Politano, M., "Taming Total Dissolved Gas using Advanced Computer Simulations and Reduced Scale Models" (2014). *International Conference on Engineering and Ecohydrology for Fish Passage*. 20.

https://scholarworks.umass.edu/fishpassage_conference/2014/June9/20

This Event is brought to you for free and open access by the Fish Passage Community at UMass Amherst at ScholarWorks@UMass Amherst. It has been accepted for inclusion in International Conference on Engineering and Ecohydrology for Fish Passage by an authorized administrator of ScholarWorks@UMass Amherst. For more information, please contact scholarworks@library.umass.edu.

TAMING TOTAL DISSOLVED GAS USING ADVANCED COMPUTER SIMULATIONS AND REDUCED SCALE MODELS

M. Politano, L. Weber, T. Lyons, A. Arenas Amado, A. Craig, C. Turan, Y. Wang, J. Dvorak, M. Carbone. IIHR – Hydroscience & Engineering. The University of Iowa.

TOTAL DISSOLVED GAS AND GAS BUBBLE DISEASE

- TDG refers to the total amount of gases present in water.
- TDG supersaturation can cause gas bubble disease (GBD) in fish. GBS in fish is similar to a diver getting the “bends”.

- In order to protect fish, Federal and State agencies have established water quality standards for TDG.

TOTAL DISSOLVED GAS ABATEMENT OPTIONS

INSIGHTS FROM LABORATORY AND NUMERICAL MODELS

Reduced-scale laboratory and numerical models were developed with the purpose of:

- Improving our understanding of the underlying phenomena leading to TDG supersaturation in tailraces
- Evaluating the effectiveness of plant operations in reducing TDG production
- Evaluating the effect of structural modifications on TDG production

TAILRACE FLOWS

The flow in the tailrace is very complex. The large energy contained in spillway flows introduce massive amount of **bubbles** and created waves and sprays.

