SUMMARY

The Banco de España Statistics Department has conducted a survey to ascertain the level of satisfaction of the users of its statistics and to improve the quality of their production and dissemination.

The survey was conducted in the early months of 2018 and was aimed at a wide range of users. First, contacts previously identified by the Bank as users with ample experience in economics were invited to participate in the survey. At the same time, a link to the survey was included in the Banco de España's website to gather the opinions of other users not previously identified. The first group was named "invited users" and the second "users via website".

The survey covered four main blocks with the possibility of including free comments in almost all of them:

- a) General matters, with questions on certain user characteristics and on the group of statistics consulted.
- b) Satisfaction with statistical production, including questions relating to assessment of the production of the statistics selected in the initial block. Given the more technical nature of the questions, this block was only included in the questionnaire that was sent to invited users.
- c) Satisfaction with statistical dissemination, with questions relating to assessment of the dissemination of the statistics selected.
- d) Overall satisfaction, including questions on the general assessment of the statistics as a whole, together with others on the assessment of aspects such as, for instance, the website.

The survey was launched on 18 January 2018 and ended on 1 March for invited users and on 19 April for those using the website. 428 responses were received in the first case and 168 in the second, i.e. 596 in total. The results were analysed jointly as the statistical distribution of results was found to be highly homogeneous between the two groups of users.

Typical user survey respondents were mostly from the academic sphere (34%), followed by the public administration (19%). The main use of the Banco de España statistics reported in the survey was for research and economic analysis purposes (30% in both cases).

Overall, the level of satisfaction with Banco de España statistics is high, with 78% of users assessing it as high or very high. Some difference is appreciated between aspects relating to statistical production, which are the most highly assessed, and dissemination. Therefore, more room for improvement is seen in statistical dissemination, affecting the three matters surveyed: location and access to information; presentation and clarity; and access to and usefulness of metadata, which has the lowest assessments. As regards other general matters, a lower level of satisfaction is reported in connection with website appearance and adaptation to new technologies.

As might be expected, the results of users' open responses are similar to those of the closed questions, with comments relating to data dissemination predominating.

In conclusion, the results of the survey suggest, without detriment to maintaining a high level of quality in statistical production, that the most pressing task ahead is improving the dissemination of information. The restructuring of the website devoted to statistics, a clearer presentation of metadata, modernising data access and downloading, and boosting visual elements have been identified as possible lines of work in this connection.

Numerous users have responded to the survey, which gives robustness to the results obtained, and their participation is appreciated.

Finally, in order to keep in contact with its statistics users, the Banco de España makes available a contact form which any person or institution may use to make suggestions and comments on the production and dissemination of statistics.

Keywords: Survey, user satisfaction, statistical production, statistical dissemination, quality.

PRESENTATION OF THE RESULTS OF THE BANCO DE ESPAÑA STATISTICS USER SATISFACTION SURVEY

1 Introduction

As producer and disseminator of economic statistical information, the Banco de España considers quality as one of its main priorities, as explicitly reflected by its adherence to the "Public commitment on European Statistics by the European System of Central Banks (ESCB)" which includes, inter alia, the obligation to provide high-quality statistics.

The quality of statistics, as that of other products or services, should be understood as part of a broad framework that is not only limited to the product offered, but also covers the efficiency of the processes followed to obtain them, the optimisation of costs incurred (even more important in the case of a public service) and statistical information needs (in this case, of users).

To reach higher quality levels in statistical production and dissemination, the Banco de España's Statistics Department posed two main questions:

- a) Do the statistics provided by the Banco de España have the quality required by its users?
- b) Do the statistics provided by the Banco de España satisfy users' information needs?

There are three main types of Banco de España statistics users. First, the Banco de España's own employees, who use them in performing their functions. Second, national and international bodies to which the Banco de España supplies statistical information. Finally, the rest of users, including, among others, research and analysis departments at different kinds of institutions, university teachers, general government, financial and nonfinancial corporations, economics or other practitioners and the general public.

In the case of the first two types of users, i.e. in-house users and national and international bodies, the Banco de España has appropriate communication channels to obtain answers to the two foregoing questions. However, this is not the case for the rest of external users. Indeed, although opinions and ideas are continuously exchanged with economics and media professionals, they are not compiled systematically and do not necessarily reach the appropriate person. In the case of other users, communication channels between them and the Banco de España are more limited. One of these channels is the statistical information service of the Statistics Department, which may be used to make suggestions to the Banco de España, although it is mainly used for consultation.

Against this backdrop, the Banco de España 's Statistics Department decided to launch a statistics user satisfaction survey as a way to respond to the two foregoing questions.

The following section describes the salient aspects of the design and implementation of the satisfaction survey and Section 3 is devoted to presenting the results obtained. Section 4 presents the conclusions drawn. There are also several annexes, including most notably Annexes 6 and 7, which contain the detailed results of the survey.

2 Survey

2.1 SURVEY TARGET POPULATION

The main interest of the survey is to learn the opinions of economics practitioners who make a relatively intensive use of Banco de España statistics. However, it was also important to ascertain the general public's perception of these statistics.

To obtain the opinions of the first type of users, economics practitioners were identified and invited to participate in the survey. In total, 2,385 invitations were successfully delivered. This group was called "guest users", since they received a personal invitation to participate.

In parallel, a link to the survey was included in different Banco de España website pages. The intention was to compile the opinions of economics practitioners not considered in the previous group and those of the general public. In this document this group is called "users via website".

Since the profiles of the two groups of users would likely differ, with a possibly higher presence of general public in the case of users via website, it was decided that the survey targeting these users would be shorter, excluding the block of questions on statistical production, which was envisaged solely for guest users.

2.2 SURVEY DESIGN

The survey design was based on four basic considerations:

- Low response cost for users
- Sufficient detail to extract useful results
- Possibility for users of contributing opinions and suggestions
- Full anonymity of responses guaranteed

The questions included in the survey were grouped into four blocks:

- a) User characteristics. The aim of this block was to determine users' characteristics, with the further aim of enriching the analysis of results. Users were also asked about which group of statistics they usually consulted, which enabled the following questions on statistical production and dissemination to focus only on the statistics that were of interest to the respondent.
- b) Satisfaction with statistical production. This block included questions on the content of the statistical output for the statistics chosen previously. These questions were only directed at guest users.
- c) Satisfaction with statistical dissemination. As with block b), questions were asked about each of the statistics of interest to the user, but this time in connection with the level of satisfaction with the way such statistics are made available.
- d) Overall satisfaction. In this block, the user assessed the statistics supplied by the Banco de España overall. Certain specific questions about the statistics as a whole were also included.

A detailed list of the survey questions can be found in Annex 1.

In many questions users were offered the possibility of supplementing or detailing their responses, through a free text section, and there was also a final section for general comments.

Annex 2 includes details on the launch of the survey and on participation.

3 Survey results

The total number of survey participants was 596, of which 428 were guest users and 168 other.

3.1 CONSIDERATIONS PRIOR TO RESULTS

Before analysing the survey results users whose responses were positively skewed (consent bias) and inconsistent were stripped out. 58 users were excluded from the results. The criteria used for stripping out users is detailed in Annex 3.

3.1.1 Stripping out users

3.1.2 Treatment of no answer

In questions where respondents were offered an assessment scale, one of the options was "Don't know/No answer" (DK/NA), so as not to oblige respondents to give their opinion either because they didn't wish to do so or because they thought they lacked the judgement to respond appropriately. This type of response was chosen by different respondents and unevenly among the questions and groups of statistics.

In addition to the former responses, there were "non-responses", i.e. the respondent failed to mark any of the response options.

The two types of response or non-response may affect comparison between questions and between groups of statistics, as they were very uneven. To facilitate comparison, these responses are not considered in the analysis of the questions where these options are present.1

3.1.3 Response fatigue

The drawback of an excessively long survey is not only that it may lead to survey abandonment before completion, but it can also prompt user fatigue, skewing responses (possibly more negatively than positively) as the survey progresses. Annex 4 analyses the average assessment of responses in the order in which the questions were set out. Based on the results obtained, there does not seem to be a bias of this kind in the results to be analysed.

3.2 SURVEY RESULTS

The results shown below are on an aggregate basis for all (guest and other) users. This aggregation affects user characteristics, general matters and statistical dissemination matters. The assessment of statistical production relates solely to the group of guest users.

The aggregation of users in terms of the assessment of statistical dissemination and of general matters could pose, a priori, the problem of joining two groups (guest and viawebsite users) which could possibly be different in nature. Analysis of the responses shows that their distribution is similar among the two groups (see Annex 5) and, therefore, their aggregation does not distort the results. In any event, Annex 6 (statistical annex) presents disaggregated and detailed results for both user groups.

The following section summarises the more general results, while subsequent sections include a more in-depth analysis.

