This Event is brought to you for free and open access by the Fish Passage Community at UMass Amherst at ScholarWorks@UMass Amherst. It has been accepted for inclusion in International Conference on Engineering and Ecohydrology for Fish Passage by an authorized administrator of ScholarWorks@UMass Amherst. For more information, please contact scholarworks@library.umass.edu.

A photograph of a culvert pipe with water flowing through it, surrounded by green vegetation. The pipe is dark and has a circular opening at the end. Water is cascading over the edge of the pipe into a stream. The surrounding area is lush with green grass and plants.

A Screening Method for Identifying Fish Passage Barriers at Road Crossings Using LiDAR-Derived Elevation Data

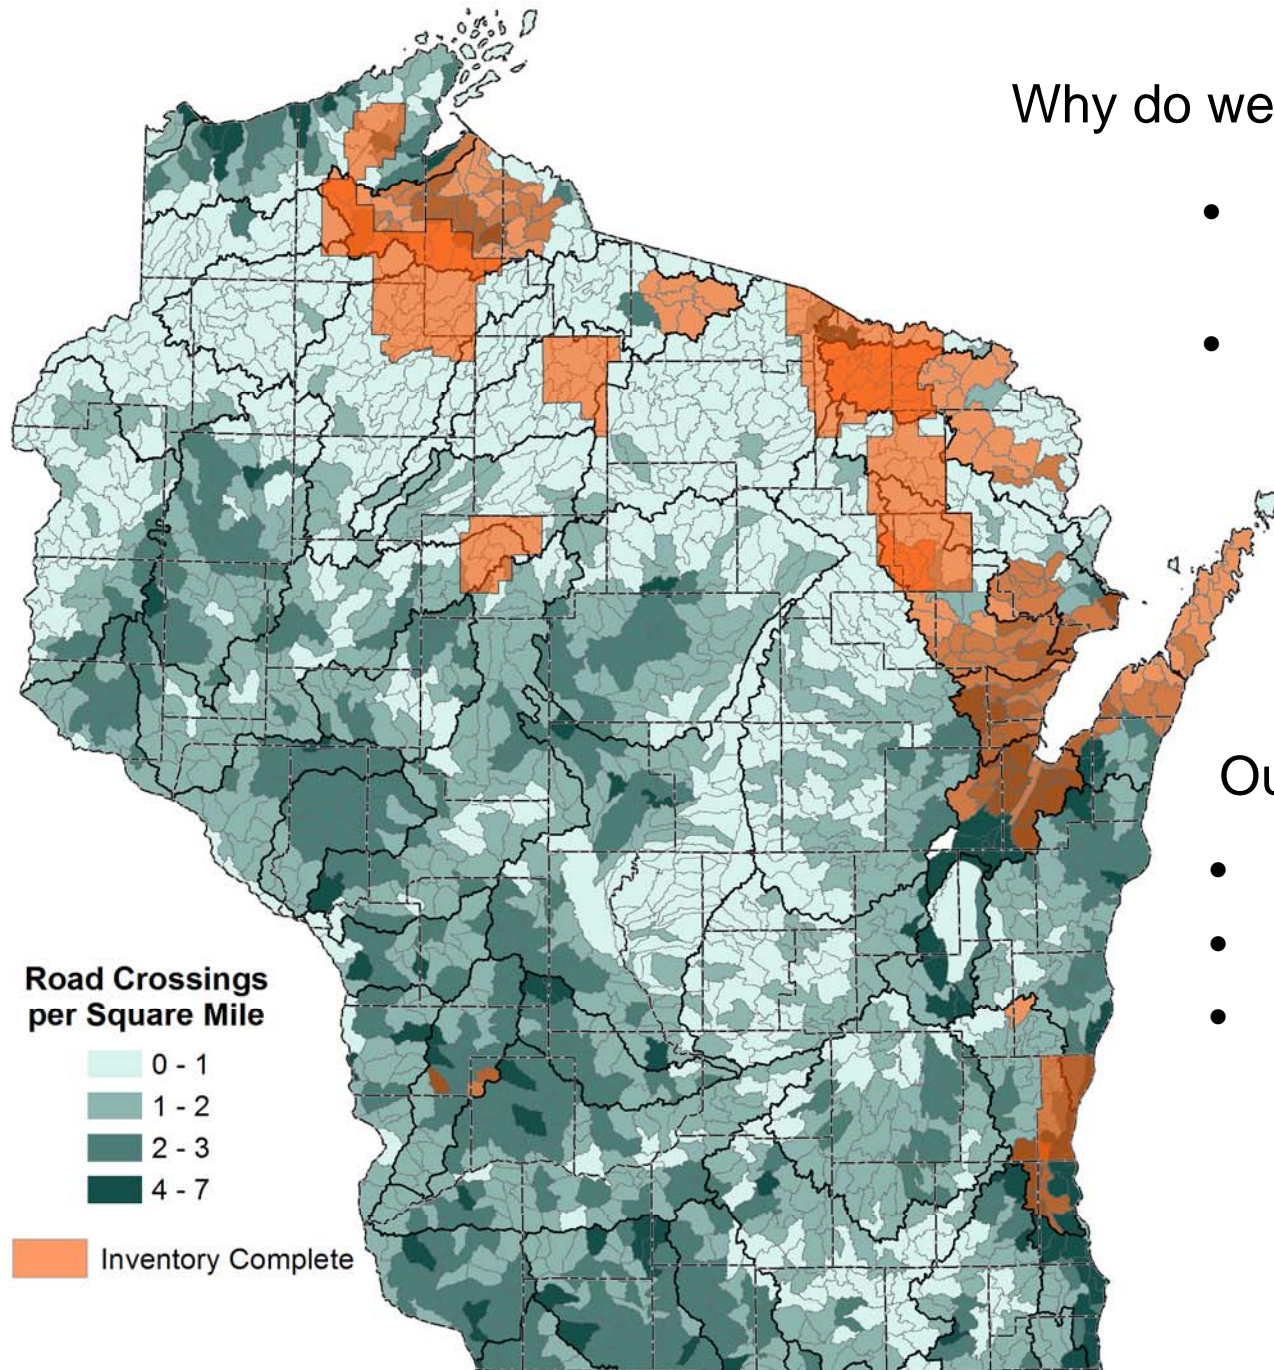

Matt Diebel and Dave Winston, Wisconsin DNR
Austin Polebitski and Zach Wallin, UW-Platteville

Why do we need a screening tool?

- Too many crossings to survey in field
- Help local governments prioritize projects

Outline

- How the method works
- Case study
- Uses and feasibility

LiDAR Basics

- Light Detection And Ranging
- Raw “point cloud” converted to bare-earth digital elevation model (DEM)
- Returns from water are usually surface
- Common horizontal resolution is 5 ft
- Common vertical accuracy is 10 cm

