# Thesis Title <br> Author <br> Miss Uraiwan Changsaluk <br> Major Program <br> Academic Year <br> Syntheses and Characterization of Ruthenium(II) Complexes with 5-Methyl-2-(phenylazo)pyridine Ligand Chemistry 2007 

#### Abstract

The new azoimine functionalized ligand, 5-methyl-2-(phenylazo)pyridine (5mazpy) was synthesized. It reacted with $\mathrm{RuCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ in ethanolic solution to give three isomers of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$. These isomers are cis-trans-cis (ctc), cis-cis-cis (ccc), trans-cis-cis (tcc). In addition, the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$, $[\mathrm{Ru}$ $\left.(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes $(\mathrm{L}=2$-(phenylazo)pyridine (azpy), 5-methyl-2-(phenylazo)pyridine (5mazpy); L' = 2,2'-bipyridine (bpy), 1,10 -phenanthrolene (phen)) were also synthesized. They were characterized by elemental analysis, mass spectrometry, UV-visible absorption spectroscopy, and infrared spectroscopy. The NMR spectra have been resolved using ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, DEPT, ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY, and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy. The electrochemistry of the complexes was investigated by cyclic voltammetry. The structures of 5mazpy, ctc-, ccc-, tcc-[ $\left.\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$, and $\left[\mathrm{Ru}\left(5 \text { mazpy }^{2}\right)_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ have been confirmed by X ray crystallography. Results from infrared spectroscopy show that $\mathrm{N}=\mathrm{N}$ stretching mode in the complexes appeared at a lower frequency than that in the free ligand supporting Ru-azo nitrogen pi bonding interaction. In addition, the complexes of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}, \quad\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ were also synthesized for studing DNA interaction. The DNA-binding properties of the ruthenium complexes were investigated by absorption titration, competitive binding, viscosity measurements, and cyclic voltammetry. In addition, the cleavage reaction on plasmid DNA (pBIND) has been monitored by agarose gel electrophoresis. The experimental results suggest that the ruthenium complexes bind to DNA in an intercalative mode and can cleave the plasmid DNA. Besides, the biological acticity of ruthenium complexes have been also studied with a series of human tumor cell lines, lung cancer (A549 and Anti-NCl-H187), colon cancer (WIDR), ovarian cancer

(IGROV), breast cancer (MCF-7 and BC), prostate cancer (PC3), melanoma cancer (SK-MEL-28), leukemia (CEM) and oral human epidermal carcinoma (KB). The results showed that $c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ displays high activity in lung cancer (A549) and colon cancer (WIDR) than cisplatin.

## Acknowledgements

I would like to thank all people who have helped and inspired me during my doctoral study.

First of all I wish to express my sincere gratitude to my advisor, Asst. Prof. Dr. Kanidtha Hansongnern, who guided this work, suggested and encouraged me in all the time of research and for writing of this thesis.

I would like to thank Asst. Prof. Dr. Chaveng Pakawatchi for suggestion and preparing X-ray cryatallographic data and Asst. Prof. Dr. Adisorn Ratanaphan for suggestion and providing the service of gel electrophoresis technique. I also wish to thank Prof. Selby A. R. Knox and Prof. Neil Connelly for FAB and ESI mass spectrometric data. I would like to thank Dr. John D Allen and his team who gave me an opportunity to do a part of my thesis at Cancer Drug Resistance (CDR) laboratory and the Centenary Institute of Cancer Medicine and Cell Biology, Faculty of Medicine, University of Sydney, Australia and gave me an important guidance about cytotoxicity assay.

I wish to thank all of examination committee of this thesis (Assoc. Prof. Dr. Sutatip Siripaisarnpipat, Asst. Prof. Dr. Kanidtha Hansongnern, Asst. Prof. Dr. Adisorn Ratanaphan, Dr. Walailak Puetpaiboon, and Dr. Nararak Leesakul) for their valuable time. I am grateful to Department of Chemistry, Faculty of Science, Prince of Songkla University for all necessary laboratory apparatus and chemical supplies used throughout this research.

The financial support from the Center for Innovation in Chemistry: Postgraduate Education and Research Program in Chemistry (PERCH-CIC), Commission on Higher Education, Ministry of Education and Thailand Research Fund (Grant No. BRG 4680018), Department of Chemistry Faculty of Science and Graduate School at Prince of Songkla University are gratefully acknowledged. I also thank the Center of Excellence in Nanotechnology under the Southern Thailand Science Park for a grant during my work in Sydney, Australia.

I wish to thank my former and present colleagues of CH 439 are grateful for their kindness, help and friendship. I would also like to thank my friends,

Kittiya Muaksang and Jerremy Shearman for all of their help and support during my stay in Sydney. Finally, my deepest gratitude goes to my family for their unflagging love and support throughout my life.

## The Relevance of the Research Work to Thailand

Cancer in Thailand is becoming a significant health problem. It is the leading cause of death in Thailand. The platinun compounds are widely used as chemotherapy drug such as cisplatin and carboplatin. It is most commonly used to treat testicular, bladder, lung, stomach and ovarian cancers. But they have toxic side effects. Therefore, the researcher try to develop the new drugs. In this work we focus on the ruthenium(II) complexes which contain the new bidentate ligand, 5-methyl-2(phenylazo)pyridine (5mazpy). The $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},[\mathrm{Ru}$ (5mazpy) $\left.)_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes $(\mathrm{L}=2$-(phenylazo)pyridine (azpy), 5-methyl-2-(phenylazo)pyridine (5mazpy); L' = 2,2'-bipyridine (bpy), 1,10 -phenanthroline (phen)) were synthesized and characterized. In addition, the water soluble complexes, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2},\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2}\right.$ 5 mazpy] $\mathrm{Cl}_{2}$, were also synthesized for study of DNA interaction. Furthermore, all complexes, $\left[\mathrm{Ru}\left(5 \text { mazpy }_{2}\right)_{2} \mathrm{Cl}_{2}\right],\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2},[\mathrm{Ru}$ $\left(\mathrm{L}^{\prime}\right)_{2} 5$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}, \quad\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}, \quad\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\quad\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2}\right.$ 5 mazpy] $\mathrm{Cl}_{2}$, were investigated cytotoxicity against a series of human tumor cell lines (A549, CEM, IGROV, MCF-7, PC3, SK-MEL-28, WIDR, Anti-NCI-H187, BC, and KB ). The result from this work is a basic knowledge for developing the new antitumor agents in the future.

## Table

3.25 UV-Visible absorption spectroscopic data of the
$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}\left(5 \text { mazpy }_{2}\right)_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes in $\mathrm{CH}_{3} \mathrm{CN}$
( $\mathrm{L}=$ azpy, 5mazpy; L' = bpy, phen)
3.26 The lowest energy of MLCT absorptions band of the
$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and [ $\left.\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes in $\mathrm{CH}_{3} \mathrm{CN}$
( $\mathrm{L}=$ azpy, 5 mazpy; $\mathrm{L}^{\prime}=$ bpy, phen)
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the
$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex in acetone- $d_{6}$
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the
$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex in acetone- $d_{6}$
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the152
$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex in acetone- $d_{6}$
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the
$\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex in acetone- $d_{6}$
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the
$\left[\mathrm{Ru}(\text { bpy })_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex in acetone- $d_{6}$
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the
$\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex in acetone- $d_{6}$
Cyclic voltammetric data of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$,
$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes in $\mathrm{CH}_{3} \mathrm{CN}(0.1 \mathrm{M} \mathrm{TBAH})$ at scan rate $100 \mathrm{mVs}^{-1}$
( $\mathrm{L}=$ azpy, 5mazpy; $\mathrm{L}^{\prime}=$ bpy, phen)$\mathrm{Ru}(5 \text { mazpy })_{2}$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex in acetone- $d_{6}$

## List of Tables (Continued)

Table Page
3.35
Crystallographic data of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex ..... 195
3.36 Selected bond lengths $(\AA)$ and bond angles $\left({ }^{\circ}\right)$ of the ..... 196$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex
3.37 The physical properties of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$, ..... 200
$\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ complexes( $\mathrm{L}=$ azpy, $5 \mathrm{mazpy} ; \mathrm{L}^{\prime}=$ bpy, phen)3.38Elemental analysis data of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$,201$\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ complexes( $\mathrm{L}=$ azpy, 5 mazpy ; $\mathrm{L}^{\prime}=$ bpy, phen)
3.39
Infrared spectroscopic data of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$, ..... 202$\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ complexes( $\mathrm{L}=$ azpy, 5 mazpy ; $\mathrm{L}^{\prime}=$ bpy, phen)3.40${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data ofthe $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$ complex in $\mathrm{CD}_{3} \mathrm{OD}$${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the218$\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} .4 \mathrm{H}_{2} \mathrm{O}$ complex in $\mathrm{CD}_{3} \mathrm{OD}$${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the226
[ $\mathrm{Ru}(5 \text { mazpy })_{2}$ bpy $] \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ complex in $\mathrm{CD}_{3} \mathrm{OD}$3.43${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the[ $\mathrm{Ru}(5 \text { mazpy })_{2}$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ complex in $\mathrm{CD}_{3} \mathrm{OD}$${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the[ $\mathrm{Ru}(\text { bpy })_{2} 5$ mazpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ complex in $\mathrm{CD}_{3} \mathrm{OD}$3.45${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the$\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$ complex in $\mathrm{CD}_{3} \mathrm{OD}$