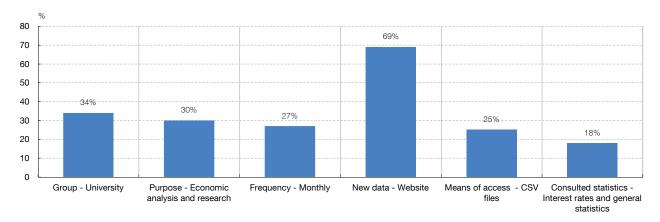

3.2.1 Summary of results

The profile of the typical user² responding to the survey is as follows (see Chart 3.1):

belongs to the university group;

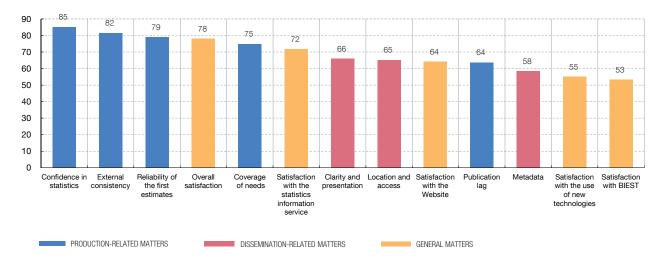

¹ This is known as "pairwise" deletion in survey literature. Other options could have been: deleting the user from the entire survey ("listwise" deletion) or estimating the response by using either the average, or regression or the response given by the most similar user in the rest of questions.

² Typical user defined by the most frequent response (mode) in each of the survey questions on user characteristics.

WEIGHT (%) OF ANSWERS WITH SATISFACTION LEVEL HIGH OR VERY HIGH

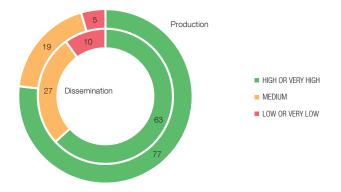

CHART 3.2

SOURCE: Banco de España.

- purpose of statistics consultation focusing on economic analysis and research;
- accesses data monthly,
- knows when statistics are published through the Banco de España website, accessing when needed,
- downloads files in CSV format,
- consults statistics relating to interest rates and exchange rates, and general economic indicators.

As regards the level of satisfaction with certain aspects of the Banco de España statistics, Chart 3.2 shows, arranged in descending order, the weight of responses with a "High" or "Very high" level of satisfaction relative to total responses (excluding don't know/no answer responses).

The level of acceptance is above 50% in all cases, reaching 85% in the case of confidence in statistics. The high level of assessment as regards overall satisfaction (78%) should be noted.

Another of the characteristics observed in this chart is some concentration by group of questions. Thus, questions relating to statistical production tend to be better assessed than those relating to dissemination and to general matters, the latter actually being closely related to dissemination, with the exception of release lag.³

The better assessment of production compared with dissemination is also seen when using aggregate results, as in Chart 3.3. It is clearly seen that while 77% of responses reflected a high or very high level of satisfaction with statistical production, the percentage drops to 63% in the case of dissemination. Also, the weight of low or very low assessments of dissemination, although small, doubles that of assessments of production.

This uneven user perception in favour of production is the most important aspect of the survey results, as it shows that improvement efforts should concentrate more on dissemination.

We analyse below in greater detail the survey results, always in aggregate terms, starting with user characteristics, followed by general matters, statistical production and, finally, dissemination.

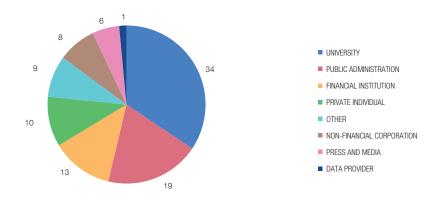

3.2.2 User characteristics

To supplement the typical user description mentioned previously in the summary of results, we provide below further details on different aspects of user characteristics.

3.2.2.1 User group

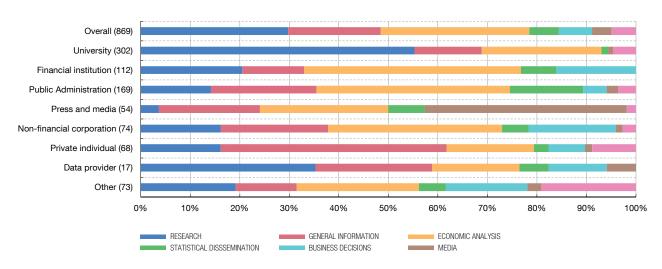

This question aimed to segment users based on the institution to which they belonged. The most numerous group was university (34%), followed by public administration (19%) and financial institutions (13%). The next group was individuals (10%), which could be assimilated to the general public (not necessarily economics practitioners) and other (9%). It should be noted that participants included in the "Other" group were asked for more details about their professional category, resulting in a greater presence of lawyers, consultants and employees of business organisations.

³ This aspect will be discussed in greater detail later on in this report.

DISTRIBUTION OF USERS BY GROUP AND PURPOSE OF CONSULTATION

CHART 3.5

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets. As this is a multiple-answer question, the number of responses may be much higher than the number of users who responded to the survey.

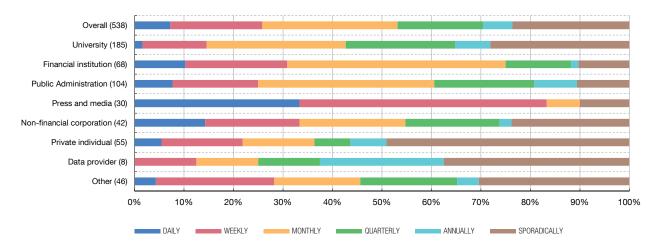

As regards the press and media and data provider groups, their low weight in the survey as a whole does not necessarily mean that these groups are under-represented, since they relate to professional groups that are small in size.

In short, it seems that out of all the survey participants, the university group is the main consumer of statistics, followed at a certain distance by public administration and, farther, by financial institutions, individuals and other.

We set forth below the remaining aspects which enable the characteristics of users who responded to the survey to be determined, stratified by the groups considered in this question.

3.2.2.2 Purpose of consultations

The different reasons for consulting Banco de España statistics include most notably economic analysis (30%), research (30%) and general information (19%) (see Chart 3.5). The overall importance of research is conditioned by the high weight of users in the "University" group, for whom research is the most common purpose (55%).

NOTE: Number of responses in each category is in brackets.

Economic analysis is the most common purpose for financial institutions, public administration, non-financial corporations and the "Other" group. Notably, in the latter group "teaching" was the predominant purpose among the users who offered the most details in their response.

General information is the third most important purpose, and it is the main one for the individuals group and the most important (with a weight of more than 20%) in the public administration, press and media, non-financial corporations and data supplier groups.

The remaining purposes have a small presence (weights under 10% for total users). Among them, it is interesting that 15% of public administration users use them for re-dissemination and that more than 15% of financial institution and non-financial corporation users use them for decision-making in business.

3.2.2.3 Frequency of consultations

Banco de España statistics are consulted relatively frequently, with 53% of the total survey participants doing so at least once a month (see Chart 3.6), while 30% state that they do so only sporadically.

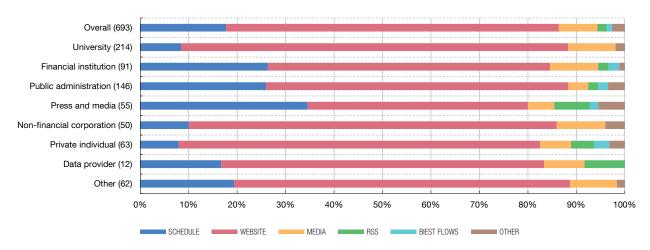

Taking as a reference, once again, the daily, weekly and monthly frequencies in conjunction, it is press and media users, followed by financial institutions, public administration and non-financial corporations who access this information most frequently. The weight of the remaining groups is lower than 50%, the less frequent users being individuals and data providers.

3.2.2.4 Channels used to know when statistics are published

The question on the channels used to find out when statistics are published gave different options to choose from (see Chart 3.7). These included those allowing greater planning, such as dissemination calendars, other more spontaneous channels, such as direct consultation on the website to check for new data, and other options enabling new statistics to be consulted in real time, such as the RSS⁴ channel which is integrated in BIEST,⁵ BIEST publication flows or through the media. The free response option was also

⁴ Abbreviation for Really Simple Syndication. This technology allows users to receive updates directly in their computers without having to visit the website.

The Banco de España's statistical information search engine.

NOTE: Number of responses in each category is in brackets. As this is a multiple-answer question, the number of responses may be much higher than the number of users who responded to the survey.

included ("Other"). These options were not mutually exclusive; several options could be selected.

The results show that accessing the Banco de España website is the method most often used to know when statistics are published (69%, see Chart 3.7). The dissemination calendar is used by 18% of users, while the remaining channels account for 11% overall.

Website access predominates among the different groups of users, although it is less important for some, such as press and media, public administration and financial institutions, for whom the dissemination calendar is more important than for the rest, although always less than website access.

3.2.2.5 Means used to access statistics

The options available to survey participants were: press releases, tables in PDF format, files in CSV format, complete publications in PDF format, files in Stata format, ⁶ BIEST and the Banco de España's statistical information service. These options were not mutually exclusive; several options could be selected.