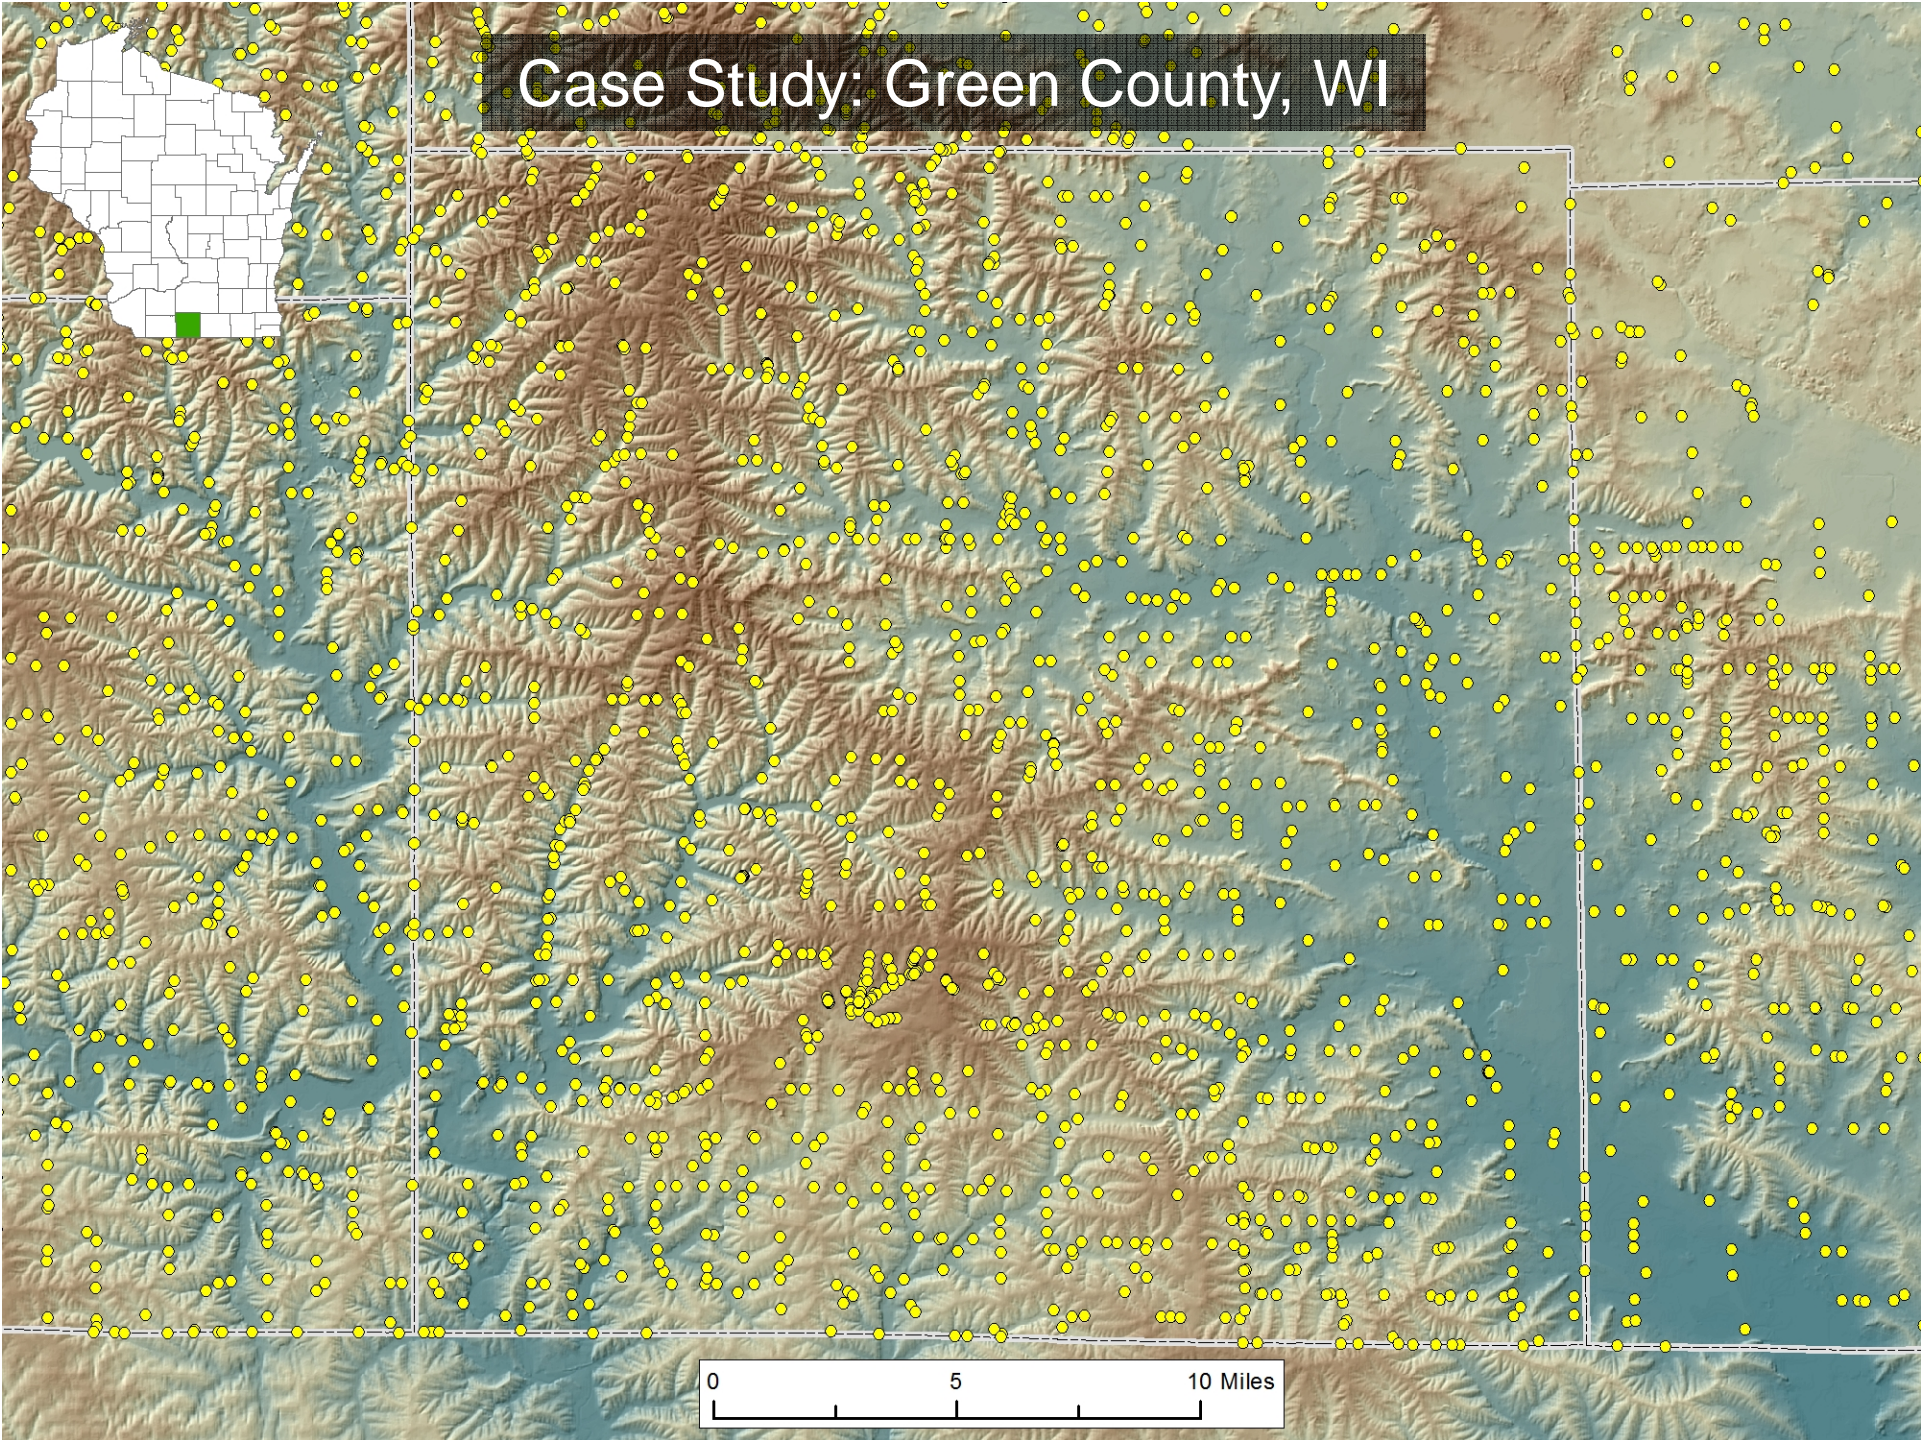