## List of Tables (Continued)

TablePage
3.46 Absorption spectral data and binding constant $\left(\mathrm{K}_{\mathrm{b}}\right)$ for binding of ..... 259$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and$\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}\left(\mathrm{~L}=\right.$ azpy, $5 \mathrm{mazpy} ; \mathrm{L}^{\prime}=$ bpy, phen $)$
3.47
Emission spectral data and linear Stern-Volmer quenching ..... 268 constants (K) for binding of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ complexes with CT DNA (L = azpy, 5mazpy; L' = bpy, phen)
3.48
Cyclic voltammetric data behaviour of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]$279$\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \text { mazpy }\right]_{C l_{2}}$ complexesin the absence and presence of CT DNA
3.49
$\mathrm{IC}_{50}$ values $(\mu \mathrm{M})$ of a series of ruthenium(II) complexes and ..... 288 cisplatin against a series of tumor cell lines (A549, CEM, IGROV, MCF-7, PC3, SK-MEL-28, WIDR)
3.50
IC $_{50}$ values ( $\mu \mathrm{g} / \mathrm{mL}$ ) of a series of ruthenium(II) complexes andcisplatin against a series of tumor cell lines (Anti-NCI-H187, BC,KB)
A. 1 The solvents for UV-Visible spectrum and the their cut-off ..... 312A. 2Bond lengths ( $\AA$ ) and angles $\left({ }^{\circ}\right)$ of the 5mazpy ligandA. 3Bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ of the $c t c-\left[\operatorname{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$complex
A. 4
Bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ of the $c c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex
A. 5
Bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ of the $t c c-\left[\operatorname{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex
Bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex ..... 332 ..... 336 ..... 338
A. 6296328329

## CHAPTER 1

## INTRODUCTION

### 1.1 Background

The ruthenium(II) complexes containing azoimine ( $-\mathrm{N}=\mathrm{N}-\mathrm{C}=\mathrm{N}-$ ) and imine ( $-\mathrm{N}=\mathrm{C}-\mathrm{C}=\mathrm{N}-$ ) functional units have been chosen for study of their chemistry. These two functions are isoelectronic and $\pi$-acidic in character.

Azoimine ligands, such as 2-(phenylazo)pyridine (azpy), which contain the $-\mathrm{N}=\mathrm{N}-\mathrm{C}=\mathrm{N}-$ linkage have unusual properties (Velder et al., 2004). The pyridine ring is an intermediate $\pi$-accepter, and its nitrogen is a weak $\sigma$-donor. The azo group has low $\sigma$-donor ability to the metal, but possesses enhanced $\pi$-accepting ability through the azo $\pi^{*}$ orbital. The polypyridyl ligand is a symmetric bidentate ligand, which has $\sigma$-donor and $\pi$-accepter properties such as $2,2^{\prime}$-bipyridine (bpy) and 1,10 -phenantroline (phen). These ligands contain the imine moiety ( $-\mathrm{N}=\mathrm{C}-\mathrm{C}=\mathrm{N}-$ ).

There are a variety of applications of the ruthenium(II) complexes with azoimine and imine ligands. In the research for antitumor-active metal complexes, several ruthenium complexes have been reported to be promising as anticancer drugs. For example, the $\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ complexes show remarkably high cytotoxicity against a reries of tumor-cell lines (Velder et al., 2004). Furthermore, the [ $\left.\mathrm{Ru}(\text { azpy })_{2} \mathrm{~L}\right]$ complexes $(\mathrm{L}=1,1$-cyclobutanedicarboxylate, oxalate, malonate) display a promising cytotoxicity in the A2780 cell line (Hotze et al., 2003). The cytotoxicity data of the mer-[Ru(azpy $\left.)_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}, \alpha-\left[\mathrm{Ru}(\text { azpy })_{2}\right.$ bpy $]\left(\mathrm{PF}_{6}\right)_{2}, \beta-\left[\mathrm{Ru}(\text { azpy })_{2}\right.$ bpy $]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(\text { bpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes show a moderate activity in some particular cell lines (Hotze et al., 2005). In addition, the interaction of the cytotoxic $\alpha$ [ $\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}$ ] with DNA-model base has been studied (Hotze et al., 2000).

Over the past decade there has been substantial interest in the design and study of DNA binding properties of a number of potential, substitution inert and redox active ruthenium(II) complexes, in the hope of developing novel probes of the

DNA structure. Particularly, the octahedral ruthenium(II) complexes incorporating the aromatic ligands are suitable for application. They have many unique and convenient features such as strong visible absorbance which provide a convenient, sensitive and powerful spectroscopic for monitoring the DNA binding process.

Recently, a ruthenium(II) polypyridyl derivative, $\left[\mathrm{Ru}(\mathrm{bpy})_{2}(\mathrm{dppz})\right]^{2+}$ (bpy $=2,2^{\prime}$-bipyridine; dppz $=$ dipyrido $\left[3,2-a: 2^{\prime}, 3^{\prime}-c\right]$ phenazine) was shown to be a remarkable luminescent light switch for DNA (Hartshorn and Barton, 1992). In addition, the $\left[\mathrm{Ru}(\text { bpy })_{2}(\right.$ actatp $\left.)\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(\text { phen })_{2}(\right.$ actatp $\left.)\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ (actatp $=$ acenaphthereno[1,2-b]-1,4,8,9-tetraazariphenylence) complexes bind to DNA through an intercalative mode (Deng et al., 2003). Zhen et al. reported that $\left[\mathrm{Ru}(\text { bpy })_{2} \mathrm{~L}\right]^{2+}(\mathrm{L}=4,5,9,18$-tetraazaphenanthreno[9,10-b]triphenylene (taptp); 2,3-di-phenyl-1,4,8,9-tetraazatriphenylene (dptatp)) bind enantioselectively to doublestranded calf thymus DNA via the intercalative mode (Zhen et al., 1999).

In this work, our interest is to synthesize the complexes of ruthenium(II) with a new azoimine ligand, 5-methyl-2-(phenylazo)pyridine (5mazpy). The 5 mazpy is similar to azpy but contains a methyl group $\left(-\mathrm{CH}_{3}\right)$ at the fifth position on the pyridine ring is an unsymmetric bidentate $\mathrm{N}, \mathrm{N}^{\prime}$-donor center. For this reason the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes can theoretically exist in five different isomeric forms. If the coordinating pairs of $\mathrm{Cl}, \mathrm{N}(\mathrm{py})$, and $\mathrm{N}(\mathrm{azo})$ are considered in that order, the configurations of these isomers are trans-trans-trans (ttt), trans-cis-cis (tcc), cis-trans-cis (ctc), cis-cis-trans (cct) and cis-cis-cis (ccc). From this work, only three isomers of $c t c, c c c$ and $t c c$ are obtained.

Recently, the chloride atoms of $\alpha-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ were replaced by a third azpy and bpy ligand and investigated this series for their cytotoxicity (Hotze et al, 2005). Moreover, the $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ complexes were under renewed investigation due to their cytotoxic activity in a series of human tumor cell lines (Velder et al., 2004). In particular the $\alpha$-configuration as this isomer displayed a very high cytotoxicity, stability and a reasonable solubility (Velder et al., 2000, 2004). Therefore, it is our interest to synthesize and to characterize the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]$ $\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes $(\mathrm{L}=2$-(phenylazo) pyridine (azpy), 5-methyl-2-(phenylazo)pyridine (5mazpy); L' = 2,2'-bipyridine
(bpy), 1,10-phenanthroline (phen)). In addition, the cytotoxicity of these complexes were also investigated.

In order to study DNA-binding properties of ruthenium complexes, the water solubility is required. Therefore, the complexes of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},[\mathrm{Ru}$ (5mazpy) $\left.)_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ were synthesized and characterized. Besides, the DNA-binding of these complexes were carried out.

### 1.2 Literature reviews

## Syntheses and characterization of the ruthenium(II) complexes

 with the imine and azoimine ligandsKrause and Krause, (1980) studied the chemistry of the 2(phenylazo)pyridine (azpy) ligand and $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ complexes. Three isomers of these complexes were obtained. The isomers were assigned to be trans-cis-cis ( $\gamma$ ), cis-trans-cis $(\alpha)$ and cis-cis-cis $(\beta)$ with referred to the order of coordination pairs of Cl , N (pyridine), N (azo), respectively. All of three isomers were characterized by infrared spectroscopy, UV-Visible absorption spectroscopy, and ${ }^{13} \mathrm{C}$ NMR spectroscopy. The data from cyclic voltammetry showed that azpy ligand appeared to be a better ligand for stabilizing ruthenium(II) than 2,2'-bipyridine (bpy).

Goswami, et al., (1981) reported the two types of ruthenium complexes $\mathrm{RuX}_{2} \mathrm{~L}_{2}$ (green) and $\left[\mathrm{Ru}(\mathrm{bpy})_{2} \mathrm{~L}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ (red) $(\mathrm{X}=\mathrm{Cl}, \mathrm{Br}, \mathrm{I} ; \mathrm{L}=2$ (phenylazo)pyridine of 2-( $m$-tolylazo)pyridine; bpy $=2,2^{\prime}$-bipyridine). Both types of complexes had intense $\mathrm{t}_{2}(\mathrm{Ru}) \rightarrow \pi^{*}(\mathrm{~L})$ transition in the visible region. The complexes displayed electrochemical responses on the negative side of SCE due to ligand-based reductions. The azopyridine ligand system greatly stabilized the +2 oxidation state in ruthenium.