The main means used to access statistics are files in CSV format (25%), followed by tables in PDF format (22%) and complete publications in PDF format (20%).⁷ Other means of access are at a certain distance, with a weight of 12% or less (see Chart 3.8).

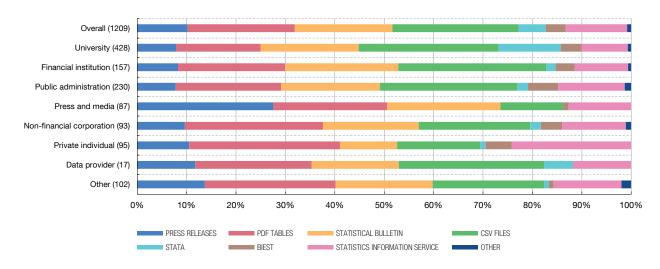

The foregoing results are, in general, the same for the different user groups, although with some exceptions. The press and media group uses press releases as its preferred means, while tables in PDF format are preferred by non-financial corporations, individuals and the "Other" group.

3.2.2.6 Groups of statistics used

The last question on user characteristics was about the statistics consulted by users. As in previous cases, the responses were not mutually exclusive and several could be chosen. These responses were used subsequently to limit inquiries on production and dissemination solely to statistics that were of interest to users.

⁶ This format may only be used to download the Spanish Survey of Household Finances.

⁷ The distinction between publications in PDF format and tables in PDF format is probably not clear for users and there may be some confusion in the response. Therefore, we suggest interpreting the two options jointly.

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets. As this is a multiple-answer question, the number of responses may be much higher than the number of users who responded to the survey.

One first result is that users consult an average of 3.2 statistics at overall level. However, this varies significantly depending on the user group. Thus, while individuals consult 2.1 statistics, the press and media group consult 4.7.

It is important to note that extreme caution should be taken when using this question to assess the relative importance of each of the statistics provided by the Banco de España. It should be borne in mind that the results obtained only reflect the composition of the survey respondents, which may differ from that of the population of Banco de España statistics users.⁸

Chart 3.9 shows the results obtained in this connection as regards all the participants. The statistics which were most consulted were general economic indicators (18%), particularly for the university and press and media groups, as well as interest rates and exchange rates (18%), with a greater presence of public administration, non-financial corporations, the "other" group and, especially, individuals. Financial institution statistics are the type most named by members of the financial institutions group.

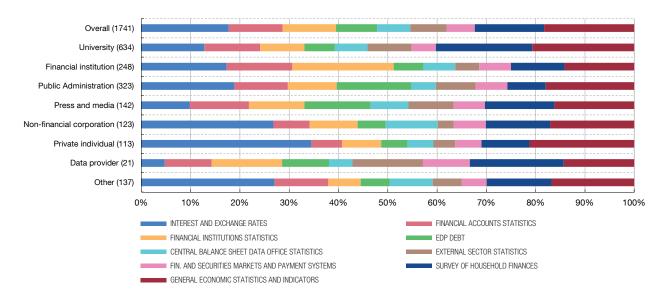

3.2.3 Results relating to general matters

This block of questions included questions which related neither to user characteristics nor to a particular type of statistics. Specifically, we asked about overall satisfaction with Banco de España statistics, with its website, with the use of new technologies to access Banco de España's statistics, with the statistics information service and with the BIEST tool.

3.2.3.1 Overall satisfaction with Banco de España statistics The purpose of this question was to obtain an overall assessment by users of the quality of Banco de España statistics as a whole, without focusing on any specific statistics or aspects. The average rating was good, since 78% of users report a high or very high level of satisfaction. Only 5% stated it was low or very low (see Chart 3.10).

This high assessment is common to the different user groups, with a minimum of 70% for the non-financial corporations group and a maximum of 89% for users in the "other" category.

⁸ Such caution should be exercised in respect of the survey results as a whole, but especially in this specific aspect.

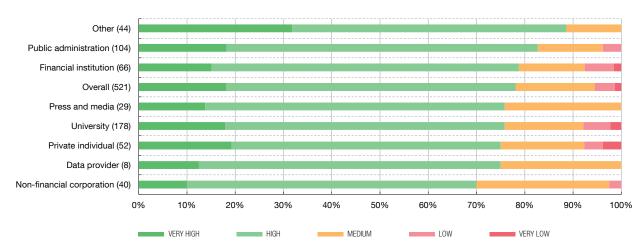

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets. As this is a multiple-answer question, the number of responses may be much higher than the number of users who responded to the survey.

LEVEL OF GENERAL SATISFACTION BY USER GROUP

CHART 3.10

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets.

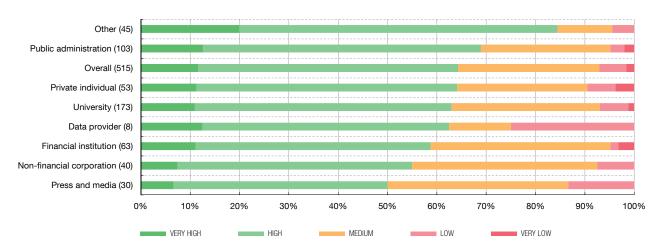

The heterogeneity of the latter group (encompassing different professions, whether known or not) makes it difficult to determine the reasons underlying such high assessments.

The users giving a negative assessment (low or very low levels of satisfaction) are concentrated in the university, financial institutions and individuals groups, where they account for more than 7%.

3.2.3.2 Overall satisfaction with the Banco de España website

Specifically, this question was about the general web page for the statistics section on the Banco de España website. The level of satisfaction was not as high, with 64% of users reporting a high or very high assessment (see Chart 3.11).

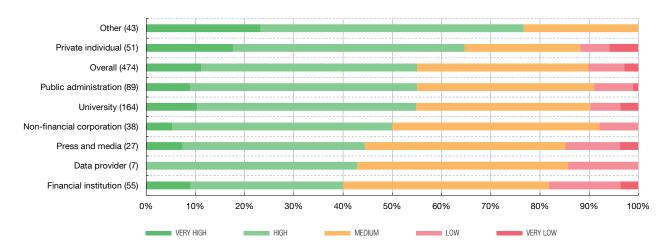

This result is consistent with those obtained in the dissemination section since, although it deals with general matters, assessment of the website is clearly related to it.

NOTE: Number of responses in each category is in brackets.

LEVEL OF SATISFACTION WITH THE USE OF NEW TECHNOLOGIES FOR ACCESS TO STATISTICS BY USER GROUP

CHART 3.12

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets.

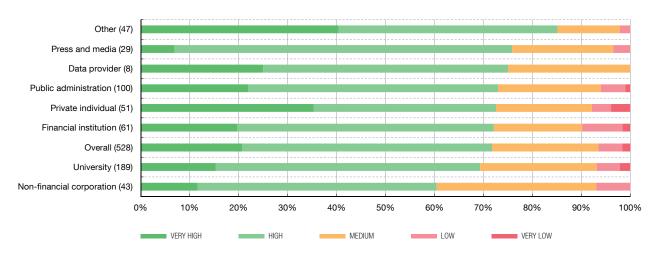

Also, in contrast with the question on overall satisfaction, website assessments are very uneven among the different user groups. Thus, topping the list, 84% of "Other" group users gave high or very high assessments, while only 50% of those in the press and media group did.

As for the negative assessments, data providers accounted for 25% of low or very low assessments, although the number of respondents is very low (only 2 users); the press and media group accounted for 13% and individuals 9%.

3.2.3.3 Assessment of use of new technologies to access the Banco de España statistics

The aim of this question was to learn how users assessed the Banco de España's use of new technologies in providing statistical information.

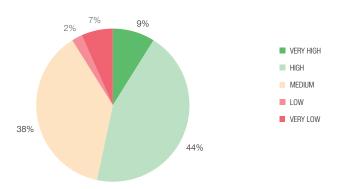

The result was one of the lowest in the survey, since only 55% of the total participants reported a high or very high level of satisfaction (see Chart 3.12). Also, three user groups (press and media, data providers and financial institutions) gave results below 50%. Moreover, this is the question with the greatest proportion of negative assessments, which in five of the eight user groups exceeded 10% of responses.

NOTE: Number of responses in each category is in brackets.

LEVEL OF SATISFACTION WITH BIEST (%)

CHART 3.14

SOURCE: Banco de España.

3.2.3.4 Assessment of statistical information service

The assessment of the statistical information service is among the items most highly valued by users (72%, see Chart 3.13), after production and overall satisfaction.

As with the foregoing general matters, the "other" group provided the highest assessment (85%), whereas non-financial corporations are on the opposite side as the group with the lowest assessment (60%). Financial institutions are the group showing greatest dissatisfaction, with 10% of low or very low assessments.

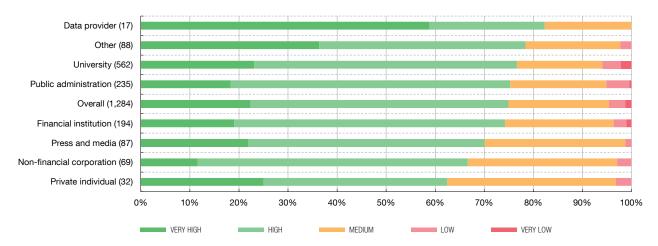

3.2.3.5 Assessment of BIEST tool

The last general type of question related to assessment of the BIEST tool. The question was only posed to users who had reported that they used this tool as a means to access data. The result is that there is only a total of 49 users, which suggests it is not advisable to correlate this question with user characteristics.