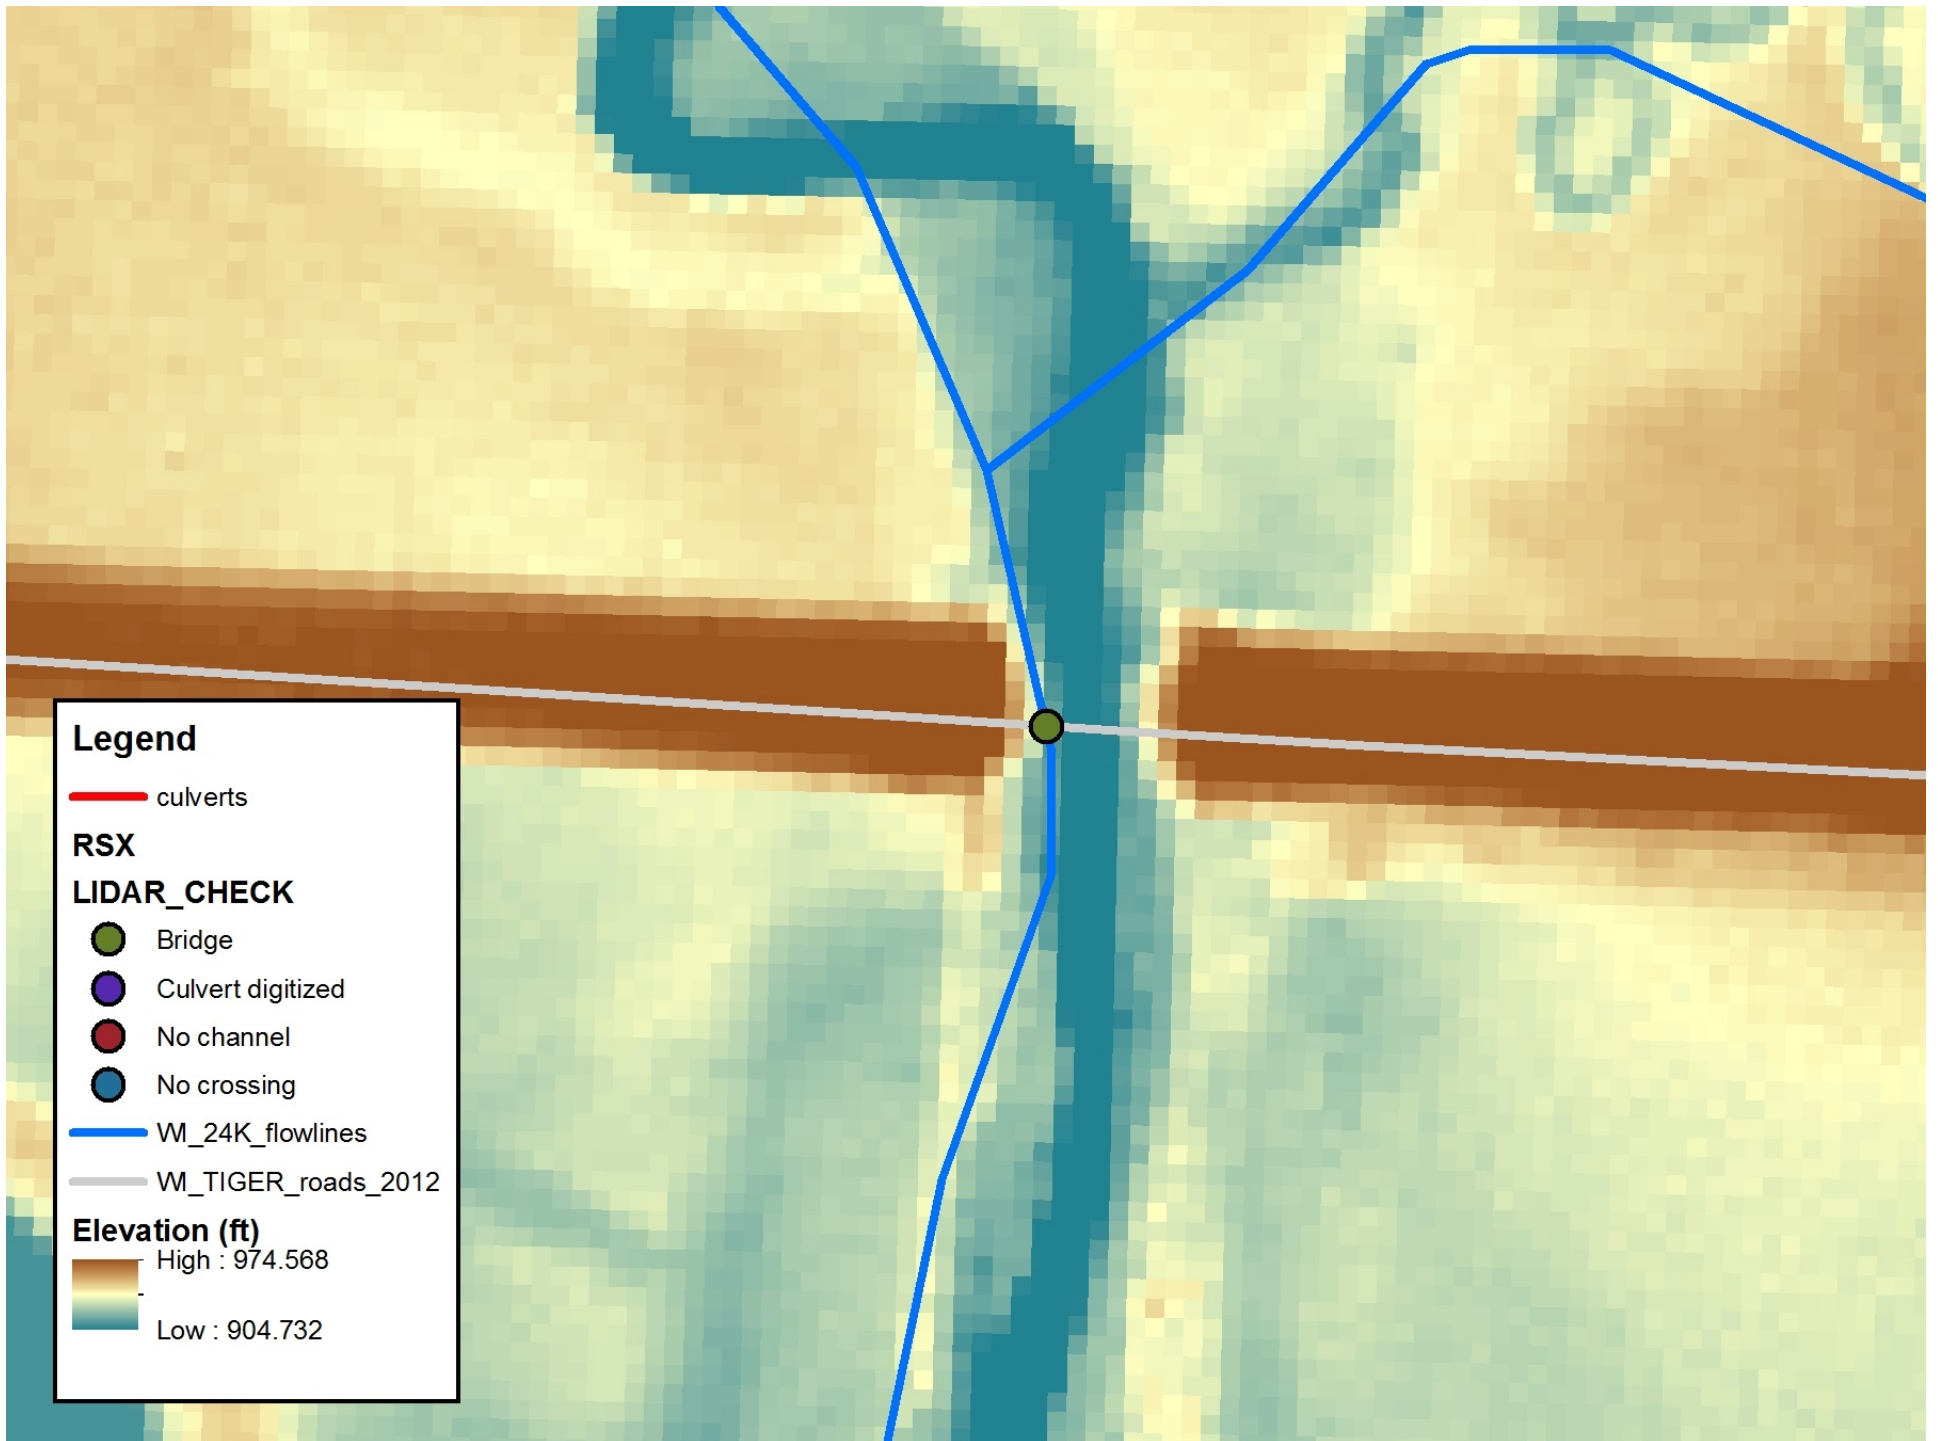

Source: Esri, DigitalGlobe, GeoEye, i-cubed, USDA, USGS, AEX, Getmapping, Aerogrid, IGN, IGP, swisstopo, and the GIS User Community