Krause and Krause, (1982) studied a series of ruthenium(II) complexes with the strong $\pi$-acceptor ligand 2-(phenylazo)pyridine (azpy), $\left[\operatorname{Ru}(a z p y)_{2}(A B)\right]^{n+}$ ( $\mathrm{AB}=2$-(phenylazo)pyridine, 2,2'-bipyridine, 4,4'-bithiazole, 1,2-diaminoethane, 2,4pentanedione; $\mathrm{X}=\mathrm{NO}_{2}^{-}, \mathrm{CN}^{-}, \mathrm{Br}^{-}, \mathrm{N}_{3}{ }^{-}$, thiourea). Infrared spectra showed the azo stretching mode $(\mathrm{N}=\mathrm{N})$ to be diagostic of the coligand (AB) $\pi$-accepting behaviour. For a very strong $\pi$-acid coligand, the azo mode could approach the free ligand value, while with a $\pi$-base coligand a single bond order might be approached for the azo linkage.Visible spectra of the complexes appeared to be typical charge-transfer(CT) spectra. The CT band energy should be indicative of the metal-ligand interaction. Emission spectra could be obtained three compounds, one compound appearing to give multiple emission. Cyclic Voltammetric data supported the strong $\pi$ stabilization.

Goswami, et al., (1983) examined the reactions of the $\left[\mathrm{Ru}\left(\mathrm{OH}_{2}\right)_{2} \mathrm{~L}\right]^{2+}$ ( $\mathrm{L}=2-(\mathrm{phenylazo})$ pyridine and 2-(m-tolylazo)pyridine) with a number of bidentate ligands (2,2'-bipyridine (bpy), ethylenediamine (en) , acetylacetone (Hacac). The stereochemistries have been established with the help of ${ }^{1} \mathrm{H}$ NMR data. The metal oxidation and ligand reduction behaviour of the complexes were studied electrochemically in acetonitrile.

Bag, et al., (1992) reported the $\mathrm{Ru}(\mathrm{RQc})(\operatorname{tap})_{2}$ complexes which were synthe- sized by reaction $\left[\mathrm{Ru}\left(\mathrm{OH}_{2}\right)_{2}(\operatorname{tap})_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ with catechols in the presence of base $\left(\mathrm{RQc}=\right.$ catecholate, $\mathrm{R}=\mathrm{H}, 4-t-\mathrm{Bu}, 3,5-(t-\mathrm{Bu})_{2}$ or $3,4,5,6-\mathrm{Cl}_{4}$; tap $=2-(\mathrm{m}-$ tolylazo) pyridine). The X-ray structure of $\left[\left\{\mathrm{Ru}(\mathrm{RQc})(\operatorname{tap})_{2}\right\}_{2} \mathrm{H}_{2} \mathrm{O}\right] . \mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathrm{R}=\mathrm{H})$ was reported. Results from UV-Visible absorption spectra showed MLCT excitation $\operatorname{Ru}(\mathrm{d} \pi) \rightarrow \operatorname{RQc}(\mathrm{p} \pi)$ at near 1000 nm . Besides, cyclic voltammetry was used to study their redox properties. The interligand charge-transfer transition $(\mathrm{RQc}(\mathrm{p} \pi) \rightarrow \operatorname{tap}$ (azo $\left.\mathrm{p} \pi^{*}\right)$ and $\mathrm{Ru}^{\mathrm{II}}(\mathrm{d} \pi) \rightarrow \mathrm{RQc}(\mathrm{p} \pi)$ energies qualitatively correlated with the relevant reduction potentials.

Figure 1.1 2-(m-Tolylazo)pyridine)

Choudhury, et al., (1992) studied the reaction of 2-arylpyridinecarboxaldimine $\left[\mathrm{RH}_{4} \mathrm{C}_{6} \mathrm{NC}(\mathrm{H}) \mathrm{Py}\right.$, L] with hydrated $\mathrm{RuX}_{3}(\mathrm{X}=\mathrm{Cl}, \mathrm{Br})$ in ethanol afforded crystals of $\mathrm{RuX}_{2} \mathrm{~L}_{2}$. Two isomers of complex have been isolated and characterized by analytical and spectroscopic data. From the IR data, the green isomer is trans with respect to two chlorides and the other isomer has a cis- $\mathrm{RuCl}_{2}$ geometry. The high-resolution ${ }^{1} \mathrm{H}$ NMR spectra of the compounds were used to examine the geometry of the isomeric $\mathrm{RuX}_{2} \mathrm{~L}_{2}$. All the complexes have multiple $\mathrm{t}_{2} \rightarrow \pi^{*}(\mathrm{~L})$ transition in the visible region. The data from cyclic voltammetry showed that $\mathrm{E}^{0}{ }_{298}$ of the $\mathrm{Ru}^{\text {III }} / \mathrm{Ru}^{\text {II }}$ couple in $\mathrm{RuCl}_{2} \mathrm{~L}_{2}$ depends on the nature of substitution (R) in the ligand L .

Boelrijk, et al., (1995) investigated the oxidation of octyl $\alpha$-Dglucopyranoside by $\mathrm{NaBrO}_{3}$. The complexes of $\left[\mathrm{Ru}(\text { azpy })_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2+}$ (azpy $=2$-(phenylazo)pyridine and $\left[\mathrm{Ru}(\mathrm{naz})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2+}$ (naz $=2-(p$-nitrophenyl)azopyridine) were used to be active catalyst yielding octyl glucopyranoside (OGP). Results from reactions with cyclobutanol in combination with spectroscopic data indicated that $\mathrm{Ru}(\mathrm{IV})=\mathrm{O}$ species was the active catalyst species. The two new complexes were synthesized, $\quad\left[\mathrm{Ru}(\right.$ terpy $)($ azpy $\left.)\left(\mathrm{H}_{2} \mathrm{O}\right)\right]\left(\mathrm{ClO}_{4}\right)_{2}$ and $\quad\left[\mathrm{Ru}(\right.$ terpy $\left.)(\mathrm{naz})\left(\mathrm{H}_{2} \mathrm{O}\right)\right]\left(\mathrm{ClO}_{4}\right)_{2}$. Besides the both complexes were less active than the first two complexes.

Misra, et al., (1998) synthesized the $\mathrm{RuL}_{2} \mathrm{Cl}_{2}$ complex which contained the new azoimidazoles, 1-methyl-2-(arylazo)imidazoles and 1-benzyl-2-(arylazo)imidazoles $\left(\mathrm{R}=\mathrm{H}, \mathrm{Me}, \mathrm{OMe}, \mathrm{Cl}, \mathrm{NO}_{2}\right)$. Two isomers of this complex were chromatographyically separated. The isomeric structures were confirmed by X-ray crystallography. The compounds exhibited $\mathrm{t}_{2}(\mathrm{Ru}) \rightarrow \pi^{*}(\mathrm{~L})$ MLCT transitions in the
visible region. Results from cyclic voltammetry revealed that the $\mathrm{Ru}(\mathrm{III}) / \mathrm{Ru}(\mathrm{II})$ couple was shifted to more positive potential on going from azoimidazole to azopyridine-ruthenium(II) complexes due to the decrease $\pi$-acidity of the fivemembered heterocycle imidazole compared to the six-membered pyridine ring.

Figure 1.2 1-Methyl-2-(arylazo)imidazoles

Santra, et al., (1999) reported the new $\mathrm{N}, \mathrm{N}^{\prime}$-chelating ligands, 2-(arylazo)pyrimidine. These ligands reacted with $\mathrm{RuCl}_{3}$ in ethanol to give three isomers. There were trans-cis-cis (tcc), cis-trans-cis (ctc), and cis-cis-cis (ccc) configurations with reference to the order of coordination paire as $\mathrm{Cl}, \mathrm{N}$ (pyridine), and $\mathrm{N}($ azo $)$. Two of the three isomeric structure $\left(t c c-\mathrm{Ru}(\mathrm{papm})_{2} \mathrm{Cl}_{2}, c c c-\mathrm{Ru}(\mathrm{papm})_{2} \mathrm{Cl}_{2}\right.$; papm $=2$-(phenylazo)pyrimidine) were confirmed by X-ray crystallography. The ${ }^{1} \mathrm{H}$ NMR spectra of the ligands and complexes were compared to determine the binding mode and stereochemistry of the complexes. The electronic spectra of complexes exhibited allowed MLCT transitions in the visible region. Results from cyclic voltammetry showed that the azopyrimidine ligands stabilize ruthenium(II) better than the azopyridines.

$$

$$

Figure 1.3 2-(Arylazo)pyrimidine

Hotze, et al., (2000) studied the $\alpha-\left[\mathrm{Ru}(\text { azpy })_{2}\left(\mathrm{NO}_{3}\right)_{2}\right]$ complex (azpy $=$ 2-(phe nylazo)pyridine). The structure of this complex was determined using X-ray crystallography. Besides, the binding of the DNA-model bases 9-ethylguanine (9equa) and guanosine (guo) was studied and compared with previously obtained results for the binding of model bases to the cis- $\left[\mathrm{Ru}(\mathrm{bpy}){ }_{2} \mathrm{Cl}_{2}\right]$ complex. The orientations of 9equa and guo in ruthenium complexes were proven using 2D NOESY NMR spectroscopy.

Peneerselvam, et al., (2000) reported the crystal structures of the [protonated 2-(phenylazo)pyridine and protonated 2-(4-hydroxyphenylazo)pyridine (3:1)]tetrafluoroborate compound. The results from X-ray showed that the protonation occurred at N (azo) atom and it was more basic than N (pyridine). The azpy compound was normally liquid at room temperature but intramolecular H bonding, $\mathrm{N}-\mathrm{H}-\mathrm{N}$, and van der waals forces stabilized this crystal structure.