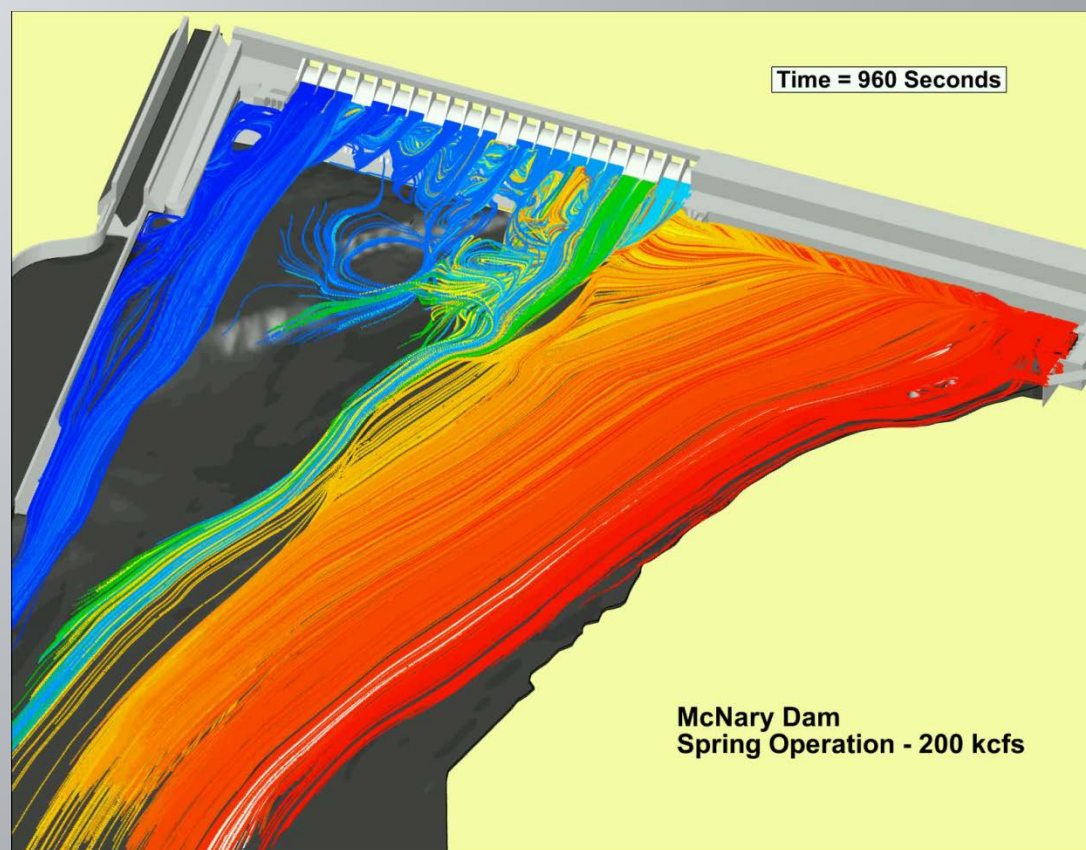

The development of a reliable numerical tool can be achieved only if **transport, mixing and production** of TDG can be adequately modeled.

The TDG **production** depends on pressure, temperature and interfacial area of the bubbles.

WATER ENTRAINMENT

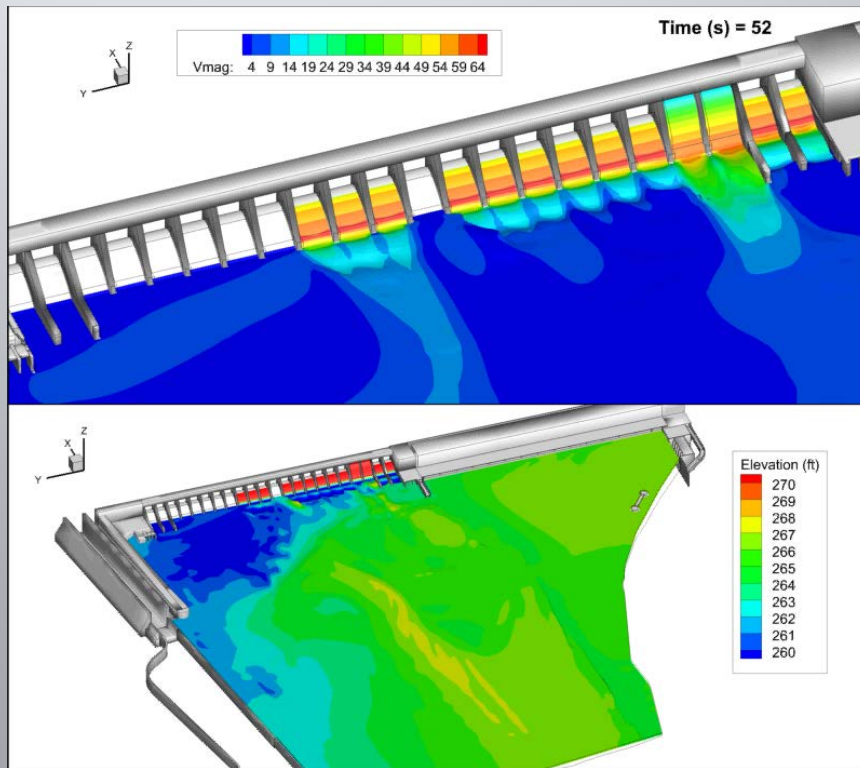

The flow pattern in the tailrace is completely modified after installation of spillway deflectors since spillway surface jets attract water toward the jet region, a phenomenon called water entrainment.