The overall results (see Chart 3.14) show that 53% have a high or very high level of satisfaction, while 9% report that it is low or very low.

3.2.4 Results of the assessment of statistical production

The quality of statistical production is a multidimensional matter which includes features such as coverage of information needs, confidence in statistics, reliability of data as initially

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

published, proximity between date of publication of a statistic and its reference period and consistency with other statistics. These features are covered by the principles of the "Public Commitment on European Statistics by the European System of Central Banks (ESCB)".

In contrast to general matters and to those relating to user characteristics, the questions on statistical production, like those relating to dissemination, are asked for each group of statistics previously selected by survey participants. These questions on production were only directed at guest users.

3.2.4.1 Coverage of information needs

One of the main aspects of quality is that users' needs are covered. The question is worded to reflect this.

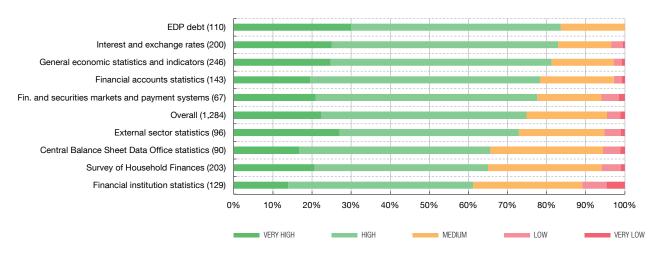

The level of satisfaction regarding the coverage of users' needs is high overall, with 77% of responses giving a high or very high assessment (see Chart 3.15). By user group, data providers are the most satisfied (82%), while non-financial corporations and individuals are the least (67% and 63%, respectively).

In terms of groups of statistics, in every case there is more than 60% of high or very high assessments (see Chart 3.16). Notably, statistics relating to EDP debt, interest rates and exchange rates, and general economic statistics and indicators exceed 80% of positive assessments. In contrast, statistics on financial institutions receive the lowest positive assessment (63%) and the most negative assessments (11% of low and very low assessments).

3 2 4 2 Confidence in statistics

All the aspects considered in this survey are important to be able to assess the quality perceived by the users of Banco de España statistics. However, the overall level of satisfaction and confidence in statistics are matters which appear to define the institution's reputation. As discussed previously, the overall level of satisfaction was high (78%). This result is reinforced by that obtained for confidence in statistics, with 85% of responses indicating a high or very high level of satisfaction (see Chart 3.17), the best valued question in all the survey.

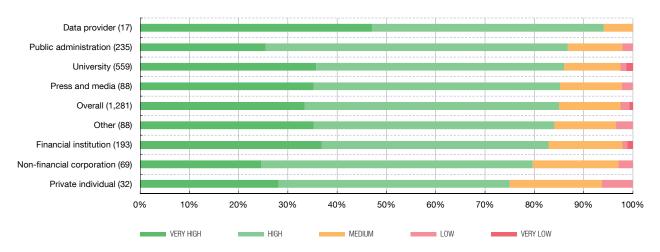

By user group the results show, at their extremes, a pattern similar to that of the previous question on user needs: while data providers are the most satisfied users, non-financial corporations and individuals are the least satisfied (although with a value of 75%).

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

CONFIDENCE IN STATISTICS BY USER GROUP

CHART 3.17

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

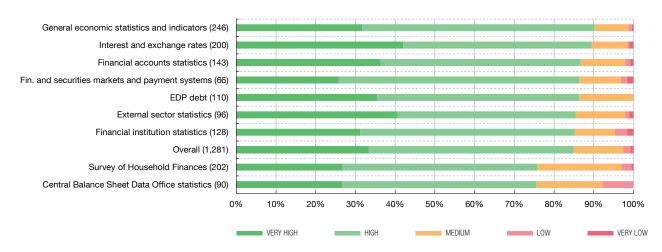

In terms of groups of statistics, practically all have more than 85% of high or very high assessments (see Chart 3.18). Exceptions relate to the Survey of Household Finances and to Central Balance Sheet Data Office statistics, although there is always over 76% of positive assessments. This result coincides with the fact that the construction of these two statistics is different in nature from that of the rest, as they are based on surveys that are not obligatory.

3.2.4.3 Reliability of data as initially published

Reliability refers to when the revised value of a specific statistic matches the initial value published. This question, like the others relating to production, received a high positive assessment (79%) (see Chart 3.19).

By user group, financial institutions give a higher assessment (83%) while individuals and non-financial corporations once again give the lowest (74% and 69%, respectively).

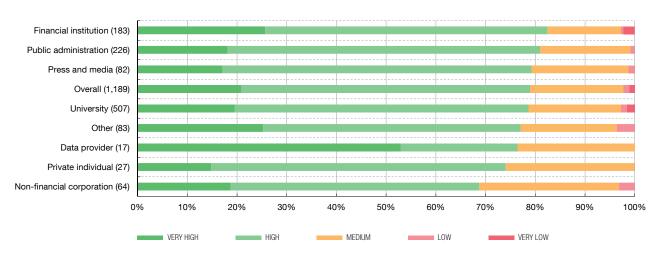

The group of statistics of EDP debt (84%) and of interest rates and exchange rates (82%) are the ones meriting the highest positive assessment in this guestion (see Chart 3. 20),

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

RELIABILITY OF FIRST ESTIMATE BY USER GROUP

CHART 3.19

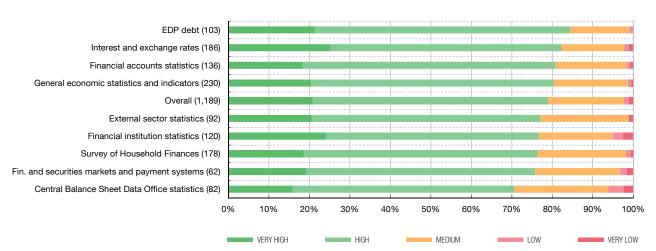

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

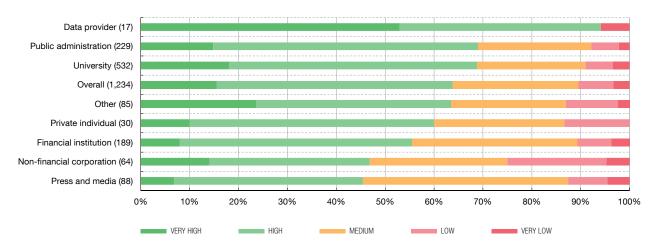

RELIABILITY OF FIRST ESTIMATE BY GROUP OF STATISTICS

CHART 3.20

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

assisted in the latter case by the fact that exchange rates are not periodically revised. Conversely, the Central Balance Sheet Data Office group of statistics has the lowest proportion of positive assessments (71%). This may derive from the fact that the first data published by this statistic are quarterly data based on a sample of firms including only the larger ones, which are subsequently corrected in the annual estimates by including small and medium-sized enterprises in the sample.

3.2.4.4 Proximity between date of publication and reference period

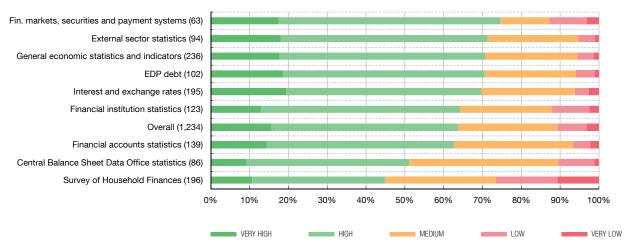

The lag between the reference date and the time of publication of data is another feature which defines the quality of statistical production, in line with the principle of "timeliness" included in the public commitment by the ESCB.

As discussed earlier, this is the question which has had the lowest positive assessment in statistical production (64%, see Chart 3.21), a difference of more than 10 percentage points relative to the rest.

In this case, the level of satisfaction shown by data providers is notable (94% of positive assessments), much higher than the rest. By contrast, the users that are most demanding in this respect are non-financial corporations (47%) which, additionally, are those with the highest percentage of negative assessments (25%), and press and media (45%).

By group of statistics, most exceed 60% of positive assessments (see Chart 3.22), with the exception of Central Balance Sheet Data Office statistics (51%) and the Survey of Household Finances (45%). This is because more time is necessary than in the rest to gather the data required to prepare these statistics. If these two groups of statistics were excluded from the total calculation, this question would obtain 69% of positive assessments, thus bettering the assessments of dissemination, as do the other questions on production.

