## 1 Introduction to the PIAAC Bibliography

---

The present bibliography provides a literature overview for the Programme for the International Assessment of Adult Competencies (PIAAC). PIAAC assesses key cognitive (e.g. literacy and numeracy) and workplace skills of the adult population in over 40 countries. First data was published in 2013 (see OECD, 2013).

The PIAAC bibliography aims to gather the different research undertaken with PIAAC and sums up all contributions including:

- Publications of the theoretical conception of the assessed skill domains
- Publications of research results based on PIAAC data
- The technical conception of the study (as well as follow-up studies)
- Published PIAAC data files.

The review focuses on worldwide contributions in the form of articles, books, working papers, technical reports, and data<sup>1</sup> published in English and in German. Conference presentations were not included in this review. Furthermore, the literature review is compiled chronologically and comprises publications since the conceptualization of PIAAC in 2008. The abstracts of the published contributions were copied from the manuscripts. If no abstract was available, or if the abstract was available only in German, authors were asked for an English abstract. Some abstracts were either written by the editors or translated by professional translators; these cases are noticed.

The literature research for the review is based on several steps:

- Search in the literature databases Education Resources Information Center (ERIC), Web of Sciences, and PsychINFO, using “PIAAC” as search keyword
- Search on the homepage of the Organisation for Economic Co-operation and Development (OECD) that initiated the PIAAC study
- Search in Google (Scholar) and ResearchGate
- Publications by data users that were reported to the Research Data Center PIAAC (RDC PIAAC) at GESIS.

Note that not all contributions could be collected worldwide, only those which were identified in the search procedure described above. Publications that have not been listed can be sent to [fdz-piaac@gesis.org](mailto:fdz-piaac@gesis.org) and will be included in the next version of this bibliography.

It is very important that authors cite the data used in publications about PIAAC. Please record the exact data that was used, for instance Scientific Use File (SUF) / Public Use File (PUF), the name and author(s) of the dataset, and if available, the version as well as the Digital Object Identifier (DOI). This procedure allows other interested readers to find your contributions.

Since the first data release in 2013 the number of publications has constantly increased, the present bibliography comprises 626 publications, 21 technical reports and 72 data sets.

---

<sup>1</sup> We report the most recent version of the data files.

## 2 Publications

---

### 2.1 Publications in 2008

**Title:**

Schleicher, A. (2008). PIAAC: A new strategy for assessing adult competencies. *International Review of Education*, 54(5), 627-650. doi: 10.1007/s11159-008-9105-0

**Abstract:**

At a time when governments face the challenges of maintaining competitiveness in a global economy, it is necessary to have high-quality comparative information regarding the fundamental skills of the adult population. Such information can help governments to evaluate policies and design more effective interventions. This article describes a strategy currently being developed by the OECD for assessing the literacy skills of adults, including familiarity with information and communication technologies and the ability to manage information, construct new knowledge and communicate with others. The work will enhance understanding of the effectiveness of education and training systems in developing basic cognitive skills and key generic work skills.

Available at (open access): <http://dx.doi.org/10.1007/s11159-008-9105-0>

### 2.2 Publications in 2009

**Title:**

Gal, I., Alatorre, S., Close, S., Evans, J., Johansen, L., Maguire, T., Manly, M., & Tout, D. (2009). *PIAAC numeracy: A conceptual framework*. OECD Education Working Paper No. 35. Paris: OECD Publishing. doi: 10.1787/220337421165

**Abstract:**

Governments and other stakeholders have become increasingly interested in assessing the skills of their adult populations in order to monitor how well prepared they are to meet the challenges of the new information world. The current paper provides an overview of the conceptual framework for the assessment of numeracy developed for the OECD's Programme for the International Assessment of Adult Competencies (PIAAC). This builds on the numeracy framework developed for the Adult Literacy and Life Skills Survey (ALL). Numeracy is broadly defined and complemented with a definition of 'numerate behaviour'. Four facets of numerate behaviour are identified and described to guide the development of assessment tasks.

Available at (open access): <http://dx.doi.org/10.1787/220337421165>

**Title:**

Jones, S., Gabrielsen, E., Hagston, J., Linnakylä, P., Megherbi, H., Sabatini, J., Tröster, M., & Vidal-Abarca, E. (2009). *PIAAC literacy: A conceptual framework*. OECD Education Working Paper No. 34. Paris: OECD Publishing. doi: 10.1787/220348414075

**Abstract:**

Governments and other stakeholders are increasingly interested in assessing the skills of their adult populations in order to monitor how well prepared they are for the challenges of the modern knowledge-based society. The current paper provides an overview of the conceptual framework

guiding the development of the assessment of literacy in the OECD's Programme for the International Assessment of Adult Competencies (PIAAC). It builds upon earlier conceptions of literacy from the International Adult Literacy Survey (IALS) in the 1990s and the Adult Literacy and Life Skills Survey (ALL) in 2003 and 2006 to facilitate an appropriate assessment of the broad range of literacy skills required for the 21st century. The framework broadens the definition of literacy to make it relevant to the information age, in particular, by including the skills of reading in digital environments.

Available at (open access): <http://dx.doi.org/10.1787/220348414075>

**Title:**

Rouet, J.-F., Bétrancourt, M., Britt, M. A., Bromme, R., Graesser, A. C., Kulikowich, J. M., Leu, D. J., Ueno, N., & Oostendorp, H. (2009). *PIAAC problem solving in technology-rich environments: A conceptual framework*. OECD Education Working Paper No. 36. Paris: OECD Publishing. doi: 10.1787/220262483674

**Abstract:**

Governments and other stakeholders have become increasingly interested in assessing the skills of their adult populations for the purposes of monitoring how well prepared they are for the challenges of the new information world. The current paper provides an overview of the conceptual framework developed for the assessment of problem solving in technology-rich environments for the OECD's Programme for the International Assessment of Adult Competencies (PIAAC). This covers the specific class of problems that people encounter when using information and communication technologies. These include problems where the existence of the problem is a consequence of the availability of new technologies, where the solution requires the use of computer-based applications or where the problem relates to the management or use of information technologies.

Available at (open access): <http://dx.doi.org/10.1787/220262483674>

**Title:**

Sabatini, J. P., & Bruce, K. M. (2009). *PIAAC reading components: A conceptual framework*. OECD Education Working Paper No. 33. Paris: OECD Publishing. doi: 10.1787/220367414132

**Abstract:**

Governments and other stakeholders have become increasingly interested in assessing the skills of their adult populations in order to examine how well prepared they are to meet the challenges of the modern knowledge-based society. The current paper provides a conceptual framework for the assessment of reading component skills in the OECD's Programme for the International Assessment of Adult Competencies (PIAAC). The assessment of component skills is intended to provide a greater level of information about the skills of individuals with low levels of literacy proficiency than has been available from previous international assessments. The 'component skills' identified for the assessment are vocabulary knowledge, sentence processing and passage comprehension.

Available at (open access): <http://dx.doi.org/10.1787/220367414132>

## 2.3 Publications in 2010

### Title:

Levy, F. (2010). *How technology changes demands for human skills*. OECD Education Working Paper No. 45. Paris: OECD Publishing. doi: 10.1787/5kmhds6czqzq-en

### Abstract:

This paper places the competencies to be measured by the OECD's Programme for the International Assessment of Adult Competencies (PIAAC) in the context of the technological developments which are reshaping the nature of the workplace and work in the 21st century. The largest technological force currently shaping work is the computer. Computers are faster and less expensive than people in performing some workplace tasks and much weaker than people in performing other tasks. On the basis of an understanding of the kinds of work computers do well, it is possible to describe the work that will remain for people in the future, the skills that work requires and the way that computers can assist people in performing that work. The paper argues that a technology-rich workplace requires foundational skills including numeracy and literacy (both to be tested in PIAAC), advanced problem-solving skills or Expert Thinking (similar to the construct of Problem Solving in Technology-Rich Environments to be tested in PIAAC) and advanced communication skills or Complex Communication (not being tested in PIAAC).

Available at (open access): <https://doi.org/10.1787/5kmhds6czqzq-en>

## 2.4 Publications in 2011

### Title:

Desjardins, R., & Rubenson, K. (2011). *An analysis of skill mismatch using direct measures of skills*. OECD Education Working Papers No. 63. Paris: OECD Publishing. doi: 10.1787/5kg3nh9h52g5-en

### Abstract:

The focus of this study is on the potential causes of skill mismatch, the extent of skill mismatch, the sociodemographic make-up of skill mismatch, and the consequences of skill mismatch in terms of earnings as well as employer sponsored adult education/training. A distinction is made between skill mismatch and education mismatch. The analysis is based on the 2003-2007 Adult Literacy and Lifeskills Survey (ALLS) – a dataset similar to the one that is forthcoming from the Programme for International Assessment of Adult Competencies (PIAAC) in 2013. These studies contain direct measures of key foundation skills as well as measures of the use of certain generic skills at work which allow for a direct measure of skill mismatch. The analysis points to the complex ways in which mismatch is generated and the need for an accurate and up to date measure of mismatch, one that reflects the possibilities for skill gain and skill loss over the lifespan, and reflects differences in the quality of qualifications. Two key findings stand out. First, including supply and demand characteristics in an earnings function reveals that labour demand characteristics are more important than labour supply characteristics in explaining earnings differentials. In other words, skills matter for earnings but only if they are required by the job. This has direct implications for understanding better the causes of mismatch on earnings. Second, the skill content of jobs seems to be an even stronger determinant of participation in employer supported adult education/training than educational attainment or literacy proficiency. The influence of demand characteristics thus tends to outweigh the influence of supply characteristics when employers make the decision to support adult education/training. Addressing mismatch thus requires a careful consideration of both the demand and supply sides of the labour market, so as to understand

better the variety of factors which may have a negative impact on the effectiveness of skill formation, skill maintenance, and also skill us.

**Title:**

Upsing, B., Gissler, G., Goldhammer, F., Rölke, H., & Ferrari, A. (2011). Localisation in international large-scale assessments of competencies: Challenges and solutions. Localisation focus. *The International Journal of Localisation*, 10(1), 44-57.

**Abstract:**

International comparative studies like the Programme for International Student Assessment (PISA) pose special challenges to the localisation of the test content. To allow for comparison between countries, the assessments have to be comparable with respect to measurement properties. Therefore, internationalisation and localisation are crucial steps to guarantee test equivalence across countries. The localisation of test items is different from the localisation of web-based contents or software as the test content has to be authentic within a country while the test's measurement properties have to be comparable across countries. Using the PIAAC study (Programme for the Assessment of Adult Competencies) as an example, this paper describes all stages of the localisation process for an international large-scale assessment. The process ranges from the development of source items to translation, adaptation of layout issues and meta-data adaptations. The paper concludes with a discussion of lessons learned and open questions.

Available at (open access): [https://www.localisation.ie/sites/default/files/publications/Vol10\\_1\\_UpsingGissleretAl.pdf](https://www.localisation.ie/sites/default/files/publications/Vol10_1_UpsingGissleretAl.pdf)

## 2.5 Publications in 2012

**Title:**

Clair, R. S. (2012). The limits of levels: Understanding the international adult literacy surveys (IALS). *International Review of Education*, 58(6), 759-776. doi: 10.1007/s11159-013-9330-z

**Abstract:**

The International Adult Literacy Survey (IALS), an initiative of the Organization for Economic Cooperation and Development (OECD), was carried out in the early to mid-1990s across more than 20 countries. It was followed in the early years of the 21st century by the Adult Literacy and Life Skills (ALL) survey and the Programme for the International Assessment of Adult Competencies (PIAAC, currently in data analysis). This article reviews the philosophical basis, theoretical underpinnings and data analysis of the original and subsequent IALS-based surveys. The purpose is to inform users of the survey data of what the surveys can, and cannot, provide. The author argues that the key use of these surveys is providing insights into population-level distribution of one form of literacy, namely a particular kind of text consumption in a developed society. He also points out the challenges regarding the use of the survey series for making international comparisons, for documenting change over time and for representing broad models of literacy. The tendency to use the survey findings for these uses is considered by the author as a misuse of the data, which leaves the potential of the IALS surveys to provide insights into the effectiveness and equity of different educational systems largely untapped.

Available at (open access): <https://doi.org/10.1007/s11159-013-9330-z>

**Title:**

Desjardins, R., & Warnke, A. (2012). *Ageing and skills: A review and analysis of skill gain and skill loss over the lifespan and over time*. OECD Education Working Papers No. 72. Paris: OECD Publishing. doi: 10.1787/5k9csvgw87ckh-en

**Abstract:**

The relationship between ageing and skills is becoming an important policy issue, not least in the context of population ageing. Data from the Programme for the International Assessment of Adult Competencies (PIAAC) will potentially add considerably to the understanding of the relationship between ageing and foundation skills. In particular, the fact that data from the 1994-1998 International Adult Literacy Survey (IALS) and the 2003-2007 Adult Literacy and Lifeskills Survey (ALL) will be linked with PIAAC offers a unique opportunity to examine trends over time at the cohort level for a wide range of countries. Specifically, repeated measures will enable an analysis of whether there is skill gain and skill loss over the lifespan of cohorts and overtime between cohorts. This is especially important because age-skill profiles observed on the basis of a single cross-section are difficult to interpret. With this as a backdrop, this paper has sought to provide an overview of what is known about age-skill profiles and to conduct an analysis that demonstrates how trend data based on repeated cross-sectional observations of direct measures of skill at the cohort level can be used to estimate skill gain and skill loss over the lifespan and over time.

Available at (open access): <https://doi.org/10.1787/5k9csvgw87ckh-en>

**Title:**

Organisation for Economic Cooperation and Development (OECD) (2012). *Literacy, numeracy and problem solving in technology-rich environments: Framework for the OECD Survey of Adult Skills*. OECD Publishing Paris: OECD. doi: 10.1787/9789264128859-en

**Abstract:**

A basic level of literacy and numeracy is essential for full participation in modern societies. While very few people in most of the advanced countries could be regarded as illiterate or innumerate, recent studies have shown that there are, in fact, significant numbers of people with poor skills, and that low levels of skills are associated with lower wages and greater chances of unemployment and disengagement from the labour market. At the same time, technological changes, particularly the increasing presence of information and communication technologies in all areas of life, have led to a growing demand for higher-level cognitive skills that involve understanding, interpreting, analysing and communicating complex information. In this context, policy makers need the most comprehensive and up-to-date information if they want to ensure that the supply of skills in the labour force matches labour-market demand. The Programme for the International Assessment of Adult Competencies (PIAAC), an international assessment of adult skills managed by the OECD, will be central in providing that information. Implemented by 25 countries in Europe, the Americas and Asia, PIAAC is compiling one of the richest sources of data regarding the skills that adults use in their work, home and communities, and related information, including family background, education, employment, income, civic participation and health. Results from the data, which are being collected from August 2011 to March 2012, will be Available at the end of 2013. This report maps the development of the Programme, from determining what should be measured, to defining the meaning of PIAAC's three core domains, "literacy", "numeracy" and "problem solving in technology-rich environments", to designing assessment tasks and determining how those tasks will be interpreted. It summarises the draft frameworks, developed by dedicated experts, for each of the assessment domains, and includes examples of the items and stimuli used to measure proficiency in the three domains. In essence, it provides an overview and a look at the underpinnings of PIAAC.

Available at (open access): <https://doi.org/10.1787/9789264128859-en>

## 2.6 Publications in 2013

### Title:

Allen, J., Levels, M., & Velden, R. (2013). *Skill mismatch and use in developed countries: Evidence from the PIAAC study*. ROA Research Memorandum No. 2013/17. Maastricht: Maastricht University, Research Centre for Education and the Labour Market (ROA). Retrieved October 27, 2017, from <https://cris.maastrichtuniversity.nl/portal/files/1544094/content>

### Abstract:

In this paper we develop and test a new set of measures of skill mismatches, based on data on skill levels and skill use in the domains of literacy and numeracy from the PIAAC project. The measures we develop represent the extent of skill use relative to ones own skill level. We test the measures by examining their relation to a number of labour market outcomes. We subsequently examine how mismatches are distributed across and within a large number of countries, and use our results to reflect on possible causes and consequences of mismatches. We find that, in general, higher skill utilization is always beneficial in terms of productivity and job satisfaction, and that overutilization of skills therefore points more towards a fuller use of the available human capital, rather than to a serious skill shortage. We find an asymmetry in returns between literacy and numeracy skills although numeracy skill level appears to pay higher dividends than literacy skill level, shifts in skill utilization within skill levels have greater consequences for literacy than for numeracy. The distribution of mismatches across and within countries is broadly consistent with the expectation that skills will be used more fully under competitive market conditions with few institutional or organizational barriers. Finally, skill mismatches are only quite weakly related to educational mismatches, reflecting the heterogeneity in skill supply and demand that cross-cuts the dividing lines set by formally defined qualification levels and job titles.

### Title:

Central Statistics Office (2013). *PIAAC 2012. Survey results for Ireland from the OECD's Programme for the International Assessment of Adult Competencies*. Dublin: Stationery Office. Retrieved October 27, 2017, from <http://www.oecd.org/skills/piaac/Ireland.pdf>

### Abstract:

This report presents the results for Ireland of the OECD's Survey of Adult Skills, also known as the Programme for the International Assessment of Adult Competencies or PIAAC. The survey was carried out in Ireland between August 2011 and March 2012 by the Central Statistics Office on behalf of the Department of Education and Skills.

Available at (open access): <http://www.oecd.org/skills/piaac/Ireland.pdf>

### Title:

Friebe, J., Gebrande, J., & Schmidt-Hertha, B. (2013). What research will show us and what we need to understand about Competencies in Later Life. *Adult Education and Development*, 80, 86-90.

### Abstract:

The International PIAAC study has collected data on competencies of adults in three domains in 25 countries, in many of them for the first time ever. The article provides an overview of central terms,

main aims and the methodological approach of this OECD study. It also discusses its potentials and limitations. One limitation is the focus on the labour force, excluding adults older than 65 years, a fast growing part of many populations in times of demographic change. To remedy this limitation, an extensional study in Germany was carried out with 1339 adults in the age group 66–80, using the PIAAC instruments and complementing them with additional qualitative inquiries.

**Title:**

Goodman, M., Finnegan, R., Mohadjer, L., Krenzke, T., & Hogan, J. (2013). *Literacy, numeracy, and problem solving in technology-rich environments among US adults: Results from the program for the international assessment of adult competencies 2012: first look*. [NCES 2014-008]. Washington, DC: National Center for Education Statistics. Retrieved October 27, 2017, from <https://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=2014008>

**Abstract:**

This report presents results of the Program for the International Assessment of Adult Competencies (PIAAC). Results are reported for a representative sample of adults in the United States age 16 to 65 and are compared to an international average of adults in countries/regions that participated in the PIAAC 2012 assessment. The report presents average score results for three separate scales: literacy, numeracy, and problem solving in technology-rich environments and percentages of adults performing at different proficiency levels for each scale. Literacy and numeracy results are reported at Below Level 1, Level 1, Level 2, Level 3, and Level 4/5; problem solving in technology-rich environments is reported at Below Level 1, Level 1, Level 2, and Level 3. The report includes results for groups of adults as defined by various demographic characteristics (e.g. gender, age, race/ethnicity, and level of educational attainment) and level of skill use in and outside of work. Overall results in literacy and numeracy are compared to results from previous international assessments.

Available at (open access): <https://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=2014008>

**Title:**

Klaukien, A., Ackermann, D., Helmschrott, S., Rammstedt, B., Solga, H., & Wößmann, L. (2013). Grundlegende Kompetenzen auf dem Arbeitsmarkt [Basic skills in the labour market]. In B. Rammstedt (Eds.), *Grundlegende Kompetenzen Erwachsener im internationalen Vergleich. Ergebnisse von PIAAC 2012 [Adults basic skills in international comparison: Results of PIAAC 2012]* (pp. 127-166). Münster: Waxmann.

**Abstract:**

The Programme for the International Assessment of Adult Competencies, PIAAC, aims at producing high-quality data. This chapter summarizes the core features of the international and national design under which the study was conducted in order to reach this goal. The international PIAAC consortium elaborated a set of comprehensive standards and guidelines and by that provided a framework of best practices in survey methodology. Participating countries had to adhere to these standards and were supposed to implement them given their national circumstances. In the first sections of this chapter the survey instruments, the survey design as well as scaling and the estimation of plausible values at the international level are briefly described. Subsequently, information is provided on sampling and data collection in Germany. A total of 5 465 individuals participated in PIAAC Germany, which corresponds to a response rate of 55% that exceeds the international minimum response rate of 50%. Survey weighting was implemented to minimize the total

survey error and the potential for bias. Nonresponse bias analyses were conducted to further ensure quality assurance.

**Title:**

Maehler, D. B., Massing, N., Helmschrott, S., Rammstedt, B., Staudinger, U. M., & Wolf, C. (2013). Grundlegende Kompetenzen in verschiedenen Bevölkerungsgruppen [Basic skills of different population groups]. In B. Rammstedt (Eds.), *Grundlegende Kompetenzen Erwachsener im internationalen Vergleich. Ergebnisse von PIAAC 2012 [Adults basic skills in international comparison: Results of PIAAC 2012]* (pp. 77-126). Münster: Waxmann.

**Abstract:**

This chapter of the German PIAAC report focuses on differences in literacy and numeracy between population subgroups across countries. Thereby skill differences related to birth cohorts, gender, educational attainment as well as migration background were analyzed. The results show that in all participating countries, the skills are for instance highly correlated with formal education. In most countries, there are considerable differences in proficiency between people with and without an immigrant background or between people from different birth cohorts. However, all of these differences decrease substantially when the influence of other factors – such as educational attainment in the case of birth cohorts – is taken into account.

**Title:**

Massing, N., Ackermann, D., Martin, S., Zabal, A., & Rammstedt, B. (2013). Controlling interviewers' work in PIAAC - The Programme for the International Assessment of Adult Competencies. In P. Winker, N. Menold, & R. Porst (Eds.), *Interviewers' deviations in surveys. Impact, reasons, detection and prevention* (pp. 117-130). Frankfurt am Main: Peter Lang. doi: 10.3726/978-3-653-02596-5

**Abstract:**

PIAAC is an international comparative survey initiated by the OECD (Organization for Economic Cooperation and Development). Its goal is the assessment of adult skills and competencies to develop an empirically-based foundation for political interventions. PIAAC is a cross-sectional survey that is being conducted in 25 countries from all over the world. To ensure that the survey data is comparable across countries, the International Consortium of PIAAC has defined specific and extensive quality standards. Each participating country had to comply with these standards and adapt them to the national context as quality control mechanisms. In this chapter, the international quality standards related to interviewer control and their implementation in Germany will be presented. In addition, we will describe the interviewer trainings conducted in Germany and discuss the potential of such trainings in preventing interview falsification.

**Title:**

Organisation for Economic Cooperation and Development (OECD) (2013). *Time for the U.S. to re-skill? What the Survey of Adult Skills says*. Paris: OECD Publishing. doi: 10.1787/9789264204904-en

**Abstract:**

The 'basic skills' of literacy and numeracy are among the most fundamental attributes of human beings and their civilization, lying at the root of our capacity to communicate and live and work

together, to develop and share knowledge, science and culture. Their contribution to workforce skills have increasingly been recognized as critical to economic success, while evidence on gaps in adult basic skills and the link with economic and social outcomes has also been growing, both at national and international level (e.g. International Survey of Adult Skills of 1994-98 and Adult Literacy and Life Skills Survey of 2003-2007). Most tellingly, there has been a belated realization that despite universal basic education in advanced countries, some adults have slipped through the net, leaving them with very weak literacy and numeracy. All of these factors underline the importance of the OECD's new international Survey of Adult Skills. This report on skills in the US draws out the policy implications of the Survey for the US, while also making use of some additional data collected for the Survey on the US alone. The study does not directly evaluate relevant US policies and programs – such as schooling and adult education. Instead it identifies in the results of the Survey some key lessons about the strategic objectives and directions which should form a frame for policy development in the US, including policy on adult learning and schooling.

Organisation for Economic Cooperation and Development (OECD) (2013). *OECD skills outlook 2013: First results from the Survey of Adult Skills*. Paris: OECD Economics Department. doi: 10.1787/9789264204256-en

**Abstract:**

This first OECD Skills Outlook presents the initial results of the Survey of Adult Skills (PIAAC), which evaluates the skills of adults in 22 OECD member countries and two partner countries. The PIAAC survey was designed to provide insights into the availability of some key skills and how they are used at work and at home through the direct assessment of key information processing skills: literacy, numeracy and problem-solving in technology-rich environments. The book examines the social and economic context, the supply of key information processing skills, who has these skills at what level, the supply of and demand for these skills in the labour market, the acquisition and maintenance of skills over a lifetime, and how proficiency in these skills translates into better economic and social outcomes.

**Title:**

Rammstedt, B. (2013). *Grundlegende Kompetenzen Erwachsener im internationalen Vergleich: Ergebnisse von PIAAC 2012* [Adults basic skills in international comparison: Results of PIAAC 2012]. Münster: Waxmann.

**Abstract:**

PIAAC, the OECD Programme for the International Assessment of Adult Competencies, assesses how well prepared adults in the various countries are for the challenges of the knowledge society. To this end, key basic skills of the population in over 20 countries worldwide were measured and compared. The skills measured were literacy, numeracy, and problem solving in technology-rich environments. PIAAC furnishes information on the extent to which the adult populations differ in terms of these basic skills and on the factors that determine their acquisition and maintenance. In addition, it assesses the impact of these skills on social, and especially on economic, participation. This allows conclusions to be drawn about the quality of education systems and the extent to which the basic skills are used on the labor market. The results thus provide policy makers and educational practitioners with an empirically sound basis on which to identify need for change and develop appropriate support measures. This book presents and discusses in international comparison the proficiency scores that adults in Germany achieved in the three basic skills and the extent to which proficiency in these skills differs across educational groups and generations, for example. An examination of the associations between the basic skills and key labor market characteristics (e.g., participation in and the demands of the labor market) and between the basic skills and income rounds of the report. In Germany, PIAAC was commissioned by the Federal Ministry for Education and Research (BMBF) with the participation of the Federal Ministry of Labor and Social Affairs (BMAS). GESIS – Leibniz Institute for the Social Sciences was responsible for conducting the study. [Translated on behalf of editors]

Münster: Waxmann.

**Abstract:**

The Programme for the International Assessment of Adult Competencies (PIAAC) is an initiative of the Organisation for Economic Co-operation and Development (OECD). This introductory chapter provides an overview of central features and innovative aspects of the first round of PIAAC in which 24 countries – including Germany – participated. It thus sets the stage for the reporting of the PIAAC results from a German national perspective in the subsequent chapters of the book. The key adult competences literacy, numeracy, and problem solving in technology-rich environments were measured using state of the art design and methodology, with exacting standards and guidelines to achieve comparability between countries and data sets with the highest possible quality. The organizational structure of PIAAC at an international and national level is also described.

Schmidt-Hertha, B., & Friebe, J. (2013). Activities and barriers to education for elderly people. *Journal of Contemporary Educational Studies*, 64(1), 10-26.

**Abstract:**

Adult education at higher age can play an important role in the preservation of autonomy and in the encouragement of social participation in later life. Hence, from both an individual and societal perspective, it is important to promote the educational activities of the elderly. Active elderly people with positive perceptions of self and ageing maintain their mental and physical fitness levels, participate in community associations and politics, and engage in intergenerational dialogue. Data from a recent study clearly show the interrelationship of individual self-perception and the perception of ageing and point to the relevance of both concepts for learning and participating in educational activities. As people age, they participate less and less in further education. This is due not only to individual learning habits, but also to the lack of learning opportunities in different regions and residential areas. In districts that are primarily comprised of people with low standards of

living and low education and/or migration backgrounds, there is a lack of sufficient educational structures, which hinders participation in adult education programs. Qualitative interviews with older adults in different districts show that social environment, social embeddedness, and individual perspectives of one's own learning abilities affect learning possibilities and learning readiness.

Statistics Canada (2013). *Skills in Canada: First results from the Programme for the International Assessment of Adult Competencies (PIAAC)*. Ottawa: Minister of Industry. Retrieved October 27, 2017, from <http://www.statcan.gc.ca/pub/89-555-x/89-555-x2013001-eng.pdf>

**Abstract:**

This report presents the first results of the Programme for the International Assessment of Adult Competencies (PIAAC), an initiative of OECD. PIAAC provides internationally comparable measures of three skills that are essential to processing information: literacy, numeracy, and problem solving in technology-rich environments (referred to as PS-TRE). The report provides information about the literacy, numeracy, and PS-TRE skills for the Canadian population aged 16 to 65. It provides results for Canada as a whole, as well as for all the provinces and territories. In addition, it looks at the relationships between skills proficiency and a range of socio-demographic characteristics (e.g. age, gender, level of education) across the entire Canadian population. It also reports on first results on the literacy, numeracy, and PS-TRE skills of Aboriginal populations, immigrants, and official-language minority communities.

Zabal, A., Martin, S., Klaukien, A., Rammstedt, B., Baumert, J., & Klieme, E. (2013). Grundlegende Kompetenzen der erwachsenen Bevölkerung in Deutschland im internationalen Vergleich [Adults basic skills in Germany and in international comparison]. In B. Rammstedt (Eds.), *Grundlegende Kompetenzen Erwachsener im internationalen Vergleich – Ergebnisse von PIAAC 2012 [Adults basic skills in international comparison: Results of PIAAC 2012]* (pp. 31-76). Münster: Waxmann.

**Abstract:**

The Programme for the International Assessment of Adult Competencies (PIAAC) assesses three key competence domains: literacy, numeracy, and problem-solving in technology new environ-

ments. This chapter presents the main results for countries participating in the first round of PIAAC separately for each domain with a focus on the German results. First, the frameworks developed by international expert groups for each of the competence domains are introduced; these frameworks define the central constructs, the cognitive processes involved, and provide a rationale for the operationalizations. The measurement instruments are illustrated (including sample items), and an explanation and description of the resulting proficiency scales (a separate scale for each domain) is provided. This includes score-point ranges and descriptions of each proficiency level. Second, the distribution of the adult population (between 15 and 65 years of age) over the different proficiency levels and the country means and variation of proficiency scores are reported. Results for German adult population are compared to those of the other participating countries and the OECD average. To conclude, the relationship between PIAAC and previous international surveys of adult competences and PISA is addressed.

## 2.7 Publications in 2014

### Title:

Ackermann-Piek, D., & Massing, N. (2014). Interviewer behavior and interviewer characteristics in PIAAC Germany. *methods, data, analyses*, 8(2), 199-222. doi: 10.12758/mda.2014.008

### Abstract:

Interviewers are the first in line when it comes to data collection. Therefore, it is important that they perform their tasks diligently, so that the data they collect are comparable and that errors are minimized. This paper analyzes how interviewers conducted interviews for the Programme for the International Assessment of Adult Competencies (PIAAC) and which kinds of mistakes they made. We approached these questions with audio interview recordings collected during the fieldwork of PIAAC in Germany (carried out in 2011/ 2012), as well as with an interviewer survey conducted with the German PIAAC interviewers. First, we introduce the data and the coding scheme used to evaluate interviewers' behavior with audio recordings. Subsequently, we describe the interviewers' actual behavior with regard to standardized interviewing techniques and investigate whether interviewer characteristics are associated with data quality. Our results demonstrate that interviewers do deviate from the expected behavior in all the aspects we examined. However, we identified only few associations with interviewers' background characteristics.

### Title:

Autorengruppe Bildungsberichterstattung (2014). *Bildung in Deutschland 2014. Ein indikatorengestützter Bericht mit einer Analyse zur Bildung von Menschen mit Behinderungen [Education in Germany 2014. An indicator-based report including an analysis of the situation of people with special educational needs and disabilities]*. Bielefeld: W. Bertelsmann Verlag. doi: 10.3278/6001820dw

### Abstract:

Like its predecessors, the National Education Report 2014 documents the state of the education system across all its different areas, showing its development over the past years and stating the current challenges. The 2014 report has a focus on the education of people with disabilities and looks at the fundamentals, facts, and backgrounds of the current debate in society and education policy. Before examining the results produced with this in-depth analysis, the report summarizes the key findings concerning the overarching developments and constellations of the education

system in terms of the following questions: What changes have taken place in the fundamental societal conditions for education in Germany? What developments can be observed regarding the sources provided for education (staff, materials, equipment, financial)? What trends are discernible in the area of education processes? What statements can be made regarding education results and outcomes? The data-based format of the national education report does not lend itself directly to deriving recommendations for action for political or educational measures. However, the findings can help to recognize where action is needed for certain groups and for certain areas of the education system. In the light of this, the key challenges identified by the authors are described at the end of this section.

**Title:**

Bonfanti, S., & Xenogiani, T. (2014). Migrants' skills: Use, mismatch and labour market outcomes – a first exploration of the International Survey of Adult Skills (PIAAC). In Organisation for Economic Cooperation and Development (OECD) (Eds.), *Matching economic migration with labour market needs* (pp. 249-312). Paris: OECD Publishing. doi: 10.1787/9789264216501-11-en

**Abstract:**

The purpose of this chapter is to explore the newly available Survey of Adult Skills (PIAAC) to provide a detailed picture of migrants; literacy and numeracy skills and how they compare with those of natives, and how they are utilised and valued in the labour market. The chapter provides a description of the Survey of Adult Skills and the differences between migrants and natives in terms of their literacy and numeracy proficiency levels. A discussion follows on the extent to which language and foreign qualifications explain part of such differences. Moreover, the chapter analyses the labour market outcomes (employment, incidence of overqualification and wages) of migrants relative to natives and discusses how these differ across migrant groups as well as the role played by literacy proficiency and other relevant factors. The analysis of wages pays special attention to the returns to schooling, literacy and numeracy proficiency as well to professional experience, distinguishing between the experience acquired abroad and that acquired in the host country. The chapter concludes by summarising the main findings and their relevance for policy and makes proposals for future work.

**Title:**

Cabrales, A., Dolado, J., & Mora, R. (2014). *Dual labour markets and (lack of) on-the-job training: PIAAC evidence from Spain and other EU countries*. CEPR Discussion Paper No. DP10246. Retrieved January 25, 2018, from <https://ssrn.com/abstract=2526359>

**Abstract:**

Using the Spanish micro data from the Programme for the International Assessment of Adult Competencies (PIAAC), we first document how the excessive gap in employment protection between indefinite and temporary workers leads to large differentials in on-the-job training (OTJ) against the latter. Next, we find that the lower specific training received by temporary workers is correlated with lower literacy and numeracy scores achieved in the PIAAC study. Finally, we provide further PIAAC cross-country evidence showing that OJT gaps are quite lower in those European labour markets where dualism is less entrenched than in those where it is more extended.

**Title:**

Cingano, F. (2014). *Trends in income inequality and its impact on economic growth*. OECD Social, Employment and Migration Working Papers No. 163. Paris: OECD Publishing. doi: 10.1787/5jxjncw xv6j-en

**Abstract:**

In most OECD countries, the gap between rich and poor is at its highest level since 30 years. Today, the richest 10 per cent of the population in the OECD area earn 9.5 times the income of the poorest 10 per cent; in the 1980s this ratio stood at 7:1 and has been rising continuously ever since. However, the rise in overall income inequality is not (only) about surging top income shares: often, incomes at the bottom grew much slower during the prosperous years and fell during downturns, putting relative (and in some countries, absolute) income poverty on the radar of policy concerns. This paper explores whether such developments may have an impact on economic performance. Drawing on harmonised data covering the OECD countries over the past 30 years, the econometric analysis suggests that income inequality has a negative and statistically significant impact on subsequent growth. In particular, what matters most is the gap between low income households and the rest of the population. In contrast, no evidence is found that those with high incomes pulling away from the rest of the population harms growth. The paper also evaluates the “human capital accumulation theory” finding evidence for human capital as a channel through which inequality may affect growth. Analysis based on micro data from the Adult Skills Survey (PIAAC) shows that increased income disparities depress skills development among individuals with poorer parental education background, both in terms of the quantity of education attained (e.g. years of schooling), and in terms of its quality (i.e. skill proficiency). Educational outcomes of individuals from richer backgrounds, however, are not affected by inequality. It follows that policies to reduce income inequalities should not only be pursued to improve social outcomes but also to sustain long-term growth. Redistribution policies via taxes and transfers are a key tool to ensure the benefits of growth are more broadly distributed and the results suggest they need not be expected to undermine growth. But it is also important to promote equality of opportunity in access to and quality of education. This implies a focus on families with children and youths – as this is when decisions about human capital accumulation are made – promoting employment for disadvantaged groups through active labour market policies, childcare supports and in-work benefits.

**Title:**

Dinis da Costa, P., Rodrigues, M., Vera-Toscano, E., & Weber, A. (2014). *Education, adult skills and social outcomes: Empirical evidence from the survey on adult skills (PIAAC 2013)*. Luxembourg: Publications Office of the European Union. doi: 10.2788/66192

**Abstract:**

It has widely been acknowledged that education is a major source of economic prosperity and social well-being. Education is not only an important factor in the productivity and innovative capacity of an economy, but is also a prerequisite for social and cultural changes in patterns of consumption and leisure behaviour to achieve a sustainable lifestyle. It puts people in a position to take well-informed decisions about the future, to assume responsibility for these decisions and to judge how their personal behaviour will affect future generations. Thus, we are then well aware that education gives access to knowledge that helps individuals and society to be more stable and resilient in times of change. These social returns can take the form of “market outcomes” such as productivity or earnings and “non-market outcomes” such as health, civic participation and more generally social capital. Deeper understanding of the contribution of education to the provision of these social outcomes is a desirable goal. While the educational system is the primary agent for the acquisition of such knowledge, learning may also take place in the family, the workplace and among our social acquaintances all through-out our live. Nowadays, constant changes taking place in society encourage individuals that besides grasping occupation-specific skills they must also stock some other various information processing skills to help them cope with this rapid changing environment, especially in the labor market. The Survey of Adult Skills (PIAAC) was designed to provide information on some these key skills in society. It directly measures proficiency in several information-processing skills –namely literacy, numeracy and problem solving in technology-rich environment. Simultaneously, it provides insights on key social outcomes such as the level of trust in others, participation in associative, religious, political or charity activities (volunteering), political efficacy or the sense of influence on the political process, and self assessed health status. The main findings on the relationship between education in its different forms (years of attainment, skills and adult lifelong learning) and the different social outcomes are presented in this report.

**Title:**

Europäische Kommission. Generaldirektion Beschäftigung Soziales und Integration (2014). *EU employment and social situation*. Quarterly review Luxemburg: Europäische Kommission. Amt für Veröffentlichungen. doi: 10.2767/39939

**Abstract:**

Developing relevant skills, activating the existing skills supply and using skills effectively are crucial for making economies more productive and internationally competitive and for stimulating sustainable, inclusive economic growth. International competitiveness country rankings show that the most competitive countries tend to have a better educated and more skilled population/workforce than less competitive ones. This supplement will focus [i] on the impact of skills beyond those acquired through initial education on individual's outcomes in the labour market and [ii] on the impact of work history on person's level of skill. The latter will be extensively analysed in the forthcoming (2014) *Employment and Social Developments in Europe 2014*. Direct ways of measuring skills, like the OECD's Programme for the International Assessment of Adult Competencies (PIAAC), also known as the Survey of Adult Skills, complement the indirect ways of doing so based on educational attainment. PIAAC provides comparable and valuable information on skills which was not previously available. This information sheds some light on the differences in human capital availability across the EU and its main partners. Although an important one, education is not the only way of acquiring skills. They are also acquired by working and doing other activities throughout the course of one's life. This article gives an overview of the availability of human capital in the EU from the skills perspective by providing information about skills proficiency across various socio-demographic groups. Skills proficiency, beyond the skills acquired through initial education, is shown to be positively and independently associated with the individual's probability of participating in the labour market, being employed and having higher wages and better social outcomes. An individual who had 46 more score points than another in literacy proficiency, was on average 20% more likely to be active and 10% more likely to be employed and could expect

on average a 7% increase in his hourly wage. Improving the skills proficiency of poorly skilled groups should allow them obtain some of those benefits.

**Title:**

Evans, J. (2014). New PIAAC results: Care is needed in reading reports of international surveys. *Adults Learning Mathematics*, 9(1), 37-52.

**Abstract:**

Results from the Survey of Adult Skills, also known as PIAAC (Programme for the International Assessment of Adult Competencies), were recently made available for 24 participating countries. PIAAC involves several developments in relation to the earlier international "adult skills" surveys (IALS in the 1990s and ALL in the 2000s), notably the use of computer administration of the survey. In this paper, I focus on understanding these studies, by considering conceptual issues, methodological validity of research design and execution, and presentation of results. I consider several of the sample items for numeracy published by OECD (2012). And I discuss illustrative results from Australia made available in February 2013, by the Australian Bureau of Statistics. The paper shows when and how to be sceptical when reading international survey reports. It also opens up questions concerning the relevance of the results, and the other types of research that may be needed, in different national and local contexts.

**Title:**

Flake, R., Malin, L., Middendorf, L., & Seyda, S. (2014). *Qualifizierung von An- und Ungelernten. Eine empirische Bestandsaufnahme der Lebenssituation und Potenziale*. [Qualification of semi-skilled and unskilled workers] IW-Analysen No. 100. Cologne: The German Economic Institute (IW).

**Abstract:**

This analysis investigates the situation of Germany's semi- and unskilled workers – particularly in the labour market. All indicators examined (gainful employment, income, further education, position in the company) show them to be worse off than those with a vocational or further training qualification or a university degree. When the semi- and unskilled succeed in entering the labour market – which the young do less often than older workers – the majority find themselves in a strongly segmented market which requires no vocational or company-specific skills, provides no opportunity for enhancing competences by training on the job and seldom offers the chance of further education. In the short term the key to improving the status of the semi- and unskilled is to give them a second chance to acquire additional skills. It makes sense, both from the employee's and employer's point of view, to do this in the form of modular certificates with the option of acquiring a full vocational qualification. In the long run, reforms to pre-school, primary and secondary education will, together with better career advice, reduce the numbers of those dropping out of school and vocational training.

of the PIAAC extension study "Competencies in later life". *Zeitschrift für Gerontologie und Geriatrie*, 47(7), 563-569. doi: 10.1007/s00391-014-0804-9

**Abstract:**

This article deals with the study "Competencies in later life" (CiLL), a parallel study to the German program for the international assessment of adult competencies (PIAAC) survey which assesses the level and distribution of skills of the adult population in a representative study. Assuming the growing importance of learning and education in a society challenged by demographic changes, the first section of the paper outlines the qualitative research of learning activities of focus groups in the daily life of elderly people. The second section of the paper presents the survey design and exemplary findings of the quantitative CiLL study. Initial results show that basic skills of the elderly are highly influenced by personal and sociodemographic variables, particularly by educational background. The data available indicate that the participation of the elderly in adult education and the options available for competence development have to be increased.

**Abstract:**

The contribution presents first results of "Competencies in Later Life" (CiLL), a German PIAAC supplement study. Using the same instruments and assessments that were applied in the PIAAC main study, CiLL measures proficiency in the domains of literacy, numeracy, and problem solving in technology-rich environments in persons aged between 66 and 88 years – an age group that was excluded from PIAAC. [Translated on behalf of editors]

Gabler, S., Häder, S., & Kolb, J.-P. (2014). A simulation approach to estimate inclusion probabilities for PIAAC Germany. *methods, data, analyses*, 8(2), 267-280. doi: 10.12758/mda.2014.011

**Abstract:**

In PIAAC (Programme for the International Assessment of Adult Competencies) inclusion probabilities have to be known for every respondent at each sampling stage in all participating countries. However, in some cases it is not possible to calculate inclusion probabilities for a sample survey analytically - although the underlying design is probabilistic. In such cases, simulation studies can

help to estimate inclusion probabilities and thus ensure that the necessary basis for the calculation of design weights is available. In this section, we present a Monte Carlo simulation using the German sample data. During the selection process for PIAAC Germany an error had occurred. Because of that, it was not possible to determine the inclusion probabilities analytically. Therefore a simulation study with 10,000 runs of the erroneous selection process was set up. As a result it was possible to compute the inclusion probabilities for the sample of PIAAC Germany.

Gal, I., & Tout, D. (2014). *Comparison of PIAAC and PISA frameworks for numeracy and mathematical literacy*. Paris: OECD Publishing. doi: 10.1787/5jz3wl63cs6f-en

**Abstract:**

This paper describes key aspects of the frameworks for the assessment of adult numeracy and mathematical literacy in PIAAC and PISA, which are OECD two flagship programs for international comparative assessment of competencies. The paper examines commonalities and differences in how the constructs of adult numeracy and mathematical literacy were assessed in PIAAC and PISA, and sketches selected challenges associated with interpretation of results from these surveys.

Goglio, V., & Meroni, E. (2014). *Adult participation in lifelong learning: Technical briefing*. European Commission, Joint Research Centre, Institute for the Protection and Security of the Citizen Luxembourg: Publications Office of the European Union. doi: 10.2788/43117

**Abstract:**

This technical briefing deals with adult participation in lifelong learning. In particular, it focuses on the implications associated to the use of different statistical sources (LFS, AES/CVTS and PIAAC), characterized by different reference periods and different definitions of lifelong learning. The main objective of the technical briefing is to examine the impact of using a 12-month or 4-week reference period on access to and intensity of adult learning. But technical briefing also includes a review of the state of the art in the field of measurement of adult perception to lifelong learning, and some statistics about the variance according to different labour market status and age groups.

Goldhammer, F., Naumann, J., Stelter, A., Tóth, K., Rölke, H., & Klieme, E. (2014). The time on task effect in reading and problem solving is moderated by task difficulty and skill. *Journal of Educational Psychology, 106*(3), 608-626. doi: 10.1037/a0034716

**Abstract:**

Computer-based assessment can provide new insights into behavioral processes of task completion that cannot be uncovered by paper-based instruments. Time presents a major characteristic of the task completion process. Psychologically, time on task has 2 different interpretations, suggesting opposing associations with task outcome: Spending more time may be positively related to the outcome as the task is completed more carefully. However, the relation may be negative if working more fluently, and thus faster, reflects higher skill level. Using a dual processing theory framework, the present study argues that the validity of each assumption is dependent on the relative degree of controlled versus routine cognitive processing required by a task, as well as a person's acquired skill. A total of 1,020 persons ages 16 to 65 years participated in the German field test of the Programme for the International Assessment of Adult Competencies. Test takers completed computer-based reading and problem solving tasks. As revealed by linear mixed models, in problem solving, which required controlled processing, the time on task effect was positive and increased with task difficulty. In reading tasks, which required more routine processing, the time on task effect was negative and the more negative, the easier a task was. In problem solving, the positive time on task effect decreased with increasing skill level. In reading, the negative time on task effect increased with increasing skill level. These heterogeneous effects suggest that time on task has no uniform interpretation but is a function of task difficulty and individual skill.

Hämäläinen, R., Cincinnato, S., Malin, A., & De Wever, B. (2014). VET workers' problem-solving skills in technology-rich environments: European approach. *International Journal for Research in Vocational Education and Training, 1*(1), 57-80. doi: 10.13152/IJRVET.1.1.4

**Abstract:**

The European workplace is challenging VET adults' problem-solving skills in technology-rich environments (TREs). So far, no international large-scale assessment data has been available for VET. The PIAAC data comprise the most comprehensive source of information on adults' skills to date. The present study (N = 50 369) focuses on gaining insight into the problem-solving skills in TREs of adults with a VET background. When examining the similarities and differences in VET adults' problem-solving skills in TREs across 11 European countries, two main trends can be observed. First, our results show that only a minority of VET adults perform at a high level. Second, there seems to be substantial variation between countries with respect to the proportion of VET adults that can be identified as "at-risk" or "weak" performers. For the future, our findings indicate the variations that can be used as a starting point to identify beneficial VET approaches.

**Abstract:**

Only few previous studies have explored cross-national variation in the relationship between educational certificates and competences. In this paper, we investigate the certificate-competence relationship, operationalized as skills gaps by level of educational attainment. More importantly, we scrutinize how two aspects of educational stratification processes, vertical stratification and occupation-specificity, affects skills gaps. Using data on 25-54 year olds from the 2011/12 round of the Programme for the International Assessment of Adult Competencies (PIAAC), we find that more occupation-specific education systems produce smaller differences in basic general skills between adults with low and intermediate levels of education. Higher levels of vertical stratification, by contrast, result in larger low-intermediate skills gaps. None of the two stratification aspects can however explain variations in the skills gaps between intermediate and high educated adults. We conclude by discussing the implications of our findings for labor market research.

Helmschrott, S., & Martin, S. (2014). Nonresponse in PIAAC Germany. *methods, data, analyses*, 8(2), 243-266. doi: 10.12758/mda.2014.010

**Abstract:**

Nonresponse is of concern for the quality of survey data, because it may introduce bias into the collected sample. To date, only few studies deal with nonresponse in skills or educational surveys. This paper aims at contributing to this field by identifying the main factors that influenced participation in the first wave of PIAAC Germany, a survey assessing skills of the adult population, conducted in 2011/ 2012. Using bi- and multivariate analyses, we found that age, citizenship, the level of education, the type of house the sampled persons live in, and municipality size were the main factors influencing response to PIAAC Germany. Our findings suggest that, for the effective reduction of nonresponse in skills or education studies, researchers should target persons with a low level of education, foreigners, those living in larger housing units, and big-city dwellers by using appropriate measures at the different stages of the survey process.

Klemm, U. (2014). PIAAC und die Erwachsenenbildung [PIAAC and adult education]. *Zeitschrift für internationale Bildungsforschung und Entwicklungspädagogik*, 37(2), 29-34.

**Abstract:**

The concise resume that could be drawn from the German PIAAC study would be: Every sixth German adult reads and calculates at a ten-year-old student's competence level and every tenth German adult cannot handle a "mouse". Or, according to PIAAC: the German educational system apparently doesn't offer all people the chance to achieve basic competences that exceed over an elementary level. Though these results are statistically valid and reliable, they reduce without further differentiation PIAACs overall intentions.

Levels, M., Van der Velden, R., & Allen, J. (2014). Educational mismatches and skills: New empirical tests of old hypotheses. *Oxford Economic Papers*, 66(4), 959-982. doi: 10.1093/oep/gpu024

**Abstract:**

This article empirically explores how the often reported relationship between educational mismatches and wages can best be understood. Exploiting the newly published Programme for International Assessment of Adult Competencies (PIAAC) data, we are able to achieve a better estimation of the classical Duncan and Hoffman ORU model than previous papers by controlling for heterogeneity of observable skills. Our findings suggest that (i) a considerable part of the effect of educational mismatches can be attributed to skills heterogeneity, and (ii) that the extent to which skills explain educational mismatches varies by institutional contexts, particularly the extent to which collective wage bargaining is regulated. These observations suggest that skills matter for explaining wage effects of education and educational mismatches, but also that the extent to which this is the case depends on collective wage bargaining.

Lunze, K., & Paasche-Orlow, M. K. (2014). Limited literacy and poor health: The role of social mobility in Germany and the United States. *Journal of health communication*, 19(sup2), 15-18. doi: 10.1080/10810730.2014.946115

**Abstract:**

The Organization for Economic Cooperation and Development (OECD) implemented the Program for the International Assessment of Adult Competencies (PIAAC) to provide policymakers with nationally representative profiles of knowledge, skills, and competencies. Results among participating countries indicate that the United States and Germany stand out as having the strongest relationship between literacy skills and self-reported health. Our analysis addresses factors that could mediate the particularly strong link between low literacy and poor health in these two countries and possible remedies for the problem. In particular, PIAAC results also reveal that the United States and Germany share the most entrenched multigenerational literacy problem among the countries in the PIAAC survey. In spite of the many social differences that currently distinguish Germany and the United States, these countries share the lowest level of social mobility for education. Promoting social mobility by making higher education more accessible for those whose parents did not have the chance to access it might thus not only promote literacy and social capital, but indirectly also promote public health. Given the PIAAC findings, the concept of social mobility and opportunities to dissolve the educational stratification merit more attention in public health research.

Maehler, D., Massing, N., & Rammstedt, B. (2014). *Grundlegende Kompetenzen Erwachsener mit Migrationshintergrund im internationalen Vergleich: PIAAC 2012 [Basic skills of adults with a migration background in international comparison: PIAAC 2012]*. Münster: Waxmann.

**Abstract:**

The migration report on the Programme for the International Assessment of Adult Competencies (PIAAC) contrasts the basic skills of the adult population with and without a migration background in Germany and in international comparison. As in most of the other countries, persons with a migration background in Germany have, on average, lower basic skills than those without a migration background. These skill disparities can be explained, in particular, by differences in structural background characteristics such as education background and socioeconomic status.

Maehler, D. B., Massing, N., Helmschrott, S., Rammstedt, B., Staudinger, U. M., & Wolf, C. (2014). Erhebliche Kompetenzunterschiede im Erwachsenenalter nach Bildungsgruppen: Ergebnisse von PIAAC 2012. [High variation in skills of adults with different educational backgrounds]. *Social Indicators Information Service (ISI)*, 52, 1-5.

**Abstract:**

One of the key tasks of education systems is to impart basic skills, for example in reading, writing, and arithmetic, thereby preparing pupils for the future. The results of the PISA study, in particular, have shown that, in Germany, attendance at different school types is associated with clear proficiency differences in different skill domains. It is therefore expected that a strong association also exists between formal education and basic skills in adulthood. Previous studies on adult skills have furnished empirical evidence in support of this assumption (Lehmann 1997; Wölfel et al. 2011). It can be assumed that formal education (and training) and skills mutually reinforce each other: On the one hand, school and vocational training impart basic skills; on the other hand, there is a high probability that persons who have deficits in basic skills will leave the education and training system earlier. In addition, an indirect effect of the education system is expected because attitudes, for example toward learning and reading, fostered within the education system increase the probability that people will undergo further education and training in later life, thereby maintaining and expanding their skills (OECD 2013).

**Title:**

Martin, S., Helmschrott, S., & Rammstedt, B. (2014). The use of respondent incentives in PIAAC: The field test experiment in Germany. *methods, data, analyses*, 8(2), 223-242. doi: 10.12758/mda.2014.009

**Abstract:**

In PIAAC, each participating country was required to attain a response rate of at least 50 percent, as long as evidence was provided that there was either no or only low nonresponse bias in the data. Achieving 50 percent is a challenge for face-to-face surveys in most Western countries and also in Germany. Previous research showed that the use of incentives is an effective tool to increase response rates in different kinds of surveys. However, incentives may have differential effects on certain socio-demographic groups, because the perceived benefits of an incentive are subjective. To assess the effects of incentives on response rate and nonresponse bias, an experi-

ment with three incentive treatments (10 Euro-coin, 25 Euro and 50 Euro in cash) was implemented in the German PIAAC field test. Results show that response rates increased as the incentive increased. With regard to nonresponse bias, the results are less explicit. According to logistic regressions, the main factors for participation in the 50 Euro condition are age, citizenship, and municipality size and in the 25 Euro condition, only municipality size. Bivariate analyses put these results into perspective. For all treatment groups, a low potential for bias is visible, and there is no statistical evidence that response distributions of the realized sample across treatments are different.

Naumann, J., Goldhammer, F., Rölke, H., & Stelter, A. (2014). Erfolgreiches Problemlösen in technologie-reichen Umgebungen: Wechselwirkungen zwischen Interaktionsschritten und Aufgabenanforderungen [Successful problem solving in technology rich environments: Interactions between number of actions and task demands]. *Zeitschrift für Pädagogische Psychologie*, 28(4), 193-203. doi: 10.1024/1010-0652/a000134

**Abstract:**

Using Field Trial data from the Programme for the International Assessment of Adult Competencies (PIAAC) from the German (N = 661) and Canadian (N = 411) Field Trials, we show that success in technology-based problem solving is predicted by the number of actions taken during problem solving. The association was reversely U-shaped. The probability of succeeding on a problem-solving task was highest at an above-average number of actions. The association between actions taken and problem solving was further moderated by task characteristics. Especially in tasks involving long navigation sequences a strong positive association between the number of actions and task success was obtained. Against expectations, the association of actions and probability of task success was higher in well-defined than in ill-defined tasks. Results for the German and the Canadian samples ran parallel.

Organisation for Economic Cooperation and Development (OECD) (2014). *Education at a glance 2014: OECD indicators*. Paris: OECD Publishing. doi: 10.1787/eag-2014-en

**Abstract:**

Education at a Glance: OECD Indicators is the authoritative source for accurate and relevant in-

formation on the state of education around the world. It provides data on the structure, finances, and performance of education systems in the OECD's 34 member countries, as well as a number of partner countries. In the 2014 edition, new material includes: - Data from the Survey of Adult Skills, a product of the OECD Programme for the International Assessment of Adult Competencies (PIAAC), on attainment, employment, intergenerational education mobility, earnings, and social outcomes related to skills proficiency. - New indicators on private institutions, on what it takes to become a teacher, and on the availability of, and participation in, professional development activities for teachers. - Data from the 2013 OECD Teaching and Learning International Survey (TALIS) in several indicators. - Analysis of the impact of the recent economic crisis on the interplay among educational attainment, employment, earnings and public finance. - More in-depth information related to upper secondary completion rates. - A detailed examination of the types and use of student loans. - For the first time, data from Colombia and Latvia.

Perry, A., & Rammstedt, B. (2014). Grundkompetenzen Erwachsener: Deutschland im internationalen Vergleich [Adult basic skills: Germany in international comparison]. *Spektrum Wissenschaft*, (2), 17-18.

**Abstract:**

Every three years, the PISA Test assesses pupils' skills and knowledge, thereby allowing educational success to be compared across countries. With the PIAAC study, results for adults are now available for the first time. One key finding up front: In PIAAC, too, Germany's performance was mediocre compared to other countries. Adult literacy skills in Germany are below the average of the participating OECD countries; numeracy skills are slightly above average. And finally, in the assessment of computer and Internet skills, performance in Germany corresponded to the international average. Japan and Finland are the highest-performing countries in reading and everyday mathematics; Spain and Italy are at the bottom of the league. Perry, A., Wiederhold, S., & Ackermann-Piek, D. (2014). How can skill mismatch be measured? New approaches with PIAAC. *methods, data, analyses*, 8(2), 137-174. doi: 10.12758/mda.2014.006

**Abstract:**

Measuring skill mismatch is problematic, because objective data on an individual skill level are often not available. Recently published data from the Program for the International Assessment of Adult Competencies (PIAAC) provide a unique opportunity for gauging the importance of skill mismatch in modern labor markets. This paper systematically compares existing measures of skill mismatch in terms of their implications for labor market outcomes. We also provide a new measure that addresses an important limitation of existing measures, namely, assigning a single competency score to individuals. We find that the importance of skill mismatch for individual earnings differs greatly, depending on the measure of mismatch used.

Rammstedt, B., & Maehler, D. B. (2014). PIAAC and its methodological challenges. *methods, data, analyses*, 8(2), 125 -136. doi: 10.12758/mda.2014.005

**Abstract:**

This article gives an overview of the Programme for the International Assessment of Adult Competencies (PIAAC) and introduces the methodological challenges in implementing the survey - especially those encountered in Germany. Adherence to high methodological standards is a prerequisite to participation in PIAAC and to inclusion of the national data of the respective participating countries in the international dataset (OECD, 2010). Depending on the standard in question, and on national circumstances, compliance is a challenging undertaking. This Special Issue discusses methodological challenges at different levels, and steps taken to implement PIAAC standards in Germany. The aspects addressed include sample design, survey instruments, field work preparation, data collection, and estimation standards. In this introductory article, we outline the central elements of the PIAAC design and the methodological challenges of the survey, and we present the other six articles in this special issue.

**Abstract:**

In empirical education research, large-scale assessments are often flanked by accompanying studies. This is also the case with PIAAC, whose accompanying study is entitled Competencies in Later Life (CiLL). What can be expected of the accompanying studies of major, and sometimes international, surveys? This contribution explores the added value that the CiLL study provides for PIAAC. The authors begin by identifying the connection points between PIAAC and CiLL. Building on this, they demonstrate in what respect CiLL expands PIAAC and deepens the insights gained from that study. **Abstract:**

The article provides an overview on two studies on competencies in adulthood, PIAAC and CiLL. Limitations in the sample of PIAAC (16- to 65-year-old people) led to a further study called CiLL, which analyses the 66- to 80-year-old population in Germany. Study design and first results of the interviews and assessments are presented and potentials of competencies in later life are discussed with regard to six aspects. In conclusion, consequences for education policy and adult education practitioners are suggested.

Schöll, I. (2014). Was aus PIAAC folgen muss – Plädoyer für ein Bundesamt zur Grundbildungssicherung [What must follow on from PIAAC – A plea for a federal agency for the assurance of basic skills education]. *DIE - Zeitschrift für Erwachsenenbildung*, 21(3), 36-38. doi: 10.3278/DIE1403W036

**Abstract:**

PIAAC shows that many adults in Germany lack basic skills. It thus depicts a problem situation whose solution requires new structures. Against this background, the author makes a plea for the establishment of a federal agency for the assurance of basic skills education in order to create a nationwide, federal-government-funded service for the provision of basic skills courses. Schrader, J., & Wanka, J. (2014). "Viele Menschen können ihr Potenzial nicht ausschöpfen" Im Gespräch mit Dr. Johanna Wanka, Bundesministerin für Bildung und Forschung" (Interview) ["Many people cannot realize their full potential." Interview with Dr. Johanna Wanka, Federal Minister of Education and Research]. *DIE - Zeitschrift für Erwachsenenbildung*, 21(3), 22-24. doi: 10.3278/DIE1403W

**Abstract:**

The central question addressed by the PIAAC special issue is the way in which the CiLL and PIAAC results have entered into adult education discourse on the part of practitioners, researchers, and policy makers. In Germany, PIAAC was funded by the Federal Ministry of Education and Research (BMBF) with the participation of the Federal Ministry of Labor and Social Affairs (BMAS). How have education policy makers received the PIAAC findings? Are education policy measures being launched? What education policy strategies does PIAAC give rise to? Editor Prof. Dr. Josef Schrader puts these and other questions to Federal Minister for Education and Research, Prof. Dr. Johanna Wanka. [Translated on behalf of editors]

Solga, H. (2014). Education, economic inequality and the promises of the social investment state. *Socio-Economic Review*, 12(2), 269-297. doi: 10.1093/ser/mwu014

**Abstract:**

Since the mid-1990s, there has been a debate about the social investment state model in advanced societies. Such an orientation towards preventive investment in education rather than redistribution (or social spending) raises the question of whether, and if so, what kinds of relationships exist between educational and economic inequalities. Based on an international comparison of 20 advanced economies, the results of the analyses suggest that the role of education as an 'equalizer' should not be overestimated. Direct redistribution is much more likely than education to combat poverty in advanced societies. Yet increasing the mean literacy rate by reducing the proportion of low-literate adults is also positively associated with less economic inequality. Welfare states with 'double liability'—investing in children's education and in more equal family conditions—therefore perform best in terms of economic inequality.

Statistics Austria (2014). Schlüsselkompetenzen von Erwachsenen (PIAAC). *Vertiefende Analysen der PIAAC-Erhebung 2011/12 [Adult key skills (PIAAC). In-depth analyses of the PIAAC Survey 2011/12]*. Wien: Statistik Austria.

**Abstract:**

In October 2013, following an initial broad-based examination of the Austrian results of the Programme for the International Assessment of Adult Competencies (PIAAC), researchers from various specialist disciplines collaborated with Statistik Austria's PIAAC Team to prepare in-depth analyses, which are now presented in this report. The contributions cover a wide range of priority topics – from the consideration and analysis of individual factors, such as sex and age, and their associations with the PIAAC key skills, to the impact of these skills on labor market participation or income. The impact of different learning activities (formal education, e.g. school and higher education; non-formal education, e.g. courses and seminars; informal learning, e.g. on-the-job learning) on skill acquisition is also examined. One specific focus of the report is on individuals with poor skills and on the living situation of these persons. The analyses focus mainly on the situation in Austria. In some of the contributions, the viewpoint is broadened to include countries that are of interest for comparison purposes, thereby incorporating an international perspective. Tsatsaroni, A., & Evans, J. (2014). Adult numeracy and the totally pedagogised society: PIAAC and other international surveys in the context of global educational policy on lifelong learning. *Educational Studies in Mathematics*, 87(2), 167-186. doi: 10.1007/s10649-013-9470-x

**Abstract:**

This paper aims to discuss the emergence, form and likely effects of international surveys of adults' skills by locating them in the global context of policies on education and Life Long Learning (LLL). It focuses on adults' numeracy and discusses its conceptualisation and assessment in the Project for the International Assessment of Adult Competencies (PIAAC), which is the most recent survey. Drawing on critical theoretical resources about new forms of governance in education and transformations in the pedagogic discourse, the paper further substantiates existing critiques of global policy trends, namely that they are motivated by human capital approaches to education and LLL. In particular, we show that the apparently commonsensical appeal of evaluative instruments like PISA and PIAAC is based on a competency model of knowledge, which embodies a narrow notion of competence. Relatedly, the notional curricula promoted by such surveys potentially articulate a more radical idea of LLL, captured by Bernstein's conception of trainability as the mode of socialisation into a Totally Pedagogised Society. The paper presents a dual approach to understanding international adult performance surveys in general—in that, besides deploying the theoretical resources already indicated, it also raises a number of methodological issues relevant to the valid interpretation of these studies' results. Ultimately, it argues for the importance of mobilising resources from critical educational perspectives to support the development of potentially powerful knowledge like numeracy and to prevent its being reduced to a narrow competency.

Vera-Toscano, M., & Meroni, E. (2014). *Formal qualifications and individuals' skills. Evidence from the Survey of Adult Skills (PIAAC)*. European Commission, Joint Research Centre, Institute for the Protection and Security of the Citizen Luxembourg: Publications Office of the European Union. doi: 10.2788/984599

**Abstract:**

The role played by the educational system regarding the provision of adequate skills is indisputable. Cognitive skills, which are the key for successful participation in the labour market, in social and civic activities and in further education and training, are mainly developed through formal education attainment at young ages. As educational attainment increases, individuals are exposed to higher levels of training and should develop greater abilities and be more skillful at processing information. Thus, the aim of this technical briefing is to look into and compare the distribution of educational attainment and the level of skills by country, as a starting point to assess the efficiency of the different educational systems in providing the appropriate level of skills to citizens.

Zabal, A. (2014). The challenge of meeting international data collection standards within national constraints. *methods, data, analyses*, 8(2), 175-198. doi: 10.12758/mda.2014.007

**Abstract:**

The Programme for the International Assessment of Adult Competencies (PIAAC) is an international OECD study that compares key competencies of adults (16-65 years) in the participating coun-

tries. In order to obtain high quality data and to ensure equivalence of measurement across countries, the international PIAAC Consortium produced a very detailed and elaborate set of standards and guidelines for all aspects of the national implementations. In Germany, a comprehensive set of measures and procedures was put in place for the PIAAC fieldwork. Some of the international requirements for data collection were not meaningful within the national context and required certain adaptations. This article describes various key fieldwork measures in Germany and discusses how specific measures relate to central international data collection standards. Reflecting on this national experience, some of the possibilities and limitations of national compliance to international standards are discussed.

## 2.8 Publications in 2015

### Title:

Adalet McGowan, M., & Andrews, D. (2015). *Labour market mismatch and labour productivity: Evidence from PIAAC data*. OECD Economics Department Working Papers No. 1209. Paris: OECD Publishing. doi: 10.1787/5js1pzx1r2kb-en

### Abstract:

This paper explores the link between skill and qualification mismatch and labour productivity using cross-country industry data for 19 OECD countries. Utilising mismatch indicators aggregated from micro-data sourced from the recent OECD Survey of Adult Skills (PIAAC), the main results suggest that higher skill and qualification mismatch is associated with lower labour productivity, with over-skilling and under-qualification accounting for most of these impacts. A novel result is that higher skill mismatch is associated with lower labour productivity through a less efficient allocation of resources, presumably because when the share of over-skilled workers is higher, more productive firms find it more difficult to attract skilled labour and gain market shares at the expense of less productive firms. At the same time, a higher share of under-qualified workers is associated with both lower allocative efficiency and within-firm productivity – i.e. a lower ratio of high productivity to low productivity firms. While differences in managerial quality can potentially account for the relationship between mismatch and within-firm productivity, the paper offers some preliminary insights into the policy factors that might explain the link between skill mismatch and resource allocation.

### Title:

Adalet McGowan, M., & Andrews, D. (2015). *Skill mismatch and public policy in OECD countries*. OECD Economics Department Working Papers No. 1210. Paris: OECD Publishing. doi: 10.1787/5js1pzw9lnwk-en

### Abstract:

This paper explores the relationship between skill mismatch and public policies using micro data for 22 OECD countries from the recent OECD Survey of Adult Skills (PIAAC). Results suggest that differences in skill mismatch across countries are related to differences in public policies. After controlling for individual and job characteristics, well-designed product and labour markets and bankruptcy laws that do not overly penalise business failure are associated with lower skill mismatch. Given the negative relationship between skill mismatch and labour productivity, reducing skill mismatch emerges as a new channel through which well-designed framework policies can

boost labour productivity. Skill mismatch is also lower in countries with housing policies that do not impede residential mobility (e.g. transaction costs on buying property and stringent planning regulations). Greater flexibility in wage negotiations and higher participation in lifelong learning as well as higher managerial quality are also associated with a better matching of skills to jobs.

**Title:**

Borgonovi, F., & Burns, T. (2015). *The educational roots of trust*. OECD Education Working Papers No. 119. Paris: OECD Publishing. doi: 10.1787/5js1kv85dfvd-en

**Abstract:**

Trust is important for social and economic well-being, for enhancing social cohesion and strengthening resilience, and for maintaining security and order in our societies. Trust is the foundation upon which social capital is built and it also is intimately related to human capital. This work examines the association between education and levels of interpersonal trust, using data from the OECD's Survey of Adult Skills (PIAAC). Our analysis demonstrated that education strengthens the cognitive and analytical capacities needed to develop, maintain, and (perhaps) restore trust in both close relationships as well as in anonymous others. It does so both directly, through building and reinforcing literacy and numeracy in individuals, and indirectly, through facilitating habits and reinforcing behaviours such as reading and writing at home and at work. Education and trust are thus fundamentally intertwined and dependent on each other. While all countries across the OECD have been striving to improve their education systems in terms of student achievement levels, this analysis suggests that there are also concrete elements that could be usefully addressed in order to reinforce and strengthen trust.

**Title:**

Brunello, G., & Rocco, L. (2015). *The effects of vocational education on adult skills and wages: What can we learn from PIAAC?* OECD Social, Employment and Migration Working Papers No. 168. Paris: OECD Publishing. doi: 10.1787/5jrxfmjvw9bt-en

**Abstract:**

In this report we investigate the effects of vocational education and training (VET) on adult skills and labour market outcomes by using the PIAAC survey. Data comparability across countries, the breadth of countries involved, and the almost unique presence of information on assessed skills, training, earnings and employment makes this survey especially valuable to study the different facets of VET as compared to more academic education.

**Title:**

Bussi, M., & Pareliussen, J. (2015). *Skills and labour market performance in Sweden*. OECD Economics Department Working Papers No. 1233. Paris: OECD Publishing. doi: 10.1787/5js0cqvnzx9v-en

**Abstract:**

Both educational attainment and skills, as measured in the OECD Survey of Adult Skills (PIAAC), are high in Sweden. They are not perfect substitutes, but both are to some degree necessary for successfully integrating in the Swedish labour market. This paper describes the distribution of proficiency in literacy in the population and explores its determinants, and uncovers a strong rela-

tionship between literacy and the likelihood of being employed. The relationship between proficiency in literacy and the likelihood of participating in adult education is also explored. Lower employment prospects for immigrants are well explained by lower literacy proficiency, lower education and less favourable socio-economic backgrounds. This Working Paper relates to the 2015 OECD Economic Survey of Sweden  
[www.oecd.org/eco/surveys/economic-survey-sweden.htm](http://www.oecd.org/eco/surveys/economic-survey-sweden.htm).

**Title:**

Cort, P., & Larson, A. (2015). The non-shock of PIAAC-tracing the discursive effects of PIAAC in Denmark. *European Educational Research Journal*, 14(6), 531-548. doi: 10.1177/1474904115611677

**Abstract:**

The results of the first PIAAC survey were published in October 2013. In the case of Denmark, the survey showed that Denmark is below the OECD average when it comes to reading skills, above average with regards to numeracy and on average with regards to IT skills. In this paper we analyse how the PIAAC results were covered by the media and how different stakeholders within the field of adult literacy took PIAAC as an opportunity to try to influence how the problem of adult literacy in Denmark should be represented. The analysis is based on Bacchi's What's the problem represented to be? approach to policy analysis (2009) and Kingdon (1984), and Zahariadis' (2003) multiple streams theory. The analysis shows that PIAAC did not provoke the same kind of national 'shock' as PISA and that adult literacy is low on the political agenda compared to basic schooling.

Cortina, K. S. (2015). PIAAC und PISA: Pädagogisch paradoxe Parallelen [PIAAC and PISA: Pedagogically paradoxical parallels]. *Zeitschrift für Pädagogik*, 61(2), 223-242.

**Abstract:**

The "Programme for the International Assessment of Adult Competencies" (PIAAC) is another important empirical study to investigate developments in the educational system of Germany beyond the 15-year olds that PISA is focused on. From a biographical viewpoint of competencies, this article combines PIAAC and PISA results to address the question how the ranking of Germany across the age groups changes across different age groups with respect to mathematics and reading literacy. The cross-sectional analyses did not provide any evidence of a positive effect of the comprehensive German professional training system. In addition, the trend towards lesser impact of parental educational background in Germany, found over five waves of PISA, could not be replicated for the 16- to 24-year-old adults in PIAAC. In light of Germany's economic success, the consistency of Germany's position close to the international average for all age groups from age 16 to 65 in both literacy domains raises questions about the relevance of these competencies for educational development beyond their value as indicators for the efficacy of the school system.

Cummins, P., Kunkel, S., & Walker, R. (2015). *Adult education and training programs for older adults in the U.S.: National results and cross-national comparisons using PIAAC data*. Washington DC: American Institutes for Research. Retrieved October 20, 2017, from <https://static1>.

squarespace.com/static/51bb74b8e4b0139570ddf020/t/54da7607e4b081084af3c485/1423603207175/Cummins\_Kunkel\_Walker\_PIAAC.pdf?\_cldee=cm9zZS1hbm5lLnBvbHZlcmVAbmN2ZXluZWR1LmF1

**Abstract:**

Continuous learning over the life course is necessary to effectively compete in a knowledge-based global economy. Shifts in the age structure of the US labor force combined with increased labor force participation among older adults add to the importance of gaining a better understanding of how adult education and training (AET) influences labor market outcomes for middle-aged and older workers. This study used data from the Programme for the International Assessment of Adult Competencies (PIAAC) and the Survey of Consumer Finances (SCF) to examine the relationship in the US between participation in AET programs and employment, labor force participation, income, and net worth for adults aged 45 to 65. Participation in an AET program in the 12 months preceding the survey significantly improved the log odds of both employment and labor force participation and significantly improved the log odds of moving up one income quintile. Lower income groups and the unemployed were less likely to participate in AET than higher income groups and the employed. [The authors] also compared outcomes of AET participation in the US with those in Germany, Japan, Sweden, and the UK and examined policies for lifelong learning in those countries.

Dämmrich, J., Kosyakova, Y., & Blossfeld, H. P. (2015). Gender and job-related non-formal training: A comparison of 20 countries. *International Journal of Comparative Sociology*, 56(6), 433-459. doi: 10.1177/0020715215626769

**Abstract:**

This article analyses gender differences in the participation in various types of job-related non-formal training in 20 societies and examines the relationship of these gender differences with country-specific institutional settings such as employment protection, family policies and the gender culture. Using data from the Programme for the International Assessment of Adult Competencies (PIAAC) and applying two-step multilevel regression analyses, two main findings are obtained: First, gendered participation clearly differs among training types, with women being less likely to participate in employer-financed training but more likely to participate in non-employer-sponsored training. These gender differences in training participation are crucial because they are likely to shape men's and women's career development in different ways, that is, by providing better future career prospects with the current employer for men and with a new employer for women. Second, country-specific settings can reduce gender differences in training participation: in countries with family policies supporting females' employment (e.g. good coverage of formal childcare and short parental leave), we found a lower training disadvantage of women in employer-financed training. In turn, gender differences in non-employer-sponsored training seem to be lower in countries with less rigid employment protection.

**Title:**

Desjardins, R. (2015). *Participation in adult education opportunities: Evidence from PIAAC and policy trends in selected countries*. Background paper for the Education for All Global Monitoring Report

Paris: UNESCO. Retrieved October 20, 2017, from <http://unesdoc.unesco.org/images/0023/002323/232396e.pdf>

**Abstract:**

This paper examines cross-country patterns of participation in adult education opportunities using comparative data made available by the OECD Survey of Adult Skills. Patterns are considered in relation to some of the mechanisms that drive unequal chances to participate, and some of the policy issues that surround the provision, governance and financing of different types of adult learning, as well as recent policy developments relevant to adult education in selected countries.

**Title:**

Desjardins, R., & Ederer, P. (2015). Socio-demographic and practice-oriented factors related to proficiency in problem solving: A lifelong learning perspective. *International Journal of Lifelong Education*, 34(4), 468-486. doi: 10.1080/02601370.2015.1060027

**Abstract:**

This article explores the relative importance of different socio-demographic and practice-oriented factors that are related to proficiency in problem solving in technology-rich environments (PSTREs) and by extension may be related to complex problem solving (CPS). The empirical analysis focuses on the proficiency measurements of PSTRE made available by the Programme for the International Assessment of Adult Competencies, which is relevant for gaining insight on some of the factors related to CPS. The purpose was to examine the relationship between the broad information processing experience that individuals gather in different contexts over the lifespan, and the chances to develop problem-solving skills that adults receive in different socio-demographic profiles. Results reveal that socio-demographic factors such as age, education and immigration status as well as practice-oriented factors such as ICT use and reading practice at and outside work are strongly related to proficiency.

**Title:**

Fridberg, T., Rosdahl, A., Halapuu, V., Valk, A., Malin, A., Hämäläinen, R., Anderssen, A. F., Björkeng, B., Størset, H., et al. (2015). *Adult skills in the Nordic Region: Key information-processing skills among adults in the Nordic Region*. Odense: Rosendahls-Schultz Grafisk. doi: 10.6027/TN2015-535

**Abstract:**

Denmark, Estonia, Finland, Norway, and Sweden participated in the first round of the International Survey of Adults' Skills. The survey is a product of the Programme for the International Assessment of Adult Competencies (PIAAC) led by the Organisation for Economic Co-operation and Development (OECD). The survey assessed the proficiency in literacy, numeracy, and problem-solving in technology-rich environments of adults aged 16–65. This publication is the product of the Nordic PIAAC Network, consisting of members from all five countries. It concentrates on the comparative results from four Nordic countries and Estonia, forming a Nordic region with many common features. It supplements the series of national and international PIAAC reports by comparing the results from five countries, as well as comparing an aggregate of these countries to other country aggregates. The results published in this book draw on a unique Nordic database, which the Nordic PIAAC Network has produced. The database consists of PIAAC assessment data and background information, supplemented by social, educational, and labour market register data from the five countries.

**Title:**

Gebrande, J., & Friebe, J. (2015). Grundkompetenzen, Bildungsverhalten und Lernen im höheren Lebensalter. Ergebnisse der Studie "Competencies in Later Life" (CiLL) [Basic competencies, educational behavior, and learning in later life – Results of the study “Competencies in Later Life” (CiLL)]. *Zeitschrift für Pädagogik*, 61(2), 192-204.

**Abstract:**

On the basis of the study Competencies in Later Life (CiLL), the authors present cornerstones of competencies in later life. First results of the surveys and determinations of competencies are differentiated according to individual sections of the population. Of particular interest is the question of in how far continuing education plays a role in promoting basic and everyday competencies. It is shown that educationally active older people have higher competencies in dealing with age-specific tasks than people who do not participate in further education. Furthermore, older active people make use of further education in the context of social participation and civic involvement.

**Title:**

Green, A., Green, F., & Pensiero, N. (2015). Cross-country variation in adult skills inequality: Why are skill levels and opportunities so unequal in anglophone countries? *Comparative Education Review*, 59(4), 595-618. doi: 10.1086/683101

**Abstract:**

This article examines cross-country variations in adult skills inequality and asks why skills in Anglophone countries are so unequal. Drawing on the Organization for Economic Cooperation and Development's recent Survey of Adult Skills and other surveys, it investigates the differences across countries and country groups in inequality in both skills opportunities and outcomes and uses pseudo-cohort analysis to establish trends over time and during the life course. The analysis shows that adults' skills in Anglophone countries, and particularly in the United States and England, tend to be more unequal than in other countries on a wide range of measures. This cannot be explained by intercohort differences, skills distributions among adult migrants, or levels and distributions of adult learning, but inequality in education levels provides a strong predictor of skills inequality among adults. Whereas research suggests that early selection drives skills inequality in compulsory schooling, certain forms of tracking, such as bifurcation into academic or apprenticeship/vocational education in upper secondary education, can have a mitigating effect.

**Title:**

Grotlüschen, A., Heinemann, A., & Nienkemper, B. (2015). Stärken zweier Leitstudien für die Weiterbildung PIAAC und leo. - Level-One Studie im Vergleich [Strengths of two lead studies for further education. A comparison between PIAAC and the leo. – Level-One Study]. In A. Grotlüschen & D. Zimper (Eds.), *Literalitäts- und Grundlagenforschung* (pp. 79-88). Münster: Waxmann. doi: 10.3278/REP1403W029

**Abstract:**

The current PIAAC results confirm in international comparison the worrying data of the national

leo. Level-One Study conducted in 2011, which found that 14.5 percent of the population of working age were functional illiterates. With their results, both studies have a strong impact on current education policy discussions on the subject of basic skills education. In order to identify the strengths of both studies for the area of further education and training, the contribution contrasts in a brief overview the research design of the two studies. The data on further education and training collected by the respective studies are then compared. And finally, the complementarity rather than the comparability of the studies is highlighted. [Translated on behalf of editors]

**Title:**

Hämäläinen, R., De Wever, B., Malin, A., & Cincinato, S. (2015). Education and working life: VET adults' problem-solving skills in technology-rich environments. *Computers & Education*, 88, 38-47. doi: 10.1016/j.compedu.2015.04.013

**Abstract:**

The rapidly-advancing technological landscape in the European workplace is challenging adults' problem-solving skills. Workers with vocational education and training need flexible abilities to solve problems in technology-rich work settings. This study builds on Finnish PIAAC data to understand adults' (N = 4503) skills for solving problems in technology-rich environments. The results indicate the critical issue that more than two thirds of adults with vocational education and training have weak skills or lack the skills in solving problems in technology-rich environments and that more than one fifth of these adults are at risk. Furthermore, this study indicates that the likelihood of having fragile problem-solving skills is six times higher for adults with vocational education and training than for adults with at least upper secondary qualification. Since the need for problem-solving in technology-rich environments is likely to increase in the future, this study also identifies the indicators for problem-solving skills differences. The models predicting problem-solving skills on the basis of theoretical assumptions as well as empirical support are presented. Our results indicate that adults' lower performance does not seem to be associated with the vocational education and training educational system itself, but is mostly due to age, education in years, occupation, and gender, as well as work-related and everyday life factors. In practice, the models help to develop new approaches to enable novel problem-solving skills in technology-rich environments based on the current European workplace needs.

**Title:**

Hanushek, E. A., Schwerdt, G., Wiederhold, S., & Woessmann, L. (2015). Returns to skills around the world: Evidence from PIAAC. *European Economic Review*, 73(103-130). doi: 10.1016/j.euroecorev.2014.10.006

**Abstract:**

Existing estimates of the labor-market returns to human capital give a distorted picture of the role of skills across different economies. International comparisons of earnings analyses rely almost exclusively on school attainment measures of human capital, and evidence incorporating direct measures of cognitive skills is mostly restricted to early-career workers in the United States. Analysis of the new PIAAC survey of adult skills over the full lifecycle in 23 countries shows that the focus on early-career earnings leads to underestimating the lifetime returns to skills by about one quarter. On average, a one-standard-deviation increase in numeracy skills is associated with an 18 percent wage increase among prime-age workers. But this masks considerable heterogeneity across countries. Eight countries, including all Nordic countries, have returns between 12 and 15

percent, while six are above 21 percent with the largest return being 28 percent in the United States. Estimates are remarkably robust to different earnings and skill measures, additional controls, and various subgroups. Instrumental-variable models that use skill variation stemming from school attainment, parental education, or compulsory-schooling laws provide even higher estimates. Intriguingly, returns to skills are systematically lower in countries with higher union density, stricter employment protection, and larger public-sector shares.