Figure 1.4 Protonated azpy $\mathrm{X}=\mathrm{H}(75 \%)$ and $\mathrm{OH}^{-}(25 \%)$

Hotze, et al., (2002) found that adenine base coordinates to the cytotoxic $\alpha-\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ complex in the rare imine form, stabilized by N6, N7didentate coordination. In addition, the $\alpha-\left[\mathrm{Ru}(\text { azpy })_{2}\left(3-\mathrm{MeAde}_{-\mathrm{H}}\right)\right]\left(\mathrm{PF}_{6}\right)_{2}$ was proven by X-ray crystallography (azpy $=2$-(phenylazo)pyridine; $3-$ MeAde $_{-\mathrm{H}}=$ deprotonate $-3-$ methyladenine)

Hotze, et al., (2002) studied the coordination of the DNA model base 9-methyladenine (9-MeAde) with cis-[Ru(bpy) $\left.)_{2} \mathrm{Cl}_{2}\right]$ and $\alpha-\left[\mathrm{Ru}(\mathrm{azpy})_{2}\left(\mathrm{NO}_{3}\right)_{2}\right]$. The structure were confirmed by using 2D NMR techniques and variable-temperature NMR studies between 25 and $-55^{\circ} \mathrm{C}$. As the binding mode of 9-MeAde to both cis-
$\left[\mathrm{Ru}(\mathrm{bpy})_{2} \mathrm{Cl}_{2}\right]$ and $\alpha-\left[\mathrm{Ru}(\text { azpy })_{2}\left(\mathrm{NO}_{3}\right)_{2}\right]$ is the same, this binding mode does not explain the earlier observed difference in cytotoxicity between cis-[Ru(bpy) $\left.{ }_{2} \mathrm{Cl}_{2}\right]$ and $\alpha-\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$.

Hansongnern, et al., (2003) reported the crystal structure of 2-(4',N,NDiethyl aminephenylazo)pyrimidine. The azo group, being coplanar with the attached benzene rings and the $-\mathrm{N}-\mathrm{C}$ group of the substituent $-\mathrm{N}\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)_{2}$ on the phenyl ring, supported extensive delocalization of electron density. The substituent donated electron to the conjugated system via benzene ring into $\pi^{*}$ orbital of the azo moiety which, decreased the bond order of the azo leading to a longer bond of 1.283(2) $\AA$.

Figure 1.5 2-(4',N,N-Diethylaminephenylazo)pyrimidine (deazpym)

Byabartta, (2003) isolated the $\left[\mathrm{Ru}(\mathrm{phen})\left(\mathrm{RaaiR}^{\prime}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ complexes (phen $=1,10$-phenanthroline; RaaiR ${ }^{\prime}=1$-alkyl-2-(arylazo)imidazole, $p-\mathrm{R}-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{N}=\mathrm{N}$ $\mathrm{C}_{3} \mathrm{H}_{2}-\mathrm{NN}-1-\mathrm{R}^{\prime}, \mathrm{R}=\mathrm{H}, \mathrm{Me}, \mathrm{Cl}$ and $\left.\mathrm{R}^{\prime}=\mathrm{Me}, \mathrm{Et}, \mathrm{CH}_{2} \mathrm{Ph}\right)$. The structure of $[\mathrm{Ru}(\mathrm{phen})$ (RaaiR' $\left.)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ was confirmed by X-ray diffraction study. Besides the structure and stereochemistry of the complexes were supported by ${ }^{1} \mathrm{H}$ NMR data. The absorption spectra of the complexes exhibited a strong MLCT transition in visible region. Electrochemical properties of all the complexes were studied by cyclic voltammetry.

Lu , et al., (2003) studied the isomeric of the $\left[\mathrm{RuL}_{2} \mathrm{Cl}_{2}\right]$ complex $(\mathrm{L}=$ 1-(phenylazo)isoquinoline). The reaction of $\mathrm{RuCl}_{3}$ with 1-(phenylazo)isoquinoline produced two isomeric form. There were trans-cis-cis (tcc) and cis-cis-cis (ccc) in order of the coordinating pairs: $(\mathrm{Cl}, \mathrm{Cl}) ;(\mathrm{N}, \mathrm{N}) ;\left(\mathrm{N}^{\prime}, \mathrm{N}^{\prime}\right)$ where N represented N (isoquinoline), $\mathrm{N}^{\prime}$ represents N (azo). The configuration of two isomers was described by X-ray crystallography.

Figure 1.6 1-(Phenylazo)isoquinoline

Hotze, et al., (2004) studied the synthesis and characterization of the new water soluble ligand, 2-phenylazopyridine-5-sulfonic acid (Hsazpy), and its ruthenium complexes, $\alpha$ and $\beta-\left[\mathrm{NEt}_{4}\right]_{2}\left[\mathrm{Ru}(\text { sazpy })_{2} \mathrm{Cl}_{2}\right]$. The compounds were characterized by 2D NMR spectroscopy. Only $\left.\alpha-\left[\mathrm{NEt}_{4}\right]_{2}[\mathrm{Ru} \text { (sazpy })_{2} \mathrm{Cl}_{2}\right] .2 \mathrm{H}_{2} \mathrm{O}$ was determined by single-crystal structure analysis. The $\alpha-\left[\mathrm{NEt}_{4}\right]_{2}\left[\mathrm{Ru}(\text { sazpy })_{2} \mathrm{Cl}_{2}\right]$ complex was classified as non-toxic in A2780 cell line.

Figure 1.7 2-Phenylazopyridine-5-sulfonic acid (Hsazpy)

Jasimuddin, et al., (2004) studied $\left[\mathrm{Os}(\mathrm{bpy})\left(\mathrm{RaaiR}^{\prime}\right)_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{RaaiR}^{\prime}=\right.$ 1-alkyl-2-(arylazo)imidazole, $p-\mathrm{R}-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{N}=\mathrm{N}-\mathrm{C}_{3} \mathrm{H}_{2} \mathrm{NN}-1-\mathrm{R}^{\prime}$, where $\mathrm{R}=\mathrm{H}, \mathrm{Me}, \mathrm{Cl}$, and $\mathrm{R}^{\prime}=\mathrm{Me}$, Et and $\mathrm{CH}_{3} \mathrm{Ph}$; bpy $=2,2^{\prime}$-biypridine). The [Os(bpy)(MeaaiMe) ${ }_{2}$ ] $\left(\mathrm{PF}_{6}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$ complex was confirmed by X-ray crystallography. The $\mathrm{v}(\mathrm{N}=\mathrm{N})$ and $v(C=N)$ appeared at $1370-1390$ and $1590-1610 \mathrm{~cm}^{-1}$, respectively. UV-Visible absorption spectra of all complexes in acetonitrile solution displayed ligand-centred transitions in UV region, and metal-to-ligand charge transfer (MLCT) transition in visible region. The cyclic voltammogram exhibited $\mathrm{Os}(\mathrm{IV}) / \mathrm{Os}(\mathrm{III})$ and $\mathrm{Os}(\mathrm{III}) / \mathrm{Os}(\mathrm{II})$ at the positive side which were quasireversible reduction couples at the negative side.

They were due to gradual addition of electron into two azoimine chelates from RaaiR' and one diimine chelate ring in the complex.

Jasimuddin, et al., (2004) prepared the $\left[\mathrm{Ru}\left(o / p-\mathrm{RaaiR}^{\prime}\right)_{3}\right] \mathrm{Cl}_{2}\left(\mathrm{RaaiR}^{\prime}=\right.$ 1-alkyl-2-(arylazo)imidazole, $\mathrm{R}=\mathrm{H}, p$-Me, $p$-Ome, o-Ome; $\mathrm{R}^{\prime}=\mathrm{Me}, \mathrm{Et}, \mathrm{CH}_{2} \mathrm{Ph}$ ) by microwave technique. The complexes were characterized by IR, UV-Visible and ${ }^{1} \mathrm{H}$ NMR spectral data. In the case of $\left[\mathrm{Ru}\left(o-O m e a a i C H_{2} \mathrm{Ph}\right)_{3}\right] \mathrm{Cl}_{2}$, single crystals were obtained. The metal-to-ligand charge transfer transition was observed at visible region. Cyclic voltammetry of the complexes showed one metal oxidation $\mathrm{Ru}(\mathrm{II}) /$ $\mathrm{Ru}(\mathrm{III})$ at the positive side and three successive ligand reduction couples negative to SCE as the reference electrode.

Kooijman, et al., (2004) reported the crystal structure of the $\left[\mathrm{Ru}(\text { dazpy })_{2} \mathrm{Cl}_{2}\right]$ complex (dazpy $=2$-phenylazo-4,6-dimethylpyridine). The dazpy ligand coordinated to ruthenium in the so-call $\alpha$-configuration, meaning that the coordinating pairs of $\mathrm{Cl}, \mathrm{N}_{\mathrm{py}}$, and $\mathrm{N}_{\mathrm{azo}}$ are in cis, trans, and cis orientations, respectively.

Figure 1.8 2-Phenylazo-4,6-dimethylpyridine (dazpy)

Velders, et al., (2004) reported the fourth isomer of $\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ (azpy $=2$-(phenylazo)pyridine). The structure of this isomer was determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy and single-crystal X-ray diffraction analysis. Besides, the UVVisible and infrared spectroscopies were used to study chemistry of this isomer.