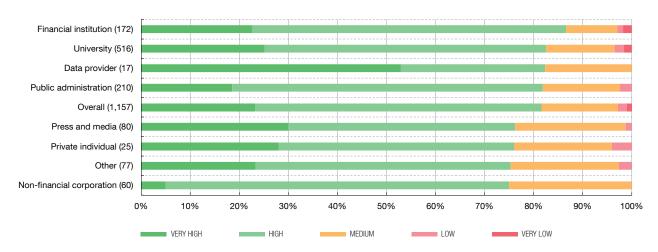

⁹ Specifically, the Survey of Household Finances is a survey that is conducted every three years and which requires highly complex field work and subsequent edition and preparation of results, which necessarily delays publication. The Central Balance Sheet Data Office compiles the information furnished by large firms to the Banco de España and that deposited by firms (small and large) in the Companies' Registry; such deposit is carried out more than six months after the reference period.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

COSISTENCY WITH OTHER NATIONAL AND INTERNATIONAL STATISTICS BY USER GROUP

CHART 3.23

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

3.2.4.5 Consistency with other domestic and international statistics

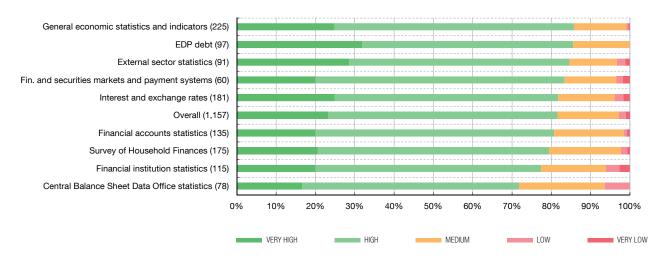

This question aimed to explore to what extent users consider that Banco de España statistics are consistent with those prepared by other institutions on the same or a similar economic phenomenon. The result is the second highest of all the survey, with 82% of positive assessments (see Chart 3.23). This is the question receiving most "don't know / no answer" responses.

The groups which are, a priori, those most knowledgeable about statistical information (financial institutions, university, data providers and public administration) give higher positive assessments (over 80%). The groups which give a lower proportion of responses with a high or very high assessment are, as in previous questions, individuals and non-financial corporations.

In terms of groups of statistics, the results are favourable, with five of the groups having more than 80% of positive assessments and none having less than 70%.

3.2.5 Results of the assessment of statistical dissemination

Data dissemination is a key element of statistical quality. Indeed, data presentation and accessibility, and the availability of the information that must accompany the data are essential to provide quality statistics.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

LOCATION OF AND ACCESS TO INFORMATION BY USER GROUP

CHART 3.25

SOURCE: Banco de España.

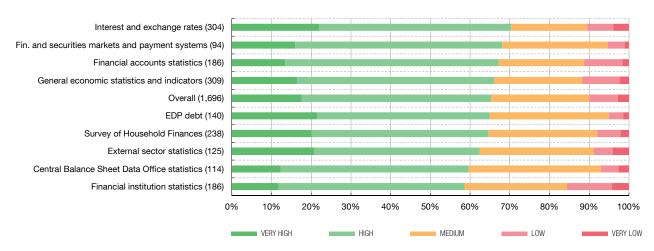

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

This section contains the overall results obtained for questions covering the aforementioned aspects. These questions, like those relating to production, were posed for each group of statistics which the survey participants had selected previously. However, unlike the questions on production, these were addressed to all users (guest and via-website users).

As noted when discussing overall results, dissemination questions received a lower positive assessment than those on production, indicating a major area in which the Banco de España's statistics can be improved.

3.2.5.1 Location and access to information sought

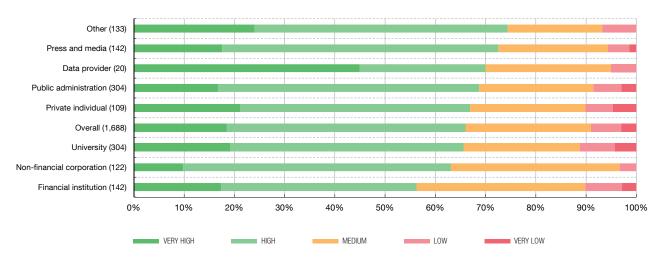

Assessment of the ease of finding and accessing statistical information was positive for almost two-thirds of responses (65%, see Chart 3.25). The groups for which this aspect was less satisfactory are press and media, and non-financial corporations, both with 52% of positive assessments. In this case, the fact that the individuals group (65%) shows a much more positive assessment than non-financial corporations stands out, since the two groups in conjunction are usually the ones posting the lowest positive assessments.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

PRESENTATION AND CLARITY BY USER GROUP

CHART 3.27

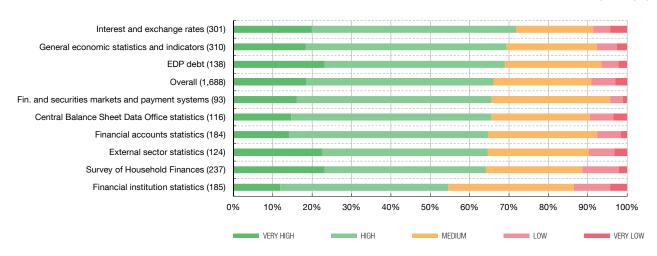

SOURCE: Banco de España.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

From the viewpoint of groups of statistics, the results are relatively homogeneous for positive assessments, spanning a range of 10 percentage points, between 59% for financial institution statistics and 70% for interest rate and exchange rate statistics (see Chart 3.26). As for negative assessments, the highest weight was recorded for financial institution statistics, with 16% of responses being low or very low assessments.

3.2.5.2 Presentation and clarity of information

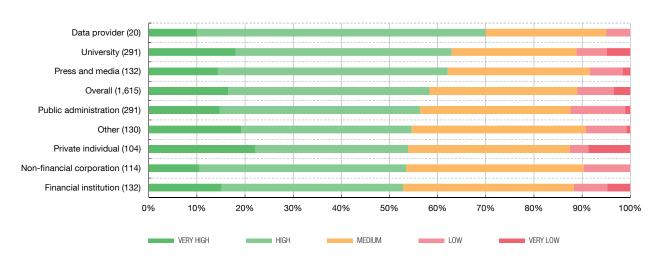

The manner in which statistics are presented received 66% of positive assessments (see Chart 3.27), in line with the previous question on ease of access to data. However, despite the similarity of the overall result for the two questions, analysis by user group offers a different scenario. While in terms of location and access to information the press and media and non-financial corporations groups gave the lowest positive assessments, in this question on presentation and clarity the non-financial corporations group was joined by the financial institutions group. Also, while the university group gave the third-best assessment in location, here it gives the third-worst assessment.

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

ACCESS TO AND USEFULNESS OF METADATA BY USER GROUP

CHART 3.29

SOURCE: Banco de España.

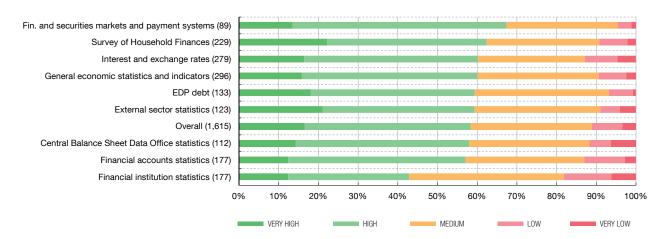

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

All the groups of statistics lie within a range from 72% (interest rates and exchange rates) to 64% (Survey of Household Finances), except for financial institutions statistics, whose positive assessments stand at 55% (see Chart 3.28).

3.2.5.3 Access to and usefulness of metadata

Metadata comprise information associated with data which enables such data to be understood and interpreted. They include things such as definitions, classifications or methodological notes. The assessment of user access to metadata and their usefulness is one of the lowest in the survey, with 58% of positive assessments. Also, negative assessments exceed ten percentage points (see Chart 3.29).

Among the different user groups, only data providers have a percentage of positive responses of 70% or more, while the university and press and media groups exceed 60%. The other groups have relatively homogeneous results (between 53% and 56%).

NOTE: Number of responses in each category is in brackets. A user may respond several times depending on the number of groups of statistics selected.

The profile of results by group of statistics is also relatively homogeneous. Thus, except for financial and securities markets and payment systems statistics, which is the group with the highest score (with 67% of positive assessments) (see Chart 3.30), and for financial institutions statistics, which is the group with the lowest positive assessment (with 43%), the other groups range between 57% and 62%. In the case of financial institutions statistics, the weight of negative assessments (18%) is also noteworthy.

3.2.6 Analysis of open responses

One of the criteria used to design the survey was to give users the opportunity of expressing their comments and suggestions, so as to obtain more precise indications of points to improve in the production and dissemination of Banco de España statistics.

This section analyses the comments and suggestions received in the survey, both at general level (the final part of the questionnaire gives users the opportunity to include any comment they wish) and at a more specific level (for each question relating to dissemination and production, open response tables were included for each group of statistics for users to include comments linked to the question and the group of statistics).

3.2.6.1 General comments

The issues addressed in the users' comments related primarily to access to information on the website and its design, followed by the format used to download data and metadata. The accompanying table details the matters into which the comments have been grouped and the related number of comments.

The most frequent comments by subject are summarised below. Annex 7 includes the comments by group of statistics.