He, Q., & Davier, M. (2015). Identifying feature sequences from process data in problem-solving items with N-Grams. In M. L. Ark, D. Bolt, W. Wang, J. Douglas, & S. Chow (Eds.), *Quantitative Psychology Research* (pp. 173-190). Cham: Springer International Publishing. doi: 10.1007/978-3-319-19977-1\_13

**Abstract:**

This article draws on process data from a computer-based large-scale program, the Programme for International Assessment of Adult Competencies (PIAAC), to address how sequences of actions recorded in problem-solving tasks are related to task performance and how feature sequences are identified for different groups. The purpose of this study is twofold: first, to explore and detect action sequence patterns of features that are associated with success or failure on a problem-solving item, and second, to mutually validate the results derived from two feature selection models. Motivated by the methodologies of natural language processing and text mining, we utilized n-gram model and two feature selection methods, chi-square statistic (CHI), and weighted log likelihood ratio test (WLLR), in analyzing the process data at a variety of aggregate levels. It was found that action sequence patterns significantly differed by performance groups and were consistent across countries. The two feature selection approaches resulted in a high agreement of feature identification.

Heisig, J. P., & Solga, H. (2015). Secondary education systems and the general skills of less- and intermediate-educated adults - a comparison of 18 countries. *Sociology of Education*, 88(3), 202-225. doi: 10.1177/0038040715588603

**Abstract:**

We investigate the impact of external differentiation and vocational orientation of (lower and upper) secondary education on country variation in the mean numeracy skills of, and skills gaps between, adults with low and intermediate formal qualifications. We use data on 30- to 44-year-olds in 18 countries from the 2011-12 round of the Program for the International Assessment of Adult Competencies. We find that higher levels of external differentiation (tracking) amplify skills gaps between less- and intermediate-educated adults. This is mainly due to lower mean skills achievement of less-educated adults. By contrast, greater emphasis on vocational skills in upper-secondary education is positively related to numeracy skills for both less- and intermediate-educated adults. Gains are larger for the less educated, so the gap in numeracy skills tends to fall with the degree of vocational orientation. We discuss implications of our findings for research on educational and labor market inequalities.

Heisz, A., Notten, G., & Situ, J. (2015). The role of skills in understanding low income in Canada. In T. I. Garner & K. S. Short (Eds.), *Research on Economic Inequality* (pp. 153-184). Bingley: Emerald Group Publishing Limited. doi: 10.1108/S1049-258520150000023005

**Abstract:**

This research explores how skill proficiencies are distributed between low-income and not-in low-income groups using the results of a highly complex survey of the information-processing skills of Canadians between the ages of 16 and 65. We find that having measures of skills enhances our understanding of the correlates of low income. Skills have an independent effect, even when controlling for other known correlates of low income, and their inclusion reduces the independent effect of education and immigrant status. This result is relevant for public policy development as the knowledge of the skills profile of the low-income population can inform the design of efficient and effective programmes.

Jerrim, J. (2015). The link between family background and later lifetime income: How does the UK compare with other countries? *Fiscal Studies*, n/a-n/a. doi: 10.1111/1475-5890.12081

**Abstract:**

The link between family background and labour market outcomes is an issue of great academic, social and political concern. It is frequently claimed that such intergenerational associations are stronger in Britain than other countries. But is this really true? I investigate this issue by estimating the link between parental education and later lifetime income, using three cross-nationally comparable datasets covering more than 30 countries. My results suggest that the UK is broadly in the middle of the cross-country rankings, with intergenerational associations notably stronger than in Scandinavia but weaker than in Eastern Europe. Overall, I find limited support for claims that family background is a greater barrier to economic success in Britain than other parts of the developed world. This article is protected by copyright. Jerrim, J. (2015). *Emigrants from Great Britain: What do we know about their lives?* DoQSS Workings Papers No. 15-02. London: University College London (UCL). Retrieved October 20, 2017, from <http://repec.ioe.ac.uk/REPEc/pdf/qsswp1502.pdf>

**Abstract:**

Each year more than 300,000 individuals leave Great Britain to start a new life overseas. Indeed, recent estimates suggest that up to 4.7 million British nationals now live abroad. Yet, in contrast to the substantial literature on the economic and social welfare of immigrants into Great Britain, comparatively little is known about the lives of emigrants from this country. This report provides, to the author's knowledge, the first quantitative study of this important issue. Labour market and social outcomes are compared between emigrants and individuals who choose to remain in Great Britain. I find a number of significant differences between these groups, along with notable variation by country of destination. This continues to hold true for certain outcomes even when differences in observable characteristics are taken into account.

Jerrim, J., & Macmillan, L. (2015). Income inequality, intergenerational mobility, and the Great Gatsby Curve: Is education the key? *Social Forces*, 94(2), 505-533. doi: 10.1093/sf/sov075

**Abstract:**

It is widely believed that countries with greater levels of income inequality also have lower levels of intergenerational mobility. This relationship, known as the Great Gatsby Curve (GGC), has been prominently cited by high-ranking public policymakers, bestselling authors, and Nobel Prize-winning academics. Yet, relatively little cross-national work has empirically examined the mechanisms thought to underpin the GGC—particularly with regard to the role of educational attainment. This paper uses the cross-nationally comparable Programme for International Assessment of Adult Competencies (PIAAC) data set to shed new light on this issue. We find that income inequality is associated with several key components of the intergenerational transmission process—including access to higher education, the financial returns on education, and the residual effect of parental education upon labor-market earnings. Thus, consistent with theoretical models, we find that educational attainment is an important driver of the relationship between intergenerational mobility and income inequality. We hence conclude that unequal access to financial resources plays a central role in the intergenerational transmission of advantage.

Jovicic, S. (2015). *Wage inequality, skill inequality, and employment: Evidence from PIAAC*. Schumpeter Discussion Papers No. 2015-007. Wuppertal: University of Wuppertal. Retrieved April 04, 2020, from <https://www.econstor.eu/bitstream/10419/121427/1/835247996.pdf>

**Abstract:**

This paper investigates how much of the difference in wage distributions is related to differences in skill distributions and whether a compressed wage distribution is associated with high unemployment across core OECD countries. Some countries that have more compressed (dispersed) wage structures simultaneously have more compressed (dispersed) skill structures as well, and according to many economists, variations in skill inequality can explain variations in wage inequality across different countries. Firstly, this paper examines the relationship between skill compression and wage compression; secondly, wage compression is linked to labor market outcomes in terms of employment. Compressed wage structure (usually caused by labor market institutions) is often seen as a cause for high unemployment in the low-skill sector. Does the wage compression hypothesis hold? Based on the PIAAC survey of adult skills for seventeen OECD countries, this paper seeks to shed light on these two important topics.

Koettl, J., Sharma, S., Kupets, O., Mattoo, A., Ozden, C., & Vigo, J. M. (2015). The effects of aging on productivity: diverse, not alarming. In M. Bussolo, J. Koettl, & E. Sinnott (Eds.), *Golden Aging: Prospects for Healthy, Active, and Prosperous Aging in Europe and Central Asia* (pp. 167-212). Washington D.C.: World Bank. doi: 10.1596/978-1-4648-0353-6

**Abstract:**

Explores how the age structure of the workforce affects aggregate productivity, and asserts that the impacts of aging on the dynamic channels of mobility, innovation, and entrepreneurship are more worrying than the effect of worker age alone on a firm's productivity. Though higher age is

associated with deterioration in some skills, aging does not necessarily lead to a drop-off in skills; some seemingly inevitable effects of aging could reflect issues specific to an older cohort of workers rather than the process of aging that will at some point affect younger cohorts, and the medical literature suggests that future cohorts will do better as they age. The old may be better than the young at certain things, but worse at others, and grasping the comparative advantage potential of aging will prove beneficial. In Europe and Central Asia (ECA) and the Baltics, as in other developing regions, the rise in average educational levels in successive cohorts provides an important cohort effect.

Le Mouel, M., & Squicciarini, M. (2015). *Cross-Country estimates of employment and investment in organisational capital: A task-based methodology using PIAAC data*. OECD Science, Technology and Industry Working Papers No. 8. Paris: OECD Publishing. doi: 10.1787/5jrs3smfgcjb-en

**Abstract:**

This work proposes a task-based methodology for the measurement of employment and investment in organisational capital (OC) in 20 OECD countries. It builds on the methodology of Squicciarini and Le Mouel (2012) and uses information from the OECD Programme for the International Assessment of Adult Competencies (PIAAC). OC is defined as firm-specific organisational knowledge resulting from the performance of tasks affecting the long-term functioning of firms, such as developing objectives and strategies; organising, planning and supervising production; and managing human resources. Cross-country heterogeneity in OC-related occupations emerges: while 20 occupational classes of the International Standard Classification of Occupations (ISCO 2008) are on average identified as being OC-related, country-specific values range between 14 (in Korea) and 24 occupations (in Poland). A core group of managerial occupations are consistently identified as OC occupations across countries, whereas differences arise in the selection of professionals and associate professionals in science and engineering, health, education, and business administration. Estimates suggest the share of OC occupations in total employment to amount to 16% on average, with country-specific values that vary between 9.5% (Denmark) and 26% (United Kingdom); and that total investment in OC, as a share of value-added, ranges from 1.4% in the Czech Republic to 3.7% in the United Kingdom, with an average 2.2% across all countries. Managers appear to account for less than half of total employment and investment in OC. Total investment in OC results higher in services than in manufacturing. In the services sector, on average half of investment in OC comes from small firms, while in manufacturing, 45% of investment in OC comes from large firms. Finally, the importance of OC investment in the public sector is investigated. With only few exceptions, investment in OC is higher in the public sector than in the private sector. These estimates of OC investment can be used to analyse its role with respect to skill use and mismatch, its impact on the routinisation of tasks and resulting polarisation of wage distribution, and its role in firms' integration and upgrading along global value chains (GVC).

Meisel, K., & Mickler, R. (2015). PIAAC: Konsequenzen für Bildungspolitik und Praxis der Erwachsenenbildung [PIAAC: Consequences for educational policy and for the practice of adult education]. *Zeitschrift für Pädagogik*, 61(2), 205-222.

**Abstract:**

The contribution focuses on the consequences of the PIAAC study and draws attention to the cir-

cumstance that the reactions to the findings have so far not had sufficient impact either on further education policy or on the practice of continuing education. A closer look at the results within the context of other thematically related studies reveals the continuing relevance and importance of basic education. Feedback from politics, the media, or the specialist community does not provide evidence of a unified maxim for action; however, concrete demands from the side of those concerned can be formulated. Consequences necessarily ensuing from these demands, which are directed at further education policy and at the practice of continuing education, are specified and hampering framework conditions as well as misdirected prioritizations are identified.

Meroni, E. C., Vera-Toscano, E., & Costa, P. (2015). Can low skill teachers make good students? Empirical evidence from PIAAC and PISA. *Journal of Policy Modeling*, 37(2), 308-323. doi: 10.1016/j.jpolmod.2015.02.006

**Abstract:**

Using teachers' skills from the Survey of Adult Skills (PIAAC) and students' performance from the Programme for International Students Assessment (PISA) we exploit a multilevel model to investigate how much of the variation in student performance can be explained by teacher quality at the country level across a number of OECD countries. Results show how teachers' skills seem to have positive effects on student achievement and explain part of the variation between countries in students' achievement. National policies and efforts made from Education departments to improve teacher quality seem crucial to achieve both overall excellence and greater equity across countries. (C) 2015 The Authors. Montt, G. (2015). *The causes and consequences of field-of-study mismatch: An analysis using PIAAC*. OECD Social, Employment and Migration Working Papers No. 167. Paris: OECD Publishing. doi: 10.1787/5jrxm4dhv9r2-en

**Abstract:**

Field-of-study mismatch occurs when workers educated in a particular field work in another. It is conceptually distinct from qualifications or skills mismatch, although a part of qualifications and skills mismatch results from graduates from a particular field having to downgrade to find work in another field. Some studies have identified labour market dynamics related to field-of-study mismatch, but few (if any) have sought to directly understand the interplay between labour supply factors (the types of skills brought to the workplace) and the labour demand factors (the types of skills demanded by employers) in field-of-study mismatch. Using data from the Programme for International Assessment of Adult Competencies' Survey of Adult Skills (PIAAC), this paper shows that although students may choose to specialise in a particular field, it is not solely up to them to actually work in that field. In accordance with assignment theories, both the degree of saturation of a particular field in the labour market and the level of generic skills of a particular field predict the occurrence of field-of-study mismatch, highlighting that mismatch is the result of both labour supply- and demand-side factors. The paper then evaluates the costs to individuals – in terms of wages, risk of being out of work and job satisfaction. Findings suggest that the costs of field-of-study mismatch may only be high in terms of individual earnings when it is associated to qualification mismatch. For economies, field-of-study mismatch, when associated with qualifications mis-

match, can amount to important costs, meriting the attention of policy makers to better aligning course places to skill needs or by encouraging skill transferability across fields.

Organisation for Economic Cooperation and Development (OECD) (2015). *OECD skills outlook 2015: Youth, skills and employability*. Paris: OECD Publishing. doi: 10.1787/9789264234178-en

**Abstract:**

Young people around the world are struggling to enter the labour market. In some OECD countries, one in four 16-29 year-olds is neither employed nor in education or training. The OECD Skills Outlook 2015 shows how improving the employability of youth requires a comprehensive approach. While education, social, and labour market policies have key roles to play, co-ordination between public policies and the private sector is also crucial. The publication, which builds on the results of the 2012 Survey of Adult Skills (PIAAC) presented in the first edition of the Skills Outlook, also presents examples of successful policies in selected countries.

Organisation for Economic Cooperation and Development (OECD) (2015). *Adults, computers and problem solving: What's the problem?* Paris: OECD Publishing. doi: 10.1787/9789264236844-en

**Abstract:**

The report provides an in-depth analysis of the results from the Survey of Adult Skills related to problem solving in technology-rich environments, along with measures concerning the use of ICT and problem solving. The Nordic countries and the Netherlands have the largest proportions of adults (around 40%) who score at the higher levels in problem solving, while Ireland, Poland and the Slovak Republic have the smallest proportions of adults (around 20%) who score at those levels. Variations in countries' proficiency in problem solving using ICT are found to reflect differences in access to the Internet and in the frequency with which adults use e-mail. The report finds that problem-solving proficiency is strongly associated with both age and general cognitive proficiency, even after taking other relevant factors into account. Proficiency in problem solving using ICT is related to greater participation in the labour force, lower unemployment, and higher wages. By contrast, a lack of computer experience has a substantial negative impact on labour market outcomes, even after controlling for other factors. The discussion considers policies that promote ICT access and use, opportunities for developing problem-solving skills in formal education and through lifelong learning, and the importance of problem-solving proficiency in the context of e-government services.

Paccagnella, M. (2015). *Skills and wage inequality: Evidence from PIAAC*. OECD Education Working Papers No. 114. Paris: OECD Publishing. doi: 10.1787/5js4xfgl4ks0-en

**Abstract:**

This paper exploits data from the Survey of Adult Skills (PIAAC) to shed light on the link between measured cognitive skills (proficiency), (formal) educational attainment and labour market outcomes. After presenting descriptive statistics on the degree of dispersion in the distributions of

proficiency and wages, the paper shows that the cross-country correlation between these two dimensions of inequality is very low and, if anything, negative. As a next step, the paper provides estimates of the impact of both proficiency and formal education at different parts of the distribution of earnings. Formal education is found to have a larger impact on inequality, given that returns to education are in general much higher at the top than at the bottom of the distribution. The profile of returns to proficiency, by contrary, is much flatter. This is consistent with the idea that PIAAC measures rather general skills, while at the top end of the distribution the labour market rewards specialized knowledge that is necessarily acquired through tertiary and graduate education. Finally, a decomposition exercise shows that composition effects are able to explain a very limited amount of the observed cross-country differences in wage inequality. This suggests that economic institutions, by shaping the way personal characteristics are rewarded in the labour market, are the main determinants of wage inequality.

Pfarr, K., Blohm, M., Blom, A. G., Erdel, B., Felderer, B., Fräßdorf, M., Hajek, K., Helmschrott, S., Kleinert, C., et al. (2015). Are incentive effects on response rates and nonresponse bias in large-scale, face-to-face surveys generalizable to Germany? Evidence from ten experiments. *Public Opinion Quarterly*, 79(3), 740-768. doi: 10.1093/poq/nfv014

**Abstract:**

In survey research, a consensus has grown regarding the effectiveness of incentives encouraging survey participation across different survey modes and target populations. Most of this research has been based on surveys from the United States, whereas few studies have provided evidence that these results can be generalized to other contexts. This paper is the first to present comprehensive information concerning the effects of incentives on response rates and nonresponse bias across large-scale surveys in Germany. The context could be viewed as a critical test for incentive effects because Germany's population is among the most survey-critical in the world, with very low response rates. Our results suggest positive incentive effects on response rates and patterns of effects that are similar to those in previous research: The effect increased with the monetary value of the incentive; cash incentives affected response propensity more strongly than lottery tickets do; and prepaid incentives could be more cost effective than conditional incentives. We found mixed results for the effects of incentives on nonresponse bias. Regarding large-scale panel surveys, we could not unequivocally confirm that incentives increased response rates in later panel waves.

Pouliakas, K., & Russo, G. (2015). *Heterogeneity of skill needs and job complexity: Evidence from the OECD PIAAC Survey*. IZA Discussion Papers No. 9392. Bonn: Institute for the Study of Labor.

**Abstract:**

We use information from the new OECD Survey of Adult Skills (PIAAC) to investigate the link between job tasks and cognitive skill demand in 22 advanced economies. Skill demand is operationalized by the assessed literacy and numeracy skills of workers with well-matched skills to their job duties. Jobs are categorised according to the nature of tasks, including the intensity of abstract reasoning, employee latitude, interactivity or manual work. The analysis confirms the significant relation between task complexity and higher skill needs. The significant relation holds independently of the endogenous supply of formal human capital, occupational or industrial structure

and other job or individual characteristics. The results confirm the (indirect) mapping between tasks and skills as predicted by the task approach to labour economics. Given the marked heterogeneity in workplace practices adopted by employers, it is clear that enterprise level workplace development policies are warranted as enablers of skills matching and higher labour productivity.

Prins, E., & Monnat, S. (2015). Examining associations between self-rated health and proficiency in literacy and numeracy among immigrants and US-born adults: Evidence from the Program for the International Assessment of Adult Competencies (PIAAC). *Plos One*, 10(7), 25. doi: 10.1371/journal.pone.0130257

**Abstract:**

This paper uses data from the Program for the International Assessment of Adult Competencies (PIAAC) to analyze the relationship between self-reported health (SRH) and literacy and numeracy proficiency for immigrants compared to U.S.-born respondents and for Hispanic versus Asian immigrants. The research questions were: (1) Are literacy and numeracy scores associated with adults' SRH? (2) Are associations between SRH and literacy and numeracy proficiency moderated by immigrant status? (3) Among immigrants, are literacy and numeracy scores more strongly associated with SRH for Hispanics versus Asians? Immigrants had significantly lower literacy and numeracy scores, yet reported better health than U.S.-born respondents. Ordinal logistic regression analyses showed that literacy and numeracy were both positively related to SRH for immigrants and U.S.-born adults, and should therefore be viewed as part of the growing evidence that literacy is an independent and significant social determinant of health. Second, U.S.-born and immigrant adults accrued similarly positive health benefits from stronger literacy and numeracy skills. Third, although Hispanic immigrants were more disadvantaged than Asian immigrants on almost all socioeconomic characteristics and had significantly lower literacy and numeracy scores and worse SRH than Asian immigrants, both Hispanic and Asian immigrants experienced similar positive health returns from literacy and numeracy proficiency. These findings underscore the potential health benefits of providing adult basic education instruction, particularly for immigrants with the least formal schooling and fewest socioeconomic resources.

Prins, E., Monnat, S., Clymer, C., & Toso, B. W. (2015). How is health related to literacy, numeracy, and technological problem-solving skills among U.S. adults? Evidence from the Program for the International Assessment of Adult Competencies (PIAAC). *Journal of Research and Practice for Adult Literacy, Secondary, and Basic Education*, 4(3), 22-42.

**Abstract:**

This paper uses data from the Program for the International Assessment of Adult Competencies (PIAAC) to analyze the relationship between U.S. adults' self-reported health and proficiencies in literacy, numeracy, and technological problem solving. Ordinal logistic regression analyses showed that scores on all three scales were positively and significantly related to health. After controlling for respondents' socioeconomic and demographic characteristics, only literacy remained significant, but the magnitude of the literacy effect diminished substantially. These results suggest that socioeconomic resources such as formal education, parents' education, and employment are the "pathway or mechanism" through which literacy, numeracy, and technological problem solving are related to health. Therefore, literacy, numeracy, and technological problem

solving should be viewed as social determinants of health. Policy implications include the need for literacy and ESL instruction, coupled with efforts to increase college completion and access to health insurance and support services for people with disabilities.

Quintini, G. (2015). *Working and learning: A diversity of patterns*. OECD Social, Employment and Migration Working Papers No. 169. Paris: OECD Publishing. doi: 10.1787/5jrw4bz6hl43-en

**Abstract:**

The combination of work and study has been hailed as crucial to ensure that youth develop the skills required on the labour market so that transitions from school to work are shorter and smoother. This paper fills an important gap in availability of internationally-comparable data. Using the 2012 Survey of Adult Skills (PIAAC), it draws a comprehensive picture of work and study in 23 countries/regions. Crucially, it decomposes the total share of working students by the context in which they work (VET, apprenticeships or private arrangements) and assesses the link between field of study and students' work. The paper also assesses how the skills of students are used in the workplace compared to other workers and identifies the socio-demographic factors and the labour market institutions that increase the likelihood of work and study. Finally, while it is not possible to examine the relationship between work and study and future labour market outcomes at the individual level, some aggregate correlations are unveiled.

Rammstedt, B., Perry, A., & Maehler, D. B. (2015). Zentrale Ergebnisse von PIAAC aus deutscher Perspektive [Key findings of PIAAC from a German Perspective]. *Zeitschrift für Pädagogik*, 61(2), 162-191.

**Abstract:**

The Program for the International Assessment of Adult Competencies (PIAAC) is an international comparative study on adult skills, namely literacy, numeracy, and problem solving in technology-rich environments. The present contribution gives a brief outline of the study's design and presents results from a German perspective. In literacy Germany is slightly below the OECD average, in numeracy slightly above. As expected, basic skills differ in all countries with individuals' educational achievements. The basic skills investigated in PIAAC are relevant to labor market indicators such as participation in the labor market and earnings.

Sabatini, J. (2015). *Understanding the basic reading skills of U.S. adults: reading components in the PIAAC literacy survey*. Princeton, N.J.: Educational Testing Service. Retrieved October 17, 2017, from <https://www.ets.org/s/research/report/reading-skills/ets-adult-reading-skills-2015.pdf>

**Abstract:**

The results of the Programme for the International Assessment of Adult Competencies (PIAAC) survey paint a troubling portrait of the literacy skills of adults in the United States. The survey included a direct assessment of skills and was conducted in 23 countries with nationally repre-

sentative samples of adults ages 16 through 65. Assessed were cognitive and workplace skills needed for success in the 21st-century global economy. The ability to read fluently and for understanding--to be able to learn from text--is perhaps the most important foundational skill for U.S. adult citizens' health, well-being, and social and economic advancement. It is a gateway to lifelong learning, education, and training. With the emergence of the Internet and social networking (which operate primarily through the written word), reading literacy provides control over an immeasurable, readily accessible library of the world's knowledge, as well as the ability to communicate with friends, family, and employers. While the digital revolution has increased the prevalence of and, access to, visual/aural media, written text--whether on paper or screen--continues to be an omnipresent currency of communication and commerce, except for adults who continue to struggle to read. Adults who have trouble reading, using mathematics, solving problems, and using technology are at a disadvantage when competing for jobs in the 21st-century workforce. The situation is perhaps most dire for those at the lowest level of reading literacy skills, because limited literacy skill reduces their access to print-based training and educational opportunities that could be used to enhance their social and workforce skills. Low literacy adults are not necessarily isolated, thanks to the ever-present visual media and communications available. However, their potential is limited because they cannot use printed media to learn, grow their knowledge, and seek opportunities. Interpersonally, it is often painfully obvious to adults when they cannot read well, as it also is to the casual observer. When confronted with text and a task, they can be observed puzzling and lingering for longer than proficient readers do when performing the same literacy activity. The introduction of reading component tasks in the 2011 PIAAC survey provided a rich opportunity to better understand adults with low literacy proficiency scores in the United States in comparison to similar populations in other countries. Reading components results help us to understand what adults with scores at or below Level 1 can and cannot do: (1) Can they identify the meaning of high-frequency vocabulary words when they appear in print? (2) Can they evaluate the meaning of single sentences? Can they read for local meaning in simple passages? and (3) What is the range and variation in foundational skills among the lowest scoring adults in a country? These are the questions addressed in this report. In sum, the reading components tasks in PIAAC were designed to complement the applied literacy tasks in order to provide a richer sense of what adults scoring at or below Level 1 can and cannot do when engaging and processing basic written words, sentences, and passages. In the remainder of the report, it describes in more detail: (1) the reading component measures, including the theoretical and empirical rationale for adopting this framework; (2) the results in a select set of countries that participated in the PIAAC survey; and (3) implications of those findings for policy and practice.

**Title:**

Squicciarini, M., Marcolin, L., & Horvát, P. (2015). *Estimating cross-country investment in training: An experimental methodology using PIAAC data*. OECD Science, Technology and Industry Working Papers No. 09. Paris: OECD Publishing. doi: 10.1787/5jrs3sftp8nw-en

**Abstract:**

The present work proposes a novel methodology for the measurement of investment in human capital in the form of training. Differently from existing studies, the expenditures-based approach pursued encompasses investment in formal and on-the-job training, as well as in informal learning and yields estimates that account for both the opportunity and the direct cost of the different forms of training considered. Using a wide array of data sources, including new and rich individual-level data collected through the OECD Programme for the International Assessment of Adult Competencies (PIAAC) survey as well as Labour Force Surveys (LFS) and System of National Accounts

(SNA) data, the study proposes estimates of investment in training for the years 2011-2012. These cover 22 OECD countries and are provided at both the economy and industry levels. Estimates suggest that average total investment in training corresponds to 6.7% of gross value added (GVA), with investment in on-the-job training (amounting to 2.4% of GVA, on average) that are substantially in line with those of previous literature. Wide sector and country heterogeneity in the relative importance of investment in formal and on-the-job and informal learning also emerge. On average, production appears more intensive in on-the-job training (relative to other training types) than overall services, but not relative to business services only. Public-oriented services such as education and health services invest a greater (smaller) proportion of total training expenditure in formal (on-the-job) training than other sectors and the overall economy.

**Title:**

Straesser, R. (2015). "Numeracy at work": A discussion of terms and results from empirical studies. *ZDM: The International Journal on Mathematics Education*, 47(4), 665-674. doi: 10.1007/s11858-015-0689-0

**Abstract:**

With a broad understanding or definition of "work" as something that includes unpaid labour, this paper examines the relationship between numeracy and work, and analyses specific forms and constraints of workplace related numeracy. This is done by highlighting and commenting on existing literature that focuses on the role of workplace mathematics and the identification of vocational mathematics. Following a numeracy framework suggested by Goos et al. (2014), the paper analyses three case studies, and pays special attention to mathematical knowledge, dispositions to mathematics, and the role of tools in industrial contexts. Workplace related mathematics often mixes mathematical and extra-mathematical knowledge and procedures into one "instrument", hiding and/or changing mathematics as it is encountered in or known from classrooms. Insights gained from case studies are complemented by an analysis of the PIAAC survey study. The paper leads to four major results, including a comment on the use of the term "numeracy" and a remark on "critical orientation" of numeracy from a workplace perspective.

**Title:**

Straková, J. (2015). Strong vocational education: A safe way to the labour market? A case study of the Czech Republic. *Educational Research*, 57(2), 168-181. doi: 10.1080/00131881.2015.1030853

**Abstract:**

Background: In its communications, the European Commission stresses the importance of vocational education and endorses apprenticeship training. Educational systems that have dual tracks of academic alongside vocational learning routes have been shown to generate better labour market outcomes for school leavers and smooth the school-to-work transition. On the other hand, dual tracked educational systems can reinforce the effect of social origin on educational performance: the differences between the achievement of students from a background characterised by low socio-economic status and students from high socio-economic status backgrounds are greater in a tracked system than in a comprehensive one. In addition to these general tendencies, the content and organisation of vocational education differ in individual countries, as do its strengths and weaknesses and impacts on the labour market prospects of young people. Purpose: This paper studies vocational education in the Czech Republic: specifically, its apprenticeship track leading directly to the labour market. It seeks to answer questions about whether the Czech appren-

ticeship education system provides its students with the knowledge and skills necessary for success in the modern labour market, and whether it facilitates their transition from school to work. The paper also studies the impact of the high vocational specificity of the Czech education system on educational inequalities and the development of these inequalities over time. Sample: The research questions are answered using statistical data and analyses of Czech data from international surveys of adult skills: the International Adult Literacy Survey (IALS) and the Organisation for Economic Co-operation and Development Programme for the International Assessment of Adult Competencies (PIAAC), which studied probability samples of adults aged 16–65 years. The IALS data were collected in 1998 and included 3132 cases, and the PIAAC data were collected in 2012 and included 6102 cases. Design and methods: The IALS and PIAAC data were analysed using binary logistic regression. Descriptive statistics from PIAAC, statistical yearbooks of education and national surveys on the transition from school to work were also used to provide evidence. Results: The analyses show that in spite of its high vocational specificity, the efficiency of the Czech education system in facilitating transition to the labour market is relatively low, as are the achievement outcomes of its apprentices. This high differentiation, moreover, contributes significantly and increasingly to educational inequalities. In the light of those findings, the paper discusses features of the Czech apprenticeship education system and intended policy measures that are aiming to retain the current structure of the system and foster apprenticeship education.

#### Title:

Sturman, L. (2015). What is there to learn from international surveys of mathematical achievement? In R. C. Kadosh & A. Dowker (Eds.), *The Oxford handbook of numerical cognition* (pp. 430–442). New York, US: Oxford University Press. doi: 10.1093/oxfordhb/9780199642342.013.037

#### Abstract:

This chapter explores some recent headline findings from the mathematical surveys (TIMSS and PISA), the possible uses to which those findings could be put, and some potential abuses of the data. It also looks at issues related to apparently different findings from the two surveys of mathematical achievement/literacy within a country. As well as direct involvement in the international coordination of some of these international studies, the NFER has long-standing experience as the National Centre coordinating and administering international surveys on behalf of the UK education departments. These studies include TIMSS (mathematics and science) and PISA (reading, mathematical literacy, scientific literacy and problem solving), as well as other international surveys such as PIRLS (reading literacy), ICCS (civics and citizenship), PIAAC (adult competences), and ESLC (European languages). This perspective of experience gives the NFER's international comparisons team strong insight into the nature of the surveys, the richness of the datasets produced, the lessons that can, in theory, be learned from them, and key limitations of the lessons that can be drawn from them.

Tippelt, R. (2015). Kompetenzentwicklung im Lebenslauf [Competence development throughout the course of life]. *Zeitschrift für Pädagogik*, 61(2), 157–161. doi: 10.3262/ZP1502157

#### Abstract:

Skills development is an integral part of the concepts of lifelong learning and development over the life course. Empirical findings show that skills are developed not only in childhood and adolescence but are also of central importance in adulthood. Adopting a cross-national comparative or a

social-differentiation perspective, the present essays describe on a representative basis the state of skills development in the residential population in Germany aged 16–65 years and 66–80 years. It must be asked whether, and if so how, further education practitioners and educational policy makers will incorporate these new findings into their formative actions. [Translated on behalf of editors]

Tippelt, R. (2015). PIAAC: Kompetenzfeststellung und-debatte in Spanien [Competence assessment and discussion in Spain]. *ZEP: Zeitschrift für Internationale Bildungsforschung und Entwicklungspädagogik*, 38(4), 26-30.

**Abstract:**

In Spain, the international competence-based studies such as PISA and PIAAC are intensely discussed. This article informs about the understanding of competence underlying these studies, about methodologically and internationally relevant results as well as about the specific disillusioning results on the competencies in reading and in mathematics of the 16 to 65 years olds in Spain. Yet, in the processing cohort-specific differences become evident because the younger age cohort acquires higher competencies as it is possible for the older cohort. In expert discussions different assessments of the PIAAC study result and strategies for educational policy and for practice become apparent, to which an outsider perspective is added.

**Title:**

Vicherková, D., Kaduchová, P., Chudy, S., & Harits, I. (2015). Readers' ways by connecting outcomes of PISA and PIAAC research and today's Czech school practice. *IJAEDU-International E-Journal of Advances in Education*, 1(3), 175-182. doi: 10.18768/ijaedu.82244

**Abstract:**

The aim of this article is to think about key issues of readers' comprehension literacy of specific category of research sample (fifteen and twenty-four) readers. To what extent is the information of both international researches implemented into reality and chosen curriculum. In the first part of the article is introduced the basic terminology (literacy according to OECD, functional literacy and reader's literacy). It is essential to understand that it is not just about literacy skills, i.e. being able to read texts and understand them, but also the skills to find, process, and compare the information contained in the text, and reproduce text content. In the second part the article thinks about and compares selected key data from international PISA and PIAAC research for specific category of research sample (fifteen and twenty-four years old readers). It is also worth considering whether the teaching community and the general public are aware of the need for specific measurements and the international comparison of literacy, in which the Czech Republic participates. In the third part the article focuses on results of international research and practice in the selected curricula of pedagogic -educational institutions for the pupil population. On several examples of pupils task from Czech curriculum are explained the reading strategies. The discussed literacy strategies reflect the skill of the student to find information, process, compare, and evaluate it according to specification. The main objective of this text is to reflect on the possibilities of linking the outputs of both readership surveys, such as functional literacy and school practice in our Czech environment.

Wiederhold, S. (2015). *Macroeconomic growth and lifelong learning*. Thematic Report, proceedings of LLLight'in'Europe research project Friedrichshafen: LLLightinEurope Research Consortium. Retrieved October 27, 2017, from [http://www.lllightineurope.com/fileadmin/lllightineurope/download/LLLight\\_Macroeconomic\\_Growth\\_and\\_LLL\\_thematicreport\\_TR6\\_20150922.pdf](http://www.lllightineurope.com/fileadmin/lllightineurope/download/LLLight_Macroeconomic_Growth_and_LLL_thematicreport_TR6_20150922.pdf)

**Abstract:**

PIAAC, a new international adult skill survey developed under the patronage of the OECD, offers novel insights on the role of cognitive skills in modern knowledge-based economies. Research based on these data shows that higher cognitive skills – measured across numeracy, literacy, and ICT domains – are systematically related to higher employment probabilities. Moreover, better cognitive skills are also associated with higher wages in all countries participating in PIAAC, with economically meaningful effect sizes. Among prime-age workers (35-54 years old), going up one out of five competency levels in numeracy skills is associated with increased hourly wages averaging some 18 percent across countries. But perhaps the most striking finding from the international analysis is the substantial heterogeneity in returns to skills across countries. Estimated returns to skills in the countries with the highest returns (the United States, Ireland, and Germany) are roughly twice as large as in the countries with the lowest returns (Sweden, the Czech Republic, and Norway). Intriguingly, returns to skills are systematically lower in countries with higher union density, stricter employment protection, and larger public-sector shares. This new research adds to previous evidence showing that cognitive skills are closely linked to economic growth. An increase in educational achievement by 50 PISA points translates into 1 percentage point higher growth rates in the long run. Importantly, what matters for growth is the skills that people have actually learned, not how long people stayed at school. This evidence strongly calls for a focus on educational outcomes, not just attainment. Given that human capital is a leading determinant of employment, earnings, and economic growth in modern knowledge-based economies such as the European Union, it is all the more worrying that many European countries show a rather poor performance in the recent PIAAC test when compared with the top-performing countries. This signals a dire need for reforms if the European Union wants to prosper in the future. Regarding human capital accumulated at school, a number of rigorous studies show that a good governance framework of the school system and effective teachers are important for achieving high levels of skills among students. However, continuing structural and technological change of the economies clearly asks for skill adaptations and a process of lifelong learning after school. This puts the focus on policies that ensure that skills are effectively retained and used. Furthermore, skills also accumulate by regularly practicing them. This learning by doing seems to develop skills at a faster rate when there is substantial novelty and challenge in the scope of everyday activities undertaken by employees. An economy which has its production composed of intellectually complex activities also appears to grow faster. In fact, more than half of the real per capita income growth in the United States over the period 1980-2010 resulted from an increased complexity of jobs, while just about one-third came from growth in average years of schooling.

### Title:

Barrett, G., & Riddell, W. (2016). *Ageing and literacy skills*. OECD Education Working Papers No. 145. Paris: OECD Publishing. doi: 10.1787/5jlphd2twps1-en

### Abstract:

This paper examines the relationship between age and literacy using data from the International Adult Literacy Survey (IALS), the Adult Literacy and Life Skills Survey (ALL) and The Survey of Adult Skills, a product of the OECD Programme for the International Assessment of Adult Competencies (PIAAC). A negative partial relationship between literacy and age exists with literacy declining with age, especially after age 45. However, this relationship could reflect some combination of age and birth cohort effects. The analysis shows that in most participating countries the negative literacy-age profile observed in cross-sectional data arises from offsetting ageing and cohort effects. With some exceptions, more recent birth cohorts have lower levels of literacy and individuals from a given birth cohort lose literacy skills after they leave school at a rate greater than indicated by cross-sectional estimates. The results for birth cohort suggest that there is not a general tendency for literacy skills to decline from one generation to the next, but that the majority of the countries examined are doing a poorer job of developing literacy skills in successive generations.

### Title:

Blossfeld, P. N., Blossfeld, G. J., & Blossfeld, H.-P. (2016). Changes in educational inequality in cross-national perspective. In M. J. Shanahan, J. T. Mortimer, & M. Kirkpatrick Johnson (Eds.), *Handbook of the life course*. New York: Springer. doi: 10.1007/978-3-319-20880-0\_10

### Abstract:

In the process of educational expansion and reforms, the old sharp divisions between academic and vocational/technical tracks in the secondary school systems of modern societies have greatly diminished and the proportion of young people who have completed at least upper secondary education has risen impressively. Also, the enrollment in higher education has quickly grown in all modern countries and turned their tertiary educational systems into institutions of mass education. Using truly comparative data from the PIAAC study, we analyze how the educational attainment of men and women from families with different educational backgrounds has changed over time in 22 modern societies. The results show that there are great cross-national differences in the development of inequality of educational opportunity.

### Title:

Brandt, N., & Sicari, P. (2016). *The skills of polish emigrants: evidence from PIAAC*. Working Papers No. 1332. Paris: OECD Publishing. doi: 10.1787/5jlpq7tg3hxs-en

### Abstract:

Based on the OECD data from the Survey of Adult Skills (PIAAC) this paper sheds light on the skills of migrants. In line with earlier research the data show that migrants from Poland are more likely to have a tertiary degree than peers at home, but they often work in elementary professions abroad that do not match these high qualifications. This may well be at least partly a language issue, as migrants from Poland resemble migrants from other low-income countries in that their numeracy and literacy skills in the language of their host country is markedly lower than the aver-

age across all PIAAC participants, migrants or not. This gap is smaller, though, when looking only at migrants who report having been tested in a language that they use often and master well. The data reveal an interesting difference with migrants from higher-income countries, as their test results do not differ from the average, although they face the same language issues as other migrants. The reason may well be that only migrants from low-income countries can hope to earn higher wages abroad even if they work in low-skill professions, while migrants from higher-income countries need to master the language of their host country to do well. In fact, Polish migrants earn higher wages than their peers who stayed at home, even though they are particularly often overqualified.

**Title:**

Chudy, S., & Vicherková, D. (2016). Application of selected outcomes from PISA and PIAAC researches to Czech curriculum and reading education. *Universal Journal of Educational Research*, 4(9), 2002-2010. doi: 10.13189/ujer.2016.040910

**Abstract:**

This article deals with problematic fields which influence the level of reading strategies of fifteen to nineteen years old pupils (e.g. selected productive learning activities, work with diverse types of texts and information sources etc.). Moreover, the paper provides information about efficiency testing of pupils in selected reading strategies during entrance examination to high school and high school graduation exams. What is the connection between the trends in the Czech and foreign curriculum based upon the PISA and PIAAC outcome application? The aim of this paper is the reflection and analysis of key issues of the functional reading literacy, the methods employed were: content analysis of a selected part of the Czech curriculum, outcome comparison of international reading literacy researches PISA and PIAAC, reflection and analysis of approaches to test tasks for entrance examination to high school. This paper points out the complexity of curricular system, i.e. interdependence of primary, secondary and lifelong reading education.

Cincinnati, S., De Wever, B., Van Keer, H., & Valcke, M. (2016). The influence of social background on participation in adult education: Applying the cultural capital framework. *Adult Education Quarterly*, 66(2), 143-168. doi: 10.1177/0741713615626714

**Abstract:**

In this article, we address the issue of participation in adult education building on the cultural capital framework. This theoretical framework suggests that (educational) practices are affected by one's social background and, more precisely, by the cultural resources handed down in the family context. To examine the validity of this theoretical framework, we build on data from the Programme for the International Assessment of Adult Competencies from 23 countries (n = 120,789). The Programme data allow using the variables parents' educational level (a proxy for social background), educational attainment, and readiness to learn as precursors of participation in adult education (both a proxy for cultural capital). Our findings suggest that the cultural capital framework is not fully suited to explain participation in adult education: Although social background has an (indirect) influence on participation, its effect does not concur with theoretical predictions, that is, mediated by the readiness to learn.

**Title:**

Danner, D., Blasius, J., Breyer, B., Eifler, S., Menold, N., Paulhus, D. L., Rammstedt, B., Roberts, R., Schmitt, M., et al. (2016). Current challenges, new developments, and future directions in scale construction. *European Journal of Psychological Assessment*, 32, 175-180. doi: 10.1027/10155759/a000375

**Abstract:**

Measurement instruments are the foundation for empirical research in the social sciences. Instruments are necessary for measuring latent constructs such as cognitive and non-cognitive skills in the Programme for the International Assessment of Adult Competencies (PIAAC), personality characteristics in studies such as the International Social Survey Program (ISSP), or attitudes in international studies such as the European Social Survey (ESS). Measurement instruments also allow researchers, practitioners, and policy makers to describe individuals, groups, or societies, to assess patients in clinical settings, or to select, classify, or assist in the remediation of workers and students. Many policy, research, and applied decisions depend on measurement instruments and the quality of these decisions depends on the quality of the instruments, which is closely entwined with the scale development process (Ziegler, 2014). The aim of this editorial is to describe challenges and new developments in scale construction and discuss how they can facilitate the quality of measurement instruments.

**Title:**

De la Rica, S., & Gortazar, L. (2016). *Differences in job de-routinization in OECD countries: Evidence from PIAAC*. IZA Discussion Papers No. 9736. Bonn: Forschungsinstitut zur Zukunft der Arbeit (IZA). Retrieved December 17, 2017, from <https://ideas.repec.org/p/iza/izadps/dp9736.html>

**Abstract:**

The aim of the paper is threefold. First, we compute differences on the degree of de-routinization of job contents across a harmonized and hence comparable sample of Anglo-Saxon, many European and even Asian advanced countries. We do so by using very precise information on job contents at the worker level, which allows for job task heterogeneity within occupations. Second we assess the extent to which computer adoption leads to the observed difference in the degree of de-routinization of job contents. Third, we test whether higher degrees of technology adoption are associated to higher wage inequality. Our results show remarkable differences in the degree of de-

routinization of job contents across countries, being computer adoption at work a key significant driver of such differences. In particular, ICT use at work explains 13.4% (6.3%) of the cross-country unconditional (conditional) differences in de-routinization of job contents. Regarding the impact of adoption technology on wage inequality, our results indicate that although differences in ICT adoption explain an important and significant part of wage differentials, the effect is homogeneous for all the wage distribution, implying that we cannot find a significant association between wage inequality and technology adoption. Tables, Figures, Appendixes, References.

**Title:**

Desjardins, R., Melo, V., & Lee, J. (2016). Cross-national patterns of participation in adult education and policy trends in Korea, Norway, and Vietnam. *Prospects: Quarterly Review of Comparative Education*, 46(1), 149-170. doi: 10.1007/s11125-016-9384-3

**Abstract:**

Using comparative data, this article examines the level and distribution of participation in adult education (AE) opportunities among countries that participated in PIAAC (Programme for the International Assessment of Adult Competencies). It considers observed cross-country patterns in relation to some mechanisms that drive unequal chances to participate and to some policy issues that surround the provision, governance, and financing of different types of adult learning. It also explores recent policy developments relevant to AE in three selected countries (Korea, Norway, and Vietnam).

Evans, J. (2016). What to look for in PIAAC results. In K. Yasukawa & S. Black (Eds.), *Beyond Economic Interests. International Issues in Adult Education* (pp. 41-58). Rotterdam: SensePublishers. doi: 10.1007/978-94-6300-444-2\_3

**Abstract:**

In October 2013, results from the Organisation for Economic Co-operation and Development (OECD) sponsored Programme for the International Assessment of Adult Competencies (PIAAC) for 24 participating countries (mostly in Europe, but also including North America, the Far East, and Australia) became available. As the successor to the International Adult Literacy Survey (IALS) in the 1990s and the Adult Literacy and Lifeskills (ALL) survey in the 2000s, PIAAC aims to provide information as an international comparative survey. In this chapter, I focus on how to understand these studies, by considering conceptual issues, methodological aspects (research design and execution), and presentation of results. I also discuss the types of results from Australia made available in October 2013, as well as preliminary results released by the Australian Bureau of Statistics (ABS) earlier in that year (ABS, 2013a, 2013b). The chapter aims to air questions concerning the relevance of these survey results to literacy and numeracy researchers and practitioners, and the types of further research possibly needed, in different national and local contexts. Falck, O., Heimisch, A., & Wiederhold, S. (2016). *Returns to ICT skills*. OECD Education Working Papers No. 134. Paris: OECD Publishing. doi: 10.1787/5jlzfl2p5rzq-en

**Abstract:**

How important is mastering information and communication technologies (ICT) in modern labour markets? We present the first evidence on this question, drawing on unique data that provide internationally comparable information on ICT skills in 19 countries from the OECD Programme for the International Assessment of Adult Competencies (PIAAC). Our identification strategy relies on the idea that Internet access is important in the formation of ICT skills, and we implement instrumental-variable models that leverage exogenous variation in Internet availability across countries and across German municipalities. ICT skills are substantially rewarded in the labour market: returns are at 8% for a one standard-deviation increase in ICT skills in the international analysis and are almost twice as large in Germany. Placebo estimations show that exogenous Internet availability cannot explain numeracy or literacy skills, suggesting that our identifying variation is independent of a person's general ability. Our results further suggest that the proliferation of computers complements workers in executing abstract tasks that require ICT skills.

Feinberg, I., Frijters, J., Johnson-Lawrence, V., Greenberg, D., Nightingale, E., & Moodie, C. (2016). Examining associations between health information seeking behavior and adult education status in the US: An analysis of the 2012 PIAAC data. *Plos One*, 11(2), 20. doi: 10.1371/journal.pone.0148751

**Abstract:**

This paper presents data from the Program for the International Assessment of Adult Competencies with a focus on the interrelationships among health information seeking behavior (HISB), and health status or use of preventive health measures for U.S. adults both with and without a high school diploma. Key results of ordinal and binary logistic regression analyses indicated that, after controlling for demographic factors, (1) adults with a high school diploma use more text-based health information sources while adults without a high school diploma use more oral sources, (2) using the Internet as a source of health information is more strongly related to reporting excellent/very good health status than having a high school diploma, (3) those without a high school diploma who use the Internet report the largest increase in health status over any other health information source, and (4) for those with learning disability or vision problem, a high facility in reading English is an important predictor of whether the Internet is used as a health information source. The Internet appears to play a key role in both enhancing health status and enabling use of preventive measures for those with and without a high school diploma; although, individuals without a high school diploma who use the Internet for health information derive substantial benefit in health status.

Forster, A. G., Bol, T., & Werfhorst, H. (2016). Vocational education and employment over the life cycle. *Sociological Science*, 3, 473-494. doi: 10.15195/v3.a21

**Abstract:**

Vocationally educated individuals often find employment sooner after school than those with a

general educational qualification. A recent study has argued that the higher employment probability associated with a vocational qualification reverses in later life. The main explanation is that although having (occupation-)specific skills is an advantage when entering the labor market, specific skills also make the vocationally educated less flexible. This life cycle effect is hypothesized to be especially strong in countries where the vocational system provides highly occupation-specific skills. We test these two hypotheses on cross-national data from PIAAC 2012. Using logistic regressions with country fixed effects, we find that individuals with a vocational qualification have a higher employment probability than those with a general qualification at the start of their career, but this pattern reverses in later life. In contrast to earlier findings, we do not find that this effect varies systematically across countries with different vocational educational systems.

Goldhammer, F., Martens, T., Christoph, G., & Lüdtke, O. (2016). *Test-taking engagement in PIAAC*. OECD Education Working Papers No. 133. Paris: OECD Publishing. doi: 10.1787/5jlzfl6fhxs2-en

**Abstract:**

In this study, we investigated how empirical indicators of test-taking engagement can be defined, empirically validated, and used to describe group differences in the context of the Programme of International Assessment of Adult Competences (PIAAC). The approach was to distinguish between disengaged and engaged response behavior by means of response time thresholds. Constant thresholds of 3000 ms and 5000 ms were considered, as well as item-specific thresholds based on the visual inspection of (bimodal) response time distributions (VI method) and the proportion correct conditional on response time ( $P_{>0\%}$  method). Overall, the validity checks comparing the proportion correct of engaged and disengaged response behavior by domain and by item showed that the  $P_{>0\%}$  method performed slightly better than the VI method and the methods assuming constant thresholds. The results for Literacy and Numeracy by module revealed that there was an increase from Module 1 to Module 2 in the proportion of disengaged responses, suggesting a drop in test-taking engagement. The investigation of country differences in test-taking engagement by domain using the  $P_{>0\%}$  method showed that the proportion of responses classified as disengaged was quite low. For Literacy, the proportion was well below 5% for the majority of countries; in Numeracy, the proportion was even smaller than 1% for almost all countries; while for Problem solving, the proportion of disengaged responses was more than 5% but usually well below 10%. There were significant differences in test-taking engagement between countries; the obtained effect sizes were small to medium. Population differences in test-taking engagement were highly correlated between the three domains, suggesting that test-taking engagement can be conceived as a consistent characteristic. Furthermore, there was a clear negative association between test-taking disengagement and proficiency in Literacy, Numeracy and Problem solving, respectively. Finally, subgroup differences for gender, age, educational attainment, and language proved to be insignificant or very small. Results suggest that males tend to be more disengaged, that disengagement increases with age in Problem solving, with lower educational attainment and when the test language is not the same as a testee's native language.

Golsteyn, B. H. H., Vermeulen, S., & Wolf, I. (2016). Teacher literacy and numeracy skills: International evidence from PIAAC and ALL. *De Economist*, 1-25. doi: 10.1007/s10645-016-9284-1

**Abstract:**

Using the OECD-studies PIAAC and ALL, this paper shows that teachers on average have better literacy and numeracy skills than other respondents in almost all of the 15 countries in the samples. In most countries, teachers outperform others in the bottom percentiles, while in some countries they perform better than others throughout the skill distribution. These results imply that the scope to improve teachers' skills varies between countries and that policy makers should take the shape of the skills distribution into account when designing interventions in order to most efficiently raise teachers' skills.

Gorges, J., Maehler, D. B., Koch, T., & Offerhaus, J. (2016). Who likes to learn new things: Measuring adult motivation to learn with PIAAC data from 21 countries. *Large-scale Assessments in Education*, 4(1), 1-22. doi: 10.1186/s40536-016-0024-4

**Abstract:**

**Background:** Despite the importance of lifelong learning as a key to individual and societal prosperity, we know little about adult motivation to engage in learning across the lifespan. Building on educational psychological approaches, this article presents a measure of Motivation-to-Learn using four items from the background questionnaire of the Programme for the International Assessment of Adult Competencies (PIAAC). **Methods:** We used multiple-group confirmatory factor analyses for ordered categorical data to investigate the scale's dimensionality and measurement invariance across countries. Regression analyses were used to investigate the scale's criterion validity. **Results:** Results show that the proposed four-item scale fits the data considerably better than the original six-item scale labeled Readiness-to-Learn. Further analyses support the scale's configural, metric (weak) and partial scalar (strong) measurement invariance across 21 countries. As expected, Motivation-to-Learn has significant relations to the working population's engagement in learning in terms of participation in non-formal education over the last 12 months. These relations remain relevant after taking literacy as an indicator of level of education into account. **Conclusion:** The Motivation-to-Learn scale presented here may be used to indicate adult motivation in cross-country comparisons. The potential of using the scale in future PIAAC analyses and research on adult learning is discussed.

Green, F., & Henseke, G. (2016). Should governments of OECD countries worry about graduate underemployment? *Oxford Review of Economic Policy*, 32(4), 514-537. doi: 10.1093/oxrep/grw024

**Abstract:**

To assess potential public concerns, this paper examines theory and evidence surrounding graduate educational underemployment (overeducation) in this era of mass higher education. Using a new, validated, index of graduate jobs, we find that the prevalence of graduate underemployment across 21 countries is correlated with the aggregate supply-demand imbalance, but not with indicators of labour market flexibility. Underemployment's association with lower job satisfaction and pay is widespread. Yet in most countries there are external benefits (social trust, volunteering, and political efficacy) associated with higher education, even for those who are underemployed. Taken together with existing studies we find that, in this era of mass higher education participation, under-employment is a useful indicator of the extent of macroeconomic disequilibrium in the graduate labour market. We conclude that governments should monitor graduate underemployment,

but that higher education policy should be based on social returns and should recall higher education's wider purposes.

Grotlüschen, A. (2016). Literacy level I and below versus literacy level IV and above. *Zeitschrift für Weiterbildungsforschung-Report*, 39(2), 255-270. doi: 10.1007/s40955-016-0068-7

**Abstract:**

Literacy as specified in the recent PIAAC survey (OECD 2013) is separated into competence levels. This allows a comparison of adults performing on literacy Level I and below versus those performing on Level IV and above. The PIAAC survey also contains variables on participation in adult education. Core findings confirm the Matthew effect for participation rates, but not for training hours.

Grotlüschen, A., Mallows, D., Reder, S., & Sabatini, J. (2016). *Adults with low proficiency in literacy or numeracy*. OECD Education Working Papers No. 131. Paris: OECD Publishing. doi: 10.1787/5jm0v44bnmnm-x-en

**Abstract:**

This paper offers a comprehensive analysis of the information from the Survey of Adult Skills (PIAAC) regarding adults with low literacy and numeracy proficiency. The paper first describes the demographic and socio-economic characteristics of these populations. Although, they are more likely than the rest of the population to exhibit certain characteristics, such as lower levels of educational attainment, lower rates of unemployment or more disadvantaged backgrounds, adults with low literacy are found in among all socio-demographic groups and in all walks of life. The paper then explores the frequency with which adults with low proficiency engage in the reading, writing and numeracy practices and the relationship between these practices and a range of social and economic outcomes. For most outcomes, levels of engagement in literacy practices appear to be as strong predictors as proficiency, indicating the importance of encouraging more intense use of these skills both in and outside of work. The unique data from the Survey of Adult Skills regarding performance on the simple reading tasks (the so called "reading components") is also analysed. Adults with low proficiency are found to be able to easily recognise commonly used words in printed form but often have difficulty with processing the logic of sentences and reading extended passages for basic meaning. Adults with low proficiency are considerably less likely than their more proficient peers to participate in formal or non-formal adult education or training programmes, which is mostly due to the socio-demographic and employment characteristics of this population. However, the lower participation rates among the low proficient adults does not appear to be a consequence of their lack of motivation as much as of the presence of various obstacles to participation, such as lack of time and the cost of training.

Gustafsson, J. E. (2016). Lasting effects of quality of schooling: Evidence from PISA and PIAAC. *Intelligence*, 57, 66-72. doi: 10.1016/j.intell.2016.05.004

**Abstract:**

The aim was to investigate to what extent quality of compulsory schooling is reflected in adult literacy and numeracy performance levels. Data from five administrations of the PISA survey between 2000 and 2012 for 20 countries were analyzed, along with data from corresponding age cohorts for the same set of countries participating in the cross-sectional PIAAC survey. For each country the PISA data was used to estimate linear achievement trends for literacy, numeracy and science to indicate change in quality of schooling and for the PIAAC data mean differences were computed between a younger and an older age group. The PIAAC performance differences were strongly related to the PISA achievement trends ( $r=0.70$ ), and relations held up when controls were introduced for level of education attained ( $\beta = 0.55$ ) and for general social and cultural development of the country ( $\beta = 0.48$ ). It is concluded that quality of schooling has lasting impact on adult literacy and numeracy performance levels. (C) 2016 Elsevier Inc. All rights reserved.

Hampf, F., & Woessmann, L. (2016). *Vocational vs. general education and employment over the life-cycle: New evidence from PIAAC*. CESifo Working Paper No. 6116. Munich: CESifo Group Munich.

**Abstract:**

It has been argued that vocational education facilitates the school-to-work transition but reduces later adaptability to changing environments. Using the recent international PIAAC data, we confirm such a trade-off over the life-cycle in a difference-in-differences model that compares employment rates across education type and age. An initial employment advantage of individuals with vocational compared to general education turns into a disadvantage later in life. Results are strongest in apprenticeship countries that provide the highest intensity of industry-based vocational education.

He, J., & Van de Vijver, F. J. R. (2016). Response styles in factual items: Personal, contextual and cultural correlates. *International Journal of Psychology*, 51(6), 445-452. doi: 10.1002/ijop.12263

**Abstract:**

This study investigated response styles in factual items and explored their associations with personal, contextual and cultural factors. Responses on various factual questions, cognitive tests and interviewers' observational data from a total of 152,514 respondents in 22 countries in the Programme for the International Assessment of Adult Competencies (PIAAC) were analysed. Indexes of extreme, midpoint and acquiescent response styles were extracted from Likert-scale and dichotomous responses of factual items. A general response style (GRS) with a positive loading of extreme response style and negative loadings of midpoint and acquiescent response styles was confirmed. This factor showed a similar cross-cultural patterning as another general factor from attitudinal and self-evaluative items of Likert scales in a previous study, which indicated the pervasiveness of response styles irrespective of types of survey items. In a multilevel analysis, the individual-level GRS was found to be negatively related to being male, educational level and literacy competency, and positively related to 3rd-person presence and background noise, and at country level negatively associated with socioeconomic development. Cross-level interactions were also found. Implications on the pervasiveness and nature of response styles are discussed.

Henseke, G., & Green, F. (2016). *"Graduate jobs" in OECD countries*. OECD Education Working Papers No. 144. Paris: OECD Publishing. doi: 10.1787/5jlphd30vdr0-en

**Abstract:**

A recurring issue for education policy-makers is the labour market effect of the long-term global mass expansion of higher education, particularly on what is a "graduate job". The traditional assumption is that graduate jobs are virtually coterminous with professional and managerial occupations. A new indicator of graduate jobs, termed ISCO(HE)2008, is derived using task-based data drawn from the Survey of Adult Skills, a product of the OECD Programme for the International Assessment of Adult Competencies (PIAAC). The new classification shows that several jobs in ISCO major group 3 "Technicians and Associate Professionals" are also classed as graduate jobs in many countries. Altogether, 27.6% of jobs are classified as graduate jobs in the 15 OECD country-regions for which we have data. Considerable variation in the proportion of graduate jobs is found across industries and countries and in the short period from 2011 to 2013, the proportion of graduate jobs has become more diverse across countries.

Jimeno, J. F., Lacuesta, A., Martínez-Matute, M., & E., V. (2016). *Education, labour market experience and cognitive skills*. OECD Education Working Paper No. 146. Paris: OECD Publishing. doi: 10.1787/5jlphd2qj19n-en

**Abstract:**

This paper examines how formal education and experience in the labour market correlate with measures of human capital available in The Survey of Adult Skills, a product of the OECD Programme for the International Assessment of Adult Competencies (PIAAC). The findings are consistent with the notion that, in producing human capital, work experience substitutes formal education at the bottom of the schooling distribution. First, the number of years of working experience correlates with literacy proficiency only among low-educated individuals. Secondly, low-educated workers who only perform simple tasks on their jobs (calculating percentages or reading emails) do better in numeracy and literacy tests than similar employees who did not perform those tasks. Thirdly, workers in jobs intensive in numeric tasks perform relatively better in the numeracy section of the PIAAC test than in the literacy part. Overall, our results suggest that the contribution of on-the-job learning to skill formation is about a third of that of compulsory schooling in most of the countries that participated in PIAAC.

Lane, M., & Conlon, G. (2016). *The impact of literacy, numeracy and computer skills on earnings and employment outcomes*. OECD Education Working Papers No. 129. Paris: OECD Publishing. doi: 10.1787/5jm2cv4t4gzs-en

**Abstract:**

Using the 2012 PIAAC data, our analysis confirms that there are significantly higher earnings and employment returns to "both" increasing levels of formally recognised education, and to increasing levels of numeracy, literacy and information and communication technologies (ICT) skills proficiencies controlling for the level of education. Unsurprisingly, the labour market returns to changes in formally recognised levels of education in general exceed the labour market returns associated with increasing levels of skills proficiency. In the case of literacy and numeracy proficiencies, improved literacy and numeracy skills narrow the labour market outcomes gap between individuals with different levels of formally recognised education, but do not close it completely. The analysis demonstrates more substantial returns to ICT skills. Furthermore, possession of higher levels of ICT skills and lower levels of formally recognised qualification are often associated with higher returns compared to individuals with higher levels of formally recognised education but lower ICT proficiency levels. In other words, ICT skills proficiencies often entirely compensate for lower formally recognised qualifications in the labour market.

Li, T., Davier, M., & Hancock, G. R. (2016). *The prediction of labor force status: Implications from international adult skill assessments*. Research Report. doi: 10.1002/ets2.12097

**Abstract:**

This report investigates the prediction of labor force status using observed variables, such as gender, age, and immigrant status, and more importantly, measured skill variables, including literacy proficiency and a categorical rating of educational attainment based on the 1994 International Adult Literacy Survey (IALS), the 2003 Adult Literacy and Life Skills Survey (ALL), and the 2011 Programme for the International Assessment of Adult Competencies (PIAAC) projects. We explored the regression relations in the past two decades for six trend countries and subnational regions that provide data for all assessments: the United States, Norway, the Netherlands, Italy, Canada's English-speaking region, and Canada's French-speaking region. Probit regression models with latent predictors were used in this cross-sectional study to investigate how those variables are structurally related to labor market outcomes. Results show the importance of literacy proficiency and education in determining individuals' labor force status across countries/regions, but with key differences among these countries/regions.

**Title:**

Lind, P., & Mellander, E. (2016). *Relations between immigration and adult skills: Findings based on PIAAC*. Working Paper No. 21. Uppsala: Institute for Evaluation of Labour Market and Education Policy.

**Abstract:**

The international survey of adult skills, PIAAC, records large differences in numeracy and literacy skills between immigrants and non-immigrants. We examine how these differences relate to the countries' average skills and skill rankings. Immigrants are defined by country of birth or in terms of languages spoken. For almost all countries, the differences in average skills between non-immigrants and the country's entire population are significant but small. Regarding skill rankings significant differences are found only for Sweden and these are found to be sensitive to the treatment of individuals that could not conduct the skill tests due to language difficulties.

Lundetræ, K., & Gabrielsen, E. (2016). Relationship between literacy skills and self-reported health in the Nordic countries. *Scandinavian Journal Of Public Health*, 44(8), 758-764. doi: 10.1177/1403494816668082

**Abstract:**

**Aims:** This study investigated the association between literacy skills and self-reported health among Danish (n = 7284), Finnish (n = 5454), Norwegian (n = 4942) and Swedish (n = 4555) participants aged 16–65 years. **Methods:** Logistic regression models were used to assess the association between literacy skills and self-reported health after adjusting for sex, age and educational level. **Results:** Nordic participants aged 16–65 years with literacy skills at the lowest level reported sub-optimal health more often (28–37%) than those with literacy skills at the highest level (7–9%). After adjusting for sex, age and educational level, the likelihood of reporting sub-optimal health was 1.99–3.24 times as high for those with literacy skills at the lowest level as for those with literacy skills at the highest level. **Conclusions:** These results suggest that poor literacy skills increase the likelihood of experiencing poor health in the Nordic countries, even after controlling for educational level.

Marcolin, L., Miroudot, S., & Squicciarini, M. T. (2016). *The routine content of occupations: New cross-country measures based on PIAAC*. OECD Trade Policy Papers No. 188. Paris: OECD Publishing. doi:10.1787/5jm0mq86fljg-en

**Abstract:**

This work proposes a novel measure of the routine content of occupations, called the Routine Intensity Indicator (RII), built on data from the OECD Programme for the International Assessment of Adult Competencies (PIAAC) survey. The RII uses information about the extent to which workers can modify the sequence of their tasks and decide the type of tasks to be performed on the job. Based on median RII values of individuals in 3-digit occupations across 20 OECD countries, jobs are grouped into quartiles of routine-intensity. On average, in 2012, 46% of employed persons worked in non-routine (18%) or low (28%) routine intensive occupations, with the distribution differing significantly across countries. The relationship between the routine content of occupations and the skills of the workforce is also investigated. While a negative correlation does emerge between

skill content and routine intensity – i.e. more routine-intensive occupations tend to be associated with lower skills – this relationship is not necessarily very strong.

O'Keeffe, C. (2016). Producing data through E-Assessment: A trace ethnographic investigation into e-assessment events. *European Educational Research Journal*, 15(1), 99-116. doi: 10.1177/1474904115612486

**Abstract:**

In this paper, I examine the role of human and digital actants in various material and spatial configurations during the Programme for the International Assessment of Adult Competencies (PIAAC) e-assessment events. It reports on an investigation into how data are produced and subsequently fed into statistical models that in turn produce analyses of skills in "centres of calculation". These data are then used to produce reports, scientific papers, marketing documents and visualizations that profoundly affect how we understand concepts such as literacy or skill. Drawing upon the theoretical resources of Actor Network Theory, this investigation employs a new and innovative methodology, trace ethnography, to follow the distributed agency of hypermobile digital actants. I examine the detail of e-assessment events and interactions between coded technologies and people and how these are translated into statements about what it means to be literate. This, in turn, highlights the role of non-governmental organizations in influencing educational and economic policy-making through the intensification of data production.

Organisation for Economic Cooperation and Development (OECD) (2016). *Skills matter: Further results from the Survey of Adult Skills*. Paris: OECD Publishing. doi: 10.1787/9789264258051-en

**Abstract:**

In the wake of the technological revolution that began in the last decades of the 20th century, labour market demand for information-processing and other high-level cognitive and interperson-

al skills is growing substantially. The Survey of Adult Skills, a product of the OECD Programme for the International Assessment of Adult Competencies (PIAAC), was designed to provide insights into the availability of some of these key skills in society and how they are used at work and at home. The first survey of its kind, it directly measures proficiency in several information-processing skills – namely literacy, numeracy and problem solving in technology-rich environments. This volume reports results from the 24 countries and regions that participated in the first round of the survey in 2011-12 (first published in OECD Skills Outlook 2013: First Results from the Survey of Adult Skills) and from the nine additional countries that participated in the second round in 2014-15 (Chile, Greece, Indonesia [Jakarta], Israel, Lithuania, New Zealand, Singapore, Slovenia and Turkey). It describes adults' proficiency in the three information-processing skills assessed, and examines how skills proficiency is related to labour market and social outcomes. Another related report, *The Survey of Adult Skills: Reader's Companion, Second Edition*, describes the design and methodology of the survey and its relationship to other international assessments of young students and adults.

**Title:**

Paccagnella, M. (2016). *Age, ageing and skills: Results from the survey of adult skills*. OECD Education Working Papers No. 132. Paris: OECD Publishing. doi: 10.1787/5jm0q1n38lvc-en

**Abstract:**

This paper presents a comprehensive analysis of the link between age and proficiency in information-processing skills, based on information drawn from the Survey of Adult Skills (PIAAC). The data reveal significant age-related differences in proficiencies, strongly suggesting that proficiency tends to "naturally" decline with age. Age differences in proficiency are, at first sight, substantial. On average across the OECD countries participating in PIAAC, adults aged 55 to 65 score some 30 points less than adults aged 25 to 34 on the PIAAC literacy scale, which is only slightly smaller than the score point difference between tertiary educated and less-than-upper-secondary educated

individuals. However, despite their lower levels of proficiency, older individuals do not seem to suffer in terms of labour market outcomes. In particular, they generally earn higher wages, and much of the available empirical evidence suggests that they are not less productive than younger workers. Older and more experienced individuals seem therefore able to compensate the decline in information processing skills with the development of other skills, generally much more difficult to measure. On the other hand, proficiency in information-processing skills remain a strong determinant of important outcomes at all ages: this makes it important to better understand which factors are the most effective in preventing such age-related decline in proficiency, which does not occur to the same extent in all countries and for all individuals. Two broad interventions seem to be particularly promising in this respect. First, it is important to ensure that there is adequate and effective investment in skills development early in the life-cycle: as skills beget skills, starting off with a higher stock of human capital seems also to ensure smaller rates of proficiency decline. Second, it is equally important that policies are in place that provide incentives to individuals (and firms) to invest in skills across the entire working life. In this respect, changes in retirement policies can not only have the short-term effect of providing some reliefs to public finance, but have the potential to radically reshape incentives to stay active, to practice their skills and to invest more in training, thus helping to maintain high levels of proficiency.

#### Title:

Paccagnella, M. (2016). *Literacy and numeracy proficiency in IALS, ALL and PIAAC*. OECD Education Working Papers No. 142. Paris: OECD Publishing. doi: 10.1787/5jlpq7qqlx5g-en

#### Abstract:

This paper analyses proficiency in literacy and numeracy in the countries that have participated in the International Adult Literacy Survey (IALS, administered between 1994 and 1998), the Adult Literacy and Life Skills Survey (ALL, administered between 2003 and 2007) and the Survey of Adult Skills (PIAAC, administered in 2012). While many countries experienced small to modest changes in literacy proficiency between IALS and PIAAC, others saw sizeable variations, mostly on the negative side. In the shorter span that separated ALL and PIAAC, numeracy proficiency clearly declined (except in Italy), while literacy moved less on average (except for the large increase registered in Italy and the large decline experienced by Norway). Changes in the composition of the population have had little impact on observed changes in scores. Larger variations took place within different socio-demographic groups, but these tended to cancel each other out on aggregate. In particular, large variations are observed by age and levels of education. Older adults in PIAAC are generally more proficient than their IALS counterparts, probably due to the increase in educational attainments that took place over recent decades. On the contrary, tertiary-educated individuals appear to be on average less proficient than in the past, which may signal that the expansion of tertiary education has been accompanied by a decline in the average quality of university graduates (or of university instruction). There is also no evidence that the change in delivery mode, with a switch to a computer-based assessment in PIAAC, had any significant effect on performance. However, the OECD is unable to ascertain how differences in implementation and technical standards affect the comparability of the data, so that a certain degree of caution should always be exercised in interpreting these results. Amongst the countries that experienced larger changes in literacy proficiency between surveys, a close inspection of IALS data (in particular through an investigation of response patterns at the item level) highlights some anomalies in Italy and Poland (and, to a lesser extent, in England and Northern Ireland), suggesting that particular caution should be exercised in interpreting the evolution of proficiency in these countries.

Palczyńska, M., & K. (2016). *Measurement properties of non-cognitive scales in the polish follow-up study on PIAAC (POSTPIAAC)*. OECD Education Working Papers No. 149. Paris: OECD Publishing. doi: 10.1787/c533e448-en

**Abstract:**

There is a growing literature providing evidence that not only cognitive skills but also non-cognitive skills are important for economic and social outcomes. This paper assesses the measurement properties of the Big Five and Grit scales in a large representative sample of adults in Poland. The data from the Polish Follow-up Study on the Programme for International Assessment of Adult Competencies (postPIAAC) include longitudinal information on PIAAC respondents in Poland and additional background information not available in the international study. The results presented in this paper show that not all the criteria concerning the reliability, validity and comparability of these scales have been satisfied, though the personality measures significantly contribute to explaining the variability in policy-relevant outcomes. Most of the questions discriminate well between people possessing a high and a low level of a given trait, though reverse-worded items perform weaker. The Big Five theoretical five-factor structure was not replicated; however, a six-factor model with an additional factor loading reverse-worded items fits the data. In case of Grit, a bi-factor model, which has an equivalent interpretation to the second-order theoretical structure, holds. The scales are not fully measurement invariant. The results confirm earlier findings from the literature that differences in personality traits are clearly associated with differences in life outcomes. For most of the outcomes, the Big Five traits outperform cognitive skills in predictive power. Only educational attainment is more strongly related to cognitive skills, while for wages, the predictive power of personality and cognitive skills is similar. The paper provides recommendations for incorporating measures of personality traits into competence surveys.

Patterson, M. B., & Paulson, U. G. (2016). Adult transitions to learning in the USA: What do PIAAC survey results tell us? *Journal of Research and Practice for Adult Literacy, Secondary, and Basic Education*, 5(1), 5-27.

**Abstract:**

The Programme for the International Assessment of Adult Competencies (PIAAC) assessed literacy, numeracy, and technology-related skills of adults and found skill levels of US adults are well below the international average. In a world where advanced skills are requisite to workplace competitiveness, low skills are a danger sign. An initial PIAAC finding was that half of US adults do not complete a postsecondary degree. A question remains: do adults continue to learn purposefully—that is, either formally or non-formally—after leaving secondary settings, and how does learning relate to their education levels? A related purpose of the paper is to describe learning types that adults pursue. The paper also investigates barriers to and motivators for learning. Implications for adult educators are discussed.

**Title:**

Pena, A. A. (2016). PIAAC skills and economic inequality. *Journal of Research and Practice for Adult Literacy, Secondary, and Basic Education*, 5(2), 17-34.

**Abstract:**

Mixed findings characterize the literature on skills and economic distributions within and across countries. The Programme for the International Assessment of Adult Competencies (PIAAC) offers new, internationally comparable data on literacy, numeracy, and digital problem-solving skills that can be combined with wage information. This paper presents statistical analyses, aimed at quantifying the contributions of observable and unobservable contributors to earnings inequality. Substantial inequality is documented across countries and skill measures, thus reinforcing previous findings that skill, even by the broader definition used here, is only a partial explanation for differences in economic inequality across countries. The paper concludes with future research possibilities that can further understandings of inequality dynamics within and across nations. [The original version of this paper was commissioned by American Institutes for Research (AIR), funded through a contract with the National Center for Education Statistics (NCES).

**Title:**

Perry, A., & Rammstedt, B. (2016). The research data center PIAAC at GESIS. *Jahrbücher für Nationalökonomie und Statistik*, 236(5), 581-593.

**Abstract:**

With the Programme for the International Assessment of Adult Competencies (PIAAC) researchers can shed light on how competencies are acquired, how its use helps us maintain and further develop skills, and whether adults are prepared for the challenges of modern knowledge societies (OECD, 2013). The Organisation for Economic Co-operation and Development (OECD) initiated PIAAC in more than 30 countries to assess competencies of the adult population. Similar to the Programme for International Student Assessment (PISA), PIAAC is planned to be repeated in regular intervals. Therefore, the next cycle of PIAAC is planned for 2022. The OECD published the PIAAC international public use file of the first cycle of PIAAC (OECD, 2015) in 2013. Due to German confidentiality rules, GESIS published a scientific use file (Rammstedt et al., 2015) that includes information that could not be released in the public use file. Further national data and para data for PIAAC can shed light on further research questions as well as methodological aspects of PIAAC. This data is currently and will be made available in the Research Data Center PIAAC (RDC PIAAC) at GESIS. In addition to this, various add-on studies were and are currently being conducted in Germany, such as Competencies in Later Life (CiLL) and the longitudinal study PIAAC-L. However, the PIAAC data presents challenges due to imputed competency scores (plausible values) and country-specific complex sample techniques. The RDC PIAAC provides information on analytic methods and the available analysis tools. It also offers workshops to familiarize users with the data and to teach them how to analyze the PIAAC data. Given the brevity of the PIAAC data release, an impres-

sive number of research papers were published that use PIAAC data. Research with PIAAC focuses, for example, on the returns to skills (e.g., Hanushek et al., 2015), skill and wage inequality (Paccagnella, 2015), skill mismatch (Allen et al., 2013; Perry et al., 2014), non-monetary outcomes, such as trust (Borgonovi & Burns, 2015), and also methodological aspects, such as incentives in large-scale assessments (Martin et al., 2014). This paper aims to present central aspects of PIAAC, analytical procedures for the competence measures and the complex sample design, as well as data, information and services provided through the RDC PIAAC at GESIS.

Pokropek, A. (2016). Grade of membership response time model for detecting guessing behaviors. *Journal of Educational And Behavioral Statistics*, 41(3), 300-325. doi:10.3102/1076998616636618

**Abstract:**

A response model that is able to detect guessing behaviors and produce unbiased estimates in low-stake conditions using timing information is proposed. The model is a special case of the grade of membership model in which responses are modeled as partial members of a class that is affected by motivation and a class that responds only according to the level of ability. Monte Carlo simulations were conducted to compare the proposed model with an approach that ignored guessing and an approach based on item filtering. In each simulated condition, the proposed model outperformed the other approaches by showing the lowest level of bias and the highest precision of item and persons estimates. Finally, the model was estimated using real life data from Programme for the International Assessment of Adult Competencies research (PIAAC). The results showed slight but expected corrections for the levels of proficiency in all countries.

Post, D. (2016). Adult literacy benefits? New opportunities for research into sustainable development. *International Review of Education*, 62(6), 751-770. doi: 10.1007/s11159-016-9602-5

**Abstract:**

Understandings of "literacy" broadened after the United Nations Development Decade of the 1960s. The corresponding research into the benefits of literacy also widened its focus beyond economic growth. The effects of adult literacy and its correlates appeared diffuse with the rise of New Literacy Studies, and the scholarship on consequences seemed less essential to advocates following the rise of a human rights perspective on education. In 2016 the agenda for literacy research has returned—but at a higher level—to concern over its benefits. The United Nations Sustainable Development Goals (SDGs) have reintegrated literacy research within an agenda to understand the channels through which literacy skills might effect change. This article briefly reviews progress in adult literacy, touches on existing perspectives on literacy, and then illustrates four recent sources of information useful in the revitalised agenda offered by the SDGs. Data from the Programme for the International Assessment of Adult Competencies (PIAAC) study conducted by the Organisation for Economic Co-operation and Development (OECD), the World Values Survey (WVS), and the World Bank's Skills Toward Employment and Productivity (STEP) study are now available to researchers wishing to link educational change with attitudinal and behavioural change. Another important resource are the emerging data on mobile learning. By integrating literacy into the SDGs, literacy researchers can reveal the channels through which literacy can contribute to social welfare and transformation.

Prokic-Breuer, T., & McManus, P. A. (2016). Immigrant educational mismatch in Western Europe, apparent or real? *European Sociological Review*, 32(3), 411-438. doi: 10.1093/esr/jcw005

**Abstract:**

Are immigrant workers in developed nations relegated to labour market positions that are beneath their qualification and skill level? This article uses newly available data from the Programme for the International Assessment of Adult Competencies to examine immigrant economic incorporation in 13 European nations. Our analyses show that immigrants in Europe are significantly more likely than natives to hold educational qualifications above those necessary for their job, and yet, immigrants are significantly less likely to be in jobs that underutilize their cognitive skills. Among workers in the highest cognitive proficiency levels, however, we find no differences between immigrants and natives in predicted overeducation. Therefore, the observed discrepancy between qualifications held and qualifications required for the job are more likely to indicate 'apparent' qualification mismatch rather than 'real' qualification mismatch among immigrants as compared with the native population. Based on our findings, we conclude that differences in educational quality, language proficiency, and the imperfect transferability of skills contribute to high rates of overeducation among immigrants.

Rammstedt, B., Danner, D., & Martin, S. (2016). The association between personality and cognitive ability: Going beyond simple effects. *Journal of Research in Personality*, 62, 39-44. doi: 10.1016/j.jrp.2016.03.005

**Abstract:**

To examine the relationship between the Big Five and cognitive ability, we investigated whether we could replicate in a heterogeneous population sample the positive association between cognitive ability and Openness and Emotional Stability and its negative association with Conscientiousness. Besides analyzing the pure associations, we shed further light on sources of these associations by investigating potential moderating effects of education and labor force participation. Our results clearly replicate the previously found positive association between cognitive ability and Emotional Stability and Openness and the negative relationship between Conscientiousness and cognitive ability. The correlation between cognitive ability and Openness was found to be moderated by educational attainment, the negative association between Conscientiousness and cognitive ability was moderated by labor force participation.

Weiß (Eds.), *Kompetenzorientierung. Berufliche Kompetenzen entwickeln, messen und anerkennen* (pp. 29-46). Bielefeld: W. Bertelsmann Verlag. doi: 10.3278/111-082w

**Abstract:**

Active and successful participation in society calls for key skills such as literacy. On the basis of the data of the Programme for the International Assessment of Adult Competencies (PIAAC), this contribution specifically examines the proportion of the German population who have only low literacy skills. The analyses on the basis of the PIAAC survey data, which are representative of the resident population in Germany, reveal that the probability that individuals belong to the group with the lowest level of literacy proficiency is greater if they have a low level of educational attainment – in particular, a lower secondary leaving certificate (Hauptschulabschluss) or no leaving certificate at all. A migration background and a low level of participation in further education and training also proved to be risk factors. [Translated on behalf of editors]

Rampey, B., Keiper, S., Mohadjer, L., Krenzke, T., Li, J., Thornton, N., & Hogan, J. (2016). *Highlights from the U.S. PIAAC survey of incarcerated adults: Their skills, work experience, education, and training: Program for the International Assessment of Adult Competencies: 2014* (NCES 2016-040). Washington DC: Retrieved October 27, 2017, from <https://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=2016040>

**Abstract:**

The U.S. PIAAC Survey of Incarcerated Adults was designed to provide policymakers, administrators, educators, and researchers with information to improve educational and training opportunities for incarcerated adults and foster skills they need in order to return to, and work successfully in, society upon release from prison. This report highlights data from the survey's extensive background questionnaire and direct assessments of cognitive skills. It examines the skills of incarcerated adults in relationship to their work experiences and to their education and training in prison. Results for incarcerated adults on the literacy and numeracy domains are presented in two ways: (1) as scale scores (estimated on a 0-500 scale), and (2) as percentages of adults reaching the proficiency levels established for each of these domains. The report includes results for groups of incarcerated adults by various characteristics, including employment prior to incarceration, experiences with prison jobs, skills certifications, educational attainment in prison, and participation in academic programs and training classes.

Rindermann, H., & Thompson, J. (2016). The cognitive competences of immigrant and native students across the world: An analysis of gaps, possible causes and impact. *Journal of biosocial science*, 48(1), 66-93. doi: 10.1017/S002193201400048

**Abstract:**

Immigration, immigration policies and education of immigrants alter competence levels. This

study analysed their effects using PISA, TIMSS and PIRLS data (1995 to 2012, N=93 nations) for natives' and immigrants' competences, competence gaps and their population proportions. The mean gap is equivalent to 4.71 IQ points. There are large differences across countries in these gaps ranging from around +12 to -10 IQ points. Migrants' proportions grow roughly 4% per decade. The largest immigrant-based 'brain gains' are observed for Arabian oil-based economies, and the largest 'brain losses' for Central Europe. Regarding causes of native-immigrant gaps, language problems do not seem to explain them. However, English-speaking countries show an advantage. Acculturation within one generation and intermarriage usually reduce native-immigrant gaps ( $\cong$ 1 IQ point). National educational quality reduces gaps, especially school enrolment at a young age, the use of tests and school autonomy. A one standard deviation increase in school quality represents a closing of around 1 IQ point in the native-immigrant gap. A new Greenwich IQ estimation based on UK natives' cognitive ability mean is recommended. An analysis of the first adult OECD study PIAAC revealed that larger proportions of immigrants among adults reduce average competence levels and positive Flynn effects. The effects on economic development and suggestions for immigration and educational policy are discussed.