Hotze, et al., (2005) studied the complexes of $\left[\mathrm{Ru}\left(\mathrm{L}_{3}\right)\right]\left(\mathrm{PF}_{6}\right)_{2}(\mathrm{~L}=2$ (phenylazo)pyridine (azpy), o-tolylazopyridine (tazpy) and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} \mathrm{~L}^{\prime \prime}\right]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}^{\prime}, \mathrm{L}^{\prime \prime}\right.$
$=2$-(phenylazo)pyridine, 2,2'-bipyridine). They were structurally characterized and investigated the cytotoxicity. The structures of mer- $\left[\mathrm{Ru}(\mathrm{azpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and mer$\left[\mathrm{Ru}(\text { tazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ were determined by X-ray diffraction. NMR spectra of these series of compounds were resolved using 2D COSY and NOESY NMR spectroscopy. The cytotoxicity data against a series of human tumor cell lines (A498, EVSA-T, H226, IGROV, M19, MCF-7, and WIDR) showed a moderate cytotoxicity for these series of complexes.

Jasimuddin, et al., (2005) reported the $\left[\mathrm{Os}(\mathrm{phen})\left(\mathrm{RaaiR}^{\prime}\right)_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes (phen $=1,10$-phenanthroline; RaaiR $^{\prime}=1$-alkyl-2-(arylazo)imidazole, $p$-R$\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{N}=\mathrm{N}-\mathrm{C}_{3} \mathrm{H}_{2}-\mathrm{NN}-1-\mathrm{R}^{\prime}$ where $\mathrm{R}=\mathrm{H}, \mathrm{Me}, \mathrm{Cl}$ and $\left.\mathrm{R}^{\prime}=\mathrm{Me}, \mathrm{Et}, \mathrm{CH}_{2} \mathrm{Ph}\right)$. The single crystal of the complexes $\left[\mathrm{Os}(\mathrm{phen})(\mathrm{ClaaiEt})_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}$ was obtained. In addition, the structure of all complexes was confirmed by ${ }^{1} \mathrm{H}$ NMR spectroscopy. Electronic spectra of the complexes showed ligand centered (LC) transitions in the UV region and metal-to-ligand charge transfer transition in visible region. Cyclic voltammetry of all complexes exhibited two metal redox couple, $\mathrm{Os}(\mathrm{III}) / \mathrm{Os}(\mathrm{II})$ and $\mathrm{Os}(\mathrm{IV}) / \mathrm{Os}(\mathrm{III})$, at the positive side versus SCE, and three successive ligand reductions.

Dinda, et al., (2006) reported the heteroleptic tris-chelates, $\left[\mathrm{Ru}(\mathrm{bpy})_{2}\right.$ $(\alpha / \beta-N a i R)]\left(\mathrm{ClO}_{4}\right)_{2}$ complexes (bpy = 2,2'-bipyridine; $\alpha$-NaiR $=1$-alkyl-2-(naphthyl-$\alpha$-azo)imidazole; $\beta$-NaiR = 1-alkyl-2-(naphthyl- $\beta$-azo)imidazole). The electronic spectra of NaiR were recorded in $\mathrm{CH}_{3} \mathrm{CN}$ in the UV-Visible region. The ${ }^{1} \mathrm{H}$ NMR spectra were collected in $\mathrm{CD}_{3} \mathrm{CN}$. The structure of $\left[\mathrm{Ru}(\mathrm{bpy})_{2}(\alpha-\mathrm{NaiEt})\right]\left(\mathrm{ClO}_{4}\right)_{2}$ was confirmed by single crystal X-ray diffraction technique. The voltammograms of all complexes displayed $\mathrm{Ru}(\mathrm{III}) / \mathrm{Ru}(\mathrm{II})$ couple at the positive side and the ligand reductions at the negative side to reference electrode, SCE. Three successive reduction may be expected to involve the ligand having the most stable lowest unoccupied molecular orbital, which was dominated by azo function of naphthyl azoimidazole than bpy.

(b) 1-Alkyl-2-(naphthyl- $\beta$-azo)imidazole ( $\beta$-NaiR)

Al-Noaimi, et al., (2007) studied three novel families of azomethine ligands (L) of the type $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{~N}=\mathrm{NC}(\mathrm{R})=\mathrm{N}\left(4-\mathrm{YC}_{6} \mathrm{H}_{4}\right)(6), \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{~N}=\mathrm{NC}(\mathrm{R})=\mathrm{N}\left(4-\mathrm{YC}_{6} \mathrm{H}_{4}\right)$ (7) and $4-\mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{~N}=\mathrm{NC}(\mathrm{R})=\mathrm{N}\left(4-\mathrm{YC}_{6} \mathrm{H}_{4}\right)$ (8). These ligands reacted with $\mathrm{RuCl}_{3}, 2,2^{\prime}-$ bipyridine (bpy) and lithium chloride in ethanol to produce trans-[ $\left.\mathrm{Ru}{ }^{\mathrm{II}}(\mathrm{bpy}) \mathrm{LCl}_{2}\right]$ complexes. These ligands were characterized by IR, ${ }^{1} \mathrm{H}$ NMR, mass spectra and elemental analysis, UV-Visible spectroscopy. The structures of the two complexes, trans- $\left[\mathrm{Ru}^{\mathrm{II}}(\mathrm{bpy})\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{~N}=\mathrm{NC}\left(\mathrm{COCH}_{3}\right)=\mathrm{N}\left(4-\mathrm{C}_{10} \mathrm{H}_{7} \mathrm{C}_{6} \mathrm{H}_{4}\right) \mathrm{Cl}_{2}\right] \cdot 0 \cdot 25 \mathrm{C}_{7} \mathrm{H}_{8}\right.$ and trans-[Ru ${ }^{\text {II }}$ (bpy) $\left(4-\mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{~N}=\mathrm{NC}\left(\mathrm{CO}_{2} \mathrm{CH}_{3}\right)=\mathrm{N}\left(4-\mathrm{C}_{6} \mathrm{H}_{5}\right) \mathrm{Cl}_{2}\right] .0 .5$ acetone were studied by X-ray crystallography. Results from crystallographic, electrochemical, electronic spectral data and DFT calculations were consistent with azomethine ligands possessing strong $\pi$-acceptor properties.

Byabartta, (2007) reported the $\left[\mathrm{Ru}(\mathrm{bpy})_{2}\left(\mathrm{RaaiR}^{\prime}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ complexes (RaaiR' = 1-alkyl-2-(arylazo)imidazole, $m$-R- $\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{N}=\mathrm{N}-\mathrm{C}_{3} \mathrm{H}_{2}-\mathrm{NN}-1-\mathrm{R}^{\prime}$ where $\mathrm{R}=\mathrm{H}$, $\mathrm{OMe}, \mathrm{NO}_{2}$ and $\mathrm{R}^{\prime}=\mathrm{Me}, \mathrm{Et}, \mathrm{CH}_{2} \mathrm{Ph}$; bpy $=2,2^{\prime}$-bipyridine). The molecular weight of all complexes was confirmed by FAB mass spectrum. IR spectra showed $-\mathrm{N}=\mathrm{N}$ stretching at $1370 \mathrm{~cm}^{-1}$ which was red shift $90 \mathrm{~cm}^{-1}$ from the free ligand value. The absorption spectra were studied within 200-1100 nm. The emission spectra was frozen glass $(77 \mathrm{~K})$ which were sharper and considerably more intense than the room temperature spectra. The ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, and ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR were used to support the structure of complexes. In addition, the ${ }^{1} \mathrm{H}^{13} \mathrm{C}$ HMQC NMR spectrum was used to assign quaternary carbons. One redox couple was observed at positive to SCE which refered to $\mathrm{Ru}(\mathrm{III}) / \mathrm{Ru}(\mathrm{II})$ couple. Besides, three redox couples at negative to SCE were due to reductions of ligand. Electrochemical parameterisation of $\mathrm{Ru}(\mathrm{III}) / \mathrm{Ru}(\mathrm{II})$ redox potential was carried out and calculated ligand potential $\mathrm{E}_{\mathrm{L}}(\mathrm{L})$.

The interactions of the ruthenium(II) complexes with calf thymus

## DNA (CT DNA)

Nair, et al., (1998) reported the synthesis and characterization of $\left[\mathrm{Ru}\left(\mathrm{NH}_{3}\right)_{4} \mathrm{dppz}\right]^{2+}(\mathrm{dppz}=$ dipyridophenazine $)$ and also explored the interactions of the complex with DNA. Results from DNA-binding studies showed that the addition of DNA clearly yielded an absorbance hypochromism of $13.6 \%$, which was possibly associated with intercalated binding of the complexes to the helix.

Zhen, et al., (1999) reported the synthesis of the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} \mathrm{~L}\right]^{2+}$ complexes ( $\mathrm{L}=4,5,9,18$-tetraazaphenanthreno[9,10-b]triphenylene (taptp), 2,3-diphe-nyl-1,4,8,9-tetraazatriphenylene (dptatp)) and characterization by using elemental analyses, ${ }^{1} \mathrm{H}$ NMR, and mass spectra. The interactions of the complexes with calf thymus DNA were investigated by viscosity measurement, absorption titration, emission titration and circular dichroism. All data indicated that both complexes bind enantioselectively to double-stranded calf thymus DNA via the intercalative mode.