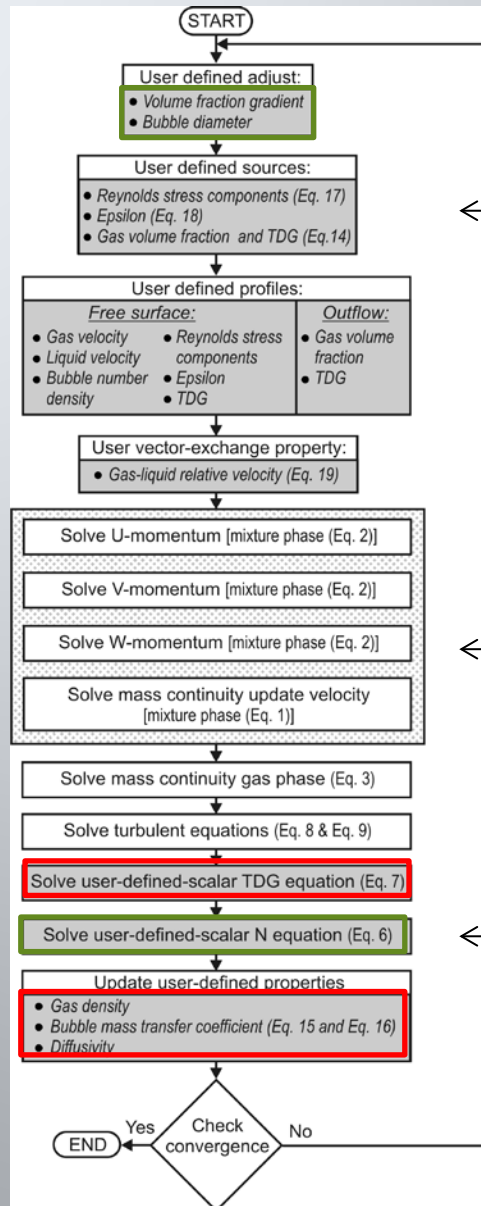

NUMERICAL MODEL

- Two models were used in the study; a volume of fluid (VOF) model and a rigid-lid two-phase flow model.
- The VOF method is used to estimate the regime of spillway jets and the free surface shape in a domain close to the spillway region.

TWO-PHASE RIGID LID MODEL

Anisotropic turbulence and effect of the bubbles on the turbulence

Mixture model: considers the volume occupied by the bubbles, the effect of bubbles on the density and viscosity, and takes into account the forces bubbles exert on the liquid phase.

Bubbles size changes due to compression and dissolution

MODEL APPLICATIONS

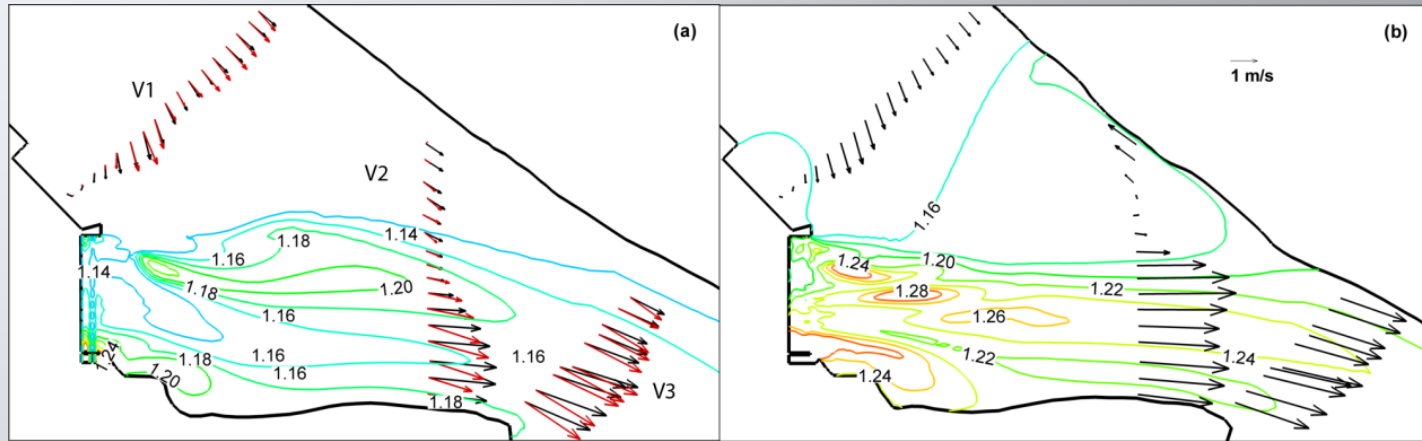

- Brownlee Dam
- Wanapum Dam
- Wells Dam
- Hells Canyon Dam
- McNary Dam