Siddiq, F., Hatlevik, O. E., Olsen, R. V., Throndsen, I., & Scherer, R. (2016). Taking a future perspective by learning from the past – a systematic review of assessment instruments that aim to measure primary and secondary school students' ICT literacy. *Educational Research Review*, 19, 58-84. doi: 10.1016/j.edurev.2016.05.002

**Abstract:**

This study systematically reviews literature on assessment instruments of primary and secondary school students' ICT literacy. It has three objectives: (1) Describe the development and characteristics of the assessments; (2) Present a synthesis of the facets of ICT literacy measured; and (3) Investigate to what extent information about reliability and validity is provided. A total of 38 tests reported in 66 studies were included. The results indicate that most of the tests target lower secondary students, comprise multiple-choice item designs, and are evaluated by quantitative methodology. The majority of the tests measure facets such as searching, retrieving, and evaluating digital information, and technical skills. In particular, the access to tests measuring digital communication, collaboration, safety, and problem solving is limited. This review demonstrates that an adequate norm for documenting and reporting test quality is lacking. Our findings point to potential future directions in developing and reporting assessments of ICT literacy.

Smith, T. J., Smith, M. C., Rose, A. D., & Ross-Gordon, J. M. (2016). An assessment of the factor structure and factorial invariance of scores from the readiness to learn scale. *Learning and Individual Differences*, 49, 230-236. doi: 10.1016/j.lindif.2016.06.015

**Abstract:**

The present study examines data from the Readiness to Learn scale obtained from the Background Questionnaire of the PIAAC Survey of Adult Skills and carries out a series of psychometric assessments. Data from the U.S. sample were used, consisting of responses from N =5010 respondents between the ages of 16 and 65 years. Variables of interest included the six indicators of "readiness to learn". Additionally, for the factorial invariance analyses that were carried out, gender

(male/female), highest attained educational level, and adult work status were used as grouping variables. [Source: From the method part of the publication]

Støren, L. A. (2016). Factors that promote innovativeness and being an innovative learner at work - results from PIAAC. *European Journal of Education*, 51(2), 176-192. doi: 10.1111/ejed.12173

**Abstract:**

In this article, innovative activity is considered in the light of broader conceptualisations of innovativeness and what it means to be innovative. Central to the definition of innovativeness used in the analysis is that the worker actively seeks new knowledge and uses it for work-related tasks. This is based on previous research emphasising learning-by-doing, taking new knowledge into use and learning organisations. Innovativeness is analysed for Denmark, Finland, The Netherlands and Norway. Data from the PIAAC survey of adult skills are examined to identify key factors involved in promoting innovative behaviours at work. Significant country differences are found. Findings suggest that the work profiles of the workers, the work environment and the intensity of training and learning are very important for the innovative capabilities of the workforce.

Tan, T., Ramos, C., Sheng, Y., & Sung, J. (2016). The determinants of training participation, a multi-level approach: Evidence from PIAAC. In L. Ark, D. Bolt, W. Wang, J. Douglas, & M. Wiberg (Eds.), *Quantitative Psychology Research* (pp. 363-375). Cham: Springer International Publishing. doi: 10.1007/978-3-319-38759-8\_27

**Abstract:**

This chapter uses the first round of the Programme for the International Assessment of Adult Competencies (PIAAC) survey data to find out the determinants of training participation of workers for the 24 countries that participated in the survey. Two measures are used in quantifying training participation: (1) whether workers participated in any training during the last 12 months and (2) the number of training modes of participation (number of types of trainings workers attended during the last 12 months). Logistic and Poisson multilevel models were used to model the two measures respectively. Both models show similar findings for the fixed effects. The results of the random slopes models show that heterogeneity exists across the 24 countries, indicating that the effects of covariates on workers' training participation and the number of training modes vary across countries. The magnitude of correlations of these random slopes differs between the logistic and Poisson models, indicating that the associations of these random effects are not totally in agreement between training participation and the number of training modes.

Taylor, N. A., Greenberg, D., & Terry, N. P. (2016). The relationship between parents' literacy skills and their preschool children's emergent literacy skills. *Journal of Research and Practice for Adult Literacy, Secondary, and Basic Education*, 5(2), 5.

**Abstract:**

The aim of the present study was to investigate the correlational and predictive relationships be-

tween parents with low literacy skills (n = 96) and their 3-5 year old children's emergent literacy skills (n = 96). In the study parents were assessed on measures of reading comprehension, decoding, fluency, oral vocabulary, and word identification, and prekindergarten children were assessed on similar measures of alphabet knowledge, beginning sound awareness, print awareness, and oral vocabulary. Results indicated that parents' word identification and fluency skills were positively correlated with all of the children's literacy skills with the exception of print awareness. Parents' decoding, receptive vocabulary, and expressive vocabulary skills were positively associated with all of the children's literacy skills with the exception of phonological awareness. Also, hierarchical regressions indicated a predictive relationship between several of the skills after accounting for child age and parent educational level. This study adds to the family literacy literature indicating the importance of the relationship between children and their parents' literacy skills.

Teltemann, J., & Schunck, R. (2016). Sozialwissenschaftliche Datensätze für Sekundäranalysen von Integrationsprozessen [Social science data sets for secondary analyses of integration processes]. In D. Maehler & H. U. Brinkmann (Eds.), *Methoden der Migrationsforschung* (pp. 311-344). Wiesbaden: Springer VS.

**Abstract:**

This book contribution presents by way of example German and international (standardized) survey datasets in which the case numbers and information collected enable the identification and examination of the living situation – and thus the integration – of persons with a migration background in different areas of life. Both panel studies and cross-sectional – but often repeatedly conducted – surveys are presented. The aim of the contribution is to examine general possibilities for the secondary analysis of data on the integration of migrants and frequently occurring problems in this respect. The longitudinal studies NEPS and CILS4EU are presented in two separate contributions as they are complex and very important for the analysis of integration processes. In addition to details of the operationalization of migration background in the respective datasets and of the general design, the contribution provides information on data access and gives examples of research questions examined in relevant preliminary studies. The German Socio-Economic Panel (SOEP), the German Microcensus, and the international educational studies PISA and PIAAC are presented in greater detail. The datasets featured here are suitable for the analysis of a range of questions (especially integration-related questions). However, the generated findings can also be used as benchmarks for further primary surveys. Other sections of the contribution summarize general information on data types and sources at different levels of aggregation. [Translated on behalf of editors]

Tikkanen, T., & Nissinen, K. (2016). Participation in job-related lifelong learning among well-educated employees in the Nordic countries. *International Journal of Lifelong Education*, 35(3), 216-234. doi: 10.1080/02601370.2016.1165749

**Abstract:**

The purpose of this study was to explore participation in job-related lifelong learning (LLL) among well-educated mature workers and compare it across four Nordic countries. Although this group generally is very active in LLL, the centrality of knowledge work in society, rapid pace of skills-renewal and rising learning demands for all qualifications levels, necessitates a better understand-

ing of the patterns and factors affecting their skill development. The paper builds on theories of learning motivation, human capital and workplace learning. Data from the Survey of Adult Skills (PIAAC) by the OECD were used. In addition to high participation rates, systematic level differences in participation were found across the countries. Results of logit regression analyses revealed clear differences between countries in the models that explained participation, which gave limited support to a single "Nordic model" of LLL. Furthermore, the predictors of participation commonly found among adult populations, low-educated individuals and/or younger adults, appeared less valid for well-educated individuals.

Vera-Toscano, E., & Meroni, E. (2016). *A descriptive analysis of the evolution of occupational mismatch in Europe*. Luxembourg: Publications Office of the European Union. doi: 10.2791/495552

**Abstract:**

Using the two surveys on adult skills- IALS and PIAAC- we investigate the evolution of occupational mismatch in Europe. We focus on both overeducation and overskilling and study how the incidence of the two phenomena in the years covered by the surveys: mid 90s and 2011. Our main findings are that in both time periods a substantial share of the working population is in a mismatched job, with great heterogeneities by countries and that overeducation and overskill seem to capture two distinct phenomena as the share of individuals who is mismatch in both categories is low relative to the ones who are mismatch in either one of the two. In addition we exploit heterogeneities by countries and by age groups and find that: (a) a group of countries (PL, SE and UK) have decreased their share of only overeducated workers, compensating it with an increase in share of overskilled workers; (b) overeducation and overskilling seem to decrease as individuals get older (c) greater overeducation is observed for the younger cohorts, especially in BE, DK, IE, FI, NL and SE.

Vörös, Z., & Rouet, J.-F. (2016). Laypersons' digital problem solving: Relationships between strategy and performance in a large-scale international survey. *Computers in Human Behavior*, 64, 108-116. doi: 10.1016/j.chb.2016.06.018

**Abstract:**

This study examines the role of online data as indicators of the cognitive processes involved in problem solving in a technology-rich environment. More specifically, we analyze the relationship between response time, logged action count and task outcomes in a sample of over 23,000 adults from 16 countries who participated in the Problem solving in technology-rich environments (PS-TRE) assessment as part of the Program for the International Assessment of Adult Competencies (PIAAC) survey. Based on a selection of tasks used in the PS-TRE assessment, the results show that while time on task may have a heterogeneous effect on a population level depending on task difficulty, action count is positively linked to task accuracy. The data also reveals a surprisingly varied and task-specific relationship between those variables.

**Title:**

Weeks, J. P., Davier, M., & Yamamoto, K. (2016). Using response time data to inform the coding of omitted responses. *Psychological Test and Assessment Modeling*, 58(4), 671-701.

**Abstract:**

Examinees may omit responses on a test for a variety of reasons, such as low ability, low motivation, lack of attention, or running out of time. Some decision must be made about how to treat these missing responses for the purpose of scoring and/or scaling the test, particularly if there is an indication that missingness is not skill related. The most common approaches are to treat the responses as either not reached/administered or incorrect. Depending on the total number of missing values, coding all omitted responses as incorrect is likely to introduce negative bias into estimates of item difficulty and examinee ability. On the other hand, if omitted responses are coded as not reached and excluded from the likelihood function, the precision of estimates of item and person parameters will be reduced. This study examines the use of response time information collected in many computer-based assessments to inform the coding of omitted responses. Empirical data from the Programme for the International Assessment of Adult Competencies (PIAAC) literacy and numeracy cognitive tests are used to identify item-specific timing thresholds via several logistic regression models that predict the propensity of responding rather than produce a missing data point. These thresholds can be used to inform the decision about whether an omitted response should be treated as not administered or as incorrect. The results suggest that for many items the timing thresholds (20 to 30 seconds on average) at a high expected probability level of observing a response are notably higher than thresholds used in the evaluation of rapid guessing of responses (e.g. 5 seconds).

Belzer, A. (2017). Reflections on the PIAAC literacy and numeracy frameworks. *Adult Learning*, 28(3), 118-120. doi: 10.1177/1045159516655150

**Abstract:**

The Program for International Assessment of Adult Competencies (PIAAC) results, released in 2013, have spurred researchers to engage in rich analyses. In addition to making it possible to compare skill levels among the 23 participating nations, the PIAAC data have enabled researchers to analyze relationships among cognitive literacy, numeracy, and problem solving in technology-rich environments skills; age, gender, race/ethnicity, educational level; and a host of personal and social outcomes including health, economic well-being, and civic engagement. The authors described how the definitional frameworks for literacy and numeracy that guided the development of the PIAAC assessment tasks could also guide practice. The underlying assumption of these commissions is that in order for instruction to improve literacy levels, it should reflect current understandings of what literacy and numeracy are.

Billington, M. G., Nissinen, K., & Gabrielsen, E. (2017). When investment in basic skills gives negative returns. *Adult Education Quarterly*, 67(2), 136-154. doi: 10.1177/0741713617692413

**Abstract:**

In recent years, the Norwegian government has invested heavily in improving basic skills in the adult population. Initiatives have included legislation, the introduction of work-based adult education programs, and reforms in schooling. In light of this investment, we explore trends in adult literacy and numeracy, by comparing data from two international surveys of adult skills, conducted in 2003 and 2012. Paradoxically, the proportion of low-performing adults appears to have increased, most significantly in the 16- to 24-year age group and in the foreign-born population. The profile of the lowest performing group has changed in the intervening years. These findings suggest that adult education programs and the education system more generally may not be in concord with the goal of including all in the communities of the literate. We discuss policy implications, in the context of the Scandinavian model, but argue that the discussion is applicable beyond national boundaries.

Blossfeld, P. N., Blossfeld, G. J., & Blossfeld, H.-P. (2017). The speed of educational expansion and changes in inequality of educational opportunity. In T. Eckert & B. Gniewosz (Eds.), *Bildungsge-rechtigkeit* (pp. 77-92). Wiesbaden: Springer Fachmedien Wiesbaden.

**Abstract:**

Using PIAAC data, this paper studies the relationship between the speed of the process of educational expansion and the change in inequality of educational opportunity in 22 industrialized countries. Our empirical results suggest that rapid educational expansion can help to achieve more educational equality. If the pie is getting larger quickly, there is less conflict over the relative size of the slices.

Borgonovi, F., Pokropek, A., Keslair, F., Gauly, B., & Paccagnella, M. (2017). *Youth in transition. How do some of the cohorts participating in PISA fare in PIAAC?* OECD Education Working Papers No. 155. Paris: OECD Publishing. doi: 10.1787/51479ec2-en

**Abstract:**

This paper uses data from PISA and the OECD Survey of Adult Skills (PIAAC) to examine the evolution of socio-economic and gender disparities in literacy and numeracy proficiency between the ages of 15 and 27 in the sample of countries that took part in both studies. Socio-economic disparities are exacerbated between the age of 15 and 27 and the socio-economic gap in proficiency widens, particularly among low-achievers. Gender disparities in literacy at age 15 are marked across the performance spectrum but are particularly wide among low-performers. However, by age 24 there is no difference in the literacy proficiency of males and females. The gender gap in numeracy at age 15 is quantitatively small when compared with the gap in literacy, although it is more pronounced among high achievers. The paper canvasses possible explanations for the trends observed and discusses implications for policy and practice, including the extent to which the lack of an established link between PISA and PIAAC limits the analytical value of the two studies.

Broecke, S., Quintini, G., & Vandeweyer, M. (2017). Explaining international differences in wage inequality: Skills matter. *Economics of Education Review*, 60, 112-124. doi: 10.1016/j.econedurev.2017.08.005

**Abstract:**

Several studies employing decomposition methods have argued that skills only play a minor role in explaining cross-country differences in wage inequality. In this paper, we build upon the work of Leuven, Oosterbeek and van Ophem (2004) and extend the decomposition analysis to take account of the relative demand for, and supply of, skills. Doing this confirms that skills do matter and are likely to be at least as important as labour market institutions in explaining international differences in wage inequality.

Bussi, M., & Pareliussen, J. (2017). Back to basics – literacy proficiency, immigration and labour market outcomes in Sweden. *Social Policy & Administration*, 51(4), 676–696. doi: 10.1111/spol.12319

**Abstract:**

We explore how education, literacy skills and migrant origin affect employment and over-qualification mismatch, using a simple model of human capital, standard regression methods and data from the OECD Survey of Adult Skills (PIAAC). Sweden is an interesting case, as a compressed wage distribution makes thresholds to enter the labour market high for those with low education and low skills. Skill and education levels are high among the native-born. At the same time, the high influx of humanitarian and family reunion migrants, who are on average less educated and less skilled than natives, increases the supply of low-skilled labour. We find that substantial employment penalties all but disappear when controlling for migrants' lower literacy proficiency. In contrast, the high incidence of over-qualification mismatch among immigrants is little sensitive to literacy proficiency and demographic profiles. However, having participated in education and training activities in Sweden improves matching considerably, in particular if such activities are manifested in formal qualifications.

**Title:**

Calero, J., & Choi, u. (2017). The distribution of skills among the European adult population and unemployment: A comparative approach. *European Journal of Education*, 52(3), 348-364. doi: 10.1111/ejed.12222

**Abstract:**

The most painful effect of the Great Recession in European countries has been the surge in unemployment rates during a period that has been characterised by an increase in income inequality and the heterogeneous pattern of this inequality by educational level. Thus, workers with low levels of educational attainment were among the first to lose their jobs. This article addresses two main research questions: first, it estimates the importance of the level of skills and education on the probability of being unemployed, disentangling the extent of the effects of human capital and signalling theories of education; and, second, it provides evidence of the impact of inequalities in the previous socioeconomic and cultural background of individuals on the probability of being unemployed. These two objectives are assessed using data for 24 jurisdictions that participated in

the first round of the OECD's "Programme for the International Assessment of Adult Competencies" (PIAAC). Skill levels play a central role in explaining unemployment in Europe and act as an indirect channel via which a family's sociocultural background has an impact on its labour market status. Combining the results of alternative models, we identify those European labour markets that are most sensitive to human capital.

**Title:**

Christl, M., & Köppl-Turyna, M. (2017). *Gender wage gap and the role of skills: Evidence from PIAAC dataset*. GLO Discussion Paper No. 63. Maastricht: Global Labor Organization (GLO). Retrieved December 27, 2017, from <http://hdl.handle.net/10419/157335>

**Abstract:**

Our paper makes a first attempt to address the impact of skills and skill use in the analysis of the gender wage gap using the PIAAC dataset. Using the case of Austria, we show that skill use as well as the skill match play an important role with regard to wage regressions of men as well as women. When we take skills into account in the gender wage gap analysis, the unexplained part of the gender wage gap is reduced by almost 4 percentage points along the whole wage distribution. Our results suggest that skill use and match play a crucial role in explaining the gender wage gap. Additionally, we show, that the self-selection problem biases the results, in particular in the lower and middle parts of the wage distribution and that we should control for it, although the effect is small. When we additionally consider discretionary bonus payments, we find that the unexplained part in the gender wage gap increases, especially in the upper part of the wage distribution.

**Title:**

De la Rica, S., & Gortazar, L. (2017). *Digitalization at work, job tasks and wages: Cross-country evidence from PIAAC*. GLO Discussion Paper No. 22. Maastricht: Global Labor Organization (GLO). <http://hdl.handle.net/10419/155358>

**Abstract:**

The aim of the paper is threefold. First, we compute differences on job tasks (Abstract, Routine and Manual) across a harmonized and hence comparable sample of Anglo-saxon, many European and even Asian advanced countries. We do so by using very precise information on job contents at the worker level, which allows for job task heterogeneity within occupations. Second we assess the extent to which computer adoption leads to the observed differences of job contents across countries. Third, we test the impact of tasks at work on average wages and wage inequality. Our results show remarkable differences in the degree of polarization of job contents across countries, being computer adoption at work a key significant driver of such differences. In particular, ICT use at work explains 10.0% (7.7%) of the cross-country conditional differences in Abstract (Routine) tasks at work. Finally, our results indicate that although differences in tasks explain an important and significant part of wage differentials (similar to what is found in Autor and Handel, 2013), we cannot find a clear pattern in the explanation of wage inequality gaps by looking at differences in task endowments and task returns.

Duchhardt, C., Jordan, A.-K., & Ehmke, T. (2017). Adults' use of mathematics and its influence on mathematical competence. *International Journal of Science and Mathematics Education*, 15(1), 155-174. doi: 10.1007/s10763-015-9670-1

**Abstract:**

The Programme for the International Assessment of Adult Competencies (PIAAC) has recently drawn additional attention to “mathematical literacy” as an important influential factor for individuals' life chances. High levels of mathematical literacy have thereby been linked to using mathematics in daily and working life frequently. In this paper, based on the data from Germany, we focus on the construct “use of mathematics” in two ways: First, we analyze in depth how it can be utilized to describe different groups of adults. Second, we investigate its role as predictor of mathematical competence and mediator of other relevant background variables. Results show that three groups of adults can be distinguished that use mathematics differently in daily and working life. However, the construct can sensibly be described as unidimensional. In a path model, “use of mathematics” turns out to be the strongest predictor of mathematical competence. In addition, it mediates effects of the mathematical requirements of the job, duration of education, and gender.

Flisi, S., Goglio, V., Meroni, E. C., Rodrigues, M., & Vera-Toscano, E. (2017). Measuring occupational mismatch: Overeducation and overskill in Europe - evidence from PIAAC. *Social Indicators Research*, 131(3), 1211-1249. doi: 10.1007/s11205-016-1292-7

**Abstract:**

Occupational mismatch has been a hot topic in the economics literature in recent decades; however, no consensus has been reached on how to conceptualise and measure this phenomenon. We explore the unique opportunity offered by the PIAAC survey to measure occupational mismatch at the individual level based on both education- (overeducation) and skill-based (overskilling) variables by using both objective and subjective measures. For this purpose, we use data on 17 European countries and compute up to 20 different indicators of occupational mismatch. We find that the conceptualisation and measurement of occupational mismatch are indeed important and that education and skill mismatch do not measure the same phenomenon. In fact, only a small percentage of mismatched individuals are mismatched with respect to both education and skill, whereas the majority are mismatched with respect to either education or skill only. At the country level, we find a negative correlation between the incidence of education and skill mismatch, which has important implications for policies aiming to address this labour market inefficiency.

Goldhammer, F., Martens, T., & Lüdke, O. (2017). Conditioning factors of test-taking engagement in PIAAC: An exploratory IRT modelling approach considering person and item characteristics. *Large-scale Assessments in Education*, 5(18). doi: 10.1186/s40536-017-0051-9

**Abstract:**

**Background:** A potential problem of low-stakes large-scale assessments such as the Programme for the International Assessment of Adult Competencies (PIAAC) is low test-taking engagement. The present study pursued two goals in order to better understand conditioning factors of test-taking disengagement: First, a model-based approach was used to investigate whether item indicators of disengagement constitute a continuous latent person variable by domain. Second, the effects of person and item characteristics were jointly tested using explanatory item response models. **Methods:** Analyses were based on the Canadian sample of Round 1 of the PIAAC, with N = 26,683 participants completing test items in the domains of literacy, numeracy, and problem solving. Binary item disengagement indicators were created by means of item response time thresholds. **Results:** The results showed that disengagement indicators define a latent dimension by domain. Disengagement increased with lower educational attainment, lower cognitive skills, and when the test language was not the participant's native language. Gender did not exert any effect on disengagement, while age had a positive effect for problem solving only. An item's location in the second of two assessment modules was positively related to disengagement, as was item difficulty. The latter effect was negatively moderated by cognitive skill, suggesting that poor test-takers are especially likely to disengage with more difficult items. **Conclusions:** The negative effect of cognitive skill, the positive effect of item difficulty, and their negative interaction effect support the assumption that disengagement is the outcome of individual expectations about success (informed disengagement).

**Title:**

Goldhammer, F., Naumann, J., Rölke, H., Stelter, A., & Tóth, K. (2017). Relating product data to process data from computer-based competency assessment. In D. Leutner, J. Fleischer, J. Grünkorn, & E. Klieme (Eds.), *Competence assessment in education: Research, models and instruments* (pp. 407-425). Cham: Springer International Publishing. doi: 10.1007/978-3-319-50030-0\_24

**Abstract:**

Competency measurement typically focuses on task outcomes. Taking process data into account (i.e., processing time and steps) can provide new insights into construct-related solution behavior, or confirm assumptions that govern task design. This chapter summarizes four studies to illustrate the potential of behavioral process data for explaining task success. It also shows that generic process measures such as time on task may have different relations to task success, depending on the features of the task and the test-taker. The first study addresses differential effects of time on task on success across tasks used in the OECD Programme for the International Assessment of Adult Competencies (PIAAC). The second study, also based on PIAAC data, investigates at a fine-grained level, how the time spent on automatable subtasks in problem-solving tasks relates to task success. The third study addresses how the number of steps taken during problem solving predicts success in PIAAC problem-solving tasks. In a fourth study, we explore whether successful test-takers can be clustered on the basis of various behavioral process indicators that reflect in-

formation problem solving. Finally, we address how to handle unstructured and large sets of process data, and briefly present a process data extraction tool.

**Title:**

Gorges, J., Koch, T., Maehler, D. B., & Offerhaus, J. (2017). Same but different? Measurement invariance of the PIAAC motivation-to-learn scale across key socio-demographic groups. *Large-scale Assessments in Education*, 5(1), 13. doi: 10.1186/s40536-017-0047-5

**Abstract:**

**Background:** Data from the Programme for the International Assessment of Adult Competencies (PIAAC) revealed that countries systematically differ in their respondents' literacy, numeracy, and problem solving in technology-rich environments skills; skill levels also vary by gender, age, level of education or migration background. Similarly, systematic differences have been documented with respect to adults' participation in education, which can be considered as a means to develop and maintain skills. From a psychological perspective, motivation to learn is considered a key factor associated with both skill development and participation in (further) education. In order to account for motivation when analyzing PIAAC data, four items from the PIAAC background questionnaire were recently compiled into a motivation-to-learn scale. This scale has been found to be invariant (i.e., showing full weak and partial strong measurement invariance) across 21 countries. **Methods:** This paper presents further analyses using multiple-group graded response models to scrutinize the validity of the motivation-to-learn scale for group comparisons. **Results:**

Results indicate at least partial strong measurement invariance across gender, age groups, level of education, and migration background in most countries under study (all CFI > .95, all RMSEA < .08). Thus, the scale is suitable for comparing both means and associations across these groups. **Conclusions:** Results are discussed in light of country characteristics, challenges of measurement invariance testing, and potential future research using PIAAC data.

**Title:**

Greiff, S., Scheiter, K., Scherer, R., Borgonovi, F., Graesser, B., Kitajima, A., & Rouet, J.-F. (2017). *Adaptive problem solving*. OECD Education Working Papers No. 156. Paris: OECD Publishing. doi: 10.1787/90fde2f4-en

**Abstract:**

The set of skills that is required to be a successful citizen in the 21st century is rapidly evolving. New technologies and social systems grow increasingly complex and require individuals to quickly and flexibly adapt to new and changing circumstances. This paper outlines the key features of the domain of adaptive problem solving that is proposed to be assessed in the 2nd cycle of the OECD Survey of Adult Skills (PIAAC) in addition to the domains of numeracy and literacy. Adaptive problem solving is considered to be a crucial 21st century skill that combines cognitive and meta-cognitive processes. The paper develops a definition of adaptive problem solving building on relevant work in cognitive psychology and cognitive science, introduces its covariates and preconditions, discusses relevant assessment principles, and provides insights on the relevance of adaptive problem solving for labour markets and social integration.

**Title:**

Hämäläinen, R., De Wever, B., Nissinen, K., & Cincinnato, S. (2017). Understanding adults' strong problem-solving skills based on PIAAC. *Journal of Workplace Learning*, 29(7/8), 537-553. doi: 10.1108/JWL-05-2016-0032

**Abstract:**

Research has shown that the problem-solving skills of adults with a vocational education and training (VET) background in technology-rich environments (TREs) are often inadequate. However, some adults with a VET background do have sound problem-solving skills. The present study provides insight into the socio-demographic, work-related, and everyday life factors that are associated with a strong problem-solving performance. The study builds on large-scale data of the Programme for the International Assessment of Adult Competencies (PIAAC) and gives insight into VET adults (N=12,929) with strong problem-solving skills in eleven European countries. Findings This study introduces new knowledge with respect to the socio-demographic, work-related, and everyday life background factors that contribute to successful VET adults' problem-solving skills. Our findings illustrate that a continuous process of development including non-formal and informal activity as well as learning taking place at work is associated with strong performance in problem-solving skills in TRE. An important implication of this study is that this article explored new knowledge about good problem-solvers in TREs with a VET background and can be used to support the development of VET adults' problem-solving skills in TREs.

Hampf, F., Wiederhold, S., & Woessmann, L. (2017). Skills, earnings, and employment: Exploring causality in the estimation of returns to skills. *Large-scale Assessments in Education*, 5(12). doi: 10.1186/s40536-017-0045-7

**Abstract:**

Ample evidence indicates that a person's human capital is important for success on the labor market in terms of both wages and employment prospects. However, unlike the efforts to identify the impact of school attainment on labor-market outcomes, the literature on returns to cognitive skills has not yet provided convincing evidence that the estimated returns can be causally interpreted. Using the PIAAC Survey of Adult Skills, this paper explores several approaches that aim to address potential threats to causal identification of returns to skills, in terms of both higher wages and better employment chances. We address measurement error by exploiting the fact that PIAAC measures skills in several domains. Furthermore, we estimate instrumental-variable models that use skill variation stemming from school attainment and parental education to circumvent reverse causation. Results show a strikingly similar pattern across the diverse set of countries in our sample. In fact, the instrumental-variable estimates are consistently larger than those found in standard least-squares estimations. The same is true in two "natural experiments," one of which exploits variation in skills from changes in compulsory-schooling laws across U.S. states. The other one identifies technologically induced variation in broadband Internet availability that gives rise to variation in ICT skills across German municipalities. Together, the results suggest that least-squares estimates may provide a lower bound of the true returns to skills in the labor market.

**Title:**

Kankaraš, M. (2017). *Personality matters*. OECD Education Working Papers No. 157. Paris: OECD Publishing. doi: 10.1787/8a294376-en

**Abstract:**

Personality characteristics shape human behaviour and influence a wide range of life events and outcomes. They do so not only through their direct effects on life outcomes, but also through their indirect effects on other important personal factors and intermediate life events, such as the development of cognitive capacities, the attainment of educational qualifications and the formation of a family. As such, personality characteristics have a demonstrable relevance for a wide range of policy issues and represent an important, although often neglected, subject of policy interest. This paper reviews the scientific literature covering a wide range of personality characteristics, discussing their conceptualisations and main features, their relevance for important outcomes in life and work, and the chief ways they are measured. It aims to provide a comprehensive overview of various attributes of personality from the perspective of their potential importance for the Survey of Adult Skills (PIAAC), taking into account their analytical potential and policy relevance. The paper also outlines and evaluates the most important measurement instruments for each personality characteristic, with a focus on short self-report scales as the most appropriate form for inclusion in large-scale international surveys. Finally, it presents some considerations related to the evaluation and promotion of personality characteristics and introduces the substantive and measurement criteria that could be used to select the personality attributes, and related measurement scales, to include in large-scale surveys.

Kirsch, I., & Lennon, M. L. (2017). PIAAC: A new design for a new era. *Large-scale Assessments in Education*, 5(11). doi: 10.1186/s40536-017-0046-6

**Abstract:**

As the largest and most innovative international assessment of adults, PIAAC marks an inflection point in the evolution of large-scale comparative assessments. PIAAC grew from the foundation laid by surveys that preceded it, and introduced innovations that have shifted the way we conceive and implement large-scale assessments. As the first fully computer-delivered survey of adults, those innovations included: a comprehensive assessment design involving multistage adaptive testing; development of an open-source platform capable of delivering both cognitive measures and nationally-specific background questionnaires; automated scoring of open-ended items across more than 50 languages; enhanced cognitive measures that included electronic texts and interactive stimuli; the inclusion of new item types and response modes; and the use of log file and

process data to interpret results. This paper discusses each of these innovations along with the development of data products and dissemination activities that have extended the utility of the survey, providing today's policy makers with information about the extent to which adults possess the critical skills required for both their own success and the health and vibrancy of societies around the world. As this paper suggests, the innovations introduced via PIAAC broadened the relevance and utility of the survey along with the accuracy and validity of the data, strengthening the foundation upon which future surveys can continue to build.

Krupar, A., Horvatek, R., & Byun, S.-y. (2017). Does nonformal education matter? Nonformal education, immigration, and skills in Canada. *Adult Education Quarterly*, 67(3), 186-208. doi: 10.1177/0741713617697423

**Abstract:**

This article examined the relationship between participation in adult nonformal education (NFE), defined as on-the-job training, attending private lessons, attending seminars, or distance learning, and Canadian immigrant respondents' literacy and numeracy outcomes, using data from the Program for the International Assessment of Adult Competencies Survey. We found that although participation in some forms of NFE was significantly related to higher literacy and numeracy scores, such relationship tended to be greater for first-generation immigrants than for nonimmigrant adults, even after controlling for their linguistic and formal educational background. Our findings suggested that first-generation immigrants in Canada might benefit the most from increased participation in NFE programs and targeted policies.

Lavrijsen, J., & Nicaise, I. (2017). Returns on vocational education over the life cycle: Between immediate labour market preparation and lifelong employability. *International Review of Education*, 63(2), 257-280. doi: 10.1007/s11159-017-9630-9

**Abstract:**

An important issue in the design of secondary-level education is the balance between conveying general and occupation-specific (vocational) skills. On the one hand, vocationally oriented programmes, providing occupation-specific skills with immediate labour market relevance, have repeatedly been shown to secure safe pathways into employment. On the other hand, these programmes tend to put less emphasis on developing general knowledge, skills and competencies,

including numeracy and literacy, which are foundational to lifelong learning. Hence, when the needs of the labour market change, employees who opted for a vocational track when they were at secondary school risk being less flexible in adapting to such changes later in their career. The authors of this article examine whether this results in a trade-off between short-term gains and long-term losses by considering differences in the labour market careers of vocationally and generally educated respondents in the 2012 Programme for the International Assessment of Adult Competencies (PIAAC). Their results suggest that early labour market benefits of vocational specialisation decrease over time; the authors relate this to its lower ability to equip secondary school students–future employees–with skills for lifelong learning.

Lavrijsen, J., & Nicaise, I. (2017). Systemic obstacles to lifelong learning: The influence of the educational system design on learning attitudes. *Studies in Continuing Education*, 39(2), 176-196. doi: 10.1080/0158037X.2016.1275540

**Abstract:**

Comparative research has often emphasized the importance of external barriers (e.g. enrolment costs) to explain inequalities in lifelong learning participation. However, individuals, in particular the low educated, are often not only prevented from participation by external barriers, but also by negative psychological dispositions about learning. In this article, we study how dispositions about learning as measured in PIAAC (2012) vary between countries. In particular, we assess how these cross-country differences are related to a number of design characteristics of the initial school system. We improve the cross-sectional research design by controlling attitudes among adults for attitudes collected among primary school students, making use of diff-in-diff and pseudo-panel-techniques. Overall, we find that strong external differentiation mechanisms, in particular tracking students at a young age and making extensively use of grade retention, are associated with less positive attitudes towards learning among adults. However, a number of methodological issues, related to small country samples and differences in data definition between surveys, calls for further investigation.

Lee, J.-W., & Wie, D. (2017). Returns to education and skills in the labor market: Evidence from Japan and Korea. *Asian Economic Policy Review*, 12(1), 139-160. doi: 10.1111/aepr.12169

**Abstract:**

This study investigates the determinants of skill proficiency, and the impact of adult skills on earnings, in Japan and Korea. Using the Program for the International Assessment of Adult Competencies survey data, it shows that Japanese adults perform better than Korean respondents, on average, on skill proficiency tests. A decomposition analysis shows that the score gap in literacy, numeracy, and problem solving skills between the two countries is mostly due to different returns to individual characteristics such as upper-secondary and tertiary education. Adult skills have a positive and significant impact on individual earnings and employment probability, in both countries. In Japan, the returns to literacy, numeracy, and problem-solving skills increase significantly with experience, and tend to fall with formal education, suggesting employer learning or human capital accumulation through career progression. In contrast, in Korea, the returns to literacy and numeracy skills do not seem to increase with experience.

Lee, Y. (2017). Does context matter? Literacy disparities in self-rated health using evidence from 17 developed countries. *American Journal of Health Behavior*, 41(3), 287-300. doi: 10.5993/AJHB.41.3.8

**Abstract:**

The study examines whether adult literacy skills predict self-rated health status beyond educational credentials in 17 developed countries using a cross-national survey, the Programme for the International Assessment of Adult Competencies (PIAAC). Methods: The study uses linear regression models with country-level fixed effects to predict self-rated health to account the unobserved country-level heterogeneity. A total of 73,806 respondents aged 25 to 65 were included in the analysis. Results: Although adult literacy is positively associated with better self-rated health in general, the strength of the relationship varies across nations. The literacy-related health inequalities are less severe in countries with the higher public share of health expenditures that may better address the needs of individuals with limited cognitive abilities. Curriculum standardization also contributes to reducing the literacy gradients in health by decreasing variations in skills obtained in school across individuals with different social origins. Conclusions: Overall, this study reveals that promoting equity in adult literacy skills is an important way to improve a population's health. Country-level differences in the strength of the relationship between literacy and self-rated health are systematically related to between-country differences in health financing and educational systems.

Levels, M., Dronkers, J., & Jencks, C. (2017). Contextual explanations for numeracy and literacy skill disparities between native and foreign-born adults in western countries. *Plos ONE*, 12(3). doi: 10.1371/journal.pone.0172087

**Abstract:**

Using new direct measures of numeracy and literacy skills among 85,875 adults in 17 Western countries, we find that foreign-born adults have lower mean skills than native-born adults of the same age (16 to 64) in all of the examined countries. The gaps are small, and vary substantially between countries. Multilevel models reveal that immigrant populations' demographic and socio-economic characteristics, employment, and language proficiency explain about half of the cross-national variance of numeracy and literacy skills gaps. Differences in origin countries' average education level also account for variation in the size of the immigrant-native skills gap. The more protective labor markets in immigrant-receiving countries are, the less well immigrants are skilled in numeracy and literacy compared to natives. For those who migrate before their teens (the 1.5 generation), access to an education system that accommodates migrants' special needs is crucial. The 1 and 1.5 generation have smaller numeracy and literacy skills gaps in more ethnically diverse societies.

Maddox, B., & Zumbo, B. D. (2017). Observing testing situations: Validation as jazz. In B. Zumbo & A. Hubley (Eds.), *Understanding and investigating response processes in validation research* (pp. 179-192). Cham: Springer International Publishing. doi: 10.1007/978-3-319-56129-5\_10

**Abstract:**

In this chapter, we describe how observations of real-life testing situations can provide insights

into test validation by focusing on response processes and test performance that are not easily captured by large-scale quantitative data or by conventional 'think aloud' protocols. The chapter is structured in the following way. Theory and Method describes the key approaches to the study of face-to-face testing situations. Informed by Goffman's micro-analysis of social situations, we describe an approach to the study of testing situations that draws on research traditions in linguistic anthropology and conversation analysis. Assessment Observed illustrates the method with short transcripts from sequences of interaction in the Slovenian PIAAC assessment. The transcripts illustrate temporal, interactive, and affective characteristics of the testing situation. They illustrate the potential for studies of the testing situation to provide new insights into response processes. In the final part of the chapter. Integrating Data, we consider how micro-analytic insights from testing situations can inform, and be integrated into, validation practice.

Sozioökonomische Faktoren in Deutschland besonders wichtig für Kompetenzdisparitäten zwischen Bevölkerung mit und ohne Zuwanderungshintergrund: Ländervergleich auf Basis der PIAAC-Studie [Socio-economic factors in Germany are important for competence disparities between the population with and without immigration background: Country comparison based on the PIAAC study]. *Informationsdienst Soziale Indikatoren (ISI)*, 58, 1-5.

**Abstract:**

Germany is today one of the most prominent immigration countries. The increase in migration worldwide poses challenges at different levels to both target and host countries. With regard to the immigrant adult population, integration into the labor market is the focus of discussions in the OECD and especially in Germany (OECD, 2016). In order to succeed it is first necessary to obtain a reliable picture of the existing skills of immigrants. Initial surveys of recently immigrated refugees already give a first indication of the situation. On average, a low level of formal education is assumed (Brücker, Rother & Schupp, 2016). For example, Wößmann (2015) calls for alternative training models (including partial qualification), which take into account different courses of life in different cultural and social settings in order to prepare low-skilled immigrants for the German labor market. As part of such considerations, various projects have been launched to first assess the existing skills of immigrants (see also OECD, 2016). In Germany, for example, Maehler, Shajek and Brinkmann (in press) are putting together a handbook of diagnostic procedures for the migrant population. Among other things, the identification and recognition of professional qualifications and professional qualifications acquired abroad are discussed (Atanassov & Erbe, in press). In contrast, the "Integration through Qualification" funding program has compiled competence assessment procedures for practitioners (e.g., Employment Agencies, Job Centers and Labor Market Actors) (IQ Fachstelle, 2015). It is based on the premise that a comprehensive picture of the competencies of an individual can not be achieved by only recording the professional skills. Comprehensive standards of competence assessment processes are expected, covering professional competencies, key competencies and individual resources (IQ Fachstelle, 2015). For example, literacy is fundamental to other subject-related competences and has a strong link with other areas of competence (see, for example, Maehler et al., 2013; OECD, 2013). This article assesses how well immigrants are qualified compared to the native populations across countries and what factors are relevant for their key competencies.

**Abstract:**

The conference focuses on scientific work based on the international data of the first cycle of PIAAC and especially on analyses of the German PIAAC longitudinal follow-up, PIAACL. The conference program reflects the broad and interdisciplinary focus of PIAAC. Particularly the contributions based on the PIAAC-L data offer first insights into the longitudinal effects of and on the PIAAC skills. The conference not only provides the opportunity to learn about adult skills, but, beyond that, it also enables networking and thus provides the ground for future joint research and practice. Eventually, we aim to inspire additional work based on the extensive PIAAC and PIAAC-L data and to provide insights into design and measurement alternatives for the upcoming second cycle of PIAAC.

Maehler, D. B., Martin, S., & Rammstedt, B. (2017). Coverage of the migrant population in large-scale assessment surveys. Experiences from PIAAC in Germany. *Large-scale Assessments in Education*, 5(9). doi: 10.1186/s40536-017-0044-8

**Abstract:**

Background: European countries, and especially Germany, are currently very much affected by human migration flows, with the result that the task of integration has become a challenge. Only very little empirical evidence on topics such as labor market participation and processes of social integration of migrant subpopulations is available to date from large-scale population surveys. The present paper provides an overview of the representation of the migrant population in the German Programme for the International Assessment of Adult Competencies (PIAAC) sample and evaluates reasons for the under-coverage of this population. Methods: We examine outcome rates and reasons for nonresponse among the migrant population based on sampling frame data, and we also examine para data from the interviewers' contact protocols to evaluate time patterns for the successful contacting of migrants. Results and Conclusions: This is the first time that results of this kind have been presented for a large-scale assessment in educational research. These results are also discussed in the context of future PIAAC cycles. Overall, they confirm the expectations in the literature that factors such as language problems result in lower contact and response rates among migrants.

Mamedova, S., Sparks, D., & Hoyer, K. M. (2017). *Adult education attainment and assessment scores: A cross-national comparison stats in brief* [NCES 2018-007]. Washington DC: Center for Education Statistics. Retrieved November 10, 2017, from <https://nces.ed.gov/pubs2018/2018007.pdf>

**Abstract:**

The Organization for Economic Cooperation and Development (OECD) conducted the Program for the International Assessment of Adult Competencies (PIAAC), a multi-domain adult skills assessment with an extensive background questionnaire, in 2012. PIAAC is a global effort to understand how individuals' education, workplace experiences, and other background factors relate to cognitive skills in the domains of literacy, numeracy, and problem solving in technology-rich environments. This Statistics in Brief builds upon the findings in the earlier National Center for Education Statistics (NCES) report (Goodman et al. 2013) to provide additional cross-national comparisons of adult literacy and numeracy proficiencies by education attainment. Specifically, the brief highlights differences between several countries in the average literacy and numeracy scores for adults at different levels of education attainment. The brief further compares gaps in literacy and numeracy scores between adults of higher and lower education attainment across participating countries. The results from the earlier NCES reports indicated that adults in the United States performed lower than or not measurably different from the PIAAC international average in literacy and in numeracy (Goodman et al. 2013, Rampey et al. 2016). Specifically, in literacy, average scores ranged from 250 in Italy to 296 in Japan. The U.S. average score was 270, while the PIAAC international average was 273. Compared with the U.S. average score, average scores were higher in 12 countries, lower in 5 countries, and not measurably different in 5 countries. In numeracy, average scores ranged from 246 in Spain to 288 in Japan. The U.S. average score was 253, while the PIAAC international average was 269. Compared with the U.S. average score in numeracy, average scores were higher in 18 countries, lower in 2 countries, and not measurably different in 2 countries (Goodman et al. 2013).

Massing, N., & Gauly, B. (2017). Training participation and gender: Analyzing individual barriers across different welfare state regimes. *Adult Education Quarterly*, 67(4), 266-285. doi: 10.1177/0741713617715706

**Abstract:**

Lifelong learning is becoming increasingly important in today's societies. Individuals need to develop their skills through training in order to be successfully integrated in the labor market. We use data from the Programme for the International Assessment of Adult Competencies to investigate gender differences in training across 12 countries. We analyze participation and perceived barriers to training for women in comparison with men and control for family structure and employment. As institutional framework, we use four different welfare state regimes to show how policies can affect the decision to participate. Our results show that different welfare regimes have an impact on the extent adults take part in training and on their perceived barriers. In all countries except Belgium and the Nordic states, men are more likely to participate in training. However, this inequality disappears once controlling for further individual characteristics. Our research provides insights why adults are deterred from engaging in training.

**Title:**

Massing, N., & Schneider, S. L. (2017). Degrees of competency: The relationship between educational qualifications and adult skills across countries. *Large-scale Assessments in Education*, 5(6). doi: 10.1186/s40536-017-0041-y

**Abstract:**

Background: Educational qualifications and literacy skills are highly related. This is not surprising as it is one aim of educational systems to equip individuals with competencies necessary to take part in society. Because of this relationship educational qualifications are often used as a proxy for “human capital”. However, from a theoretical perspective, there are many reasons why this relationship is not perfect, and to some degree this is due to third variables. Thus, we want to explore the net relationship between educational attainment (harmonized according to the International Standard Classification of Education, ISCED) and literacy skills, and how much skills vary within education levels across countries. Methods: We use data from 21 countries from the Programme for the International Assessment of Adult Competencies 2012. This paper compares the literacy skills of adults who achieved different levels of educational attainment across countries. Given the high degree of educational differentiation in most countries, we do this using a more differentiated educational attainment variable than what is commonly used. In our analyses we firstly adjust for factors that are likely to affect access to education and the acquisition of educational qualifications and literacy skills, such as parental education and language and migration background. In a second step, we also take into account factors affecting skill development after initial formal education, such as occupation and skill use at home. Results: We firstly find a high degree of heterogeneity of skills across countries for equivalent education categories. Secondly, we find skill similarities for equivalent education categories classified at different broad education levels, sometimes even breaking the hierarchical order of ‘higher education entails higher competencies’. Conclusion: We conclude that ISCED levels cannot be taken as a cross-nationally comparable proxy for human capital in terms of literacy skills, and that education has to be harmonized in a substantively more meaningful way in future adult literacy surveys.

**Title:**

Mateos-Romero, L., & Salinas-Jiménez, M. M. (2017). Skills heterogeneity among graduate workers: Real and apparent overeducation in the Spanish labor market. *Social Indicators Research*, 132(3), 1247-1264. doi: 10.1007/s11205-016-1338-x

**Abstract:**

This paper takes account of skills heterogeneity among workers with a higher education degree and proposes a new measure to differentiate between real and apparent overeducation based on the level of cognitive skills actually achieved by the individuals. This proposal is applied to the study of the wage effects of overeducation in the Spanish labor market using data from PIAAC. The results suggest that between a quarter and a half of the graduate workers who appear to be overeducated in the Spanish labor market could be considered as being only apparently overeducated since they show a lower level of skills than that corresponding to their educational level or, alternatively, a level of cognitive skills which is commensurate with their job. Different returns are found for each group of overeducated individuals both when compared with adequately educated peers within a similar level of education (with greater wage penalties for apparently overeducated workers) and when the comparison is done with well-matched co-workers doing a similar job (with a wage premium for real overeducation but no significant returns for apparently overeducated workers). These different returns by skill levels beyond what overeducation measures implies that the market distinguishes between education and skills and that educational attainment per se

does not perfectly align with acquired skills, meaning that traditional measures of overeducation would overstate the actual level of skills mismatch in the labor market.

**Title:**

Nieto, S., & Ramos, R. (2017). Overeducation, skills and wage penalty: Evidence for Spain using PIAAC data. *Social Indicators Research*, 134(1), 219-236. doi: 10.1007/s11205-016-1423-1

**Abstract:**

The literature on educational mismatches finds that overeducated workers suffer a wage penalty compared with properly educated workers with the same level of education. Recent literature also suggests that individuals' skill heterogeneity could explain wage differences between overeducated and properly matched workers. The hypothesis is that overeducated workers earn less due to their lower competences and skills in relative terms. However, that hypothesis has been rarely tested due to data limitations on individuals' skills. The aim of this paper is to test the individuals' skill heterogeneity theory in Spain using microdata from PIAAC, because it is one of the developed countries supporting the highest overeducation rates and where its adult population holds the lowest level of skills among a set of developed countries. Our hypothesis is that the wage penalty of overeducation in Spain is explained by the lower skill level of overeducated workers. The obtained evidence confirms this hypothesis but only to a certain extent as skills only explain partially the wage penalty of overeducation.

Pellizzari, M., & Fichen, A. (2017). A new measure of skill mismatch: Theory and evidence from PIAAC. *IZA Journal of Labor Economics*, 6(1). doi: 10.1186/s40172-016-0051-y

**Abstract:**

This paper proposes a new measure of skill mismatch to be applied to the recent OECD Survey of Adult Skills (PIAAC). The measure is derived from a formal theory and combines information about skill proficiency, self-reported mismatch and skill use. The theoretical foundations underlying this measure allow identifying minimum and maximum skill requirements for each occupation and to classify workers into three groups: the well-matched, the under-skilled and the over-skilled. The availability of skill use data further permits the computation of the degree of under- and over-usage of skills in the economy. The empirical analysis is carried out using the first round of the PIAAC data, allowing comparisons across skill domains, labour market statuses and countries.

**Title:**

Perry, A. (2017). Are over-qualified immigrants mismatched according to their actual skills? An international comparison of labor market placement in OECD countries. GESIS Papers No. 2017/19. Köln: GESIS - Leibniz-Institute for the Social Sciences.

**Abstract:**

Previous research finds that immigrants are more often over-qualified than natives. Reasons can be imperfect transferability and signaling of skills. However, over-qualification does not necessarily imply that someone is over-skilled when it comes to actual skills and vice versa. The Programme for the International Assessment of Adult Competencies (PIAAC 2012) provides most recent data

on basic skills of the working-age population. With this data I examine numeracy mismatch of first generation immigrants and natives in 13 OECD countries. My results suggest that especially non-native speaking immigrant workers have difficulties finding employment that aligns with their skill level. This results in genuine mismatch of immigrants, meaning that they are more often over-qualified than native workers and at the same time (comparing individuals at the same skill level) more often over-skilled. Hence, their skills are not put into effective use. These findings differ across occupations.

**Title:**

Rammstedt, B., Danner, D., & Lechner, C. (2017). Personality, competencies, and life outcomes: Results from the German PIAAC longitudinal study. *Large-scale Assessments in Education*, 5(2). doi: 10.1186/s40536-017-0035-9

**Abstract:**

The present paper investigates the power of personality to predict important life outcomes in the context of the Programme for the International Assessment of Adult Competencies (PIAAC). On the most global level, personality can be described by the Big Five dimensions, extraversion, agreeableness, conscientiousness, emotional stability, and openness to experience. These five dimensions were assessed in the German PIAAC longitudinal study (N = 4122) and can thus be directly related to the central competence and outcome indicators measured in PIAAC. In a first step, we report the relationships between the Big Five dimensions and the basic competencies literacy and numeracy. In a second step, we investigate the extent to which the five personality dimensions can contribute to explaining six important life outcomes, above and beyond competencies and socio-demographic characteristics. Our results indicate that personality is substantially related to all six life outcomes. The portion of variance explained by personality was similar to, and sometimes larger than, that explained by competencies. After adjusting for competencies, personality was incrementally predictive of life satisfaction and health, in particular, and, to a lesser extent, of educational attainment, employment status, and income. The only outcome of which personality was not incrementally predictive over and above competencies was participation in continuing education. Overall, these findings highlight the merit of including measures for the Big Five personality domains in upcoming cycles of PIAAC.

Rammstedt, B., Martin, S., Zabal, A., Carstensen, C., & Schupp, J. (2017). The PIAAC longitudinal study in Germany: Rationale and design. *Large-scale Assessments in Education*, 5(4). doi: 10.1186/s40536-017-0040-z

**Abstract:**

In Germany, the respondents who had participated in the 2012 survey of the Programme for the International Assessment of Adult Competencies (PIAAC) were re-approached for the panel study PIAAC-L. PIAAC-L aims at investigating the longitudinal effects of skill outcomes over the life course and the development of the key skills assessed in PIAAC. Moreover, additional and alternative background information was collected and analyzed within PIAAC-L. PIAAC-L consists of three follow-up waves to the initial PIAAC 2012 survey. The present paper describes the rationale for PIAAC-L and the benefits of conducting a longitudinal PIAAC follow-up study in Germany. In addition, we outline the general design of PIAAC-L and the specific design of the three waves of data

collection. Finally, we address the analytic potential of PIAAC-L data set and its availability to the scientific community.

Romero, L. M., Murillo Huertas, I. P., & M., S. J. (2017). Wage effects of cognitive skills and educational mismatch in Europe. *Journal of Policy Modeling*, 39(5), 909-927. doi: 10.1016/j.jpolmod.2017.08.001

**Abstract:**

This paper analyzes the returns to education and educational mismatch in thirteen European countries taking account not only of years of education but also of cognitive skills actually acquired by workers. Using the PIAAC database, our results suggest that both years of education and skills contribute to determine wages, with higher returns to years of education as the level of skills increases. Educational and skills mismatches appear to be two different phenomena, with educational mismatch lying behind wages. It is also found that the higher the level of skills achieved by an individual, the higher the returns to years of required education or to years of overeducation. Policy implications are derived as regards educational mismatch, which reflects inefficiencies in the allocation of the educational resources, and as regards the relevance of cognitive skills, leaving room for improving the quality of education to fully take advantage of educational investments.

Scandurra, R., & Calero, J. (2017). Modelling adult skills in OECD countries. *British Educational Research Journal*, 43(4), 781-804. doi: 10.1002/berj.3290

**Abstract:**

Research in the social sciences has focused extensively on the relationship between family background, educational attainment and social destination, on the one hand, and on the processes of skills creation and skills use, on the other. This paper brings these two branches of the literature together by examining the correlation between a range of social factors. The methodology we adopt provides a comprehensive approach to the study of the channels through which literacy skills are acquired, taking into account the interrelation of family background, educational attainment, and the use of skills at work and at home. We use the Programme of International Assessment of Adult Competences (PIAAC) dataset and apply a structural equation model (SEM). Our results show that family background and education play an important role in the configuration of adult skills and skill practices. Unequal family access to resources has a strong impact at later stages in life and strongly affects educational attainment and skills outcomes. Additionally, skills use has a positive and direct impact on adult skills.

**Title:**

Schnepf, S. V. (2017). How do tertiary dropouts fare in the labour market? A comparison between EU countries. *Higher Education Quarterly*, 71(1), 75-96. doi: 10.1111/hequ.12112

**Abstract:**

Dropping out of university is regularly discussed as a negative indicator. However, research on actual career trajectories of dropouts is virtually non-existent. This study estimates the association

between tertiary dropouts and career chances in 15 European countries. Using data from the 2011 Programme for the International Assessment of Adult Competencies (PIAAC), estimates are derived from the application of propensity score matching taking a variety of individual background characteristics including cognitive skills into account. Results indicate that individuals are likely to fare better in the labour market if they enrol in university and drop out than if they do not enrol at all. Policy makers need to revise the notion that dropping out is purely negative.

**Title:**

Tverdostup, M., & Paas, T. (2017). Gender-specific human capital: Identification and quantifying its wage effects. *International Journal of Manpower*, 38(6), 854-874. doi: 10.1108/IJM-05-2016-0111

**Abstract:**

**Purpose:** The purpose of this paper is to better understand the possible reasons behind gender pay disparities, focussing on the unique features of male and female human capital and their wage returns. Despite increasing convergence of male and female human capital attainments, substantial differences remain. Extraction of human capital components non-overlapping across genders provides more profound explanation of the unexplained wage gap of men and women. **Design/methodology/approach:** Starting with the non-parametric matching-based decomposition technique, the authors extend the pay gap estimation framework and focus on males and females having no counterpart in a set of characteristics within the opposite gender. The authors identify gender-unique human capital in terms of differences in distribution of individual characteristics across men and women and gender-specific combination of human capital characteristics. Wage returns to gender-specific profiles are evaluated applying wage regression on both full distribution of earnings and wage quantiles. The research relies on the Survey of Adult Skills (PIAAC) database for Estonia, which incorporates both formal education and cognitive skill records. **Findings:** The study identifies sets of characteristics and competencies exclusive for both genders, proving that male and female profiles cannot be directly compared. The results suggest that men possess high individual and combined abilities in numeracy and problem solving in technology-rich environment, not always reached by females. This potentiates men's higher earnings in spite of their generally lower formal educational attainments. Wage gap analysis over the full distribution of earnings shows even larger "glass ceiling" effect for females, possessing woman-specific human capital. **Originality/value:** The authors raise a research from a novel perspective towards a role of human capital in gender wage inequality. Instead of usual reference to observable gaps in male and female characteristics, the authors identify the gender-specific human capital profiles, to a large extent non-reached by the opposite gender. Analysed associations between gender-specific characteristics and earnings provide an insight to possible effects of gender-unique human capital on a male-female wage disparity.

**Title:**

Vera-Toscano, E., Rodrigues, M., & Costa, P. (2017). Beyond educational attainment: The importance of skills and lifelong learning for social outcomes. Evidence for Europe from PIAAC. *European Journal of Education*, 52(2), 217-231. doi: 10.1111/ejed.12211

**Abstract:**

Empirical evidence suggests that educational attainment nurtures people's social outcomes and promotes active participation in society and stability. However, it is unclear to what extent other types of human capital also correlate with social outcomes. Hence, we explored the opportunity

offered by the PIAAC survey through its provision of information on educational attainment, observed individual key skills proficiency, and participation in adult education and training (adult lifelong learning). We therefore studied the association between these human capital variables and social outcomes, and more specifically interpersonal trust and participation in volunteering activities. Results revealed that these social outcomes were affected not only by the formal qualification obtained, determined by the education variable, but also throughout the life-cycle. Indeed, education and training when undertaken during adult life have a significant impact, especially on volunteering. The fact that the skill proficiency also plays a significant role is extremely relevant, as skills are more likely to change over the life-cycle, either in a positive or negative way. Whilst the formal education received is constant after exiting the educational system, skills reflect competences more accurately: first, because those with the same level of education may have different skill levels because of differences in the quality of education or ability; second, because skills can vary over time. For example, they may increase with work experience or informal education, or decrease as a result of depreciation and ageing. These findings suggest that social outcomes are prone to be affected by many factors other than formal education, suggesting that policy makers can implement recommendations even after formal education has been completed.

Yasukawa, K., Hamilton, M., & Evans, J. (2017). A comparative analysis of national media responses to the OECD Survey of Adult Skills: Policy making from the global to the local? *Compare: A Journal of Comparative and International Education*, 47(2), 271-285. doi: 10.1080/03057925.2016.1158644

**Abstract:**

The Organization for Economic Co-operation and Development's (OECD) Programme of International Assessment of Adult Competencies (PIAAC) is put forward as a landmark development in the lifelong monitoring and international comparison of education. The first round of PIAAC's Survey of Adult Skills compared performance in literacy, numeracy and problem solving in technology-rich environments across 24 countries. However, the translation of any OECD agenda into national policies is mediated by many actors, including the media. This paper examines and compares how the national media of Japan, England and France reported on the PIAAC results of their countries and the extent to which these reports mirror key messages from the OECD's Country Notes. It begins to trace how the OECD PIAAC agendas materialise into national policies. Although their role in this initial period was limited, we argue the roles of the media together with other policy actors must be monitored as they interact to shape possibilities for sustainable adult education policies.

Ackermann-Piek, D. (2018). *Interviewer effects in PIAAC Germany 2012* (Dissertation). Mannheim University. Retrieved February 15, 2019, from <https://ub-madoc.bib.uni-mannheim.de/42772>

### Abstract:

Concerns about interviewer effects in interviewer-mediated surveys have accompanied generations of survey researchers. Following the Total Survey Error (TSE) framework, this dissertation examines interviewer effects in multiple areas of a survey: interviewer effects on estimates of substantive survey variables and interviewer effects on unit nonresponse. The aim is to address whether the same interviewer characteristics are associated with interviewer effects across these multiple error sources. Researchers typically address interviewer effects on a single source of error. Part of the reason for this is that sufficient data on multiple error sources are seldom available in a single survey. Using data from PIAAC Germany 2012, in this dissertation the results of analyses into individual error sources described in the TSE can be combined.

Addey, C. (2018). Assembling literacy as global: The danger of a single story. In M. Milana, S. Webb, J. Holford, R. Waller, & P. Jarvis (Eds.), *The palgrave international handbook on adult and lifelong education and learning* (pp. 315-35). London: Palgrave Macmillan. doi: 10.1057/978-1-137-55783-4\_17

### Abstract:

This chapter enquires into the dominant conceptualization of literacy in international assessments of adult literacy. Framed by debates about evolving conceptualizations of international commensurative practices on literacy, it explores how a single story of literacy has been chosen, defined, organized, measured, legitimated and interpreted in international large-scale assessments. Taking a New Literacy Studies (NLS) ontological approach to literacy as its point of departure, the analysis draws on the theoretical assumptions of Latourian Actor-Network Theory and Adichie's experience of 'The danger of a single story' to propose a concept of 'global literacy', which is described as both assembled and single. The chapter argues that global literacy is not intrinsically bad, but that, in Adichie's words, it is only one of the many literacy stories. The epistemological pluralisms of literacy include global literacy, but only as one of many literacy stories.

### Title:

Akgündüz, Y. E., & Torun, H. (2018). *Two and a half million Syrian refugees, skill mix and capital intensity*. GLO Discussion Paper No. 186. Maastricht: Global Labor Organization (GLO). Retrieved February 15, 2019, from <http://hdl.handle.net/10419/175271>

### Abstract:

We investigate how the rapid increase in the low-skilled labor supply induced by the inflow of 2.5 million Syrian refugees changed the tasks performed by native workers and the amount of capital used by firms in Turkey. Despite the unexpected nature of the refugee inflow, location choice of the refugees may be endogenous to the labor market opportunities of hosting regions. To handle this endogeneity issue, we use an instrument for the refugee intensity based on the distance of Turkish regions to the Syrian ones. The results based on Labor Force Survey suggest that the in-

flow of refugees increased natives' task complexity, reducing the intensity of manual tasks, and raising the intensity of abstract, routine and ICT tasks. This effect is particularly strong for natives with medium level of education. Exploiting the administrative firm data that contains the entirety of firms in the country, we find that the firms reduced their fixed assets. The fixed asset reduction is largest in machinery and equipment, which can be interpreted as a decline in the capital intensity of production. We conclude that tasks provided by Syrian refugees are substitutes for natives' manual tasks and firms' capital, and complementary to natives' more complex tasks.

**Title:**

Albrecht, S. (2018). *Empirical studies in labour and migration economics* (Dissertation). Universiteit van Amsterdam. Retrieved February 15, 2019, from <https://pure.uva.nl/ws/files/29052726/Thesis.pdf>

**Abstract:**

This thesis consists of three empirical studies investigating topics in the fields of labour and migration economics, using a combination of administrative and survey data. The first study in labour economics seeks to answer the question of whether international differences in earnings inequality between skilled and (relatively) unskilled workers can be explained by differences in the relative supply of and demand for skilled and unskilled workers across countries. Both the second and third studies are placed in the field of migration economics, dealing with the topical issue of refugee migration. Specifically, they investigate the social and attitudinal effects of the reception of refugees on host communities. The second study employs a case study of a town in rural Australia to examine how a large influx of refugees to the township has impacted social capital among the native residents. The third study broadens the context by using refugee centre data from all of the Netherlands over a number of years to link exposure to refugees to changes in natives' attitudes to immigration. While the three studies differ (in parts) in the subfield, context and methodology of empirical microeconomics, a uniting factor is that they are motivated by important real-world problems, and that any conclusions drawn are based on the thorough analysis of a suitable dataset.

**Title:**

Almeida, R. K., Fernandes, A. M., & Viollaz, M. (2018). Software adoption, employment composition, and the skill content of occupations in Chilean firms. *The Journal of Development Studies*, 56(1), 169-185. doi: 10.1080/00220388.2018.1546847

**Abstract:**

We contribute to the technology, skills, and jobs debate by exploiting a novel dataset for Chilean firms between 2007 and 2013, with information on the firms' adoption of complex software used in client management, production, or administration and business software packages. Instrumental variables estimates show that, in the medium-run, adoption of this complex software reallocates employment away from professional and technical workers, toward administrative and unskilled workers (production and services). Adoption also increases the use of routine and manual tasks and reduces that of abstract tasks within firms. The contrast between ours and previous findings shows that labour market impacts of technology adoption hinge on the type of technology and its complementarity with the skills content of occupations.

Andrews, D., Nicoletti, G., & Timiliotis, C. (2018). *Digital technology diffusion. A matter of capabilities, incentives or both?* OECD Economics Department Working Papers No. 1476. Paris: OECD Publishing. doi: 10.1787/7c542c16-en

**Abstract:**

Insufficient diffusion of new technologies has been quoted as one possible reason for weak productivity performance over the past two decades (Andrews et al., 2016). This paper uses a novel data set of digital technology usage covering 25 industries in 25 European countries over the 2010-16 period to explore the drivers of digital adoption across two broad sets of digital technologies by firms, cloud computing and back or front office integration. The focus is on structural and policy factors affecting firms' capabilities and incentives to adopt – including the availability of enabling infrastructures (such as high-speed broadband internet), managerial quality and workers skills, and product, labour and financial market settings. We identify the effects of structural and policy factors based on the difference-in-difference approach pioneered by Rajan and Zingales (1998) and show that a number of these factors are statistically and economically significant for technology adoption. Specifically, we find strong support for the hypothesis that low managerial quality, lack of ICT skills and poor matching of workers to jobs curb digital technology adoption and hence the rate of diffusion. Similarly our evidence suggests that policies affecting market incentives are important for adoption, especially those relevant for market access, competition and efficient reallocation of labour and capital. Finally, we show that there are important complementarities between the two sets of factors, with market incentives reinforcing the positive effects of enhancements in firm capabilities on adoption of digital technologies.

**Title:**

Annen, S. (2018). Measuring labour market success: A comparison between immigrants and native-born Canadians using PIAAC. *Journal of Vocational Education & Training*, 71(2), 218-238. doi: 10.1080/13636820.2018.1473469

**Abstract:**

Canadian society is characterised by a plurality of immigrants and Canadian migration policy and corresponding recognition approaches are strongly geared to economic criteria, qualifications and skills. This paper addresses the question how immigrants who have acquired their highest qualification outside Canada are able to use their foreign qualifications and skills in their current job. The analyses are conducted to verify the assumptions of human capital theory as well as the lack of transferability of human capital across country borders. To answer these questions a labour market success index is developed, which is used as a dependent variable in regression models. The results show that traditional operationalisations of human capital (years of education, years of work experience and skills) have a positive effect on individual labour market success. At the same time, being born abroad and having acquired one's highest qualification abroad in comparison to Canada, especially in a Non-Western country, has negative effects on the overall labour market success of an individual. Detailed comparisons regarding different indicators of labour market success also prove these comparatively negative effects. The results demonstrate the limited explanatory power of human capital theory and the necessity to complement it with Bourdieu's concepts of social and cultural capital.

Avvisati, F., Cherian, M., Encinas-Martin, M., Fitzpatrick, M., Pacileo, B., & Toledo, D. (2018). *Skills in Ibero-America: Insights from PISA 2015*. Paris: OECD Publishing.

**Abstract:**

In a knowledge-based global economy, investment in human capital is an essential component of any inclusive growth strategy. When workers lack the necessary skills, new technologies and production processes are adopted more slowly and do not translate into new growth models with higher value-added activities. However, skills affect individual's lives and well-being far beyond what can be measured by labour-market earnings and economic growth. This is particularly relevant for Ibero-American countries as they embark on a path of structural reforms to unleash new and sustainable sources of growth.

**Title:**

Barker, A. (2018). *Increasing inclusiveness for women, youth and seniors in Canada*. OECD Economics Department Working Papers No. 1519. Paris: OECD Publishing. doi: 10.1787/83cb8b8d-en

**Abstract:**

Women, youth and seniors face barriers to economic inclusion in Canada, with considerable scope to improve their labour market outcomes. There has been no progress in shrinking the gender employment gap since 2009, and women, particularly mothers, continue to earn significantly less than men, in part due to a large gap in unpaid childcare responsibilities. Outside the province of Québec, low (but increasing) rates of government support for childcare should be expanded considerably, as should fathers' low take-up of parental leave. Skills development should be prioritised to arrest declining skills among youth and weak wage growth among young males with low educational attainment. Fragmented labour market information needs to be consolidated to address wage penalties associated with the widespread prevalence of qualifications mismatch. Growth in old-age poverty should be tackled through further increases in basic pension payments over time. Linking changes in the age of eligibility for public pensions to life expectancy would boost growth by increasing employment of older Canadians still willing and able to work. For all three groups, well-targeted expansions of in-work tax benefits and active labour market spending have the potential to increase employment.

**Title:**

Bashir, S., Lockheed, M., Ninan, E., & Tan, J.-P. (2018). *Facing forward: Schooling for learning in Africa*. Washington: World Bank Publications. Retrieved February 15, 2019, from <https://openknowledge.worldbank.org/bitstream/handle/10986/29377/9781464812606.pdf?sequence=14&isAllowed=y>

**Abstract:**

This book lays out a range of policy and implementation actions that are needed for countries in sub-Saharan Africa to meet the challenge of improving learning while expanding access and completion of basic education for all. It underscores the importance of aligning the education system to be relentlessly focused on learning outcomes and to ensuring that all children have access to good schools, good learning materials, and good teachers. It is unique in characterizing countries according to the challenges they faced in the 1990s and the educational progress they have made

over the past 25 years. The authors review the global literature and contribute their extensive new analyses of multiple datasets from over three dozen countries in the region. They integrate findings about what affects children's learning, access to schooling, and progress through basic education. The book examines four areas to help countries better align their systems to improve learning: completing the unfinished agenda of reaching universal basic education with quality; ensuring effective management and support of teachers; targeting spending priorities and budget processes on improving quality; and closing the institutional capacity gap. It concludes with an assessment of how future educational progress may be affected by projected fertility rates and economic growth. The primary audience for this book are policy makers in Africa, practitioners, and partners concerned about building the knowledge capital of sub-Saharan Africa.

**Title:**

Bechichi, N., Grundke, R., Jamet, S., & Squicciarini, M. (2018). *Moving between jobs*. OECD Science, Technology and Industry Policy Papers No. 52. Paris: OECD Publishing. doi: 10.1787/d35017ee-en

**Abstract:**

This paper aims to inform policies facilitating job-to-job transitions triggered by changes in the task content of occupations and in job demand. It assesses the distances existing between occupations in terms of cognitive skills and of skills as they emerge from the tasks performed on the job, and the training needs that moving between occupations entails. Skill “shortages” and “excesses” calculated on data for 31 countries and aggregated over 127 occupations are used to estimate the training efforts required to meet the skills requirements of the destination job. Distances in cognitive skills are found to be higher among low-skilled or from mid- to high-skilled occupations than among higher-skilled occupations. Conversely, distances in task-related skills are higher within high-skilled than low-skilled occupations. These results call for policies aimed at developing general cognitive skills complemented by task-related skills for workers in low-skilled occupations, and on-the-job training options for workers in high-skilled occupations.

Becker Patterson, M. (2018). The forgotten 90%: Adult nonparticipation in education. *Adult Education Quarterly*, 68(1). doi: 10.1177/0741713617731810

**Abstract:**

Despite a highly developed U.S. adult education system, 90% of adults aged 20 years and older considered the least educated did not participate recently in formal or nonformal education. What are nonparticipants' characteristics, learning backgrounds, and skill levels? What predicts their likelihood of not participating in recent formal or nonformal education? The author analyzed 2012/2014 Program for the International Assessment of Adult Competencies–USA data. Situational deterrents of increasing age, parental education, low income, and work and family responsibilities contribute to nonparticipation. Dispositional deterrents include health and disability challenges, low social trust, and difficulties relating new ideas to real life. Institutional deterrents are education costs and little work schedule flexibility. Supports reported by nonparticipants are liking to learn new things, use of computers, and getting information from television and people they trust. Results from Program for the International Assessment of Adult Competencies–USA analyses inform adult and postsecondary educators and policy makers on what happened to—and how to reach—the forgotten 90%.

**Title:**

Behr, D. (2018). Translating questionnaires for cross-national surveys: A description of a genre and its particularities based on the ISO 17100 categorization of translator competences. *Translation & Interpreting*, 10(2), 5-20. doi: 10.12807/ti.110202.2018.a02

**Abstract:**

Sound questionnaire translation is crucial for collecting equivalent data in cross-national surveys. The topic is widely discussed in fields in which translated questionnaires are used, such as in the social sciences or in cross-cultural psychology, but hardly in translation studies. This article aims at bridging this gap by bringing the genre of questionnaires closer to translation scholars and practitioners. To begin with, we will provide a sketch of key characteristics of cross-national survey methodology, with a special focus on questionnaire translation. Next, the multi-dimensional concept of translation competence will be introduced. Along the ISO 17100 competence model then, we will list requirements, challenges, and resources for questionnaire translation and illustrate those with examples. The concluding paragraph will highlight areas for interdisciplinary research involving both translation studies and cross-national survey methodology.

**Title:**

Bentaouet Kattan, R., Macdonald, K., & Patrinos, H. A. (2018). *Automation and labor market outcomes: The pivotal role of high-quality education*. Policy Research Working Paper No. WPS8474. Washington: The World Bank. doi: 10.1596/1813-9450-8474

**Abstract:**

Automation will be a boon or a catastrophe depending on whom you listen to. This paper proposes an overlapping-generations model with endogenous school choice in which the quality of a country's education system determines how well skill supply can respond to increased demand from automation and subsequently whether automation will be beneficial or detrimental. In this sense, education quality in the model offers a bridge between the optimistic and pessimistic perspectives on automation. In testing the model's assumptions, the paper finds evidence that educational attainment, cognitive skills, and select noncognitive skills are associated with avoiding automation-prone occupations. Consistent with the model's predictions, census data indicate that countries have historically relied most on these types of occupations at middle-income status. The model and empirical findings suggest that it is middle-income countries that are most vulnerable to automation if their education systems are unable to affect cognitive and noncognitive skills sufficiently. As a result, automation may herald a much different growth model for developing countries: one in which developing these skills is central.

Berson, C. (2018). Fixed-term contracts and labor market duality in France. *De Economist*, 166(4), 455-476. doi: 10.1007/s10645-018-9318-y

**Abstract:**

The French labor market is segmented between permanent and temporary workers. The second category has difficulty in getting an open-ended contract. This paper aims at depicting workers on short-term contracts and shows the consequences on their professional career are negative and

significant. A large part of the wage gap between permanent and temporary workers remains unexplained by observable characteristics. They receive less on-the-job training and their likelihood of obtaining a stable job is lower than 30% after 1 year and a half. They have also a higher probability of being the adjustment variable in case of an economic negative shock. These different findings show the importance of using public policies to encourage transitions from fixed-term to permanent employment and reducing labor-market duality.

Biagi, F., Grubanov-Boskovic, S., Natale, F., & Sebastian, R. (2018). *Migrant workers and the digital transformation in the EU*. JRC Technical Reports No. 30. Luxembourg: European Union. doi: 10.2760/561934

**Abstract:**

The aim of this report is to provide insights on the implications that structural changes in the labour market related to the Digital Transformation (DT) could have on the integration of EU mobile citizens and third country nationals working in the EU. A comprehensive analysis of the changing nature of the EU labour markets and the effects of DT is provided in the upcoming European Commission's 2018 Employment and Social Developments in Europe (ESDE) review. Building upon these general findings, this report contributes to the debate from a migration specific point of view by providing evidence on the extent to which migrants are employed in occupations that are potentially prone to automation and therefore may disappear in future. The analysis is based on data drawn from EU LFS 2015- 2016 and PIAAC 2012 surveys.

Bijlsma, I., & Velden, R. (2018). *Much ado about social outcomes? Effective skill, skill mismatch, and their relation with job satisfaction and other social outcomes*. ROA Research Memoranda No. 002. Maastricht: Research Centre for Education and the Labour Market. Retrieved February 15, 2019, from [https://cris.maastrichtuniversity.nl/portal/files/26163153/ROA\\_RM\\_2018\\_2.pdf](https://cris.maastrichtuniversity.nl/portal/files/26163153/ROA_RM_2018_2.pdf)

**Abstract:**

Skills and skill mismatches are claimed to have major consequences for societies and individuals, although convincing evidence mainly exists for wages. Our article examines the association between skill mismatch and job satisfaction as well as other social outcomes, such as political efficacy and social trust. Drawing on data from the OECD Programme for the International Assessment of Adult Competencies (PIAAC), we contribute to sociological research by applying the 'effective skill' concept, a new conceptual approach to measure skill mismatch. We relate this new concept to job satisfaction and other social outcomes, comparing our results with alternative skill mismatch indicators. Our findings provide empirical evidence for two important messages: First, we provide evidence that once we use objective indicators for the skill match – and we make use of all measures that we currently have – there is no association between skill mismatch and job satisfaction. In fact, job satisfaction is driven by skill use, not by skill mismatches or skill proficiency. Second, we show that effective skill and skill mismatch are associated with other social outcomes, having quite considerable effects especially on political efficacy.

Blasius, J. (2018). Fabrication of interview data. *Quality Assurance in Education*, 26(2), 213-226. doi: 10.1108/QAE-06-2017-0028

**Abstract:**

**Purpose:** Evidence from past surveys suggests that some interviewees simplify their responses even in very well-organized and highly respected surveys. This paper aims to demonstrate that some interviewers, too, simplify their task by at least partly fabricating their data, and that, in some survey research institutes, employees simplify their task by fabricating entire interviews via copy and paste. **Design/methodology/approach:** Using data from the principal questionnaires in the Programme for International Student Assessment (PISA) 2012 and the Programme for the International Assessment of Adult Competencies (PIAAC) data, the author applies statistical methods to search for fraudulent methods used by interviewers and employees at survey research organizations. **Findings:** The author provides empirical evidence for potential fraud performed by interviewers and employees of survey research organizations in several countries that participated in PISA 2012 and PIAAC. **Practical implications:** The proposed methods can be used as early as the initial phase of fieldwork to flag potentially problematic interviewer behavior such as copying responses. **Originality/value:** The proposed methodology may help to improve data quality in survey research by detecting fabricated data.

Bode, E., & Gold, R. (2018). Adult training in the digital age. *Economics: The Open-Access, Open-Assessment E-Journal*, 12(36), 1-14. doi: 10.5018/economics-ejournal.ja.2018-36

**Abstract:**

Digital technologies will both create new jobs and replace existing ones. To cope with increasing labor market dynamics in the digital age, workers will have to become more mobile across jobs, occupations, and industries. The relative importance of their job-specific skills will decrease while that of their general skills applicable to various occupations will increase. The G20 should establish national adult training programs that focus on improving workers' general skills, specifically their

theoretical, non-cognitive, and digital skills. These general skills will enable workers to work with technology instead of competing with it, thereby increasing their job mobility and employability.

Boeren, E., & Whittaker, S. (2018). A typology of education and training provisions for low educated adults: Categories and definitions. *Studies in the Education of Adults*, 50(1), 4-18. doi: 10.1080/02660830.2018.1520017

**Abstract:**

It is Europe's ambition to be a strong knowledge based economy. The European Commission recognises the role of lifelong learning in achieving this aim. However, exploring participation rates in post-compulsory learning, it is clear that access to education and training is unequally distributed in society. We know that participation rates vary by socio-economic and socio-demographic groups, as well as by country. However, the role of education and training institutions in facilitating and enabling participation is less well known and deserves further in-depth attention. In order to fill this gap, we scrutinised definitions and categorisations of adult education provisions as published by the leading international organisations in the field of education and training. We paid specific attention to opportunities available for the lowest educated adults in society. Based on our review, we constructed a new typology consisting of seven categories for addition to the knowledge base and use in our own Horizon 2020 project. The categories are: (1) basic skills and basic education, (2) second chance education at upper secondary levels, (3) post-secondary VET, (4) apprenticeships, (5) training that forms part of Active Labour Market Policies, (6) workplace or job-related learning and (7) personal or social learning.

Borgonovi, F., Choi, u., & Paccagnella, M. (2018). *The evolution of gender gaps in numeracy and literacy between childhood and adulthood*. OECD Education Working Papers No. 184. Paris: OECD Publishing. doi: 10.1787/0ff7ae72-en

**Abstract:**

Numeracy and literacy skills have become increasingly important in modern labour markets. The large gender differences that several studies have identified have therefore sparked considerable attention among researchers and policy makers. Little is known about the moment in which such gaps emerge, how they evolve and if their evolution differs across countries. We use data from large-scale international assessments to follow representative samples of birth-cohorts over time, and analyse how gender gaps in numeracy and literacy evolve from age 10 to age 27. Our results suggest that, across the countries examined, males' advantage in numeracy is smallest at age 10 and largest at age 27. The growth in magnitude of the gender gap is particularly pronounced between the age of 15 and 27. Such evolution stands in sharp contrast with the evolution of the gender gap in literacy, which is small at age 10, large and in favour of females at age 15, and negligible by age 27.

Borgonovi, F., Ferrara, A., & Maghnouj, S. (2018). *The gender gap in educational outcomes in Norway*. OECD Education Working Papers No. 183. Paris: OECD Publishing. doi: 10.1787/f8ef1489-en

**Abstract:**

As is the case in most OECD countries, boys in Norway are more likely to have lower levels of academic achievement and attainment than girls. While this phenomenon is not recent, it has become increasingly pronounced in recent years and, as a result, is attracting considerable attention from policy-makers in many countries. This paper develops evidence of gender gaps in educational outcomes in Norway and selected OECD countries and identifies examples of policies and practices that could help close existing gender gaps in Norway. The first part of the paper describes gender gaps in school achievement, attainment, attitudes, beliefs and behaviours using an international comparative analysis. Evidence from PIRLS, TIMSS, PISA and the OECD Survey of Adult Skills (PIAAC) is used to identify gender gaps during primary and secondary schooling as well as young adulthood. The second part of the paper summarises evidence on policies and practices that were implemented in other countries and that could support efforts in Norway to mitigate, prevent and reduce gender gaps in achievement and attainment. Most of the evidence on policies and practices reviewed in the report comes from the peer countries Finland, the Netherlands and the United States that were identified of particular relevance for Norway, given the policy challenge Norway faces.

Bosio, G., & Cristini, A. (2018). Is the nature of jobs changing? The role of technological progress and structural change in the labour market. In G. Bosio, T. Minola, F. Origo, & S. Tomelleri (Eds.), *Rethinking Entrepreneurial Human Capital: The Role of Innovation and Collaboration* (pp. 15-41). Cham: Springer International Publishing. doi: 10.1007/978-3-319-90548-8\_2

**Abstract:**

We examine the process of radical transformation that during the last decades has changed labor markets in developed countries and, in particular, the nature of jobs. Indeed, the advances in ICT and robotics have generated the concern that automation could substitute people in a wide range of activities, therefore contributing to the potential increase in the fraction of jobs at risk in the next future. However, empirical evidence on labour demand in the majority of OECD countries emphasizes a process of labour market polarization that consists in the hollowing out of routine occupations accompanied by a quasi-simultaneous rise of non-routine occupations, both high skilled conceptual and manual low skilled ones. This process has been explained by the routinization hypothesis, whereby computer-based technologies allow machines to perform repetitive tasks and replace workers in routine jobs where such tasks are prevalent. In this perspective, structural and occupational changes are naturally intertwined with technological change; their understanding can therefore help unravelling the features of new technologies and how they can influence demand for skills. In such a setting, entrepreneurship can play an important role as driver of innovation and employment growth.

Brandt, N. (2018). *France: Promoting economic opportunities and well-being in poor neighbourhoods*. OECD Economics Department Working Papers No. 1454. Paris: OECD Publishing. doi: 10.1787/7266e91e1-en

**Abstract:**

Thanks to a highly developed welfare state, poverty is moderate on average in France, but – as in other countries – highly concentrated in some neighbourhoods. Their residents face many social

disadvantages, including high unemployment and inactivity, schools with many struggling children, often run-down housing and urban infrastructure, and a lack of local enterprises, services and amenities. The government focuses a wide array of policies on these areas to promote better schooling outcomes, employment and local economic activity. Urban renewal and public housing policies aim explicitly at promoting social mixing, often presented as an anti-ghetto policy. Evidence suggests that targeted investment in transport and housing infrastructure as well as education and training could go a long way to improving economic opportunities and well-being in poor areas. In contrast, special economic zones with tax breaks to attract business to these areas have a mixed track record at best. Greater social mixing is difficult to engineer, and it is far from clear if this by itself would improve the lives of the poor. There is a need to better link urban, social and judicial policies favouring alternative sentencing and support for offenders to integrate into society to avoid vicious circles of social disadvantage and crime.