Vaidyanathan and Nair, (2002) reported the $\left[\mathrm{Ru}(\text { bzimpy })_{2}\right] \mathrm{Cl}_{2}$ complex (bzimpy $=2,6$-bis(benzimidazole-2-yl)pyridine). It was characterized by ESI-MS, UV -Visible, ${ }^{1} \mathrm{H}$ NMR and fluorescence spectra. The interaction of this complex with calf thumus DNA was studied by absorption titration, thermal denaturation, viscosity measurement and fluorescence spectroscopy.

Deng, et al., (2003) reported the two novel ruthenium complexes, $\left[\mathrm{Ru}(\text { bpy })_{2}(\right.$ actatp $\left.)\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(\text { phen })_{2}(\right.$ actatp $\left.)\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ (actatp $=$ acenaph -thereno-[1,2-b]-1,4,8,9-tetraazariphenylence; phen = 1,10-phenanthroline). These complexes were characterized by UV-Visible, ${ }^{1} \mathrm{H}$ NMR, and mass spectra. The cyclic voltammetry was used to study electrochemical behavior of the two complexes. The interaction of the two complexes with calf thymus DNA was investigated by spectrophotometric methods and viscosity measurements. The experimental results supported that the actatp ligand strongly intercalated into the DNA helix. Besides, both complexes were found the photo cleavage of plasmid pBR322.

Jiang, et al., (2003) reported the synthesis of ruthenium complexes with the two novel tridentate ligand, 2-(2-benzimidazole-1,10-phenanthroline (PHBI), 2-(2-naphthoimidazole-1,10-phenanthroline ( PHNI ). The $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{PHBI})]\left(\mathrm{ClO}_{4}\right)_{2}$. $2 \mathrm{H}_{2} \mathrm{O}$ and $[\mathrm{Ru}($ tpy $)(\mathrm{PHNI})]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ complexes (tpy $=2,2^{\prime}: 6^{\prime}, 2^{\prime \prime}$-terpyridyl) were characterized by elemental analysis, mass spectra, ${ }^{1}$ H NMR, absorption spectroscopy and also studied electrochemical behaviours by cyclic voltammetry. The interaction of these complexes with calf thymus DNA was investigated by spectroscopic methods and viscosity measurements. Results from DNA interaction study indicated that the two complexes interact with DNA in different binding mode.

Deng, et al., (2005) reported the series of $\mathrm{Ru}(\mathrm{II})$ polypyridyl complexes, $\quad\left[\mathrm{Ru}(\mathrm{bpy})_{2}(\mathrm{ptdb})\right]\left(\mathrm{ClO}_{4}\right)_{2}, \quad\left[\mathrm{Ru}(\mathrm{bpy})_{2}(\mathrm{ptda})\right]\left(\mathrm{ClO}_{4}\right)_{2}, \quad\left[\mathrm{Ru}(\mathrm{bpy})_{2}(\mathrm{ptdp})\right]$ $\left(\mathrm{ClO}_{4}\right)_{2}$ (bpy $=2,2^{\prime}$-bipyridine; ptdb = 3-(pyridine-2-yl)5,6-diphenyl-as-triazine; ptda $=3$-(pyridine-2-yl)-as-triazino-[5,6-f]phenanthrene; ptda $=3$-(pyridine-2-yl)-as-triazi-no-[5,6-f]acenaphthylene. They were characterized by elemental analysis, mass spectra, ${ }^{1} \mathrm{H}$ NMR, and cyclic voltammetry. The structure of $\left[\mathrm{Ru}(\mathrm{bpy})_{2}(\mathrm{ptdb})\right]\left(\mathrm{ClO}_{4}\right)_{2}$
was determined. The DNA-binding properties of the complexes were investigated by absorption titration, luminescence spectroscopy, and viscosity measurements. The experimental results suggested that all complexes bind to DNA in an intercalation mode.

Mazumder, et al., (2005) reported a series of the $\left[\mathrm{Ru}(\mathrm{M})_{2} \mathrm{U}\right]^{2+}$ complexes $\left(M=2,2^{\prime}\right.$-bipyridine, 1,10-phenanthroline; $\mathrm{U}=\mathrm{tpl}(\mathrm{Ru} 1)$, 4-Cl-tpl (Ru2), $4-\mathrm{CH}_{3}-\mathrm{tpl}(\mathrm{Ru} 3), 4-\mathrm{CH}_{3}-\mathrm{O}-\mathrm{tpl}(\mathrm{Ru} 4), 4-\mathrm{NO}_{2}-\mathrm{tpl}(\mathrm{Ru} 5)$, pai ( $\mathrm{Ru}(6)$; tpl $=$ thiopicolinanilide and pai = 2-phenylazoimidazole). All of complexes were characterized by IR, UV-Visible, ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, FAB mass spectrophotometer, and elemental analysis. The complexes displayed the tumor inhibitory activity of ruthenium complexes against transplantable murine tumor cell line, EAC. The study of in vitro antibacterial activity revealed the significant activity of Ru1-Ru4 against microorganisms compared of the standard drug chloramphenicol.

Tan, et al., (2005) synthesized and characterized the $\left[\operatorname{Ru}(\mathrm{phen})_{2}\right.$ (NMIP) $]^{2+}$ complex (NMIP $=2^{\prime}-\left(2^{\prime \prime}\right.$-nitro- $3^{\prime \prime}-4^{\prime \prime}$-methylenedioxyphenyl)imidazo[ $\left.4^{\prime}, 55^{\prime}-f\right][1,10]$-phenanthroline. This complex were characterized by mass spectrometry, ${ }^{1} \mathrm{H}$ NMR spectroscopy and cyclic voltammetry. Binding of the complex to calf thymus DNA was investigated by spectroscopic methods, viscosity and electrophoresis measurements. Results from this study indicated that $\left[\mathrm{Ru}(\mathrm{phen})_{2}(\mathrm{NMIP})\right]^{2+}$ binds to DNA via partial intercalative mode. In addition, it was also found to promote cleavage of plasmid pBR322 DNA.

## The cytotoxicity of the ruthenium(II) complexes

Velders, et al., (2000) studied the cytotoxicity of the three isomers of the $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ complexes (azpy $=2$-(phenylazo)pyridine). They found that these complexes showed different in vitro cytotoxicity. The $\alpha-\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ complex showed remarkably high cytotoxicity against a series of tumor-cell lines (MCF-7, EVSA-T, WIDR, IGROV, M19, A498, and H226). It was in contrast to the low
cytotoxicity of $\beta-\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ and $\gamma-\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ and the structurally related complex cis- $\left[\mathrm{Ru}(\mathrm{bpy})_{2} \mathrm{Cl}_{2}\right]$ (bpy $=2,2^{\prime}$-bipyridine).

Hotze, et al., (2003) reported the new water-soluble bis(2phenylazopyridine)ruthenium(II) complexes. The $\alpha-\left[\mathrm{Ru}(\operatorname{azpy})_{2}\left(\mathrm{cbdca}-\mathrm{O}, \mathrm{O}^{\prime}\right)\right], \alpha-$ $\left[\mathrm{Ru}(\text { azpy })_{2}(\right.$ ox $\left.)\right]$, and $\alpha-\left[\mathrm{Ru}(\text { azpy })_{2}(\mathrm{mal})\right]$ (cbdca-O, $\mathrm{O}^{\prime}=1,1$-cyclobutanedicarboxylate, $\mathrm{ox}=$ oxlate, $\mathrm{mal}=$ malonate $)$ were synthesized and characterized. The structures of first two complexes were confirmed by X-ray crystallography. The cytotoxicity of these complexes was determined in A2780 human ovarian carcinoma and A2780cisR, the corresponding cisplatin-resistant cell line. Results from cytotoxicity showed that all the water-soluble carboxylato complexes displayed a cytotoxicity of a factor 10 less than the $\alpha-\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ in the A 2780 and A2780cisR cell lines.

Hotze, et al., (2004) reported the most common isomers, $\alpha-$, $\beta$-, and $\gamma$ [ $\left.\mathrm{RuL}_{2} \mathrm{Cl}_{2}\right]$ (L = o-tolylazopyridine (tazpy) and 4-methyl-2-phenylazopyridine (mazpy) ). All complexes were synthesized and characterized by NMR spectroscopy. The molecular structures of $\gamma-\left[\mathrm{Ru}(\operatorname{tazpy})_{2} \mathrm{Cl}_{2}\right]$ and $\alpha-\left[\mathrm{Ru}(\text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ were investigated by X-ray diffraction analysis. The $\mathrm{IC}_{50}$ values of the geometrically isomeric $\left[\mathrm{Ru}(\text { tazpy })_{2} \mathrm{Cl}_{2}\right]$ and $\left[\mathrm{Ru}(\text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes were compared with those of the parent $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ complexes which were determined in the series of human tumour cell lines (MCF-7, EVSA-T, WIDR, IGROV, M19, A498 and H266). These data unambiguously showed for all complexes the following trend: the $\alpha$ isomer showed a very high cytotoxicity, where the $\beta$ isomer was a factor 10 less cytotoxic. The $\gamma$ isomer of $\left[\mathrm{Ru}(\operatorname{tazpy})_{2} \mathrm{Cl}_{2}\right]$ and $\left[\mathrm{Ru}(\text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ displayed a very high cytotoxicity comparable to that of the $\gamma$ isomer of the parent compound $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ and to that of the $\alpha$-isomer.