Access to information/website design/BIEST

As mentioned above, this matter received the most comments and suggestions. In general terms, users state that the website design is outdated. They consider it is not easy to find information and that a powerful search tool is lacking. The organisation of statistical information in terms of publications rather than by subject is a negative factor for most users, since it makes it difficult to locate the information.

Users would like the information to be structured more intuitively, with a good system of menus and/or interactive trees through which to navigate to find information.

Data downloading format/encoding

The comments received suggest, in general, that the use of CSV format files is not very friendly and that other formats, such as Excel, are preferred. The advisability of facilitating automatic (or automatable) downloads is also pointed out.

Improvement of metadata/notification of changes

Users comment on the need to have more documentation on published data, their definition and methodological or presentation changes. They also ask for such documentation to be more didactic and to enable rapid consultations to be made (without it being necessary to read long documents to learn about a concept).

Geographical disaggregation

Geographical disaggregation (at least at regional government level) is requested by some users.

Statistical information service

Comments are very mixed. Thus, positive comments where users express their satisfaction with the service provided are mixed with negative comments requesting an improvement in the quality of replies.

4 Conclusions

Thanks to the collaboration of users, this first edition of the Banco de España statistics user survey has been clearly successful in the sense that it has enabled strengths and, more importantly, weaknesses susceptible to improvement, to be detected in Banco de España statistics.

Although one of the basic criteria for designing the survey was that it should not take long to complete, the number of questions included was sufficient to obtain very rich results. Also, the possibility offered to users of providing comments and suggestions throughout the survey, another basic criteria considered in the survey's design, made it possible to better ascertain the reasons lying behind the level of satisfaction of users and even to receive suggestions by users to improve the statistics.

Overall, the results of the survey were positive. The users of Banco de España statistics have a high overall level of satisfaction. This is perceived in the confidence they have in the statistics and is extensive to different aspects of statistical production. The assessment of aspects relating to dissemination of information is also mainly positive, although less so than production. This is, therefore, an area where improvement efforts can be made in the short term, without detriment to possible measures to increase perceived quality in production aspects.

Restructuring the Banco de España's statistics website, presenting metadata in a more accessible and clearer manner, providing for easier data downloading and boosting visual data presentation are the lines of improvement currently being considered to make the consultation of Banco de España statistics a more rewarding experience for users.

It should also be noted that there are aspects which, although requested by users in the survey, cannot be satisfied. One of them is to have geographically disaggregated statistics at a lower than national level. The sources available to prepare Banco de España statistics do not generally provide this breakdown, so it is not possible to reach this level for publication purposes. Another aspect is the availability of long time series. In this case, changes in statistical sources or in methodology prevent earlier data from being obtained for certain statistics. Finally, there is also a degree of dissatisfaction with the release lag for some statistics, such as the Survey of Household Finances and the Central Balance Sheet Data Office, but this lag is difficult to reduce given the distinctive nature of these statistics.

Official statistics face the problem of satisfying two types of very distinct demands. On one hand, that of a specialised public which works with data on a customary basis and, on the other, that of a more general public which requires clear and readily available data at specific points in time. Servicing both kinds of public is difficult and efforts have to be made to ensure that the information provided sufficiently covers the needs of these two types of users. In this connection, the survey indicates that non-financial corporations and individuals, as a generally unspecialised public, and financial institutions and press and media, as specialised users, are the groups with a lower level of satisfaction on average, considering all the questions in the survey.

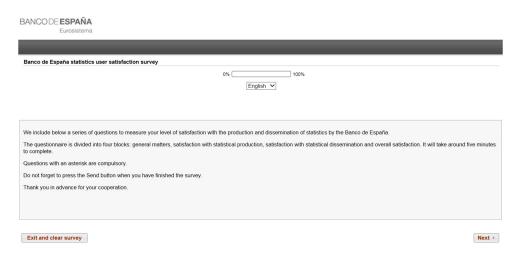

As the interview is conducted individually for each group of statistics in production and dissemination issues, it is much easier to detect factors susceptible to improvement and identify future actions to be taken by the area responsible for such statistics.

The Statistics Department of the Banco de España wishes to remain in contact with its users in order to receive their comments and suggestions with a view to improving the quality of its statistics. For this purpose, institutions and users that so wish can use the following contact form to send us their proposals.

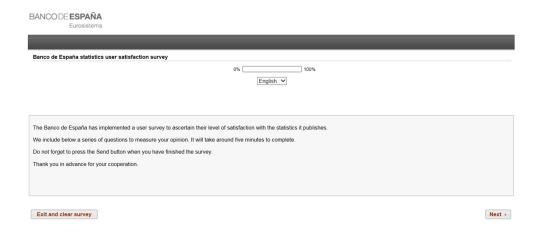

Finally, we wish to thank the users who have participated in this first edition of the survey.

ANNEX 2 LAUNCH OF AND PARTICIPATION IN THE SURVEY

The survey was launched on 18 January 2018 and the response cut-off date was 1 March for guest users and 19 April for users via website. The total responses received from the former numbered 428 (a response rate of 18%) and those from the latter numbered 168, making a total of 596.

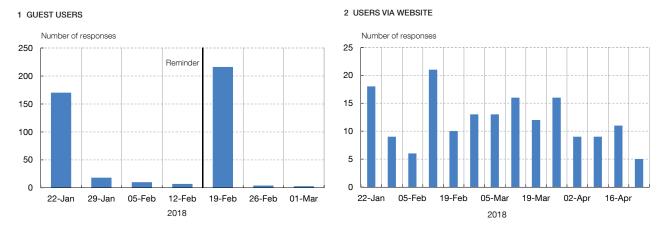

The different response cut-off dates were set in view of the differing response patterns over time. Chart A.2.1, which plots the time variation of the number of new responses for both parts of the survey, shows that the responses from guest users were concentrated in the days following the launch of the survey and in those following the reminder that they were invited to participate in it. In other weeks the participation was very low. Given this behaviour, it was not necessary to prolong the survey period. Sending a second reminder was considered. According to international evidence, a second reminder would have triggered a rise in the number of new responses, albeit to a much lower extent than the first one. Therefore, so as not to bother users, we decided not to send that second reminder and to deem the survey to be closed.

In the case of users via website, the time pattern was relatively stable, with around ten new responses per week. In view of this time profile, we decided to prolong this leg of the survey by one month more than that targeted at guest users, in order to increase the number of responses.

The participation in the survey was generally satisfactory for both guest and other users. Thus, although the response rate of guest users (18%) was appreciably lower than in the equivalent survey of the Spanish National Statistics Institute (INE by its Spanish acronym) (62.5%),¹ it is much higher than that obtained by other statistics institutions such as Eurostat (3%).² In any event, the volume of responses from guest users (428) is very near to that of the INE survey (453).

TIME VARIATION OF NUMBER OF NEW RESPONSES

CHART A2.1

ANNEX 3 STRIPPING OUT RESPONSES

Stripping out guest users

ACQUIESCENCE BIAS

The selection of a significant portion of guest users from among professionals that have, or have had, direct relationships with the Banco de España may give rise to what is known in the opinion survey literature as "acquiescence bias". This bias occurs when some respondents systematically tend to give a positive assessment so as to please, or not displease, the interviewer. This survey does not employ interviewers, but users' responses may be influenced by their more or less close relationship between the respondent and the institution, making the respondent excessively accommodating in his opinions.

These considerations led us to rule out those users that always gave the maximum score in their responses.

CONSISTENCY OF USERS' RESPONSES

As noted above, the survey included specific questions for the various groups of statistics on their production and dissemination, in addition to a question asking for an overall assessment.

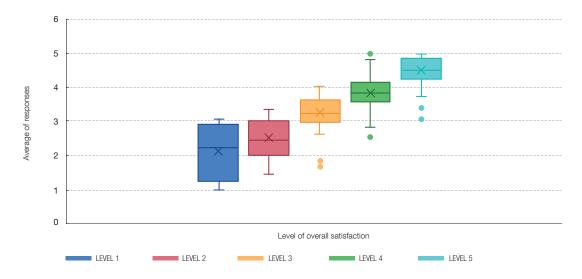

To determine whether the responses of each user are consistent among themselves, we compared the average of each user's responses to the specific questions on production and dissemination for the various groups of statistics with the overall satisfaction level. The criterion used for this type of stripping-out is that when a user has a certain overall satisfaction level, his average level of satisfaction in questions and statistics should be similar. These two levels of satisfaction need not be equal. When deciding on his overall satisfaction, a user may give more weight to some matters than to others and to some statistics more than to others, and may even consider factors not raised in the individual questions.

To make this analysis, the response to the question on overall satisfaction was treated as a control and it was determined whether that response was consistent with the individual responses on production and dissemination of the statistics selected by the respondent. To do this, the possible responses were converted to a numerical scale (Very low = 1, Low = 2, Medium = 3, High=4 and Very high = 5), and the average of each user's specific responses for the statistics in question was calculated. The surveyed users are separated according to the assessment they gave when asked about their overall satisfaction. Thus the first group, denoted "level 1", consists of the users whose answer to the overall satisfaction question was "Very low", while the "level 5" group comprises those who answered "Very high". For each group a box plot was prepared. The result for guest users is shown in Chart A3.1.