Brandt, N. (2018). *Strengthening innovation in Poland*. OECD Economics Department Working Papers No. 1479. Paris: OECD Publishing. doi: 10.1787/abf2c877-en

**Abstract:**

Poland's catch up with other OECD country has been largely based on productivity growth resulting from restructuring towards more productive sectors and foreign technology absorption. The economy's own innovation capacity is relatively weak, with low investment in research and development, no tradition of commercialising research and very limited innovation activity within firms. The government plans a higher education reform to strengthen the quality of research output, science-industry cooperation and international collaboration, which are all weak. Considerable EU funding is available to support innovation. Most of it is conditioned on science-industry cooperation, which is showing initial benefits. A lively start-up scene is gradually emerging, and the government foresees considerable public support for venture capital financing. Yet, investment in higher education and research trails behind economies that have been able to build strong science and high-tech start-up activity. Poland's many small and medium-sized enterprises have particularly low productivity, partly related to weaknesses in vocational training and adult education, as too many workers have weak basic and digital skills. The government's education reform and digital strategy address some of these issues.

Braun, H. (2018). How long is the shadow? The relationships of family background to selected adult outcomes: Results from PIAAC. *Large-scale Assessments in Education*, 6(4), 1-52. doi: 10.1186/s40536-018-0058-x

**Abstract:**

Background: Ongoing interest in the relationships between family background and adult outcomes is motivated by concerns regarding the intergenerational transmission of advantage/disadvantage. Currently all countries are far from achieving the ideal that all individuals, irrespective of their starting points or their demographic characteristics, are able to accumulate sufficient human capital so that they can achieve success in the workplace and fulfill their responsibilities as family members and as citizens. This study quantifies the length of the shadow cast by family background and personal characteristics on an individual's prospects in the labor market. It also examines the extent to which these relationships are mediated by factors more proximal to

labor market entry. Methods: This study uses data for 21 OECD countries from the first round of PIAAC. It employs descriptive statistics, correlations and logistic regression. Two dichotomous variables are derived from each country's national annual income distribution: Q1 = 1 if the individual's income is in the first (lower) quartile and Q4 = 1 if the individual works full-time and whose income is in the fourth (upper) quartile. For each country, a nested sequence of logistic regression models are fit to ascertain the role of more proximal factors in mediating the impact of family background and demographic characteristics on these labor market outcomes. Results: The patterns of relationships are qualitatively similar across the 21 countries, although the estimated associations vary greatly in strength. Parental education accounts for substantial proportions of the variation in respondents' Educational Attainment and Cognitive Skills. In most countries, children born to parents with lower levels of education have less than a fifty-fifty chance of exceeding that level. Family background is strongly associated with income, but the relationship is largely mediated by Educational Attainment and Cognitive Skills. Females and younger individuals have much higher odds of being in the lower quartile and much lower odds of reaching the upper quartile, even after adjusting for other variables. The magnitudes of these adjusted odds are concerning. Conclusions: Family background and gender cast a long shadow on individuals' life prospects. Countries vary greatly in their success in mitigating these disadvantages. Formulating effective policies will depend on understanding a complex set of dynamics that surely differ among countries.

Brezis, E. S. (2018). Elitism in higher education and inequality: Why are the Nordic countries so special? *Intereconomics*, 53(4), 201-208. doi: 10.1007/s10272-018-0750-7

**Abstract:**

Countries in which there are two channels of education may have a separating equilibrium in which individuals with high abilities learn in elite universities and individuals with low ability learn in standard ones. Elite universities have higher budgets, better scholars, better labs and a better student network, resulting in the human capital of these students having a higher productivity in the more competitive tradable sector.

Brezis, E. S., & Brand, G. (2018). Productivity gap between sectors and double duality in labor markets. *Open Economies Review*, 29(4), 725-749. doi: 10.1007/s11079-018-9487-y

**Abstract:**

Over the last decades, productivity in the tradable sector rose substantially, while in the non-tradable sector, output per worker has remained the same, despite a similar increase in human capital in both sectors. This paper shows that a double duality both in the production and the higher-education sectors as well as heterogeneous ability of individuals might explain the differences in labor productivity between tradable and non-tradable industries. The double duality in the economy enables a separation of individuals by their ability, and in consequence, human capital in both industries is different. The heterogeneity in human capital can explain that despite an increase in human capital in both sectors there is still a gap in productivity and in wage premium. In other words, the productivity gap between sectors is fueled by the double duality in labor markets, leading to heterogeneity in human capital. In consequence, there is a contrast between on one hand, more mobility across countries, and on the other hand, less mobility between sectors.

Brink, S., & Nissinen, K. (2018). *The challenge for equity and excellence in bilingual Finland: Evidence for future successful action*. Finnish Institute for Educational Research Reports No. 54. Jyväskylä: University of Jyväskylä, Finnish Institute for Educational Research. Retrieved February 15, 2019, from <http://urn.fi/URN:ISBN:978-951-39-7535-7>

**Abstract:**

In 2013, the authors prepared a report on educational excellence and equity in Finland based on PISA 2009 data and asked the question “Could Finland achieve both excellence and equality goals in the coming decade? Five years later, this report re-examines the challenge faced by Finland in light of recent PISA results. The Finnish school system, both the Finnish and Swedish speaking components, have consistently ranked at the top of the list of OECD countries. However, Finland’s performance has been dropping compared to previous years, while it failed to keep pace with performance improvements in other countries. Simply working harder along the same path will no longer work. Therefore, this report examines of evidence from PISA 2015 in context, to provide some insights for successful action by those involved in education in order to slow and eventually reverse the decline in student performance. The context in which Finland’s comprehensive schooling operates has changed: the numbers of students of school age are declining; there are more foreign language speakers than Swedish speakers in the population; and there have been Swedish school closures and amalgamations. There have been positive changes, too, such as the pioneering new curriculum. Suggestions are made for strategic action arising from analyses of PISA 2000 to 2015. A series of analyses on student performance over PISA cycles since 2000 in science, reading and mathematics show that there has been a decreasing gap between the average performance of students in Finnish speaking schools and students in Swedish speaking schools. The way this reduction was achieved is not sustainable because students in Finnish speaking schools declined in their performance and students in Swedish speaking schools who had a lower average to start with did not improve much. Thus, increased equality was gained at the expense of excellence. In general, science was the domain with the best performance and Swedish speaking students performed better in mathematics while Finnish speaking students had a higher average in reading in PISA 2015. It is time for Finland to compare performance with top performers wherever they may be and not just among OECD countries. In its heyday, Finland had scores that were similar to those of the top performer Singapore in 2015 and it should be able to achieve those scores again. Analyses of high and low performers, boys and girls and their social background also showed areas where steps can be taken to reduce risk of low scores, to respond early to low performance through monitoring and to provide both opportunities for academic and personal development. Suggestions were made for Finland to work at improving average scores all three domains to achieve higher average scores with less difference between students and schools, particularly through individualized teaching and planning for effective use of additional resources when needed. There were positive signs that both Finnish and Swedish speaking students continue to learn into young adulthood after their comprehensive schooling. The importance of coordinated approaches involving the Ministry of education, municipalities, schools, teachers and parents were highlighted for optimum results. Both excellence and equity should be the goals of education in the coming decade without sacrificing one for the other.

Broecke, S., Quintini, G., & Vandeweyer, M. (2018). Wage inequality and cognitive skills: Reopening the debate. In *Education, Skills, and Technical Change: Implications for Future U.S. GDP Growth* (pp. 251-286). Chicago: University of Chicago Press.

**Abstract:**

Inequality in the United States is high by international standards, and keeps rising. This is likely to bring significant social as well as economic costs, including lower growth. In this paper, we use the Survey of Adult Skills (PIAAC) to revisit the debate on the relative importance of skills in explaining international differences in wage inequality. While simple decomposition exercises suggest that skills only play a minor role, demand and supply analysis indicates that the relatively low supply of, but high demand for, high-skilled workers in the United States compared to other countries could explain 29% of the higher top-end wage inequality observed in the United States.

Washington: International Monetary Fund. Retrieved February 15, 2019, from <https://www.imf.org/~media/Files/Publications/SDN/2018/SDN1807.ashx>

**Abstract:**

New technologies digitalization, artificial intelligence, and machine learning are changing the way work gets done at an unprecedented rate. Helping people adapt to a fast-changing world of work and ameliorating its deleterious impacts will be the defining challenge of our time. What are the gender implications of this changing nature of work? How vulnerable are women's jobs to risk of displacement by technology? What policies are needed to ensure that technological change supports a closing, and not a widening, of gender gaps? This SDN finds that women, on average, perform more routine tasks than men across all sectors and occupations tasks that are most prone to automation. Given the current state of technology, we estimate that 26 million female jobs in 30 countries (28 OECD member countries, Cyprus, and Singapore) are at a high risk of being displaced by technology (i.e., facing higher than 70 percent likelihood of being automated) within the next two decades. Female workers face a higher risk of automation compared to male workers (11 percent of the female workforce, relative to 9 percent of the male workforce), albeit with significant heterogeneity across sectors and countries. Less well-educated and older female workers (aged 40 and above), as well as those in low-skill clerical, service, and sales positions are disproportionately exposed to automation. Extrapolating our results, we find that around 180 million female jobs are at high risk of being displaced globally. Policies are needed to endow women with required skills; close gender gaps in leadership positions; bridge digital gender divide (as ongoing digital transformation could confer greater flexibility in work, benefiting women); ease transitions for older and low-skilled female workers.

Bulman, T., & Pisu, M. (2018). *Generating employment, raising incomes and addressing poverty in Greece*. OECD Economics Department Working Papers No. 1505. Paris: OECD Publishing. doi: 10.1787/8eec4ced-en

**Abstract:**

Employment is pivotal to strengthening Greece's economic recovery, increasing social welfare and redressing poverty. Jobs are returning, making inroads into high unemployment, but their wages and skill levels are lower than many that were lost during the crisis. Greece's hiring is benefiting from more flexible arrangements. Legislative amendments can maintain this flexibility, ensure wages align with productivity and better protect individuals from labour market risks. Ensuring that workers possess skills that match employers' needs will sustain employment and productivity growth. Improving the education system is a long-term mission and involves raising its pedagogical strength and orientation towards professional needs. A social welfare system dominated by pensions has not been able to prevent a steep hike in poverty among children and the young, risking long-term harm to well-being. Pursuing recent steps towards a better targeted social protection, accompanied by support programmes for jobseekers, will provide a reliable safety net and reduce poverty. This Working Paper relates to the 2018 OECD Economic Survey of Greece.

Cai, J., & Gut, D. (2018). Literacy and digital problem-solving skills in the 21st century: What PIAAC says about educators in the United States, Canada, Finland, and Japan. *Teaching Education*, 1-32. doi: 10.1080/10476210.2018.1516747

**Abstract:**

The purpose of our study is to delve into the education gap between the United States and some countries by examining the literacy and digital problem-solving skills of American educators, and comparing their performance with that of their peers from Canada, Finland, and Japan. We use PIAAC data collected by the Organization for Economic Co-operation and Development (OECD), and define educators as professionals with the highest level of qualification in the area of teacher training and education science. Our findings show that, internationally, U.S. educators are at a great disadvantage vis a vis their peers in Finland and Japan in terms of literacy, and they rank the lowest in digital problem-solving skills among the four studied countries. Other key findings include (a) in Canada and Finland, educators perform significantly higher in literacy than non-educators in their respective countries; (b) young educators in the United States (under age 35) lag far behind the same age group in Finland, Japan, and Canada; and (c) in all four countries, digital problem-solving skills of educators tend to decrease as their age increases. All statistical analyses are based on regression using sampling weights.

Calvino, F., Criscuolo, C., Marcolin, L., & Squicciarini, M. (2018). *A taxonomy of digital intensive sectors*. OECD Science, Technology and Industry Working Papers No. 2018/14. Paris: OECD Publishing. doi: 10.1787/f404736a-en

**Abstract:**

This study proposes a taxonomy of sectors according to the extent to which they have gone digital. The taxonomy accounts for some of the key facets of the digital transformation, and recognises that sectors differ in their development and adoption of the most advanced “digital” technologies, in the human capital needed to embed them in production and in the extent to which digital tools are used to deal with clients and suppliers. The indicators used to classify 36 ISIC revision 4 sectors over the period 2001-15 are: share of ICT tangible and intangible (i.e. software) investment; share of purchases of intermediate ICT goods and services; stock of robots per hundreds of employees; share of ICT specialists in total employment; and the share of turnover from online sales. The study further proposes an overall summary indicator of the digital transformation in sectors which encompasses all the considered dimensions.

**Abstract:**

The research team administered the Problem Solving in Technology Rich Environments (PSTRE) assessment connected to the Program for the International Assessment of Adult Competencies (PIAAC) and accessed through Education and Skills Online (OECD, 2016). The PSTRE is a valid and reliable scenario-based assessment made up of 9 multi-stem constructed response items that evaluate digital communication, use of networks to acquire and evaluate information and perform practical tasks in personal, work-related, and community contexts. Completing these tasks required basic digital navigation abilities and also required advanced knowledge to conduct and

interpret searches, interact within databases, and make decision about competing information in order to solve problems.

**Abstract:**

The definition of literacy itself is evolving due to the prevalence of digital texts, tools, and applications that are ubiquitous within our daily interactions. Literacy not only involves the ability to read the word, but also to read and interpret the world. Likewise, digital problem solving is broad in that it reflects an individual's ability to navigate and use multiple digital resources in order to accomplish one's goals in multiple domains including professional work, personal interests/hobbies, educational pursuits, social/professional networking, civic areas, and for future uses we have not yet conceptualized.

**Abstract:**

This mixed-methods research study examined digital problem solving strategies of 18 adults who ranged from novice to very experienced computer users. The research documented the digital problem solving strategies using a verbal protocol approach and analyzed to examine approaches. The tasks participants completed included the 9-item multi-stem PSTRE items from PIAAC and digital problem solving tasks in a library context the research team designed.

Cathles, A., Ou, D., Sasso, S., Setrana, M., & Veen, T. (2018). *Where do you come from, where do you go? Assessing skills gaps and labour market outcomes of young adults with different immigration backgrounds*. CESifo Working Paper Series No. 7157. München: CESifo Group Munich. Retrieved February 15, 2019, from [http://www.cesifo-group.de/DocDL/cesifo1\\_wp7157.pdf](http://www.cesifo-group.de/DocDL/cesifo1_wp7157.pdf)

**Abstract:**

This paper analyzes numeracy and literacy skills of migrants, using PISA and PIAAC data from twelve OECD countries. Our results first show some convergence of the skills gap between the second generation immigrants and the natives over time. Second, the gap in literacy skills among the first-generation and natives and among first-generation and second-generation immigrants has increased over time. Third, demographics and family background contribute to the achievement gaps between different groups. Fourth, school input variables do contribute to skills gaps of young adults with different immigrant backgrounds. Fifth, an immigrant background does not appear to affect the chances of studying in a STEM field.

Chelli, F. M., Ciommi, M., Mariani, F., & Recchioni, M. C. (2018). Opportunity and discrimination in tertiary education: A proposal of aggregation for some European countries. *Rivista Italiana di Economia Demografia e Statistica*, 72(2), 77-88. Retrieved February 15, 2019, from [http://www.sieds.it/isting/RePEc/journal/2018LXXII\\_N2\\_RIEDS\\_07\\_59\\_Chelli\\_Ciommi\\_Mariani\\_Recchioni\\_ok.pdf](http://www.sieds.it/isting/RePEc/journal/2018LXXII_N2_RIEDS_07_59_Chelli_Ciommi_Mariani_Recchioni_ok.pdf)

**Abstract:**

The paper deals with two aspects related to the possibility of reaching a given educational level conditioned on the educational level of the family: discrimination and opportunity. Ten European countries are ranked according to these indices, showing a different pattern. Consequently, a new index that takes into account the two aspects is proposed. The index proposed here can be used by policy makers to monitor and evaluate the effectiveness of public policies. In fact, in contrast to the unidimensional mobility indices, that take into account only one dimension, the new index is able to capture simultaneously two different information: on one hand the difference in the probability of getting tertiary education given the family status (i.e., the discrimination index,  $\Delta$ ) and, on the other hand, the probability for a child of not attaining tertiary education independently from the education level attained by his/her parents (i.e., the opportunity loss index,  $h$ ). Thus,  $(\Delta, h)$  is more informative than the unidimensional indices while preserving a simple functional form that requires an elementary computation. These are two key-properties necessary to define good composite indicators (OECD, 2008). However, our index is defined by assuming that the two dimensions are equally weighted. Therefore, further researches will be devoted to the analysis of how combining these two indices in a different way. For instance, a different system of weights or a different functional form can be used. [Source: From the conclusion, p. 86]

Chetty, K., Qigui, L., Gcora, N., Josie, J., Wenwei, L., & Fang, C. (2018). Bridging the digital divide: Measuring digital literacy. *Economics: The Open-Access, Open-Assessment E-Journal*, 12(23), 1-20. doi: 10.5018/economics-ejournal.ja.2018-23

**Abstract:**

To promote digital transformation, equal emphasis needs to be placed on digital skills development as to infrastructure development. Integral to investment in digital skills development is the subsequent management and evaluation of digital training programmes. This paper assesses mechanisms to ensure digital training programmes are adequately managed using a standardized data collection framework to measure an internationally accepted digital literacy index. Such an index must be defined by an agile definition of digital literacy responsive to the fluid nature of the digital economy. The paper also explores the extent to which a G20 advisory body may inform a nationally representative data collection strategy within the context of a data collection process that is cognizant of the evolving demands of businesses and users alike.

Chmielewski, A. K. (2018). *Can we close gaps in literacy by social background over the life course? Evidence from synthetic 1950-1980 birth cohorts*. OECD Education Working Papers No. 178. Paris: OECD Publishing. doi: 10.1787/c105422d-en

**Abstract:**

It is well-known that there are large disparities in academic achievement between children of different socio-economic status (SES) backgrounds. This study examines the evolution of disparities in literacy skills between adults of different SES backgrounds. It compares countries' patterns in the evolution of disparities in literacy by SES background as cohorts age and asks which patterns of educational and labour force participation predict a narrowing rather than a widening of these disparities. Since there is no international longitudinal study of skills across the entire adult life span, this study uses three cross-sectional international adult studies (International Adult Literacy Survey, Adult Literacy and Lifeskills and Programme for the International Assessment of Adult Competencies) and matches birth years to create synthetic cohorts. Results indicate that there is large cross-national variation in the evolution of skills disparities associated with SES background. Disparities in literacy proficiency tend to widen when SES disparities in high school completion, professional and blue-collar employment increase. Disparities narrow when workers exit the labour force, a finding that is explained by the large inequalities in the employment experiences of individuals from different SES backgrounds, measured by differences in use of literacy skills at work. These results help to explain cross-national variation in the evolution of skills disparities by SES background, which has implications for policies aimed at closing skills gaps over the life course.

Christl, M., Köppl-Turyna, M., & Gnan, P. (2018). Wage differences between immigrants and natives: The role of literacy skills. *Journal of Ethnic and Migration Studies*, 1-33. doi: 10.1080/1369183X.2018.1526062

**Abstract:**

This paper analyses the impact of literacy skills on wage differences between natives and immigrants, using Austria as a case study. We show that, for both groups, literacy skills are an important determinant of the hourly wage. In the second step, we show that differences in proficiency with respect to literacy can explain more than 30% of the total wage gap of 11 log points between natives and immigrants. When adding literacy skills to the wage decomposition, the unexplained part vanishes almost completely, suggesting that the wage difference between immigrants and natives can, to a large extent, be explained. The importance of literacy skills in explaining wage differences between natives and immigrants is robust across several sensitivity tests.

Coben, D., & Alkema, A. (2018). Scoping the development of a measure of adults' numeracy (and literacy) practices. In K. Safford-Ramus, J. Maaß, & E. Süß Stepancik (Eds.), *Contemporary Research in Adult and Lifelong Learning of Mathematics: International Perspectives* (pp. 75-92). Cham: Springer International Publishing. doi: 10.1007/978-3-319-96502-4\_5

**Abstract:**

We describe our research scoping the development of a measure of adults' numeracy and literacy practices, focusing in particular on numeracy. Our ultimate aim is to develop a way of tracking changes in how adults use numeracy and literacy in the workplace, community and at home, to inform educational efforts. This is particularly important for numeracy because there is often a gap between the numeracy adults use in their daily lives and their performance on proficiency tests designed to measure their progress and assess their suitability for work or further training. We

treat numeracy and literacy as both social practices and technical skills, against prevailing polarized positions in the academic and policy literature, and present a conceptual framework encompassing numeracy, reading, writing, speaking and listening practices, in real and virtual (digital) environments.

Cook, R. (2018). *Gender differences in adult numeracy: A comparative study* (Dissertation). University College London. Retrieved February 15, 2019, from [http://discovery.ucl.ac.uk/10055384/1/Cook\\_10055384\\_thesis.pdf](http://discovery.ucl.ac.uk/10055384/1/Cook_10055384_thesis.pdf)

**Abstract:**

This thesis presents a comparative study of gender differences in adult numeracy in 20 OECD countries. It explores the ways in which the widespread male advantage in adult numeracy is associated with gender relations. Gender relations are measured in terms of gender differences in power and status, the gender division of paid and unpaid labour, and gender culture. The thesis uses quantitative secondary analysis of data from the OECD's 2012 Programme for International Assessment of Adult Competencies (PIAAC), which provides direct measures of adults' numeracy skills. The analysis proceeds from an original theoretical framework which combines insights from life course research on the determinants of skills in adulthood, as well as integrating feminist theory of multidimensional gender relations. At the individual level, the results demonstrate that female advances in education do not necessarily equalise adult numeracy. Women's participation in the labour market is also not enough to guarantee equal levels of adult numeracy: women must also be able to access occupations that use numeracy skills. Cross-nationally, there is no obvious empirical relationship between gender inequality, conventionally conceived, and the gender difference in adult numeracy. Instead, paradoxically, gender differences in adult numeracy are larger in societies that combine egalitarianism with gender segregation in the labour market, and smaller in countries with relatively inequitable gender relations. Overall, there is little evidence that gender differences in adult numeracy are associated with conventional indicators of gender inequality in this sample of countries. The thesis thereby questions the findings of previous research and suggests that instead of being framed as an outcome of female disempowerment, gender differ-

ences in adult numeracy should be understood in relation to the multidimensionality of gender relations in post-industrial societies.

Cook, R. (2018). Gender differences in adult numeracy skills: What is the role of education? *Educational Research and Evaluation*, 1-24. doi: 10.1080/13803611.2018.1540992

**Abstract:**

Previous research suggests that as societies empower women educationally, gender differences in numeracy skills will decline. Using direct measures of 56,142 adults' numeracy skills from the Programme for International Assessment for Adult Competencies (PIAAC), this article studies whether this claim is evidenced across 20 Organisation for Economic Co-operation and Development (OECD) countries. Results show that in many countries, as education has equalised over generations, gender differences in adult numeracy skills have indeed declined. However, women's advances in education have not always been matched by a reduction in the gender difference in adult numeracy. Contrary to expectations, gender differences in fields of study in further and higher education cannot systematically explain gender differences in adult numeracy. This suggests that to achieve gender equality in numeracy skills, societies must do more than empower women educationally. More research is needed on the educational policies, contextual, and life course factors contributing to gender differences in adult numeracy in post-industrial societies.

**Abstract:**

Middle aged and older workers constitute a growing segment of the U.S. labor force. These workers face considerable challenges in the wake of the Great Recession, which have important consequences for the sustainability of social safety net programs and the U.S. economy as a whole. Despite the policy implications of significant unemployment among middle aged and older workers, little is known about specific factors impacting labor market outcomes for this age group, including the role of adult education and training (AET) and literacy and numeracy skills. This study used data from the 2014 Program for the International Assessment of Adult Competencies (PIAAC) National Supplement to examine relationships among educational attainment, participation in AET, skill proficiencies, health, and economic outcomes for U.S. adults ages 45-74 who are unemployed or not in the labor force. Overall, employed adults ages 45 – 65 participate in lifelong learning activities significantly more than the unemployed and out of the labor force groups. On average, the unemployed and out of the labor force groups had significantly lower literacy skills than the employed group among those ages 45-65. There was a positive relationship between literacy skills and self-rated health in both the 45 – 65 and 66 – 74 age groups. Findings are discussed in view of labor, education and public health policies in order to enhance the well-being of middle-aged and older adults in the U.S.

Dämmrich, J., & Triventi, M. (2018). The dynamics of social inequalities in cognitive-related competencies along the early life course – a comparative study. *International Journal of Educational Research*, 88, 73-84. doi: 10.1016/j.ijer.2018.01.006

**Abstract:**

This paper investigates the development of social inequalities in cognitive-related competencies (mathematics and reading) from primary school to young adulthood among 15 OECD countries and examines whether patterns of development vary among countries and school tracking regimes. We use a pseudo-cohort approach by comparing data on individuals of approximately the same birth cohorts in primary school (TIMSS, PIRLS), secondary school (PISA) and young adulthood (PIAAC). We found that children from lower social background perform less well already in primary education (particularly in reading). Overall, social inequalities in competencies tend to persist (reading) or increase (mathematics) over the early life-course. Finally, we detected only some weak evidence of higher growth of social inequalities over the early life-course among highly tracked systems.

Davier, M. (2018). Detecting and treating errors in tests and surveys. *Quality Assurance in Education*, 26(2), 243-262. doi: 10.1108/QAE-07-2017-0036

**Abstract:**

**Purpose:** Surveys that include skill measures may suffer from additional sources of error compared to those containing questionnaires alone. Examples are distractions such as noise or interruptions of testing sessions, as well as fatigue or lack of motivation to succeed. This paper aims to provide a review of statistical tools based on latent variable modeling approaches extended by explanatory variables that allow detection of survey errors in skill surveys. **Design/methodology/approach:** This paper reviews psychometric methods for detecting sources of error in cognitive assessments and questionnaires. Aside from traditional item responses, new sources of data in computer-based assessment are available – timing data from the Programme for the International Assessment of Adult Competencies (PIAAC) and data from questionnaires – to help detect survey errors. **Findings:** Some unexpected results are reported. Respondents who tend to use response sets have lower expected values on PIAAC literacy scales, even after controlling for scores on the skill-use scale that was used to derive the response tendency. **Originality/value:** The use of new sources of data, such as timing and log-file or process data information, provides new avenues to detect response errors. It demonstrates that large data collections need to better utilize available information and that integration of assessment, modeling and substantive theory needs to be taken more seriously.

Delmez, F., & Vandenberghe, V. (2018). Long working hours make us less productive but also less costly. *LABOUR*, 32(4), 259-287. doi: 10.1111/labr.12128

**Abstract:**

This paper develops and assesses empirically a simple model of firms' optimal decision regarding working hours, where productivity varies with hours and where the firm faces quasi-fixed labour costs. Using Belgian firm-level data on production, labour costs, workers, and hours, and focusing

on the estimation of elasticities along the isoquant and the isocost, we find evidence of not only declining productivity of hours but also of quasi-fixed labour costs in the range of 20 per cent of total labour costs. The tentative conclusion is that firms facing such costs are enticed to raise working hours, even if this results in lower productivity.

Desjardins, R. (2018). Economics and the political economy of adult education. In M. Milana, S. Webb, J. Holford, R. Waller, & P. Jarvis (Eds.), *The Palgrave International Handbook on Adult and Lifelong Education and Learning* (pp. 211-226). London: Palgrave Macmillan UK. doi: 10.1057/978-1-137-55783-4\_12

**Abstract:**

This chapter provides a critical overview of the contribution of economics to research and policy on adult education. It discusses three distinct political economy perspectives and links these to the shifting policy agenda related to adult education at the OECD over the last five decades. This is done to reveal the link between different political economy perspectives and the implications for analytical as well as political perspectives when approaching the study and policy of adult education. Some implications and challenges for research on adult education are discussed.

Dohmen, T., Falk, A., Huffman, D., & Sunde, U. (2018). On the relationship between cognitive ability and risk preference. *Journal of economic perspectives*, 32(2), 115-34. doi: 10.1257/jep.32.2.115

**Abstract:**

This paper will focus on the relationship between cognitive ability and decision-making under risk and uncertainty. Taken as a whole, this research indicates that cognitive ability is associated with risk-taking behavior in various contexts and life domains, including incentivized choices between lotteries in controlled environments, behavior in nonexperimental settings, and self-reported tendency to take risks. One pattern that emerges frequently in these studies is that cognitive ability tends to be positively correlated with avoidance of harmful risky situations, but it tends to be negatively correlated with risk aversion in advantageous situations. We conclude by discussing perspectives for future research, in particular the scope for the development of richer sets of elicitation instruments and measurement across a wider range of concepts.

Dudaitė, J. (2018). Lifelong learning: Lithuania's case. *Social Work*, 16(2), 226-239. doi: 10.13165/SD-18-16-2-05

**Abstract:**

After the publication of the EU's Memorandum on Lifelong Learning, the relevance of lifelong learning became emphasised all over Europe including Lithuania. The Seimas of the Republic of Lithuania approved the National Progress Strategy "Lithuania 2030" where lifelong learning is mentioned as one of the key factors which will contribute to ensuring the creation of smart society in Lithuania. The National Progress Strategy states that it will be aimed at developing an effective framework of lifelong learning in Lithuania which would effectively apply information and com-

munication technology and ensure acquisition and improvement of knowledge and skills necessary for the dynamic society. The idea of lifelong learning and conditions and possibility of implementation thereof is important and relevant to both Lithuania and wider society. This raises the question of the extent to which the adult learning in non-formal education is popular in Lithuania and what social factors are connected with such learning. The purpose of the article is to analyse the extent of the adult lifelong learning in Lithuania and the factors which condition such learning. In order to achieve the set purpose, the survey data of the Programme for the International Assessment of Adult Competencies (PIAAC), commissioned by the Organisation for Economic Cooperation and Development (OECD), were used for the analysis. The data allow estimating the participation of persons aged 16–65 in the lifelong learning activities. According to the analysis of the results, the activity of Lithuania's population in terms of participation in lifelong learning is one of the lowest compared with other countries. Over the last year, slightly more than a quarter of Lithuania's adult population participated in various trainings. The most common type of learning is work-related training, the least common – private lessons. Persons with pedagogical background are the most active participants in any kind of training, followed by the representatives of medicine and social welfare, social sciences, business, law, humanities, languages and arts. The factors having significant influence on lifelong learning activity are gender, education, field of education, having children or having no children, earnings. Most of those who wish to improve their knowledge and skills find the opportunity to do so. Obstacles for participation in desired training are more often faced by women than men and by persons having children than those who have no children.

Esping-Andersen, G., & Cimentada, J. (2018). Ability and mobility: The relative influence of skills and social origin on social mobility. *Social Science Research*, 75, 13-31. doi: 10.1016/j.ssresearch.2018.06.003

**Abstract:**

The recent PIAAC data offer us the first ever opportunity to identify the relative salience of abilities versus social origin in comparative social mobility research. Sampling 21 countries, we identify the degree of meritocratic selection by estimating the relative influence of social origin versus individual cognitive and social skills. We pay particular attention to the possibility of skills combinations as regards both upward and downward mobility. Social skills may compensate for weak cognitive

abilities, or vice-versa; and what are the added effects of commanding strong skills on both counts? This is, as far as we know, the first time that comparative mobility research has examined such skills-complementarities. As in previous research we, too, uncover a significantly more egalitarian mobility pattern in the Nordic countries. This however obtains also for Canada and the Netherlands. A unique feature of Scandinavia is its asymmetric profile: significant upward mobility for those of low social origin, but surprisingly little downward mobility among those of privileged origins. Contrary to expectations, this cannot be ascribed to skills compensation. We find, however, that social skills play an important role for upward mobility among low-SES sons.

Ferreira, M., Grip, A., & Velden, R. (2018). Does informal learning at work differ between temporary and permanent workers? Evidence from 20 OECD countries. *Labour Economics*, 55, 18-40. doi: 10.1016/j.labeco.2018.08.009

**Abstract:**

This paper analyses the relationship between temporary employment and the intensity of on-the-job informal learning across 20 developed countries. Using microdata from the OECD's PIAAC survey, we estimate an instrumented endogenous switching regression model and find that temporary employees engage in on-the-job learning more intensively than their counterparts in permanent employment. We show that this higher intensity of informal learning does not substitute for temporary workers' lower participation in formal training. Instead, both types of learning are complementary. Heterogeneous-effect analyses suggests that early career expectations of gaining a permanent contract could explain the higher informal learning investments of employees while in a temporary job.

Ford, K. (2018). Persisting gaps: Labor market outcomes and numeracy skill levels of first-generation and multi-generation college graduates in the United States. *Research in Social Stratification and Mobility*, 56, 21-27. doi: 10.1016/j.rssm.2018.06.003

**Abstract:**

While empirical research on American first-generation college students has tracked how students move into and through institutions, researchers rarely report on post-graduation outcomes of first-generation students. This project tests the assumption that first-generation and multi-generation college graduates are indistinguishable across numeracy skill and labor market outcomes. We analysed a nationally representative survey collected by the Organisation for Economic Co-operation and Development (OECD) which includes a measure of numeracy skill as well as labor market outcomes. We find that first-generation college graduates enjoy access to many of the same labor market outcomes of their multi-generation college graduate peers. However, first-generation college graduates lag behind in measures of numeracy.

**Title:**

Ford, K., & Choi, J. (2018). *The importance of skills and majors in determining future earnings*. Retrieved February 15, 2019, from <http://piaacgateway.com/researchpapers>

**Abstract:**

The purpose of this study is to better understand the relationship between majors and earnings, by examining within-major heterogeneity in earnings attributable to the role of general cognitive skills and how cognitive skills interact with knowledge obtained from different majors to affect earnings. Among graduates of the same major, it is possible for earnings to vary according to differences in general cognitive skills. Our findings indicate that considering cognitive skills is useful when estimating the relationships between majors and earnings. That is, within each major, earnings varied by levels of cognitive skills. We understand this finding to support a human capital framing of labor market returns: skills and competencies, rather than credential alone, proved to be important in determining labor market returns. Fraillon, J. (2018). International large-scale computer-based studies on information technology literacy in education. In *Second Handbook of Information Technology in Primary and Secondary Education* (pp. 1-19). Cham: Springer International Publishing. doi: 10.1007/978-3-319-71054-9\_80

**Abstract:**

The first international large-scale study in Information Technology (IT) literacy was conducted in 1987, and a broad range of studies that assess IT literacy and related areas of digital learning have followed. This chapter discusses recent developments in international large-scale studies of IT literacy-related achievement with a focus on their shared necessary attributes and the associated challenges with operationalizing these attributes in the test instruments. Two key attributes addressed are: (i) that the test contents reflect real-world use of Information and Communications Technology (ICT) and (ii) that the tests make use of the dynamic functionality and multimodal opportunities afforded by the computer-based environment. Challenges associated with these attributes include ensuring that the individual tasks within each assessment are independent of each other, maintaining a standardized test-taker experience, providing test-takers with plausible feedback from the computer-based environment, and maintaining construct validity. Examples are discussed of how the common challenges in creating the test instruments are addressed in the design of the instruments with some further discussion of possible future directions in large-scale international studies related to IT literacy.

Fregin, M.-C., Bijlsma, I., & Velden, R. (2018). *Much ado about social outcomes? Effective skill, skill mismatch, and their relation with job satisfaction and other social outcomes*. ROA Research Memoranda No. 2. Maastricht: Maastricht University, Research Centre for Education and the Labour Market. Retrieved February 15, 2019, from [https://cris.maastrichtuniversity.nl/portal/files/26163153/ROA\\_RM\\_2018\\_2.pdf](https://cris.maastrichtuniversity.nl/portal/files/26163153/ROA_RM_2018_2.pdf)

**Abstract:**

Skills and skill mismatches are claimed to have major consequences for societies and individuals, although convincing evidence mainly exists for wages. Our article examines the association between skill mismatch and job satisfaction as well as other social outcomes, such as political efficacy and social trust. Drawing on data from the OECD Programme for the International Assessment of Adult Competencies (PIAAC), we contribute to sociological research by applying the 'effective skill' concept, a new conceptual approach to measure skill mismatch. We relate this new concept

to job satisfaction and other social outcomes, comparing our results with alternative skill mismatch indicators. Our findings provide empirical evidence for two important messages: First, we provide evidence that once we use objective indicators for the skill match – and we make use of all measures that we currently have – there is no association between skill mismatch and job satisfaction. In fact, job satisfaction is driven by skill use, not by skill mismatches or skill proficiency. Second, we show that effective skill and skill mismatch are associated with other social outcomes, having quite considerable effects especially on political efficacy.

Gal, I. (2018). *Developing a monitoring scheme for adult numeracy as part of SDG indicator 4.6. 1: Issues and options for discussion*. Discussion Paper for the UNESCO Expert Meeting on Adult Literacy and Numeracy Assessment Frameworks Paris: UNESCO. Retrieved February 15, 2019, from [http://gaml.uis.unesco.org/wp-content/uploads/sites/2/2018/12/4.6.1\\_Developing-a-monitoring-scheme-for-adult-numeracy-as-part-of-SDG-indicator-4.6.1.pdf](http://gaml.uis.unesco.org/wp-content/uploads/sites/2/2018/12/4.6.1_Developing-a-monitoring-scheme-for-adult-numeracy-as-part-of-SDG-indicator-4.6.1.pdf)

**Abstract:**

This paper focuses on issues, dilemmas and options for assessment of the numeracy skills of adults, associated with Target 4.6.11 of the Sustainable Development Goals (SDGs). That target calls on countries to ‘ensure that all youth and a substantial proportion of adults, both men and women, achieve literacy and numeracy’ by 2030. The paper presents ideas for a monitoring and assessment strategy that can satisfy common criteria, i.e. policy relevance, credibility, comparability, feasibility in data collection, and so forth. 2. Methodologies developed for assessment of adult numeracy skills in high-income countries, e.g. as part of the Organisation for Economic Co-operation and Development’s Programme for International Assessment of Adult Competencies (PIAAC), are sometimes deemed inappropriate for lower-income countries, due to cost, necessary technical capacity, item content, and other factors. Hence, this paper assumes that countries interested in the numeracy monitoring process (hereafter, ‘target countries’) will be mainly those considered low- and middle-income, although some high-income countries may also be interested (according to the World Bank, at present there are 31 low-income, 53 lower-middle income and 56 upper-middle income countries, in addition to 78 high-income countries). Some of the same target countries may also opt to join PIAAC’s second cycle in 2021–2023.

Galeshi, R., Sharman, J., & Cai, J. (2018). Influence of ethnicity, gender, and immigration status on millennials’ behavior related to seeking health information: Results from a national survey. *Equality, Diversity and Inclusion: An International Journal*, 37(6), 621-631. doi: 10.1108/EDI-05-2017-0102

**Abstract:**

**Purpose:** The purpose of this paper is to understand the behavior diversities that exist among young millennials’ subgroups in ways they seek health-related information. **Design/methodology/approach:** The authors ran several sets of analyses on the 2012–2014 US Program for the International Assessment of Adult Competencies (PIAAC) Data using Stata. The population was stratified into four specific subgroups based on their gender, ethnicity—blacks, Hispanics and whites—immigration status, college status—whether they were enrolled in a program of study at the time of the survey. The outcome variables were sources of health information including print

(books/magazines/brochures), traditional media (Radio/TV), internet, family/friends/co-workers and health professionals. The independent variables were gender, ethnicity, educational status and immigration status. The authors utilized the appropriate sample weight derived by Organization for Economic Cooperation and Development so the findings can be generalized to the populations. The analysis included several descriptive statistics and  $\chi^2$  test of independence. Findings: Despite similarities, young adults' health seeking behavior is complex influenced by gender, ethnicity, immigration status and education. The results indicated that while the internet is the primary source of health-related information for all young adults, there are subtle differences in utilizing other available resources. For example while more educated young adults seek help from their family members, the less educated peers use the media to obtain health-related information. Ethnicity has also an effect on young adults' information seeking behavior. The number of Hispanics and blacks that obtain their information from traditional media is significantly higher than their white counterparts. Research limitations/implications: This study has several limitations. First, the authors did not consider the effect of young adults' digital literacy skills, problem solving skills and numeracy skills on their health seeking approach. Including these cognitive skills could reveal key information about young adults approach to information seeking that is not apparent by race, ethnicity and gender only. Another limitation of this study is the lack of the ability to claim causation, PIAAC data are designed strictly for cross-sectional analysis. Practical implications: Although, behaviors often do not change simply by presenting information, trying to change behavior without improving individuals' understanding of the issue by providing accurate information is likely to fail. Providing standardized health-related information sources that are accessible to all is vitally important. The results indicate that while the majority of young adults use the internet as their primary source of information only a few percentage of young adults seek information from health professional. Consequently, there is a need for an easily accessible and standardized online health-related source of information. Social implications Healthcare facilities and health related industries have the resources and the ability to develop a reliable infrastructure that could potentially provide reliable information that is easy to understand and navigate for adults with a variety of literacy and skills to use. Perhaps adopting the Universal Design for Learning approach and providing information that is accessible to a variety of individuals regardless of their education, learning skills and language skills. Flexible learning resources provided within a standard infrastructure accessible to all can help individuals find trustworthy and consistent information that they can trust. Originality/value Despite the unique characteristics of the millennials and the profound change in the way young adults seek information, there is a paucity of research on the ways young adults seek health-related information. Most existing literature is based on locally developed surveys and convenient sampling with limited reliability and validity information. Consequently making a sweeping statement based on their findings is considered as hasty generalization. The PIAAC, on the other hand, is a nationally representative data, extensively examined for its validity and reliability.

Ganzach, Y., & Patel, P. C. (2018). Wages, mental abilities and assessments in large scale international surveys: Still not much more than g. *Intelligence*, 69, 1-7. doi: 10.1016/j.intell.2018.03.014

**Abstract:**

We examine the role of General Mental Ability (GMA or g), versus specific abilities, in predicting wages among 69,901 participants from 19 countries in the Programme for International Assessment of Adult Competencies (PIAAC). We define GMA as the first principal component in a battery of three ability tests, and specific abilities as the low order components. Our initial results – a difference of 52%, between a g only model and a g + specific abilities model (R<sup>2</sup>s of 0.061 and 0.093,

respectively) – is considerably different from earlier results suggesting that "there is not much more than g" in predicting performance. However, further analyses show that this difference is reduced to 0.5% when crucial non-cognitive individual differences (age and sex) are controlled for (R2s of 0.0763 and 0.0767, respectively). Path models of the relationships between individual differences, specific abilities, GMA and wage shed light on these results. Implications for the understanding of the relationship between mental abilities and wage, and to the understanding of cognitive test scores as representing various skills versus general ability, are discussed.

Goncharenko, L., Sybachin, S., & Savchenko, I. (2018). The analysis of leadership in Russian scientific sphere. In W. Strielkowski & O. Chigisheva (Eds.), *Leadership for the Future Sustainable Development of Business and Education* (pp. 439-445). Cham: Springer International Publishing. doi: 10.1007/978-3-319-74216-8\_43

#### Abstract:

The paper is dedicated to the analysis of the condition of the Russian scientific sphere. After the breakup of the Soviet Union, science was in stagnation because of numerous problems such as lack of systematization, bad conditions for scientists' work, and many others. To solve those problems nowadays, funding has been increased, additional motivational factors have been added, and measures have been implemented to decrease corruption in scientific sphere. According to forecast, in 2019–2020 condition of science will improve, and Russia will strengthen its positions in the global ratings. This article covers the issues of establishment of the Russian science and presents generalized data in graph forms. These data concern global rating, expenditure, budget, and position of Russia in comparison with other developed countries. The analysis is an inseparable part of a scientific article as it allows to follow the dynamics of the development of the Russian science. It is essential that this paper has a very clear focus and practical importance strengthened by target setting, analysis of the problem, and marked directions of its problem-solving in order to improve indicators of statistic data as well as indicators connected with leadership and dominance implied in real life.

Grotlüschen, A. (2018). Literacy level 1 and below versus literacy level 4 and above-international results regarding participation in adult education. *Journal of Contemporary Educational Studies/Sodobna Pedagogika*, 69(2), 130-147.

#### Abstract:

Literacy, as specified in the Programme for the International Assessment of Adult Competencies (PIAAC) survey (OECD 2013), is separated into competence levels. This allows for a comparison of adults performing at literacy Level 1 and below versus those performing at Level 4 and above. The PIAAC survey also contains variables on participation in adult education. The findings show how type of seminar or training, type of employment (monotony) and type of learning (formal, non-formal, informal or mere readiness to learn) correlate with participation rates. Most findings confirm the 'Matthew Effect' for participation rates, but this is not true for training hours. More training hours are delivered to subpopulations with lower literacy levels than to those with higher levels. Barriers to training comprise costliness and lack of time, and many respondents indicated training they had wished to undertake but for some reason did not. Conclusions point at the paradoxon of need for employment being the most important reason for attending training and at the

same time being the most important barrier to undertaking training. The learning strategies' indicator shows that the majority of the population is ready to learn but do not participate in adult education and training to do so. As a whole, roughly one-third of the low-literate subpopulations participate in adult education and training.

Grotlüschen, A. (2018). Global competence – does the new OECD competence domain ignore the global South? *Studies in the Education of Adults*, 50(2), 185-202. doi: 10.1080/02660830.2018.1523100

**Abstract:**

Global Competence is a domain developed for PISA 2018. We ask whether it ignores voices from the Global South. Criteria are taken from Robertson, known for the theory of glocalisation as well as the educational scientist Seitz. Further criteria are added from a 21st century perspective. The discourse analysis uses documents available to the public since the PISA tender was launched by OECD in 2013. This includes minutes and drafts of an expert group, a webinar on the results of the consultation, held by Schleicher in 2015 and the final brochure on global competence. Results show that from the expert group towards the final brochure voices and theories from the Global South have been eliminated step by step during the procedure or are referred to in extra boxes (Ubuntu). Global competence levels are specified. Level one is described in a deficit-oriented terminology. Overall, the western, cognitive and rational, late modern discourse seems to be dominant while it silently disqualifies the areas ascribed as non-scientific, like religious, emotional, bodily issues (most of them being constructed as 'female' rather than 'male' and 'colored/south' than 'white/male'). This happens even though the earlier document interestingly does reference on postcolonial, queer, feminist and moral theory.

**Title:**

Grotlüschen, A. (2018). The narrative of 'equality of chances' as an approach to interpreting PIAAC results on perceived political efficacy, social trust and volunteering and the quest for political literacy. *European Journal for Research on the Education and Learning of Adults*, 9(1), 109-125. doi: 10.3384/rela.2000-7426.rela0211

**Abstract:**

The article focuses on the theoretically and empirically addressed question of whether workforce literacy strategies in research and policies may tend to exclude relevant fields of literacy, which have emancipatory chances for participants, but which regularly fail to include low qualified or literate adults (Hufer, 2013), namely the area of basic civic education or political literacy. First, a theoretical discussion makes use of recent publications. The relevance of basic civic education will be discussed using contemporary theories, which point at a crisis of democracy and explain this by the spread of income and capital (Piketty, 2014) and its legitimation (Rosanvallon, 2013). Further detail is provided by using Rosanvallon's criticism of the term 'equality of chances'. The everyday unfairness, covered by the narrative of equal chances, leads to peoples' disengagement from reciprocal relations and disintegration of solidarity within a society. This theoretical approach will then be supplemented by empirical data. The empirical research question is: Do adults with low literacy skills agree less often on feelings of political efficacy and social trust than adults with high literacy skills? Do they engage less often in volunteering than adults with high literacy skills? This is based on the PIAAC 2012 dataset which relates literacy on the one hand with variables of political

efficacy, social trust and volunteering on the other hand. Results will be compared with volunteer and youth surveys. Furthermore, the connection of a “Nouvelle Droite” (contemporary right-wing populism) and peoples’ low feelings of political efficacy will be reflected in order to refute the stereotype that marginalized groups automatically become voters of right-wing populists. (DIPF/Orig.)

Grundke, R., Marcolin, L., Squicciarini, M., & others. (2018). *Which skills for the digital era? Returns to skills analysis*. OECD Science, Technology and Industry Working Papers No. 9. Paris: OECD Publishing. doi: 10.1787/9a9479b5-en

**Abstract:**

This paper sheds light on the extent to which different types of skills are rewarded as industries go digital. It relies on information from the OECD Survey of Adult Skills on labour market participation and workers’ skills for 31 countries as well as on a novel OECD index on the digital penetration of industries. It investigates how cognitive and non-cognitive skills are rewarded in digital vs. less digital intensive industries and assesses the extent to which skills bundles matter. The results indicate that digital intensive industries especially reward workers having relatively higher levels of self-organisation and advanced numeracy skills. Moreover, for workers in digital intensive industries, bundles of skills are particularly important: workers endowed with a high level of numeracy skills receive an additional wage premium, if they also show high levels of self-organisation or managing and communication skills.

Gustafsson, J.-E., & Blömeke, S. (2018). Development of school achievement in the Nordic countries during half a century. *Scandinavian Journal of Educational Research*, 62(3), 386-406. doi: 10.1080/00313831.2018.1434829

**Abstract:**

The aim is to describe the development of achievement in compulsory school in the Nordic countries from the 1960s. The study relies on published results concerning literacy and numeracy from the international large-scale assessments between 1964 and 2012. Among others, the following conclusions are drawn: (1) for most countries, a small but consistent increase in the level of achievement was observed from the mid-1970s to around 1990 for both literacy and numeracy; (2) Finland improved literacy performance dramatically between the mid-1980s and the mid-1990s, which is hypothesized to be associated with the introduction of part-time special education; (3) for all countries performance declined from the late-1990s/early-2000s, which is hypothesized to be due to different factors in different countries.

Hamilton, M. (2018). Contributing to the common good? Media coverage of the international largescale assessment of adult skills (PIAAC) in four national contexts. *Studies in the Education of Adults*, 50(2), 167-184. doi: 10.1080/02660830.2018.1523101

**Abstract:**

This paper focuses on the rapidly expanding field of largescale international assessment surveys and their impact on the field of adult education and learning. I take the case of OECD's survey assessing adult skills (PIAAC) and situate it within the wider context of the datification of educational policy and practice. The claims made for the policy effects of surveys like PIAAC are far-reaching and include the promotion of economic growth and more inclusive and equitable societies. I examine how these claims are translated into national contexts by examining documentary data collected from the OECDs publicity materials and media coverage of the second round PIAAC survey findings in 2016 in four of the nine countries that took part: Singapore, Greece, New Zealand and Slovenia. Using a socio-material approach, I discuss how these discourses were managed by the OECD and national actors and show how the survey findings are framed and interpreted through existing public debates. The paper concludes that international assessments do not serve the goals of growth and equity in any straightforward way, since many interests and contextual factors may intervene to create a mismatch between the testers' intentions, media discourse and policy outcomes.

Hamilton, M. (2018). Managing public reception of assessment results. In B. Maddox (Eds.), *International Large-Scale Assessments in Education: Insider Research Perspectives* (pp. 175-196). London: Bloomsbury Publishing.

**Abstract:**

The focus of this chapter is on how findings from ILSAs reach into national contexts and establish the public presence which enables them to intervene effectively in policy and practice as they are designed to do. In particular it examines how testing organizations and the media manage public and policy discourse on assessment results. It takes the example of the assessment of adult skills by the OECD which has already gone through several iterations and is currently embodied in the PIAAC. [Source: From the introduction, p. 175]

Han, S. W., Borgonovi, F., & Guerriero, S. (2018). What motivates high school students to want to be teachers? The role of salary, working conditions, and societal evaluations about occupations in a comparative perspective. *American Educational Research Journal*, 55(1), 3-39. doi: 10.3102%2F0002831217729875

**Abstract:**

This study examines between-country differences in the degree to which teachers' working conditions, salaries, and societal evaluations about desirable job characteristics are associated with students' teaching career expectations. Three-level hierarchical generalized linear models are employed to analyze cross-national data from the Programme for International Student Assessment (PISA). Results reveal that teacher salaries and societal evaluations about the importance of job responsibility and respect are positively associated with teaching career expectations, while working hours are negatively associated with teaching career expectations. Analyses further reveal that the association between salaries and career expectations and societal evaluations and career expectations differ among students with different mathematics skills. We conclude by discussing

policy initiatives that can encourage students with strong quantitative abilities to consider a career in teaching.

Hardy, W., Lewandowski, P., Park, A., & Yang, D. (2018). *The global distribution of routine and non-routine work: Findings from PIAAC, STEP and CULS*. IBS Working Paper No. 05. Warsaw: Institute for Structural Research. Retrieved February 15, 2019, from [http://conference.iza.org/conference\\_files/WoLabConf\\_2018/lewandowski\\_p9882.pdf](http://conference.iza.org/conference_files/WoLabConf_2018/lewandowski_p9882.pdf)

**Abstract:**

The shift away from manual and routine cognitive task, and towards non-routine cognitive tasks changes the nature of work. Using the US PIAAC data, we develop measures of non-routine cognitive analytical and personal, routine cognitive and manual task content that are consistent with measures based on O\*NET, but are country-specific and worker-specific. We apply them to 42 countries covered by PIAAC, STEP and CULS surveys. We find that the relationship between relative routine task intensity and development level is inverse-U shaped. Tertiary education, computer use, literacy skills, and work in professional or managerial jobs are negatively related to the routine task intensity. In most countries, structure of worker and job characteristics is more conducive to routine-intensive work than in the US, but these differences cannot fully explain cross-country differences in routine task intensity. The higher is the ICT capital stock per worker or the position in the global value chain, the lower is the routine task intensity, especially among, respectively, high-skilled and low-skilled occupations. The use of robots within an industry is negatively related to the routine task intensity, though it does not contribute much to the differences with regards to the US.

**Abstract:**

The study was conducted within a framework agreement with the Chamber of Commerce and Industry for Munich and Upper Bavaria to provide objective, scientifically-based economic advisory work. This study aims to thoroughly evaluate the digital skills of employees, especially among young professionals, in a national and international comparison, and to find out who, in terms of these skills, starts into an increasingly digital working environment under good or bad preconditions. The analysis employs data from PIAAC (Programme for the International Assessment of Adult Competencies) that includes the measured digital skills of adults in a number of OECD countries. The results show that Bavaria and Germany perform well by international comparison. Compared to other countries participating in PIAAC, the digital skills of the German workforce are similar to the international average; with Bavaria performing better than other German federal states. Restricting the sample to young professionals gives similar results. However, further analyses reveal strong heterogeneities in digital skills in terms of education and socio-economic background characteristics. Furthermore, digital skills are strongly correlated with occupations and sectors. In

some occupations (such as service technicians, craftsmen, and office workers), only the top 25% of young professionals in Germany are digitally skilled to a similar extent as the average performers in top performing countries. Based on these differences and results, two main policy implications are derived: the education system should strengthen the development of digital skills and foster life-long learning, as well as training-on-the job.

Heisig, J. P. (2018). Measuring the signaling value of educational degrees: Secondary education systems and the internal homogeneity of educational groups. *Large-scale Assessments in Education*, 6(9), 1-35. doi: 10.1186/s40536-018-0062-1

**Abstract:**

Background: By providing high-quality, internationally comparable data on the cognitive skills of working-age adults, the Programme for the International Assessment of Adult Competencies (PIAAC) offers great potential for illuminating the complex interplay of formal qualifications and skills in shaping labor market attainment as well as social inequalities more broadly. I argue that PIAAC can be used to construct direct, country-level measures of the ‘skill transparency’ or ‘signaling value’ of formal qualifications, that is, of how informative the latter are about a person's actual skills. The primary goal of the analysis is to extend previous work on skills gaps by educational attainment and map cross-national variation in the internal skills homogeneity of educational groups as a second dimension shaping the signaling value of educational degrees. I also explore whether the internal homogeneity of educational groups is related to national (secondary) education systems. Methods: I use a sample of 30,646 20-to-34-year-olds in 21 countries that participated in the first round of PIAAC. The internal homogeneity of educational groups is measured using the residual standard deviation of literacy and numeracy skills after adjusting for sex, age, and foreign-birth/foreign-language status. Residual standard deviations for the different educational groups are subjected to a factor analysis to construct a one-dimensional measure of internal homogeneity for each country. This index of internal homogeneity is then related to education system characteristics in a series of country-level regressions. Results: The internal homogeneity of educational groups with respect to literacy and numeracy skills varies considerably across countries and is highly correlated across both skill domains and educational groups. Educational groups tend to be more homogeneous in countries with stronger (ability-related) tracking in secondary education. In addition, there is some evidence that internal homogeneity declines when instructional resources such as computer hardware and lab equipment are distributed more unequally across schools. An unexpected finding is that internal homogeneity is negatively associated with standardization of input (e.g., curricula, textbooks). Conclusions: The signaling value of educational degrees varies substantially across advanced economies, not only in terms of skills gaps among educational groups, but also in terms of their internal homogeneity. Some features of secondary education systems appear to be systematically related to the extent of internal homogeneity. The findings lend empirical support to so far untested assumptions about the relationship between formal qualifications and skills in cross-national research on labor market inequalities.

Hinz, S. (2018). *Literacy and numeracy skills of U.S. men and women. Data point*. Data Point No. 164. Washington: National Center for Education Statistics. Retrieved February 15, 2019, from <https://files.eric.ed.gov/fulltext/ED586045.pdf>

**Abstract:**

This Data Point examines the literacy and numeracy skills of U.S. men and women ages 16-65. The data are from the Program for the International Assessment of Adult Competencies (PIAAC), which measures adults' skill levels in literacy and numeracy, as well as their ability to solve problems using computers. PIAAC literacy and numeracy scores range from 0 to 500, but they cannot be compared directly because each domain has a distinct framework, construct, set of items, and scale. This analysis uses PIAAC data from the U.S. Main Study of 2012 and the U.S. National Supplement of 2014, which together provide a nationally representative sample of about 8,000 adults ages 16-65.

Hoftijzer, M., & Gortazar, L. (2018). *Skills and Europe's labor market: How technological change and other drivers of skill demand and supply are shaping Europe's labor market*. World Bank Report on the European Union. Paris: World Bank. Retrieved February 15, 2019, from <https://openknowledge.worldbank.org/bitstream/handle/10986/29965/127183-WP-EU-P161873-GU-Skills-and-Labor-Markets-final-5-29-2018-PUBLIC.pdf?sequence=1>

**Abstract:**

This report examines recent trends and underlying causes in labor market outcomes, to assess how the importance of skills for productive employment has evolved. It serves as a background paper to the findings and analyses that are reflected in Chapter 2 of the Growing United report (Bodewig, C., Ridao-Cano, C, 2018), on "The Future of Work". It particularly reviews labor market

outcomes and the demand and supply side factors that determine labor outcomes, with an emphasis on the extent to which technological change drives labor outcomes via its impact on the task content of jobs.

Hogg, S. (2018). *School's out for the summer: Slowing the growth of summer educational achievement gaps in British Columbia* (Master's thesis). Simon Fraser University. Retrieved February 15, 2019, from [http://summit.sfu.ca/system/files/iritems1/17991/etd10578\\_SHogg.pdf](http://summit.sfu.ca/system/files/iritems1/17991/etd10578_SHogg.pdf)

**Abstract:**

The summer reading setback is a major driver of educational inequality across British Columbia. This capstone research project examines educational inequality in the province and analyzes policy options to reduce the growth of summer educational achievement gaps. The analysis focuses on three international case studies, with a literature review and interviews that confirm the results. The policy options considered include targeted summer programs in low-achieving schools, targeted summer programs across the province, and the expansion of existing summer reading programs in libraries.

**Abstract:**

The rapid changes in our society have amplified the need for adult learning opportunities. However, adults often make decisions not to persist in formal learning experiences in a smooth, linear fashion. The decision to pause or terminate formal learning is a complex behavioral decision that includes knowledge, the cognitive process, personal belief and environmental context. Since the construct of numeracy also necessitates the use of content, cognitive processes, dispositions, and context, this study examined the link between adults' numeracy abilities and learning readiness and commitment. This study analyzed the Programme for the International Assessment of Adult Competencies (PIAAC) Survey Adult Skills. The findings suggest numeracy abilities are positively related to readiness to learn and learning commitment. Further analysis demonstrated a relationship between parents' education level and learning commitment. Implications of the study suggest that social and cultural capital from family background impact adult learning persistence. Thus, multigenerational educational support must be considered in tandem with basic skill interventions for adult learners.

Hoogland, K., & Tout, D. (2018). Computer-based assessment of mathematics into the twenty-first century: Pressures and tensions. *ZDM Mathematics Education*, 50(4), 675-686. doi: 10.1007/s11858-018-0944-2

**Abstract:**

In recent decades, technology has influenced various aspects of assessment in mathematics education: (1) supporting the assessment of higher-order thinking skills in mathematics, (2) representing authentic problems from the world around us to use and apply mathematical knowledge and skills, and (3) making the delivery of tests and the analysis of results through psychometric analysis more sophisticated. We argue that these developments are not pushing mathematics education in the same direction, however, which creates tensions. Mathematics education—so essential for educating young people to be creative and problem solving agents in the twenty-first century—is at risk of focusing too much on assessment of lower order goals, such as the reproduction of procedural, calculation based, knowledge and skills. While there is an availability of an increasing amount of sophisticated technology, the related advances in measurement, creation and delivery of automated assessments of mathematics are however being based on sequences of atomised test items. In this article several aspects of the use of technology in the assessment of mathematics education are exemplified and discussed, including in relation to the aforementioned tension. A way forward is suggested by the introduction of a framework for the categorisation of mathematical problem situations with an increasing sophistication of representing the problem situation using various aspects of technology. The framework could be used to reflect on and discuss mathematical assessment tasks, especially in relation to twenty-first century skills.

Hovdhaugen, E., & Opheim, V. (2018). Participation in adult education and training in countries with high and low participation rates: Demand and barriers. *International Journal of Lifelong Education*, 37(5), 560-577. doi: 10.1080/02601370.2018.1554717

**Abstract:**

This paper explores patterns in participation in adult education and training (AET) by comparing five countries with high participation rates (the Nordic countries and the Netherlands) with three countries with significantly lower participation rates (France, Poland and the Slovak Republic). Using PIAAC data the paper examines differences in the levels of demand for AET as well as variations in barriers to AET participation between the two groups of countries. The demand for AET is higher than the actual participation rate since it includes those who do not participate although they wish to. The demand for AET is substantially higher in countries with high participation rates. Further, the structure and level of barriers is quite similar in the two groups of countries. Countries with low AET participation rate do not have a higher proportion of individuals reporting barriers to AET participation; that they do not participate in AET although they wish to. In both groups of countries demand for AET is strongly associated with the individuals' educational level. The findings are discussed by drawing on previous studies on drivers of and barriers to participation in AET.

Hutfilter, A. F., Lehmann, S., & Kim, E. J. (2018). *Improving skills and their use in Germany*. OECD Economics Department Working Papers No. 1516. Paris: OECD Publishing. doi: 10.1787/8a251b1f-en

**Abstract:**

Cognitive skills, such as reading and numeric skills, are key determinants of wages, employment and long-term economic growth. Good cognitive skills also reduce poverty risk and improve non-

material wellbeing, such as health and social cohesion. Non-cognitive skills, such as skills to use information and communication technology as well as managerial skills, also help workers adapt to new technologies and globalisation. In Germany cognitive skills among adults are above OECD average, but weaker than in leading economies, especially among individuals with low and middle qualifications. Much progress has been made to improve learning outcomes of youth with disadvantaged socio-economic background. Nonetheless, high-quality childcare, early childhood and full-day primary education still need to expand. The vocational education system is very successful in integrating young people well in the labour market. Strengthening general education within the successful vocational education and training system could help ensure the capacity of graduates to adapt to technological change at higher age in the future. Participation in life-long learning could be encouraged by better addressing individual training needs. This could improve prospects for adults without professional qualifications. Women's skills are used less well than men's, calling for policies to address gender imbalances in the labour market. This Working Paper relates to the 2018 OECD Economic Survey of Germany.

Jiao, H., Lissitz, R. W., & Wie, A. V. (2018). *Data analytics and psychometrics: Informing assessment practices*. Charlotte: Information Age Publishing.

**Abstract:**

The general theme of this book is to encourage the use of relevant methodology in data mining which is or could be applied to the interplay of education, statistics and computer science to solve psychometric issues and challenges in the new generation of assessments. In addition to item response data, other data collected in the process of assessment and learning will be utilized to help solve psychometric challenges and facilitate learning and other educational applications. Process data include those collected or available for collection during the process of assessment and instructional phase such as responding sequence data, log files, the use of help features, the content of web searches, etc. Some book chapters present the general exploration of process data in large-scale assessment. Further, other chapters also address how to integrate psychometrics and learning analytics in assessment and survey, how to use data mining techniques for security and cheating detection, how to use more assessment results to facilitate student's learning and guide teacher's instructional efforts. The book includes both theoretical and methodological presentations that might guide the future in this area, as well as illustrations of efforts to implement big data analytics that might be instructive to those in the field of learning and psychometrics. The context of the effort is diverse, including K-12, higher education, financial planning, and survey utilization. It is hoped that readers can learn from different disciplines, especially those who are specialized in assessment, would be critical to expand the ideas of what we can do with data analytics for informing assessment practices.

Jolita, D. (2018). Literacy change as a result of the education reform: Lithuanian population literacy comparison against other post-soviet countries population literacy. *Social Work*, 16(1), 92-105. doi: 10.13165/SD-18-16-1-07

**Abstract:**

The dissolution of the Soviet Union in 1989–1991 allowed structural changes in the educational systems in 28 new countries which were under control of the Soviet government for a long time.

Almost three decades have passed and several generations have been raised within the reformed educational systems. Therefore, it is important to assess the results of these reforms. One, yet not the only, of the main units of measurement for the assessment of the results of the educational system or education reform refers to population literacy and competencies gained through certain educational systems. The purpose of the article is to compare the results of the education reforms in Lithuania and other post-communist countries based on the population literacy as the expression of learning achievements. Data of the survey of adult skills under the Programme for the International Assessment of Adult Competencies (PIAAC) organized by the OECD (The Organisation for Economic Co-operation and Development) were used for comparison of the learning achievements. The OECD PIAAC survey databases of Lithuania, Estonia, Russian Federation, Poland, the Czech Republic, Slovakia and Slovenia were used for comparison of the results of the reforms carried out in the post-Soviet countries. 5093 participants from Lithuania participated in the OECD PIAAC survey. Accordingly, 7632 participants participated in Estonia, 3892 in Russian Federation, 9366 in Poland, 6102 in Check Republic, 5723 in Slovakia, and 5331 in Slovenia. The total number of respondents in the seven analyzed countries is 43139. Analysis of the data of the said countries showed that in the education reform context the lowest value added generated by the secondary school was observed in Lithuania. The most positive results of the education reform at vocational education level were recorded in Estonia, at secondary education level – in Estonia and the Czech Republic, at lower secondary education level – in Lithuania. At secondary education level, the most considerable deterioration of the results was recorded for Russia, at lower secondary education level – for Russia and Slovakia. The most moderate change in the results at vocational education level was observed in Lithuania, at secondary and lower secondary education levels – in Poland.

Jonas, N. (2018). *Numeracy practices and numeracy skills among adults*. OECD Education Working Papers No. 177. Paris: OECD Publishing. doi: 10.1787/8f19fc9f-en

**Abstract:**

We assess the relationship between numeracy skills and numeracy practices among adults in everyday life and at work from the Survey of Adult Skills, a product of the Programme for the International Assessment of Adult Competencies (PIAAC), an international survey of about 250 000 adults aged 16-65 years old conducted by the OECD in 33 countries/economies. The level of proficiency and the intensity of engagement in numeracy practices are two embedded aspects of numeracy. Proficient adults use numeracy frequently and adults who regularly engage in numeracy practices improve their performance. Individual and contextual factors influence, in different ways across countries, the strength of these links. The intensity of the use of numeracy in everyday life decreases as the lapse of time since a person's studies increases. Moreover, employed people engage in mathematical activities less in the private setting if they do not do so intensively in the workplace.

**Title:**

Jonas, N. (2018). *Students' numeracy skills and practices*. Adult Skills in Focus No. 8. Paris: OECD Publishing. doi: 10.1787/b6ce23eb-en

**Abstract:**

The results of the Survey of Adult Skills confirm that there is a strong link between the level of nu-

meracy performance and the use of these skills in practice. In view of these findings, countries could further encourage the teaching of numeracy-related disciplines in a wider variety of higher education pathways. Such a measure is particularly important as numeracy skills and practices play a crucial role in many dimensions of individual well-being.

**Title:**

Jonas, N. (2018). *Teenage parenthood*. Adult Skills in Focus No. 9. Paris: OECD Publishing. doi: 10.1787/de7859a0-en

**Abstract:**

The results of the Adult Skills Assessment confirm that there is a strong link between the level of literacy proficiency and the rate of teenage motherhood. Countries where this link is strongest could further encourage the prevention of and support with pregnancies before the age of 20 in the groups at highest risk. These measures are all the more crucial as they are about protecting not just the most vulnerable teenagers but also their prospective children against the long-term consequences of these early births.

**Title:**

Jonas, N., & Thorn, W. (2018). *Literacy skills and family configurations*. OECD Education Working Papers No. 192. Paris: OECD Publishing. doi: 10.1787/19939019

**Abstract:**

We study the links between family configuration and formation on the one hand and adult literacy skills on the other by analysing data from the Programme for the International Assessment of Adult Competencies (PIAAC), a survey of 250 000 people aged 16 to 65 conducted by the OECD in 33 countries and economies. Literacy proficiency has an effect on many aspects of the formation and development of families, such as age of parents at birth of first child, or age of partners at cohabitation, even when educational attainment and age are taken into account. Moreover, having children and living with a partner have consequences for adults' job opportunities and participation in the labour market, which can be particularly negative for the women with the highest literacy proficiency.

Kahn, L. M. (2018). Permanent jobs, employment protection, and job content. *Industrial Relations: A Journal of Economy and Society*, 57(3), 469-538. doi: 10.1111/irel.12209

**Abstract:**

Using Programme for the International Assessment of Adult Competencies (PIAAC) data for twenty-one countries, I study the impact of employment protection laws (EPL) on job content. I find that workers' use of influence, reading, writing, planning, numeracy and information and computer technology skills, and their task discretion, were higher in permanent than in temporary jobs. Moreover, stricter EPL on permanent jobs raised the gap in job content for influence, reading, writing, and planning skills used in permanent jobs versus temporary jobs.

Kakarmath, S., Denis, V., Encinas-Martin, M., Borgonovi, F., & Subramanian, S. V. (2018). *Association between literacy and self-rated poor health in 33 high-and upper-middle-income countries*. OECD Education Working Papers No. 165. Paris: OECD Publishing. doi: 10.1787/7aaeac27-en

**Abstract:**

We assess the relationship between general literacy skills and health status by analysing data from the Programme for the International Assessment of Adult Competencies (PIAAC), an international survey of about 250 000 adults aged 16-65 years conducted by the Organisation for Economic Co-operation and Development (OECD) from 2011-15 in 33 countries/national sub-regions. Across countries, there seems to be a strong and consistent association between general literacy proficiency and self-rated poor health, independent of prior socio-economic status and income. General literacy proficiency also appears to be a mediator of the association between self-education and self-rated poor health. While the literacy-health association is robust over time, it varies in magnitude across countries. It is strongest for those with a tertiary or higher degree and does not appear to exist among young adults (ages 25 to 34 years). Future studies are required to understand the contextual factors that modify the general literacy proficiency-health association.

Kawaguchi, D., & Toriyabe, T. (2018). *Parental leaves and female skill utilization: Evidence from PIAAC*. RIETI Discussion Paper Series No. 18003. Tokyo: Research Institute of Economy, Trade and Industry (RIETI). Retrieved February 15, 2019, from <https://www.rieti.go.jp/jp/publications/dp/18e003.pdf>

**Abstract:**

Most developed countries adopt parental leave policies to promote women's labor force participation without sacrificing family formation. Studies find that short-term parental leaves for women increase the time spent at home and promote their return to the labor force after childbearing, but some studies point out that long-term parental leaves hinder the career advancement of high-skilled women. This paper analyzes heterogeneous impacts of parental leave policies on women's skill-use intensity by skill level, drawing on rich information on individual skill and skill-use intensity available from the micro data of the Programme for the International Assessment of Adult Competencies (PIAAC), which covers 30 countries. The results show that longer parental leaves narrow the gender gap in skill-use intensity among low-skilled workers but widen it among high-skilled workers. This finding is robust after controlling for international differences in gender norms and labor market institutions and allowing for country fixed effects. The findings corroborate with the claim that a longer parental leave period suppresses the career advancement of high-skilled women.

**Title:**

Keslair, F. (2018). *Interviewers, test-taking conditions and the quality of the PIAAC assessment*. OECD Education Working Papers No. 191. Paris: OECD Publishing. doi: 10.1787/5babb087-en

**Abstract:**

This paper explores the impact of test-taking conditions on the quality of the Programme for the International Assessment of Adult Competencies (PIAAC) assessment. Interviewers record information about the room of assessment and interruptions that occurred during each interview.

These observations, along with information on interviewer assignment size and a careful look at interviewer effects, provide insights into the quality of the assessment. This working paper first describes the variations in test-taking conditions among participating countries. Second, it examines interviewer assignment sizes and the frequency of interruptions, finding that both vary markedly among countries (contrary to the room of assessment). The paper then looks at the relationship between these variations and response rates and engagement measures. While neither the room of assessment nor the recorded interruptions impact quality differences among countries, interviewer assignment size and interviewer effects may have a mild impact on results.

Killian, M. R. (2018). *The mediated relationship between everyday literacy skills and adult literacy scores by vocabulary proficiency* (Dissertation). Tennessee Technological University. Retrieved March 5, 2020, from <https://pqdtopen.proquest.com/pubnum/10979453.html>

**Abstract:**

This study is an ex post facto correlational study that analyzed the mediated relationship between everyday adult literacy practices (directions or instructions; letters, memos, or mail; newspapers or magazines; professional journals or publications; books, manuals or reference materials; financial statements; diagrams, maps, or schematics) and literacy scores, using vocabulary scores as the mediator while controlling for educational attainment, current educational practices, age, and number of books at home. This study used the Program of International Assessment of Adult Competency (PIAAC) 2012/2014 public use household dataset which includes data from over 8,000 participants. This dataset contains information about participants' background, daily lives, and reading practices as well as literacy, numeracy, and informational technology skills. Analyses were completed using the IDB analyzer to complete regression analyses on the final sample which included 1,599 participants who had taken both the literacy and print vocabulary assessment. The Sobel process was used to determine mediation. According to the Sobel test, the vocabulary score mediated the relationship between reading letters, memos, or mail ( $b = 4.18$ ,  $SE = 0.23$ ,  $p < .001$ ) and newspapers or magazines ( $b = 2.55$ ,  $SE = 0.29$ ,  $p < .05$ ) and the combined plausible literacy score. This showed that a portion of the ability to predict adult literacy scores from the frequency of reading letters, memos, or mail and newspapers or magazines could be due to vocabulary proficiency.

Kim, S. (2018). Literacy skills gaps: A cross-level analysis on international and intergenerational variations. *International Review of Education*, 64(1), 85-110. doi: 10.1007/s11159-018-9703-4

**Abstract:**

The global agenda for sustainable development has centred lifelong learning on UNESCO's Education 2030 Framework for Action. The study described in this article aimed to examine international and intergenerational variations in literacy skills gaps within the context of the United Nations Sustainable Development Goals (SDGs). For this purpose, the author examined the trend of literacy gaps in different countries using multilevel and multisource data from the OECD's Programme for the International Assessment of Adult Competencies (PIAAC) and UNESCO Institute for Lifelong Learning survey data from the third edition of the Global Report on Adult Learning and Education (GRALE III). In this article, particular attention is paid to exploring the specific effects of education systems on literacy skills gaps among different age groups. Key findings of this study indicate sub-

stantial intergenerational literacy gaps within countries as well as different patterns of literacy gaps across countries. Young generations generally outscore older adults in literacy skills, but feature bigger gaps when examined by gender and social origin. In addition, this study finds an interesting tendency for young generations to benefit from a system of Recognition, Validation and Accreditation (RVA) in closing literacy gaps by formal schooling at country level. This implies the potential of an RVA system for tackling educational inequality in initial schooling. The article concludes with suggestions for integrating literacy skills as a foundation of lifelong learning into national RVA frameworks and mechanisms at system level.

Kónya, I. (2018). Labor input and labor income. In *Economic Growth in Small Open Economies: Lessons from the Visegrad Countries* (pp. 29-45). Cham: Springer International Publishing. doi: 10.1007/978-3-319-69317-0\_3

**Abstract:**

This chapter discusses the measurement of labor input in the eight countries. Labor input is a combination of employment, hours per worker, and human capital per worker. Detailed data on the school attainment of the employed and their full-time/part-time status is used to construct more precise measures of total labor input than what is typically found in the literature. The chapter finishes with a comparison of total labor input and its components across the two country groups.

Koutná, M., & Janíčko, M. (2018). Trajectories in the Czech labour market: The role of information-processing skills and education. *Ekonomický Casopis*, 66(1), 3-27.

**Abstract:**

The article assesses the role of information-processing skills and education in people's labour market trajectories in the Czech Republic in the period of economic recovery from 2011/2012 to 2015. We examine the extent to which literacy and numeracy and formal and informal education influenced changes in the stability of individuals' employment and their income mobility, incorporating polarisation and segmentation perspectives. The analysis is conducted using a unique combination of Czech PIAAC data and a follow-up survey. The findings show that formal education compared to information-processing skills and further education is by far the most important factor of change in a person's position in the labour market while the role of skills is only limited.

Krieger-Boden, C., & Sorgner, A. (2018). Labor market opportunities for women in the digital age. *Economics: The Open-Access, Open-Assessment E-Journal*, 12(2018-28), 1-8. doi: 10.5018/economics-ejournal.ja.2018-28

**Abstract:**

Digitalization offers a variety of opportunities for female empowerment and for a more equal female participation in labor markets, financial markets, and entrepreneurship. Currently, digitaliza-

tion seems to favor female labor force, since women face on average lower risk of being replaced by machines, as compared to men. Women's often superior social skills represent a comparative advantage in the digital age, and this is particularly so when social skills are complemented with higher education and advanced digital literacy. However, the same barriers and deficits that obstruct women's current advancement in many countries may deprive them from many beneficial opportunities in the digital age, including new entrepreneurial opportunities. Major efforts by policy makers are required to invalidate these barriers. New digital technologies should be used more decisively to achieve the goal of gender equality.

Lauttamäki, H. M. (2018). *The relationship between cognitive skills and earnings inequality* (Master's thesis). University of Helsinki. Retrieved February 15, 2019, from <http://hdl.handle.net/10138/235910>

**Abstract:**

In this thesis the relationship between cognitive skills and earnings inequality is analyzed using a decomposition method on the dataset of PIAAC. The implementation of this thesis is sort of a replication of a study by Blau and Kahn (2005). The core of their study was to investigate if cognitive skills explain the higher wage inequality in the US compared to other countries. This thesis studies the relationship between earnings and skills inequality and analyzes if cognitive skills explain higher wage inequality in the UK compared to other countries. Due to country specific restrictions in the earning variables, some of the countries could not be included into my sample, for instance the US is missing. The UK is thus set as the base country in the country-specific comparisons of differences in wage inequality. The model used for these comparisons is a full distributional accounting method, also known as a decomposition method, which was originally created by Juhn, Murphy and Pierce (1993). The advantage of the decomposition method is that it enables the differences in wage inequality to be decomposed into different components at any desired point of the wage distribution. Under examination in this thesis are the 90-10, 90-50 and 50-10 wage gaps across countries by gender. The final sample comprises 21 countries and includes part- and full-time workers aged 16 to 65.

The main question in this thesis is partly to replicate the study of Blau and Kahn (2005) and to see if the results on returns to skills and the decomposition model are similar to the results of Blau and

Kahn (2005). Based on the results, some of the findings are surprisingly close to the findings of Blau and Kahn and some of the results quite different.

Leckelt, M., Richter, D., Schröder, C., Kufner, A. C. P., Grabka, M. M., & Back, M. D. (2018). The rich are different: Unravelling the perceived and self-reported personality profiles of high-net-worth individuals. *British Journal of Psychology*, 1-21. doi: 10.1111/bjop.12360

**Abstract:**

Beyond money and possessions, how are the rich different from the general population? Drawing on a unique sample of high-net-worth individuals from Germany ( $\geq 1$  million Euro in financial assets;  $N = 130$ ), nationally representative data ( $N = 22,981$ ), and an additional online panel ( $N = 690$ ), we provide the first direct investigation of the stereotypically perceived and self-reported personality profiles of high-net-worth individuals. Investigating the broad personality traits of the Big Five and the more specific traits of narcissism and locus of control, we find that stereotypes about wealthy people's personality are accurate albeit somewhat exaggerated and that wealthy people can be characterized as stable, flexible, and agentic individuals who are focused more on themselves than on others.

Lee, J. (2018). Conceptual foundations for understanding inequality in participation in adult learning and education (ALE) for international comparisons. *International Journal of Lifelong Education*, 37(3), 297-314. doi: 10.1080/02601370.2018.1462265

**Abstract:**

Inequality in adult learning and education (ALE) participation has been reported by previous comparative studies. In doing so, however, most of efforts have been made to understand such patterns of inequality in ALE participation at the micro-level using a conceptual approach based on human capital theory. While the micro-level approach offers an individualistic and economic perspective on learning, macro-level structural conditions play an important role in creating the circumstances faced by individuals. By performing a critical literature review, this paper intends to build conceptual foundations conducive to understand both micro- and macro-level dimensions implicitly and/or explicitly linked to inequality in ALE participation. Specifically, this paper takes a brief look into social origins as a micro-level factor, and takes an in-depth look into social inequality (i.e. education, economic and skill inequality) and institutional settings (i.e. active labour market policies and strictness of employment protection,) as macro-level factors. These conceptual foundations can be used as a conceptual framework for a cross-country empirical analysis of the degree of inequality in ALE participation.

Lee, J.-H., Jeong, H., & Hong, S. C. (2018). *Human capital and development: Lessons and insights from Korea's transformation*. Cheltenham: Edward Elgar Publishing. doi: 10.4337/9781786436979

**Abstract:**

Over the last 70 years, Korea has experienced a rapid and remarkable transformation from a dev-

astatingly poor nation to one of the world's leading advanced economies, achieving both sustained economic growth and a successful democracy. This pioneering work focuses on the key role of sustained investment in human capital behind Korea's phenomenal success. *Human Capital and Development* analyzes the importance of balancing diverse aspects of the educational system at different stages of development. The need to balance general and vocational education, top-down and bottom-up reform, as well as qualitative and quantitative expansion are highlighted. Adapting Korea's development experience to general principles shows that rather than seeking universal strategies and rules, the key to successful transformation is the provision of educational systems that can evolve over time depending on socio-economic and technological conditions for both developing and advanced countries. For researchers and students of economic development, education, and Asian development, this book is an excellent tool to discover possible ways for developing countries to initiate and accelerate their paths of economic growth and development. This book also provides a useful reference for policy makers of advanced as well as developing countries in designing their education systems and policies.

Lee, R., Kim, J., & others (2018). Women and/or immigrants: a feminist reading on the marginalised adult learners in Korean lifelong learning policy and practice. *Australian Journal of Adult Learning*, 58(2), 184-208.

**Abstract:**

This paper aims to analyse the policy and practice of lifelong learning (LLL), particularly adult education and learning (ALE) for women, immigrants, and women/immigrants in South Korea. An international as well as national policy document analysis was conducted to explore the impact of Korea's policy and practice of LLL for these groups of learners. Findings reveal that they are situated in the middle of gendered and/or racialised trends in ALE within an intensifying neoliberal context where learning is mainly utilised as a tool for employment in contemporary Korean society. Possible implications from the analysis were addressed to suggest policy updates and better practices.

Lewandowski, P. (2018). *How does technology change the nature of work? Poland vs. the EU*. IBS Policy Papers No. 02/2018. Warszawa: Instytut Badan Strukturalnych. Retrieved February 15, 2019, from [http://ibs.org.pl/app/uploads/2018/06/IBS\\_Policy\\_Paper\\_02\\_2018\\_en.pdf](http://ibs.org.pl/app/uploads/2018/06/IBS_Policy_Paper_02_2018_en.pdf)

**Abstract:**

Recent technological progress speeds up changes in the nature of work. The tasks that we perform at work have changed, and they require different skills. The consequences of the accelerated changes in the nature of work affect employers, who introduce new technologies, and workers, who have to adapt to the new demands. The effects are also felt by governments whose role is to support the absorption of new technologies, on the one hand, and to mitigate the negative consequences of rapid changes in the labour market, on the other hand. Therefore, it is important to understand how technological progress impacts changes in the nature of work.