Chen, et al., (2006) studied the electronic and geometric structures of a series of isomeric complexes $\alpha, \beta, \gamma, \delta$, and $\varepsilon-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ using the density functional theory (DFT) method. The computed results showed that: (i) The mainbody (azopyridine) planes of two conjugative ligands (azpy) in $\gamma-\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ were
almost located on the same plane; therefore it must be advantageous for the conjugative ligand to intercalate between DNA-base pairs whereas those in $\alpha$ - and $\beta$ $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ were almost inter-vertical; thus it must be disadvantageous to their DNA-binding affinities due to their greater steric hindrance. (ii) The energies ( $\varepsilon_{\mathrm{L}}$ ) of the LUMO were in sequence of $\varepsilon_{\mathrm{L}}(\beta)>\varepsilon_{\mathrm{L}}(\alpha)>\varepsilon_{\mathrm{L}}(\gamma)$. The energy differences $\left(\Delta \varepsilon_{\mathrm{L}-\mathrm{H}}\right)$ between LUMO and HOMO were in sequence of $\Delta \varepsilon_{\mathrm{L}-\mathrm{H}}(\gamma)<\Delta \varepsilon_{\mathrm{L}-\mathrm{H}}(\alpha)<\Delta \varepsilon_{\mathrm{L}-\mathrm{H}}(\beta)$. (iii) The total dipole moments $(\mu)$ of the isomers were in sequence of $\mu(\beta)>\mu(\alpha)>\mu(\gamma)$. (iv) The positive charges $\left(\mathrm{Q}_{\mathrm{L}}\right)$ in the ligand azpy were in sequence of $\mathrm{Q}_{\mathrm{L}}(\gamma)>\mathrm{Q}_{\mathrm{L}}(\alpha)>$ $\mathrm{Q}_{\mathrm{L}}(\beta)$.

Dougan, et al., (2006) studied the ruthenium(II) $\eta^{6}$-arene complexes containing $p$-cymene ( $p$-cym), tetrahydronaphthalene (thn), benzene (bz), or biphenyl (bip), as the arene, phenylazopyridine derivatives $\left(\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{NN}: \mathrm{NC}_{6} \mathrm{H}_{5} \mathrm{R} ; \mathrm{R}=\mathrm{H}\right.$ (azpy), OH (azpy-OH), $\mathrm{NMe}_{2}$ (azpy- $\mathrm{NMe}_{2}$ )) or a phenylazopyrazole derivatives $\left(\mathrm{NHC}_{3} \mathrm{H}_{2}\right.$ $\mathrm{NN}: \mathrm{NC}_{6} \mathrm{H}_{5} \mathrm{NMe}_{2}\left(\right.$ azpy- $\left.\mathrm{NMe}_{2}\right)$ ) as $\mathrm{N}, \mathrm{N}$-chelating ligands and chloride as a ligand. All complexes displayed intense transitions in the visible region assignable to MLCT from the filled 4 d orbitals of $\mathrm{Ru}(\mathrm{II})$ to the empty $\pi^{*}$ ligand orbital. The structure of these complexes was characterized by ${ }^{1} \mathrm{H}$ NMR spectroscopy and X-ray crystallography. None of the azpy complexes were cytotoxic toward A2780 human ovarian or A549 human lung cancer cells, but several of the azpy- $\mathrm{NMe}_{2}$, azpy-OH, and azpyz-NMe $2_{2}$ complexes were active ( $\mathrm{IC}_{50}$ values $18-88 \mu \mathrm{M}$ ).

### 1.3 Objectives

1. To synthesize and characterize a new bidentate ligand, 5-methyl-2-(phenylazo)pyridine (5mazpy).
2. To synthesize and characterize the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes.
3. To synthesize and characterize the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes $\left(\mathrm{L}=\right.$ azpy, 5 mazpy; $\mathrm{L}^{\prime}=\mathrm{bpy}$, phen $)$.
4. To synthesize and characterize the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ complexes $\left(\mathrm{L}=\right.$ azpy, 5 mazpy; $\mathrm{L}^{\prime}=\mathrm{bpy}$, phen $)$.
5. To study the interactions of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right){ }_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ complexes with calf thymus DNA.
6. To test the cytotoxicity of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right],\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ complexes with cell lines.
7. To analyze and to summarize the chemistry of all complexes.

## CHAPTER 2 <br> MATERIALS AND METHODS

### 2.1 Materials

### 2.1.1 Chemical substances

Materials from Fluka AG, Switzerland<br>6-amino-3-picoline $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{~N}_{2}$, AR grade<br>Nitrosobenzene, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NO}$, AR grade<br>2,2'-bipyridine, $\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{~N}_{2}$, AR grade<br>Ruthenium(III)chloride trihydrate, $\mathrm{RuCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$, AR grade<br>Tetrabutylammonium hexafluorophosphate, $\mathrm{C}_{16} \mathrm{H}_{36} \mathrm{~F}_{6} \mathrm{NP}$, AR grade<br>Ethidium Bromide, $\mathrm{C}_{21} \mathrm{H}_{20} \mathrm{BrN}_{3}$, AR grade

## Materials from Merck

Silica gel 60 ( $0.040-0.063 \mathrm{~nm}$ ) GF 254
Sodium hydroxide, NaOH, AR grade
Tetra- $n$-butylammoniumchloride, $\mathrm{C}_{16} \mathrm{H}_{36} \mathrm{NCl}$, AR grade
1,10-phenanthroline, $\mathrm{C}_{12} \mathrm{H}_{8} \mathrm{~N}_{2}$, AR grade

Materials from Aldrich Chemical Company, Inc.

Ammoniumhexafluorophosphate, $\mathrm{NH}_{4} \mathrm{PF}_{6}, \mathrm{AR}$ grade
Ferrocenemethanol, $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{FeO}$, AR grade

Materials from BDH Laboratory Supplies, Poole

Silver nitrate, $\mathrm{AgNO}_{3}$, AR grade
Lithium chloride, LiCl, AR grade

Materials from Lab-Scan analytical sciences

Sodium chloride, $\mathrm{NaCl}, \mathrm{AR}$ grade
Hydrochloric acid, $\mathrm{HCl}, \mathrm{AR}$ grade

## Materials from Sigma-Aldrich Laborchemkalien

Deoxyribonucleic acid (CT DNA), AR grade
Trisbase, $\mathrm{C}_{4} \mathrm{H}_{11} \mathrm{NO}_{3}$, AR grade

### 2.1.2 Solvents

Solvents from Lab-Scan analytical sciences

Acetonitrile, $\mathrm{CH}_{3} \mathrm{CN}$, AR grade
Acetone, $\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{O}$, AR grade
Benzene, $\mathrm{C}_{6} \mathrm{H}_{6}$, AR grade
Chloroform, $\mathrm{CHCl}_{3}$, AR grade
Dimethylsulfoxide, $\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{OS}$, AR grade
Ethanol, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$, AR grade
Ethyl acetate, $\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{O}_{2}$, AR grade
Methanol, $\mathrm{CH}_{3} \mathrm{OH}$, AR grade
$\mathrm{N}, \mathrm{N}$-dimethylformamide, $\mathrm{C}_{3} \mathrm{H}_{7} \mathrm{NO}$, AR grade

## Solvents from Merck

Dichloromethane, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, AR grade
Hexane, $\mathrm{C}_{6} \mathrm{H}_{14}$, AR grade

The solvents for column chromatography, dichloromethane and hexane, were reagent grade and purified by distillation prior to use.

### 2.2 Instruments

### 2.2.1 Melting Point Apparatus

Melting Points of the complexes were measured on an Electrothermal melting point apparatus (Electrothermal 9100).

### 2.2.2 Elemental Analysis

Elemental analysis was measured by CE Instruments Flash 1112 Series EA CHNS-O Analyzer.

### 2.2.3 The Fast-atom bombardment (FAB) Mass Spectrometry

The Fast-atom bombardment (FAB) mass spectra were measured on a VG Autospec instrument and ESI mass spectrometry (University of Bristol, UK.).

### 2.2.4 Infrared Spectroscopy

Infrared spectra were measured on a Perkin Elmer Spectrum GX FT-IR spectrophotometer from 370 to $4,000 \mathrm{~cm}^{-1}$. All samples were prepared in the KBr pellets.

### 2.2.5 UV-Visible Absorption Spectroscopy

Ultraviolet and visible absorption spectra were measured on UV-Vis Spectrophotometer SPECORD S100.

### 2.2.6 Fluorescence Spectroscopy

Emission spectra were recorded with Hellet packard L55S Spectrofluorometer.

### 2.2.7 1D and 2D Nuclear Magnetic Resonance Spectroscopy

1D and 2D NMR spectra were measured in $\mathrm{CDCl}_{3}$, acetone- $d_{6}$, and $\mathrm{CD}_{3} \mathrm{OD}$ with a Varian UNITY SNOVA 500 MHz FT-NMR spectrometer at ambient temperature with $\mathrm{Me}_{4} \mathrm{Si}$ as an internal standard.

### 2.2.8 Cyclic Voltammetry

Electrochemical experiments were measured using MacLab (4e AD Instruments) with potentiostat (Serial No p068). The program was EChem 1.5.1. A glassy carbon working electrode, platinum wire auxillary electrode, and platinum reference electrode were used in three-electrode configuration. The supporting electrolyte was tetra-n-butylammonium hexafluorophosphate ( $\left[\mathrm{NBu}_{4}\right] \mathrm{PF}_{6}$ ) in $\mathrm{CH}_{3} \mathrm{CN}$ and dichloromethane. Ferrocene was added at the end of each experiment as an internal standard. All potentials were quoted vs the ferrocene/ferrocenium couple $\left(\mathrm{Fc} / \mathrm{Fc}^{+}\right)$. The solvent was used as received. The argon gas was bubbled through the solution prior to each measurement.

