB Redis Memcached VoltDB Redis Merncached VoltDB 45 1400 10000 x 1000 100000 9000 40 400000 1200 75000 8000 Throughput (ops/s) 35 300000 1000 7000 50000 atency (us) (sn) 30 200000 6000 800 25000 25 100000 Latency 5000 20 600 0 4000 15 3000 400 10 2000 200 5 1000 0 n 45-1^{,3} 45^{55,55} 45^{9;1} 45-1-?3 55⁵⁵ ES-RDMA InfiniswaP 45.5M 45.9:1 InfiniswaP ES-ROMA InfiniswaP 45.5M linut ribat 155N · 45⁵⁵ roat SROWA linut linut ribat 45.9:1 451.3 (a) Throughput (b) Median Latency (c) 99th Latency

50% of application working set is in memory

using FS-SM in FastSwap: throughputs of Redis, Memcached, and VoltDB
→ increase by up to 571x, 171x, and 240x respectively, compared with Linux.
→ increase by 11.4x, 5.1x, and 2.0x compared to Infinitswap and increase by 10.5x, 4.9x, and 1.8x compared with nbdX

Huge Data Challenge: Transparent In-Network Memory Centric Computing

- Transparent In-Network Memory Centric Computing
 - Transparent utilization of available memory of other in-network executors
 - Instead of distributed controlled data partitioning and resorting to external I/O storage for contingency
- Transparent In-Network Federated Edge System Computing
 - Transparent federation of available edge system computing capability
 - instead of moving/collecting data to a central location
