This Event is brought to you for free and open access by the Fish Passage Community at UMass Amherst at ScholarWorks@UMass Amherst. It has been accepted for inclusion in International Conference on Engineering and Ecohydrology for Fish Passage by an authorized administrator of ScholarWorks@UMass Amherst. For more information, please contact scholarworks@library.umass.edu.

Seeking Better Fishways: the Pump Fishway Program

John Harris ¹, Bill Peirson ¹, Lee Baumgartner ², Brent Mefford ³ &
Richard Kingsford ¹

¹ UNSW Australia, ² Latrobe University, Victoria, ³ Wild Fish Engineering, Denver USA

Pump Fishway Objectives

- Design a better, cheaper upstream fishway
- Combine fish–passage knowledge with aquaculture fish–transport methods
- Optimize all four stages of fish passage:
 - **attraction, entry, passage, refuge**

Basic Design Principles

- Use existing fishways knowledge to raise fish above tailwater (~ 0.4 m)
- Enclose fish in a chamber that can be pressurized to achieve passage
- Use hydraulic head of reservoir to provide all flow & energy needs

Commercial Fish Pump in Operation

Tassal Salmon Farm, Bruny Island, Tasmania

- Airlift pump relocating & grading Atlantic salmon
- 10,000 fish, 2–4kg moved without injury through 200mm pipe in 3 hours

- 4 kg Atlantic salmon passing through pipe

Deelder open-lock Fishway

1. Basic structure

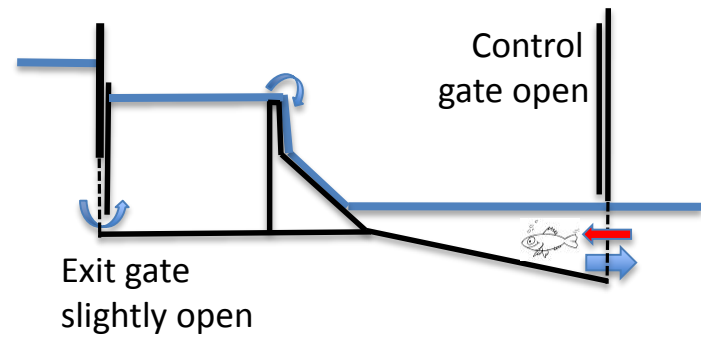

Deelder open-lock Fishway

1. Basic structure

2. Attraction stage

Deelder open-lock Fishway

1. Basic structure

2. Attraction stage

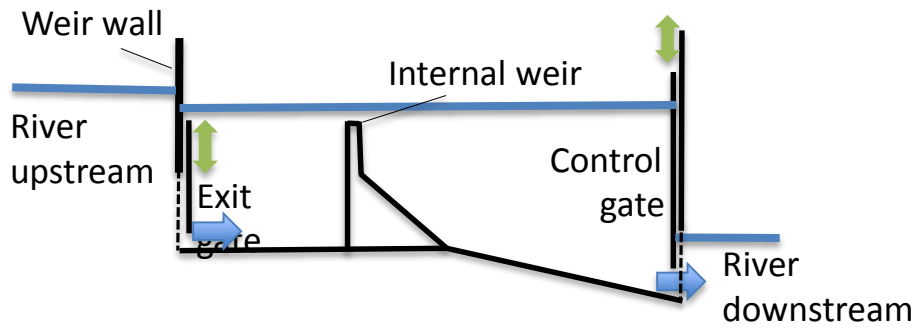

3. Filling stage

Deelder open-lock Fishway

1. Basic structure

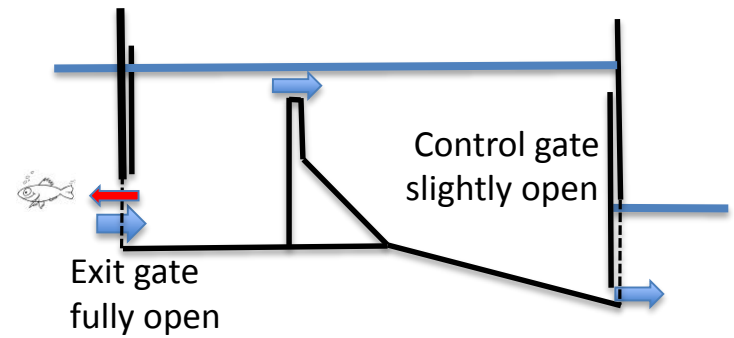

2. Attraction stage

3. Filling stage

4. Exit stage

Modifications to Basic Open-Lock Design

- Translate linear layout to circular arrangement
- Collection area added at downstream end
- Fish trapped then enclosed in transfer chamber
- Fish transferred passively to reservoir

Lock-Base Pump Fishway: General Layout

Circular arrangement, shown straightened A-B

7.2m (centreline)

Lock-Base Pump Fishway: Plan View

Lock-Base Pump Fishway: Elevation

Fishway Components

Operations: 1. Attraction stage

2. Filling stage

3. Trapping stage: Part 1

3. Trapping stage: Part 2

3. Trapping stage: Part 3

4. Transfer stage

5. Re-set stage

Features of Lock-Base Pump Fishway

- The Deelder open lock has a proven performance record with both large and very small fish (12mm)
- Innovation combines benefits of fish pumping & available head difference
- Passage stages less dependent on constraints of fish physiology & behaviour
- Compact, light-weight, potential modular construction
 - May be barge-mounted & re-positioned for optimal attraction
 - Independent of tailwater variation – floating (?)
 - Removable before floods
- Constant operation with short cycling period
- Few moving parts – 2 valves, 2 gates, 1 auxiliary pump (eliminate?)

Expected Benefits of Lock-Base Pump Fishway

- Versatile configuration, adaptable to new & existing sites >2m
- Low capital and operating costs
- Potential to serve all four critical fishway functions effectively:
attraction, entry, passage & refuge