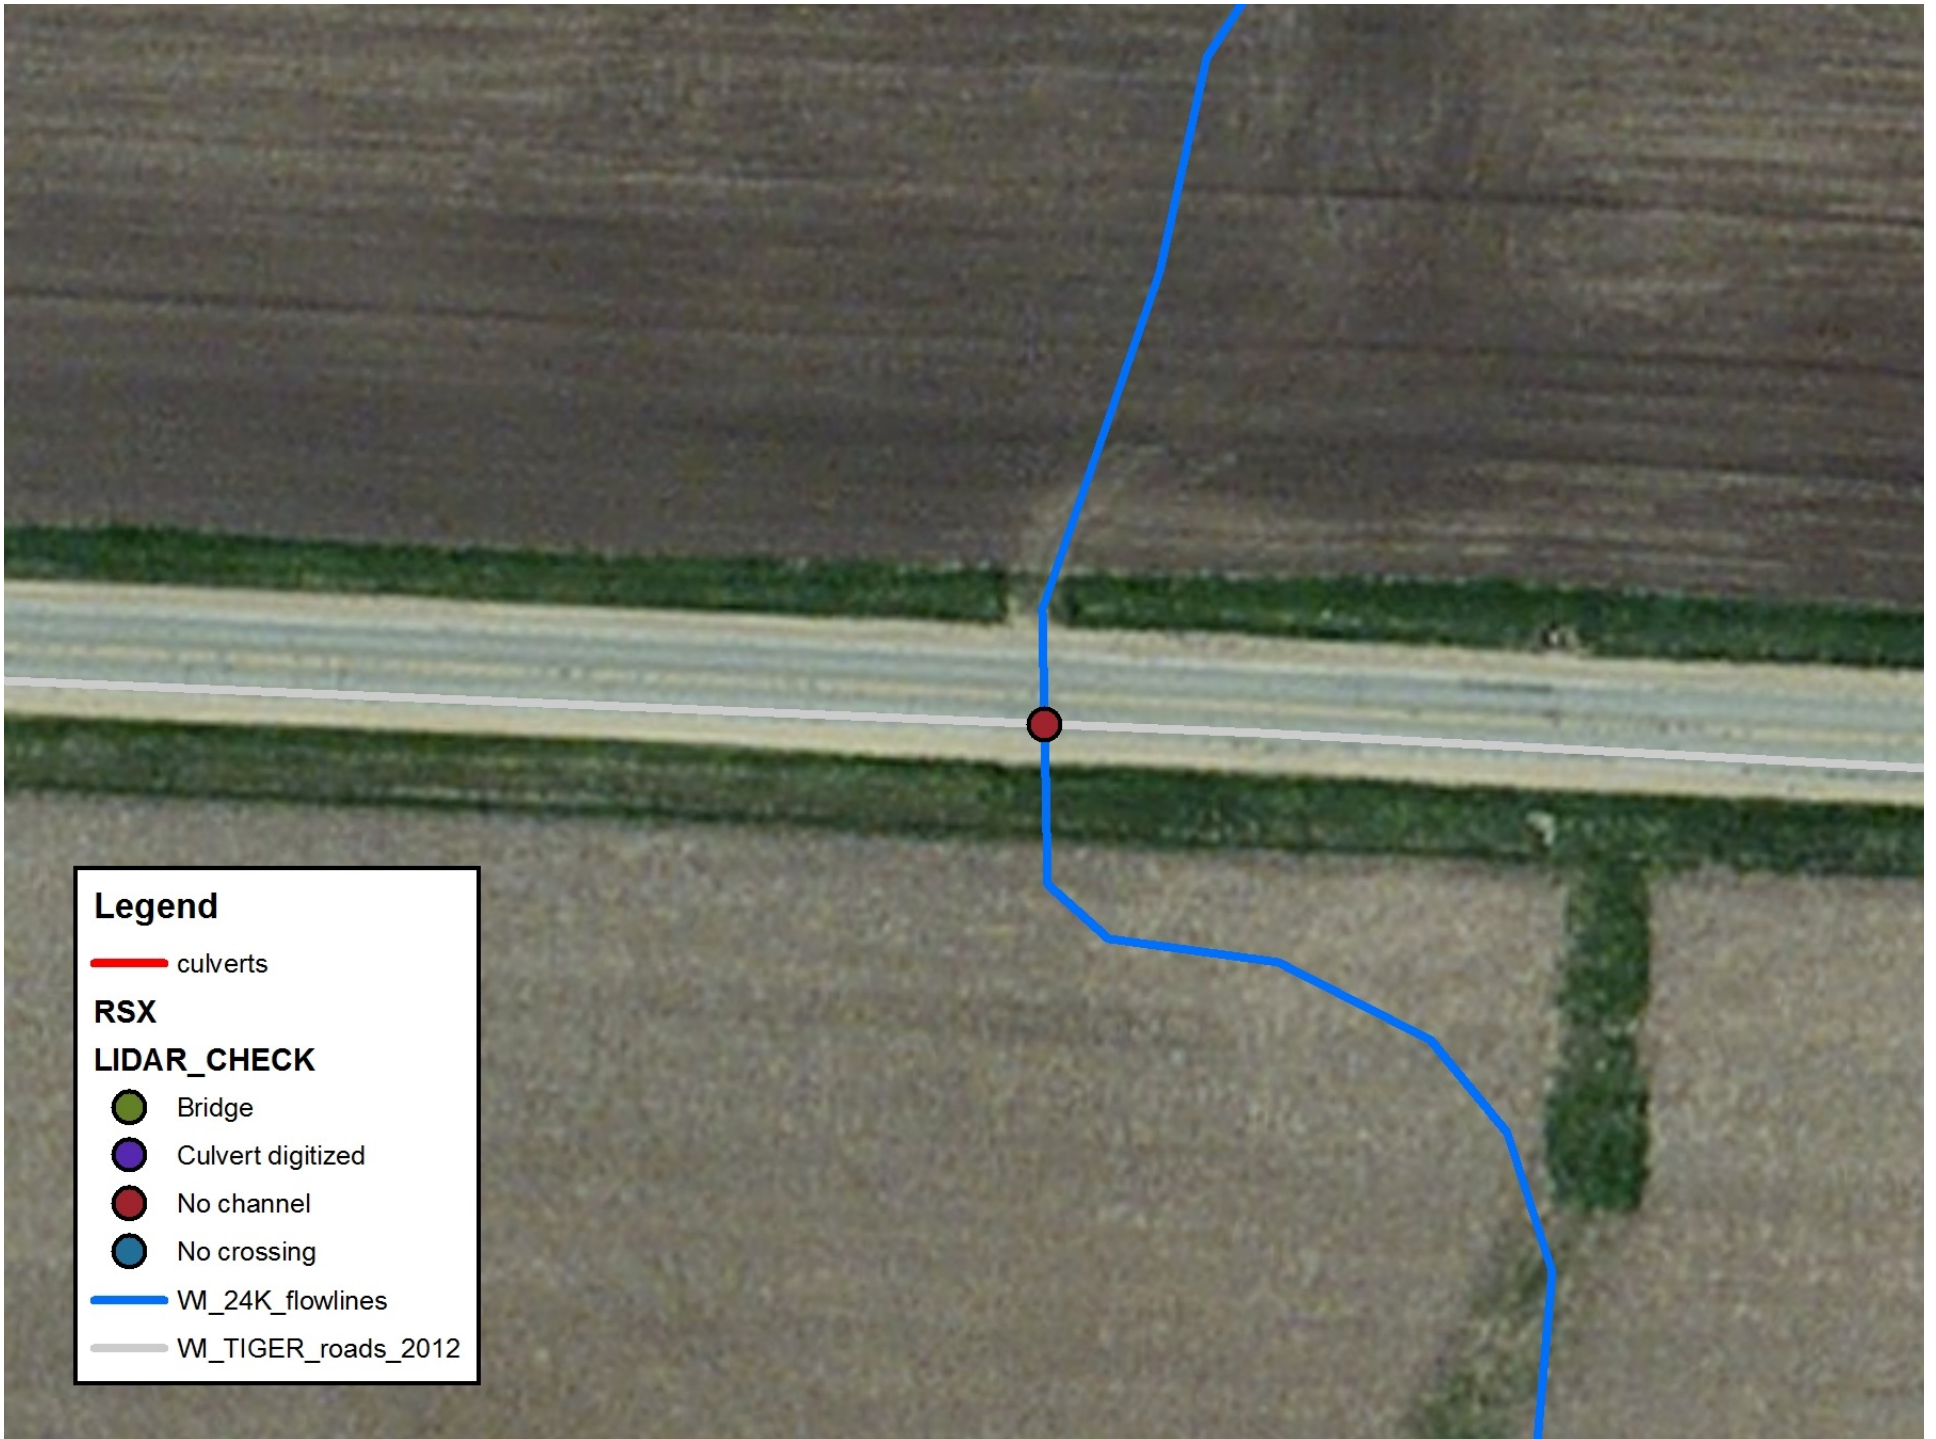

Stream
Flow

Case Study: Green County, WI

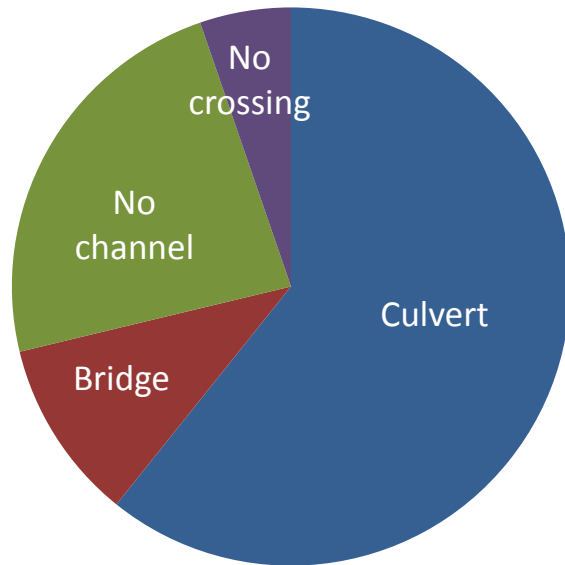

Green County, WI Road Crossings

All Road Crossings (1,363)

Culverts (Vertical Drop)

Accuracy of LiDAR Assessment

Overall accuracy of DEM: RMSE = 0.38 ft (12 cm)

How much drop or slope is a problem?

Limitations

1. Cannot assess culvert size, condition, or detailed hydraulic profile
2. Requires high resolution and quality DEM
 - a. Works best with streams that are wider than DEM resolution
 - b. Works best in locations without tree canopy
 - c. Be aware of hydrologic conditioning used in DEM development

Comparison of Methods

Criteria		Fish Xing	Field Surveys	LiDAR	Statistical Model
Accuracy	Passability	Highest	High	Moderate-High	Low-Moderate
	Cost	Highest	High	Moderate-High	Low-Moderate
Speed		1 site/day	20 sites/day	400 sites/day	Completed for all RSX in GL Basin
Completeness		Depends on methods used to identify crossings for field surveys		Highest	Moderate
Other		Estimate how passability varies with flow	Identify defined channels / fish habitat		Evaluate landscape factors that influence passability
		Identify site-specific factors that influence replacement cost		Condition DEM for hydrography development	

Next Steps

1. Complete assessment for all Wisconsin counties with adequate LiDAR-based DEMs
2. Prioritize road crossings based on benefit to fish per dollar
3. Evaluate automated methods for identifying culvert ends in DEM
4. Assess correspondence between finding of “no channel” in DEM and field-based navigability determination
5. Continue accuracy testing

Publicly Available Enhanced Elevation Data