Lim, D. H., Hee Jeong, S., Yoo, S., & Yoo, M. H. (2018). Older workers' education and earnings among OECD countries. *European Journal of Training and Development*, 42(3/4), 170-190. doi: 10.1108/EJTD-08-2017-0069

**Abstract:**

**Purpose:** The purpose of this study is to identify to what extent individual-level factors (age, gender, participation in formal and non-formal education and levels of skills use at work) and country-level factors (social capital factors, national competitiveness and gross domestic product [GDP]) have contributed to older generations' earnings in developed countries. **Design/methodology/approach:** Utilizing the data from the Organizational Economic Co-operation and Development Skills Outlook 2013 survey, GDP and the World Economic Forum's annual Global Competitiveness Report, this study adopted a multilevel path analysis method to measure cross-country-level effect of the study variables on older workers' earnings. **Findings:** Study results indicated that age, gender, non-formal education, use of influencing and task discretion skills at work at the individual level, and GDP, social trust, and higher education and training at the country level were identified as influential factors for older workers' monthly earnings. **Originality/value:** With more aging societies worldwide, the traditional view of the aging workforce has been affected by the desires and needs of the elderly. This study contributes to the literature by identifying what individual- and country-level factors should be considered for policymakers to improve the economic benefits of older generations living in developed countries.

Lindberg, M., & Silvennoinen, H. (2018). Assessing the basic skills of the highly educated in 21 OECD countries: An international benchmark study of graduates' proficiency in literacy and numeracy using the PIAAC 2012 data. *Comparative Education*, 54(3), 325-351. doi: 10.1080/03050068.2017.1403676

**Abstract:**

This study compares the literacy and numeracy proficiencies of higher education (HE) degree holders in 21 OECD countries based on primary analysis of the national data sets collected via the OECD's Programme for the International Assessment of Adult Competencies (PIAAC) 2012 study. The differences in the graduates' average literacy and numeracy proficiencies amongst the OECD countries are substantial. Depending on the country, a smaller or greater proportion of a young highly educated age group does not have sufficient skills in literacy or numeracy to cope with many of the everyday tasks requiring the use of that skill. The PIAAC study challenges existing evaluation practices of the effectiveness of HE in fostering individual skills and puts into perspective the attempts to lift national average skill levels by increasing the HE sector's intake.

Liu, H. (2018). *Education systems, education reforms, and adult skills in the Survey of Adult Skills (PIAAC)*. OECD Education Working Papers No. 182. Paris: OECD Publishing. doi: 10.1787/bef85c7d-en

**Abstract:**

This study uses the PIAAC data to examine the relationships between education system characteristics (e.g. early tracking and vocational education orientation) and distributions of adult numeracy

cy skills. It also investigates the effects of postponing the tracking age and easing university access for students on a vocational track on the average skills and different percentiles of the skills distribution. Correlational analysis suggests that education systems with more students enrolled in vocational tracks have on average higher levels of numeracy skills and more compressed skills distributions between the 50th and 90th percentiles. Further analysis suggests that postponing the tracking age among 14 European countries does not have a significant effect on the average skills of the population. However, it increases skills for individuals at the 10th, 20th, and 30th percentiles of the skill distribution. Expanding university access is associated with an increase in numeracy skills, particularly for individuals at the bottom three deciles of the distribution.

Liu, H., & Fernandez, F. (2018). *Examining the ways that numeracy skills and soft skills are related to occupational status: The case of US workers*. Commissioned Paper Washington: American Institutes for Research. Retrieved February 15, 2019, from [https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5b50a5d21ae6cfa99e6e444c/1532011986927/Liu\\_Fndz\\_Soft\\_Skills\\_Report\\_2018\\_Final.pdf](https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5b50a5d21ae6cfa99e6e444c/1532011986927/Liu_Fndz_Soft_Skills_Report_2018_Final.pdf)

**Abstract:**

Policymakers are increasingly concerned that employees need both foundational skills, such as numeracy, and soft skills to be successful in the 21st century economy. However, there is little empirical research that examines whether foundational skills and soft skills have independent or interactive relationships with occupational outcomes. Based on our analysis of PIAAC data, we find that four self-reported measures of the use of soft skills at work have statistically significant, positive relationships with an employee's occupational status—and that these relationships are independent of numeracy skill. The soft skills measures that are positively correlated with occupational status are (a) Readiness to Learn; (b) Influence; (c) Planning; and (d) Task Discretion. We also estimate interaction effects between numeracy skill proficiency and all four aspects of soft skills. The result indicate that the relationships between occupational status and two soft skill types (planning and influence) are significantly different between workers with low and high numeracy proficiency. That is, workers with low-numeracy skills tend to benefit more from exercising planning or influence skills at work than workers with high numeracy proficiency. Independent of soft skills, workers with higher levels of numeracy skills also tend to have higher occupational status.

Liu, Q. (2018). *On-job learning and human capital accumulation* (Dissertation). Georgia Institute of Technology. Retrieved February 15, 2019, from <http://hdl.handle.net/1853/60218>

**Abstract:**

The dissertation investigates the human capital accumulation through on-job learning. It has three empirical studies. The first two essays investigate skill accumulation through performing job tasks. The third one analyzes the labor market effect of tertiary education for full time workers. Using the data from the Programme for the International Assessment of Adult Competencies (PIAAC) for USA, the first essay investigates whether cognitive skills, including literacy and numeracy skills, can be improved through on-the-job learning, especially via tasks at work. With rich information on job tasks performed at individual level, we construct different job complexity measures: a general job complexity measure, and two specific complexity measures of interactive and analytical

tasks. The results show that workers can accumulate cognitive skills through solving complex problems. Additionally, analytical tasks play an important role on cognitive skills, while interactive tasks at work do not show a significant effect. The second essay investigates whether tasks performed at work contribute to the improvement of a worker's problem-solving skills. Based on two datasets for Germany, the Programme for the International Assessment of Adult Competencies (PIAAC) and "LLLight'in'Europe" project (LLL), we analyze on problem-solving skills at different levels, general problem-solving skills and complex problem-solving skills. The results of two problem-solving skill measures show workers benefit from doing a complex job, and task complexity improves complex problem-solving skills with a much smaller  $\alpha$  magnitude. In addition, analytical tasks at work play a more important role than interactive tasks. The third essay investigates the difference in effects of tertiary education between full-time workers and full-time students, based on data from the Chinese Household Income Project (1995, 2002, 2007, and 2013). We find that the schooling returns to a college and a graduate degree earned by full-time workers are significantly lower than the returns on corresponding degrees earned via full-time studies, however, there is a much smaller or no significant gap for junior college degrees for those two groups. The results are quite robust with different model specifications and estimation methods. Our further investigation shows that school quality or aging cannot explain the gap fully.

**Title:**

Lopez-Fogues, A., & Scandurra, R. (2018). Analyzing PIAAC through the capability approach. In S. McGrath, M. Mulder, J. Papier, & R. Suart (Eds.), *Handbook of Vocational Education and Training: Developments in the Changing World of Work* (pp. 1-21). Cham: Springer International Publishing. doi: 10.1007/978-3-319-49789-1\_3-1

**Abstract:**

The purpose of this chapter is to evidence the shortcomings of large-scale assessments and the new shift toward capability-oriented indicators. Focusing on the international data on adult skills (PIAAC) and its impact in forging VET (vocational education and training) policies, we assume that current VET systems are confronted with many challenges that arise from the interaction of two sources. On one hand, VET policy focuses mainly on employability which is insufficient to grasp wider benefits that education entails – as postulated by many educational (i.e., Nussbaum, *Creating capabilities: The human development approach*. Harvard University Press, Cambridge, MA, 2011; Boni and Walker, *Universities and global human development: Theoretical and empirical insights for social change*. Routledge, London, 2016) and a considerable smaller education and work scholars (i.e., McGrath and Powell, *Int J Educ Dev* 50:12–19, 2016; Egdell and McQuaid, *Soc Policy Adm* 50:1–18, 2016). On the other hand, the underpinnings of the objectives and designs of VET should adapt to the socioeconomic consequences of the Great Recession. The chapter focuses on the PIAAC and most concretely to the Spanish case as an example of how the Great Recession becomes an open license to fast- and short-term strategies that favors employment regardless of its quality and long-term consequences and values education and youth role in society in relation to their contribution to boost the economy. The chapter recognizes the urge for seeking fast solutions that shift the unemployment rates but alerts to the overlooked aspects with some of those measures in relation to VET. In fact, this chapter is a call to policy-makers and academics toward the importance of rethinking education on the basis of new information basis of judgment that are human-centered.

Lorenz, H., & Stephany, F. (2018). *Back to the future: changing job profiles in the digital age*. Agenda Austria Working Paper No. 13. Wien: Agenda Austria. Retrieved February 15, 2019, from <https://www.agenda-austria.at/wp-content/uploads/2018/04/aa-wp13-changing-job-profiles.pdf>

**Abstract:**

In light of increasingly "smarter" technologies, the future of (human) labour is questioned on a daily basis. A study by Frey and Osborne (2013), one of the most recognised contributions in this domain, estimated that half of the US labour force is highly susceptible to computerisation in the near future. Their findings have been applied for several follow-up investigations in other countries. However, the transferability of the results is limited by the set-up of the study. In contrast to previous investigations, our approach tries to overcome past shortcomings by collecting assessments on the susceptibility to digital technologies for the Austrian labour market by Austrian experts. We show that the diversity of previous findings regarding the degree of job automation is to a large extent driven by model selection and not by controlling for personal characteristics or tasks. Our results indicate that while clerical computer-based routine jobs are likely to change in the next decade, professional activities, e.g., the processing of complex information, are prone to digital change.

**Title:**

Lyberg, L., Hibben, K. C., & Pennell, B.-E. (2018). Applying the total survey error framework to PIAAC. *Quality Assurance in Education*, 26(2), 153-168. doi: 10.1108/QAE-07-2017-0035

**Abstract:**

**Purpose:** Surveys in multinational, multiregional and multicultural contexts (or "3MC" surveys) are becoming increasingly important to global and regional decision-making and theory building. To serve this purpose, the surveys need to be well managed, with an awareness of key sources of survey error and how to minimize them, mechanisms in place to control the implementation process and an ability to intervene in that process when necessary in a spirit of continuous improvement (Pennell et al., 2017). One key approach for managing and assessing the quality of 3MC surveys is the total survey error (TSE) framework and associated survey process quality. This paper aims to examine the application of the TSE framework and survey process quality to the Programme for the International Assessment of Adult Competencies (PIAAC). **Design/methodology/approach:** The authors begin with a background on TSE and discuss recent adaptations of TSE and survey process quality for 3MC surveys. They then presents a TSE framework tailored with examples of potential contributions to error for PIAAC and ways to address those through effective quality assurance (QA) and quality control (QC) approaches. **Findings:** Overall, the authors find that the design and implementation of the first cycle of PIAAC largely reflect the current best practice for 3MC surveys. However, the authors identify several potential contributions to error that may threaten comparability in PIAAC and ways these could be addressed in the upcoming cycle. **Originality/value:** With a view toward continuous improvement, the final section draws on the survey process quality approach adapted from Hansen et al.'s study (2016) to summarize the recommendations in terms of additional QA elements (inputs and activities) and associated QC elements (measures and reports) for PIAAC's consideration in the next cycle.

**Title:**

Maddox, B. (2018). Interviewer-respondent interaction and rapport in PIAAC. *Quality Assurance in Education*, 26(2), 182-195. doi: 10.1108/QAE-05-2017-0022

**Abstract:**

**Purpose:** This paper aims to investigate small-scale, qualitative observations of interviewer-respondent interaction in the Organisation for Economic Co-operation and Development's Programme for the International Assessment of Adult Competencies (PIAAC). **Design/methodology/approach:** The paper uses video-ethnographic methods to document talk and gesture in assessment in Slovenian household settings. It presents an in-depth case study of interaction in a single testing situation. **Findings:** Observing interaction in assessment captures data on assessment performance that is not available in quantitative analysis of assessment response processes. The character of interviewer-respondent interaction and rapport is shaped by the cognitive demands of assessment and the distinctive ecological setting of the household. **Research limitations/implications:** Observational data on assessment response processes and interaction in real-life assessments can be integrated into and synthesized with other sources of "process data". **Practical implications:** Assessment programs such as PIAAC should consider the significance of the household setting on assessment quality and observations of interaction in assessment as a valid source of paradata. **Social implications:** There is a place for small-scale observational studies of assessment to inform public understanding of assessment quality and validity. **Originality/value:** The paper provides qualitative insights into the significance of interaction and "interviewer effects" in household assessment settings.

**Title:**

Maddox, B., Bayliss, A. P., Fleming, P., Engelhardt, P. E., Edwards, S. G., & Borgonovi, F. (2018). Observing response processes with eye tracking in international large-scale assessments: Evidence from the OECD PIAAC assessment. *European Journal of Psychology of Education*, 33(3), 543-558. doi: 10.1007/s10212-018-0380-2

**Abstract:**

This paper reports on a pilot study that used eye tracking techniques to make detailed observations of item response processes in the OECD Programme for the International Assessment of Adult Competencies (PIAAC). The lab-based study also recorded physiological responses using measures of pupil diameter and electrodermal activity. The study tested 14 adult respondents as they individually completed the PIAAC computer-based assessment. The eye tracking observations help to fill an 'explanatory gap' by providing data on variation in item response processes that are not captured by other sources of process data such as think aloud protocols or computer-generated log files. The data on fixations and saccades provided detailed information on test item response strategies, enabling profiling of respondent engagement and response processes associated with successful performance. Much of that activity does not include the use of the keyboard and mouse, and involves 'off-screen' use of pen and paper (and calculator) that are not captured by assessment log-files. In conclusion, this paper points toward an important application of eye tracking in large-scale assessments. This includes insights into response processes in new domains such as adaptive problem-solving that aim to identify individuals' ability to select and combine resources from the digital and physical environment.

Mandrone, E. (2018). *Economic literacy financial costs and social implications*. Social Science Research Network. doi: 10.2139/ssrn.3124793

**Abstract:**

What is the ability of Italians to understand wider economic and financial dimensions? Do they know what they do when they invest their savings, use credit cards or gamble with their money? Knowing how to handle the numbers, terms, and norms that we use is a major issue for the ever-increasing implications that financial capacity will have on our lives. Not only consumption or savings, but also insurance, housing and employment choices, public services and school choices along with democratic participation require a good level of economic literacy. This article seeks to identify cognitive and regulatory limits and both individual and collective tools to defend from so many occasions where the economic dimension involves the possibility of financial loss or cost-opportunity and the implications that an improvement in economic literacy may lead to the interpretation of one's own situation.

**Title:**

Manuela, B., & Simona, M. (2018). Social integration dynamics for migrants: PIAAC to measure skill and qualification mismatch. *Universal Journal of Educational Research*, 6, 970-982. doi: 10.13189/ujer.2018.060518

**Abstract:**

This paper aims at highlighting the overlapping between the qualification mismatch and the skill mismatch, using a specific Italian data set drawn from PIAAC survey (2012). The main concern, regarding skills and competences, is that they may be gathered and accumulated, but also potentially become obsolete, thus, qualifications (formally recognized) do not necessarily correspond to used skills and competences. Measuring skill mismatch is evidently problematic as there are not many direct information regarding skills at the workplace. Usually information comes from self-reported measures (correspondence of tasks performed at work) or comparing indicators of proficiency and use at work, methodologies prone to bias. Skill mismatch arises from several structural modifications in countries economy and social demographic events such as migration. And skill mismatch and qualification mismatch are a common phenomenon among foreign workers. The levels of both their qualifications and the skills used at work are rarely well-match among this particular target group. Besides, the Italian system not always is able to adequately assess, recognize and validate qualifications and/or skills and competences possessed by immigrants who are

applying for working positions. PIAAC makes it possible to compare qualifications, information processing skills (literacy and numeracy) and skills required on the job, for specific target groups. The Survey of Adult Skills provides a measure of skill mismatch: it arises when workers have higher or lower skills proficiency (measured) than that required by their jobs (self-reported information). The relationship between skill mismatch and labour market outcomes involves different approaches and implications at policy level in inclusive societies, especially considering economic and socio-demographic factors. Among the three proficiency cognitive domains of PIAAC, we focused on literacy mismatch as (compared to numeracy) is a parameter of high relevance for the chosen target group (migrants). In fact it indicates the adaptability in the host working context due to language difficulties. Findings in PIAAC show that foreign workers are three times more likely than natives to be under-skilled in literacy. And the difference arises if we consider the time parameter ("since how long they have been living in Italy"): less than 5 years residents are even more under-skilled (more than 30%). Besides, foreign workers are overqualified (26.5%) much more than Italians (12.4%) and also two times more likely to be over-qualified than natives. But it is worth noting that among overqualified workers (with a higher qualification than the one needed to carry out the specific job), foreign workers seem to lack the necessary skills. This discrepancy is an important element to understand social integration dynamics and thus orientate policies.

Marguerit, D., Cohen, G., & Exton, C. (2018). *Child well-being and the sustainable development goals*. OECD Statistics Working Papers No. 92. Paris: OECD Publishing. doi: 10.1787/5e53b12f-en

**Abstract:**

This paper summarises available evidence on the distance that OECD countries need to travel in order to reach the Sustainable Development Goal (SDG) targets for children and young people. More than 50 indicators are included in this analysis, covering 43 of the 169 targets, and 11 of the 17 Goals. The analysis finds that, on average, OECD countries are still far from reaching the targets pertaining to Goals 4 "Quality education", and 8 "Decent work and economic growth". Goals 1 "No poverty", 2 "Zero hunger" and 16 "Peace, justice and strong institutions" are also highlighted as priority areas. However, the results vary widely across OECD countries, and among specific targets within each of the goals. Yet, all of these findings need to be considered in light of what it is not currently possible to measure. In particular, there are large data gaps for Goals 1 ("No poverty"), 5

(“Gender equality”), 11 (“Sustainable cities and communities”), and 16 (“Peace, justice and strong institutions”).

Martin, A. (2018). *Bildungspolitische Steuerungspotentiale im Feld der Weiterbildung [Potentials for educational governance in continuing education]*. (Dissertation) Jacobs University Bremen. Retrieved February 15, 2019, from <http://nbn-resolving.org/urn:nbn:de:gbv:579-opus-1008042>

**Abstract:**

Education is one of the most important factors for the cultural, economic, political, and social development of modern societies. Consequently, all areas of education are increasingly moving into the focus of political governance demands of actors on both national and supranational levels. The achievement of such political objectives, however, poses major challenges for the actors. Especially the area of continuing education is characterized by a high degree of heterogeneity on all levels of action. Therefore, continuing education often resists direct interventions of political actors. The present cumulative thesis presents four studies that examined the political governance potentials in the area of continuing education for actors on the national and the supranational levels. The chances of successful interventions concerning the typical functions of the education system in modern society and the corresponding political objectives were analyzed on different levels of action. It was of special interest, which level of action is most suitable for political governance and what mode of coordinated social action is particularly effective. A multi-level model of continuing education was used as the basis for this research. The results show that the national framework represents a highly relevant context of continuing education behavior. Furthermore, public spending on education increases the participation of the adult residential population, with low-skilled persons especially benefitting from these expenditures. Public spending on education was used as a proxy for the degree of decommodification of the education system. Regional and local contexts, however, turn out to be less important contexts of continuing education behavior. The strongest effect on the continuing education behavior can be seen for the context of counties and cities. In addition, these administrative spatial divisions are of particular importance as coordination frameworks of regional continuing education landscapes at the level of the institutional environment of continuing education organizations. Here, the effects of politically initiated education networks on the continuing education behavior of the entire population as well as for educationally disadvantaged subpopulations were examined. The analyses identified a small but significant effect only for low-skilled males. At the level of action of the further education organizations, it was examined to what extent cooperation between continuing education centers and other institutions, as laid down in the further education laws of most federal states in Germany, are suitable for implementing additional participations and for opening up previously inaccessible participation potentials. The results show that cooperation allows for additional course offerings, which are accompanied by additional participation. Furthermore, cooperation provides a chance for adult education centers to gain new groups of participants in the long term.

Martin, J. P. (2018). *Skills for the 21st century: Findings and policy lessons from the OECD survey of adult skills*. OECD Education Working Papers No. 166. Paris: OECD Publishing. doi: 10.1787/96e69229-en

**Abstract:**

The OECD Survey of Adult Skills is the jewel in the crown of its Programme for the International Assessment of Adult Competencies (PIAAC). This paper argues that the findings and policy lessons from the project to date justify the high hopes which were placed in PIAAC when detailed planning for the project began in 2003. First, it presents a brief recap of PIAAC and its two predecessor international skills surveys. Second, it outlines the main themes which have been investigated to date using data from PIAAC. Third, the main findings and policy lessons drawn from PIAAC are highlighted. Finally, looking forward to the second cycle of PIAAC, for which planning is now underway, the paper suggests some priority areas for improvement to the survey design in order to add to its analytical usefulness and enhance its utility to policy makers.

Mateos-Romero, L., & Salinas-Jiménez, M. d. M. (2018). Labor mismatches: Effects on wages and on job satisfaction in 17 OECD countries. *Social Indicators Research*, 140(1), 369-391. doi: 10.1007/s11205-017-1830-y

**Abstract:**

This study analyzes the effects of labor mismatches on wages and on job satisfaction in seventeen OECD countries by distinguishing between educational mismatch and skills mismatch. Using data from PIAAC, the results suggest that whereas educational mismatch shows greater effects on wages, the effects of labor mismatch on job satisfaction are generally better explained by skills mismatches. Both phenomena appear to be relevant for understanding the economic effects of labor mismatch and suggest that educational mismatch is not an accurate proxy for skills mismatch, mainly when the non-monetary effects of labor mismatch are addressed.

Mazar, Y. (2018). *Differences in skill levels of educated workers between the public and private sectors, the return to skills and the connection between them: Evidence from the PIAAC surveys*. Bank of Israel Working Papers No. 2018.01. Jerusalem: Bank of Israel. Retrieved February 15, 2019, from [ftp://repec-boi.northeurope.cloudapp.azure.com/RePEc/boi/wpaper/WP\\_2018.01.pdf](ftp://repec-boi.northeurope.cloudapp.azure.com/RePEc/boi/wpaper/WP_2018.01.pdf)

**Abstract:**

This study relates to a series of countries, and examines how the private sector differs from the public sector in the distribution of cognitive skills that characterize educated workers, and what variables are correlated with these differences. We find that in almost all countries, the return on skills is higher in the private sector, but there is a high level of variance between countries. The gap in returns in Israel is similar to the average of the other countries among men, and relatively high among women. The wider the gap is, the higher the skills of workers in the private sector are relative to the skills of those employed in the public sector. It was also found that the higher the country's per capita GDP is, the higher the skills of educated men in the public sector are relative to the skills of educated men in the private sector.

McQuay, L. (2018). Will robots duplicate or surpass us? The impact of job automation on tasks, productivity, and work. *Psychosociological Issues in Human Resource Management*, 6(2), 86-91. doi: 10.22381/PIHRM6220189

**Abstract:**

This article reviews recent literature concerning the impact of job automation on tasks, productivity, and work. Building my argument by drawing on data collected from Atlas, Autonomous Research, McKinsey Global Institute, OECD/PIAAC, Pew Research Center, PwC, and U.S. Bureau of Labor Statistics, I performed analyses and made estimates regarding percentage of adults who think it is likely that people would have a hard time finding jobs/the inequality between the rich and poor would be much worse than it is today/ economy would be more efficient/there would be new, better-paying jobs if robots and computers were able to do much of the work currently being done by humans, time spent in U.S. occupations and ability to automate, percentage of EU jobs at high risk of automation by 2030s (by sector), percentage of adults who say that in the next 50 years robots and computers will do much of the work currently done by humans, and percentage of workers who say the jobs/professions they work in now will/will not exist in 50 years.

Medrano-Adan, L., Salas-Fumás, V., & Sanchez-Asin, J. (2018). *Does the dispersion of skills explain inequality in market labor income? An analysis from occupational choice models*. Social Science Research Network. doi: 10.2139/ssrn.3271577

**Abstract:**

This paper examines the relationship between the dispersion of general skills in the working population, and inequality in the distribution of labor income that arises from the market equilibrium from occupational choices. In general, more skilled individuals earn higher labor income in the equilibrium, and the relationship between skills and income is proportional in the occupational group of employees, but labor income increases more than proportionately with skills in the groups of solo self-employed and entrepreneur-managers. Labor income inequality at the economy level is then the result of combining the distribution of skills with the sizes of occupational groups. This paper helps to explain some apparent contradictions between the theory, which predicts a close association between dispersion of skills and labor income inequality, and the empirical evidence, using data from the PIAAC project, of no correlation between dispersion of skills and wage inequality in cross-country data.

**Title:**

Mohadjer, L., & Edwards, B. (2018). Paradata and dashboards in PIAAC. *Quality Assurance in Education*, 26(2), 263-277. doi: 10.1108/QAE-06-2017-0031

**Abstract:**

Purpose: This paper aims to provide a brief review of the dashboard literature, an account of the development of performance dashboards for field data collection at Westat, and more specifically for the first cycle of the Programme for the International Assessment of Adult Competencies (PIAAC). A brief concluding section offers suggestions for improvements in survey dashboards for PIAAC's next cycle. Design/methodology/approach: To manage field work at Westat, the authors create views into various paradata databases and present them in a dashboard, showing key per-

formance indicators at a glance. Users can drill down from the dashboard into underlying databases to investigate potential problems. The US PIAAC dashboard is a monitoring system that supports daily review of many activities. For example, it provides overnight alerts to the field supervisor when global positioning system (GPS) data from an interviewer's smartphone shows the interview occurred far from the respondent's home. Findings: Performance dashboards may represent best practice for monitoring field activities. Paradata sources and systems vary greatly across the PIAAC countries, but a multitude of process data exists in every country and can be used to create quality indicators and a monitoring system. PIAAC can establish standards/guidelines to improve visualization of quality metrics and management data, regardless of the local survey infrastructure. Originality/value: The core of the paper is a case study of the experiences on the US PIAAC implementation of dashboards to monitor survey quality, production and costs, with special attention to the issue of fabrication.

Molina-Domene, M. (2018). *Specialization matters in the firm size-wage gap*. CEP Discussion Papers No. 1545. London: Centre for Economic Performance, LSE. Retrieved February 15, 2019, from <http://cep.lse.ac.uk/pubs/download/dp1545.pdf>

**Abstract:**

This study applies the O-ring theory to explain the firm-size wage premium. It focuses on the joint role of the division of labor and employee characteristics. Including the firm heterogeneity of occupations in a standard wage regression with individual fixed effect shrinks the size coefficient by a third. Labor productivity follows a similar pattern as wages. The intuition is that individuals who work for large firms focus on a limited number of tasks become more efficient and productive, and earn higher wages. Additional predictions originating from the labor specialization hypothesis receive support from the data.

Moreira, L. (2018). *Health literacy for people-centred care*. OECD Health Working Papers No. 107. Paris: OECD Publishing. doi: 10.1787/d8494d3a-en

**Abstract:**

In the 21st century care, the old paradigm “because the doctor said so” no longer holds. Individuals are now seeking ways to understand their health options and take more control over their health decisions. But this is not an easy task. Professionals continue to use medical jargon, drug instructions are not always clear, and health information in clinical settings continue to be complex and challenging to navigate. Widespread access to digital technologies offset some of these barriers by democratising access to health information, providing new ways to improve health knowledge and support self care. Nonetheless, when health information is misused or misinterpreted, it can wrongly influence individuals’ preferences and behaviour, jeopardise their health, or put unreasonable demands on health systems.

Mueller, R. E., Truong, N. K., & Smoke, W. (2018). Underrepresentation of women in Canada's information and communication technology sector: What can we learn from a Canadian survey of adult skills? *Canadian Public Policy*, 44(1), 73-90. doi: 10.3138/cpp.2017-073

**Abstract:**

The proportion of women in Canada's information and communication technology (ICT) sector is well below their proportion in other fields. One hypothesis for this phenomenon is that women may not have the "right stuff" to be heavily involved in ICT. We use basic ICT scores derived from Statistics Canada's 2012 Survey of Adult Skills, which is the Canadian portion of the 2012 Organisation for Economic Co-operation and Development Programme for the International Assessment of Adult Competencies as a proxy for the "right stuff." We find that, after controlling for appropriate covariates, Canadian women score higher than men on basic ICT skills. However, women with the same ICT test scores are much less likely than men to be employed in ICT occupations. We also find that hourly wages in ICT occupations are lower for women, but this wage gap is no greater than that in the general labour market. Given the current and projected shortages of ICT professionals, women represent a large, yet untapped, pool of talent for this sector.

Muñoz de Bustillo Llorente, R., Sarkar, S., Sebastian, R., & Antón, J.-I. (2018). Educational mismatch in Europe at the turn of the century: Measurement, intensity and evolution. *International Journal of Manpower*, 39(8), 977-995. doi: 10.1108/IJM-10-2018-0327

**Abstract:**

**Purpose:** The purpose of this paper is to present the stylized facts of over-education among European graduates over time (1998-2013), paying special attention to the measurement issues. **Design/methodology/approach:** The authors use two different sources, the Programme for the International Assessment of Adult Competencies 2012, and the European Union Labour Force Survey 1998-2013, with two different aims. We employ the first one to make a detailed analysis of the different forms of measuring over-education and its implications in terms of the result obtained. The analysis of the second one responds to study the evolution and characteristics of over-education in Europe. **Findings:** In first place, the paper provides evidence of the high level of sensitivity of the level of measured over-education to the type of methodology used. Such difference is even higher when we focus on skills versus educational mismatch. The work also shows how with all their shortcomings, the measures of over-education used in the analysis point to the existence of convergence in over-education levels among the European countries of the sample (only interrupted by the crisis), in a context of reduction of over-education rates in many countries. **Practical implications.** Researchers should be particularly careful when estimating over-education, because of the strong implications in terms of the so different results obtained when choosing between competing methods. **Originality/value:** The analysis abound in the implications of the use of different methodologies of estimating over-education in terms of both size and ranking among European countries. The production of long-run and updated estimates of overeducation for a large sample of countries using a homogenous database and different estimation methods.

Naval Navarro, J., Silva Becerra, J. I., & Vázquez Grenno, J. (2018). *Employment effects of on-the-job human capital acquisition*. IEB Working Paper No. 05. Barcelona: Institut d'Economia de Barcelona. Retrieved February 15, 2019, from <http://hdl.handle.net/2445/121339>

**Abstract:**

This paper quantifies the joint effect of on-the-job training and workers' on-the-job learning decisions on aggregate employment. We present an Index of On-the-job Human Capital Acquisition (OJHCA), based on data from the OECD Program for the International Assessment of Adult Competencies. The objective of the index is to capture both formal and informal learning in the workplace. We document a strong positive association between the two components of our index, i.e., on-the-job training and on-the-job learning. We also show that the index is positively correlated with employment across OECD economies. To explain these stylized facts, we build a search and matching model with on-the-job human capital acquisition that depends on both on-the-job training provided by firms and on the workers' level of on-the-job learning. We calibrate the model to the Canadian economy and adjust the learning and training marginal costs to match cross-country levels in the human capital index. We compare the model's predictions with the data and we conclude that differences in marginal costs are necessary to match the differences observed in employment rates across countries. We also extend the model including payroll taxes and education. The model is able to reproduce the observed differences in employment rates between countries with the highest and the lowest level of OJHCA.

Nedelkoska, L., & Quintini, G. (2018). *Automation, skills use and training*. OECD Social, Employment and Migration Working Papers No. 202. Paris: OECD Publishing. doi: 10.1787/2e2f4eea-en

**Abstract:**

This study focuses on the risk of automation and its interaction with training and the use of skills at work. Building on the expert assessment carried out by Carl Frey and Michael Osborne in 2013, the paper estimates the risk of automation for individual jobs based on the Survey of Adult Skills (PIAAC). The analysis improves on other international estimates of the individual risk of automation by using a more disaggregated occupational classification and identifying the same automation bottlenecks emerging from the experts' discussion. Hence, it more closely aligns to the initial assessment of the potential automation deriving from the development of Machine Learning. Furthermore, this study investigates the same methodology using national data from Germany and United Kingdom, providing insights into the robustness of the results. The risk of automation is estimated for the 32 OECD countries that have participated in the Survey of Adult Skills (PIAAC) so far. Beyond the share of jobs likely to be significantly disrupted by automation of production and services, the accent is put on characteristics of these jobs and the characteristics of the workers who hold them. The risk is also assessed against the use of ICT at work and the role of training in helping workers transit to new career opportunities.

**Abstract:**

Because of structural and technological changes, millions of employees experience job displacement every year (OECD, 2013a). Concurrently, a substantial proportion of employees can be defined as skill mismatched (OECD, 2013b). This paper explores the relationship between skill mismatch and job displacements. Are employees who are skill mismatched at their job more likely to become displaced? To explore the relationship between skill mismatch and job displacements, a dataset collected by the Programme for the International Assessment of Adult Competencies (PIAAC) from 27 countries is used. This dataset enables the identification of skill mismatch. Three measures that reflect skill mismatch in the domains of literacy, numeracy, and problem solving are used. The empirical findings suggest that overskilled employees are less likely to be displaced, while under-skilled employees are more likely to be displaced. These findings are valid for all three skill domains.

O'Leary, M., Scully, D., Karakolidis, A., & Pitsia, V. (2018). The state-of-the-art in digital technology-based assessment. *European Journal of Education*, 53(2), 160-175. doi: 10.1111/ejed.12271

**Abstract:**

The role of digital technology in assessment has received a great deal of attention in recent years. Naturally, technology offers many practical benefits, such as increased efficiency with regard to the design, implementation and scoring of existing assessments. More importantly, it also has the potential to have profound, transformative effects on the field of assessment by facilitating the integration of formative activities with accountability requirements and broadening the range of abilities and the scope of constructs that can be assessed. This article provides an overview of the current state-of-the-art in digital technology-based assessment, with particular reference to advances in the automated scoring of constructed responses, the assessment of complex 21st century skills in large-scale assessments and innovations involving high fidelity virtual reality simulations. Key challenges with respect to each are highlighted before the extent to which digital technology is truly transforming assessment is considered.

Obiols-Homs, F., & Sánchez-Marcos, V. (2018). Education outcomes and the labor market. *Labour Economics*, 54, 14-28. doi: 10.1016/j.labeco.2018.06.001

**Abstract:**

The quality of education appears to be negatively correlated with both the overeducation of workers at the tasks they perform and the unemployment rate across EU-15 countries, and positively correlated with the wage premium associated to tertiary education. We develop a model of the labor market with frictions to quantitatively investigate the impact of the education outcomes on the labor market. We show that both the ability of educated and non-educated workers have sizeable effects on the incentives of firms regarding the type of vacancies they open and also regarding the incentives of educated workers as of where to search for a job. Therefore education outcomes are relevant to understand the overeducation phenomena observed in the labor market. According to our quantitative analysis had the quality of education observed in Spain been similar to the European average then the overeducation rate would have been between 5 and 10 percentage points lower and the unemployment rate of the two types of workers would be reduced by 40%.

but the tertiary education wage premium would be slightly smaller than in the benchmark economy.

**Title:**

Organisation for Economic Cooperation and Development (OECD) (2018). *OECD economic surveys: Israel*. OECD Economic Surveys Paris: OECD Publishing. doi: 10.1787/eco\_surveys-isr-2018-en

**Abstract:**

Israel's economy continues to register remarkable macroeconomic and fiscal performance. Growth is strong and unemployment is low. The external surplus is comfortable, and the public debt-to-GDP ratio, already well below the OECD average, is still falling. However, Israeli society remains marked by weak social cohesion and significant disparities, which penalise parts of the population and threaten the longer-term sustainability of these good results. Despite better employment outcomes among Israeli-Arabs and the Haredim, workers from these communities are often trapped in low-paid jobs due to their weak skill sets, implying persistent poverty and weak aggregate productivity. Moreover, low social transfers imply that the often large families in these communities face deprivation that contributes to child poverty. High cost of living and house prices also weigh on the social situation and well-being, and public transport deficiencies are detrimental to work-life balance and cause urban congestion and poor air quality. The authorities have continued their reform process over the last few years to address these issues. Making growth stronger, more inclusive and more sustainable will require further action and more public investment in education to improve the skills of Israeli-Arabs and Haredim together with additional product market reforms and better transport infrastructure.

Olsen, D. S., & Tikkanen, T. (2018). The developing field of workplace learning and the contribution of PIAAC. *International Journal of Lifelong Education*, 37(5), 546-559. doi: 10.1080/02601370.2018.1497720

**Abstract:**

There has been a prolific production of research papers on workplace learning (WPL) during the last two decades. Several reviews of the field discuss the development of themes, the use of foundational terms and some different models and frameworks have been developed. The purpose of this article is to analyse the recent development of the field of WPL, as presented in research literature, and to evaluate the potential of international survey data from the Programme for the International Assessment of Adult Competencies (PIAAC) to contribute to this development. Our study is organised in three stages. Firstly, we summarise the main topics and trends emerging from recent literature on WPL. Secondly, we analyse how peer-reviewed publications using data from the OECD PIAAC survey have contributed to WPL. Thirdly, we compare and discuss the different contributions and make some suggestions as to how PIAAC survey data might be used to further develop our understanding of WPL.

Oughton, H. M. (2018). Disrupting dominant discourses: A (re) introduction to social practice theories of adult numeracy. *Numeracy*, 11(1), 20. doi: 10.5038/1936-4660.11.1.2

**Abstract:**

The role of dominant discourse in constructing a deficit view of adult numeracy is examined, using reports from recent international surveys of adult skills as illustrative examples. Social practice theory is introduced as an alternative perspective for examining the ways adults actually use numeracy in their daily lives and work. This perspective suggests the test items used by large-scale surveys such as PIAAC are only proxies for real-life numeracy skills, and that performance in such tests may misrepresent the numeracy skills of adults. Instead, social practice theory suggests that adults may have informal, situated numeracy practices that serve them adequately in their daily lives. However, it also draws attention to the difficulty of transferring mathematics from the classroom to everyday numeracy situations, while it recognizes that adult numeracy learners may be motivated by other goals than functional numeracy, such as personal fulfillment or a gateway qualification. Alternative approaches to classroom teaching for adult students are suggested which acknowledge and draw on adults' rich and varied experiences; the challenges and tensions of such approaches are explored.

Palczynska, M. (2018). *Wage premia for skills: The complementarity of cognitive and non-cognitive skills*. IBS Working Papers No. 09. Warszawa: Instytut Badan Strukturalnych. Retrieved February 15, 2019, from [http://ibs.org.pl/app/uploads/2018/12/IBS\\_Working\\_Paper\\_09\\_2018.pdf](http://ibs.org.pl/app/uploads/2018/12/IBS_Working_Paper_09_2018.pdf)

**Abstract:**

This paper provides evidence on the association between individuals' cognitive abilities, personality traits, and earnings. I find that cognitive skills and certain personality traits are complements. In particular, I find that cognitive skills and emotional stability are complementary, with neurotic individuals having significantly lower returns to their cognitive skills. Furthermore, my results indicate that agreeableness, neuroticism, and – surprisingly – grit are penalised significantly in the labour market; and that there is a positive relationship between conscientiousness and wages. Finally, I observe that, contrary to previous findings, women and men have similar returns to personality traits. I use well-established measures of cognitive skills and personality: namely, competence tests from the PIAAC survey to assess cognitive skills, as well as the Big Five inventory and the Grit scale to assess personality traits.

**Abstract:**

This paper provides evidence on the relationship between individuals' cognitive abilities, their personality measured by the Big Five inventory and earnings. Using data from the Polish Follow-up Study to the Programme for International Assessment of Adult Competencies (postPIAAC) I find that the returns to cognitive skills depend on the personality of an individual: neurotic individuals experience significantly lower returns to their cognitive skills. Results also indicate that agreeableness and neuroticism are penalized significantly in the Polish labour market and that there is a positive relationship between conscientiousness and wages. Moreover, unlike previous literature, I find no substantial gender discrepancies in the personality associations with wages.

**Title:**

Palczyńska, M., & , K. (2018). Personality, cognitive skills and life outcomes: Evidence from the Polish follow-up study to PIAAC. *Large-scale Assessments in Education*, 6(2), 1-23. doi: 10.1186/s40536-018-0056-z

**Abstract:**

Background: There is a growing literature providing evidence on the importance of non-cognitive skills for life outcomes. However, to date there is limited evidence on the gains from incorporating such measures into large-scale competence surveys. Methods: We investigate the relationship between personality traits and eight important life outcomes: educational attainment, labour market participation, employability, wages, job satisfaction, health, trust and life satisfaction measured in the Polish follow-up study to PIAAC. The study assesses two short scales: the Big Five Inventory and Grit. First, we compare explanatory power of personality traits to that of cognitive skills measured by PIAAC. Second, an incremental validity of Grit after controlling for the Big Five dimensions is assessed. Results: The analyses show that differences in personality traits are important in explaining differences in life outcomes. Educational attainment is more strongly related to cognitive skills, while for wages, the explanatory power of personality and cognitive skills is similar. For most of the subjective outcomes, the Big Five traits outperform cognitive skills in predictive power. Conscientiousness is positively related to most of the outcomes analysed while Neuroticism has a negative relationship. After controlling for sociodemographic characteristics and cognitive skills, Big Five traits add explanatory power to all models except for employability. Grit explains some additional variation in educational attainment and in a number of subjective outcomes: health, trust, job and life satisfaction, even after adjusting for the effects of cognitive skills and Big Five traits. Conclusions: Given the potential benefits and relatively small burden on respondents in terms of required time it seems advisable to incorporate measures of personality traits into competence surveys as they contribute to explaining the variability in policy-relevant outcomes. The use of the Big Five Inventory seems preferable to Grit when a broad range of life outcomes is of interest, as the former covers multiple aspects of personality. However, using both scales offers an improvement in explanatory power.

Pareliussen, J., & Hwang, H. (2018). *Benefit reform for employment and equal opportunity in Finland*. OECD Economics Department Working Papers, No. 1467. Paris: OECD Publishing. doi: 10.1787/26e12903-en

**Abstract:**

The combination of different working-age benefits, childcare costs and income taxation creates complexity, reduces work incentives and holds back employment. Major disincentives in Finland are related to tapering rules for unemployment benefits, social assistance and the housing benefit, the extended unemployment benefit for older workers, the childcare fee structure and the homecare allowance. Improved benefit design combined with efficient activation policies can reduce complexity and remove the strongest disincentives while minimising adverse fiscal and social impacts. Replacing current benefits with a basic income would improve incentives for many, but with a drastic redistribution of income and likely increasing poverty as a result. Merging working-age benefits with similar aims and coordinating their tapering against earnings would on the

other hand consistently improve work incentives and transparency, while preserving social protection. Once the new income registry comes online, linking benefit payments to real-time incomes, combined with strengthened work incentives, would make for a truly efficient and inclusive benefit system, fit for the future of work. This Working Paper relates to the 2018 OECD Economic Survey of Finland ([www.oecd.org/eco/surveys/economic-survey-finland.htm](http://www.oecd.org/eco/surveys/economic-survey-finland.htm)).

Parteka, A., Wolszczak-Derlacz, J., & others (2018). *Wage response to global production links - evidence for workers from 28 European countries (2005-2014)*. Working Paper Series A No. 5. Gdansk: Faculty of Management and Economics, Gdansk University of Technology. Retrieved February 15, 2019, from <http://hdl.handle.net/10419/202499>

**Abstract:**

By using very rich individual-level data on workers from 28 European countries, we provide the first so extensive cross-country assessment of wage response to global production links within global value chains (GVCs) in the period 2005–2014. Unlike the other studies, we (i) address the importance of backward links in globally integrated production structures (capturing imports of goods and services required in any stage of the production of the final product); (ii) measure the occupational task profile of workers with new country-specific indices of routinisation; (iii) compare the impact of global production links on wages between workers from Western, Central–Eastern, and Southern Europe employed in manufacturing and non-manufacturing sectors; and (iv) account for direct and indirect dependence on GVC imports from developing and high-income countries. We consider the potential endogeneity problems. Our results suggest that global import intensity of production exhibits negative pressure on wages in Europe. This effect mainly concerns workers from Western Europe employed in manufacturing and is driven by production links with non-high-income countries. Our counterfactual estimates suggest that the effect for all of Europe is small, but the pressure of GVC imports on wages in Western Europe is not economically negligible, in particular when inputs are from less developed countries including China.

Patterson, M. B. (2018). *Incarcerated adults with low skills: Findings from the 2014 PIAAC Prison study*. Vienna: Research Allies for Lifelong Learning. Retrieved February 15, 2019, from [http://researchallies.org/wp-content/uploads/2018/08/2018\\_Patterson\\_Incarcerated-Adults-with-Low-Skills\\_Final.pdf](http://researchallies.org/wp-content/uploads/2018/08/2018_Patterson_Incarcerated-Adults-with-Low-Skills_Final.pdf)

**Abstract:**

Incarcerated men and women in state and federal prisons face multiple educational and economic challenges. Disabilities and health concerns of incarcerated adults exceed that of the general population. Despite widespread availability of correctional education programs in prisons, only a small proportion of prisoners completes them. Employing quantitative data from the Programme for the International Assessment of Adult Competencies (PIAAC) Prison Study (2014), this paper investigates the characteristics and assessed skill levels of incarcerated adults with less than high school education attainment. It considers how characteristics and assessed skill levels differ by gender and from the general population, as well as the role of current and future learning in the lives of incarcerated adults with low skills. Findings include educational and health vulnerabilities for men and women that may be heightened in already-stressed, impoverished communities. Adults in correctional education programs cite future jobs after release and gaining knowledge as

reasons to attend; the same reasons are prominent as motivations for future learning. Even so, the proportion of adults completing these programs and gaining credentials is even lower than earlier research reported.

Patterson, M. B., & Song, W. (2018). *Critiquing adult participation in education, report 1: Deterrents and solutions*. Vienna: Research Allies for Lifelong Learning. Retrieved February 15, 2019, from <https://static1.squarespace.com/static/560d5789e4b015789104a87e/t/5b0836968a922dcd7645c2b8/1527264943963/CAPE-Report-1-Deterrents-and-Solutions.pdf>

**Abstract:**

A recent report, *The Forgotten 90%*, revealed that only 10% of adults who need basic skills participate in the U.S. adult education system (Patterson, 2018). Educators and policymakers might ask the following important questions: What about the other 90%? Which deterrents do these nonparticipants face—and what might engage them to participate in adult education? VALUEUSA, a national non-profit organization committed to adult learner involvement and leadership, believed adults themselves could best answer questions on nonparticipation. VALUEUSA partnered with Research Allies for Lifelong Learning on the *Critiquing Adult Participation in Education (CAPE)* project to identify deterrents and seek solutions. CAPE researchers conducted 25 group interviews with 125 adults in Florida, Kansas, Louisiana, Ohio, and Virginia. Interview sites included employment agencies and workforce and community service non-profits. None of the interviewees were currently engaged in adult education and three-fourths had never been. Adults identified and prioritized deterrents and solutions with researchers. The findings of this first in a series of CAPE reports are intended to inform policymakers and adult educators as they seek to engage more of the forgotten 90% in adult education. Before interviews, adults took brief surveys. Survey and interviews yielded findings on value of education and access to technology by nonparticipants. Adults had high rates of agreement with positive survey statements on value of education. During interviews, however, adults expressed more nuanced opinions, with many valuing education positively and others neutral or unsure. Technology access is an indicator of whether adults can access solutions for learning when they cannot get to adult education in person. Surveys revealed most adults were currently online, and nearly all with access did so by smartphone.

Pena, A. A. (2018). Skills and economic inequality across race and ethnicity in the United States: New evidence on wage discrimination using PIAAC. *The Review of Black Political Economy*, 45(1), 40-68. doi: 10.1177/0034644618770834

**Abstract:**

Using skill and earnings data from the OECD's newly released Programme for the International Assessment of Adult Competencies (PIAAC) and decomposition methodology from literature on economic distributions across countries, this research provides new evidence about the limited extent to which levels of and rates of return to skills explain unequal wage distributions in subgroups defined by race and ethnicity in the United States. The specific importance of PIAAC skill levels and of rates of return to skill varies substantially between racial and ethnic minorities relative to Whites and across the upper and lower parts of the wage distribution, while unobservables

remain critical. These findings about differential characteristics of wage spreads are in contrast to relatively high correlations between the means of wage distributions and the more comprehensively defined skill measures observed in PIAAC (in comparison to those that have been examined in past literature), and are robust to the inclusion of other observable human capital and socioeconomic determinants. Results have implications for understanding how formal and informal institutions, discrimination, and labor market compensation practices may translate differentially across racial and ethnic groups and into observed variation in earnings.

Pensiero, N., & Green, A. (2018). The effects of post-compulsory education and training systems on literacy and numeracy skills: A comparative analysis using PISA 2000 and the 2011 survey of adult skills. *European Journal of Education*, 53(2), 238-253. doi: 10.1111/ejed.12268

**Abstract:**

This article analyses the contribution of post-compulsory education and training systems to the development of literacy and numeracy skills across OECD countries. While there is extensive cross-country comparative research on the effects of primary and lower secondary education systems on aggregate skills levels, there has been little comparative analysis of system effects after the end of lower secondary education. This article uses a quasi-cohort analysis of the tested literacy and numeracy skills of 15-year-olds in PISA 2000 and 27-year-olds in the 2011 OECD Survey of Adult Skills (SAS) to estimate the gains in different countries in mean levels of competence in literacy and numeracy. We found that Nordic countries (Norway and Sweden) with comprehensive upper secondary education and training systems and German-speaking countries (Austria and Germany) with dual systems of apprenticeship were particularly effective, whilst countries with mixed systems (England, Ireland, Northern Ireland and Spain) showed a relative decline in both literacy and numeracy. The education system characteristics that account for these differences are (a) the inclusiveness – as proxied by high rates of participation at 17/18 and low social gradients of level 3 completion; (b) the esteem of vocational programmes; and (c) curriculum standardisation with regard to the study of maths and the national language.

Perry, K. H., Shaw, D. M., Ivanyuk, L., & Tham, Y. S. S. (2018). The “ofcourseness” of functional literacy: Ideologies in adult literacy. *Journal of Literacy Research*, 50(1), 74-96. doi: 10.1177%2F1086296X17753262

**Abstract:**

We used metastudy and metasynthesis techniques to conduct a discursive review of 101 recent publications on the topic of adult functional literacy (FL). Our purpose was to understand the ideologies shaping current definitions and conceptualizations of FL, as well as how and why FL is researched and assessed as it is. Using discursive review techniques, we analyzed instances of legitimation, dissimulation, reification, and “ofcourseness” to explore the ideological underpinnings of the field. Close analysis of three passages related to theory, research, and assessment illustrates ideological patterns in what “counts” as FL. These patterns are grounded in ideological divisions between cognitive and sociocultural perspectives on FL—the effects of which we traced through our findings on what “counts” as FL, the logics of inquiry that undergird the field, and the ways in which these ideologies shape adult literacy assessment. Our discussion considers the larger implications of these ideologies: What is legitimated or reified, and what is ignored, dismissed, or subsumed, by these ways of conceptualizing FL? We offer future directions and raise important questions that arise from these conclusions.

Popescu, G. H., Petrescu, I. E., Sabie, O. M., & Musat, M. (2018). Labor-displacing technological change and worldwide economic insecurity: How automation and the creation of innovative tasks shape inequality. *Psychosociological Issues in Human Resource Management*, 6(2), 80-85. doi: 10.22381/PIHRM6220188

**Abstract:**

Research evidence suggests that automation and the creation of innovative tasks shape inequality, generating labor-displacing technological change and worldwide economic insecurity. Using and replicating data from Frey and Osborne (2013), McKinsey Global Institute, OECD PIAAC, Pew Research Center, PwC, Statista, U.S. Bureau of Labor Statistics, we performed analyses and made estimates regarding percentage of workers in each group who say that in 50 years robots and computers will do much of the work currently done by humans, percentage within each group who think their current jobs will definitely/probably exist in 50 years, probability of job automation by education, potential jobs at high risk of automation, and percentage of existing jobs at potential risk of automation.

Popov, D., & Strelnikova, A. (2018). The problem of the discrepancy between work, education, and literacy in Russia. *Russian Education & Society*, 60(6), 520-535. doi: 10.1080/10609393.2018.1527130

**Abstract:**

This article studies the problem of the discrepancy between attained education and employment in Russia. Our research relies on the results of an international study of adult competencies (Programme for the International Assessment of Adult Competencies, or PIAAC) that measured the reading literacy and numeracy of working-age people using representative national samples. The test results of OECD countries demonstrate that there is a connection with the level of formal edu-

cation. However, we observed several deviations from this general trend in Russia. An analysis has allowed us to identify three types of discrepancies. We discovered that there is no linear relationship between the level of formal education and measured literacy in Russia. Gains in competency slow down at the higher education level in Russia. At the same time, the literacy level that was observed at the lower educational stages was in line with what was observed in leading countries from around the world. It was discovered that a larger share of people with a low level of literacy occupy high-skilled jobs in Russia than in developed countries. When we assess the distribution of people with a particular formal education on the labor market in Russia, we see a picture that is very similar to what we can observe in the OECD countries. Apparently, this discrepancy has remained hidden because of the unreliability of the educational indicator of possessing a higher education degree. This indicator has been used as the main (and in most cases the only) factor in both sociological and economic studies that have been conducted in Russia. The third empirical finding of our study indicates that there is a correspondence between the importance assigned to measured literacy and possessing a higher education degree in the job placement process. In Russia, both factors seem to be significant, but measured literacy is more strongly correlated with the likelihood of being employed than possessing a formal degree. At the same time, the difference in income level among respondents with low and high rates of literacy in Russia is much less than in the OECD countries. We interpret the quantitative measurements in light of qualitative data from a research project that studied life trajectories.

Provasnik, S. (2018). *Analyzing U.S. young adults' skills by student and employment status: Methodology for a new PIAAC variable with initial results*. No. 122. Washington: National Center for Education Statistics. Retrieved February 15, 2019, from <https://nces.ed.gov/pubs2018/2018122.pdf>

**Abstract:**

The Program for the International Assessment of Adult Competencies (PIAAC) is a cyclical, large-scale study of adult cognitive skills and life experiences. The study focuses on cognitive skills in three domains: literacy, numeracy, and problem solving in technology-rich environments. The purpose of this report is to provide researchers a simple and efficient way of investigating policy issues related to young adults (age 16-34) and their transition into the labor force using PIAAC data. In particular, the report introduces a student-and-employment status variable, explains how this variable was developed, and illustrates the use of the variable, reporting skills by student and employment status. The initial PIAAC 2012/2014 First Look report was released in 2016.

Rasmusson, M., Albæk, K., Lind, P., & Myrberg, M. (2018). Cognitive foundation skills following vocational versus general upper-secondary education: A long-term perspective. *Scandinavian Journal of Educational Research*, 1-22. doi: 10.1080/00313831.2018.1466361

**Abstract:**

The present study aims at investigating the long-term cognitive effects of vocational education and training (VET) in Sweden and Denmark using data from the PIAAC Survey of Adult Skills. While Sweden has moved towards a more academic vocational education, Denmark has kept the apprenticeship system. Using multiple regression analysis we estimate the contribution of VET versus general upper-secondary education to the proficiency in literacy. The results show a higher literacy performance in those Swedish age groups in more academic VET programmes compared to the

older Swedish age groups and to all the Danish age groups. A reasonable interpretation is that the amount of cognitively challenging subjects at the upper-secondary level gives a lasting imprint on literacy proficiency later in life.

Redmer, A., Heilmann, L., & Grotlüschen, A. (2018). Grundkompetenzen und Hochschulzugang. Zur Rolle von Literalität und Numeralität beim Zugang zur Hochschule [Basic competences and access to higher education. On the role of literacy and numeracy in access to higher education]. *Magazin Erwachsenenbildung.at*, 34, 10. Retrieved February 15, 2019, from <http://nbn-resolving.org/urn:nbn:de:0111-pedocs-157364>

**Abstract:**

Do basic competences determine access to tertiary education? Can significant differences in reading competence and basic math competence be detected between children from non-academic households who have gained access to higher education and children from academic households with access to higher education? Based on a secondary analysis of PIAAC data from 2011/2012, the article describes what significance basic competences may have during the transition to university. It examines the literacy and basic math competences of a small test group from Austria and Germany composed of people who obtained access to higher education less than five years ago. The result of the investigation: the transition from being admitted to a university to attending university is influenced by neither basic competences nor parental educational background if admission has already been granted. The mechanisms of exclusion due to the educational background of the parents seem to have an effect before admission to a university is granted. (DIPF/Orig.)

Ridao-Cano, C., & Bodewig, C. (2018). *Growing united: Upgrading Europe's convergence machine*. World Bank Report on the European Union Washington: World Bank. doi: 10.1596/29448

**Abstract:**

Since its foundation over sixty years ago, the European Union (EU) has become the modern world's greatest "convergence machine", propelling poorer, and newer, member states to become high-income economies, and delivering to its citizens some of the highest living standards and lowest levels of income inequality in the world. But today, Europeans are increasingly recognizing that convergence is not automatic. Inequality among people has been mounting in many parts of the EU since the 1990s, as low-income Europeans are falling behind in the labor market. And the productivity gap between Southern and Northern member states has been widening since the early 2000s. The EU is growing, but Europeans are not "growing united". Why? Growing United argues that technological change, by revolutionizing product and labor markets, is slowing down the old convergence machine: technology offers ever richer opportunities for well-skilled workers and frontier firms, while low-skilled workers and less productive firms risk falling behind. As a result, countries that provide less opportunities for people to build relevant skills and a less supportive environment for firms to thrive are losing ground. This calls for an upgrade to Europe's convergence machine, to seize the benefits of technological change for all Europeans. Growing United argues that the convergence machine, version 2.0, should focus on the convergence of opportunities for people and firms across the Union. It should support the capabilities of people (skills) and

firms (innovation), and provide a level-playing field for people and firms through "flexicure" labor markets and an enabling business environment.

Romero, L. M., & Mar Salinas-Jiménez, M. (2018). Skills use in the workplace and its effects on wages and on job satisfaction: An application to the Spanish case. *Personnel Review*, 47(2), 494-516. doi: 10.1108/PR-03-2017-0088

**Abstract:**

The purpose of this paper is to analyze the effects of labor mismatches on wages and on job satisfaction for the Spanish case, with a distinction been made between educational and skills-related measures of mismatch. Design/methodology/approach: The focus is placed on the usage that the individuals do of their skills in the workplace and different measures of skills use are considered to check the robustness of the results. Findings: Using data from PIAAC, the results suggest that whereas educational mismatch shows greater effects on wages, the effects of labor mismatch on job satisfaction are better explained by the relative use of individual skills in the workplace. Research limitations/implications: Both educational and skills mismatches are relevant for understanding the economic effects of labor mismatch. Nevertheless, it should be taken into account that educational mismatch is not an accurate proxy for skills mismatch, mainly when the non-monetary effects of labor mismatch are addressed. Practical implications There is room to increase workers' skills utilization in the workplace, which, in turn, would contribute to enhance individual job satisfaction and, consequently, workers productivity. Social implications A process of upgrading in the Spanish labor market would allow to take full advantage of recent investments in education and skills formation done in the country in the last decades. Originality/value: This study contributes to the literature on labor mismatch by explicitly considering that educational and skills mismatch might reflect different phenomena and by analyzing the effects of both types of mismatches on different labor market outcomes.

Rubenson, K. (2018). Conceptualizing participation in adult learning and education: Equity issues. In M. Milana, S. Webb, J. Holford, R. Waller, & P. Jarvis (Eds.), *The Palgrave International Handbook on Adult and Lifelong Education and Learning* (pp. 337-357). London: Palgrave Macmillan UK. doi: 10.1057/978-1-137-55783-4\_18

**Abstract:**

The policy interest in adult learning and education raises issues not only about the extent of participation but also more fundamentally about who participates and the social construction of inequalities in adult learning and education. However, to judge participation is not a straightforward task as the figures are highly dependent on how adult learning and education is being understood. The purpose of this chapter is to explore rates and inequalities in participation in a comparative perspective, while at the same time being mindful of how adult learning and education is being conceptualized and measured. The examination of what understanding of adult learning and education is driving the collection of information on participation points to fundamental shortcomings in the way the data have been classified. There exists a noticeable job-related bias, particularly in the PIAAC survey and forms of adult learning and education that may be important for fostering democratic traditions to become marginalized. Looking at trends in participation, two broad interrelated trends are evident, rising participation rates and a dramatic increase in employer-

supported learning activities. The analyses reveal major inequalities in participation in all countries, but it should be noted that they are more severe in some countries than others which can be explained by differences in welfare state regime.

Rüber, I. E., Rees, S.-L., & Schmidt-Hertha, B. (2018). Lifelong learning - lifelong returns? A new theoretical framework for the analysis of civic returns on adult learning. *International Review of Education*, 64(5), 543-562. doi: 10.1007/s11159-018-9738-6

**Abstract:**

Education is associated with a wide range of positive outcomes such as higher wages and employability, but also with increased well-being or volunteering. While previous research focused mainly on returns on formal education in schools or universities, there has been a notable shift in recent years towards the analysis of returns on adult learning. While research has established theory-driven empirical evidence concerning labour market-related outcomes, it fails to identify and coherently explain non-monetary outcomes. The authors of this article review 13 empirical studies on different forms of civic participation as a return on engagement in adult learning. Individuals' civic participation is one precondition to social cohesion and functioning citizenship at a societal level and thus a factor of high political and societal relevance. All the studies reviewed in this article suggest a positive association between adult learning and civic engagement. To what extent this association is causal, however, remains an open question. The authors argue that any efforts to identify such causality must begin with a number of theoretical assumptions about the mechanisms through which learning may influence civic participation. By linking the theoretical ideas of the studies reviewed with the literature on volunteering, the authors suggest a new theoretical framework, which may guide further research.

Ryu, K. (2018). Labor market dualism and the wage penalty for temporary employment: Evidence on the interplay of employment protection legislation and labor market institutions from PIAAC data. *Development and Society*, 47(4), 535-562.

**Abstract:**

This paper analyzes how employment protection legislation (EPL) shapes wage gaps by labor contract status among 19 countries. Drawing on the Survey of Adult Skills (PIAAC), it attempts to delineate whether the effects of overall EPL and EPL by contract status have the inequality enhancing or reducing effects for employees on fixed-term contract with other labor market institutions taken into account. The results suggest that strict overall employment protection works to the disadvantage of temporary employees and that employment protection dualism by contract status has a further negative effect on wages gaps. Finally, implications regarding labor market reform have been suggested.

Saal, L. K., Gholson, M., Machtmes, K., & Machtmes, R. (2018). *Associations between adults' numeracy skills and employment status: An analysis of PIAAC's US dataset*. Commissioned Paper Washington: American Institutes for Research. Retrieved February 15, 2019, from <https://static1>.

squarespace.com/static/51bb74b8e4b0139570ddf020/t/5be486bcf950b74caa092c42/1541703356167/2018\_Saal\_Gholson\_Machtmes\_Machtmes\_Numeracy\_EmploymentStatus.pdf

**Abstract:**

While many U.S. adult education programs and policies (including the Workforce Innovation and Opportunity Act (WIOA)) focus on low literacy skill as a barrier to employment, this study recognizes the role of increasing numeracy skill as critical in reducing the probability of unemployment. This study used a series of regression analyses to examine the relationship between numeracy skills and practices and employment status across four categories (currently employed, no experience with paid work, short-term unemployment, and long-term unemployment). Variables investigated included: participants' scale scores on literacy, numeracy, and PS-TRE assessments and selected demographic characteristics. Methods and Data Source: We ran several sets of analyses on the 2012/14 PIAAC U.S. public use data files using Stata 13. In order to answer our research questions, descriptive statistics for all variables as well as a series of multinomial logistic regression models were run utilizing numeracy, literacy, and problem solving in technology-rich environments as the independent variables and employment status/work history as the dependent variable. The initial logistic regression model was first run using only the independent and dependent variables. Next, a model was run including additional control variables with the exception of the six numeracy skill use in everyday life variables. Finally, a model isolating numeracy skill as assessed by PIAAC, the six numeracy skill use in everyday life variables, employment status, and all control variables was run. Key Results: Only increases in numeracy skills were protective of the (un)employment categories of no experience with paid work and long-term unemployment after all variables were added to the model. The study's results point to the centrality of advanced numeracy skills as protective of continued employment for marginalized groups in the U.S. like women, older adults, and some people of color. Further, some numeracy related everyday life skills were related to employment status.

Salvatori, E. (2018). *Data analytics for educational processes: assessing basic skills of adult students* (Dissertation). Università di Pisa. Retrieved February 15, 2019, from <https://etd.adm.unipi.it/theses/available/etd-10082018-110643/unrestricted/TesiElenaSalvatori.pdf>

**Abstract:**

The EC publication "Horizon Report Europe: 2014 Schools Edition", analyzed the emerging technologies and their impact on education. The report identified a number of trends and challenges to be faced by educational institutions in the near future. The educational data, made available thanks to the introduction of web-based learning systems and the large scale adoption of ICT in education, allows the analysis of the named trends and challenges through different types of analytics. These include Educational Data Mining, Learning Analytics and Academic Analytics. At the same time, the contemporary information society is mostly grounded on text-based technologies where reading, writing and numeracy skills play a fundamental role. International, European and national organizations, recognizing the strategic importance of human capital for economic growth, have placed a lot of efforts in defining core skills. OECD developed a strategy called "Better skills. Better jobs. Better lives" to help countries analyze their national skills systems. The most relevant program launched by OECD has been the Survey PIAAC which started in 2012 and was later on supported by a tool called EsOnline. Furthermore, in Italy, the national school reform identified the certification of basic skills as one of the priorities to be implemented. This research

intends to investigate the possible use of EsOnline precisely to respond to this need. Two case studies were developed, the first intended to test EsOnline in a real adult education setting, in Grosseto, Italy. A second case study was based on the data available through the 2012 PIACC Survey covering more than 30 countries including Italy.

Schmidt-Hertha, B. (2018). Kompetenzerwerb im Lebenslauf: Ergebnisse aus PIAAC und CiLL [Acquiring competences through life: Results based on PIAAC and CiLL]. In C. Hof & H. Rosenberg (Eds.), *Lernen im Lebenslauf: Theoretische Perspektiven und empirische Zugänge* (pp. 121-37). Wiesbaden: Springer Fachmedien. doi: 10.1007/978-3-658-19953-1\_7

**Abstract:**

The article focuses on competence development from a lifespan perspective and uses data from PIAAC and CiLL studies. Literacy is much more pronounced with younger adults than with older ones, although cross-sectional data age or cohort effects could not be distinguished. At the same time, literacy is associated with further training behavior, even if controlled for school and vocational training. Finally, qualitative studies have shown, e.g. on media skills development in old age, that competence development is also likely in older adulthood. [Note from editors]

Schneider, S. (2018). Education in OECD's PIAAC study: How well do different harmonized measures predict skills? *methods, data, analyses*, 12(1), 26. doi: 10.12758/mda.2017.15

**Abstract:**

The comparable measurement of educational attainment is a challenge for all comparative surveys and cross-national data analyses. While education is an important predictor or control variable in many research contexts, it is particularly important when studying education and education-related outcomes such as skills or labor market chances. This study evaluates the cross-nationally comparable measurement of education in OECD's Programme for the International Assessment of Adult Competencies, PIAAC, in terms of its construct validity when predicting general basic skills. In order to do so, the predictive power of country-specific (i.e. non-comparable) education variables is compared to the predictive power of different cross-nationally harmonized variables, namely the detailed ISCED-based coding scheme used in PIAAC, ISCED 2011 and 1997 levels, the broad education levels 'low, medium, high', ES-ISCED, as well as years of education. The analyses consist in sets of country-wise linear regressions, taking PIAAC's plausible values and complex sampling into account, and use adjusted R<sup>2</sup> as the indicator for predictive power and validity. The results show that while harmonization into a detailed coding scheme such as the most detailed comparable variable available in PIAAC does not entail large losses of information, the way this variable is further simplified plays a major role for validity. The paper also highlights shortcomings of the detailed variable from a theoretical point of view, such as the lack of differentiation of vocational and general education and other markers of educational content and quality, which are important aspects both for skill development as well as the labor market outcomes of education, and of the country-specific measures of education, which may make the detailed PIAAC education variable look better than it actually is.

**Abstract:**

The Handbook Age - Learning - Education links these scientific discourses together and for the first time offers a common conceptual foundation for a comprehensive theory of learning and education in and for age (s). It enables quick orientation to the "state of the art" in research, unfolds the broad spectrum of innovative concepts and approaches of learning and educational processes for the second half of life and concretizes them with a view to practice.

Schwellnus, C., Pak, M., Pionnier, P.-A., & Crivellaro, E. (2018). *Labour share developments over the past two decades*. OECD Economics Department Working Papers No. 1503. Paris: OECD Publishing. doi: 10.1787/3eb9f9ed-en

**Abstract:**

Over the past two decades, real median wage growth in many OECD countries has decoupled from labour productivity growth, partly reflecting declines in labour income shares. This paper analyses the drivers of labour share developments using a combination of industry- and firm-level data. Technological change in the investment goods-producing sector and greater global value chain participation have compressed labour shares, but the effect of technological change has been significantly less pronounced for high-skilled workers. Countries with falling labour shares have witnessed both a decline at the technological frontier and a reallocation of market shares toward "superstar" firms with low labour shares ("winner-takes-most" dynamics). The decline at the technological frontier mainly reflects the entry of firms with low labour shares into the frontier rather than a decline of labour shares in incumbent frontier firms, suggesting that thus far this process is mainly explained by technological dynamism rather than anti-competitive forces.

Sgobbi, F. (2018). The skills of European ICT specialists. In M. Khosrow-Pour (Eds.), *Encyclopedia of Information Science and Technology* (pp. 4785-4796). Pennsylvania: IGI Global. doi: 10.4018/978-1-5225-2255-3.ch415

**Abstract:**

After a brief survey of the international literature on skill-related issues that may either support or threaten the further development of ICT-based applications this article provides a picture of the state-of-the-art of the professional skills supplied by ICT specialists in 11 EU countries based on data from the OECD Survey of Adult Skills. The first part of the empirical analysis focuses on the skills profile of ICT personnel from EU countries and examines to what extent the higher skills displayed by ICT specialists depend on a different distribution of demographic characteristics and job characteristics compared to the rest of the workforce. The second part of the empirical analysis focuses on the relationship between skills and wages and tests whether employers recognize an occupation-specific wage premium to ICT specialists. The results of the proposed empirical anal-

yses confirm the existence of significant differences between skill profiles and earnings determinants of ICT specialists compared to other workers.

Singer, J. D., & Braun, H. I. (2018). Testing international education assessments. *Science*, 360(6384), 38-40. doi: 10.1126/science.aar4952

**Abstract:**

News stories on international large-scale education assessments (ILSAs) tend to highlight the performance of the media outlet's home country in comparison with the highest-scoring nations (in recent years, typically located in East Asia). Low (or declining) rankings can be so alarming that policy-makers leap to remedies—often ill-founded—on the basis of what they conclude is the “secret sauce” behind the top performers' scores. As statisticians studying the methods and policy uses of ILSAs (1), we believe the obsession with rankings—and the inevitable attempts to mimic specific features of the top performing systems—not only misleads, it diverts attention from more constructive uses of ILSA data. We highlight below the perils of drawing strong policy inferences from such highly aggregated data, illustrate benefits of conducting more nuanced analyses of ILSA data both within and across countries, and offer concrete suggestions for improving future ILSAs.

Smith, M. L., Anýžová, P., & Matějů, P. (2018). Returns to cognitive skills: New evidence from 14 nations. *Innovation: The European Journal of Social Science Research*, 1-23. doi: 10.1080/13511610.2018.1508335

**Abstract:**

This study examines the role of cognitive skills on labor market outcomes in 14 developed countries. In contrast to standard Mincer-type regressions, we utilize a structural modeling approach that can take into account different types of skills on different economic outcomes. The results, based on data from the OECD PIAAC project, provide strong evidence that the income returns to adult cognitive skills are substantially large across the OECD, net of education, occupational status, gender and family background. However, the size of these effects, particularly in comparison with returns to education, vary greatly across countries. While in all countries examined education is strongly associated with cognitive skills, those skills translate into more prestigious occupations and higher incomes in countries that can be tentatively described as more innovative, as well as

have less stratified educational systems. We discuss potential explanations for this, which can serve as a basis for further research.

Solheim, O. J., & Lundetræ, K. (2018). Can test construction account for varying gender differences in international reading achievement tests of children, adolescents and young adults? – A study based on Nordic results in PIRLS, PISA and PIAAC. *Assessment in Education: Principles, Policy & Practice*, 25(1), 107-126. doi: 10.1080/0969594X.2016.1239612

**Abstract:**

Gender differences in reading seem to increase throughout schooling and then decrease or even disappear with age, but the reasons for this are unclear. In this study, we explore whether differences in the way ‘reading literacy’ is operationalised can add to our understanding of varying gender differences in international large-scale surveys. We first compare the impact of gender on reading literacy in PIRLS 2011 (10-year-olds), Programme for International Student Assessment (PISA) 2009 (15-year-olds) and Programme for the International Assessment of Adult Competencies (PIAAC) 2012 (16–24-year-olds), respectively, across the Nordic countries. Then we compare how reading literacy is operationalised in those surveys. We find similar patterns of gender differences across the Nordic countries, with the largest effect sizes in PISA and the smallest in PIAAC. Further, even though the three surveys define reading literacy in similar ways, they operationalise and assess that construct differently. The magnitude of the observed gender differences appears to be associated with certain assessment features including text type, item format, aspects of reading and implementation.

Spörlein, C. (2018). How educational systems structure ethnic inequality among young labour market participants in Europe: Occupational placement and variation in the occupational status distribution. *Research in Social Stratification and Mobility*, 55, 109-119. doi: 10.1016/j.rssm.2018.04.006

**Abstract:**

Prior research has demonstrated that patterns of early labour market careers vary considerably across European societies. However, little research investigated how these patterns differ between immigrants and majority youth and whether the extent of ethnic inequality varies with educational system characteristics. Using the 2009 European Labour Force Survey data for 18 countries on the early careers of non-tertiary educated labour market participants, the results of this study show that immigrants work in lower-status jobs more frequently than majority youth do. In addition and conditional on these mean differences, immigrant’s status distributions are more dispersed suggesting more erratic early career patterns. Educational system characteristics moderate these differences: the occupational status difference between immigrants and majority youth is considerably larger in countries with strongly differentiated, specifically highly tracked educational systems. In addition, ethnic disadvantages are even more severe in differentiated educational systems when central exams are present. The findings further show that educational tracking is associated with less variation in a country’s occupational status distribution, thus shaping ethnic inequality beyond its relationship with mean differences. Ethnic penalties are estimated to be considerably more severe in highly differentiated countries due to their lower baseline variability in the occupational status distribution.

Stijepic, D. (2018). *Skills, job mobility and productive efficiency*. No. 3040285. Social Science Research Network (SSRN). doi: 10.2139/ssrn.3040285

**Abstract:**

Making use of a survey that directly assesses the participants' cognitive skills, I study the relation between skills and job mobility in a large international comparison of 32 countries. Motivated by the canonical on-the-job search model, I measure job mobility by the ratio of the job-finding rate on the job to the transition rate into unemployment. A higher ratio of these rates induces, *ceteris paribus*, first-order stochastic dominance in the distribution of workers over jobs, indicating a more efficient allocation of resources across firms. On average across the 32 countries, a one-standard-deviation increase in numeracy skills is estimated to double the ratio of the job-finding rate on the job to the transition rate into unemployment. The positive association between skills and job mobility is statistically significant in a majority of countries. Furthermore, countries with a higher average level of skills tend to exhibit a higher degree of job mobility. The robust positive association between skills and job mobility suggests that skills contribute to a country's productive efficiency by limiting the misallocation of resources across firms.

Støren, L. A., & Børing, P. (2018). Immigrants' participation in non-formal job-related training. *International Journal of Lifelong Education*, 37(5), 598-614. doi: 10.1080/02601370.2018.1554719

**Abstract:**

Participation in job-related training among immigrants is becoming more important in Europe in view of large immigration inflows. This paper considers differences in training participation rates by immigrant background including by whether they are from Western or non-Western origins. Also considered is whether differences by immigrant background depend on whether the training was supported by employers. The analyses are based on individual-level data from the PIAAC database. Four countries are included in the analysis: Denmark, Finland, the Netherlands and Norway, countries that feature a highly educated labour force and social policies designed to support and incentivise skill development over the life span including disadvantaged groups. The analyses reveal that the differences in participation rate according to immigrant backgrounds are relatively small, in all countries except Finland. Still, the immigrants receive less employer-sponsored training than non-immigrants. The results indicate a high demand for training among immigrants.

Støren, L. A., & Børing, P. (2018). Training of various durations: Do we find the same social predictors as for training participation rates. *International Journal of Lifelong Education*, 37(5), 527-545. doi: 10.1080/02601370.2018.1490933

**Abstract:**

Most studies on participation in training focus on participation versus non-participation. The individual's participation varies, however, very much in terms of the duration of training, from until a few days to intensive participation. This study examines participation in non-formal training by the total amount of training during a year. In the analysis, we use PIAAC data for eight European coun-

tries, of which half represents a group of countries with high participation rates in non-formal training and the other half have lower participation rates. One purpose is to examine whether the duration of training varies between these groups of countries. We expected that countries which score high on training rates are characterised by high proportions participating in short courses. Another purpose is to examine the relationship between duration of training and educational levels and immigrant backgrounds. We expected that the relationship that is normally found between training rates and social background variables would be reversed when it comes to duration of training. In the analyses, controls are applied for several individual and workplace characteristics, including skills level, firm size, occupational level, and industrial sector. The estimation results indicate that overall, our expectations are not supported.

Støren, L. A., Lundetræ, K., & Børing, P. (2018). Country differences in numeracy skills: How do they vary by job characteristics and education levels? *International Journal of Lifelong Education*, 37(5), 578-597. doi: 10.1080/02601370.2018.1554718

**Abstract:**

To what extent do favourable job characteristics contribute to the variation in numeracy skills between countries? Based on theory of maintenance and further development of pre-existing skills, this is explored by applying data on numeracy skills among employed persons in seven European countries participating in the Survey of Adult Skills (PIAAC). Regression analyses are used to examine the extent to which numeracy skills vary with job characteristics and education levels across the seven countries, when controlling for industrial sector, work hours, demographic variables (gender, age, Western and Non-Western immigrant background), cultural capital (books at home and parental education level). The findings indicate that job characteristics and the individuals' educational level have large and equal statistical impact on the total skills variation in the seven countries. However, regarding the country-differences, variations in education level play a lesser role than job characteristics.

Sulkunen, S., & Malin, A. (2018). Literacy, age and recentness of education among Nordic adults. *Scandinavian Journal of Educational Research*, 62(6), 929-948. doi: 10.1080/00313831.2017.1324898

**Abstract:**

The purpose of the present study was to examine the relationship between reading literacy and age in an adult population aged 25 to 65 in Nordic countries using PIAAC 2012 data. More specifically, the study examined to what extent variations in the literacy proficiency of adults are explained by age and the recentness of qualifications when variables related to education, occupation, and skill use are controlled. The statistical method was regression analysis. The recentness of education explained only a part of the performance gap between the oldest adults and others. The significance of the length and scope of initial education in developing literacy proficiency overall, is difficult to compensate. There were insignificant differences between the Nordic countries.

Sweetman, A., & Truong, K. (2018). The United States and Canada: Intergenerational social mobility among immigrants and their native-born children. In Organisation for Economic Cooperation and Development (OECD) (Eds.), *Catching Up? Country Studies on Intergenerational Mobility and Children of Immigrants* (pp. 169-202). Paris: OECD Publishing. doi: 10.1787/9789264301030-9-en

**Abstract:**

This chapter reviews the academic literature on new immigrants' intergenerational educational and labour market integration in the United States and Canada, and presents new findings. It begins with a discussion of American and Canadian immigration history, and then addresses the intergenerational transmission of educational outcomes. Particular attention is paid to students from disadvantaged backgrounds, especially minority ethnic-group students. The discussion points to language deficiencies as a major drawback, and outlines possible reasons for the relatively slow integration of the Hispanic community into higher levels of education in the United States. The chapter then turns to labour market outcomes in both countries, examining participation rates and earnings gaps for adult immigrants, immigrants who arrived as children, the children of immigrants and, as a comparison group, children with two native-born parents.

Tamilina, L., & Tamilina, N. (2018). Explaining the impact of formal institutions on social trust: A psychological approach. *Journal of Interdisciplinary Economics*, 30(2), 164-190. doi: 10.1177%2F0260107917742743

**Abstract:**

By drawing on psychological models of action choice, this study distinguishes between four key factors that determine trust building: (a) knowledge to trust, (b) others-regarding, (c) cognition and (d) contexts. These four factors are combined into a single analytical framework that is used for establishing channels through which the institutional context impacts social trust formation. Our theoretical and empirical evidence suggests that context is the strongest determinant of trust, with its overall effect being, however, modified by the degree to which the individual's knowledge of trusting, cognition and others-regarding is developed. The Programme for the International Assessment of Adult Competencies (PIAAC) data from the year 2012 are utilized for testing our propositions.

Tamilina, L., & Tamilina, N. (2018). Trust as a skill: Applying psychological models of skill acquisition to explain the social trust formation process. *Psychology and Developing Societies*, 30(1), 44-80. doi: 10.1177%2F0971333617747344

**Abstract:**

A growing body of research is considering how social trust is built at the individual and societal levels. This study introduces a new conceptual framework of trust formation by uniting dispositional and experiential determinants into a single analytical framework. By drawing on psychological theories of skill acquisition, we describe trust as shaped by four factors: crystallised, cognitive, contact and context. We combine these four factors into a 4C-component analytical model by establishing links between them and explaining the rationale behind their individual and joint effects on trust. The proposed model is tested with the Programme for the International Assess-

ment of Adult Competencies (PIAAC) public-use data. Both theoretical and empirical elaborations suggest that context is the strongest driver of trust formation. Good contexts also spur more trust when individuals already possess crystallised knowledge and can display faith in others. Such knowledge can be learned if it is missing, but how efficiently depends on the quality of one's cognitive system, frequency of contacts with others and the distance between one's actual knowledge of trust and the optimal level of trust knowledge for the given context.

Tikkanen, T., & Nissinen, K. (2018). Drivers of job-related learning among low-educated employees in the Nordic countries. *International Journal of Lifelong Education*, 37(5), 615-632. doi: 10.1080/02601370.2018.1554720

**Abstract:**

This study explored drivers of participation in job-related lifelong learning (LLL) among low-educated mature-aged employees and compared them across four Nordic countries. Workplaces can be low-threshold, effective arenas for development of their skills in work and learning. The paper builds on the Bounded Agency Model and theories of learning motivation, human capital, and workplace learning. We used data from the Survey of Adult Skills (Programme for the International Assessment of Adult Competencies) by Organisation for Economic Co-operation and Development. The average participation rate was 36%. Results of the logistic regression analyses showed that income, skills use at work, sector and gender were significant drivers of participation in all countries. Additionally, being under-skilled was significant in Finland and parents' education in Sweden. Totally, these variables explained a quarter of the variation in participation. Thus, the drivers of participation appeared more similar than different across the countries. Implications of the findings are discussed in relation to how to support skills development among low-educated older workers, and to some challenges in cross-country comparative research.

Tippelt, R. (2018). Lebenslanges Lernen als Kompetenzentwicklung [Lifelong learning as skills development]. In C. Hof & H. Rosenberg (Eds.), *Lernen im Lebenslauf: Theoretische Perspektiven und empirische Zugänge* (pp. 105-120). Wiesbaden: Springer.

**Abstract:**

The challenging topic is processed in the form of a thesis and at the same time taking empirical evidence into account: First, the educational process across the lifespan and concepts for lifelong learning are dealt with, and then various competence models are presented in contrast. This is followed by a brief and very selective overview of the development of competencies in the sub-areas of the education system, whereby the trends shown in the national education report (authors' group Education Reporting 2014) are discussed, along with early childhood education, school education, vocational education and the university and continuing education are taken into account. The education of older people in connection with lifelong learning should be considered specifically and in depth as a development of competences. Therefore, some empirical results on the competence development of older adults from large scale assessments are shown, with findings from the PIAAC and CiLL study are being discussed in particular (Rammstedt 2013; Friebe / Schmidt / Tippelt 2014). Finally, it is pointed out in a summary that lifelong learning and education are based on professional competence, but at the same time it is always more than the imparting of pure specialist competences.