First, it can be seen that the responses are generally consistent. The boxes for each level of overall satisfaction do not overlap and the median increases with level of overall satisfaction. The exception is the group whose level of overall satisfaction is "Very low" (level 1), which overlaps with the "Low" satisfaction group. This is due to the small number of observations and the high variability in the "Very low" satisfaction group.

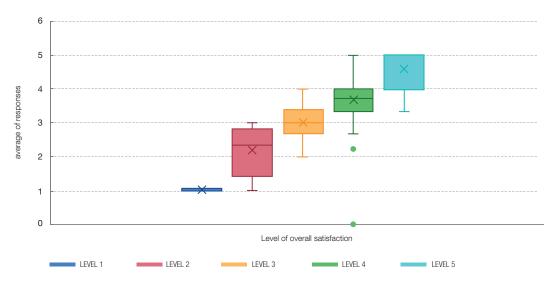

As regards the inconsistency within each surveyed user, there are six users that lie outside the whiskers (two at level 3, i.e. "Medium"; two at level 4, i.e. "High"; and two at level 5, i.e. "Very high").

¹ Charts of this type are interpreted as follows. The box shows the range between the first and third quartile of the averages. The bar inside the box shows the median (second quartile). The "whiskers" or lines extending away from the boxes represent the range delimited by 1.5 times the interquartile range (difference between the third and first quartile) starting from the median. The points beyond the whiskers represent possible anomalous values.

CONSISTENCY OF WEBSITE USERS' RESPONSES WITH OVERALL SATISFACTION

CHART A3.2

SOURCE: Banco de España.

Stripping out users via website

In the case of users via website, we only applied the response consistency criterion, in a similar manner to the procedure employed with guest users (see results in Chart A3.2). In this case it is seen that acquiescence bias is not applicable to this user group as there is no previous direct relationship between the users and the Banco de España and thus no reason for this bias to exist.

As in the case of guest users, there is a general consistency in responses. The average of the responses increases with the level of overall satisfaction and the boxes barely overlap. Regarding individual cases, there are two users outside the whiskers, specifically in the case of satisfaction level 4 ("High").

ANNEX 4 RESPONSE FATIGUE

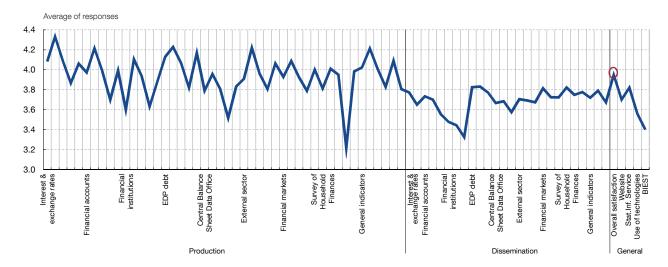

The survey was designed so as not to be burdensome for participants, i.e. they could complete it in a short time, with a view to increasing the response rate. It was also wished to avoid so-called "fatigue bias", which is described in the survey literature and for which some solutions have been proposed. The nature of this bias is that, as the respondent gets towards the end of the survey questions, his interest progressively wanes and his assessments in the final stretch of the survey may be affected (usually in a negative manner) by that lesser interest or fatigue.

To analyse the possible existence of this effect on responses, we obtained an average of guest users' assessments (numbers were assigned to the various satisfaction levels, such that "Very low" is equal to 1 and "Very high" is equal to 5) for each question, and we plotted the course of this average as the questions were progressively asked in the survey. This exercise enables us to represent the responses of an average user who answered all the questions of the survey.

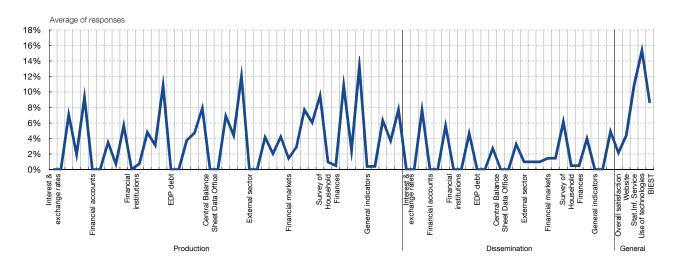

Chart A4.1 shows the results. In the chart, the vertical lines separate the three groups of the survey: questions on production, questions on dissemination and general questions. As can be seen, within each group of questions, no clear trend (negative or positive) is detected. The third group (general questions) is influenced by the fact that the last question asks for an assessment of BIEST. Also apparent is that the average assessment in the second group of questions is lower than that in the first group, which could be attributed to the fatigue effect. However, this does not seem to be the case, and the assessments of dissemination are genuine, representing a worse opinion of dissemination than of statistical production. Supporting this is the question on overall satisfaction (red circle), which shows a rebound, outside the average of the group of questions on dissemination. In conclusion, we do not find any fatigue effect.

AVERAGE OF INDIVIDUAL RESPONSES ACCORDING TO THE ORDER OF THE QUESTIONS IN THE SURVEY

CHART A4.1

¹ These include making the order of questions random.

To complete the aforementioned analysis, we considered the percentage of "DN/NA" responses in the total responses for each question. If the respondent showed fatigue, this percentage would increase as the survey progressed. Chart A4.2 shows that this is not so. However, what is found is that the weight of this type of response is higher in the questions on production that in those on dissemination, possibly due to the greater difficulty in interpreting the questions. The greater weight of "DN/NA" responses in general questions seems to reflect the very nature of the questions, the user not having a clear opinion.

ANNEX 5 MEAN AND VARIANCE EQUALITY TESTS ON THE RESPONSES OF GUEST USERS AND USERS VIA WEBSITE

As noted in Section 3.2 "Survey results", the results reported there are those of all users, i.e. both guest users and users via website. This form of presenting the results involves joining together two populations which may have differing natures, in which case aggregating them could distort the results. Therefore, before aggregating them, we carried out statistical tests to check that there were no significant differences between the distributions of the responses of the two user groups.

A first step before carrying out the tests is to express in numerical form the various degrees of satisfaction reported, using a scale from 1 to 5: a value of 1 for the level of satisfaction "Very low" and 5 for "Very high". Next we calculated the mean and the variance for each user group and for each question common to both of them (it should be kept in mind that users via website were not asked about statistical production). Finally, we carried out the test under the null hypothesis that the means are equal (the results of shown in column 2 of Table A5.1), under the null hypothesis that the variance of the guest users' responses does not exceed that of the users via website (column 3 of Table A5.1) and under the hypothesis that the variance of the website users' responses does not exceed that of the guest users (column 4 of Table A5.1).

Table A5.1 signals with an "*" the cases in which the aforementioned null hypotheses are rejected at the 0.05 level of significance and with "**" those in which they are rejected at the 0.01 level of significance. As can be seen, in the vast majority of cases the null hypotheses are verified and only in six cases is there a significant difference between means or between variances. Therefore, in general terms, aggregating the results of the two samples does not alter the conclusions.

Test of equality of variances Alternative hypothesis: Alternative hypothesis: Test of equality variance of guest users variance of users via of averages exceeds that of users via the website exceeds the website that of guest users General matters Overall satisfaction 1.60 0.80 1.25* Website -0.06 0.82 1.22 Statistical information service -0.54 0.77 1.30* BIEST -1.64 0.75 1.33* 2 Dissemination-related matters 2.1 Location and access Interest and exchange rates 0.10 0.82 1.22 General economic statistics and indicators 1.74 0.85 1.18 Financial institution statistics -0.30 0.62 1,60* External sector statistics 0.73 1.37 1.16 Financial accounts statistics 1.46 0.81 1.23 EDP debt 1.76 1.14 0.88 Central Balance Sheet Data Office statistics 0.34 1.37 0.73 Fin. and securities markets and payment systems 0.62 0.90 1.11 Survey of Household Finances 2.68** 0.79 1.27 2.2 Presentation and clarity Interest and exchange rates -1.02 1.09 0.92 General economic statistics and indicators 1.11 0.87 1.15 Financial institution statistics -0.84 1.34 0.75 External sector statistics -0.05 1.18 0.85 Financial accounts statistics 0.05 1.23 0.81 EDP debt 0.76 1.44 0.69 -0.40 Central Balance Sheet Data Office statistics 1.32 0.76 Fin. and securities markets and payment systems -0.95 1.13 0.89 Survey of Household Finances 0.17 1.16 0.86 2.3 Metadata Interest and exchange rates 0.42 1.04 0.97 General economic statistics and indicators 1.48 0.91 1.10 Financial institution statistics 0.13 1.17 0.85 External sector statistics 0.87 1.12 1.15 Financial accounts statistics 0.20 1.01 0.99 EDP debt 3.06** 1.09 0.92 Central Balance Sheet Data Office statistics 1.15 -0.09 0.87 Fin. and securities markets and payment systems -0.740.97 1.04 1.36 Survey of Household Finances 1.61 0.73

