

4 Things you need to know about your Weight and Diabetes

1 Many people are at risk of type 2 diabetes without even knowing it!

Diabetes is when your body does not produce enough **Insulin** to deal with the **Glucose (Sugar)** produced by the food you eat.

The food you eat

Your body

To help control your **Glucose (Sugar)** depending on your type of diabetes, you can:

- Get **Insulin** injections
- Help yourself by leading a healthy lifestyle
- Take medication

You need to have an equal balance **Glucose (Sugar)** and **Insulin** to control your diabetes.

2 Extra sugar in the blood can cause problems like:

Heart Disease

Kidney Failure

Blindness

Amputation

3 What to look out for:

Women
Is your waistline more than?
31.5 INCHES

Do you go to the toilet a lot?

Men
Is your waistline more than?
37 INCHES

Do you feel thirsty a lot?

Do members of your family have diabetes?

Do you feel tired a lot?

4 Say no to diabetes by doing 4 things:

Have your blood sugar checked.

By your GP or at the chemist.

Eat more fruit and veg.

And reduce the size of your portions.

Use less salt.

No more than one teaspoon per day.

Exercise more.

You need to exercise for 2.5 hours per week over 2 days or more that week.