Truong, N. K., & Sweetman, A. (2018). Basic information and communication technology skills among Canadian immigrants and non-immigrants. *Canadian Public Policy*, 44(1), 91-112. doi: 10.3138/cpp.2017-032

**Abstract:**

Male immigrants are disproportionately employed in information and communication technology (ICT) industries and occupations in Canada. The authors use a measure of basic ICT skills to document differences in skill levels, and those skills' relationship with labour market earnings, across immigration classes and categories of Canadians at birth. Adult immigrants, including those assessed by Canada's points system, have lower average ICT scores than Canadians at birth, although the rate of return to ICT skills is not statistically different between them. Immigrants who arrive as children and the Canadian-born children of immigrants have similar outcomes as the Canadian-born children of Canadian-born parents.

Tverdstup, M., & Paas, T. (2018). Skills heterogeneity and immigrant-native wage gap in the European countries. *International Journal of Economic Sciences*, 7(2), 119-142. doi: 10.20472/ES.2018.7.2.007

**Abstract:**

The paper analyses individual human capital, measured by the education, literacy and numeracy skills, and explores to what extent immigrants employ their cognitive skills at work. Based on the Program of International Assessment of Adult Competencies (PIAAC) data for 15 European countries, we document that, on average, foreign-born respondents achieve substantially worse scores in literacy and numeracy test domains in majority of analysed countries. Only immigrants in the Nordic countries reveal skill improvement over immigration tenure. Once we account for both skill levels and use of skills at work in wage regressions, no statistically significant gap in earnings across immigrants and natives remains. Although, once immigrants attain comparable to natives' skill use frequency, their pay disadvantage turns statistically insignificant in all countries, except Estonia and Ireland. The results are leading us to the conclusion that potential for development

and utilization of immigrants' skills in the European labour markets is still underused. Immigrants are not yet sufficiently well integrated in labour markets in most of the European countries.

Upsing, B., & Rittberger, M. (2018). The translator's perspective on translation quality control processes for international large-scale assessment studies. *Translation & Interpreting*, 10(2), 55-72. doi: 10.12807/ti.110202.2018.a05

**Abstract:**

International Large-Scale Assessment studies (iLSAs) like PISA (the Programme for International Student Assessment) and PIAAC (the Programme for the International Assessment of Adult Competencies) employ stringent quality control procedures for the translation of their test items. The translations are crucial: a test item should not become more or less difficult because of its translation, given that test results are used to assess and compare the competency levels of different populations across countries. This article discusses how PISA and PIAAC translation procedures have evolved from earlier translation quality processes, and the underlying assumptions about translation that have shaped this evolution. We then report on findings from a qualitative interview study with translators, reviewers, and translation managers who have been involved in PISA or PIAAC translation processes. The objective of the interview study is to analyse the quality control procedures from the perspective of translation players. How do translators prepare for and perform translations for iLSA studies, and how does this process compare with other translation assignments they receive? This comparison will give an understanding of whether translators, in general, believe the iLSA translation process and its quality control procedures provide adequate guidance for performing these translations. We finish by proposing recommendations for future iLSA translation processes.

Urlick, A. (2018). Secondary data analysis in the field of educational leadership and policy studies. In C. R. Lochmiller (Eds.), *Complementary Research Methods for Educational Leadership and Policy Studies* (pp. 143-171). Cham: Springer International Publishing. doi: 10.1007/978-3-319-93539-3\_8

**Abstract:**

This chapter discusses secondary data analysis and identifies several of the most prominent data sets used in education policy and leadership research. Existing, generalizable data allow researchers to address pressing national and systemic issues in educational leadership and policy. These common data sets provide an opportunity for comparison and replication of findings across studies. These data sets also provide more options for advanced statistical analysis. Indeed, once researchers learn how to analyze one of these main data sets, this knowledge can be applied across additional years of the same data set, extended to other available national/international surveys, and can provide an example of how future original data collections may be shared with other researchers.

Velden, R., & Bijlsma, I. (2018). Effective skill: A new theoretical perspective on the relation between skills, skill use, mismatches, and wages. *Oxford Economic Papers*, 71(1), 145-165. doi: 10.1093/oep/gpy028

**Abstract:**

Skills and skill mismatches affect workers' productivity. However, current approaches to measuring this problem fail to specify the underlying mechanism. In this paper, we develop a new perspective by integrating skill proficiency and skill use into a new concept called 'effective skill'. Effective skill is defined as a multiplicative function of skill proficiency and skill use. The intuitive understanding of this concept is that a skill can have no effect on productivity if it is not used and, vice versa, the effect of using skills is moderated by the skill proficiency level. We develop a skill matching model using data from the OECD PIAAC Survey. We show that there is no effect of numeracy on wages, other than through the use of numeracy skills. Moreover, we show that a skill mismatch model based on this concept is superior to alternative skill mismatch models in explaining wage differences.

Verhaest, D., Lavrijzen, J., Omey, E., Van Trier, W., & Nicaise, I. (2018). General education, vocational education and skill mismatches: Short-run versus long-run effects. *Oxford Economic Papers*, 70(4), 974-993. doi: 10.1093/oep/gpy026

**Abstract:**

Earlier research showed that obtaining a vocational instead of a general qualification has contrasting effects on employment and earnings over the life course. Relying on two international datasets (ESJS and PIAAC) and focussing on upper-secondary and post-secondary non-tertiary qualifications, we find similar contrasting effects in terms of educational and skill mismatches. While vocationally educated individuals are less likely to face mismatches at the start of their careers, this advantage gradually fades over time. This pattern is not only found for overall mismatches, but also for mismatches in terms of several more detailed types of skills. We also find more favourable effects in terms of avoided mismatches for vocational programmes that combine a specific focus with workplace learning, while programmes that combine a less-specific focus with workplace learning seem to be less effective.

Vézina, S., Bélanger, A., Sabourin, P., & Marois, G. (2018). *Projecting the literacy skills proficiency of the working-age population in a context of high immigration and increasing education levels*. Working paper No. 03. Montréal: Institut National de la Recherche Scientifique - Centre Urbanisation Culture. Retrieved February 15, 2019, from <http://espace.inrs.ca/7155/1/Note03-2018.pdf>

**Abstract:**

Labour economists and other experts have been using standard educational attainment variables to assess the workforce's human capital. While the link between skills and education level seems straightforward among the native-born population, the correlation is a lot more blurred among the foreign-born population. A more direct measure of skills, precisely the proficiency in key information-processing skills, was developed by the Organisation for Economic Cooperation and Development (OECD) and its Programme for the International Assessment of Adult Competencies

(PIAAC). With a specific focus on Canada, this paper presents literacy skills proficiency projection results. Using the 2012 PIAAC survey data, skills proficiency determinants of the working-age population are analysed for both native- and foreign-born subgroups. Regression parameters serve as parameters for a skills proficiency projection module that is added to LSD-C, a microsimulation model that simultaneously projects demographic, ethnocultural and socioeconomic characteristics of the Canadian population between 2011 and 2061. Projection results show that the literacy skills proficiency is likely to be slightly declining over the next 50 years as the positive effect of increasing education is mitigated by the effect of large immigration intakes. Results also suggest that changes to immigrant selection policies could prevent the projected literacy skills decline of the Canadian working-age population. This research provides an analytical tool in simulating the effects of different immigrants' selection patterns or language training policies on the skills of the future labour force population.

**Abstract:**

The classical occupational choice model does not explain the simultaneous existence of low and high ability entrepreneurs. In this paper, we study the decision to become an entrepreneur when individuals choose their education level and the economic sector where to operate. We distinguish two sectors: the knowledge and the traditional sector. The knowledge sector requires individuals to invest in education. Under this framework, two results are possible: one where only high ability individuals become entrepreneurs, and one with the coexistence of low and high ability entrepreneurs. This framework provides a rational explanation of the relationship between ability, education, and self-employment. Using PIAAC data, we test the empirical implications of the model. We find that most countries have an equilibrium with low and high ability entrepreneurs.

Vogtenuber, S. (2018). The institutional conditions of inequality in credential and skill attainment and their impact on occupational placement. *Research in Social Stratification and Mobility*, 55, 13-24. doi: 10.1016/j.rssm.2018.03.005

**Abstract:**

This study comparatively analyses inequalities in educational outcomes as well as education effects on the occupational status of prime-age workers across 21 countries. Considering two distinct aspects of educational outcomes—credentials and measured worker skills—the study's main role is to assess their partial effects on occupational placement, contingent on social origin. Overall, parental education effects on educational achievement in terms of both credentials and skills are large. Likewise, occupational status is strongly associated with educational certificate attained. Labor market placement based on worker skills is significant as well, but to a lesser extent. The individual-level path dependencies of origin-education and education-destination vary considerably across countries. In part, this variation is associated with a country's skills formation system in terms of vocational specialization and the degree of economic coordination as meas-

ured by bargaining coordination. In line with prior research, vocational specificity relates to increased educational inequality. In addition, the study finds that economic coordination mitigates educational inequality as it reduces the intergenerational transmission of certificates and skills. In systems in which vocational specificity is accompanied by a high degree of coordination, the detrimental inequality effect of vocational specificity tends to level off. Moreover, economic coordination facilitates occupational placement based on worker skills. A concise discussion of the policy implications concludes this paper.

Weingarten, H. P., & Hicks, M. (2018). Performance of the Ontario (Canada) higher-education system: Measuring only what matters. In A. Curaj, L. Deca, & R. Pricopie (Eds.), *European Higher Education Area: The Impact of Past and Future Policies* (pp. 471-485). Cham: Springer. doi: 10.1007/978-3-319-77407-7\_29

**Abstract:**

This paper describes the thinking behind the development of an improved tool to measure the performance of the postsecondary system in Ontario. The rationale is relevant to other jurisdictions. Ontario's public higher-education system consists of 24 community colleges and 20 universities and constitutes 40% of higher-education enrolments in Canada. HEQCO has a legislated mandate to conduct performance assessments of the postsecondary sector and to make these evaluations public. In contrast to the approach of others who use a broad range of performance indicators, we are developing a performance measurement tool with a very limited number of indicators that are tied directly to the high priority goals of the Ontario government and that are designed to assess the effectiveness and impact of government policies and actions (e.g., tuition, financial aid, funding formulas, institutional differentiation). The instrument will measure system performance, not that of individual institutions (or their ranking). This approach, which measures only what matters, forces definition and measurement of the most relevant, meaningful and revealing measures. The indicators address equity of access, sustainability of institutions and academic quality, the three highest priorities for the postsecondary system in Ontario. The indicators selected reflect outcomes and impact, not inputs. Academic quality was the domain hardest to measure but our bias was to measures that are direct, embedded, meaningful to students and government, and validated by the institutions. We describe significant research trials we are currently conducting to determine the best and most efficient ways of obtaining these academic quality measures that, in our view, should form the centrepiece of any instrument that purports to measure the performance of a higher-education system or institutions.

Woessmann, L. (2018). *Effects of vocational and general education for labor-market outcomes over the life-cycle*. EENEE Analytical Report No. 37. Luxembourg: European Union. doi: 10.2766/566869

**Abstract:**

Vocational skills are job-specific skills that prepare for work in specific occupations. By contrast, the usage of general skills transcends specific occupations. In dynamically changing economies, this difference implies a basic trade-off between vocational and general education programs for labor-market experiences over the life-cycle. Vocational education programs have the advantage of helping young people master the transition from school to work because job-specific skills directly prepare students for the tasks demanded by firms. As a consequence, they may result in

reduced youth unemployment. But there is another side to the same coin: Job-specific skills will be subject to increasing risk of becoming obsolete when the structure of occupations changes. In addition, if the acquired general skill base is limited, vocationally educated people may find it hard to learn different job-specific skills. By contrast, the skills generated by general education programs may provide workers with greater adaptability to changing environments. As a consequence, they may result in higher employment opportunities at older ages. An increasing body of empirical evidence confirms this basic trade-off between vocational and general education programs over the life-cycle. While vocationally educated individuals initially have better employment opportunities than generally educated individuals, this pattern turns around at older ages. Results are particularly strong in countries that have extensive apprenticeship systems. The trade-off between education types over the life-cycle is also visible in earnings and in participation in adult career-related education. The consistent evidence on a life-cycle trade-off of focusing education programs on job-specific skills provides the basis for policy implications about how education systems can prepare students for lifetime work. At the most basic level, the findings indicate that in dynamic economies, policy needs to consider the full working life-cycle, which also implies that they must convey the ability to adapt to changing economic conditions. Each country should aim to find the right balance between conveying general and work-specific skills to its population. Successful apprenticeship systems require institutional and regulatory frameworks defining the tasks of stakeholders, financial structures, and certification requirements. To make graduates fit for employment over their full life-cycles, apprenticeship programs could reduce the early specialization of apprentices by lowering the number of specific apprenticeships, expanding the share of general educational content, and modularizing apprenticeship components. General education programs could implement measures to relate the conveyed skills to tasks that are relevant in the real world as currently demanded on the labor market. Finally, countries should establish strong systems of lifelong learning.

Wojniak, J., & Majorek, M. (2018). Polish education system under 2017 reform: Assumptions, aims and controversies. *SHS Web Conferences*, 48, 1-12. doi: 10.1051/shsconf/20184801043

**Abstract:**

The paper analyzes some current changes in the Polish education system. The comprehensive reform of the system was undertaken in 2016, and the new system was introduced in the school year 2016/2017, changing the structure of the education cycle as well as the teaching content and the handbooks. The aim of the Ministry of National Education was to create a “good school” for students, teachers and parents. The reform, however, triggered a national discussion on its aims and assumptions, as it is accompanied by a number of controversies and strong differences of opinions in the Polish society.

**Abstract:**

The process of technological progress is one of creative destruction, where some occupations, skills, products and firms become obsolete and are replaced by technologically superior alterna-

tives. This process, facilitated by trade, improves overall economic growth and raises living standards in the long run. In the short run, however, it risks igniting economic and political tensions as some businesses fail and some people lose their jobs. At the same time, new jobs are created and the skills required to perform others might change dramatically. Given historical trends of employment, it seems unlikely that all occupations that are highly susceptible to automation will be replaced by smart machines over the next few years. As the demand for skills in the labour market continues to grow, however, there is room for public policy to moderate the effect of technological change on the labour market in a number of ways. Each province faces slightly different challenges when developing policy to confront a technologically advanced and uncertain future. Some provinces, with more economic diversification or a concentration of workers in areas that are not very susceptible to automation, appear to be better situated for technological change than others. In developing policies to facilitate the transition to a high-tech future, provinces that face a higher risk of labour market disruption might require a broad-based approach, while those facing a lower risk of disruption might be able leverage existing policies and expand educational or unemployment support where necessary. Differences in the composition of employment and skills levels across the country highlight priority areas that provincial governments should consider in developing education and employment policy responses to adapt to current and future technological change. Disruption as a result of technological change is not a uniform process, so the policies to tackle it similarly should not be uniform, but should take into account each region's strengths and weaknesses.

Yamamoto, K., Khorramdel, L., & Shin, H. J. (2018). Introducing multistage adaptive testing into international large-scale assessments designs using the example of PIAAC. *Psychological Test and Assessment Modeling*, 60(3), 347-368.

**Abstract:**

PIAAC is one of the first international large-scale assessments that implemented a multistage adaptive testing (MST) design. The design consists of multiple layers of adaptation to administer the most relevant and efficient set of questions based on the estimated proficiency of respondents. The benefits of the MST design were evaluated in terms of the comparability of item parameters across countries and the test efficiency. To assess the comparability across countries, item-by-country interactions were examined using item response theory (IRT) models. The efficiency of the MST design was calculated and compared to a nonadaptive design with a fixed item format. Moreover, possible effects of the position of item sets on item difficulty, which would present a problem for implementing MST, were examined. Results show a higher test efficiency in the MST design, only small item position effects and a high comparability of item parameters across different countries and languages.

**Title:**

Yamamoto, K., & Lennon, M. L. (2018). Understanding and detecting data fabrication in large-scale assessments. *Quality Assurance in Education*, 26(2), 196-212. doi: 10.1108/QAE-07-2017-0038

**Abstract:**

Purpose: Fabricated data jeopardize the reliability of large-scale population surveys and reduce the comparability of such efforts by destroying the linkage between data and measurement con-

structs. Such data result in the loss of comparability across participating countries and, in the case of cyclical surveys, between past and present surveys. This paper aims to describe how data fabrication can be understood in the context of the complex processes involved in the collection, handling, submission and analysis of large-scale assessment data. The actors involved in those processes, and their possible motivations for data fabrication, are also elaborated. Design/methodology/approach: Computer-based assessments produce new types of information that enable us to detect the possibility of data fabrication, and therefore the need for further investigation and analysis. The paper presents three examples that illustrate how data fabrication was identified and documented in the Programme for the International Assessment of Adult Competencies (PIAAC) and the Programme for International Student Assessment (PISA) and discusses the resulting remediation efforts. Findings: For two countries that participated in the first round of PIAAC, the data showed a subset of interviewers who handled many more cases than others. In Case 1, the average proficiency for respondents in those interviewers' caseloads was much higher than expected and included many duplicate response patterns. In Case 2, anomalous response patterns were identified. Case 3 presents findings based on data analyses for one PISA country, where results for human-coded responses were shown to be highly inflated compared to past results. Originality/value: This paper shows how new sources of data, such as timing information collected in computer-based assessments, can be combined with other traditional sources to detect fabrication.

Yamamoto, K., Shin, H. J., & Khorramdel, L. (2018). Multistage adaptive testing design in international large-scale assessments. *Educational Measurement: Issues and Practice*, 37(4), 16-27. doi: 10.1111/emip.12226

**Abstract:**

A multistage adaptive testing (MST) design was implemented for the Programme for the International Assessment of Adult Competencies (PIAAC) starting in 2012 for about 40 countries and has been implemented for the 2018 cycle of the Programme for International Student Assessment (PISA) for more than 80 countries. Using examples from PISA and PIAAC, this article addresses the advantages and considerations of an MST design in the context of international large-scale assessments (ILSAs). It illustrates and discusses the unique features of the implemented designs in PISA and PIAAC and the expected gains in test efficiency and accuracy, as well as limitations and challenges of MST designs for cross-country surveys. Practical aspects and insights into utilizing MST to measure complex constructs in cross-cultural surveys are provided.

Yamashita, T., Bardo, A. R., & Liu, D. (2018). *Numeracy skills, health information-seeking, and preventative health behaviors among middle and older aged adults in the US*. Commissioned Paper Washington: American Institutes for Research. Retrieved February 15, 2019, from [https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5b50a5b80e2e72f3e4d63ae5/1532011961211/Yamashita\\_Bardo\\_Liu\\_Health\\_Report2018\\_Final.pdf](https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5b50a5b80e2e72f3e4d63ae5/1532011961211/Yamashita_Bardo_Liu_Health_Report2018_Final.pdf)

**Abstract:**

Background: Given the information/technology rich environment coupled with ongoing trends in population aging in the U.S., the central role that health literacy plays in determining health behaviors and outcomes has recently received an increasing amount of attention. Despite a growing

research and policy focus on health literacy, some key components that constitute this multifaceted construct that reflects one's ability to access, process, and understand basic health information remain under-examined. Specifically, print and oral literacy have been extensively examined, but the potentially important role that numerical literacy (i.e., numeracy) plays in shaping health behaviors remains largely unknown. This issue is particularly pertinent for the older population, which is generally characterized by worsening overall physical and cognitive health. Therefore, we examined the role of numeracy in the context of relevant health determinants, including health information seeking and preventive health behaviors. Methods: Data were obtained from the 2012/2014 Program for the International Assessment of Adult Competencies (PIAAC), which include a nationally representative sample of American adults ages 45-74 years old. Detailed descriptive statistics and appropriate regression analyses were conducted with the use of a SAS macro program developed by the International Association for the Evaluation of Educational Achievement (IEA). Multivariate associations between numeracy skills and eight health information sources (newspaper, magazines, internet, radio, television, books, friends and family, health professional) and four preventive health behaviors (flu shot, dental check-up, vision screening, osteoporosis screening) were estimated after adjusting for age, gender, race, educational attainment, employment status, self-rated health, literacy skills, and use of numeracy skills at home. The PIAAC final sampling weights and replicate weights were also used to generate nationally representative and unbiased findings. Results: We provided detailed descriptive statistics for numeracy skills by demographic (i.e. age, gender, race) socioeconomic (i.e., education, and employment status) and health (i.e., self-rated health) characteristics, as well as by health information sources (i.e., health professionals, internet, television, friends and family, books, newspapers, magazines, and radio), and preventive health behaviors (i.e., flu shot, dental checkup, vision screening, and osteoporosis screening). Multivariate results, conditioned on these demographic, socioeconomic and health characteristics, and other controls, indicated that the medium to high numeracy proficiency was associated with less frequent use of magazines, books, television, and newspapers as health information sources with respect to the low numeracy proficiency. Furthermore, numeracy skills were positively associated with dental checkups, but they were not associated with other preventive health practices, after accounting for the sociodemographic, health and other covariates. Significance: The present study is among the first to provide a nationally representative overview and exploration of numeracy skills data among middle-aged and older adults in the U.S. Thus, results from the current study represent a foundation from which future research can build upon, which ideally will lead to the identification of specific pathways that link numeracy skills with health behaviors and outcomes. Findings highlight social and economic disparities in numeracy proficiency, and the potentially important role that numeracy skills play in determining health information seeking and preventive health behaviors. These findings are useful for informing policy discussions aimed at population health promotion. Specifically, it may be beneficial for future health education and communication to target specific health information sources and improve accessibility to the vulnerable populations who generally have lower numeracy skills

Yamashita, T., Bardo, A. R., Liu, D., & Cummins, P. A. (2018). Literacy, numeracy, and health information seeking among middle-aged and older adults in the United States. *Journal of Aging and Health*, 32(1), 33-41. doi: 10.1177%2F0898264318800918

**Abstract:**

Objectives: Health literacy is often viewed as an essential skill set for successfully seeking health information to make health-related decisions. However, this general understanding has yet to be

established with the use of nationally representative data. The objective of this study was to provide the first nationally representative empirical evidence that links health information seeking behaviors with health literacy among middle-age to older adults in the United States. Methods: Data were obtained from the 2012/2014 Program for the International Assessment of Adult Literacy (PIAAC). Our analytic sample is representative of adults age 45 to 74 years (N = 2,989). Results: Distinct components of health literacy (i.e., literacy and numeracy) were uniquely associated with the use of different health information sources (e.g., health professionals, the Internet, television). Discussion: Findings should be useful for government agencies and health care providers interested in targeting health communications, as well as researchers who focus on health disparities.

**Title:**

Yamashita, T., Bardo, A. R., Millar, R. J., & Liu, D. (2018). Numeracy and preventive health care service utilization among middle-aged and older adults in the U.S. *Clinical Gerontologist: The Journal of Aging and Mental Health*, 1-12. doi: 10.1080/07317115.2018.1468378

**Abstract:**

Objectives: Determine whether a specific numeracy skill cut-point(s) reflects an empirical threshold in the context of preventive health service utilization, and identify associations between numeracy and preventive health services utilization among middle-aged and older adults in the United States. Methods: A nationally representative sample (n = 2,989) of adults 45 years and older from the International Assessment of Adult Competencies (PIAAC) was analyzed. Binary logistic regression was used to examine the utilization of dental checkup, vision screening, influenza vaccination, and osteoporosis screening, using multiple numeracy level classifications. Results: A dichotomous classification of numeracy skill levels (low vs. moderate to high proficiency) was associated with dental checkup utilization, but vision screening, influenza vaccination, and osteoporosis screening. Conclusions: Middle-aged and older adults with sufficient numeracy skills are more likely to have had a dental check up in the past 12 months. Findings suggest that numeracy may be more relevant for long-term vs. short-term risk assessment in determining preventive health care service utilization. Clinical Implications: Two-level numeracy categories are recommended in preventive health contexts. Numeracy proficiency-sensitive risk communication by health care providers and education programs may enhance awareness of preventive health care and promote the utilization of specific preventive health service utilization among older adults.

**Title:**

Yamashita, T., Cummins, P. A., Arbogast, A., & Millar, R. J. (2018). Adult competencies and employment outcomes among older workers in the United States: An analysis of the program for the international assessment of adult competencies. *Adult Education Quarterly*, 68(3), 235-250. doi: 10.1177/0741713618773496

**Abstract:**

A growing segment of the U.S. workforce—older workers—face challenges such as a greater chance of being unemployed for a longer period of time than younger workers and skill obsolescence in contemporary societies. In an age of fast-paced economic and technological change, ongoing investment in human capital in the form of skill training represents a potential strategy for improving older workers' employment prospects. However, empirical evidence is lacking on the relationship between basic skill competencies and employment outcomes for older workers in general. This study analyzed nationally representative data of adults aged 45 to 65 years (n =

2,169) from the Program for the International Assessment of Adult Competencies. Literacy skills were used as the main measure of competencies. Results from multinomial logistic regression identified statistically significant positive associations between literacy skills and employment among older workers. Implications for research, policy, and practice are discussed.

Yamashita, T., Jennifer, R. K., Sheniz, A. M., Shen, J. J., Jennifer, R. P., & Yoo, J. W. (2018). Literacy activity and health among older adults in the USA. *Educational Gerontology, 44*(10), 627-638. doi: 10.1080/03601277.2018.1521077

**Abstract:**

Health literacy skills are known to be a key mediator of the relationship between education and health in the general population. However, one aspect of health literacy skills—individuals' actual literacy activities—remains understudied, especially among older adults. Health disparities that are driven by inequalities in education and level of health literacy skills are particularly problematic for older adults since they are exacerbated in old age by disadvantages that accumulate over the life course. This study examined a nationally representative sample of US adults age 50 years and older (n = 2,573) using data from the 2014 Program for International Assessment of Adult Competencies (PIAAC). Parallel mediation analysis was conducted to examine the partial mediation effects of health literacy skills and literacy activity (i.e., reading at home) on the relationship between education and health. Results showed that both health literacy skills and literacy activity mediated the education–health relationship. On average, literacy skills mediated 31.89% and literacy activities mediated 9.59% of the effect of education on self-rated health. Literacy activity, such as reading, is an easily accessible, autonomous, and sustainable option for promoting health in later life. Policies that support the intersection of public health and education may promote lifelong learning and well-being among US adults.

Yasukawa, K., Jackson, K., Kane, P., & Coben, D. (2018). Mapping the terrain of social practice perspectives of numeracy. In K. Yasukawa, A. Rogers, K. Jackson, & B. V. Street (Eds.), *Numeracy as Social Practice* (pp. 21-36). London: Routledge. doi: 10.4324/9781315269474

**Abstract:**

A numeracy as social practice perspective focuses on what people do with numeracy through social interactions in particular contexts, rather than on people's performance of mathematical skills in isolation of context. Moreover, this perspective highlights that numeracy activity must be understood in relation to the social, cultural, historical and political contexts in which it takes place. In this chapter, we map four key theoretical influences on this perspective: situative learning, cultural historical activity theory, literacy as social practice, and ethnomathematics.

Yu, C. H., Lee, H. S., Lara, E., & Gan, S. (2018). The ensemble and model comparison approaches for big data analytics in social sciences. *Practical Assessment, Research & Evaluation, 23*(17), 1-11. doi: 10.7275/chaw-y360

**Abstract:**

Big data analytics are prevalent in fields like business, engineering, public health, and the physical sciences, but social scientists are slower than their peers in other fields in adopting this new methodology. One major reason for this is that traditional statistical procedures are typically not suitable for the analysis of large and complex data sets. Although data mining techniques could alleviate this problem, it is often unclear to social science researchers which option is the most suitable one to a particular research problem. The main objective of this paper is to illustrate how the model comparison of two popular ensemble methods, namely, boosting and bagging, could yield an improved explanatory model.

Zwart, S., & Baker, M. (2018). *Improving productivity and job quality of low-skilled workers in the United Kingdom*. OECD Economics Department Working Papers No. 1457. Paris: OECD Publishing. doi: 10.1787/14dfd584-en

**Abstract:**

More than a quarter of adults in the United Kingdom have low basic skills, which has a negative impact on career prospects, job quality and productivity growth. Furthermore, unlike most other countries, young adults do not have stronger basic skills than the generation approaching retirement. The lack of skills development starts at young ages and continues in secondary education; despite a modest reduction in recent years, the educational attainment gap between disadvantaged and non-disadvantaged students remains high. The low participation in lifelong learning of low-skilled individuals puts them at risk of falling behind in meeting the changing skill demands of the dynamic labour market. Ongoing reforms to the vocational education and training (VET) system and apprenticeship system should have a positive impact on low-skilled productivity, enabling students to gain the necessary basic skills and for workers to find quality jobs. Improving the targeting of active labour market policies, and ensuring that the ongoing increases in the national living wage are delivered in a sustainable way will also play an important role in improving job quality and reducing the high rate of youth neither employed or in education or training. Policy responses to the rise of non-standard work will also be essential in improving the job quality of the low-skilled.

Albæk, K., & Rosdahl, A. (2019). Decomposing cross-country differences in skills: Evidence from four Nordic countries. *Scandinavian Journal of Educational Research*, 63(2), 163-178. doi: 10.1080/00313831.2017.1324908

**Abstract:**

This paper performs multivariate analysis of skill differences in four Nordic countries as assessed by the Organisation for Economic Co-operation and Development's Programme for the International Assessment of Adult Competencies survey of adults aged 16-65. The differences in average skills between Finland and each of the three Scandinavian countries are decomposed into a component that is due to different skill levels in subgroups of the population and a component that is due to differences in the composition of subgroups. The decompositions show that the high Finn-

ish average skill level compared to the three Scandinavian countries can be attributed to the low share of immigrants in Finland and to high scores among Finns with high school and less than high school education. The Finnish average score is pulled substantially downwards as a consequence of the low numeracy skill level among older Finns, which is consistent with an increase in the quantity or quality of Finnish education over time, relative to the other three Nordic countries.

Annen, S. (2019). Measuring labour market success: A comparison between immigrants and native-born Canadians using PIAAC. *Journal of Vocational Education & Training*, 71(2), 218-238. doi: 10.1080/13636820.2018.1473469

**Abstract:**

Canadian society is characterised by a plurality of immigrants and Canadian migration policy and corresponding recognition approaches are strongly geared to economic criteria, qualifications and skills. This paper addresses the question how immigrants who have acquired their highest qualification outside Canada are able to use their foreign qualifications and skills in their current job. The analyses are conducted to verify the assumptions of human capital theory as well as the lack of transferability of human capital across country borders. To answer these questions a labour market success index is developed, which is used as a dependent variable in regression models. The results show that traditional operationalisations of human capital (years of education, years of work experience and skills) have a positive effect on individual labour market success. At the same time, being born abroad and having acquired one's highest qualification abroad in comparison to Canada, especially in a Non-Western country, has negative effects on the overall labour market success of an individual. Detailed comparisons regarding different indicators of labour market success also prove these comparatively negative effects. The results demonstrate the limited explanatory power of human capital theory and the necessity to complement it with Bourdieu's concepts of social and cultural capital.

Arcangelis, G. D., & Mariani, R. D. (2019). *Multi-country tasks measures: Beyond US-based data and a focus on migration*. Working Paper Series No. 5. Roma: Dipartimento di Scienze Sociali ed Economiche della Sapienza Università di Roma. Retrieved March 6, 2020, from [http://www.diss.uniroma1.it/sites/default/files/allegati/DisSE\\_DeArcangelis\\_Mariani\\_wp5\\_2019.pdf](http://www.diss.uniroma1.it/sites/default/files/allegati/DisSE_DeArcangelis_Mariani_wp5_2019.pdf)

**Abstract:**

The US-based O\*NET database is commonly used for multi-country studies on labor markets and migration by assuming invariant occupation technology, i.e. the quantitative assignment of tasks to occupations. We claim that the OECD dataset PIAAC (Programme for the International Assessment of Adult Competencies) could provide a valid alternative to obtain country-specific task measures. The US presence in both datasets allows us to compare the consistency of the two data sources along two dimensions. First, we compute the correlation coefficients between aggregate task indexes and they are very high (rarely less than 0.7). Secondly, we use the PIAAC database to replicate the empirical model in Peri and Sparber (2009) on US natives' task upgrading after a migration shock, and the results are strikingly similar to the original O\*NET-based estimates. The multi-country variability of PIAAC-based task indexes for European countries are non-negligible; hence, we recommend these PIAAC-based measures for future multi-country analysis.

Aspøy, T. M. (2019). Low education, high job quality? Job autonomy and learning among workers without higher education in Scandinavia, the United Kingdom and Ireland. *European Societies*, 1-23. doi: 10.1080/14616696.2019.1660392

**Abstract:**

Most comparative studies of job autonomy and learning opportunities find that workers in Scandinavian countries are better off. Recent studies have challenged these findings, showing low job quality, particularly in the lower private service sector in the Scandinavian countries. The aim of this article is to examine whether the autonomous and learning-intensive working life of Scandinavia also applies to people without higher education. It explores if there is a gap in job autonomy and informal job learning between educational groups, and if this gap varies across the social democratic systems of Sweden, Norway and Denmark on the one hand, and the liberal systems of the United Kingdom and Ireland on the other. Drawing on quantitative micro-data from PIAAC (2011/2012), this article demonstrates that Scandinavians with no education above upper secondary school do experience greater job autonomy than their counterparts in the British Isles. Moreover, the gap between educational groups in terms of job autonomy is smaller in Scandinavia than it is in the liberal systems. Regarding informal learning opportunities, the relative disadvantage among workers without higher education seems to be associated with selection into occupations with few opportunities for informal job learning, in Scandinavia as well as the British Isles.

Barrett, G. F., & Riddell, W. C. (2019). Ageing and skills: The case of literacy skills. *European Journal of Education*, 54(1), 60-71. doi: 10.1111/ejed.12324

**Abstract:**

The relationship between ageing and skills is of growing policy significance due to population ageing, the changing nature of work and the importance of literacy for social and economic well-being. This article examines the relationship between age and literacy skills in a sample of OECD countries using three internationally comparable surveys. By pooling the survey data across time we can separate birth cohort and ageing effects. In doing so, we find that literacy skills decline with age and that, in most of our sample countries, successive birth cohorts tend to have poorer literacy outcomes. Therefore, once we control for cohort effects, the rate at which literacy proficiency falls with age is much more pronounced than that which is apparent, based on the cross-sectional relationship between age and literacy skills at a point in time. Further, in studying the literacy-age relationship across the skill distribution in Canada we find a more pronounced decline in literacy skills with age at lower percentiles, which suggests that higher initial literacy moderates the influence of cognitive ageing.

Barth, E., Keute, A. L., Schøne, P., Simson, K., & Steffensen, K. (2019). NEET Status and early versus later skills among young adults: Evidence from linked register - PIAAC data. *Scandinavian Journal of Educational Research*, 1-13. doi: 10.1080/00313831.2019.1659403

**Abstract:**

Do skills protect against exclusion in adult ages, and how important are the skills acquired before the age of 16 years versus those acquired later on? We match the scores on numeracy and literacy skills from the 2011 PIAAC for young adults backwards to grade point average (GPA) data from compulsory school education, measured at the age of 16 years (GPA16), and forwards to employment and education register data 2 years after the PIAAC test. There is a high correlation between GPA16 and PIAAC scores even when controlling for parental background, health status, and completion of post-compulsory school education. Including both GPA16 and PIAAC scores in a model of the probability of NEET status 2 years after the PIAAC test shows three times as large differences associated with GPA16 scores than with PIAAC scores, even though the PIAAC test is taken closer in time than the GPA16 results.

Bechichi, N., Jamet, S., Kenedi, G., Grundke, R., & Squicciarini, M. (2019). *Occupational mobility, skills and training needs*. ECD Science, Technology and Industry Policy Papers No. 70. Paris: OECD Publishing. doi: 10.1787/30a12738-en

**Abstract:**

his work investigates how education and training policies may facilitate occupational transitions. It proposes a methodology to estimate cognitive and task-based skill distances across occupation. It identifies the occupational transitions that can occur upon small (of up to 6 months), moderate (up to 1 year) or important (up to 3 years) (re)training spells. “Possible” transitions, i.e. transitions implying reasonable upskilling needs and similar knowledge areas, are distinguished from “acceptable” occupations, i.e. possible transitions entailing limited loss of human capital and income, if any. Possible and acceptable transitions exist for the quasi-totality of occupations, when up to one year of training is considered. Low-skilled occupations display fewer acceptable transitions and generally require higher cognitive or task-based skills. Transitions for many high-skilled occupations entail important wage decreases or skills excesses. Acceptable transitions for occupations at high-risk of automation are harder to find, and tend to require cognitive and task-based skills-related training.

**Title:**

Bizopoulou, A. (2019). *Job tasks and gender wage gaps within occupations*. VATT Working Papers No. 124. Helsinki: VATT Institute for Economic Research. Retrieved March 4, 2020, from <https://www.doria.fi/handle/10024/171446>

**Abstract:**

I provide evidence that task use at work by men and women in the same occupations is significantly different. The observed difference can account for the within-occupational gender-wage gap that is prevalent in many developed countries. Using data for thirteen European countries, I find that women consistently report spending less time than men on specific job tasks. The effect is exacerbated with fertility and selection into the labour force, however neither mechanism can completely account for the observed differences. The difference is also not accounted for by the type of occupations in which women are employed, nor their working hours and it is not driven by measurement error. Similarly to studies for the US and Australia, I find that a large portion of the gender wage-gap is found among individuals employed in the same occupational titles. However,

controlling for both occupations and task use in a wage equation accounts for the entirety of the within-occupational gender wage-gap, for all countries in the sample.

**Title:**

Boeren, E. (2019). Foreign-born adults' participation in educational activities: Evidence from Europe. *European Education*, 51(2), 127-146. doi: 10.1080/10564934.2018.1520600

**Abstract:**

This article demonstrates that foreign-born adults in Europe tend to participate less in adult education activities compared to native-born adults living in the same country. However, this is mainly explained through the job-related nature of nonformal education. Foreign-born adults tend to participate more in formal adult education than native-born adults in a range of countries. Based on analyses using data from the Organization for Economic Cooperation and Development Programme on the International Assessment of Adult Competencies (PIAAC), this article shows that participation rates in European countries are mainly determined by adults' educational attainment and having a job and that countries with overall high participation rates have higher participation rates among foreign-born adults as well. Exploring the participation in adult education of foreign-born adults in European countries is important, as it is known that those adults perceive difficulties in finding a job and having their foreign credentials recognized in the new country context. Participation in adult education courses might help them in learning new or maintaining their already existing skills.

Bönisch, M., Peterbauer, J., & Stöger, E. (2019). Skills mismatch among older workers. In M. Barlund (Eds.), *Policies for an Ageing Workforce: Work-life balance, working conditions and equal opportunities* (pp. 44-50). Brussels: Centre for European Policy Studies (CEPS). Retrieved March 9, 2020, from <https://www.ceps.eu/wp-content/uploads/2019/11/Policies-for-an-ageing-work-force-1.pdf>

**Abstract:**

Skills are viewed as a major component of knowledge-based economies. On an individual level, skills can support labour market success and can have an effect on earnings and job satisfaction (Hanushek et al., 2014). But skills must be used efficiently to generate these positive labour market outcomes. If this is not the case, skill mismatch occurs. This means that workers either do not meet the skills required at their workplace (under-skilled / over-utilisation) or have higher skills than needed (over-skilled / under-utilisation). In this chapter, we look at differences between two age groups (25-49 and 50-65 years) with regard to their skill levels and skill use at the workplace. We analyse how older workers (50-65) utilise their skills in the workplace compared to the younger ones. Which factors influence skill utilisation? Does age have a relevant effect on skill mismatch when controlling for gender, education and other variables? Do older workers tend to lose their skills because these skills are not fully utilised in the workplace? And what are the effects of over- or under-utilisation of skills on earnings and job satisfaction? The focus of our empirical research is on the analysis of the PIAAC dataset<sup>17</sup> for the five countries that participate in the European FACTAGE (Fairer Active Ageing for Europe) project: Austria, Germany, Spain, Belgium and the UK.

Borgna, C., Solga, H., & Protsch, P. (2019). Overeducation, labour market dynamics, and economic downturn in Europe. *European Sociological Review*, 35(1), 116-132. doi: 10.1093/esr/jcy046

**Abstract:**

Previous research on overeducation focused on labour market entrants and investigated the role of individual characteristics and, more recently, labour market and educational institutions. This article shifts the focus to primeage workers, exploring the relation between economic conditions, related labour market dynamics, and overeducation across 16 European countries in the aftermath of the 2008 economic crisis. We regard cross-sectional overeducation rates as the result of past labour market dynamics involving employers' hiring and dismissal decisions and employees' job mobility. Based on data from the 2011/2012 Programme for the International Assessment of Adult Competences (PIAAC), we estimate mixed-effects linear-probability models. We find that overeducation risks are higher for individuals who experienced job mobility after the outbreak of the crisis (movers) than for those who were able to keep their jobs, with workers who changed their job before the crisis (short-term stayers) experiencing higher overeducation risks than long-term stayers. These differences are partly explained by compositional and contextual factors—however, our newly introduced differentiation of labour market dynamics profiles also shows an independent effect. Moreover, tertiary graduates are more likely to be overeducated than workers with upper-secondary qualifications—controlling for workers' skill heterogeneity. The findings on macroeconomic conditions are mixed: overeducation risks are higher in contexts of poorer economic conditions and even more so for movers; however, the multiplicative negative effect for movers disappears after controlling for job characteristics. This finding suggests that post-crisis mobility channeled workers more often into labour market segments with inferior job conditions where the risk of overeducation is generally higher.

Brand, G. (2019). *Returns to skills in the Israeli labor market*. Policy Research Jerusalem: Taub Center for Social Policy Studies in Israel. Retrieved March 6, 2020, from [http://taubcenter.org.il/wp-content/files\\_mf/returnstoskillsinteisraelilabormarket2019eng.pdf](http://taubcenter.org.il/wp-content/files_mf/returnstoskillsinteisraelilabormarket2019eng.pdf)

**Abstract:**

This study focuses on workers identified in the OECD Survey of Adult Skills as highly skilled and examines their employment characteristics, wages, and the degree to which they are employed in occupations demanding high skill levels. Although the survey data show that the skill level of highly skilled workers in Israel is lower than in other developed countries, it appears that these workers are fulfilling their potential to a greater extent. They have a greater tendency to be employed in high-paying professions and are less likely to be found in low-paying positions that do not require high skill levels. The result is that wage gaps between Israel and other countries are narrower at higher skill levels and the wages of the highest-skilled workers in Israel approach those of their counterparts in the selected OECD countries examined. This is particularly true in the case of men. The successful utilization of human capital in Israel is an indication of the need for policy makers to focus attention on low-skilled workers. Although the share of these workers with a college education is high, it has been found that they are often characterized by a low return to their education. This highlights the limitations of increasing accessibility to higher education as a way of reducing disparities and the need to improve basic skills at early education stages. Special attention should be devoted to the Arab Israeli population since, in contrast to other groups, it is characterized by low returns to both skill and experience in the labor market.

Brussevich, M., Dabla-Norris, E., & Khalid, S. (2019). *Is technology widening the gender gap? Automation and the future of female employment*. IMF Working Paper No. 19/91. Washington: International Monetary Fund. Retrieved February 28, 2020, from <https://www.imf.org/~media/Files/Publications/WP/2019/WPIEA2019091.ashx>

**Abstract:**

Using individual level data on task composition at work for 30 advanced and emerging economies, we find that women, on average, perform more routine tasks than men - tasks that are more prone to automation. To quantify the impact on jobs, we relate data on task composition at work to occupation level estimates of probability of automation, controlling for a rich set of individual characteristics (e.g., education, age, literacy and numeracy skills). Our results indicate that female workers are at a significantly higher risk for displacement by automation than male workers, with 11 percent of the female workforce at high risk of being automated given the current state of technology, albeit with significant cross-country heterogeneity. The probability of automation is lower for younger cohorts of women, and for those in managerial positions.

**Title:**

Buehler, E., & Pampaka, M. (2019). Validating a measure of numeracy skill use in the workplace for incarcerated and household adults. *Journal of Applied Measurement*, 20(3), 272-292.

**Abstract:**

The aim of this study is to construct a measure of numeracy skill use in the workplace for incarcerated and household adults. The 2012/2014 Programme for the International Assessment of Adult Competencies (PIAAC) Survey of Adult Skills asked about the type and frequency of numeracy tasks performed as part of one's job to nationally-representative incarcerated and household adult samples. This paper takes these items from this survey and focuses on the validation of a measure of numeracy skill use in the workplace using the principles of the Rasch rating scale model. In the interest of exploring options for strengthened validity, response categories were collapsed to produce an optimal categorization structure. Findings suggest an instrument to measure numeracy skill use in prison and free market workplaces could potentially be improved with fewer response categories and more items that ask about a broader range of numeracy skills.

Bustelo, M., Flabbi, L., & Viollaz, M. (2019). *The gender labor market gap in the digital economy*. IDB Working Paper Series No. 1056. Washington, DC: Inter-American Development Bank (IDB). doi: 10.18235/0001941

**Abstract:**

Recent years have seen an ever-greater expansion of the digital economy, a development that may bring new opportunities to workers who were at a disadvantage in the traditional economy. We focus on a specific set of workers who belong to such a group: women. We study a skill set of particular relevance in the digital economy and estimate their returns in the labor market, according

to gender, across four Latin American countries. We find that information and communication technologies (ICT) skills and science, technology, engineering, and mathematics (STEM) skills yield significant positive returns for both men and women. However, there is a significant gender gap that favors men on the STEM returns. There is also a sizable gender gap regarding the amount of skills accumulated by gender. Through an Oaxaca-Blinder decomposition, we estimate that up to 80% of the gender gap in hourly wages may be due to the lower returns that women receive, relative to men, on their STEM skills. If an investment in skills relevant to the digital economy may be beneficial for the labor market performance of both men and women, why returns to STEM exhibit such strong gender asymmetries remains an open and relevant question.

**Title:**

Byrne, K., & Plekhanov, A. (2019). *Education reforms and adult skills: Evidence from Estonia*. EBRD Working Paper No. 237. London: European Bank for Reconstruction and Development (EBRD). doi: 10.2139/ssrn.3493799

**Abstract:**

This paper investigates the impact of education reforms in Estonia on adult skills, using the PIAAC surveys conducted by the OECD. Estonia implemented comprehensive education reforms in the early 1990s throughout Estonian-speaking schools while in Russian-speaking schools less comprehensive reforms were implemented later. A large minority of Estonia's population at the time was enrolled in Russian-speaking schools. This provides a unique opportunity to measure the impact of education reforms on literacy, numeracy and problem-solving skills among adults by comparing improvements in PIAAC performance among Estonian and Russian speakers. Difference-in-difference estimations suggest that the reforms led to an improvement of around 15 per cent of a standard deviation in terms of adult skills. This translates into a wage (productivity) premium of around 6 per cent.

**Abstract:**

Today, more people are incarcerated in the United States than in past decades, and we have the infamous distinction of being the nation that leads in incarceration rates (670 per 100,000 persons as per Walmsley 2018). Although an increasing body of research shows that correctional education works in terms of enhancing post-release employability and reducing recidivism, there is a paucity of literature that identifies the educational programs that benefit inmates the most vis-à-vis developing the literacy/numeracy skills needed for reentry into an ever-changing labor market. Identifying the type, amount and intensity of programs that reduce recidivism is not a choice, it is a critical path to reducing recidivism. Given this need our study focuses on 3Ps – prison-based education programs, prisoners' participation in academic/vocational programs, and their proficiency in literacy and numeracy as assessed during their incarceration by the Program for the International Assessment of Adult Competencies (PIAAC) Survey of Incarcerated Adults in 2014. Our investigation spans the following broadly defined questions: 1) How do inmates differ from the household population in the use of literacy/numeracy skills in life and at work? 2) How do participants in

different types of prison-based educational programs (such as basic skills, General Equivalency Degree (GED), employment readiness and job training) reflect literacy and numeracy proficiency? That is, does proficiency vary by program? 3) Do inmates who participate in prison-based academic and/or vocational programs use more literacy and numeracy skills in their prison life, compared with non-participants? Our study identified three types of prison-based programs that serve inmates who possess a range of literacy and numeracy levels: (i) programs targeting basic skills serve inmates without a GED or high school diplomas; (ii) programs that help inmates obtain a GED or high school diplomas that equip inmates with necessary proficiency in literacy and numeracy to pursue appropriate job training programs/postsecondary education, and; (iii) vocational/professional training programs that advance skills in areas such as computers, mechanics and technology. What we found: Compared with the household population, a large proportion of inmates rarely use certain literacy /numeracy skills (e.g., reading bills, invoices and financial statements, reading diagrams, maps and schematics, filling in forms and writing reports at prison jobs) in life or work during incarceration, particularly when it comes to numeracy. Inmates who did not reach high school level and did not participate in any programs had the lowest literacy and numeracy. By contrast, inmates who participated in basic skills programs performed significantly higher than this reference group in both literacy and numeracy. Over two-thirds of inmates who participated in vocational programs (i.e. employment readiness and/or job training) had a high school diploma, and participants in vocational programs during incarceration were likely to use more literacy and numeracy skills in their prison life than the non-participants. We recommend that policy makers consider the valuable link we found between skills use and participation in vocational programs or career and technical education (CTE). From the perspective of need-based education, expanding programs targeting basic skills is a must, as almost one in three inmates have education levels lower than high school diploma. Since evidence shows that educational programs in prison benefit inmates on improving skills, CTE should receive more resources precisely because these programs lead not only to obtaining but also retaining employment, which is a critical policy lever if we truly wish to reduce recidivism.

Calero, J., Murillo Huertas, I. P., & Raymond Bara, J. L. (2019). Education, age and skills: An analysis using PIAAC data. *European Journal of Education*, 54(1), 72-92. doi: 10.1111/ejed.12318

**Abstract:**

The main aim of this article is to analyse the change of adult skills, as captured by cognitive skills assessed in PIAAC, across age cohorts, taking into account that the quality of schooling may change from one cohort to another. We estimate a model that relates numeracy and literacy skills to age, schooling, gender and variables related to both family background and labour market performance. The specification allows us to control for changes in the efficiency of the transformation of schooling into skills when drawing age-skill profiles. Our results show that the effect of ageing on skills, once isolated from cohort effects related to schooling, decreases monotonically across consecutive cohorts. The change of the efficiency of the transformation of schooling into both numeracy and literacy skills shows a remarkably similar pattern. Nonetheless, this change differs substantially between education levels, with the efficiency of the transformation of schooling into skills showing a steadier profile for intermediate than for higher education. Finally, empirical evidence is provided for the decomposition of the differences in the skill levels of the older vs. the prime age generations. The results suggest that the progressive expansion of schooling across younger generations partially offsets the negative effect of the irrepressible ageing of society on skills.

Calmfors, L., & Gassen, N. S. (2019). Integrating immigrants into the Nordic labour markets: Background, summary and policy conclusions. In L. Calmfors & N. S. Gassen (Eds.), *Integrating Immigrants into the Nordic Labour Markets* (pp. 9-35). Copenhagen: Nordic Council of Ministers. Retrieved March 9, 2020, from <https://norden.diva-portal.org/smash/get/diva2:1317928/FULLTEXT01.pdf>

**Abstract:**

Denmark, Finland, Norway and Sweden face similar problems of integrating large groups of immigrants, especially low-educated ones from outside the EU, into their labour markets. This volume investigates how labour market integration of these groups can be promoted and seeks to identify appropriate policies. Our introduction presents the background to the volume, summarises the main findings and discusses policy recommendations. A key conclusion is that no single policy will suffice. Instead, a combination of education, active labour market, social benefit and wage policies should be used. The exact policy mix must depend on evaluations of the trade-offs with other policy objectives.

Cebolla-Boado, H., Miyar-Busto, M., & Muñoz-Comet, J. (2019). How much can you take with you? The role of education in explaining differences in the risk of unemployment between migrants and natives. *Comparative Migration Studies*, 7(41), 1-21. doi: 10.1186/s40878-019-0144-4

**Abstract:**

This paper looks at how migrants with different skill profiles make use of their education in order to avoid unemployment compared with natives in three European countries with significantly different labour markets and policies for attracting highly skilled migration: France, Spain and the UK. The paper also explores the role played by the quality of the education migrants and natives received in accounting for these differentials, an explanation rarely tested in the literature due to a lack of appropriate data. We here use PIAAC data (OECD), which for the first time offers an interesting proxy of the quality of education, namely the cognitive skills of a representative sample of adult workers in our selected countries. The paper reaches three clear conclusions. Firstly, that it is among the most educated that inequality in obtaining returns to education by migrant status reaches a maximum. Secondly, that there are important differences in how this happens across countries, with the UK minimizing migrant-native differentials when compared with France and Spain. And that thirdly, and most surprisingly, differences in cognitive abilities, our proxy of the quality of education, are somewhat irrelevant in explaining this inequality.

Chatoor, K., MacKay, E., & Hudak, L. (2019). *Parental education and postsecondary attainment: Does the apple fall far from the tree?* Toronto: Higher Education Quality Council of Ontario. Retrieved March 4, 2020, from <http://hdl.voced.edu.au/10707/524226>

**Abstract:**

Research conducted over the past two decades has revealed that parental education is an important determinant of post secondary education (PSE) attainment. Students who come from a

family where neither parent completed PSE are far less likely to pursue PSE themselves. As a result, the government of Ontario put in place policies that dramatically increased overall enrolment at universities and colleges. It also expanded financial assistance, capped tuition fees and provided targeted funding to institutions to support underrepresented students, including those whose parents did not complete PSE (known as first-generation students). Using newly available data, this report assesses whether the gap in PSE attainment between first-generation students and their counterparts whose parents attained a postsecondary credential has changed, and whether parental education remains a significant determinant of PSE attainment. [The authors] also examined whether first-generation students who do obtain a postsecondary education reap the benefits of their credentials once in the labour market, and what effect, if any, their parents' educational background has on their labour market outcomes. Key findings reveal that a notable gap still exists in the PSE completion rate between first-generation students and their counterparts. The situation appears to be particularly worrisome for young men. [The authors'] analysis indicates that parental education carries more weight in determining postsecondary attainment than other factors including family income.

Choi, S. J., Jeong, J. C., & Kim, S. N. (2019). Impact of vocational education and training on adult skills and employment: An applied multilevel analysis. *International Journal of Educational Development*, 66, 129-38. doi: 10.1016/j.ijedudev.2018.09.007

**Abstract:**

Vocational education and training has played a central role in promoting the school-to-work transition of young people. Despite this role, the return to Vocational Education and Training (VET) has been neglected in previous studies. This paper aims to examine individual returns to VET over a lifespan and to assess the effects of national VET systems, including school-based and work-based VET systems, on economic outcomes. We use the OECD's Program for the International Assessment of Adult Competencies (PIAAC) dataset for conducting our analyses. The results of this study indicate that vocational track graduates are more likely to have literacy skill disadvantages, short-term employment advantages, and long-term employment disadvantages compared to general track graduates. The most significant finding is that there are substantial differences between work-based and school-based VET systems with regard to their literacy and employment effects. Compared to VET graduates from general education-oriented countries, VET graduates from work-based VET-oriented countries are initially more likely to be employed, but that employment premium narrows faster over time. Therefore, a lifespan overview and the characteristics of national VET systems should enter into policy debates on national educational systems.

Çim, M. (2019). *Analysis of labor markets and migration* (Dissertation). Ruhr-Universität Bochum. doi: 10.13154/294-6479

**Abstract:**

Do immigrants steal our jobs? Do robots take over our jobs? These two questions have been part of public concerns in many industrialized countries. These concerns were accelerated by the recent immigrant inflows and the rapid technological advancements, and were rooted in discussions in the media in the last years. Demographic change, globalization and new technologies alter the nature of labor markets and pose various challenges, but also provide opportunities to the labor

force. The dissertation analyzes the recent trends in the labor markets as well as immigrant-native discrepancies with respect to educational and occupational outcomes; focuses on the educational differences between natives and immigrants and investigates the prevalence of qualification-occupation mismatches among immigrants compared to natives in Europe; studies the impact of automation on the labor market transitions of workers in Germany and examines how immigration influences the occupational attainment of natives by considering the role of workplace tasks. Cook, R. (2019). Participation and inclusivity in adult learning: International perspectives. In J. Tummons (Eds.), *PCET: Learning and teaching in the post compulsory sector*. London: Sage.

**Abstract:**

This chapter uses the international data from PIAAC to analyses: (a) levels of participation in adult learning (how many adults participate); and (b) its inclusivity (to what extent all individuals in society have a chance to participate in adults learning). Empirical findings are discussed alongside the theories that have been used to understand why participation rates vary across countries and across different groups in society. The chapter finishes with a discussion of the Nordic countries' distinctive approach to adult learning, followed by a conclusion, referring back to the key arguments about adult learning and providing an outlook for future international comparative research on adult learning. Cooper, R., & Liu, H. (2019). MisMatch in human capital accumulation. *International Economic Review*, 60(3), 1291-1328 doi: 10.1111/iere.12386

**Abstract:**

This article studies the allocation of heterogeneous agents to levels of educational attainment. The goal is to understand the magnitudes and sources of mismatch in this assignment, both in theory and in the data. The article presents evidence of substantial mismatch between ability and educational attainment across 21 OECD countries, with a main focus on Germany, Italy, Japan, and the United States. Model parameters are estimated using a simulated method of moments approach. The main empirical finding is that measured mismatch arises largely from noise in test scores and does not reflect borrowing constraints. Taste shocks play a minor role in explaining mismatch.

Cummins, P. A., Yamashita, T., Millar, R. J., & Sahoo, S. (2019). Problem-solving skills of the U.S. workforce and preparedness for job automation. *Adult Learning*, 30(3), 111-120. doi: 10.1177/1045159518818407

**Abstract:**

Automation and advanced technologies have increased the need for a better understanding of the skills necessary to have a globally competitive workforce. This study used data from the Program for the International Assessment of Adult Competencies to compare problem-solving skills in

technology-rich environments among adults in South Korea, Germany, Singapore, Japan, Canada, Estonia, the United Kingdom, the United States, and Australia. Overall, the United States had the lowest scores among all countries, and in all countries scores declined with age. The United States had higher proportions of survey participants in the lowest skill category and lower proportions in the top-skill categories. The results of this study suggest changes in the U.S. educational and life-long learning systems, and policies may be necessary to ensure all adults have the necessary skills in a competitive workforce.

Daley, A., Hu, M., & Warman, C. (2019). *Language proficiency and immigrants' economic integration. It is vital to measure language proficiency well, as it crucially determines immigrants' earnings*. IZA World of Labor No. 469. Bonn: IZA – Institute of Labor Economics. doi: 10.15185/izawol.469

**Abstract:**

Over recent decades, Western countries have admitted many immigrants from non-traditional regions (e.g. Philippines, India, China), which has coincided with poor economic integration. Language proficiency is an important determinant of economic integration; in addition to being a component of human capital, it plays a key role in facilitating the transmission of other components of human capital. Examining the strengths and weaknesses of objective and subjective measures of language proficiency is crucial for good integration policy, as is understanding the relationship between these measures and earnings, a key indicator of economic integration.

Damme, D. V. (2019). Convergence and divergence in the global higher education system: The conflict between qualifications and skills. *International Journal of Chinese Education*, 8(1), 7–24. doi: 10.1163/22125868-12340102

**Abstract:**

Globally, higher education is expanding at an unprecedented pace. But two competing forces seem to be at work. The first is globalization: higher education systems are globalizing, especially through international research networks and global rankings which fuel competition on a global scale. Internationally comparable qualification frameworks, credit transfer, internationalization policies and quality assurance and accreditation arrangements work towards globally exchangeable qualifications. But the second force, driving institutions to deliver skills which are relevant for the national and regional economies, works against convergence. The skills equivalents of national qualifications remain very different across countries. The skills agendas, driven by countries' position in global value chains, drive unequal outcomes. The consequence is that the global higher education system will remain characterized by huge inequalities, which are perceived as quality differences. Higher education policies need to find a balance between integration in the global higher education order and serving the domestic skills needs.

Davier, M., Khorramdel, L., He, Q., Shin, H. J., & Chen, H. (2019). Developments in psychometric population models for technology-based large-scale assessments: An overview of challenges and

opportunities. *Journal of Educational and Behavioral Statistics*, 44(6), 671-705. doi: 10.3102/1076998619881789

**Abstract:**

International large-scale assessments (ILSAs) transitioned from paper-based assessments to computer-based assessments (CBAs) facilitating the use of new item types and more effective data collection tools. This allows implementation of more complex test designs and to collect process and response time (RT) data. These new data types can be used to improve data quality and the accuracy of test scores obtained through latent regression (population) models. However, the move to a CBA also poses challenges for comparability and trend measurement, one of the major goals in ILSAs. We provide an overview of current methods used in ILSAs to examine and assure the comparability of data across different assessment modes and methods that improve the accuracy of test scores by making use of new data types provided by a CBA.

Delaney, R., & Smith, L. (2019). *Understanding educational aspiration among people in prison*. Washington: PIAAC Gateway. Retrieved March 5, 2020, from [https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5c51c4f7562fa792468f687e/1548862712295/2019\\_Delaney\\_Smith\\_Educational\\_Aspiration\\_Prison.pdf](https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5c51c4f7562fa792468f687e/1548862712295/2019_Delaney_Smith_Educational_Aspiration_Prison.pdf)

**Abstract:**

This study contributes to the research on achievement and educational aspirations in prison. What we found indicates a broad interest in education among incarcerated people that is not specific to gender, educational attainment, race (except perhaps among incarcerated Hispanics), or parental education, that becomes stronger with age and that is predicted by cognitive skill. In addition, we find that a substantial majority of people in prison across all the co-variables and independent variables studied except one (having below high school educational attainment) that aspire to any level of education, indicate that they ultimately seek postsecondary education. In addition, those that aspire to postsecondary education have higher cognitive skill scores than those who seek programs other than postsecondary education. Given the malleability of cognitive skills, this would seem to suggest an opportunity for skill-building programs within prisons that could enhance interest in further educational attainment, perhaps increasing the pool of students motivated to pursue additional education, including postsecondary education in prison or after release. Higher levels of educational attainment could have a significant impact on the quality of life of these individuals, their families, and their communities in the future, in addition to public safety gains (Davis et al, 2013; Attewell and Lavin, 2007). Finally, enhancing cognitive skill-building programs in prison could aid corrections and college program staff in cultivating more interest in education programs, potentially diversifying the pool of applicants to postsecondary programs by increasing interest among underrepresented populations (for example Hispanic people). [Source: From the conclusion, p. 22]

Demirbolat, A. O. (2019). A study on the relationship between mean years of schooling, literacy skills level of the countries, and their level of democratic development. *World Journal of Education*, 9(1), 145-151. doi: 10.5430/wje.v9n1p145

**Abstract:**

This study's objective is to examine the relationship between the mean years of schooling, level of adult literacy skills, and democratic development levels. The study was designed as a relational survey model. The analytics employed is the path analysis, which tests the existence of causal relationship between the variables. The statistical analysis indicates that a significant and strong relationship exists between the mean years of schooling and adult literacy skills and further that a significant, medium level, relationship is present between the countries' adult literacy skills and their democratic development levels. Moreover, literacy skills create a significant mediation impact on the relationship between the mean years of schooling and democratic development level. Also significant is the indirect impact of the nations' mean years of schooling on their democratic development levels. Countries seeking to sustain and protect participative and deep democracy may need to review their formal and informal education policies. Therefore, it may be especially necessary to attach greater importance to cognitive-verbal processes in formal education institutions as a departure point of action.

**Title:**

Desjardins, R. (2019). The relationship between attaining formal qualifications at older ages and outcomes related to active ageing. *European Journal of Education*, 54(1), 30-47. doi: 10.1111/ejed.12315

**Abstract:**

Active ageing has become a policy concept that serves as an important response to the ageing of many societies, primarily because it is thought to lead to positive outcomes such as increased employment, productivity, health and other well-being into older ages. This article presents results of an analysis of the relationship between attaining qualifications at older ages and active ageing in later life. The analysis is based on data made available by the Programme for the International Assessment of Adult Competencies (PIAAC). Results of the analysis show that adults who attain higher levels of qualifications in mid to later life are associated with an increased probability of, being employed, participating in continued learning, and scoring higher on the PIAAC literacy scale when they are older. The findings suggest that open and flexible formal education structures at all levels is good for activating the population to be employed, to engage in continued learning and to develop and maintain literacy skills into older ages.

Desjardins, R. (2019). *Revisiting the determinants of literacy proficiency: A lifelong-lifewide learning perspective*. Commissioned Paper Washington: PIAAC Gateway. Retrieved February 28, 2020, from [https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5dd814b4f6489a1d4d9bf678/1574442164794/2019\\_Desjardins\\_Determinants\\_Literacy.pdf](https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5dd814b4f6489a1d4d9bf678/1574442164794/2019_Desjardins_Determinants_Literacy.pdf)

**Abstract:**

Emphasis on the acquisition and maintenance of literacy skills has grown due to mounting evidence of their importance to quality of life and overall societal productivity and social cohesion. This is one of the underlying motivations for the OECD's Programme for the Assessment of Adult Competencies (PIAAC). Important goals of the PIAAC study are to provide an accurate overview of the extent and distribution of literacy proficiency and other core competencies among and within countries in a comparable manner, and to study the antecedents as well as individual and societal outcomes associated with such competencies. Foremost, an important goal is to provide data to

conduct analyses which can suggest ways in which policymakers might work to augment adult literacy competencies in the society in which they live and work. To do so, it is important to understand the determinants of literacy proficiency, how they may be implicated in the development of literacy from an individual lifecycle perspective, as well as how they may be implicated in development of national profiles of literacy proficiency as countries' socio-demographic make-up, socio-cultural practices and economies change over time. As part of the PIAAC study, direct links were established with the International Adult Literacy Survey (IALS) conducted in the 1990s, which together now provide measures of literacy proficiency and a range of antecedents that are comparable over time and across countries. First results of the PIAAC study were reported in OECD (2013a) which included some analysis of the determinants of literacy proficiency. Similarly, Desjardins (2003) summarized results from an extensive analysis of the determinants of literacy on the basis of the IALS data. The purpose of this paper is to revisit research examining the determinants of literacy proficiency and specifically to examine further the underlying structure of the determinants from a lifecycle perspective as well as the trends in this structure at the macro level for countries that participated in both the PIAAC and IALS studies.

**Title:**

Dohmen, D., Yelubayeva, G., & Wrobel, L. (2019). *Patterns in adult education participation in Europe*. FiBS-Forum No. 65. Berlin: Forschungsinstitut für Bildungs- und Sozialökonomie (FiBS). Retrieved February 28, 2020, from <http://hdl.handle.net/10419/203472>

**Abstract:**

In light of the growing importance of lifelong learning and the increased skills demand more and more studies focus on adult education statistics to derive policy recommendations. In part, the project VoRREFi-WB ("Economic and regional costs, funding structures and benefits of continuing education") aims to producing a more grounded analysis of perspectives on adult education and to contribute to the discussion of several EU policy objectives, especially with respect to the follow-up indicators of the Lisbon strategy and the new Europe 2020 strategy. There is an urgent need for a common understanding of adult education statistics to overcome misinterpretations of Europe-wide comparable datasets on adult education. This paper provides an in-depth analysis of issues related to adult learning classifications and statistical concerns as well as an analysis of the development and performance of the adult education sector in Europe. The main overarching policy objectives to which the VoRREFi-WB project contributes include: Analysing trans-European data on the adult education sector to monitor the multiplicity of adult learning and to develop evidence-based policies; Achieving better insights about and understanding of the participation of adult learning, its participants, providers and nature. In the literature, analysts use a variety of concepts of training. Moreover, compared to compulsory education and higher education, data on adult education are limited due to their varied nature and the high dispersion of providers. Since for their surveys analysts must draw on what is available in terms of data, the emphasis is generally placed on simple measures of training participation, for example, whether training has been received during a particular time period. Furthermore, are statistical issues arise from the method of data collection as well as the varied wording of survey questions. Thus far, the literature is less focused on training aspects such as its duration, purpose, funding, location and the number of courses taken. These concepts have, however, often been regarded as important in more general discussions about the provision of training. To restate, this paper aims to fill the gap in the analysis of statistical data collection of adult education surveys, to provide a holistic analysis of the content and comparability of surveys as well as of current trends with comprehensive data split by contextual factors.

Doposo-Fernández, R., Giusti, G., & Kucel, A. (2019). *Predicting job satisfaction through individual cognitive ability and job autonomy*. Barcelona: Escola Superior de Ciències Socials i de l'Empresa de Tecnocampus, Universitat Pompeu Fabra. doi: 10.2139/ssrn.3404302

**Abstract:**

This paper analyzes the effects of cognitive ability on job satisfaction. Using PIAAC data we explore whether job satisfaction predictors observed in the literature change their behavior once we control for cognitive ability, proxied by an explicit test of individual numeracy level. We show that both, learning at work and job autonomy affect differently the job satisfaction for workers interacting with their level of cognitive ability measured. While learning increases job satisfaction for highly cognitive-able workers, task discretion (a measure of job autonomy) is particularly well valued by lower cognitive-able workers.

**Title:**

Dudaitė, J. (2019). Literacy change as a result of the education reform: Comparison among the Post-Soviet countries. *New Educational Review*, 54(1), 17-28.

**Abstract:**

In 1989 – 1991, after the collapse of the Soviet Union, it was an auspicious moment for structural changes in education systems in the new independent countries, which had been under control of the Soviet government for a long time. About three decades have passed since the beginning of the education reforms in the post-Soviet countries and several generations who studied within the framework of the reformed systems starting from the first grade have already grown up. Therefore, it is relevant to estimate the results of the reforms. One of the possible measures for estimating the results of the education system or education reform is the change in population literacy within certain education systems. The purpose of the article is to compare the results of education reforms of the post-Soviet countries based on the population literacy considered as a result of former learning. The data of the Programme for the International Assessment of Adult Competencies (PIAAC) organised by the Organisation for Economic Co-operation and Development (OECD) are used for literacy comparison. The OECD PIAAC survey databases of Lithuania, Estonia, Russia, Poland, the Czech Republic, Slovakia and Slovenia were used for comparison of the results of the reforms implemented in the post-Soviet countries. Data analysis showed that at the lower and upper secondary education levels, the most positive results of the education reform were observed in Lithuania, while in Russia, the results were negative.

Engelhardt, L., & Goldhammer, F. (2019). Validating test score interpretations using time information. *Frontiers in Psychology*, 10(1131), 1-18 doi: 10.3389/fpsyg.2019.01131

**Abstract:**

A validity approach is proposed that uses processing times to collect validity evidence for the construct interpretation of test scores. The rationale of the approach is based on current research of processing times and on classical validity approaches, providing validity evidence based on relationships with other variables. Within the new approach, convergent validity evidence is obtained

if a component skill, that is expected to underlie the task solution process in the target construct, positively moderates the relationship between effective speed and effective ability in the corresponding target construct. Discriminant validity evidence is provided if a component skill, that is not expected to underlie the task solution process in the target construct, does indeed not moderate the speed-ability relation in this target construct. Using data from a study that follows up the German PIAAC sample, this approach was applied to reading competence, assessed with PIAAC literacy items, and to quantitative reasoning, assessed with Number Series. As expected from theory, the effect of speed on ability in the target construct was only moderated by the respective underlying component skill, that is, word meaning activation skill as an underlying component skill of reading competence, and perceptual speed as an underlying component skill of reasoning. Accordingly, no positive interactions were found for the component skill that should not underlie the task solution process, that is, word meaning activation for reasoning and perceptual speed for reading. Furthermore, the study shows the suitability of the proposed validation approach. The use of time information in association with task results brings construct validation closer to the actual response process than widely used correlations of test scores.

Feinberg, I., Tighe, E. L., Talwar, A., & Greenberg, D. (2019). *Writing behaviors relation to literacy and problem solving in technology-rich environments: Results from the 2012 and 2014 U.S. PIAAC study*. Commissioned Paper Washington: PIAAC Gateway. Retrieved March 5, 2020, from [https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5d3a210b5abd570001becd72/1564090635798/2019\\_Feinberg\\_Tighe\\_Talwar\\_Greenberg\\_WritingBehaviors.pdf](https://static1.squarespace.com/static/51bb74b8e4b0139570ddf020/t/5d3a210b5abd570001becd72/1564090635798/2019_Feinberg_Tighe_Talwar_Greenberg_WritingBehaviors.pdf)

**Abstract:**

Writing is a fundamental skill used in everyday life and in the workplace, yet there is a paucity of research describing adults' self-reported writing behaviors as a function of their measured literacy and digital skills. Writing is a critical survival skill in the 21st century as adults need to fill out forms or write emails or letters in both paper-based and digital environments for many different reasons such as health care, banking, voting, and education. Empirical evidence has found that in children, reading and writing skills are positively related, yet little is known about this relationship for adults. To deepen our understanding of this relationship, the study aims: a. to gain an understanding of relations among overall reading and writing behaviors at home and at work; b. to examine functional writing behaviors (writing emails/letters/memos, filling in forms) among lower- and higher-skilled adults in the Program for the International Assessment of Adult Literacy (PIAAC) Literacy and Problem Solving in Technology-Rich Environments (PSTRE) by varying demographic characteristics (age, race, native language status, job category); and c. to examine the predictive relations of Literacy, PSTRE, and reading behaviors to writing behaviors at home and at work and whether the relations of reading behaviors to writing behaviors depends on higher or lower literacy skills.

Fernandez, F., & Liu, H. (2019). Examining relationships between soft skills and occupational outcomes among U.S. adults with - and without - university degrees. *Journal of Education and Work*, 32(8), 650-664. doi: 10.1080/13639080.2019.1697802

**Abstract:**

Policymakers are increasingly concerned that employees need both foundational skills, such as numeracy, and soft skills to take better advantage of new technologies and adapt to changing work. In this study, we examined the relationships between the use of soft skills and occupational outcomes among a nationally representative sample of adult workers in the United States. Based on our analysis of PIAAC data, we found that even after accounting for numeracy skill and university degrees, there were positive, statistically significant relationships between the use of soft skills (i.e. Readiness to Learn; Influence; Planning; and Task Discretion) and workers' occupational outcomes. Our findings also suggested that, relative to university graduates, adult workers without university degrees tend to have higher occupational status if they more frequently exercise soft skills.

Fialho, P., Quintini, G., & Vandeweyer, M. (2019). *Returns to different forms of job related training*. OECD Social, Employment and Migration Working Papers No. 231. Paris: OECD Publishing. doi: 10.1787/b21807e9-en

**Abstract:**

This study aims at disentangling the returns to formal, non-formal and informal training and fills key knowledge gaps. Informal learning is found to be by far the most common form of job-related learning at work. Learning informally at work is found to be associated with 3.5% higher wages, on top of the wage returns of non-formal training which amount to about 11%. Work environments which apply high performance work organisation practices – i.e. where workers have more autonomy and work in teams – are found to nurture a training culture that yields high returns. Workers in these contexts are 12% more likely to experience informal learning. In addition, they also reap higher returns from the training they attend, both non-formal and informal. This suggests that HPWP may amplify the benefits of learning at work, possibly giving workers more opportunities to turn what they learn into immediate use because of the increased flexibility in organising once work.

Flisi, S., Goglio, V., Meroni, E. C., & Vera-Toscano, E. (2019). Cohort patterns in adult literacy skills: How are new generations doing? *Journal of Policy Modeling*, 41(1), 52-65. Retrieved March 4, 2020, from doi: 10.1016/j.jpolmod.2018.10.002

**Abstract:**

Skills are core elements of the socio-economic prospects of individuals, while they also improve national productivity, growth and social cohesion. Understanding how skills evolve over time and what drives their evolution has become a policy priority of many European countries. Using the 1994–1998 International Adult Literacy Survey (IALS) and the 2012 Survey on Adult Skills (PIAAC) we build synthetic cohorts and examine how the population gains, loses or preserves cognitive skills (literacy) over time. While, as expected, deterioration in the level of skills due to ageing is common to almost all the European countries studied, for some of them concerns arise for the occurrence of skill deterioration across generations, especially among less well-educated and medium-educated individuals. Certain countries appear to be doing a poorer job in providing the necessary literacy skills over successive generations.

Fogg, N., Harrington, P., & Khatiwada, I. (2019). *Skills and the earnings of college graduates. The impact of human capital in the American labor market series*. The Impact of Human Capital in the American Labor Market Series Princeton: ETS Center for Research on Human Capital and Education Research and Development Educational. Retrieved March 4, 2020, from <https://files.eric.ed.gov/fulltext/ED595423.pdf>

**Abstract:**

In this paper, the second in the "Impact of Human Capital in the American Labor Market" series, the authors reveal that there are large groups of college graduates who lose out on the seemingly automatic earnings premium from their degree, and that their failure is related to a lack of skills. One of every five bachelor's degree holders among employed college graduates ages 21 to 65 lacks some important skills in literacy. For numeracy, the number is one in three. Furthermore, the authors determined that access to college labor market, or CLM, occupations is critical. Working in an occupation that utilizes the skills, knowledge, and abilities that are typically developed with a college education reaps large earnings premiums. But those who wind up mal-employed—working in jobs that do not require those types of skills—get no premium at all. This report amplifies a crucial message emanating from a wider series of reports by the ETS Center for Research on Human Capital and Education: the importance of human capital and the cost to a large number of individuals—and to society itself—when levels of it are lacking. Specifically, this report examines the relationship between Programme for the International Assessment of Adult Competencies (PIAAC), an assessment measuring achievement for countries across the world, measures of human capital traits and the earnings of 21- to 65-year-old employed college graduates in the United States. It begins with an examination of the basic demographic characteristics of employed college graduates, level of college degree completion, college major field of study, literacy and numeracy proficiencies, access to college level jobs, and intensity of employment (weekly hours of work). The next section contains a descriptive analysis of the mean earnings of college graduates by key characteristics including college degree and major, literacy and numeracy proficiencies, and access to employment in CLM occupations. Following the descriptive analysis, the report presents findings from human capital earnings functions designed to estimate the independent effect of human capital traits and other covariates on the earnings of employed college graduates in the United States.

Franzini, M., & Raitano, M. (2019). Earnings inequality and workers' skills in Italy. *Structural Change and Economic Dynamics*, 51, 215–224. doi: 10.1016/j.strueco.2019.09.004

**Abstract:**

The increasing trend of earnings inequality observed in many countries is usually ascribed to a higher premium to skills, commonly proxied by education. Focusing on Italy, a country characterized by a steep rise in earnings inequality since the '90s, we aim at verifying whether this trend is attributable to education. Making use of administrative data about private employees, we carry out Theil decompositions and estimate wage equations to investigate how much of this trend is linked with education and other observable worker's and firm's characteristics. We find that the rise in earnings inequality is explained by the "within education" component, rejecting the idea that it is due to a higher premium for the high-skilled. Furthermore, controlling for workers' and firms' characteristics in wage regressions – also including workers' literacy and numeracy recorded in OECD-PIAAC – we find that level and trend of earnings inequality are not explained by these characteristics.

Galeshi, R., & Bolin, R. M. (2019). *The influence of correctional education, skills, and lifelong learning on social outcomes*. Commissioned Paper Washington: PIAAC Gateway. Retrieved March 5, 2020, from <http://piaacgateway.com/researchpapers>

**Abstract:**

A rich body of scientific research suggests a positive relationship between education and social and political engagement. Active social engagement is important for incarcerated individuals if they are to successfully reintegrate into communities and desist from further involvement in crime. While a plethora of research has focused on the importance of correctional education, the extent of association between other forms of human capital such as cognitive skills and adult lifelong learning is unclear. The current study utilized data from the U.S. PIAAC Prison Study (2014) to explore the relationship between educational attainment, adult cognitive skill proficiency, lifelong learning, and social outcomes among incarcerated individuals. At least one of the three types of human capital variables included was found to be positively and significantly related to the three social outcomes of political efficacy, interpersonal trust, and health perception, even after controlling for the other two human capital variables and a number of demographics, demonstrating that each has its own, distinct contribution to social outcomes. Policy implications regarding these findings are discussed.

Gauly, B., & Lechner, C. M. (2019). Self-perfection or self-selection? Unraveling the relationship between job-related training and adults' literacy skills. *PLOS ONE*, *14*(5), 1-23. doi: 10.1371/journal.pone.0215971

**Abstract:**

Can participation in job-related training contribute to the formation and maintenance of adults' literacy skills? Although evidence suggests that participation in training is related to higher literacy skills, it remains unclear whether this association reflects a causal effect of training participation on literacy (training effects), results from the self-selection of more high-skilled individuals into training (selection effects), or is due to other sources of endogeneity (e.g., omitted variable bias). To unravel these possibilities, we used data from the Programme for the International Assessment of Adult Competencies (PIAAC) and its German follow-up, PIAAC-Longitudinal (PIAAC-L). As these unique data offer repeated measures of literacy skills, spaced three years apart, in a large and representative sample, they allowed us to disentangle training effects from selection effects and to account for potential endogeneity. Analyses revealed that, even after taking account of formal education and a host of job characteristics, individuals with higher literacy skills were more likely to participate in training. By contrast, no evidence for effects of training on literacy skills emerged in any of our models, which comprised lagged-dependent, fixed effects, and instrumental-variable models. These findings suggest that, rather than job-related training contributing to literacy development, individuals with higher literacy skills are more likely to participate in training.

Geis-Thöne, W. (2019). Sprachkenntnisse entscheidend für die Arbeitsmarktintegration [Language proficiency and labour market integration]. *IW-Trends - Vierteljahresschrift zur empirischen Wirtschaftsforschung*, 46(3), 73-89. doi: 10.2373/1864-810X.19-03-05

**Abstract:**

Unlike their level of formal education, it is very difficult to monitor immigrants' German language skills and there is always a degree of uncertainty about their measurement. For this reason, the relationship between language skills and wages and unemployment was analysed using three different sets of data. In the National Education Panel and the PIAAC study, knowledge of German was measured using standardised tests, ensuring good comparability and accuracy of data. However, recent immigrants are not included in these datasets. The Socio-Economic Panel does cover the newly arrived, but only contains self-assessments of their language level. The National Educational Panel and the Socio-Economic Panel fail to find any wage differences between immigrants and natives when language skills and formal educational attainment are controlled for. In the PIAAC study, wage differences are so small as to be of scarce practical relevance. For unemployment there is no uniform picture. However, here too the results suggest that language skills are a decisive factor. On average, highly qualified immigrants perform better in the German tests than the low-skilled without a migration background. Language problems are therefore not exclusive to members of migrant families. In certain cases the indigenous population would also benefit from courses in basic literacy to improve their language skills.

Geraint, J. (2019). The incidence of and returns to 'overeducation': PIAAC evidence on the G7. *Minnerva*, 57(1), 85-107. doi: 10.1007/s11024-018-9357-1

**Abstract:**

PIAAC data are used to evaluate the extent of overeducation in G7 countries. Incidence of overeducation is seen to vary systematically with a number of demographic characteristics. The impact of overeducation on remuneration is then estimated using quantile regression. This impact is observed to be minor, suggesting that while some individuals have qualifications in excess of those required to undertake their job, their additional human capital is nonetheless rewarded. Care therefore needs to be taken in interpreting measures of overeducation.

Gray, C. M. K. (2019). Using profiles of human and social capital to understand adult immigrants' education needs: A latent class approach. *Adult Education Quarterly*, 69(1), 3-23. doi: 10.1177/0741713618802271

**Abstract:**

With the U.S. adult education system providing education services to millions of immigrants annually, understanding the unique skills and assets among adult immigrant learners is important. Using data from the U.S. Program for the International Assessment of Adult Competencies, this study used data on immigrants (n = 1,873) to identify latent classes along dimensions of human and social capital. Latent class analysis indicated five discrete profiles: High Opportunity, Upskill Ready, Satisfactorily Skilled, Motivated and Engaged, and Highly Skilled. The results provide sup-

port for using customized education approaches to capitalize on the collection of assets adult learners have while concurrently increasing education service providers' capacity to serve.