ANNEX 8 COMMENTS ARRANGED BY GROUP OF STATISTICS

USERS' COMMENTS BY GROUP OF STATISTICS

TABLE A8.1

Interest rates and exchange rates
Production
Time series
Dissemination
Improvement of metadata (concepts and methodology)
Publication at different frequencies
Improvement of information location and downloading
Publish data as levels as well as rates
Improvement of BIEST dissemination schedule
Provide data in "Open data" or JSON format
Need for a certification service
Interest rates
Production
Lack of consistency between the Banco de España's data and financial institutions' data
Publish loan interest rate data by firm size
Publish again mortage foreclosure statistics
Publish swap transaction data in gross terms
Supplement Banco de España information with that from the financial institutes of regional governments and their audit watchdogs
Publish pre-2007 interest rates
Dissemination
Publish international comparisons
Exchange rates
Production
Excessive lag in publication of rates not published by the ECB
Increase the number of currencies
Time series
Dissemination
Improve metadata in terms of a better explanation of concepts
Financial accounts
Production
Long lag in publication
Lack of disaggregation of data; little granularity
Discrepancies with Eurostat
Disaggregation of monetary financial institutions
Geographical breakdown
Dissemination
Arrange information in tree form
Improve data download format
Information difficult to locate and extract
International comparison

Improve metadata

Explain differences in

Explain differences in net borrowing/net lending in the financial and non-financial accounts $% \left(1\right) =\left(1\right) \left(1\right) \left($

SOURCE: Banco de España.

NOTE: The most common comments are in bold.

Financial institutions
Production
Time series
Greater detail
Lack of key information such as off-balance-sheet business
Structure poorly adapted to FINREP
Include information from financial stability reports
Geographical breakdown
Breakdown of information by firm size
Hold meetings with analysts to ascertain their needs
Lack of consistency between Banco de España's data and financial institutions' data
Basence of micro data. Absence of financial inclusion reports and inter-bank comparisons
Access to data on bank supervision, bank loans (e.g. CCR)
Absence of automatic downloan of sectorisation file
Significant information has been supressed, e.g. the statistical annex of the Banco de España's Banking Supervision Report
Dissemination
Advance notice of changes (net structure of information and new definitions)
Information difficult to locate and extract
Inform of reasons for removal of data
Improvement of metadata/unclear explanation of items
Improve communication of revisions
Problems caused by change in information structure, lack of detail regarding ratios
Use of unique codes for downloading time series
Inclusion/removal of headings which makes it more difficult to monitor them
The methodological notes of Chapter 4 have been under revision for six months
More efforts devoted to dissemination
Multiple unexplained errata in the past year
EDP Debt
Production
Time series
The Banco de España gives more credibility to data from banks than from general government
More detailed breakdown of consolidation of organisations
Reconsider financial debt insofar as imputations are concerned
It would be usefule to have more detailed breakdowns of statistics
Dissemination
Improve data download format
Information difficult to locate and extract
International comparison
Provide data in "Open data" or JSON format

SOURCE: Banco de España. NOTE: The most common comments are in bold.

Improvement of metada. Explanation of concepts, including basic ones such as EDP

Central Balance Sheet Data Office
Production
Excessive publication lag
Geographical breakdown
Greater disaggregation
More frequent data
Access to microdata
Download of sectoral ratios of non-financial corporation (RSE database) by variable instead of by sector
Dissemination
Improvement of data download format
Information difficult to locate and extract
Notification of availability of new data
External statistics
Production
Time series beyond 2013
Links to BPM5
Geographical breakdown by autonomous region
Greater sectoral breakdown (services, with BPM5 there were more) and geographical breakdown (goods and services), even though the level of reliability is not so high. Greater detail in investment flows, such as DataInvest
Greater breakdown by product and country. Greater breakdown of IIP by country
International comparison
Include ICEX information on characteristics of export firms
Lack of information on external debt rescheduling
Dissemination
Improvement of data download format and structure
Information difficult to locate and extract
Problem in aggregating data due to lack of decimals
More explanatory press releases
Information expressed as annual averages and as percentage of GDP
Publish an annual summary table encompassing all the balance of payments (similar to that in the annual publication)
Frequent changes in codes and overly long codes
Improve metadata: explain concepts
Financial and securities markets and payment systems
Production
Provide statistics not offset
Link CNMV statistics using the same code
Dissemination
Explain how breakdowns are prepared
Metadata: improve explanation of methodology

SOURCE: Banco de España. NOTE: The most common comments are in bold.

Greater emphasis on outreach

urvey of Household Finances	
Production	
Greater geographical breakdown	
Absence of time series	
Tool to carry out the same data matches that are published	
Greater survey frequency	
Long publication lag	
Long lag in access to microdata	
Improvement of instructions and field descriptions	
Greater breakdown in certain financial instruments	
Lack of consistency with the Tax Authorities	
Dissemination	
Metadata: improve the explanation of methodology, provide examples	
Extend the definition of concepts to all those in the survey	
Include interactive tools for selecting information	
There is no "Open data" access; there is no JSON download	
Greater emphasis on outreach	
eneral economic statistics and indicators	
Production	
Provide information on the volume of marginal deposit and lending facilities	
Extend time coverage	
Greater geographical breakdown	
Dissemination	
Problems in locating and extracting data	
Increase the statistics published	
Provide data with different frequency	
Provide at least three decimal places in downloads	
Resume publication of international comparisons	
stand mathodalogical notes	

Extend methodological notes

FASE	Financial Accounts of the Spanish Economy	SSM	Single Supervisory Mechanism
FDI	Foreign direct investment	TFP	Total factor productivity
FROB	Fund for the Orderly Restructuring of the Banking Sector	TLTROs	Targeted longer-tem refinancing operations
FSB	Financial Stability Board	ULCs	Unit labour costs
FSF	Financial Stability Forum	VAT	Value Added Tax
GDI	Gross disposable income	WTO	World Trade Organization

COUNTRIES AND CURRENCIES

In accordance with Community practice, the EU countries are listed using the alphabetical order of the country names in the national languages.

		,
BE	Belgium	EUR (euro)
BG	Bulgaria	BGN (Bulgarian lev)
CZ	Czech Republic	CZK (Czech koruna)
DK	Denmark	DKK (Danish krone)
DE	Germany	EUR (euro)
EE	Estonia	EUR (euro)
IE	Ireland	EUR (euro)
GR	Greece	EUR (euro)
ES	Spain	EUR (euro)
FR	France	EUR (euro)
IT	Italy	EUR (euro)
HR	Croatia	HRK (Croatian kuna)
CY	Cyprus	EUR (euro)
LV	Latvia	EUR (euro)
LT	Lithuania	EUR (euro)
LU	Luxembourg	EUR (euro)
HU	Hungary	HUF (Hungarian forint)
MT	Malta	EUR (euro)
NL	Netherlands	EUR (euro)
AT	Austria	EUR (euro)
PL	Poland	PLN (Polish zloty)
PT	Portugal	EUR (euro)
RO	Romania	RON (New Romanian leu)
SI	Slovenia	EUR (euro)
SK	Slovakia	EUR (euro)
FI	Finland	EUR (euro)
SE	Sweden	SEK (Swedish krona)
UK	United Kingdom	GBP (Pound sterling)
JP	Japan	JPY (Japanese yen)
US	United States	USD (US dollar)

M1	Notes and coins held by the public + sight deposits.
M2	M1 + deposits redeemable at notice of up to three months - deposits with an agreed maturity of up to two years.
M3	M2 + repos + shares in money market funds and money market instruments + debt securities issued with an agreed maturity of up to two years.
Q1, Q4	Calendar quarters.
H1, H2	Calendar half-years.
bn	Billions (10 ⁹).
m	Millions.
bp	Basis points.
pp	Percentage points.
	Not available.
_	Nil, non-existence of the event considered or insignificance of changes when expressed as rates of growth.
0.0	Less than half the final digit shown in the series.

STATISTICAL NOTES PUBLISHED

- 1 STATISTICS AND CENTRAL BALANCE SHEET DEPARTMENT: Registering financial intermediation services on the national accounts as of 2005. (The Spanish original of this publication has the same number.)
- 2 STATISTICS AND CENTRAL BALANCE SHEET DEPARTMENT: Valuation of shares and other equity in the Financial Accounts of the Spanish Economy. (The Spanish original of this publication has the same number.)
- 3 STATISTICS AND CENTRAL BALANCE SHEET DEPARTMENT: Registering Financial Intermediation Services on the National Accounts as of 2005. Addendum. (The Spanish original of this publication has the same number.)
- 4 LUIS GORDO MORA AND JOÃO NOGUEIRA MARTINS: How reliable are the statistics for the Stability and Growth Pact?
- 5 STATISTICS DEPARTMENT: Methodological notes on the Financial Accounts of the Spanish Economy.
- 6 STATISTICS DEPARTMENT: Methodological notes on the Financial Accounts of the Spanish Economy. SEC-2010.
- 7 STATISTICS DEPARTMENT: Holding companies and Head offices within the framework of the SNA 2008 / ESA 2010.
- 8 STATISTICS DEPARTMENT: Presentation of the results of the Banco de España statistics user satisfaction survey.