Greenberg, D., & Feinberg, I. Z. (2019). Adult literacy: A perspective from the United States. *Zeitschrift für Erziehungswissenschaft*, 22(1), 105-121. doi: 10.1007/s11618-018-0853-8

**Abstract:**

Although low adult literacy has a long history in the United States, it continues to be very prevalent. Low literacy skills impact adults' abilities to read, write, compute, use technology, and successfully engage in functional areas such as health. Adults in the United States who have literacy difficulties are a heterogeneous group. As an example of a skill considered difficult by those who struggle with literacy, health literacy is discussed. This article describes the landscape of adult literacy in the United States, with a highlighted focus on health literacy. It concludes with the notion that more research is needed in all areas of literacy to better understand how to interact with and teach adults in the United States who have low literacy skills.

Grotlüschen, A., Buddeberg, K., Redmer, A., Ansen, H., & Dannath, J. (2019). Vulnerable subgroups and numeracy practices: How poverty, debt, and unemployment relate to everyday numeracy practices. *Adult Education Quarterly*, 69(4), 251-270. doi: 10.1177/0741713619841132

**Abstract:**

Adult numeracy is underresearched especially regarding numeracy practices. Research shows general correlations between numeracy skills and the use of these skills, indicating that low proficient groups use their skills less often than others do. Earlier research also shows correlations of low numeracy skills and practices with low income. Both results feed stereotypes that vulnerable subgroups—with low numeracy proficiency or a low monthly budget—would not calculate much and this would even cause their complicated income situation. Findings of this article show that the tighter the budget is the more likely vulnerable subgroups are to monitor it by frequent calculations of prices, costs, or budgets. This article connects representative Programme for the International Assessment of Adult Competencies data from the German data set with a local sample of people with lowest income. Findings show that vulnerable subgroups calculate more often than other parts of the population, but they mostly do without technical devices.

Grotlüschen, A., Thériault, V., Nienkemper, B., & Capstick, T. (2019). Critical viewpoints on adult literacy practices at the time of PIAAC. *International Journal of Lifelong Education*, 38(4), 361-365. doi: 10.1080/02601370.2019.1614105

**Abstract:**

The aim of this special issue is to question and, in our exploration, unsettle the rising hegemony of skills-oriented approaches and ideologies driven by the power of international literacy surveys such as the Programme for the International Assessment of Adult Competencies (PIAAC) in the field of adult education. This special issue is the culmination of many years of collaboration and

discussions. Two symposiums were held in 2016 that have established the foundations of this collection of research papers: the first one was in Maynooth, as part of the European Society for Research on the Education of Adults Conference, and the second in Dublin, as part of the European Educational Research Association Conference. Yet, the scope of the special issue goes beyond Europe and includes perspectives from different national contexts (Canada, Germany, Japan, New Zealand, Pakistan, and the United Kingdom) that present alternative views on adults' literacy practices. It sheds light on adults' literacy practices, on the creativity needed to research these practices, and on the obstacles researchers and practitioners face in trying to confront the dominant skill-oriented perspective on literacy (Duckworth & Hamilton, 2016). This creativity can be seen in the multi-disciplinary frameworks drawn on in this special issue, frameworks that have literacy practices as their central orientation as they aim to account for the socio-political influences and political processes that shape adult literacies. The papers focus on aspects that are generally not considered in large-scale literacy surveys such as multilingual literacy practices, emotions, and social contexts. Drawing on the New Literacy Studies (NLS), the papers adopt a 'literacy as social practice' perspective (Barton & Hamilton, 1998; Street, 1984). This perspective recognises that there is more to literacy than skills. Accordingly, literacies are looked at in terms of what people do, as part of social interactions, as multimodal, and as situated in complex and layered social contexts.

Hämäläinen, R., Wever, B. D., Nissinen, K., & Cincinato, S. (2019). What makes the difference – PIAAC as a resource for understanding the problem-solving skills of Europe's higher-education adults. *Computers & Education*, 129, 27-36. doi: 10.1016/j.compedu.2018.10.013

**Abstract:**

The ever-evolving technological landscape is challenging adults' problem-solving skills. The central goal of higher education (HE) is to guarantee a high level of know-how, which is in line with the changing demands of technology at work and in everyday life. This study builds on European data from the Programme for the International Assessment of Adult Competencies (PIAAC) to understand adults' (N = 53,407) skills for solving problems in technology-rich environments. The study provides insight into the socio-demographic, work-related, and everyday factors that are associated with a strong and a weak problem-solving performance. The results indicate that HE adults stand out from adults with other educational backgrounds. Having a higher education degree is related with strong problem-solving skills. Still, it is rather surprising that only 15% of HE adults are strong problem-solvers and that as many as 35% can be considered weak problem-solvers. Since this century requires citizens to possess more and more skills to resolve problems in technology-rich environments, this study identifies the indicators for problem-solving skills differences. Namely, this article presents the models that predict problem-solving performance on the basis of theoretical assumptions as well as empirical support. Our results indicate that HE adults' strong or weak performance seems to be associated with socio-demographic factors (especially age, gender, parental education, and native speaking skills), as well as work-related and everyday-life factors. The models presented in this study may be helpful when developing HE practices and new approaches to foster HE adults' problem-solving skills to meet the needs of technological advancement at work and in everyday life.

Hamilton, M. (2019). The discourses of PIAAC. Re-imagining literacy through numbers. In F. Finnegan & B. Grummell (Eds.), *Power and Possibility. Adult Education in a Diverse and Complex World* (pp. 65-74). Leiden: Brill. doi: 10.1163/9789004413320\_006

Abstract: Mary Hamilton reveals in her analysis of how people's own experience and meanings of literacy are devalued and rendered invisible in international comparative surveys such as PIAAC. As she argues, such surveys play a significant role in the establishment of new forms of governance and social regulation on a global and national basis, where power is exerted through data management and efforts are made to normalize knowledge in line with neoliberal views of the world, leading to a narrowing of the educational imagination. [Source: From the editor's introduction, Finnegan & Grummell, p. 7]

Hampf, F. (2019). *The effect of compulsory schooling on skills: evidence from a reform in Germany*. ifo Working Paper Series No. 313. Munich: ifo Institute - Leibniz Institute for Economic Research. Retrieved February 28, 2020, from <https://www.ifo.de/publikationen/2019/working-paper/effect-compulsory-schooling-skills-evidence-reform-germany>

**Abstract:**

Based on high-quality skill data from PIAAC, this paper provides evidence on the effect of schooling on labor-market relevant cognitive skills. For identification, I exploit the staggered introduction of a compulsory ninth grade in basic track schools across German states, as well as a simultaneous reform that introduced short school years to harmonize the start of the school year nation-wide. Instrumental-variable results suggest that the additional year of compulsory schooling increased numeracy skills of basic-track students by about 0.2 standard deviations. Using superior skill data, the results contrast with previous evidence of zero skill effects of compulsory schooling in Germany

**Abstract:**

In this study, we construct a measure of human capital using micro datasets on labor composition of age, gender, education, and wage rate and analyze its role in economic growth for the Korean economy. Over the past three decades, human capital has grown steadily at about 1% per year, contrasting to a continuously declining trend of total workhours. This growth has been driven by the rise of better-educated baby boom cohorts. A growth accounting exercise shows that human capital contributes significantly to economic growth; it accounted for 0.5% points of annual GDP growth over the period. Human capital is projected to remain a major growth factor over the next two decades as the increase in educational attainment continues. Increased employment rate of elderly or female workers reduces the aggregate human capital growth while increasing the avail-

able labor. Policies to improve human capital of less-productivity workers will help to support aggregate human capital and economic growth.

**Abstract:**

The evaluation of educational programs has accelerated dramatically in the past quarter century. While such evaluations were once almost exclusively conducted in the U.S., they have broadened dramatically across many countries of the world. At the same time, the methodology has improved, strengthening considerably the internal validity of various studies. We must now consider what conclusions can be drawn from the growing wealth of international results. In particular, available cross-national studies on a variety of topics suggest using caution when generalizing results, because the results vary systematically with a number of institutional characteristics of the different countries that are not explicitly considered in within-country analyses.

Hanushek, E. A., Piopiunik, M., & Wiederhold, S. (2019). Do smarter teachers make smarter students? International evidence on teacher cognitive skills and student performance. *Education Next*, 19(2), 57-64.

**Abstract:**

Student achievement varies widely across developed countries, but the source of these differences is not well understood. One obvious candidate, and a major focus of research and policy discussions both in the United States and abroad, is teacher quality. Research and common sense tell that good teachers can have a tremendous impact on their students' learning. But what, exactly, makes some teachers more effective than others? Can systematic evidence be provided that teachers' cognitive skills matter for student achievement? Do smarter teachers make for smarter students? And if so, how might education systems recruit teachers with stronger cognitive skills in the U.S.? To investigate these questions, the authors look at whether differences in the cognitive skills of teachers can help explain differences in student performance across developed countries. The authors consider data from the Organization for Economic Cooperation and Development (OECD), an association of 36 largely developed countries that has assessed nationally representative samples of both adults and students in reading and math. The authors use these data to estimate the effects of teacher cognitive skills on student achievement across 31 OECD countries. They find that teachers' cognitive skills differ widely among nations--and that these differences matter greatly for students' success in school. An increase of one standard deviation in teacher cognitive skills is associated with an increase of 10 to 15 percent of a standard deviation in student performance. This implies that as much as one quarter of the gaps in average student performance across the countries in the study would be closed if each of them were to raise their teachers' cognitive skills to the level of those in the highest-ranked country, Finland. The authors also investigate two explanations for why teachers in some countries are smarter than in others: differences in

job opportunities for women and in teachers' salaries compared to those of other professions. They find that teachers have lower cognitive skills, on average, in countries with greater non-teaching job opportunities for women in high-skill occupations and where teaching pays relatively less than other professions. These findings have clear implications for policy debates here in the U.S., where teachers earn some 20 percent less than comparable college graduates.

Hanushek, E. A., Piopiunik, M., & Wiederhold, S. (2019). The value of smarter teachers. International evidence on teacher cognitive skills and student performance. *Journal of Human Resources*, 54(41), 857-899. doi: 10.3368/jhr.54.4.0317.8619R1

**Abstract:**

We construct country-level measures of teacher cognitive skills using unique assessment data for 31 countries. We find substantial differences in teacher cognitive skills across countries that are strongly related to student performance. Results are supported by fixed-effects estimation exploiting within-country between-subject variation in teacher skills. A series of robustness and placebo tests indicate a systematic influence of teacher skills as distinct from overall differences among countries in the level of cognitive skills. Moreover, observed country variations in teacher cognitive skills are significantly related to differences in women's access to high-skill occupations outside teaching and to salary premiums for teachers.

Harrington, A. K., & Cummins, P. (2019). Adult education and training in Canada: Opportunities, funding, and gender gaps. *Innovation in Aging*, 3(Suppl 1), S4-S4. doi: 10.1093/geroni/igz038.012

**Abstract:**

Labor force participation rates for middle-aged and older Canadians have increased substantially over the past two decades, with increases for women outpacing men. Given the importance of adult education and training (AET) to stay competitive in later career, we used a mixed methods approach to examine gender differences. Our analysis of the 2012 Program for the International Assessment of Adult Competencies (PIAAC) data indicated that, for ages 55-65, rates of AET participation are similar for both men and women. However, women are less likely than men to have AET funded by their employers. Findings suggest that women are more likely to need alternate funding sources for AET, such as other organizations or through self-funding. In addition, our review of literature, policy-related documents, and key informant interviews identified possible changes in policies and practices for the promotion of AET for middle-aged and older Canadians.

Hazan, M., & Tsur, S. (2019). *Why is labor productivity in Israel so low?* CEPR Discussion Papers No. 14011. London: Centre for Economic Policy Research (CEPR), from [http://www.cepr.org/active/publications/discussion\\_papers/dp.php?dpno=14011](http://www.cepr.org/active/publications/discussion_papers/dp.php?dpno=14011)

**Abstract:**

We analyze differences in labor productivity between Israel and a group of small OECD countries. We assume a more general human capital production function and calibrate it using PIAAC sur-

veys, which examine the literacy and numeracy skills of the adult population in the OECD countries. Whereas Israel has more years of schooling, its population has lower measured skills. Using development accounting exercise, we show that once years of schooling and numeracy skills are taken into account, differences in accumulated factors explain more than three-quarters of the gap. This is against a split of 60-40 between accumulated factors and total factor productivity, when these skills are ignored. Additionally, using panel data on 13 OECD countries we show strong positive correlation between physical and human capital per worker at the industry level. A causal interpretation of our estimates implies that closing the gap in skills will indirectly close 18 percent of the gap in physical capital.

He, Q., Borgonovi, F., & Paccagnella, M. (2019). *Using process data to understand adults' problem-solving behaviour in the Programme for the International Assessment of Adult Competencies (PIAAC)*. OECD Education Working Papers No. 205. Paris: OECD Publishing. doi: <https://doi.org/10.1787/650918f2-en>

**Abstract:**

The Survey of Adult Skills, a product of the OECD Programme for the International Assessment of Adult Competencies (PIAAC), used computers as the main assessment deliver platform. This enabled the Programme to collect data not only on whether respondents were able to solve specific tasks, but also on how they approached the problems at hand and how much time they spent on them. This paper draws on this information to characterise individuals' problem-solving strategies using the longest common subsequence (LCS) method, a sequence-mining technique commonly used in natural language processing and biostatistics. The LCS is used to compare the action sequences followed by PIAAC respondents to a set of "optimal" predefined sequences identified by test developers and subject matter experts. This approach allows studying problem-solving behaviours across multiple assessment items.

He, Q., Liao, D., & Jiao, H. (2019). Clustering behavioral patterns using process data in PIAAC problem-solving items. In B. P. Veldkamp & C. Sluijter (Eds.), *Theoretical and Practical Advances in Computer-based Educational Measurement* (pp. 189-212). Cham: Springer International Publishing. doi: [10.1007/978-3-030-18480-3\\_10](https://doi.org/10.1007/978-3-030-18480-3_10)

**Abstract:**

Technical advances provide the possibility of capturing timing and process data as test takers solve digital problems in computer-based assessments. The data collected in log files, which represent information beyond response data (i.e., correct/incorrect), are particularly valuable when examining interactive problem-solving tasks to identify the step-by-step problem-solving processes used by individual respondents. In this chapter, we present an exploratory study that used cluster analysis to investigate the relationship between behavioral patterns and proficiency estimates as well as employment-based background variables. Specifically, with a focus on the sample from the United States, we drew on a set of background variables related to employment status and process data collected from one problem-solving item in the Programme for the International Assessment of Adult Competencies (PIAAC) to address two research questions: (1) What do respondents in each cluster have in common regarding their behavioral patterns and backgrounds? (2) Is problem-solving proficiency related with respondents' behavioral patterns? Significant dif-

ferences in problem-solving proficiency were found among clusters based on process data, especially when focusing on the group not solving the problem correctly. The results implied that different problem-solving strategies and behavioral patterns were related to proficiency estimates. What respondents did when not solving digital tasks correct was more influential to their problem-solving proficiency than what they did when getting them correct. These results helped us understand the relationship between sequences of actions and proficiency estimates in large-scale assessments and held the promise of further improving the accuracy of problem-solving proficiency estimates.

Heilmann, L. (2019). Health and numeracy: The role of numeracy skills in health satisfaction and health-related behaviour. *ZDM Mathematics Education*, 1-12. doi: 10.1007/s11858-019-01106-z

**Abstract:**

Health-related decisions make use of numeracy skills, for example counting medication dosages, extracting health-related information from food packaging or understanding statistical data. Even though the concept of health literacy is often used to explain health disparities (Freedman et al., in *American Journal of Preventive Medicine* 36:446–451, 2009), discourses that differentiate between health literacy and health numeracy are emerging. Golbeck et al. (*American Journal of Preventive Medicine* 29:375–376, 2005) defined health numeracy as “the degree to which individuals have the capacity to access, process, interpret, communicate, and act on numerical, quantitative, graphical, biostatistical, and probabilistic health information needed to make effective health decisions” (p. 375). To determine which numeracy skills impact health and health practices, the present study examines the 2015 German extension of the Programme for the International Assessment of Adult Competencies (PIAAC) survey, which collected data on numeracy skills and numeracy practices and on the perception of health and health practices (as in the socio-economic panel, SOEP). Further, it indicates which numeracy practices (or the lack of these) might play a part in poor health and in (health) vulnerability in Germany.

Heisig, J. P., Gesthuizen, M., & Solga, H. (2019). Lack of skills or formal qualifications? New evidence on cross-country differences in the labor market disadvantage of less-educated adults. *Social Science Research*, 83(102314), 102314. doi: 10.1016/j.ssresearch.2019.06.005

**Abstract:**

We use PIAAC data on the literacy and numeracy skills of 49,366 25-to-54-year-olds in 27 countries to shed new light on cross-national variation in the labor market disadvantage of less-educated adults (i.e., those who have not completed upper secondary education). Our empirical analysis focuses on the occupational status gap between less-educated adults and those with a degree at the upper secondary level and yields three main findings. First, individual-level differences in literacy and numeracy skills are an important source of cross-national variation in labor market inequalities by educational attainment, but substantial gaps in occupational status remain even after accounting for individuals' actual skills and further socio-demographics. Second, this remaining occupational status gap rises with a country's level of “skills transparency” (i.e., the extent to which formal qualifications are more informative about actual skills): labor market gaps increase as the skills gap between the two educational groups increases and as the within-group distribution of skills becomes more homogeneous. Third, country differences in skills transparency seem

to be the primary mediating channel for the inequality-enhancing effect of tracking in secondary education found in previous research.

Heller-Sahlgren, G. (2019). *Education policy for health equality: Lessons for the Nordic region*. Stockholm: Nordic Welfare Centre. Retrieved March 4, 2020, from <http://norden.diva-portal.org/smash/get/diva2:1315464/FULLTEXT01.pdf>

**Abstract:**

In the Nordic countries, health is linked to educational attainment to a higher extent than to income. Studies have now shown that the progressive pedagogy which generally characterizes Nordic teaching is likely to actually increase social disparities in health. The Education Policy for Health Equality – Lessons for the Nordic Region report analyses the link between health, education, knowledge and pedagogical methods. Health is often linked to educational attainment, to a greater extent than to income. Therefore, it is important to examine the extent to which education policy can contribute to, or be counterproductive to, health equality and health equity. In the report research director Gabriel Heller-Sahlgren raises a critical voice against the type of progressive, student-centered learning that the Nordic countries utilize to varying degree. It is the report's recommendation that student-centered learning should be reassessed and phased out if the school is to contribute to greater equality in health and provide all children a good education.

**Title:**

Hicks, J. C. (2019). *The use of process data to examine reading strategies* (Dissertation). University of North Carolina at Greensboro.

**Abstract:**

Researchers are increasingly interested in the cognitive behaviors students display during tests. This interest has led researchers to look for innovative ways to collect this type of data. Due to the proliferation of computer-based assessments, process data has become popular for its ability to help show what students know, what students don't know, and how students interact during assessments. Aim: The aims of the current study are 1) to use process data to identify potential reading strategies and 2) to examine if reading strategy is associated with gender, race/ethnicity, and differences in performance. Methods: Apply latent profile analysis (LPA) to extracted process data variables collected from US examinees who participated in the literacy section of the Program for the International Assessment of Adult Competencies (PIAAC). The variables are item response time and number of highlight events per item. Results: A two-class solution provided the best fit for the data in each testlet of the literacy section of the PIAAC. Class one progressed through items in each testlet faster than class two. Class one most closely resembled a skimming strategy while class two most closely resembled a full-reading strategy. However, there was not conclusive evidence to suggest that the classes were reminiscent of skimming and full-reading. Class assignment had no significant relationship with gender nor race/ethnicity, and there was no significant difference in literacy performance between the two classes, except in one case. Even then, both classes performed at a level two on the PIAAC literacy achievement scale. Discussion: Response time was found to be the only discriminating variable in the identification of patterns related to reading strategies. While there was some separation between classes, it was minimal in some cases. Response time was found to be useful but not enough to identify conclusive reading strategies. Fur-

ther research is needed to identify process data variables with explanatory power other than response time to aid in the identification of reading strategies.

Hu, M. (2019). *Three essays on labour and health outcomes of vulnerable populations in Canada* (Dissertation). Dalhousie University. Retrieved March 5, 2020, from <http://hdl.handle.net/10222/75415>

**Abstract:**

This dissertation contains three essays examining the labour market and health outcomes of vulnerable populations in Canada. The first essay examines the relationship between information-processing skills, educational attainment, and labour market outcomes among Indigenous peoples in Canada, and uses the 2012 Programme for the International Assessment of Adult Competencies (PIAAC). Relative to the non-Indigenous sample, this study finds negative earning differentials, lower information-processing skills, higher unemployment, lower employment and labour market participation among Indigenous peoples. The results show a positive relationship between skills and earnings and there is no evidence of economic discrimination based on the returns to skills which are very similar for both groups. The results also imply the need to consider barriers to education faced by Indigenous peoples. The second essay measures and examines the gender gaps in the health status among Indigenous adults living off-reserve in 2001, 2006 and 2012 with three corresponded Aboriginal People Surveys (APS). It shows that the self-rated general health gap between Indigenous males and females widened from 1.6 to 5.2 percentage point between 2001 and 2012. Oaxaca-Blinder decomposition shows that differences in the observable characteristics between males and females explain more than half of the gender difference in good general health. Specifically, the results indicated that improving socioeconomic status and participation in traditional activities of females to the level of males will effectively reduce the gender health gap among Indigenous peoples in Canada. The third essay investigates the causal detrimental effect of Ramadan fasting during pregnancy on infant birth weight and fraction of male births in Canada. With seven million birth record from 1990-2016 Canadian Vital Statistics Birth Record, and large variation in daylight hours within geographic locations over time, as well as across locations, this study also enables estimations of a large amount variation in Ramadan fasting hours. The results show that babies of Muslim mothers have lower average birth weight and are more likely to be below the low birth threshold. Moreover, once the extreme fasting hours are removed, modest reductions are found in birth weight associated with Ramadan falling on the ninth, seventh or fifth month of pregnancy.

Hu, M., Daley, A., & Warman, C. (2019). Literacy, numeracy, technology skill, and labour market outcomes among indigenous peoples in Canada. *Canadian Public Policy*, 45(1), 48-73. doi: 10.3138/cpp.2017-068

**Abstract:**

We use the 2012 Programme for the International Assessment of Adult Competencies to examine the relationship between information-processing skills, educational attainment, and labour market outcomes among Indigenous peoples in Canada. Relative to the non-Indigenous sample, we find negative earnings differentials, higher unemployment, and lower employment and labour

market participation among Indigenous peoples, as well as important differences between First Nations, Métis, and Inuit workers. First Nations peoples show larger gaps in terms of earnings and employment outcomes. Moreover, Métis peoples show worse employment outcomes and negative earnings differentials in the upper part of the distribution. First Nations peoples also show sizable gaps in literacy, numeracy, and technology skill relative to the non-Indigenous sample. Not surprisingly, there is a positive relationship between information-processing skills and wages. However, the returns to skills are very similar for Indigenous and non-Indigenous peoples. That is, we find no evidence of economic discrimination. Once these skills are conditioned on, the earnings differentials decline. We also find that education can reduce skill and wage gaps, although the additional impact is small. The results imply the need to consider barriers to education faced by Indigenous peoples.

Huber, E., Gunderson, J., & Stephens, J. D. (2019). Private education and inequality in the knowledge economy. *Policy and Society*, 1-18. doi: 10.1080/14494035.2019.1636603

**Abstract:**

This article explores the consequences of public and private spending on education at all levels, looking at skills and income inequality. We use data for 22 affluent democracies from 1960 or 1995 (depending on data availability) to 2017. High levels of public education spending consistently lower income inequality, both measured as wage dispersion and as the education premium. In contrast, higher levels of private education spending are associated with both higher wage dispersion and a higher education premium. We show that this effect works in part through differential skills acquisition. Public education spending raises the math scores of 15-years old students at the mean and at the 25th percentile, but private education spending has no effect on skills at these levels. We find the same pattern among skills of adults; public education spending raises skills at the 25th percentile and the mean; private spending has no effect. Finally, we also show that higher levels of adult skills indeed depress the education premium.

Icardi, R. (2019). Does workplace training participation vary by type of secondary level qualification? England and Germany in comparison. *International Journal of Lifelong Education*, 38(6), 615-631. doi: 10.1080/02601370.2019.1689434

**Abstract:**

Existing evidence shows that the higher the level of education the higher the likelihood to participate in workplace training. However, we know little about training participation of individuals educated to the secondary level, and whether this may vary by the type of qualification attained, i.e. vocational or general. Vocational qualification holders are known to find employment sooner after school than those with a general qualification but we do not know whether they are also more likely to participate in workplace training. Using data from the 2012 Programme of International Assessment of Adult Competencies (PIAAC) and logistic regressions, we investigate whether vocational qualification holders are more likely to participate in workplace training than general ones in Germany and England. Germany is a coordinated labour market economy with a large emphasis on the provision of vocational qualifications which facilitate school-to-work transitions whereas England is an example of liberal labour markets where the focus is on general qualifications. Results show that in Germany general qualification holders are more likely to participate in

training compared to vocational ones; however, differences reduce when controlling for endogeneity. In contrast, in England there is no difference between types of qualification.

Iñiguez-Berrozpe, T., & Boeren, E. (2019). Twenty-first century skills for all: Adults and problem solving in technology rich environments. *Technology, Knowledge and Learning*. doi: 10.1007/s10758-019-09403-y

**Abstract:**

The current Information Society requires new skills for personal, labor and social inclusion. Among the so-called Twenty-First Century Skills (Care et al. (eds) in *Assessment and teaching of 21st century skills*, Springer, New York, 2018) is Problem Solving in Technology Rich Environments (PS-TRE) competence evaluated in PISA and PIAAC tests (OECD in Survey of adult skills (PIAAC). Retrieved from <https://goo.gl/cpb3fQ> (2016)). This skill, although currently receiving considerable attention in compulsory education, has not received the same level of thought in the case of adult education. In this article, the presence of the PS-TRE skill among adults of working age (25–65 years) in Europe is analysed in relation to the factors that potentially affect a higher score in this skill. This analysis is carried out using structural equations modelling, taking into account socio-personal and educational factors, as well as the use of different skills in work and daily life. The results indicate that educational level and the use of different skills (reading, numerical, related to ICT) at home and at work, as well as participation in non-formal education activities, decisively relate to a higher level of PS-TRE. This result is positively mediated through risk factors such as being older or being a woman. This study concludes that it is necessary to reinforce these skills, not only in children, but also in the adult population, in order to avoid social and labour exclusion.

Jakubowski, M., & Pokropek, A. (2019). *piaactools*: A program for data analysis with PIAAC data. *The Stata Journal*, 19(1), 112-128. doi: 10.1177/1536867X19830909

**Abstract:**

The OECD Programme for the International Assessment of Adult Competencies (PIAAC) is currently the only international survey of adult skills. It provides rich data on skills, work and life situations, earnings, and attitudes. To ensure representativeness and high reliability, the study is based on a complex survey design and advanced statistical methods. To obtain correct results from publicly available microdata, one must use special methods that are often too advanced for less experienced researchers. In this article, we present *piaactools*—a package of three commands that facilitate analysis with PIAAC data. The command *piaacdes* calculates basic statistics, *piaactab* computes frequencies of adults at each proficiency level, and *piaacreg* allows for the use of several regression models with PIAAC data. Output is saved as HTML files that can be opened in most spreadsheets and as Stata matrices that can be further processed in Stata. We also explain how to use these commands and provide examples that can be easily modified for use with different models and variables.

Johnes, G. (2019). The incidence of and returns to 'overeducation': PIAAC evidence on the G7. *Minnerva*, 57(1), 85-107. doi: 10.1007/s11024-018-9357-1

**Abstract:**

PIAAC data are used to evaluate the extent of overeducation in G7 countries. Incidence of overeducation is seen to vary systematically with a number of demographic characteristics. The impact of overeducation on remuneration is then estimated using quantile regression. This impact is observed to be minor, suggesting that while some individuals have qualifications in excess of those required to undertake their job, their additional human capital is nonetheless rewarded. Care therefore needs to be taken in interpreting measures of overeducation.

Kaul, C. R. (2019). *Using structural equation modeling to examine the relationships between environmental characteristics, intrapersonal characteristics, and adult numeracy achievement*. (Dissertation). Baylor University. Retrieved March 5, 2020, from <https://hdl.handle.net/2104/10666>

**Abstract:**

Quantitative literacy or numeracy skills are increasingly important at every level in a knowledge-based society. The purpose of this study was to investigate the relationships between numeracy achievement, environmental and intrapersonal characteristics. Although the sample for this study included 5,862 U.S. adults (aged 16-65) from the Program for International Assessment of Adult Competencies (PIAAC), the results were weighted to represent the population. According to descriptive statistics, significant differences were found for multiple variables. The top 10% were more likely to have a foreign-born father, higher levels of parent education, more books in their childhood home, more years of formal schooling, be employed, and earn more money. Individuals with the following characteristics were more likely to be in the high numeracy group: male, native-English speaking, White, age 25 to 34, very good to excellent health, and no learning disability. Confirmatory Factor Analysis (CFA) and Structural Equation Modeling (SEM) were conducted on a new Adult Numeracy Achievement Model. The second-order Intrapersonal factor predicted numeracy achievement in the top 10%; however, the second-order Environmental factor did not. Intrapersonal characteristics with small indirect effects on numeracy achievement included gender, age, race, native language, learning disability, health, and participation in ongoing training or education outside of a degree program. Findings were used to support suggestions for future methodological and future numeracy research. Implications for parents, adults, educators, and policymakers are suggested which include greater emphasis on mathematical learning, understanding, and application at all levels including school, home, and workplace.

Khorramdel, L., Davier, M., & Pokropek, A. (2019). Combining mixture distribution and multidimensional IRTree models for the measurement of extreme response styles. *British Journal of Mathematical and Statistical Psychology*, 72(3), 538-559. doi: 10.1111/bmsp.12179

**Abstract:**

Personality constructs, attitudes and other non-cognitive variables are often measured using rating or Likert-type scales, which does not come without problems. Especially in low-stakes assessments, respondents may produce biased responses due to response styles (RS) that reduce the

validity and comparability of the measurement. Detecting and correcting RS is not always straightforward because not all respondents show RS and the ones who do may not do so to the same extent or in the same direction. The present study proposes the combination of a multidimensional IRTree model with a mixture distribution item response theory model and illustrates the application of the approach using data from the Programme for the International Assessment of Adult Competencies (PIAAC). This joint approach allows for the differentiation between different latent classes of respondents who show different RS behaviours and respondents who show RS versus respondents who give (largely) unbiased responses. We illustrate the application of the approach by examining extreme RS and show how the resulting latent classes can be further examined using external variables and process data from computer-based assessments to develop a better understanding of response behaviour and RS.

**Title:**

Klotzke, K., & Fox, J.-P. (2019). Bayesian covariance structure modeling of responses and process data. *Frontiers in Psychology, 10*(1675), 1-15. doi: 10.3389/fpsyg.2019.01675

**Abstract:**

A novel Bayesian modeling framework for response accuracy (RA), response times (RTs) and other process data is proposed. In a Bayesian covariance structure modeling approach, nested and crossed dependences within test-taker data (e.g., within a testlet, between RAs and RTs for an item) are explicitly modeled. The local dependences are modeled directly through covariance parameters in an additive covariance matrix. The inclusion of random effects (on person or group level) is not necessary, which allows constructing parsimonious models for responses and multiple types of process data. Bayesian Covariance Structure Models (BCSMs) are presented for various well-known dependence structures. Through truncated shifted inverse-gamma priors, closed-form expressions for the conditional posteriors of the covariance parameters are derived. The priors avoid boundary effects at zero, and ensure the positive definiteness of the additive covariance structure at any layer. Dependences of categorical outcome data are modeled through latent continuous variables. In a simulation study, a BCSM for RAs and RTs is compared to van der Linden's hierarchical model (LHM; van der Linden, 2007). Under the BCSM, the dependence structure is extended to allow variations in test-takers' working speed and ability and is estimated with a satisfying performance. Under the LHM, the assumption of local independence is violated, which results in a biased estimate of the variance of the ability distribution. Moreover, the BCSM provides insight in changes in the speed-accuracy trade-off. With an empirical example, the flexibility and relevance of the BCSM for complex dependence structures in a real-world setting are discussed.

Komatsu, H., & Rapple, J. (2019). Refuting the OECD-World Bank development narrative: Was East Asia's 'Economic Miracle' primarily driven by education quality and cognitive skills? *Globalisation, Societies and Education, 17*(2), 101-116. doi: 10.1080/14767724.2019.1577718

**Abstract:**

Founded on several highly influential quantitative studies, the past decade has witnessed the OECD and World Bank increasingly converge on the view that cognitive levels of students and education quality, as proxied by international large-scale assessments (ILSAs), are the primary determinant of national economic growth worldwide. More recent OECD and World Bank pronouncements have further suggested these dynamics are clearly illustrated in East Asia's education and

'Economic Miracle', in particular the cases of South Korea and Singapore. Herein we utilise the OECD's own data to examine this new development narrative, finding little evidence in support of these claims.

Automating gender roles at work: How digital disruption and artificial intelligence alter industry structures and sex-based divisions of labor. *Journal of Research in Gender Studies*, 9(1), 153–159. doi: 10.22381/JRGS9120198

**Abstract:**

We draw on a substantial body of theoretical and empirical research concerning how digital disruption and artificial intelligence alter industry structures and sex-based divisions of labor, and using and replicating data from Bloomberg, BLS, Eurostat, McKinsey, OECD, PIAAC, PISA, PwC, and World Economic Forum, we performed analyses and made estimates regarding patterns of jobs lost and gained (% of 2019 employment for each gender) and potential impact of job automation over time across workers (% by gender, age group, and education level). Structural equation modeling was used to analyze the data and test the proposed conceptual model.

Kristal, T., & Edler, S. (2019). Computers meet politics at wage structure: An analysis of the computer wage premium across rich countries. *Socio-Economic Review*. doi: 10.1093/ser/mwz049

**Abstract:**

This article addresses an important question in the age of rapid spread of new computer technologies: how do institutions influence the computer wage premium? To identify institutional factors that account for differences in computers' impact on wages, the authors estimate computer wage premiums for 20 countries classified into three national 'varieties' of capitalism and distinct forms of industrial relations and education systems. The analyses are based on unique international data from the Survey of Adult Skills, recently conducted by the Organisation for Economic Co-operation and Development. Results reveal that computer use at work is rewarded considerably higher in Liberal countries than in other countries—Nordic Coordinated countries above all. These results signify the centrality of coordinated markets, grounded in strong unions, centralized wage bargaining and publicly funded education and training, for lower computer wage gaps, hence for lower levels of wage inequality.

Lane, J., & Murray, T. S. (2019). *What now? The literacy hustle how 'learning-to-learn' skills help people survive in the changing workplace*. Policy Brief Calgary: Canada West Foundation. Retrieved March 5, 2020, from [https://cwf.ca/wp-content/uploads/2019/03/2019-02-CWF\\_WhatNowPolicyBrief\\_LiteracyHustle\\_WEB-2.pdf](https://cwf.ca/wp-content/uploads/2019/03/2019-02-CWF_WhatNowPolicyBrief_LiteracyHustle_WEB-2.pdf)

**Abstract:**

**Problem:** In a world where jobs are changing quickly, or being eliminated altogether, it's more essential than ever for the people in Canada's workforce to be able to "learn their way" into new or changing roles. The problem is that in Canada, more than 40 per cent of the workforce doesn't

have enough “learning-to-learn” skills to enable them to maintain stable and well-paying employment. To learn easily, an individual must first master the basic skills: communicating well – through speaking and listening (language); understanding and using printed and digital material (literacy); and, managing basic arithmetic (numeracy). Written words only make sense if you understand at least some of the language, and basic reading skills are needed to understand, formulate and solve problems, including those that involve numbers. Recommendation Because learning is entwined in language, literacy and numeracy, improving these skills is critical if Canada wants a workforce that can thrive in the changing world of work. As it stands, much of the country’s workforce won’t fare as well as they could as jobs change or disappear altogether. That outcome could be improved if we – individuals, employers, training providers and governments – build on and expand proven methods for improving basic skills in adults, through education, training and workplace learning programs.

**Abstract:**

Mention that there’s a literacy problem and most people’s eyes glaze over. “Everyone can read, so there can’t be a problem!” This belief is one of Canada’s most pervasive and enduring myths about literacy. However, while virtually everyone can read, not everyone can read well enough to realize their full economic potential. And that’s a problem for them, for their employers and for our country. Solution: Almost half of the working-age population needs to improve not just their ability to read, but also their ability to understand and use what they have read to meet the demands of life and work. This is not an impossible goal – it can be done. But, some enduring myths about literacy keep us from understanding and tackling the problem. They can all be busted.

**Abstract:**

Canada’s poor productivity performance is holding back improvements in its standard of living, including wages. In particular, labour productivity has been virtually stagnant since 2000. For the last few years, Canada’s Gross Domestic Product (GDP) per capita has hovered about \$14,000 below that of the U.S. In advanced services, manufacturing and energy industries, the workforce in the U.S. is twice as productive as Canada’s. The usual solutions to improved productivity include investing in more capital items such as machinery and information and communication technology, or asking people to work harder. These solutions are not working. As more routine tasks are being assigned to machines, people are being asked to do more thinking, problemsolving and relational tasks. Rather than becoming less important, cognitive skills are becoming more important. It is clear that the Canadian economy needs to increase investment in another kind of capital: human capital. Solution Working smarter, not harder can improve both productivity and

economic growth. Working smarter requires the skills to learn new ways of doing things. Advanced literacy skills increase a person's ability to learn easily and efficiently. New evidence shows that improvements in literacy can also increase productivity and GDP per capita more than ever before. Research also indicates that improving the skills of the people with the lowest levels of literacy provides an even greater boost. Furthermore, Canadian experience has shown that literacy skills can be increased through inexpensive and efficient workplace learning programs.

**Abstract:**

The Problem: A significant proportion of Canada's youth have poor literacy and numeracy skills. This is bad news for them, for employers and for our economy. These skills still matter. Level 3 literacy, the level at which readers begin to analyze, evaluate and apply what they have read in new and different situations and to easily problem-solve, is needed to perform well in every new job that is being created. What's more, literacy and numeracy are the core "learning to learn" skills, and more than ever, our young people will need to keep learning to keep pace with the changing world of work. The Solution Building basic skills is the mandate of the K-12 system, but despite rising high school graduation rates, average literacy and numeracy scores of Canada's high school aged youth are actually declining. The solution must begin here. More immediate results would be realized if the literacy and numeracy skills of the more than 80 per cent of youth who attend post-secondary education were assessed and, where necessary, boosted, upon entry to their post-secondary institutions. This would guarantee that graduates have these essential skills and would have the added benefit of ensuring students get more out of their expensive education. Finally, there is a need to embed these fundamental skills into any workplace training, including orientation training offered as new graduates begin their careers.

Larson, A., Milana, M., Klatt, G., Klempova, M., Knipprath, H., Rasmussen, P., Studena, I., Taru, M., & Vatrella, S. (2019). *Deliverable D3.3. Report on the use of PIAAC in informing policy in selected countries*. Encouraging Lifelong Learning for an Inclusive & Vibrant Europe Brüssel: European Commission. Retrieved March 6, 2020, from <https://iris.univr.it/retrieve/handle/11562/1008715/148362/enliven-d3.3-final.pdf>

**Abstract:**

This report deals with the role standard setting plays as a governance mechanism in adult learning, building on previous work on European governance carried out under the ENLIVEN project. But it does so from a specific angle. It focuses on the Programme for the International Assessment of Adult Competencies (PIACC) to exemplify how standard setting in adult learning influences the public debate (through national newspapers), which informs policy in selected European countries (Estonia, Denmark, Italy, Slovakia, and the United Kingdom). Standard setting, particularly in European adult learning, is framed in this report as the process involved in the establishment of common rules for states, which implies two concurring phenomena: normative action (or the enti-

tling of some actions as good, desirable, or permissible versus those that are bad, undesirable or impermissible), that is never value-free; and the agreement on common goals to be pursued through normative action. Moreover this reports acknowledges the growing use of social indicators and benchmarks for monitoring progress in EU adult learning. On this ground, this report claims that both the data generated through PIAAC and the 'implicit' benchmarking of Level 3 in adults' literacy, numeracy and problem-solving skills that come with it, contribute to standard setting in adult learning within the EU. But too little is known on how PIAAC's contribution to standard setting in adult learning influences the public debate through national media, and particularly the highest circulating newspapers, which contribute to knowledge production around the events on which they report, yet from ideological stances. Hence this report presents the methodology applied to, and the results of, a coverage and content media analysis that was performed on a total of 116 news articles. These were published between 2012 and 2019 (July) in the highest circulating newspapers of Estonia, Denmark, Italy, Slovakia, and the United Kingdom. Among all countries involved in the ENLIVEN project, these were selected as each represents a typology of Welfare State Regimes (WSRs), as developed by Roosmaa and Saar (2017). Albeit Bulgaria (also an ENLIVEN country) would have represented one more WSR (Post-socialist, Balkan), it was not considered, as it did not partake in the PIAAC Survey. The results highlight that the national press differently presents and represents the PIAAC Survey, and connects PIAAC data to other subject matters across as much as within countries. Such differences connect to the wider context of reference at the time of publication (i.e., the government on power, the socio-economic situation, and on-going or foreseen education and labour markets reforms) but also to the WSR to which each country belongs. Regardless of such differences, however, some trends and common topics are found in that since 2014 the weight of PIAAC as a subject matter as gradually decreased, while reference to PIAAC data by the press persisted and acquired political, ideological, and ontological functions. Therefrom two policy recommendations can be drawn: 1. Make benchmarking in EU adult learning an explicit process, under the solely responsibility of the Union and its member states; 2. Do not take results from international assessment surveys (like PIAAC) at face value.

#### Title:

Le Mouel, M. (2019). *Knowledge-based capital and firm productivity* (Dissertation). Technische Universität Berlin. doi: 10.14279/depositonce-8120

#### Abstract:

The productivity slowdown of the last decades has raised concerns about the ability of advanced economies to sustain high living standards and renewed the interest in understanding the sources of aggregate productivity growth. The present thesis looks at the role of knowledge-based capital as a determinant of productivity, both within and across firms. I use firm-level administrative data to explore whether investment in knowledge assets is associated with productivity divergence between top performers and other firms, and how labour mobility can act as a vector of knowledge transmission between firms to mitigate this dynamic. First, I estimate the effect on productivity of a firm's stock of knowledge-based capital (encompassing research and development, software, intellectual property products and organizational capital), and connect the micro-level relationship to industry-level patterns of productivity divergence for Germany. Second, I use international survey information on tasks performed in the workplace to identify the categories of employees involved in implementing effective management practices. Finally, using Finnish firm-level data, I test whether the mobility of managers between firms can help reduce productivity dispersion, by helping low productivity firms acquire managerial knowledge and improve their productivity.

Lechner, C. M., Anger, S., & Rammstedt, B. (2019). Socio-emotional skills in education and beyond: Recent evidence and future research avenues. In R. Becker (Eds.), *Research Handbook on the Sociology of Education* (pp. 427-453). Cheltenham: Edward Elgar Publishing. doi: 10.4337/9781788110426.00034

**Abstract:**

During the past two decades, socio-emotional (or ‘non-cognitive’) skills have gained currency in research on education. In this chapter we begin by introducing the reader to the concept of socio-emotional skills and identify core themes in the current body of evidence. We then review recent studies, including several from our own research groups, which illustrate research on each of these core themes. Using the Big Five framework of personality as a guidepost, and drawing on large-scale data, these studies shed light on three main issues. First, they show that socio-emotional skills contribute to educational outcomes (e.g., academic success and educational transitions) in childhood and adolescence – above and beyond cognitive skills and socioeconomic background. Second, they demonstrate that socio-emotional skills co-shape important life outcomes in adulthood (e.g., income, health and social participation) over and above formal educational attainment and cognitive skills. Third, they demonstrate that various educational factors (e.g., characteristics of educational systems such as school starting age, schooling intensity) contribute to the formation of socio-emotional skills in childhood and adolescence. We conclude by outlining future avenues for research on socio-emotional skills in the educational context that pays particular attention to enhancing causal inference and strengthening policy relevance.

Lechner, C. M., Danner, D., & Rammstedt, B. (2019). Grit (effortful persistence) can be measured with a short scale, shows little variation across socio-demographic subgroups, and is associated with career success and career engagement. *PLoS one*, 14(11), 1-29. doi: 10.1371/journal.pone.0224814

**Abstract:**

Grit (effortful persistence) has received considerable attention as a personality trait relevant for success and performance. However, critics have questioned grit's construct validity and criterion validity. Here we report on two studies that contribute to the debate surrounding the grit construct. Study 1 (N = 6,230) examined the psychometric properties of a five-item grit scale, covering mainly the perseverance facet, in a large and representative sample of German adults. Moreover, it investigated the distribution of grit across sociodemographic subgroups (age groups, genders, educational strata, employment statuses). Multiple-group measurement models demonstrated that grit showed full metric, but only partial scalar, invariance across all sociodemographic subgroups. Sociodemographic differences in the levels of grit emerged for age, education, and employment status but were generally small. Study 2 investigated how grit relates to career success (income, job prestige, job satisfaction) and career engagement (working overtime, participation in continuing professional development courses, attitudes toward lifelong learning) in an employed subsample (n = 2,246). When modeled as a first-order factor, grit was incrementally associated with all indicators of career success and especially of career engagement ( $.08 \leq \beta \leq .75$ )-over and above cognitive ability and sociodemographic characteristics. When modeled as a residual facet of conscientiousness, grit largely retained its criterion validity for success but only partly for en-

gement ( $-.14 \leq \beta \leq .61$ ). Our findings offer qualified support for the psychometric quality of the short grit scale and suggest that grit may provide some added value in predicting career outcomes. We critically discuss these findings while highlighting that grit hardly differs from established facets of conscientiousness such as industriousness/perseverance.

Lee, H. (2019). *Patterns and determinants of intergenerational educational mobility: Evidence across countries*. Working Paper Series No. 2019-02. Kitakyūshū: Asian Growth Research Institute. Retrieved February 28, 2020, from <http://www.agi.or.jp/workingpapers/WP2019-02.pdf>

**Abstract:**

This study measures the intergenerational persistence of education attainment, using internationally comparable data for parents' and children's education levels by age cohort for 30 countries, and identifies its determinants. The estimated intergenerational regression coefficients show that educational mobility worsened over generations in most countries, but its degrees varies considerably across countries and over time. The country-cohort panel regressions show that intergenerational educational mobility decreases with educational expansion, income inequality and credit constraints, and increases with per-capita GDP. The results also highlight the importance of progressive public expenditure on education for improving intergenerational educational mobility.

Lee, J., & Desjardins, R. (2019). Inequality in adult learning and education participation: The effects of social origins and social inequality. *International Journal of Lifelong Education*, 38(3), 339-359. doi: 10.1080/02601370.2019.1618402

**Abstract:**

This comparative study examines patterns of inequality in participation in two different types of adult learning and education (ALE) – job-related formal ALE (JFALE) and job-related non-formal ALE (JNFALE) – as related to social origins at the micro-level and three categories of social inequality at the macro-level at the macro level (economic, education, and skill inequality). Using data from the Programme for the International Assessment of Adult Competencies (PIAAC), two methods are used to analyse 19 selected OECD countries: multivariate binary logistic regressions to explore the extent to which individuals' social origins are associated with ALE participation and two-stage multilevel analysis to examine the relationship between social origins' advantages in ALE participation and social inequality. Statistically significant advantages in ALE participation of social origins were observed in some countries. Additionally, statistically significant positive relationships between social inequality and social origins' advantages in JNFALE participation are found, which implies that increases in social inequality strengthen advantages associated with social origins.

Lee, J.-W., Han, J.-S., & Song, E. (2019). The effects and challenges of vocational training in Korea. *International Journal of Training Research*, 17(sup1), 96-111. doi: 10.1080/14480220.2019.1639272

**Abstract:**

This paper explores whether training programs were effective in improving labor market performance of individuals, in particular wages and employment probability, in South Korea. The regression analyses using the data from Korean respondents in the Program for the International Assessment of Adults Competencies (PIAAC) survey show the strong positive effects of vocational training programs on earnings as well as on employment probability of individuals, while controlling for education, experience, and literacy skills as a proxy for unobserved ability, as well as occupation and industry. Moreover, the effects of job-training tend to be larger in older cohorts. These results suggest that against challenges posed by rapidly aging population and emergence of technological breakthroughs, Korea should promote vocational training activities and life-long learning programs, especially to the elderly.

Lewandowski, P., Park, A., Hardy, W., & Yang, D. (2019). *Technology, skills, and globalization: Explaining international differences in routine and nonroutine work using survey data*. IBS Working Papers No. 04/2019. Warszawa: Instytut Badan Strukturalnych. Retrieved February 28, 2020, from [http://ibs.org.pl//app/uploads/2019/04/IBS\\_Working\\_Paper\\_04\\_2019.pdf](http://ibs.org.pl//app/uploads/2019/04/IBS_Working_Paper_04_2019.pdf)

**Abstract:**

The shift away from manual and routine cognitive work, and towards non-routine cognitive work is a key feature of labor markets. There is no evidence, however, if the relative importance of various tasks differs between workers performing seemingly similar jobs in different countries. We develop worker-level, survey-based measures of task content of jobs – non-routine cognitive analytical and personal, routine cognitive and manual – that are consistent with widely-used occupation-specific measures based on O\*NET database. We apply them to representative surveys conducted in 42 countries at different stages of development. We find substantial cross-country differences in the content of work within occupations. Routine task intensity (RTI) of jobs decreases significantly with GDP per capita for high-skill occupations but not for middle- and low-skill occupations. We estimate the determinants of workers' RTI as a function of technology (computer use), globalization (specialization in global value chains), structural change, and supply of skills, and decompose their role in accounting for the variation in RTI across countries. Computer use, better education, and higher literacy skills are related to lower RTI. Globalization (as measured by sector foreign value-added share) increases RTI in poorer countries but reduces RTI in richer countries. Differences in technology endowments and in skills' supply matter most for cross-country differences in RTI, with globalization also important. Technology contributes the most to the differences in RTI among workers in high-skilled occupations and non-off-shorable occupations; globalization contributes the most to differences among workers in low-skilled occupations and offshorable occupations.

Liao, D., He, Q., & Jiao, H. (2019). Mapping background variables with sequential patterns in problem-solving environments: An investigation of United States adults' employment status in PIAAC. *Frontiers in Psychology, 10*, 1-32. doi: 10.3389/fpsyg.2019.00646

**Abstract:**

Adult assessments have evolved to keep pace with the changing nature of adult literacy and learning demands. As the importance of information and communication technologies (ICT) continues

to grow, measures of ICT literacy skills, digital reading, and problem-solving in technology-rich environments (PSTRE) are increasingly important topics for exploration through computer-based assessment (CBA). This study used process data collected in log files and survey data from the Programme for the International Assessment of Adult Competencies (PIAAC), with a focus on the United States sample, to (a) identify employment-related background variables that significantly related to PSTRE skills and problem-solving behaviors, and (b) extract robust sequences of actions by subgroups categorized by significant variables. We conducted this study in two phases. First, we used regression analyses to select background variables that significantly predict the general PSTRE, literacy, and numeracy skills, as well as the response time and correctness in the example item. Second, we identified typical action sequences by different subgroups using the chi-square feature selection model to explore these sequences and differentiate the subgroups. Based on the malleable factors associated with problem-solving skills, the goal of this study is to provide information for improving competences in adult education for targeted groups.

Lind, P., & Mellander, E. (2019). The immigration-skill nexus: similarities and differences among the Nordic countries. *Scandinavian Journal of Educational Research*, 1-14. doi: 10.1080/00313831.2019.1577755

**Abstract:**

We examine if the OECD survey of adult skills, PIAAC, can provide information about the relative quality of education and training in Denmark, Finland, Norway and Sweden. We find that the average population scores are inappropriate while the mean scores of natives well approximate the skills of individuals that had the chance to attend the countries' education and training systems in full. Native mean scores are invariably higher than population scores in all four countries, for all skills: literacy, numeracy, and ICT problem-solving. Thus, viewed as quality measures, average population scores are biased downwards. The native-population differences are small – at most 3.5% of population scores – but statistically significant. We also consider how the ranks of these Nordic countries in the international skill distribution are changed when mean native scores are substituted for average population scores. Except for an improvement in Sweden's numeracy rank, all changes are statistically insignificant.

Lissitsa, S., & Chachashvili-Bolotin, S. (2019). Cognitive skills and labour market experience of FSU immigrants in Israel. *Current Politics and Economics of the Middle East*, 10(3), 357-379.

**Abstract:**

Based on the nationwide database of the Programme for the International Assessment of Adult Competencies (PIAAC), the current study investigated the correlation between three cognitive skills (literacy, numeracy and problem solving in technology-rich environments) and three indicators of labour market integration of Former Soviet Union (FSU) immigrants in Israel - income, job autonomy and job satisfaction. FSU immigrants reported relatively high levels of job satisfaction, medium levels of job autonomy and an average income. Our findings from multivariate analysis show that numeric skills and problem solving in technology-rich environments were positively correlated with income, while the effect of literacy skills was insignificant, controlling for socio-demographic variables. The effects of the three types of cognitive skills on job autonomy and job

satisfaction were found to be insignificant. Our important finding is that if FSU immigrants want to succeed economically, they have to be proficient in the Hebrew language.

Liu, H. (2019). Low-numerate adults, motivational factors in learning, and their employment, education and training status in Germany, the US, and South Korea. *ZDM Mathematics Education*, 1-13. doi: 10.1007/s11858-019-01108-x

**Abstract:**

Drawing on the PIAAC data, in this paper I examine how motivational factors such as motivation to learn and grit are related to low-numerate adults' employment status and their actual participation in lifelong learning in Germany, the United States and South Korea. In particular, the study uses PIAAC self-reported data on the degree to which the respondent "likes learning new things", and "likes to get to the bottom of difficult things" as proxies of motivational factors in adult learning. Findings show that across three countries both motivation to learn and grit have independent relationships with adults' employment status and actual participation in adult learning. Considering that low-skilled adults are the ones who need further learning the most, yet are repeatedly reported to have the lowest rate of participation in further learning, these findings highlight the motivational factors in adult learning. They also suggest that motivation to learn and grit may mitigate the disadvantages that 'vulnerable' adults experience due to low numeracy skills. Implications for mathematics educators and adult education research are discussed.

Liu, H., Fernandez, F., & Grotlüschen, A. (2019). Examining self-directedness and its relationships with lifelong learning and earnings in Yunnan, Vietnam, Germany, and the United States. *International Journal of Educational Development*, 70. doi: 10.1016/j.ijedudev.2019.102088

**Abstract:**

This study provides an empirical analysis of the significance of self-directedness in learning in the labor market and further pursuit of education and training among adults in two high-income (Germany, U.S) and two middle-income countries (Vietnam, Yunnan China). We find substantial gaps in the self-directedness measures between low- and high-SES workers. Additionally, self-directedness in learning is rewarded in the labor market in Yunnan and Vietnam. Those who are motivated to learn and are resilient are more likely to pursue further learning opportunities in the high-income countries, as well as in Yunnan China where adult learning opportunities are severely lacking.

Llena-Nozal, A., Martin, N., & Murtin, F. (2019). *The economy of well-being. Creating opportunities for people's well-being and economic growth*. OECD Statistics Working Papers No. 2019/02. Paris: OECD Publishing. doi: 10.1787/498e9bc7-en

**Abstract:**

As well-being has matured as a statistical and measurement agenda, it has become increasingly

relevant as a “compass” for policy, with a growing number of countries using well-being metrics to guide decision-making and inform budgetary processes. One remaining challenge has consisted in providing policy-makers with a better understanding of the linkages between the drivers of well-being and economic growth. This paper develops the concept of an “Economy of Well-being” as a basis for highlighting these linkages and showing how policy can most effectively leverage them. The paper defines an economy of well-being around the idea of a “virtuous circle” in which individual well-being and long-term economic growth are mutually reinforcing. It also explores the characteristics of an economy of well-being and the conditions under which it can be sustained. Secondly, based on a survey of existing empirical evidence, the paper contributes to outline how economies of well-being can be built. It provides analysis of several important channels through which economic growth and well-being support and reinforce one another, focusing on the multi-dimensional impact of policies in four areas that research has shown to be important for well-being: Education and Skills; Health; Social Protection and Redistribution; and Gender Equality.

Lopes, T., Scully-Russ, E., Zarestky, J., & Collins, J. C. (2019). The effects of social characteristics of jobs on the cognitive skills of adults in the United States: A PIAAC analysis. *Adult Education Quarterly*, doi: 10.1177/0741713619884567

**Abstract:**

There is contrary research around whether collaboration at work fosters individual learning and skill development. This study’s purpose was to examine the relationship between social characteristics of jobs on adults’ cognitive skills as measured by the Program for the International Assessment of Adult Competencies (PIAAC). For select industry sectors, we used a linear regression model to predict scores for PIAAC scales—literacy, numeracy, and problem solving in technology-rich environments—based on the independent variables gender, education level, frequency of workplace collaboration, and frequency of sharing work-related information. Results showed level of collaboration at work is negatively associated with PIAAC scores, contradicting current thinking on the role of social interactions in the workplace. We conclude there may be an overemphasis on the social characteristics in job design in some industries and workplaces, leaving little support and time for other activities known to support workplace learning, like management support and time for reflection.

**Title:**

Lopez-Fogues, A., & Scandurra, R. (2019). Analyzing PIAAC through the capability approach. In S. McGrath, M. Mulder, J. Papier, & R. Suart (Eds.), *Handbook of Vocational Education and Training: Developments in the Changing World of Work* (pp. 237-257). Cham: Springer International Publishing. doi: 10.1007/978-3-319-94532-3\_3

**Abstract:**

The purpose of this chapter is to evidence the shortcomings of large-scale assessments and the new shift toward capability-oriented indicators. Focusing on the international data on adult skills (PIAAC) and its impact in forging VET (vocational education and training) policies, we assume that current VET systems are confronted with many challenges that arise from the interaction of two sources. On one hand, VET policy focuses mainly on employability which is insufficient to grasp wider benefits that education entails – as postulated by many educational (i.e., Nussbaum, *Creating capabilities: The human development approach*. Harvard University Press, Cambridge, MA,

2011; Boni and Walker, *Universities and global human development: Theoretical and empirical insights for social change*. Routledge, London, 2016) and a considerable smaller education and work scholars (i.e., McGrath and Powell, *Int J Educ Dev* 50:12–19, 2016; Egdell and McQuaid, *Soc Policy Adm* 50:1–18, 2016). On the other hand, the underpinnings of the objectives and designs of VET should adapt to the socioeconomic consequences of the Great Recession. The chapter focuses on the PIAAC and most concretely to the Spanish case as an example of how the Great Recession becomes an open license to fast- and short-term strategies that favors employment regardless of its quality and long-term consequences and values education and youth role in society in relation to their contribution to boost the economy. The chapter recognizes the urge for seeking fast solutions that shift the unemployment rates but alerts to the overlooked aspects with some of those measures in relation to VET. In fact, this chapter is a call to policy-makers and academics toward the importance of rethinking education on the basis of new information basis of judgment that are human-centered.

Lorenz, E., & Potter, J. (2019). *Workplace organisation and innovation in small and medium-sized enterprises*. OECD SME and Entrepreneurship Papers No. 17. Paris: OECD Publishing. doi: 10.1787/1732c0c-en

**Abstract:**

This paper examines the relationship between workplace organisation and innovation in small and medium-sized enterprises (SMEs). It uses data for 30 countries, drawn from the European Company Survey, the OECD Programme for International Assessment of Adult Competencies and the Community Innovation Survey. It contrasts SMEs adopting a “learning organisation” or “discretionary learning” form of workplace organisation with SMEs adopting more hierarchical organisational forms. Learning organisation or discretionary learning SMEs are characterised by high levels of self-planning of tasks by employees, teamwork, knowledge exchange with employees and supervisors, on-the-job training, and employee performance incentives. They account for approximately one-third of SMEs across the countries examined. SMEs with this form of work organisation are more likely than other SMEs to develop new products/services and processes. At a macro level, countries with high proportions of these SMEs have higher rates of new-to-the-market innovations among SMEs and of SME innovation collaborations with other firms and organisations. The findings point to the potential role of policies favouring organisational change in SMEs as a means of stimulating SME innovation.

Madhala, S. (2019). *The risk of automation in the Israeli labor market*. Policy Research Jerusalem: Taub Center for Social Policy Studies in Israel. Retrieved March 6, 2020, from [http://taubcenter.org.il/wp-content/files\\_mf/theriskofautomationintheisraelilabormarket2019eng75.pdf](http://taubcenter.org.il/wp-content/files_mf/theriskofautomationintheisraelilabormarket2019eng75.pdf)

**Abstract:**

This research presents a current mapping of the Israeli labor market using data from the OECD’s Survey of Adults Skills (PIAAC — Programme for the International Assessment of Adult Competencies) and based on a recent model that ranks different jobs according to the tasks required in the future labor market. The study focuses on identifying the population that is at highest risk of automation and further identifying their specific skill weaknesses that put them at higher risk of automation and less fit for the future labor market. The results of the mapping show that the share of

occupations at high risk in Israel stands at about 15 percent. A large portion of these positions are in the manufacturing and construction industries as well as clerking positions. The study also found that a central characteristic of work at risk of automation is that it does not require higher education, and a large portion of these jobs, in fact, do not require any formal education. Further, occupations at high risk are also characterized by low hourly wages and, often, less than full-time work hours. The data reveal the existence of gender gaps and indicate that women, and especially non-Haredi Jewish women, are at higher risk of computerization relative to their male peers, apparently mainly due to the fact that they make less use of the skills that will be required in the future labor market and not due to their choice of occupation. Another population at high risk of automation is the Arab Israeli population, and especially Arab Israeli men. A large share of these men are employed in positions characterized by low wages with minimal educational requirements, with little use of the skills that will be required in the future labor market and in digital platforms. Proper preparation for the expected changes in the Israeli labor market is essential in order to train workers for the future and to narrow inequalities that are foreseen within the labor force. In this framework, it is important to consider how these essential skills are provided to workers and at what stage it is optimal to provide them. It is, of course, preferable to provide these skills early on, within the formal education system. The findings indicate the financial difficulties in gaining new skills particularly among this group of workers at high risk of automation, and underscore the advantages of a wider use of the training system run by the government. Nevertheless, the best way to enable the adaptability of workers to the future labor market is through appropriate long-term planning, including the collection of a wide range of data on an ongoing basis.

Mahboubi, P. (2019). *Bad fits: The causes, extent and costs of job skills mismatch in Canada*. Commentary No. 552. Toronto: C.D. Howe Institute. Retrieved March 4, 2020, from [https://www.cdhowe.org/sites/default/files/attachments/research\\_papers/mixed/Commentary%20552.pdf](https://www.cdhowe.org/sites/default/files/attachments/research_papers/mixed/Commentary%20552.pdf)

**Abstract:**

About 13 percent of Canadian workers have skills mismatched to their jobs. Although this is somewhat in line with an average of around 10 percent among OECD countries in an international survey, Canadian policymakers have two reasons for concern. Firstly, there is significant variation across socioeconomic groups. While workers with higher educational attainment are more likely to be over-skilled, women, immigrants, and older workers are more likely to be under-skilled for their jobs. In the case of immigrants, the under-skilled problem entirely disappears with time spent in Canada, highlighting the importance of settlement policies that provide rigorous and accessible skills training, language programs, and job-search workshops for newcomers. Secondly, these results could worsen in the years ahead in the face of technological development and demographic aging that are occurring in the labour market at the same time as the role of newcomers in Canada's labour force is growing. As it is, the majority of workers across occupations need to use cognitive skills such as literacy, numeracy, and problem solving at least once a week at work. More importantly, there is no occupation where these skills are not required at all. This study's results highlight the importance of providing more opportunities for skills development and lifelong learning for all workers and better addressing individual training needs, particularly, among under-skilled people such as older workers and new immigrants. Businesses – in addition to providing training opportunities for under-skilled workers – can reduce mismatches within their organizations by appropriately reassigning tasks, providing relocation assistance and finding innovative ways to use workers' skills in order to optimize productivity. Governments can help reduce skills

mismatch with policies that enhance labour market flexibility, ease labour mobility, and more importantly, increase participation in lifelong learning.

Marcolin, L., Miroudot, S., & Squicciarini, M. (2019). To be (routine) or not to be (routine), that is the question: a cross-country task-based answer. *Industrial and Corporate Change*, 28(3), 477–501. doi: 10.1093/icc/dty020

**Abstract:**

This work proposes a new measure of the routine content of occupations and sectors for 20 OECD countries, based on information about the sequence and flexibility of the tasks performed on the job. A negative but weak association emerges between routineness and skill intensity, which suggests the importance of both technological and organizational considerations in the measure of routine intensity. Between 2000 and 2010, employment mainly grew in non-routine occupations, especially in market services, while manufacturing shed routine and non-routine jobs. Changes in shares of employment by routine quartile are dominated by within-effects.

Maryna, T., & Tiiu, P. (2019). Immigrant–native wage gap in Europe: The role of cognitive skills and their use at work. *International Journal of Manpower*, 40(1), 154–175. doi: 10.1108/IJM-03-2018-0087

**Abstract:**

**Purpose:** The purpose of this paper is to address the role of cognitive skills and extent of skill use at work in explaining the immigrant–native wage gap in Europe. The study targets immigrant–native disparities in literacy and numeracy cognitive skills, as important, yet not exhaustive factor behind immigrants’ wage penalty. **Design/methodology/approach:** The research relies on the Program of International Assessment of Adult Competencies data for 15 European countries. The empirical analysis employs multivariate regression analysis and incorporates the full set of plausible values for each skill domain, to correctly measure cognitive skills. To estimate standard errors, the authors employ Jackknife replication methodology with 80 replication weights and final population weight. **Findings:** The authors document that, on average, immigrants achieve substantially worse scores in literacy and numeracy test domains. Only highly educated immigrants tend to improve their skills over time in host countries. The results of wage gap analysis indicate that having cognitive skills, demographic profile and occupation category comparable to natives does not yield comparable wage rate. The remaining wage gap results from the systematic differences in skills application at work, as immigrants use their skills to lower extent, relative to natives. **Originality/value:** The research employs a novel measure of productive human capital, which accounts for cognitive skills in literacy and numeracy domains, and frequencies of skill use at work. It allows to more precisely evaluate the immigrant–native disparity in human capital application and its reflection on the wage rate.

Massing, N., Wasmer, M., Wolf, C., & Zuell, C. (2019). How standardized is occupational coding? A comparison of results from different coding agencies in Germany. *Journal of Official Statistics*, 35(1), 16-187. doi: 10.2478/jos-2019-0008

**Abstract:**

As occupational data play a crucial part in many social and economic analyses, information on the reliability of these data and, in particular on the role of coding agencies, is important. Based on our review of previous research, we develop four hypotheses, which we test using occupation-coded data from the German General Social Survey and the field test data from the German Programme for the International Assessment of Adult Competencies. Because the same data were coded by several agencies, their coding results could be directly compared. As the surveys used different instruments, and interviewer training differed, the effects of these factors could also be evaluated. Our main findings are: the percentage of uncodeable responses is low (1.8–4.9%) but what is classified as “uncodeable” varies between coding agencies. Inter-agency coding reliability is relatively low  $k \approx 0.5$  at four-digit level, and codings sometimes differ systematically between agencies. The reliability of derived status scores is satisfactory (0.82–0.90). The previously reported negative relationship between answer length and coding reliability could be replicated and effects of interviewer training demonstrated. Finally, we discuss the importance of establishing common coding rules and present recommendations to overcome some of the problems in occupation coding.

Mayerl, M. (2019). Qualifikationsmismatch und generische Arbeitsplatz [Qualification mismatch and generic workplace]. In F. Gramlinger, C. Iller, A. Ostendorf, K. Schmid, & G. Tafner (Eds.), *Bildung = Berufsbildung?! (pp. 33-44)*. Bielefeld: wbv. doi: 10.3278/6004660w033

**Abstract:**

A central issue in the discourse on qualifications and skills mismatch is whether skills mismatch (over- or under-qualification) can be explained by variances in the actual skill levels of the workforce or job requirements. Subsequently, this paper uses linear regression analyses based on the data of PIAAC 2011/12 to empirically test a possible relationship between the qualification-related employment status and the generic job requirements of workers for the Austrian labour market. The results show that qualification mismatch implies to a high degree skills mismatch. Non-qualification-adequate employment is not correlated to heterogeneity in the skills of the workforce and the skill requirements of jobs, but rather to the qualification-related structure of jobs, which limits (overqualification) or enables (underqualification) the use of skills by the workforce. McLean, D., Bouaissa, M., Rainville, B., & Auger, L. (2019). Non-cognitive skills: How much do they matter for earnings in Canada? *American Journal of Management*, 19(4), 104-124. doi: 10.33423/ajm.v19i4.2392

**Abstract:**

Evidence from different countries suggests that non-cognitive skills play an important role in wage determination and overall social outcomes, but studies for Canada are scarce. We contribute to filling this gap by estimating wage regressions with the Big Five traits using the Longitudinal and

International Study of Adults. Our results indicate that conscientiousness is positively associated with wages, while agreeableness, extraversion, and neuroticism are associated with negative returns, with higher magnitudes on agreeableness and conscientiousness for females. Cognitive ability has the highest estimated wage return so, while significant, non-cognitive skills do not seem to be the most important wage determinant.

Millar, R. J., Sahoo, S., Yamashita, T., & Cummins, P. (2019). Language use, literacy skills, and online health information-seeking in later life among Hispanics in the U.S. *Innovation in Aging*, 3(Supplement 1), S266-S266. doi: 10.1093/geroni/igz038.989

**Abstract:**

Online platforms, which are often in English, have become a common source of health information. Accordingly, language skills have been shown to be important for health information-seeking. In the United States, the use of online health information is generally low among Hispanics, particularly those with limited English proficiency. What is less clear, however, is how different measures of English proficiency may be linked to online health information seeking in later life. This study examines the associations between language spoken at home, literacy skills, and online health information seeking among middle age and older Hispanics in the U.S. Data of Hispanic adults aged 40 years and older (n = 315) come from the 2012/2014 Program for International Assessment of Adult Competencies (PIAAC). We used binary logistic regression models with complex sampling weights to examine online health information seeking as a function of primary language use at home (Spanish vs. English) and literacy skill assessment scores (low – high: 0 – 500 points). Results indicated that speaking Spanish at home (OR = 0.317, p < 0.05) is a negative predictor, and greater literacy skills (OR = 1.011, p < 0.05) is a positive predictor of online health information seeking. Findings from this study clarify possible health information disadvantages by limited English proficiency and lower literacy skills. We discuss how the impact of primary language use and literacy skills should be incorporated into future health communication and policy initiatives to address the barriers to health information among middle-aged and older Hispanic adults.

Millar, R. J., Sahoo, S., Yamashita, T., & Cummins, P. (2019). Problem solving in technology-rich environments and self-rated health among adults in the U.S.: An analysis of the program for the international assessment of adult competencies. *Journal of Applied Gerontology*, doi: 10.1177/0733464819829663

**Abstract:**

Problem-solving skills in the context of technologically complex modern societies have become increasingly important to health management in later life. This study is designed to investigate the associations between problem-solving skills in technology-rich environments (PSTRE) and health, and to explore whether age differences exist. Using data from the 2012/2014 Program for the International Assessment of Adult Competencies (PIAAC), we used logistic regression to examine the relationship between PSTRE and self-reported health among a representative sample of American adults aged 35 years and older (N = 3,260). Overall, greater PSTRE (odds ratio [OR] = 1.012, p < .001) was significantly associated with better self-rated health even after adjusting for the sociodemographic characteristics. Yet, PSTRE was only partially predictive of health in some age groups. Our

findings highlight the potential of PSTRE to reduce health disparities among middle-aged and older adults living in modern technology and information-rich societies.

Mor, Z., Iris, B.-H., & Joseph, K. (2019). Education and competencies within Belt and Road countries. *International Journal of Educational Management*, 33(6), 1411-1430. doi: 10.1108/IJEM-032019-0100

**Abstract:**

**Purpose:** The purpose of this paper is to examine the relationships between education and competencies from a comparative view, while controlling for background characteristics (e.g. parental education), home features (e.g. income) and country fixed effect. **Design/methodology/approach:** This paper utilises an international data sets of 12 Belt and Road (B&R) countries participating in the PIAAC survey. Data are examined using regression models with “REPSET” Stata code. The focus on B&R countries is interesting as this recent economic and strategic development alliance might transform the contemporary global balance of power. Therefore, examining its educational development is important. **Findings:** Findings reveal the higher the level of education, the higher the competency level in numeracy and literacy. Age was found to be negatively related to competencies, and gender was found to be dually significant. Among the examined B&R countries, Slovenia, Russia and Israel contribute the most to the numeracy, literacy and problem solving competencies (respectively) compared with other countries. The findings might contribute to the design of education for development policies aimed at increasing the level of state competitiveness while accounting for social cohesiveness. **Originality/value:** The paper provides a comparative study into educational development of the B&R alliance, and therefore offers an insight of the developmental cooperation as it emerges. The focus on the B&R initiative is important as it is a strategic development alliance which might transform the contemporary global balance of power. Therefore, the examination of the above-mentioned relationships with the focus on B&R countries might advance the strategic design of this cooperation.

Mu, C., Reeve, R., & Cronin, P. (2019). *Association of literacy and numeracy with adult health and socioeconomic outcomes*. CHERE Working Paper No. 2019/02. Sydney: Centre for Health Economics Research and Evaluation (CHERE). Retrieved March 4, 2020, from <http://hdl.handle.net/10453/133392>

**Abstract:**

Literacy and numeracy are cognitive skills which are core components of human capital. Understanding the effect of literacy and numeracy on individual outcomes in adulthood can help identify long term benefits of interventions to improve these skills. Utilising a national survey in Australia, we examine the links between literacy and numeracy and adult health and socioeconomic outcomes including employment status and social capital (measured by volunteering and level of trust). To account for the potential endogeneity of literacy and numeracy and educational attainment, we develop a simultaneous equation model consisting of outcome variables, literacy and numeracy, and education. The results show that literacy and numeracy exert a positive influence on education, health, the probability of being employed, the probability of participating in voluntary work, and having high level of trust.

Mueller, R., & Truong, K. (2019). *The impacts of literacy and numeracy on earnings: Do admission categories matter?* Child and Youth Refugee Research Coalition (CYRRC) Halifax: Dalhousie University. Retrieved March 9, 2020, from <http://hdl.handle.net/10222/76735>

**Abstract:**

We explore differences in literacy and numeracy skills, and the economic returns to these skills for immigrants to Canada in different admission classes, and their Canadian-born counterparts. Respondents are categorized into nine subpopulations: adult economic immigrants, adult refugees, adult family reunification, other adult immigrants, adult temporary residents, young refugees, young non-refugee immigrants, second- and third-generation Canadians. With some exceptions, the results suggest that both adult and young immigrants (those who arrived in Canada at age 13 or younger) do not perform as well on literacy and numeracy tests as those born in Canada, although young immigrants have higher test scores than adult immigrants. Similar results are found for wages, our metric for success in the labour market. Generally, we find that economic immigrants tend to have the highest test scores and hourly wages, with refugees having the lowest, amongst all immigration categories. A one-standard deviation increase in literacy attracts a wage premium of eight percent for men and nine percent for women. Those of numeracy scores are associated with 10 percent wage premium for both males and females. Though literacy and numeracy tests in PIAAC 2012 are used to capture basic everyday life and workplace proficiency, the returns to these basic skills are economically significant across different quantiles of earnings.

Musset, P., Field, S., Mann, A., & Bergseng, B. (2019). *Vocational education and training in Estonia*. Paris: OECD Publishing. doi: 10.1787/g2g9fac9-en

**Abstract:**

One of a series of studies on vocational education and training, this review assesses the vocational education and training (VET) in Estonia and provides policy recommendations. Estonia does very well in terms of student achievement on PISA, and the results from the Survey of Adult Skills (PIAAC) are also excellent. Unemployment levels are low. But despite recent reforms, VET remains relatively low status compared to general education, dropout rates are too high for comfort, and apprenticeships, despite recent efforts, fail to attract many young people. Suggested approaches to improve VET in Estonia include the expansion of work-based learning within all VET programmes and measures to increase the number of apprentices. Tackling dropout should be done by a set of complementary measures, including support in basic skills for those students lagging behind. Building pathways between VET and general education options can help improve the status of VET. More and better career guidance, especially before the key grade 9 transition point, is also needed.

Nienkemper, B., & Grotlüschen, A. (2019). Using PIAAC data to learn more about the literacy practices of adults. *International Journal of Lifelong Education*, 38(4), 393-405. doi: 10.1080/02601370.2019.1596171

**Abstract:**

The present article connects a secondary analysis of quantitative data from the Programme for the

International Assessment of Adult Competencies (PIAAC) with the theoretical approach of 'literacy practices' and related research results from the so-called New Literacy Studies (NLS) tradition, which follows a cultural practices paradigm. According to the literacy as social practice approach, the analysis of adults' literacy and numeracy practices could provide relevant policy information about how to address target groups in adult literacy and basic education. Thus, a Latent Class Analysis was carried out with the German PIAAC dataset in order to differentiate the adult population by their uses of literacy, numeracy and ICT. As a result of this procedure, three subgroups of adults can be distinguished by the frequency in which they use selected skill-related activities. Surprisingly, an adult's individual literacy level does not clearly predict group membership. A further interesting result is that participants in one of the groups seem to compensate for the few chances they have to use their skills at work by using them more often in their everyday life. Both results contribute to the need to draw a more differentiated picture of adults with lower literacy skills.

Nygren, H., Nissinen, K., Hämäläinen, R., & De Wever, B. (2019). Lifelong learning: Formal, non-formal and informal learning in the context of the use of problem-solving skills in technology-rich environments. *British Journal of Educational Technology*, 50(4), 1759-1770. doi: 10.1111/bjet.12807

**Abstract:**

The evolving technological landscape in the digital era has a crucial influence on lifelong learning and the demand for problem-solving skills. In this paper, we identify associations between formal, non-formal and informal learning with sufficient problem-solving skills in technology-rich environments (TRE). We focus on adults' problem-solving skills in TRE as a novel approach to investigate formal, non-formal and informal learning based on data from the Programme for the International Assessment of Adult Competencies. This programme measured 16–64-year-old adults' proficiency in problem-solving skills in TRE. The total sample size was 61 654 individuals from 13 European countries. Our results clearly indicate that the skill levels of more than 50% of adults aged 16–64 years old seem to be insufficient to cope effectively in TRE. The findings suggest that the learning ecologies of adults are a combination of formal, non-formal and informal learning activities. The overall level of problem-solving skills in TRE was higher among individuals who indicated that they have participated either formal or non-formal learning activities, compared to those who have not. However, interestingly, the association between formal learning and problem-solving skills in TRE was not major. Instead, our results clearly indicate that informal learning seems to be highly associated with sufficient problem-solving skills in TRE. In practice, we outline those formal, non-formal and informal learning activities that adults perform when applying the skills in TRE. By recognising these activities undertaken by sufficient problem solvers, we can promote lifelong learning skills. Our findings can also be used as a starting point for future studies on lifelong learning.

**Title:**

Oakford, P., Brumfield, C., Goldvale, C., & Tatum, L. (2019). *Investing in futures: Economic and fiscal benefits of postsecondary education in prison*. New York: Vera - Institute of Justice. Retrieved March 4, 2020, from [https://storage.googleapis.com/vera-web-assets/downloads/Publications/investing-in-futures-education-in-prison/legacy\\_downloads/investing-in-futures.pdf](https://storage.googleapis.com/vera-web-assets/downloads/Publications/investing-in-futures-education-in-prison/legacy_downloads/investing-in-futures.pdf)

**Abstract:**

Efforts to build robust postsecondary education programs in prison have accelerated in recent years, with support from a broad range of groups from correctional officers to college administrators. This report describes how lifting the current ban on awarding Pell Grants to incarcerated people would benefit workers, employers, and states. Specifically, it analyzes the potential employment and earnings impact of postsecondary education programs in prison; identifies the millions of job openings annually that require the skills a person in prison could acquire through postsecondary education; and estimates the money states would save through lower recidivism rates these postsecondary education programs would yield.

Organisation for Economic Cooperation and Development (OECD) (2019). *Investing in the skills of adult immigrants*. Adult Skills in Focus No. 11. Paris: OECD Publishing. doi: 10.1787/79990b8c-en

**Abstract:**

Lifelong learning is especially important for immigrants, who are often at a disadvantage in terms of the languages and skills that are valued in the labour market of their host country. Yet foreign-born adults are less likely to participate in training than native-born ones, and face higher financial and non-financial barriers to training. Policy efforts should focus not only on providing more training opportunities, but also on removing barriers to participation.

Organisation for Economic Cooperation and Development (OECD) (2019). *Beyond proficiency. Using log files to understand respondent behaviour in the survey of adult skills*. Paris: OECD Publishing. doi: 10.1787/0b1414ed-en.

**Abstract:**

Computer-based administration of large-scale assessments makes it possible to collect a rich set of information on test takers, through analysis of the log files recording interactions between the computer interface and the server. This report examines timing and engagement indicators from the Survey of Adult Skills, a product of the Programme for the International Assessment of Adult Competencies (PIAAC), both of which indicate large differences across countries and socio-demographic groups, in the amount of time spent by respondents and their levels of disengagement, which reduce the probability of giving a correct answer and consequently reduces measured performance. Such insights can help policy makers, researchers and educators to better understand respondents' cognitive strategies and the underlying causes of low and high performance. This, in turn, can help improve the design of assessments and lead to more effective training and learning programmes.

Pak, M., & Schwellnus, C. (2019). *Labour share developments over the past two decades*. OECD Economics Department Working Papers No. 1541. Paris: OECD Publishing. doi: 10.1787/b21e518b-en

**Abstract:**

Labour share developments over the past two decades have differed widely across OECD countries, with about half of them experiencing significant declines. This paper analyses the role of public policies in shaping labour share developments across countries. The results suggest that pro-competition product market reforms raise the labour share by reducing producer rents. Labour market reforms that strengthen the bargaining position of workers, such as tightening employment protection or raising minimum wages, may raise wages in the short term but risk triggering the substitution of capital for labour in the medium term. On average, across countries, such reforms are estimated to reduce the labour share. By contrast, promoting the re-employment of workers who lose their jobs through active labour market policies unambiguously raises the labour share.

Pareliussen, J., André, C., & Hwang, H. (2019). *Improving school results and equity in compulsory education in Sweden*. OECD Economics Department Working Papers No. 1587. Paris: OECD Publishing. doi: 10.1787/99a20fbc-en

**Abstract:**

Swedish school results declined for two decades following a series of reforms in the early 1990s decentralising the school system and introducing choice, competition and management by objectives. The general aims and direction of reform were not destined to lower results, but weaknesses of reform design and implementation, against the backdrop of a deep recession, likely contributed to falling outcomes. Residential segregation and the current model of competition and choice increase school segregation and likely reduce equality of opportunity. A coherent set of reforms should strengthen central government institutions, rebuild a regional governance structure and increasingly target funding to pupils' needs. Better steering of competition and school choice implies ensuring that grades fairly represent pupils' skills and knowledge, that municipalities increasingly take the socio-economic mix of pupils into account in entry and investment decisions, and that entry and expansion of private schools are better coordinated to counter school segregation. Teaching needs to become more attractive to raise the quality of recruitment to the profession and to address current and future teacher shortages by improving teacher education, strengthening continuous learning and instigating more cooperation, feedback and support between colleagues.

Parkin, A., Seward, B., & Truong, K. (2019). *Combining school and work: An update on postsecondary student employment in Canada*. Mowat Research No. 187. Toronto: Mowat Centre. Retrieved March 4, 2020, from <http://hdl.handle.net/1807/99436>

**Abstract:**

Postsecondary students have been increasingly combining education and employment as a way of enhancing skills and not only as a way of managing costs. This Mowat note summarizes what descriptive statistics from Statistics Canada's most recent Longitudinal and International Survey of Adults (LISA) data tell us about students' work experiences while in postsecondary education. We find that: Combining work and studies is a common experience for postsecondary students. Fewer than two in five PSE students report holding a job while enrolled that is related to their studies. Nearly one in two students who combined employment with their PSE studies say it provided

them with knowledge and experience needed to help them obtain their first career-related job. Students with higher literacy, numeracy and problem-solving scores – who are less likely to face difficulties transitioning into the labour force – are more likely to work while in PSE.

Patel, P. C., & Ganzach, Y. (2019). Returns to balance in cognitive skills for the self-employed: Evidence from 18 countries. *Small Business Economics*, 52(1), 89-109. doi: 10.1007/s11187-018-0018-4

**Abstract:**

Is there a positive contemporaneous association between balance in cognitive skills and self-employment earnings? In this paper, we extend past studies that draw on balance in cognitive skills tests administered at an early age and use the balance in scores on cognitive skills tests administered during 2011–2012 in the Programme for the International Assessment of Adult Competencies (PIAAC), a cross-sectional sample of 47,768 adult participants from 18 countries. Lowering concerns for cognitive skills measured at an early age, PIAAC's measure of cognitive skills provides a contemporaneous measure of cognitive skills also accumulated through past experiences. Using a standardized measure of cognitive skills across participating countries, PIAAC also lowers concerns for measurement error resulting from cultural bias in country-specific cognitive skills tests. Extending the entrepreneurship earnings puzzle—lower average income for the self-employed relative to wage earners—a greater balance in cognitive skills among the self-employed helps close earnings gaps with wage earners. However, balance in cognitive skills is not associated with self-employment. The implications of the findings are discussed.

Patterson, M. B. (2019). Adults with low skills and learning disabilities. In D. Perin (Eds.), *The Wiley Handbook of Adult Literacy* (pp. 337-360). Hoboken: John Wiley & Sons. doi: 10.1002/9781119261407.ch16

**Abstract:**

In this chapter, the author describes the characteristics, background, and experience of adult learners with low skills and self-reported learning disabilities (LD) using two large-scale sets of data: the Programme for International Assessment of Adult Competencies (PIAAC:2012/2014), which contains data on adults with low skills and LD from a representative sample of 5,040 U.S. working-age adults; and PowerPath™ to Education and Employment, which contains data from 1,761 U.S. adult learners screened for learning challenges at adult education enrollment. PIAAC:2012/2014 respondents reported limited participation in formal education, lower educational attainment and employment, and high rates of coexisting disabilities and poor health. PowerPath respondents and PIAAC: 2012/2014 respondents reported an incidence of LD of 26 and 10%, respectively. A partial explanation for the difference in rates of LD is that PowerPath respondents who were entering adult education, had lower skills than adults with low skills and LD in the more broadly representative PIAAC: 2012/2014 sample. Findings from visual, auditory, and attention screenings are presented.

Perry, A., & Gauly, B. (2019). Analysing poor reading skills: A comparison between PIAAC literacy levels and reading components. *Survey Methods: Insights from the Field*, 1-9. doi: 10.13094/SMIF-2019-00020

**Abstract:**

The aim of this paper is to compare two measures of literacy skills used in the Programme for the International Assessment of Adult Competencies (PIAAC), i.e. literacy levels and reading components. Different from assessing literacy levels, which cover the entire range of reading skills from very high to very low, the reading components assessment is specifically designed to test the reading skills of the low literate. As literacy skills are an important determinant for labour market success, we examine whether the reading components assessment is a better predictor of employment of the test takers than the general literacy level assessment used in PIAAC. We compare different logistic regression models that include literacy levels and the reading components and use the Wald-test to compare the model fit of each examined model. In a further step we test whether the predictive validity differs between low and high literate test takers. Our results indicate that the PIAAC reading components are more useful in predicting employment of the low literate than the PIAAC literacy levels.

Popov, D., & Strelnikova, A. (2019). Inconsistency between educational attainment and literacy: The case of Russia. *Communist and Post-Communist Studies*, 52(3), 259-269. doi: 10.1016/j.postcomstud.2019.08.001

**Abstract:**

From the moment when wide spread of large scale assessments in sociology and economics began, the most commonly used indicators of peoples' qualifications are the number of years spent in education and the possession of a high school/college/university diploma. But what if these formal indicators are unreliable under certain conditions and do not reflect actual literacy and competency of people? This article, drawing on data from the Programme for the International Assessment of Adult Competencies (PIAAC), questions accuracy of the basic educational indicators in Russia. There is a linear relationship between the possession of a formal graduation diploma and the measurement of PIAAC literacy of the able-bodied population in OECD countries, including the Eastern European ones. However, the analysis shows that in Russia there is an inconsistency between literacy and formal educational status. This fact in itself casts doubt on the effectiveness of formal education indicators in Russia. The social implications resulting from this inconsistency become apparent through an international comparison of research results. These ill effects have been documented in the areas of employment, education and social reproduction and in the social self-awareness of the Russian people.

Prins, E., & Monnat, S. (2019). Literacy, numeracy, and self-rated health among U.S. Adults. In *The Wiley Handbook of Adult Literacy* (pp. 317-336). Hoboken: John Wiley & Sons. doi: 10.1002/9781119261407.ch15

**Abstract:**

In this chapter, we examine whether and how health is related to adult literacy and numeracy. A

social determinants of health model is applied to elucidate how literacy and numeracy may facilitate access to health-promoting opportunities and resources. Health literacy is differentiated from print literacy. We highlight two prevalent problems in discussions of literacy/numeracy and health: (a) conflation of print and health literacy and (b) failure to control for sociodemographic characteristics. We then summarize research on the key predictors of limited (health) literacy and numeracy and explains how these capabilities are implicated in health. Finally, we present findings from two studies in which data analyzed from the Program for International Assessment of Adult Competences (PIAAC), indicates that literacy and numeracy should be considered as potential determinants of health. The PIAAC findings underscore the need to couple basic skills instruction with other initiatives to enhance health, especially among low-socioeconomic status adults.

Pullman, A., & Jongbloed, J. (2019). The relative relationship between education and workplace task discretion: An international comparative perspective. *Journal of Education and Work*, 32(1), 66-84. doi: 10.1080/13639080.2019.1594173

**Abstract:**

Through analyses of Programme for the International Assessment of Adult Competencies (PIAAC) data, the following study considers the direct and indirect association between education and workplace task discretion in 30 countries. By focusing on cross-national comparison, it considers the ways in which these findings are dependent on both the overall level and the range of task discretion across occupational sectors within a country. Theoretically, individual-agency and critical-institutional hypotheses are compared, two perspectives that provide divergent explanations for the indirect association between education and task discretion. The findings partially support both perspectives and there is strong evidence of a relative relationship between education and task discretion. That is, in country contexts where overall levels of task discretion are higher and more equal, education operates less strongly as a stratifying force. The originality of this approach showcases empirically how the association between education and task discretion is context dependent and theoretically how individual-agency and critical-institutional perspectives both contribute to understanding this relationship.

Rammstedt, B., Zabal, A., & Gaily, B. (2019). Grundkompetenzen Erwachsener im internationalen Vergleich - Ergebnisse aus 32 PIAAC Teilnehmerländern [Literacy skills of adults in international comparison – Results from 32 PIAAC countries]. In G. Quenzel & K. Hurrelmann (Eds.), *Handbuch Bildungsarmut* (pp. 287-314). Wiesbaden: Springer Fachmedien. doi:10.1007/978-3-658-19573-1\_11

**Abstract:**

The chapter presents the literacy skills in more than 30 countries participating in the first and second rounds of PIAAC (Programme for the International Assessment of Adult Competencies) from the perspective of Germany. Furthermore, the findings of this international comparison are contrasted with the findings exclusively based on the countries of the first PIAAC round. With 17.5 percent, Germany has a comparatively high proportion of individuals with very low literacy skills compared to other countries with a similar average level of literacy skills. The study examines determinants of and protective factors for low literacy skills in Germany, and it compares these findings with those for Austria and the USA, as these countries had a similar average level of literacy skills in PIAAC.

Rappleye, J., & Komatsu, H. (2019). Is knowledge capital theory degenerate? PIAAC, PISA, and economic growth. *Compare: A Journal of Comparative and International Education*, 1-19. doi: 10.1080/03057925.2019.1612233

**Abstract:**

Extending recent analyses using PISA data, the current study utilises the OECD's Survey of Adult Skills (PIAAC) to test the central claims of knowledge capital theory. PIAAC has a distinct advantage over PISA in that it more directly tests levels of purported 'knowledge capital' across an entire national workforce, rather than offering approximations based on the performance of 15-year-old students. Findings from our two original studies reported herein further refute the tight linkage between cognitive levels and GDP growth per capita envisaged by proponents of knowledge capital, most notably the OECD and World Bank. These results suggest that knowledge capital theory is now degenerate. If scholars are willing to extend this reporting of results refuting knowledge capital theory, this will likely accelerate the theory's loss of momentum in the coming years.

Rasmusson, M., Albæk, K., Lind, P., & Myrberg, M. (2019). Cognitive foundation skills following vocational versus general upper-secondary education: A long-term perspective. *Scandinavian Journal of Educational Research*, 63(7), 985-1006. doi: 10.1080/00313831.2018.1466361

**Abstract:**

The present study aims at investigating the long-term cognitive effects of vocational education and training (VET) in Sweden and Denmark using data from the PIAAC Survey of Adult Skills. While Sweden has moved towards a more academic vocational education, Denmark has kept the apprenticeship system. Using multiple regression analysis we estimate the contribution of VET versus general upper-secondary education to the proficiency in literacy. The results show a higher literacy performance in those Swedish age groups in more academic VET programmes compared to the older Swedish age groups and to all the Danish age groups. A reasonable interpretation is that the amount of cognitively challenging subjects at the upper-secondary level gives a lasting imprint on literacy proficiency later in life.

Reder, S. (2019). Numeracy imprisoned: skills and practices of incarcerated adults in the United States. *ZDM Mathematics Education*. doi: 10.1007/s11858-019-01094-0

**Abstract:**

The development of cognitive skills is influenced by characteristics of both individuals and the environments in which they live, including their homes, neighborhoods, schools and workplaces. Contextual features of these environments shape and constrain cognitive development in various ways. This article considers the case of numeracy development within the highly constrained environment of prisons in the United States. Data are analyzed from recent PIAAC assessments of the incarcerated and household populations of the United States. Individuals' assessed numeracy skills and engagement in everyday numeracy practices, both inside and outside of prisons, are

analyzed in relation to their education and other background characteristics. Although some of the observed differences in numeracy between household and prison populations can be attributed to differences in these background characteristics, significant differences in numeracy skills and practices remain after controlling for background characteristics. Such regression-adjusted differences may reflect the distinctive numerate environment of prisons. Prisoners' numeracy appears to be initially disrupted by incarceration but gradually improves as it adjusts over time to the new numerate environment. Numeracy also appears to be an important determinant of key social outcomes in prisons. Some methodological limitations of these findings are considered along with their implications for fostering numeracy development and improved social outcomes inside and outside of prisons as well as in other vulnerable populations.

Redmer, A., & Dannath, J. (2019). Changes in employment since the 1990s: Numeracy practices at work in IALS and PIAAC. *ZDM Mathematics Education*, 1-13. doi: 10.1007/s11858-019-01112-1

**Abstract:**

Observing the transition from industrial work to more and more digitalised work in the last decades, in this paper we discuss changes in employment and the relevance of numeracy in adult basic education and in working environments. In a knowledge society, the demand for highly qualified professionals is growing. It is questionable what effects this need will have on other occupational groups. Is there a higher risk of becoming more vulnerable as a result of a so-called 'polarisation of the labour market'? Dealing with change in employment structures for industrialised countries, the authors examine the change in numeracy practices in the International Adult Literacy Survey compared with that in the Programme for the International Assessment of Adult Competencies. In a comparison of the two large-scale assessments, the authors are able to confirm a polarisation in the sense of more higher- and lower-qualified jobs and less medium-qualified jobs. Numeracy practices, however, have been decreasing across all occupational groups over the last 3 decades. Today there is a higher risk of becoming vulnerable if the occupations are part of a middle qualified job. More critical numeracy skills and a visibility of numeracy at work could reduce the risk of vulnerability.

Redmer, A., & Grotlüschen, A. (2019). Alltagsmathematische Praktiken im höheren Lebensalter [Numeracy practices in older age]. *Zeitschrift für Weiterbildungsforschung*, 42(3), 397-413. doi: 10.1007/s40955-019-0135-y

**Abstract:**

Demographic change renders basic skills important at an increasingly older age. Among them, skills in financial matters are becoming increasingly relevant. The skills measured in PIAAC and CiLL represent comprehensive cognitive abilities which can be seen as the basis for successful participation in social and economic life. Based on a secondary analysis, this paper shows that financial practices remain for older people, although their numeracy skills proficiency lower than those of younger people. The analysis clearly shows a gender difference in dealing with financial matters: men handle bills and bank statements, women manage the household.

Renbarger, R., Rivera, G., & Sulak, T. (2019). What predicts literacy, numeracy, and problem solving for incarcerated individuals? A PIAAC examination. *Journal of Offender Rehabilitation*, 58(3), 199-219. doi: 10.1080/10509674.2019.1582575

**Abstract:**

The purpose of this article was to investigate relationships between literacy, numeracy, and problem solving ability with characteristics of individuals within the United States prison system. The Programme for the International Assessment of Adult Competencies (PIAAC) dataset was used for analysis, which included information for 1,319 participants ages 16–74. Results indicated that offenders' prior experiences and prison context variables differentially predicted literacy, numeracy, and problem solving in technology-rich environments. Implications for prison education are discussed along with study limitations.

Rhodes, C. M., Cordie, L., & Wooten, M. (2019). An examination of social capital among U.S. Adults: Patterns that facilitate social well-being as measured by PIAAC. *International Journal of Learning, Teaching and Educational Research*, 18(2), 1-12. doi: 10.26803/ijlter.18.2.1

**Abstract:**

Communities thrive when individuals work together to share knowledge and resources. This phenomenon, social capital, is widely understood as the access and proficiency individuals have to knowledge and networks that facilitate acquisition of economic resources and social well-being (Putnam, 2000). This paper presents findings from data collected in the Programme for the International Assessment of Adult Competencies (PIAAC) related to three elements of social capital. Community involvement, political efficacy, and social trust were explored as they relate to age, educational attainment, and time of residence in the United States. Key results include low levels of all social capital variables and differences by age and educational attainment. Findings add to the understanding of the ways in which sub-groups of U.S. communities engage with their social networks.

Ridala, S., & Toomet, O. (2019). Wage gap in an ethnically segmented labor market: The role of cognitive skills. *Eastern European Economics*, 57(1), 20-30. doi: 10.1080/00128775.2018.1524713

**Abstract:**

We analyzed the ethnic wage gap in Estonia that hosts a large Russian-speaking minority population. We used the Oaxaca-Blinder decomposition to test whether the observed wage gap among the working population is related to commonly unobserved skills. Data from the Estonian Labor Force Survey and the Programme for the International Assessment of Adult Competencies (PIAAC) have been used. We find that the three PIAAC skills combination lowered the estimated unexplained wage differential by approximately 20%. We conclude that the unexplained wage gap is most likely related to entry barriers, combined with low-level segregation and segregated social networks.

**Abstract:**

We examine civic engagement among immigrants and native-born adults in the United States (U.S.) and Germany—world-leading nations with different responses to immigration and assimilation. Civic engagement involves the practices and beliefs underpinning the democratic functions of citizenry, and is operationalized in this study as voluntary work or volunteerism, political efficacy, and social trust. Data for the analyses are drawn from PIAAC. Individual background factors—age, gender, education level, skills, immigrant status, and employment—serve as covariates in our regression models. Several cross-national differences were observed in the relationships among background factors and dimensions of civic engagement. Results are discussed regarding the role of adult education programs for supporting both the transitions of migrants and maintenance of democratic behaviors among native-born citizens.

Roumell, E., & Roessger, K. (2019). Humanistic, innovative solutionism: What role do data analytics play in developing a more responsive and more intelligent adult and workforce education policy? In T. Jules & F. Salajan (Eds.), *International Perspectives on Education and Society* (pp. 127-142). Bingley: Emerald Publishing Limited. doi: 10.1108/S1479-367920190000038008

**Abstract:**

In a world where the continual combining of computer applications and the expansion of artificial intelligence is already necessarily changing the world of work for people, an education system that does not adequately respond to these trends and changes will render itself irrelevant. Education policy and regulation may suffer at the hand of such accelerations due to unexpected consequences and developments. However, the rapid, exponential improvements in computer hardware and software that have enhanced the rate and our ability to gather, transform, manipulate, and interpret these data in an ongoing fashion also present myriad educational opportunities. The so-called Fourth Industrial Revolution offers societies data and information capabilities previously unimagined, making it possible to learn how to combine, innovate, and imagine entirely new avenues for building responsive and intelligent education policies and systems that promote the education and wellbeing of citizens as well as improving their economic participation. These advances necessitate a growing number of educators and education systems who can intelligently respond to Industry 4.0 trends. In this chapter, some considerations regarding the use of large-scale, international datasets and emerging data analytics for analyzing policy for the governance of education are offered, and a discussion of the need for the more systematic use of data analytics as a mechanism for developing socially responsive adult learning and workforce education policy and programming.

Rubenson, K. (2019). Assessing the status of lifelong learning: Issues with composite indexes and surveys on participation. *International Review of Education*, 65(2), 295-317. doi: 10.1007/s11159-019-09768-3

**Abstract:**

A quick review of national policy documents reveals how lifelong learning has evolved as the key principle for a comprehensive education and learning strategy from cradle to grave. This raises major challenges for how to assess and report the state of lifelong learning in UNESCO Member States. It is in this context that this article critically evaluates the efforts to develop a composite index on lifelong learning. In addition, the author reviews the two leading surveys on adult education and learning, the OECD's Programme for the International Assessment of Adult Competencies (PIAAC) and the European Union's Adult Education Survey (AES). He examines their potential to provide a national picture of the state of lifelong learning, pointing out some fundamental shortcomings in these surveys and in the way their data have been classified. The present approach to data gathering on adult and lifelong learning, with its deep roots in the skills agenda, creates a "reality" of adult learning where the broad humanistic traditions of adult education become invisible. Analyses of the European and Canadian composite indexes of lifelong learning reveal serious problems using this approach. Not only must one question the underlying framework based on Jacques Delors' four pillars of learning, but also its practical use for directly assessing the impact of the various aspects of lifelong learning and education. A core argument in this article is that there is a need to broaden not only the indicators used to assess the state of lifelong learning, but also the approach to how outcomes are being understood and judged.

Saal, L. K., Yamashita, T., Shaw, D. M., & Perry, K. H. (2019). An exploration of U.S. adults' information processing skills and political efficacy. *Journal of Adult and Continuing Education*. doi: 10.1177/1477971419852750

**Abstract:**

As recent debates about the role of social media in election outcomes suggest, understanding the association between information processing skills and political efficacy in the U.S. is a significant inquiry for adult and continuing education. Data from the Programme for the International Assessment of Adult Competencies were used to explore relationships between U.S. participants' information processing skills and political efficacy. Given the impact of certain demographic characteristics on political efficacy, the study also analyzed whether the relationship between information processing skills and self-reported political efficacy varied across levels of cultural engagement, formal educational attainment, or immigrant status. The results illustrate that higher levels of literacy, numeracy, and problem solving in technology-rich environments are associated with higher political efficacy for U.S. participants. Our research is framed in both cognitive and critical lenses, and we provide implications for practice in adult and continuing education settings.

**Title:**

Salinas, D. (2019). Can academic performance help disadvantaged students to achieve upward educational mobility? *Pisa in Focus* No. 99. Paris: OECD Publishing. doi: 10.1787/fd5356d0-en

**Abstract:**

During the past century, access to education increased in countries all over the world. Up until the early decades of the 20th century, people attended school for only a few years. Towards the end of the century, adults in high-income countries completed 12 years of schooling, on average. Today in OECD countries, a larger share of the population than ever before completes tertiary education. For many, especially socio-economically disadvantaged students whose parents had attained only low levels of education, this expanded access to education has led to upward educational mobility – attaining a higher level of education than their parents did. But just as economic growth does not necessarily reduce income inequality, so the expansion of access to education does not automatically result in greater equity in educational attainment. For that to happen, disadvantaged students need to benefit as much as or more than advantaged students. A recent PISA report, *Equity in Education*, explores how upward educational mobility has changed over recent decades. It finds that, despite the expansion of access, socioeconomic disparities in the completion of tertiary education remain large. However, the report also shows that when students with low-educated parents perform at high levels by age 15, as measured by PISA, their chances of completing tertiary education improve considerably.

Sasso, S., & Ritzen, J. (2019). Sectoral cognitive skills, R&D, and productivity: A cross-country cross-sector analysis. *Education Economics*, 27(1), 35-51. doi: 10.1080/09645292.2018.1515309

**Abstract:**

We focus on human capital measured by skills and analyse its relationship with R&D investments and productivity across 12 OECD economies and 17 industries. We compute a measure of sectoral human capital defined as the average cognitive skills of the workforce in each country-sector combination. The variation in labour productivity that can be explained by human capital is remarkably large when measured by the sectoral skills, whereas it appears statistically insignificant when measured by the sectoral school attainment. This suggests that using measures of sectoral cognitive skills can represent a major step forward in any future sectoral growth accounting exercise.

Scandurra, R., & Calero, J. (2019). How adult skills are configured? *International Journal of Educational Research*, 99, 1-7. doi: 10.1016/j.ijer.2019.06.004

**Abstract:**

This article examines the relationship between family background, education, skills use and direct measures of literacy skills in five countries: the United States, Japan, Germany, Denmark and Spain. The main aim is to contribute to the research on skills acquisition by providing a comprehensive analysis of literacy skills. We employ a structural equation modelling and use PIAAC data. Results show that skills are configured in a highly complex manner and that significant differences emerge across the five countries, reflecting their historical and institutional characteristics. Inter-generational transmission of educational inequality is a crucial factor in shaping skills outcomes, although this factor varies considerably between countries. The effects of family background, educational attainment, and skills use in daily life on literacy respond to country specific equilibria.

Schleicher, A., & Schuknecht, L. (2019). Bildung, Ausbildung, Fortbildung: Herausforderungen aus internationaler Perspektive [Education, training, further education: Challenges from an international perspective]. *ifo Schnelldienst*, 72(15), 20-35. Retrieved March 4, 2020, from <http://hdl.handle.net/10419/206900>

**Abstract:**

In this contribution two international trends, that are of particular relevance for education policy in Germany and Europe, are pointed out: First, a high level of education remains the guarantor of prosperity and growth. But in international comparison, more and more Asian countries are taking the top positions in the OECD surveys. Some European countries are falling behind not only in relative but also in absolute terms. Secondly, technological progress and especially digitization will continue to change the world of work and require different skills than in the past. At the same time, further growth in life expectancy and working life will make lifelong learning more necessary than ever. This poses major challenges for education policy in Germany and internationally, which must be addressed in order to remain at the forefront of international education policy. [Translated on behalf of editors]

Schnitzlein, D. D. (2019). *The relationship between trust, cognitive skills, and democracy - evidence from 30 countries around the world*. Hannover Economic Papers (HEP) No. dp-650. Hannover: Leibniz Universität Hannover, Wirtschaftswissenschaftliche Fakultät. Retrieved February 28, 2020, from <http://hdl.handle.net/10419/20066>

**Abstract:**

Based on highly comparable data from the OECD PIAAC Programme, this note analyzes the relationship between generalized trust and cognitive skills among 30 countries around the world. The results show that the strength and direction of the relationship is not a universal characteristic but varies substantially among countries worldwide. A detailed descriptive analysis of this variation provides evidence that the relationship strengthens with the level of democracy in a country. In a second step, German separation and reunification is used as external variation in the level of democracy in the German PIAAC subsample. The results support the evidence from the cross-country analysis. Thus, the institutional framework in a country not only shapes an individual's level of trust but also amplifies the relationship between individual characteristics such as cognitive skills and generalized trust.

Schröter, H., & Bar-Kochva, I. (2019). Keyword: Reading literacy. Reading competencies in Germany and underlying cognitive skills. *Zeitschrift für Erziehungswissenschaft*, 22(1), 17-49. doi: 10.1007/s11618-018-00864-y

**Abstract:**

There is a general consensus that reading competencies, being a core element of basic education, are an essential prerequisite for the acquisition, organization, and application of knowledge in various subjects and domains. Thus, reading competencies represent a key factor for educational and professional success, lifelong learning, and social participation. In the first part of this article, we summarize the main findings of recent international and national large-scale assessment stud-

ies suggesting that a significant proportion of children, adolescents, and adults in Germany do not attain a sufficient level of reading competence to understand and learn from texts. Because there is evidence that a share of these poor readers may have limited basic reading abilities that underlie text comprehension, in the second part of this article we review meta-analyses on the relations between cognitive skills and reading competence. Finally, we discuss challenges for school and adult education, and mention possible perspectives for future research.

Sieben, S., & Lechner, C. M. (2019). Measuring cultural capital through the number of books in the household. *Measurement Instruments for the Social Sciences*, 1(1), 1-6. doi: 10.1186/s42409-018-0006-0

**Abstract:**

Cultural capital is frequently measured via the number of books in a respondent's household. Despite this measure's widespread use, its quality remains largely unclear. To remedy this, we conducted a comprehensive assessment of the measurement properties of two items measuring past and present objectified cultural capital via the number of books in the household of the respondent's family of origin and the respondent's current household, respectively. For this purpose, we used data (N = 3260) from the Programme for the International Assessment of Adult Competencies (PIAAC) 2012 survey in Germany and the 2015 wave of a follow-up study (PIAAC-L). We analyzed the two items' distributions (total sample and separately by age-group), test-retest reliability over 3 years (for past cultural capital only), and their convergent and divergent validity (i.e., correlations with socioeconomic status, literacy and numeracy skills, and cultural and literary activities).

Sikora, J., Evans, M., & Kelley, J. (2019). Scholarly culture: How books in adolescence enhance adult literacy, numeracy and technology skills in 31 societies. *Social Science Research*, 77, 1-15. doi: 10.1016/j.ssresearch.2018.10.003

**Abstract:**

A growing body of evidence supports the contention of scholarly culture theory that immersing children in book-oriented environments benefits their later educational achievement, attainment and occupational standing. These findings have been interpreted as suggesting that book-oriented

socialization, indicated by home library size, equips youth with life-long tastes, skills and knowledge. However, to date, this has not been directly assessed. Here, we document advantageous effects of scholarly culture for adult literacy, adult numeracy, and adult technological problem solving. Growing up with home libraries boosts adult skills in these areas beyond the benefits accrued from parental education or own educational or occupational attainment. The effects are loglinear, with greatest returns to the growth in smaller libraries. Our evidence comes from regressions with balanced repeated replicate weights estimated on data from 31 societies which participated in the Programme for the International Assessment of Adult Competencies (PIAAC) between 2011 and 2015.

Smith, M. C., Smith, T. J., Rose, A.~D., & Ross-Gordon, J. M. (2019). Readiness to learn among adults with low skills. In *The Wiley Handbook of Adult Literacy* (pp. 171-191). Hoboken: John Wiley & Sons. doi: 10.1002/9781119261407.ch8

**Abstract:**

This chapter describes a population of adults—those possessing low skill proficiency in literacy, numeracy, and information and computer technology (ICT)—and explores how a specific construct, readiness to learn, relates to their skill proficiency and to their use of literacy skills in everyday life and work. These ideas are discussed within the framework of the Programme for the International Assessment of Adult Competencies (PIAAC) Survey of Adult Skills (SAS), which assessed adults' skills, skill use in different contexts, and readiness to learn. The chapter reports results for low-skilled, English-speaking adults in four countries in which the relationships between readiness to learn and (a) use of literacy skills in the workplace and everyday life, and (b) skill proficiency were analyzed. Across countries, readiness to learn was significantly, positively related to low-skilled adults' skills and skills use in everyday life and the workplace. Implications for adult education and workplace training are described.

Stadtmüller, S., Martin, S., & Zabal, A. (2019). *Das Zielpersonen-Anschreiben in sozialwissenschaftlichen Befragungen [Advance and Invitation Letters in Social Science Surveys]*. GESIS – Survey Guidelines. doi: 10.15465/gesis-sg\_029

**Abstract:**

In social science surveys, fieldwork is usually initiated by mailing advance or invitation letters to the target persons. The objective of the advance letter is to convey the survey request and provide key information about the survey. In order to gain the target person's co-operation, the advance letter should clarify the purpose of the survey, stress its importance and communicate its seriousness. The aim of this Survey Guideline is to give some recommendations for advance letters, including both formal and content issues. Moreover, this Guideline deals with other features that may affect how target persons perceive the advance letter. This includes, for instance, certain delivery specifications.

Stephany, F., & Lorenz, H. (2019). *Back to the future - changing job profiles in the digital age*. Kiel, Hamburg: ZBW – Leibniz Information Centre for Economics. Retrieved March 4, 2020, from <http://hdl.handle.net/10419/202035>

**Abstract:**

The uniqueness of human labour is at question in times of smart technologies. The 250 years-old discussion on technological unemployment reawakens. Frey and Osborne (2013) estimate that half of US employment will be automated by algorithms within the next 20 years. Other follow-up studies conclude that only a small fraction of workers will be replaced by digital technologies. The main contribution of our work is to show that the diversity of previous findings regarding the degree of job automation is, to a large extent, driven by model selection and not by controlling for personal characteristics or tasks. For our case study, we consult Austrian experts in machine learning and industry professionals on the susceptibility to digital technologies in the Austrian labour market. Our results indicate that, while clerical computer-based routine jobs are likely to change in the next decade, professional activities, such as the processing of complex information, are less prone to digital change.

Stijepic, D. (2019). *An international comparison of skills, traits and job mobility*. doi: 10.2139/ssrn.3466370

**Abstract:**

In a large international comparison of 29 countries, I study the relation between job mobility and a person's skills and traits. While cognitive skills are associated with lower job mobility, some traits are associated with higher job mobility. For instance, a one-standard-deviation increase in numeracy skills (in the willingness to learn) is estimated to reduce (to raise) the probability of having at least two jobs over a period of five years by 2.7 percentage points (by 2.7 percentage points). While there is substantial heterogeneity across countries, the relations are statistically significant in a vast majority of countries. Notably, the studied individual characteristics tend to be more closely related to job mobility in more advanced economies.

Strakova, J., & Vesely, A. (2019). Other things being equal: Comparing literacies in the Czech and Slovak Republics. *Comparative Education Review*, 63(3), 418-438. doi: 10.1086/703869

**Abstract:**

Large-scale international assessments, such as PIAAC (Programme for the International Assessment of Adult Competencies) or PISA (Programme for International Student Assessment), have heightened interest in the comparative analysis of factors influencing the formation of skills and their change over time. However, such comparison has been hindered by substantial differences in contexts that can only be partially controlled in statistical analysis (e.g., cultural, social, or geographical factors particular to jurisdictions). In this article, we analyze a "natural experiment," trends in the development of learning outcomes in the Czech and Slovak Republics following the dissolution of the joint state in 1993. The analysis is theoretically based on an age cohort-period framework. We find that in both countries, PISA results are closely related to the future abilities of the particular age cohort (as measured in PIAAC), which supports the thesis that education has a

long-lasting effect. Although both countries followed similar trajectories, we find that some noticeable trends can be explained by different policies following dissolution of the joint state.

Sudaryana, B., Wellda, S., Ratnasari, D., Herdiyanti, H., & Siddiqa, D. (2019). The impact of digital economy towards the national economy development in Indonesia (the study case in Bandung, West Java). *International Journal of Academic Research in Business and Social Sciences*, 9(12), 409-424. doi: 10.6007/IJARBSS/v9-i12/6736

**Abstract:**

Indonesia is predicted to become the biggest digital economy country in Asian region. It can penetrate the amount of 130 billion US dollars or around 1, 729, 000 billion IDR. However, it will not be easy for Indonesia to successfully achieve the digital economy with this high value; there are still several major problems that must be faced by Indonesia, which is the sector of Indonesian higher level education that could not provide human resources in accordance with the industry needs, could not give consumer protection, taxation system, cyber security, and ICT infrastructure. The research used the experiment research methodology, which is the research trying to find the influence of a certain variable towards another variable in strictly controlled condition. The researcher manipulated the independent variable. This research intends to notice the causality and the influence of factors in certain condition. In the simplest form, the approach of this experiment tried to explain, control, and predict the phenomena as elaborate as possible. Quantitative model was mostly used in this experiment research. The result of the research indicates that Digital Economy Regulation and Human Resource Quality significantly influence the Development of Indonesian Economy. As well as, it is characterized by three fast-developing sectors; among them are on-demand services, financial technology (fin-tech), and e-commerce.

Sørensen, K., Krassel, L., & Fritjof, K. (2019). Childhood and adulthood skill acquisition - importance for labor market outcomes. *Journal of Economics and Economic Education Research*, 20(1), 1-23.

**Abstract:**

Using Danish matched PISA and PIAAC data; the study investigates the return to cognitive and non-cognitive skills to labor market outcomes. It measured skills at childhood and adulthood after entering the labor market. Hence, both whether cognitive and/or non-cognitive skills relate to earnings and employment rate were measured as well as how important the timing of acquiring skills was for outcomes on the labor market. Overall it was found that cognitive skills are important for both earnings and the employment rate but that the timing of the acquisition of the skills is of less importance. On the contrary, non-cognitive skills are important for earnings independent on whether the worker had high or low cognitive skills at childhood, but only important for the employment rate for workers with high cognitive and low non-cognitive childhood skills. Overall findings suggested that both cognitive and non-cognitive skills are important but that the dynamics differ.

Tamilina, L., & Tamilina, N. (2019). *Social trust formation in the workplace: Applying the job strain model to explain variations in social trust levels among employed individuals*. MPRA Paper No. 93559. Munich: Munich Personal RePEc Archive. Retrieved March 4, 2020, from <https://mpra.ub.uni-muenchen.de/93559/>

**Abstract:**

This study applies the job strain model (JDC-S) to social trust to analyze how workplace characteristics influence social trust formation patterns. By defining the “workplace” as consisting of (1) workload, (2) control, and (3) social support, the JDC-S model predicts job demands to inversely relate to social trust, whereas job control and social support to positively affect trust among the employed. We utilize the sample of 60250 respondents from the Programme for the International Assessment of Adult Competencies (PIAAC) public-use data to operationalize the three components and to link them to social trust scores. Our analysis provides strong empirical evidence that the three factors are not only associated with trust among employed individuals but that their impact is also contingent on the respondents’ sex and age.

Tong, T., Li, H., & Greiff, S. (2019). Human capital and leadership: The impact of cognitive and non-cognitive abilities. *Applied Economics*, 51(53), 5741-5752. doi: 10.1080/00036846.2019.1619022

**Abstract:**

We conduct an economic analysis about the impact of human capital on an individual’s potential of becoming a leader based on data from the Programme for the International Assessment of Adult Competencies Survey (PIAAC). Our human capital indicators include not only traditional measures such as education and experience, but also various measures of cognitive and noncognitive ability. Our cognitive ability measures include numeracy, literacy, and problem solving abilities, and non-cognitive ability measures include perseverance, motivation to learn, and social trust. We specifically investigate the effect of measurement error and reverse causality on the estimation results. We find that problem-solving ability is the most important in affecting leadership among cognitive ability measures, and perseverance shows the strongest impact among noncognitive ability measures. As a leader supervises more employees, the role of cognitive and noncognitive ability becomes more critical.

Trapp, S., Blömeke, S., & Ziegler, M. (2019). The openness-fluid-crystallized-intelligence (OFCI) model and the environmental enrichment hypothesis. *Intelligence*, 73, 30-40. doi: 10.1016/j.intell.2019.01.009

**Abstract:**

The Openness-Fluid-Crystallized-Intelligence (OFCI) model describes how these different constructs interact over time. One fundamental element in the model is the Environmental Enrichment Hypothesis, which states that more Openness leads to more learning opportunities, thereby fostering fluid intelligence (Gf). Indirectly, this positive influence also has a positive effect on crystallized intelligence (Gc). Despite empirical evidence supporting the model as a whole, little is known with regard to the actual mechanisms underlying environmental enrichment. PIAAC (Programme for the International Assessment of Adult Competencies) data (N = 5465) were used to

explore possible behavioral differences that lead to enriched environments for more open people. To this end, we utilized different indicators of reading and calculating behavior. The indicator of Openness used was indeed found to be associated with differences in reading and calculating activities at work and during leisure time. These relations were also shown to be related to the indicator of Gf and indirectly to the indicator of Gc. Theoretical implications and limitations of the study are discussed.

Trapp, S., & Ziegler, M. (2019). How openness enriches the environment: Read more. *Frontiers in Psychology*, 10(1123), 1-12. doi: 10.3389/fpsyg.2019.01123

**Abstract:**

The recently proposed OFCI model and specifically the Environmental Enrichment Hypothesis state that Openness positively influences the development of cognitive abilities (Ziegler et al., 2012). It is assumed that Openness leads to engagement in more learning activities through creating an enriched environment (e.g., reading). However, despite positive evaluations of the OFCI model in general, there is little empirical research on this specific hypothesis. The current paper used a longitudinal design to test the positive impact of Openness on the frequency of reading activities in general and in the specific case of periods of unemployment. PIAAC (Programme for the International Assessment of Adult Competencies) data were used to fit structural equation models. The results show that Openness fosters greater engagement in reading activities over 3 years; a buffering function in case of unemployment could not be found. Theoretical and practical implications are discussed.

Tverdostup, M., & Paas, T. (2019). *Valuation of human capital and the gender wage gap in Europe*. Working Paper Series No. 118. Tartu: University of Tartu. doi: 10.2139/ssrn.3460494

**Abstract:**

This paper investigates the gender wage gap in relation to the multi-dimensional human capital measure across 17 European countries. To date, the role of cognitive and task-specific skills had a limited empirical evidence in the gender wage gap literature. We narrow this research gap by relying on PIAAC (Program of International Assessment of Adult Competencies) data and applying Gelbach's (2016) decomposition methodology. The analysis reveals that occupation-/industry-specific work experience and task-specific cognitive and non-cognitive skills are the most rewarding human capital attainments. Work experience largely decreases the gender wage disparity in all analysed countries. Cognitive numeracy skill is another strong predictor of gender wage disparity. The effect of numeracy is rather homogeneous across countries, namely, controlling for numeracy reduces the wage gap. Unlike studies that stress the decreasing importance of human capital in gender wage gap assessments, we argue that a narrow definition of human capital may undermine the actual effect of the latter. Therefore, we conclude that human capital should be viewed as a combination of multiple characteristics and traits, each having specific valuation on the labour market, and thus, a particular role in explaining the gender wage gap.

Ugarov, A. (2019). *Talent misallocation across countries: Evidence from educational achievement tests*. Meeting Papers No. 1466. Minneapolis: Society for Economic Dynamics. Retrieved March 4, 2020, from <https://econpapers.repec.org/paper/redsed019/1466.htm>

**Abstract:**

Despite growing evidence on occupational and educational barriers in developing countries, there are few estimates of their effect on the aggregate productivity. This paper measures the magnitude of these barriers and their impact on aggregate productivity using the data on expected occupational choice of students. First, I document striking differences in the way students' skills affect occupational choice across countries. In most developing countries cognitive skills of students have a relatively little effect on prestige, skill intensity, or earning potential of expected occupations. This suggests a higher incidence of occupational barriers in developing countries. Next, I evaluate the efficiency losses associated with occupational barriers by calibrating a model of occupational choice based on the Roy (1951) framework. Workers have correlated Fréchet-distributed talents for professional occupations, non-professional occupations, and academic study as measured by academic proficiency scores. I calibrate the model by combining the data on expected occupations and skills from the PISA database with the data from nationally-representative samples of working adults. I find that developing countries can increase the productivity of workers with high school education by up to twenty percent by reducing the barriers to the level of a benchmark country (UK).

Ugarov, A. S. (2019). *Essays on human capital formation in developing countries* (Dissertation). University of Arkansas. Retrieved March 4, 2020, from <https://scholarworks.uark.edu/etd/3349>

**Abstract:**

Differences in human capital explain approximately one-half of the productivity variation across countries. Therefore, we need to understand drivers of human capital accumulation in order to design successful development policies. My dissertation studies formation and use of human capital with emphasis on its less tangible forms, including skills, abilities and know-how. The first chapter of my dissertation explores the effects of occupational and educational barriers on human capital stock and aggregate productivity. I find that students' academic skills have very small impact on occupational choice in most developing countries. This finding suggests a higher incidence of occupational barriers in developing countries. I evaluate the productivity losses resulting from occupational barriers by calibrating a general equilibrium model of occupational choice. According to my estimation, developing countries can increase their GDP by up to twenty percent by reducing the barriers to the level of a benchmark country (US). In the second chapter of my dissertation, I study the effects of economic growth on education quality. Several models of human capital accumulation predict that incomes have a positive causal effect on human capital for given levels of education by increasing the consumption of educational goods. The paper tests this prediction by using a within country variation in incomes per-capita across different cohorts of US immigrants. Wages of US migrants conditional on years of education serve as a measure of education quality. I find that average domestic incomes experienced by migrants in age from zero to twenty years have a significant positive effect on their future earnings in the US. The third chapter studies the effects of employee-driven technology spillovers on technology adoption. It challenges the theoretical result of Franco and Filson (2006) by assuming that workers are risk averse and that the number of competitors is finite. In this more realistic scenario spillovers significantly reduce pay-offs from adopting advanced technologies.

Ulitzsch, E., Davier, M., & Pohl, S. (2019). Using response times for joint modeling of response and omission behavior. *Multivariate Behavioral Research*, 1-29. doi: 10.1080/00273171.2019.1643699

**Abstract:**

For adequate modeling of missing responses, a thorough understanding of the nonresponse mechanisms is vital. As a large number of major testing programs are in the process or already have been moving to computer-based assessment, a rich body of additional data on examinee behavior becomes easily accessible. These additional data may contain valuable information on the processes associated with nonresponse. Bringing together research on item omissions with approaches for modeling response time data, we propose a framework for simultaneously modeling response behavior and omission behavior utilizing timing information for both. As such, the proposed model allows (a) to gain a deeper understanding of response and nonresponse behavior in general and, in particular, of the processes underlying item omissions in LSAs, (b) to model the processes determining the time examinees require to generate a response or to omit an item, and (c) to account for nonignorable item omissions. Parameter recovery of the proposed model is studied within a simulation study. An illustration of the model by means of an application to real data is provided.

Vézina, S., & Bélanger, A. (2019). Literacy skills as an explanation for labor market imbalances by occupational type in Canada: Microsimulation projections for 2014–2024. *Population Research and Policy Review*, doi: 10.1007/s11113-019-09560-z

**Abstract:**

In Canada, the immigration selection process gives great importance to education level. However, studies find that given an equivalent level of education, immigrants have significantly lower literacy skills than their Canadian-born counterparts. This research shows the importance of accounting for literacy skills in the analysis of labor supplies. Made possible by survey data from the Programme for the International Assessment of Adult Competencies (PIAAC) and a microsimulation model (LSD-C), the Canadian workforce (labor supply) is projected by many socio-economic variables, including literacy skill proficiency. The projected workforce is then distinguished according to the five major occupational types as defined by the National Occupational Classification (NOC) of Canada. The parameters used for this distribution derive from multinomial logistic regressions stratified by education level and immigration status. These regressions first account for a slough of socio-demographic variables including level of literacy (N = 15,180). The procedure is then repeated omitting literacy. A comparison of the two breakdowns shows that by factoring literacy skills into the analysis, the projected supply of labor (and skills) is more conservative. In analyzing this refined reflection of labor force supply, we show how it is more balanced and how it better matches the labor demand. This paper highlights how traditional projections and analyses of labor supply and demand, which only account for education level, overestimate the number of workers who have a proper skillset for holding professional or managerial positions. Policy implications in terms of immigrants' selection and economic integration are discussed.

Vézina, S., Bélanger, A., Sabourin, P., & Marois, G. (2019). Literacy skills of the future Canadian working-age population: Assessing the skill gap between the foreign- and Canadian-born. *Canadian Studies in Population*, 46(1), 5-25. doi: 10.1007/s42650-019-00002-x

**Abstract:**

This paper presents the results of literacy proficiency projections using a microsimulation model that simultaneously projects future demographic, ethnocultural, and socioeconomic characteristics of the Canadian population. Factors linked with literacy skills of the working-age population are analyzed for both native- and foreign-born Canadians. The projection results show that literacy skills are likely to slightly decline between 2011 and 2061, as the positive effects of increasing education are canceled out by the important skill gap between native- and foreign-born Canadians. Results of the simulation suggest that plausible changes to immigrant selection policies could prevent against the associated literacy skill decline among the Canadian working-age population.

Vickerstaff, S. A., & Horst, M. F. (2019). Training at work: The impact of internalized ageism. *Innovation in Aging*, 3(Supplement1). doi: 10.1093/geroni/igz038.010

**Abstract:**

It is well documented that seniors receive less work based training than younger counterparts. Studies have assessed the extent to which managers afford access to training because of stereotypes about older workers being less trainable or interested in training. Less is known about the degree to which individuals have internalised age stereotypes and self-stereotype which impacts their attitudes about training. In this work place based study, through analysis of interviews with older workers we examine the extent to which internalised ageism is an inhibitor for seeking further training. We examine the role of gender and work setting. The data includes 185 participants in five different UK organisations in blue collar, white collar, managerial, manufacturing and services sectors. There is some evidence that older workers may feel that they are less deserving and less capable of training and development with implications for policy in this field.

**Title:**

White, S., Lacey, A., & Ardanaz-Badia, A. (2019). *The probability of automation in England: 2011 and 2017. Estimates of the probability of automation in England, including findings, and the skills and tasks at risk of automation within jobs*. London: Office for National Statistics. Retrieved March 9, 2020, from <https://www.ons.gov.uk/employmentandlabourmarket/peopleinwork/employmentandemployeetypes/articles/theprobabilityofautomationinengland/2011and2017>

**Abstract:**

Automation is of increasing importance to society, reflecting that the job market is changing composition. This article describes the methodology used by the Office for National Statistics (ONS) for producing estimates of the probability of automation for 2011 and 2017. We describe previous studies that have examined the impact of automation, before outlining the ONS approach. We present analysis of the probability of automation by demographic variables and highlight the skills and tasks that are at risk of automation within jobs.

**Title:**

Wicht, A., Müller, N., Haasler, S., & Nonnenmacher, A. (2019). The interplay between education, skills, and job quality. *Social Inclusion*, 7(3), 254-269. doi: 10.17645/si.v7i3.2052

**Abstract:**

Compared to general education, vocational education and training (VET) has been shown to facilitate young people's integration into the labour market. At the same time, research suggests that VET falls short in teaching basic skills and, in turn, may lead to less adaptability to labour market changes and long-term disadvantages in individual labour market outcomes. To better understand the relationships between education, skills, and labour market outcomes, we examine to what extent job quality differs between individuals with general education and those with VET with respect to different skill levels. Furthermore, we investigate whether the relationship between type of qualification and job quality differs by skills. We broaden past research by considering four indicators of job quality: earnings, job security, job autonomy, and the match between respondents' abilities and job demands. Using data from the Programme for the International Assessment of Adult Competencies for Germany, we demonstrate that individuals with academic education and advanced VET score higher in job quality concerning earnings and job autonomy as compared to individuals with initial VET. Comparing the two higher qualified groups, academic education is more associated with higher earnings than advanced VET, while the level of job autonomy is similar. Regarding the abilities-demands match, both groups score lower than individuals with initial VET. Moreover, higher literacy skills are associated with higher levels of job quality irrespective of the type and level of formal qualification. Finally, we find no empirical evidence that skills compensate for or reinforce disadvantages in job quality derived from professional qualifications.

Williams, R. (2019). National higher education policy and the development of generic skills. *Journal of Higher Education Policy and Management*, 41(4), 404-415. doi: 10.1080/1360080X.2019.1606690

**Abstract:**

This article explores the contribution of higher education to the development of numeracy and literacy competencies. To control for other post-schooling determinants of generic skills, the analysis is confined to adults aged 20–24 years who have completed or who are enrolled in tertiary studies. The quality of incoming students is controlled for by estimating the average PISA score attributable to this cohort using a truncated distribution approach. Average tertiary competencies are obtained for 31 countries from the OECD's Programme for the Assessment of Adult Competencies (PIAAC). The empirical findings are that the PISA scores account for most (70 per cent) of the international variation in PIAAC scores. Government expenditure on higher education is found to exert a small positive effect on PIAAC scores, at least for numeracy. The level of national research activity, as measured by research publications, has a small negative effect on PIAAC scores.

**Title:**

Woessmann, L. (2019). Facing the life-cycle trade-off between vocational and general education in apprenticeship systems. An economics-of-education perspective. *Journal for educational research online*, 11(1), 31-46.

**Abstract:**

This paper discusses the role of vocational education, and in particular apprenticeship education,

in preparing students for the labor market, with a particular focus on a life-cycle perspective in changing economies. The basic idea is that vocational education may facilitate entry into the labor market but hurt employment opportunities later in life because of limited adaptability to changing economic environments. We summarize evidence on the changing effects of vocational education over the life cycle from the international adult achievement tests IALS and PIAAC and country-specific evidence. We then discuss policy implications for elements of future-oriented education systems, especially apprenticeship programs.

Xiao, F., Barnard-Brak, L., Lan, W., & Burley, H. (2019). Examining problem-solving skills in technology-rich environments as related to numeracy and literacy. *International Journal of Lifelong Education*, 38(3), 327-338. doi: 10.1080/02601370.2019.1598507

**Abstract:**

This study sought to a better understanding of the construct of problem solving in technology-rich environments and the effect of literacy and numeracy on problem solving. Data used in this study were drawn from Programme for the International Assessment of Adult Competencies US data which includes 5010 completed cases and a total of 1326 variables. The assessment of literacy, numeracy and problem-solving competencies were administrated using computer-based approaches. The result of the study showed that adults with higher numeracy and literacy competencies were more likely to have higher level of problem-solving skills. The results of the analyses also revealed that solution latency (i.e. time) were an important factor influencing problem-solving skills. This study indicates that basic mathematical skills are essential for solving problems that require interpersonal communication, computer and software knowledge, planning, and organising. The findings from this study provide several implications for researchers, educators, teachers and policymakers.

Yalcin, S. (2019). Competence differences in literacy, numeracy, and problem solving according to sex. *Adult Education Quarterly*, 69(2), 101-119. doi: 10.1177/0741713619827386

**Abstract:**

This study aimed to determine individual- and country-level latent classes in literacy, numeracy and problem-solving competencies of individuals participating in the Programme for the International Assessment of Adult Competencies 2015. Specifically, it sought to distinguish these classes in relation to individuals' sex and to identify the state of prediction of the determined latent classes by each person's level of education. The study population consisted of 116,301 adults aged 16 to 65 years in 20 countries. Multilevel latent class analysis was conducted to consider the nested data structure and determine the number of latent classes. According to the results of the multilevel latent class analysis, Turkey and Chile were in the low achievement group in all skills, while Japan was in the most successful group. Moreover, the results revealed that sex and education level had a considerable influence on certain competence levels.

Yamashita, T., Bardo, A. R., Cummins, P. A., Millar, R. J., Sahoo, S., & Liu, D. (2019). The roles of education, literacy, and numeracy in need for health information during the second half of adulthood: A moderated mediation analysis. *Journal of Health Communication, 24*(3), 271-283. doi: 10.1080/10810730.2019.1601303

**Abstract:**

We examine complex pathways that link health information seeking behavior with education and health literacy (decomposed into general literacy and numeracy), and how these pathways differ by perceived health status (need) among a nationally representative sample of Americans age 50 and older (n = 2,750). Data come from the Program for International Assessment of Adult Competencies (PIAAC). Multi-group structural equation models were used to examine the use of eight health information sources (newspapers, magazines, internet, radio, TV, books, friends/family, and health professionals). Findings partially support the long-standing notion that health seeking behaviors are directly linked to educational attainment, and provide some of the first nationally representative evidence for how education functions through distinct health literacy components to shape health information seeking behaviors by health status. Findings from this moderated mediation analysis point to the importance of examining, and addressing, health literacy disparities in access to and use of health information.

Yamashita, T., Bardo, A. R., Liu, D., & Yoo, J. W. (2019). Education, lifelong learning and self-rated health in later life in the USA. *Health Education Journal, 78*(3), 328-339. doi: 10.1177/0017896918809500

**Abstract:**

This study examined the mediating effects of lifelong learning on the association between self-rated health and educational attainment among a nationally representative sample of US residents aged 50 years and older. Setting: Socioeconomic disparities in health are a major public health concern in economically developed nations where improving socioeconomic status (e.g. formal educational attainment) at the population level is challenging. In the light of population ageing, alternative approaches to improve health through malleable factors are urgently needed. Recent research suggests that participation in organised learning activities – lifelong learning – could attenuate the lack of formal educational attainment on health. Methods: Data come from the 2012 wave of the US Health and Retirement Study. Structural equation models with bootstrapping were used to estimate the mediation effect of lifelong learning activity in the relationship between self-rated health and formal educational attainment. Results: Approximately 3%–5% of the effect of formal education on self-rated health was mediated by lifelong learning activity. Findings from this study support the notion that ongoing participation in organised learning activities is beneficial for health in later life. Conclusion: Lifelong learning reflects a promising autonomous and sustainable strategy to improve health in later life. Future public health and education policy as well as education institutions should consider providing more learning opportunities for older populations.

Yamashita, T., Cummins, P. A., Millar, R. J., Sahoo, S., & Smith, T. J. (2019). Associations between motivation to learn, basic skills, and adult education and training participation among older adults

in the USA. *International Journal of Lifelong Education*, 38(5), 538-552. doi: 10.1080/02601370.2019.1666927

**Abstract:**

The objective of this study is to examine the associations between the motivation to learn, basic skills (i.e. literacy and numeracy), and organised adult education and training (AET) participation among the middle-aged and older adults in the USA. Rapid technological advancement and globalisation necessitate individuals to engage in lifelong learning to actively participate in society. However, little is known about the roles of motivation to learn and basic skills in the AET participation in the U.S. adult population. We obtained the data from the 2012/2014 Programme for International Assessment of Adult Competencies restricted-use file and adults aged 50 years and older ( $n = 2,580$ ) are included. Structural equation models are used to examine (1) any AET, (2) formal AET and (3) non-formal AET participation as a function of the motivation to learn latent construct, literacy, numeracy, and other covariates. Results showed that the motivation to learn, literacy and numeracy are all positive predictors of non-formal AET participation. Only motivation to learn is associated with formal AET participation. Findings from this study may inform future interventions as well as policy changes to promote specific types of organised AET programmes among older adult population in the USA.

Yao, K. (2019). Heterogeneous skill distribution and college major: Evidence from PIAAC. *Journal of Applied Economics*, 22(1), 504-526. doi: 10.1080/15140326.2019.1665310

**Abstract:**

A large literature documents the uneven distribution of labor market outcomes across majors. Students in STEM (science, technology, engineering, and mathematics) can earn more than their peers. This earnings gap can be attributed not only to the differential educational resources investment but also to heterogeneous distribution of initial cognitive skills across majors. I benefit from the rich data from the Programme for the International Assessment of Adult Competencies to examine this earnings gap in the United States and the United Kingdom. Based on my findings, this paper establishes new facts that add to the understanding of how college field premiums are generated. I show that a sizable portion of the return to majors is due to self-selection and up to two-fifths of the field premiums can be explained by basic cognitive skills. Despite the qualitatively similar impacts of numeracy and literacy skills on choosing college field of study, the pricing of numeracy is much higher than literacy in the labor market.

**Title:**

Yasukawa, K. (2019). The role of national media in adult literacy and numeracy policy: A case study from Australia. *Canadian Journal of Science, Mathematics and Technology Education*, 19(1), 35-47. doi: 10.1007/s42330-018-0038-8

**Abstract:**

In 2013, the OECD released its findings from the Survey of Adult Skills (SAS) which assessed adults' skills in literacy, numeracy, and problem-solving in technology-rich environments in 22 countries. OECD initiatives like SAS and PISA have been the subject of critical policy studies, particularly in relation to their influence on national policymaking. National media as actors in these policy contexts have been the focus of some of these policy studies. Using a methodology informed by actor network theory (ANT), this study examines the Australian media's responses to the release of the

country's SAS results, whilst making historical and international comparisons to uncover factors that mobilise the media to become a policy actor.

**Title:**

Yu, C. H., Lee, H. S., Lara, E., & Gan, S. (2019). Adult learning across USA, Canada, and New Zealand: A cross-cultural study of PIAAC. *International Education Studies*, 12(5), 1-16. doi: 10.5539/ies.v12n5 p1

**Abstract:**

Skeptics of Programme for International Student Assessment (PISA) and Trend for International Math and Science Study (TIMSS) argue that while US elementary and high school students are behind their peers in other nations, the US workforce is still excellent because of the high quality post-secondary educational institutions in the US. However, the Programme for the International Assessment of Adult Competencies (PIAAC) indicates that US adults are in fact far behind their international peers in literacy, numeracy, and technology-based problem solving. Through the use of data mining, this study explored the possible association between PIAAC scores and several constructs. Since the US, Canada, and New Zealand were considered culturally similar nations, according to cluster analysis, patterns between PIAAC scores and selected constructs were analyzed by a variety of big data analytical methods, including cluster analysis, bootstrap forest, boosted tree, and data visualization. Given that PIAAC used multiple computerized adaptive testing, the consequential plausible values were randomly selected when the ensemble approach was used. Additionally, model comparison was utilized to decide between bagging and boosting in order to select the optimal model for each sample. In these samples, cultural engagement, readiness to learn, and social trust, respectively emerged as strong predictors for learning outcomes as they were assessed by PIAAC.

**Title:**

Zamzam, R. D. (2019). *Relationships among information communication technology skills, proficiencies in literacy, numeracy, problem-solving in technology-rich environment, enrollment in distance learning, and student-employment status of adult immigrants in the United States* (Dissertation). Keiser University.

**Abstract:**

Workforce education and development are necessary to prepare individuals to compete in the global market. Building individuals' key job skills ensures career success and economic growth of the United States. The purpose of this quantitative cross-sectional survey study was to describe the U.S. adult immigrants' information communication technology (ICT) skills, literacy, numeracy, and problem-solving in technology-rich environment (PS-TRE) stratified by student and employment status using the U.S. PIAAC data, 2012/2014. The research questions served to identify statistically significant ( $p < 0.05$ ) predictors of literacy, numeracy, PS-TRE, ICT skills, open-distance education, educational attainment, employment, and income using multiple linear-logistic regression models. Descriptive statistics showed most of the active segment of adult immigrants (student-employed) were ranked the lowest in education with a high school diploma or less. A considerable proportion of the active adult immigrants performed at Level 1 or below in literacy, numeracy, and PS-TRE. A sizable number of the disconnected adult immigrants (unemployed-out of labor force) were classified as highly educated or working-age groups. Results revealed that ICT skills were a positive and significant predictor of literacy, numeracy, and PS-TRE, educational at-

tainment, and income. There were positive and significant relationships between open–distance education and educational attainment, participation in learning activities, and gender, with females having greater odds to enroll in open–distance education. Findings indicate that ICT skills and distance learning opportunities could be powerful and flexible training tools for U.S. adult immigrants to enhance their vocational and educational skills.

Zarifa, D., Seward, B., & Milian, R. P. (2019). Location, location, location: Examining the rural-urban skills gap in Canada. *Journal of Rural Studies*, 72, 252-263. doi: 10.1016/j.jrurstud.2019.10.032

**Abstract:**

The elevated demands of the new knowledge economy pose particular challenges to rural and northern regions in Canada, long acknowledged by policymakers to suffer from acute human capital deficits. Rural residents obtain lower levels of education than their urban counterparts and those that do obtain post-secondary training often migrate to urban regions offering abundant employment opportunities and higher wages. Despite an emerging consensus around over skill deficits across rural regions, Canadian researchers have yet to systematically explore contemporary rural-urban differences in human capital using refined measures of literacy and numeracy skills. We ameliorate this deficiency by mapping rural-urban disparities in skills across the working age population (16–65) using Statistics Canada's 2012 Longitudinal International Study of Adults (LISA). Our results indicate that residents from smaller population centers and rural areas within Canada show significantly lower skills proficiencies. These differences across location of residence shrink considerably when controlling for education level, underscoring the need to enhance post-secondary access in rural areas.

**Title:**

Zhou, K. (2019). *Education, skills, and wage outcomes among mid-career adults: A cross-national study*. (Dissertation). State University of New York at Albany.

**Abstract:**

Interest in the role of non-cognitive skills on successful life outcomes (such as academic performance) has increased in recent years. Policy makers in many countries have prioritized the learning of non-cognitive skills in the school curriculum and training frameworks. Although studies in labor economics have provided important insights about the impact of non-cognitive skills on earnings (e.g., Lindqvist and Vestman 2011; Heckman, Stixrud, and Urzua 2006), solid evidence about how labor markets produce or facilitate the acquisition of non-cognitive skills in different country settings is lacking. The linkage between education, skills and wages has been at the core discussion of human capital theory since Becker (1964). However, existing studies rarely look at the relative influence of non-cognitive and cognitive skills on earnings keeping in mind differences in educational attainment, socio-demographic and work-related factors. This new comparative study attempts to disaggregate the value in different human capital of prime-age full-time working adults and explores the complex relationships between educational attainment, skills, work-related factors, and socio-demographic factors that strengthen or weaken key labor market results. Furthermore, the study specifically examines how non-cognitive skills contribute to cognitive skills performance and subsequently influence labor market outcomes while controlling educational attainment, socio-demographic background, and work-related factors. It is based on a

synthesis of the different strands of human capital theory, Heckman's economic theory of non-cognitive skills, and the screening hypothesis, all of which help account for earnings differentials. Sometimes considered as rival theoretical frameworks, they are closely related to each other. In addition to bivariate analyses, three structural equation models are examined and tested using cross-sectional secondary data from the PIAAC survey on 22 OECD countries. Bivariate analyses showed that non-cognitive skills (measured as metacognitive abilities) are related to educational attainment, parents' education, cognitive skills, and hourly wages among mid-career adults. However, after controlling for variation in education, socio-demographic background, and work-related factors, the SEM analyses found that only education and occupation are robust predictors of cognitive skills. Whether and how cognitive skills and non-cognitive skills are related to monetary return vary across different education degree holders groups and across different countries. The study also discusses the policy implications of the findings as they pertain to skills policy in higher education and training.

Rammstedt (Eds.), *Grundlegende Kompetenzen Erwachsener im internationalen Vergleich - Ergebnisse von PIAAC 2012* (pp. 167-183). Münster: Waxmann.

**Abstract:**

The Programme for the International Assessment of Adult Competencies, PIAAC, aims at producing high-quality data. This chapter summarizes the core features of the international and national design under which the study was conducted in order to reach this goal. The international PIAAC consortium elaborated a set of comprehensive standards and guidelines and by that provided a

framework of best practices in survey methodology. Participating countries had to adhere to these standards and were supposed to implement them given their national circumstances. In the first sections of this chapter the survey instruments, the survey design as well as scaling and the estimation of plausible values at the international level are briefly described. Subsequently, information is provided on sampling and data collection in Germany. A total of 5 465 individuals participated in PIAAC Germany, which corresponds to a response rate of 55% that exceeds the international minimum response rate of 50%. Survey weighting was implemented to minimize the total survey error and the potential for bias. Nonresponse bias analyses were conducted to further ensure quality assurance.

Canada, S. (2013). *PUMF 2012 - Programme for the International Assessment of Adult Competencies (PIAAC)* [Catalogue number. 89-555-X2013002]. Ottawa: Statistics Canada.

**Abstract:**

The public use microdata file (PUMF) from the Programme for the International Assessment of Adult Competencies (PIAAC) provides data on three skills that are essential to processing information: literacy, numeracy, and problem-solving in technology-rich environments (referred to as PS-TRE). Data are based on interviews with approximately 27,000 respondents, which allows for reliable estimation at the national, provincial and territorial level. The file provides information about the literacy, numeracy and PS-TRE skills for the Canadian population aged 16 to 65. It provides results for Canada as a whole, as well as for all the provinces and territories. In addition, it provides skills proficiency information and a range of socio-demographic characteristics (e.g., age, gender, level of education) across the entire Canadian population. It also provides information on the literacy, numeracy and PS-TRE skills of Aboriginal populations, immigrants, and official-language minority communities.

### 3.3 Data files and technical reports in 2014

**Title:**

Holtzman, S., Barone, J., Li, L., Krenzke, T., Hogan, J., Mohadjer, L., Carstens, R., & Daniel, T. (2014). *Program for the International Assessment of Adult Competencies (PIAAC) 2012 U.S. Restricted Use File* [NCES 2014046REV]. Washington DC: U.S. Department of Education, National Center for Education Statistics.

**Abstract:**

The PIAAC U.S. RUF contains individual unit record data (SPSS and SAS format) including both responses to the background questionnaire and the cognitive assessment from the original U.S. PIAAC data collection completed in 2012. Statistical disclosure control treatments were applied due to confidentiality concerns. In addition to the variables in the PUF [NCES 2014-045REV], the RUF contains detailed versions of variables and additional data collected through U.S. specific questionnaire routing. The RUF can be accessed through a restricted use license agreement with the National Center for Education Statistics. For more details on the RUF, please refer to Appendix J of the U.S. PIAAC Technical Report [NCES 2014-047].

Available at (open access): <https://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=2014046REV>

**Title:**

**Title:**

Statistics Austria (2014). *Programme for the International Assessment of Adult Competencies (PIAAC), Scientific Use File PIAAC 2011/12 for Austria*. Vienna: Statistics Austria.

**Abstract:**

The Austrian PIAAC Public Use File (OECD 2016) contains information on the respondents' background and on their cognitive assessment (in literacy, numeracy, and problem solving in technology-rich environments). It excludes certain background variables (e.g., some of the national adaptations), and some variables were not released in all the available detail. The majority of the variables were suppressed or coarsened to comply with national data protection legislation. The Austrian PIAAC Scientific Use File includes many of the suppressed background variables. Further-

more, other variables (e.g., age and income) have been released in full detail. [Source: Maehler & Konradt, 2020<sup>2</sup>]

Zabal, A., Martin, S., Massing, N., Ackermann, D., Helmschrott, S., Barkow, I., & Rammstedt, B. (2014). *PIAAC Germany 2012: Technical report*. Münster: Waxmann.

**Abstract:**

The Programme for the International Assessment of Adult Competencies (PIAAC) is a large-scale initiative of the Organization for Economic Cooperation and Development (OECD) that aims at assessing key adult competencies considered important for individual and societal success. This technical report describes how the PIAAC survey was conducted in Germany. It provides information on the PIAAC instruments: the background questionnaire and the cognitive assessment. Furthermore, it describes sampling, fieldwork, weighting, and nonresponse bias analyses. The report concludes with an overview of the data management processes and data products as well as a brief evaluation of the overall data quality.

### 3.4 Data files and technical reports in 2015

**Title:**

Situ, J. (2015). *Using the Program for International Assessment of Adult Competencies direct measures of skills in the Longitudinal and International Study of Adults*. *Longitudinal and International Study of Adults*. Research Paper Series Ottawa: Statistics Canada. Retrieved May 5, 2019, from <https://www150.statcan.gc.ca/n1/en/catalogue/89-648-X2015001>

**Abstract:**

The Longitudinal and International Study of Adults (LISA) has the direct measures of skills from the Program for International Assessment of Adult Competencies (PIAAC) because the two surveys had coordinated collection. The direct measures of skills cover three domains: literacy, numeracy, and problem solving in technology-rich environments. The skills measures are reflected in sets of 10 plausible values (PVs) that were created using a multiple imputation methodology. This paper demonstrates the proper use of the PVs. It also demonstrates that reliable estimates of skills can be produced using LISA and the results are similar to what would be obtained from the PIAAC data.

Solga, H., & Heisig, J. P. (2015). *Programme for the International Assessment of Adult Competencies (PIAAC), Germany - Prime Age (2012)*. Data file version 1.1.0 [ZA5951]. Cologne: GESIS Data Archive. doi:10.4232/1.12386

**Abstract:**

This data set (SPSS and Stata format) contains an additional national oversample of 26- to 55-year-old adults in former East Germany. 560 additional respondents were surveyed using the same procedures, instruments, and assessments that were used for the PIAAC Main Study in Germany. Finally the data was appended to the PIAAC main data (only 26- to 55-year-olds). [Note from editors]

**Title:**

Statistics Norway (2015). *Survey of Adult Skills (PIAAC) 2012* [Dataset NSD2135]. Bergen: Norwegian Social Science Data Services. doi: 10.18712/NSD-NSD2135-V1

**Abstract:**

The Norwegian PIAAC data contain information on respondents' background and on their cognitive assessment (in literacy, numeracy, and problem solving in technology-rich environments). The PIAAC data provided by the Norwegian Centre Research Data (NSD) contain more detailed information—for example, on earnings, country of birth, and occupation (detailed, four-digit, ISCO-08 codes)—than that available in the Norwegian PIAAC Public Use File (OECD 2016). Furthermore, the Norwegian PIAAC data can be extended with administrative (register) data, such as demographic data (e.g., citizenship and marital status), data on educational attainment and current education, employment, occupation and industry, and information about the workplace of the respondents and about social security for the years 2010–2020. These linked data are provided by Statistics Norway. Mode of Data Collection PIAAC data: face-to-face interview (computer-assisted personal interview, CAPI) to collect the background information; computer-based or paper-based assessment of skills in literacy, numeracy, and problem solving in technology-rich environments. The administrative data are derived from administrative registers (e.g., the population register). Sample Description and Size: The sample comprised 5,128 adults aged 16 to 65 years. The Norwegian PIAAC data are provided in SPSS, Stata, and SAS format by the Norwegian Centre for Research Data (NSD) to researchers, teachers and students located in Norway [Source: Maehler & Konradt, 2020]

Program for the International Assessment of Adult Competencies (PIAAC) 2014: U.S. National Supplement Restricted Use Data Files-Prison [2016058REV]. Washington DC: U.S. Department of Education, National Center for Education Statistics.

**Abstract:**

The 2014 PIAAC U.S. Prison Study Restricted Use File (RUF) contains individual unit record data (SPSS and SAS format) including responses to both the background questionnaire and the cognitive assessment from the data collection completed in 2014. Statistical disclosure control treatments were applied due to confidentiality concerns. In addition to the variables in the Prison Study PUF (NCES 2016-337), the RUF contains detailed versions of variables and additional data collected through U.S. specific questionnaire routing. The RUF can be accessed through a restricted use license agreement with the National Center for Education Statistics. For more details on the RUF, please refer to Appendix E of the U.S. PIAAC Technical Report 2012/2014 (NCES 2016-036) with additional details on the prison variables found in the Addendum to the Technical Report (NCES 2016-036).

(2016). *U.S. Program for the International Assessment of Adult Competencies (PIAAC). 2012/2014: Main Study and National Supplement Technical Report* [NCES 2016-036REV]. Washington DC: U.S. Department of Education, National Center for Education Statistics.

**Abstract:**

This technical report replaces the Program for the International Assessment of Adult Competencies (PIAAC) 2012: U.S. Main Study Technical Report (NCES 2014-047) as it combines information from both, the U.S. PIAAC 2012 Main Study and U.S. PIAAC 2014 National Supplement data collection efforts. This report includes detailed information on the Main Study and National Supplement sample design, survey instruments used for data collection, the data collection process and quality of the data, weighting, scaling, and data analysis.

**Abstract:**

The German PIAAC Public Use File (OECD 2016) contains information on the respondents' background and on their cognitive assessment (in literacy, numeracy, and problem solving in technology-rich environments). It suppresses certain background variables (e.g., some of the national adaptations), and some of the included variables have not been released in all available detail. Background variables were suppressed or coarsened to comply with national data protection legislation. The German PIAAC Scientific Use File (SPSS and Stata format) includes many of these suppressed variables and releases other variables in full detail (e.g., age and income). (2016). *Skills of U.S. unemployed, young, and older adults in sharper focus: Results from the Program for the International Assessment of Adult Competencies (PIAAC) 2012/2014: First look* [NCES 2016-039rev]. Washington DC: National Center for Education Statistics.

**Abstract:**

The purpose of this report is to present updated and additional results from the U.S. PIAAC household data collection, based on data collected in 2012 and 2014. PIAAC is an international large-scale study of adult skills and life experience focusing on education and employment that was developed and organized by the Organization for Economic Cooperation and Development (OECD). PIAAC was first conducted in 2011–2012 in the United States and 23 other countries. In the United States, PIAAC was administered to a nationally representative sample of 5,000 adults between the ages of 16 and 65. Similar nationally representative samples of adults were surveyed in each of the 23 other participating countries. In 2013–14, NCES conducted a second round of data collection in the United States to enhance the U.S. PIAAC dataset. Specifically, the second round of data collection added (a) 3,600 adults from three key subgroups of policy interest and (b) 1,200 incarcerated adults in federal and state prisons. The three key subgroups of adults “living in households” that were oversampled were: unemployed adults, young adults (ages 16–34), and

older adults (ages 66-74). The expanded national household sample (8,600 adults, combining the first and second rounds) supports more accurate and reliable national estimates of unemployed and young adults and makes possible analyses of older adults.

Friebe, J., Gebrande, J., Gnahn, D., Knauber, C., Schmidt-Hertha, B., Setzer, B., Tippelt, R., & Weiß, C. (2017). *Competencies in Later Life (CiLL) – Programme for the International Assessment of Adult Competencies (PIAAC), Germany*. Data file version 1.1.0 [ZA5969]. Cologne: GESIS Data Archive. doi: 10.4232/1.12814

**Abstract:**

This data file (SPSS format) contains competency scores (plausible values) for each participant in the domains Literacy, Numeracy and Problem solving in technology-rich environments as well as their background information. It contains more detailed information about respondents in Germany than the German public use file for PIAAC available at the OECD homepage (<http://www.oecd.org/site/piaac/publicdataandanalysis.htm>). The background questionnaire for

CiLL is identical to the background questionnaire for PIAAC and is divided into the following topics: A: General Information, such as age and gender; B: Education, such as highest educational achievement, current education, participation in continuing education; C: Current status and work history, such as paid work and unpaid work for family business, information on job search; D: Current work, such as profession, self-employment, and income; E: Recent work, such as profession, self-employment, reason for quitting; F: Skills used at work, such as influence and physical skills; G: Skill use Literacy, Numeracy etc. at work; H: Skill use Literacy, Numeracy etc. in everyday life; I: About yourself, such as readiness to learn and volunteering; J: Background information, such as country of birth, citizenship, language, parents' profession. Additionally, the data file contains further derived variables, information on competency assessment, information on sampling and weighting, limited regional information and time information of the interview.

GESIS – Leibniz Institute for the Social Sciences, German Socio-Economic Panel (SOEP) at DIW Berlin, LIfBi – Leibniz Institute for Educational Trajectories (2017). *PIAAC Longitudinal (PIAAC-L), Germany*. Data file version 3.0.0 [ZA5989]. Cologne: GESIS Data Archive. doi: 10.4232/1.12925

**Abstract:**

The German PIAAC-L study ("PIAAC-Longitudinal (PIAAC-L), Germany" [ZA5989]) is a collaborative effort undertaken by GESIS – Leibniz Institute for the Social Sciences (lead) together with the German Institute for Economic Research (DIW) and the Leibniz Institute for Educational Trajectories (LIfBi). It follows up the German PIAAC sample with three additional waves of data collection (in 2014, 2015, and 2016), each with a somewhat different focus. The PIAAC-L questionnaires are based on core instruments from the German Socio-Economic Panel (SOEP) and also include various additional questions and modules on the respondent's background. In addition, assessment instruments from PIAAC and the National Educational Panel Study (NEPS) measuring key competencies are implemented. The objective of the PIAAC-L project is to significantly expand the German PIAAC database (SPSS and Stata format) by adding a longitudinal dimension and by enriching the depth and breadth of information available on the German PIAAC respondents. Mode of Data Collection Face-to-face interview (CAPI) and computer-based or paper-based cognitive assessment. Sample Description and Size: The sample comprised German PIAAC 2012 respondents aged 18 to 65 years who agreed to participate in PIAAC-L and other members of their household aged 18 years and over (total initial sample at the first wave: N = 6,231). Whereas the focus and the groups of addressed persons varied somewhat across waves, German PIAAC 2012 respondents (N = 5,465)—the so-called anchor persons—were consistently the central response units in PIAAC-L (Zabal et al. 2016). Wave 1 was designed to target anchor persons (n = 3,758) and their household members aged 18 years and over (i.e., born in 1996 or earlier; n = 2,473). In Wave 2, anchor persons (n = 3,263) and their partners, if living in the same household, were addressed (n = 1,368). The design of the third wave was similar to that of the first wave: anchor persons (n = 2,967) and all household members aged 18 years and over (i.e., born in 1998 or earlier) were to be interviewed (n = 1,914).

Organisation for Economic Cooperation and Development (OECD) (2017). *Programme for the International Assessment of Adult Competencies (PIAAC), Estonia log file*. Data file version 2.0.0 [ZA6712\_EE.data.zip]. Cologne: GESIS Data Archive. doi: 10.4232/1.12955

**Abstract:**

The PIAAC 2012 study was the first fully computer-based large scale assessment in education. During the PIAAC assessment 2011–2012 (Round 1 of the 1st Cycle), user interactions with the computer were logged automatically. This means that respondents' actions (e.g., starting a unit, opening a webpage, entering an answer) within the assessment tool were recorded and stored with time stamps in separate log files. These log files contain paradata for each participant in the domains of literacy, numeracy, and/or problem solving in technology-rich environments.

The PIAAC 2012 study was the first fully computer-based large scale assessment in education. During the PIAAC assessment 2011–2012 (Round 1 of the 1st Cycle), user interactions with the computer were logged automatically. This means that respondents' actions (e.g., starting a unit, opening a webpage, entering an answer) within the assessment tool were recorded and stored with time stamps in separate log files. These log files contain paradata for each participant in the domains of literacy, numeracy, and/or problem solving in technology-rich environments.

**Abstract:**

The data set contains contextual information that describes either the household or the neighbourhood of the respondents and which was not included in the regular PIAAC Scientific Use File (SUF) 'PIAAC, Germany - Reduced version' (ZA5845) due to national data privacy legislation. This spatial data comes from microm Micromarketing-Systeme und Consult GmbH in Neuss, Germany. The microm data available include more than 100 variables from the microm domains sociodemographics and -economics, consumer behavior, area- and site planning, and strategic segmentation models. Variables for instance contain information about: Type of residential area, number of private households and businesses, sociodemographic and -economic characteristics (e.g. unemployment, confessions, ethnic composition), Mobility (e.g. population fluctuation), affinity towards fundraising, communications and print media, Sinus Geo-Milieus® or purchasing power at the level of street sections.

Burkhardt, L., Silbermann, T., & Bartsch, S. (2018). *Weighting in PIAAC-L 2016*. GESIS Papers No. 2018/15. Cologne: GESIS - Leibniz-Institute for the Social Sciences.

**Abstract:**

The present paper describes the weighting process for the last of the three PIAAC-L waves, by illustrating the two classical weighting steps nonresponse adjustment and post-stratification or calibration. For the documentation of the weighting process for the first and second PIAAC-L waves as well as for information on the overall PIAAC and PIAAC-L weighting concept, see Bartsch, Poschmann, and Burkhardt (2017) and Burkhardt and Bartsch (2017). As weighting in PIAAC-L follows a consistent concept across waves, a large part of the present paper was taken literally from these preceding papers. Where applicable, updates or adaptations were undertaken, based on wave 3 weighting processes and data from dataset ZA5989\_Weights\_16. This dataset is one of twelve sub-datasets that were released for 2016 as part of the PIAAC-L database that encompasses datasets from 2014, 2015, and 2016.

Caro, D., Biecek, P., & Caro, M. D. (2018). *Package 'intsvy'*. Retrieved February 15, 2019, from <http://www.vps.fmvz.usp.br/CRAN/web/packages/intsvy/intsvy.pdf>

**Abstract:**

intsvy allows use Rs to work with international assessment data (e.g., TIMSS, PIRLS, PISA, ICILS, and PIAAC). The data is publicly available @ rms.iea-dpc.org and www.oecd.org/pisa in SPSS format. Data and merge functions print variable labels and the name of participating countries in international assessments as well as import data directly into R for the variables in student, parent, school, and teacher instruments and countries selected by the use R. Analysis functions, including mean statistics, standard deviations, regression estimates, correlation coefficients, and frequency tables, calculate point estimates and standard errors that take into account the complex sample design (i.e., replicate weights) and rotated test forms (i.e., plausible achievement values).

**Title:**

Engelhardt, L., & Goldhammer, F. (2018). *Number series study (DIPF): Technical report*. GESIS Papers No. 2018/1. Cologne: GESIS - Leibniz-Institute for the Social Sciences.

**Abstract:**

The Number Series Study addresses the fundamental research question of what is measured by competence tests used in the Survey of Adult Skills (PIAAC; Programme for the International Assessment of Adult Competencies): More specifically, to what extent do the PIAAC Literacy and Numeracy measures capture the outcome of learning processes, and to what extent do they measure general cognitive abilities? This technical report describes the implementation of the Number Series Study for the third wave of PIAAC-L and focuses only on information specific to the Number Series Study. Detailed information on the PIAAC-L study can be found in the PIAAC-L Technical Reports of the three waves (Martin, Zabal, & Rammstedt, 2018; Zabal, Martin, & Rammstedt, 2016, 2017). Martin, S., Zabal, A., & Rammstedt, B. (2018). *PIAAC-L data collection 2016: Technical report*. GESIS Papers No. 2018/5. Cologne: GESIS - Leibniz-Institute for the Social Sciences.

**Abstract:**

This paper is part of a series of reports describing the technical implementation of PIAAC-L, the German PIAAC-Longitudinal project. PIAAC-L is designed as a three-wave follow-up survey to PIAAC respondents, with data collections in 2014, 2015, and 2016. While foci and groups of addressed persons vary somewhat across waves, PIAAC respondents, called anchor persons, are consistently the central response units in PIAAC-L. This paper is a follow-up to the technical reports for wave 1 (Zabal, Martin, & Rammstedt, 2016) and wave 2 (Zabal, Martin, & Rammstedt, 2017) and aims to describe the design, instruments, fieldwork processes, and data dissemination for wave 3. The design of the third wave was similar to that of the first wave: Anchor persons and all household members aged 18 and over (born 1998 or earlier) were to be interviewed; a household and a person questionnaire were administered. Although some questions were taken from SOEP questionnaires, the instruments were adapted to include questions newly developed by researchers from the PIAAC Leibniz network. In addition, two modules assessing cognitive skills were administered. [Source: From the introduction, p. 5]

Organisation for Economic Cooperation and Development (OECD) (2018). *Programme for the International Assessment of Adult Competencies (PIAAC), English Pilot Study on Non-Cognitive Skills*. Data file version 1.0.0 [ZA6940]. Cologne: GESIS Data Archive. doi: 10.4232/1.13062

**Abstract:**

This online survey (see also Kankaraš 2017) was designed to test the measurement properties of nine personality scales: the Big Five, Traditionalism, Self-Control, Self-Efficacy, Honesty/Integrity, Socio-Emotional Skills, Intellectual Curiosity, Job Orientation Preferences, and Vocational Interests. Eight of these nine scales were existing scales (or combinations of existing scales) available for use in the public domain. The study (data collection period: June–July 2016) was conducted in two phases, each with a somewhat different study design. The objectives of the online survey were to test (a) the measurement characteristics of the selected scales; (b) the relationships of the selected scales with background and other characteristics of respondents; (c) different item formulations—original vs. simplified; (d) different response options—with or without a neutral/middle category; (e) scales with different item formats—multiple choice vs. forced choice (Vocational Interests Scale); and (f) the new balanced scales (compared to the original unbalanced scales). Mode of Data Collection: The entire survey was conducted online. It was implemented using the Survey Monkey platform. Sample Description and Size: The sample comprised 5,910 adults aged 16 to 65 years from the United States and the United Kingdom in the first phase and 1,606 in the second phase (only United States). Organisation for Economic Cooperation and Development (OECD) (2018). *Programme for the International Assessment of Adult Competencies (PIAAC), International Pilot Study on Non-Cognitive Skills*. Data file version 1.0.0 [ZA6941]. Cologne: GESIS Data Archive. doi: 10.4232/1.13063

**Abstract:**

This study was designed with the following objectives: first, to test the measurement characteristics of selected scales; second, to test the cross-national comparability of selected scales. The measurement properties of nine personality scales—the Big Five, Traditionalism, Self-Control, Self-Efficacy, Honesty/Integrity, Socio-Emotional Skills, Intellectual Curiosity, Job Orientation Preferences, and Vocational Interests—were tested (data collection period: January–March 2017). Mode of Data Collection: The entire survey was conducted online. It was implemented using the Survey Monkey platform. Sample Description and Size: The sample comprised 6,924 adults aged 16 to 65 years from Germany, Spain, France, Japan, and Poland. [Source: Maehler & Konradt, 2020]