### 2.2.9 X-ray Diffractometer

The X-ray structures of 5-methyl-2-(phenylazo)pyridine, ctc-[Ru (5mazpy $\left.)_{2} \mathrm{Cl}_{2}\right]$, ccc-[Ru(5mazpy) $\left.{ }_{2} \mathrm{Cl}_{2}\right]$, tcc-[Ru(5mazpy) $\left.{ }_{2} \mathrm{Cl}_{2}\right]$, and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ bpy $]$ $\left(\mathrm{PF}_{6}\right)_{2}$ complexes were determined by Smart APEX CCD diffractometer.

### 2.3 Syntheses of ligands

### 2.3.1 Synthesis of the 2-(phenylazo)pyridine (azpy) ligand

The 2-(phenylazo)pyridine ligand was prepared by modified literature method (Krause and Krause, 1980).

The 2-(phenylazo)pyridine ligand was prepared by literature method (Krause and Krause, 1980). 2-Aminopyridine ( $0.45 \mathrm{~g}, 4.78 \mathrm{mmol}$ ) reacted with nitrosobenzene $(0.60 \mathrm{~g}, 5.60 \mathrm{mmol})$ in the mixture of 20 M NaOH 13.5 mL and 10 mL of benzene with stirring. The reaction mixture was heated on the water bath for 45 min . The reaction mixture was extracted five times with 5 mL portions of benzene, then the solvent was removed by rotary evaporation. The residue was purified by column chromatography on a silica gel. A mixture of hexane and ethyl acetate as the eluting solvent. The orange band was collected. The yield was $35 \%$.

### 2.3.2 Synthesis of the 5-methyl-2-(phenylazo)pyridine (5mazpy)

## ligand

The 5-methly-2-(phenylazo)pyridine ligand was prepared by using literature procedure (Changsaluk and Hansongnern, 2005). 6-Amino-3-picoline (0.34 $\mathrm{g}, 3.13 \mathrm{mmol}$ ) was added to the benzene solution and the mixture was stirred on water bath. Then NaOH was added to the reaction. Nitrosobenzene $(0.34 \mathrm{~g}, 3.16$ mmol ) in small portions was added to the reaction then the reaction mixture was refluxed for 8 h . The green solution became brown. The product was extracted with benzene and evaporated to dryness. The residue was purified by column chromatography on silica gel. The orange band was eluted with the mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ : Hexane ( $1: 9 \mathrm{v} / \mathrm{v}$ ). The yield of 5 mazpy ligand was $62 \%$.

### 2.4 Syntheses of the ruthenium complexes

### 2.4.1 Synthesis of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex

The $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex was prepared by modified literature method (Krause and Krause, 1980).

The ruthenium complex, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$, was prepared by the reaction between $\mathrm{RuCl}_{3} .3 \mathrm{H}_{2} \mathrm{O}(0.05 \mathrm{~g}, 0.24 \mathrm{mmol})$ and 5 mazpy $(0.10 \mathrm{~g}, 0.53 \mathrm{mmol})$ in ethanol. After the mixture was refluxed for 6 h , the solution was evaporated to dryness. The dried product was dissolved in a small volume of $\mathrm{CHCl}_{3}$ and purification of the compound was carried out by column chromatography on silica gel by using a mixture of chloroform and hexane (9:1) as the eluting solvent. Three isomers were collected as blue $(\%$ yield $=28)$, purple $(\%$ yield $=20)$, and green $(\%$ yield $=35)$ isomers.

### 2.4.2 Synthesis of the cis-[Ru(bpy) $\mathbf{2}_{2} \mathrm{Cl}_{2}$ ] complex

The cis- $\left[\mathrm{Ru}(\mathrm{bpy})_{2} \mathrm{Cl}_{2}\right]$ complex was prepared by using literature method (Sullivan et al., 1978).

The $\mathrm{RuCl}_{3} .3 \mathrm{H}_{2} \mathrm{O}(0.10 \mathrm{~g}, 5 \mathrm{mmol}), 2,2^{\prime}$-bipyridine ( $1.56 \mathrm{~g}, 10 \mathrm{mmol}$ ), and $\mathrm{LiCl}(2.12 \mathrm{~g}, 50 \mathrm{mmol})$ were heated by refluxing in dimethylformamide ( 25 mL ) for 4 h . The reaction was stirred magnetically throughout this period. The reaction mixture was cooled to room temperature and a mixture of $200 \mathrm{~mL} \mathrm{1:1} \mathrm{acetone-water}$ was added. Dark green solid was obtained by filtration. The product was washed with water and ether, and then it was dried by suction. The yield was $80 \%$.

### 2.4.3 Synthesis of the cis-[ $\left.\mathrm{Ru}(\mathrm{phen})_{2} \mathrm{Cl}_{2}\right]$ complex

The cis-[ $\left.\mathrm{Ru}(\text { phen })_{2} \mathrm{Cl}_{2}\right]$ complex was prepared by using literature method (Sullivan et al., 1978).

The $\mathrm{RuCl}_{3} .3 \mathrm{H}_{2} \mathrm{O}(0.50 \mathrm{~g}, 2.4 \mathrm{mmol})$, 1,10-phenanthroline ( $0.99 \mathrm{~g}, 5$ $\mathrm{mmol})$, and $\mathrm{LiCl}(0.03 \mathrm{~g}, 0.6 \mathrm{mmol})$ were heated at reflux in dimethylformamide (30
mL ) for 4 h . After the reaction mixture was cooled to room temperature, 70 mL of acetone was added and the resultant solution cooled at $0^{\circ} \mathrm{C}$ overnight. The solid was filtered and washed with 75 mL of water followed by 75 mL of diethyl ether. The yield was $33.8 \%$.

### 2.4.4 Synthesis of the $\left[\operatorname{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

$c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right](0.07 \mathrm{~g}, 0.13 \mathrm{mmol})$, and $\mathrm{AgNO}_{3}(0.05 \mathrm{~g}, 0.29$ mmol ) were suspended in 50 mL of methanol. After the solution was refluxed 2 h , AgCl was removed by filtration. The 5-methyl-2-(phenylazo)pyridine ( $0.03 \mathrm{~g}, 0.16$ mmol ) ligand was added into the solution mixture. Then the solution was refluxed for $7 \mathrm{~h}, \mathrm{AgCl}$ was removed by filtration. The aqueous solution of $\mathrm{NH}_{4} \mathrm{PF}_{6}(0.042 \mathrm{~g}, 0.27$ mmol ) was added to the filtrate. The solvent was removed by rotary evaporation, the resulting precipitate from methanol was separated by filtration, washed with hexane and ether, respectively. Thenit was dried at $80^{\circ} \mathrm{C}$. The yield was $79 \%$.

### 2.4.5 Synthesis of the $\left[\operatorname{Ru}(5 m a z p y)_{2} \operatorname{azpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

This complex was synthesized by using the same method as the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex, but the 5-methyl-2-(phenylazo)pyridine ligand was replaced by 2-(phenylazo)pyridine. The yield was $75 \%$.

### 2.4.6 Synthesis of the $\left[\operatorname{Ru}(5 m a z p y)_{2} b p y\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

This complex was synthesized by using the same method as the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex, but the 5 -methyl-2-(phenylazo)pyridine ligand was replaced by $2,2^{\prime}$-bipyridine ligand. The yield was $76 \%$.

### 2.4.7 Synthesis of the $\left[\operatorname{Ru}(5 m a z p y)_{2} p h e n\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

This complex was synthesized by using the same method as the $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex, but the 5-methyl-2-(phenylazo)pyridine ligand was
replaced by 1,10-phenanthroline ligand. The yield was $78 \%$.

### 2.4.8 Synthesis of the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

The cis-[Ru(bpy) Cl $_{2}$ ] complex ( $0.05 \mathrm{~g}, 0.13 \mathrm{mmol}$ ), and $\mathrm{AgNO}_{3}(0.05$ $\mathrm{g}, 0.29 \mathrm{mmol}$ ) were suspended in 50 mL of methanol. After the solution was refluxed $2 \mathrm{~h}, \mathrm{AgCl}$ was removed by filtration. The 5-methyl-2-(phenylazo)pyridine ( 0.03 g , 0.16 mmol ) ligand was added into the solution mixture. Then the solution was refluxed for $10 \mathrm{~h}, \mathrm{AgCl}$ was removed by filtration. The aqueous solution of $\mathrm{NH}_{4} \mathrm{PF}_{6}$ ( $0.042 \mathrm{~g}, 0.27 \mathrm{mmol}$ ) was added to the filtrate. The solvent was removed by rotary evaporation, the resulting precipitate from methanol was separated by filtration, washed with hexane and ether respectively, and dried at $80^{\circ} \mathrm{C}$. The yield was $85 \%$.

### 2.4.9 Synthesis of the $\left[\mathrm{Ru}(\mathrm{phen})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

This complex was synthesized by using the same method as the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex, but the cis- $\left[\mathrm{Ru}(\mathrm{bpy})_{2} \mathrm{Cl}_{2}\right]$ was replaced by cis$\left[\mathrm{Ru}(\text { phen })_{2} \mathrm{Cl}_{2}\right]$. The yield was $86 \%$.

### 2.4.10 Synthesis of the $\left[\mathrm{Ru}(5 \mathrm{mazp})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 5 \mathrm{H}_{2} \mathrm{O}$ complex

$c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right](0.07 \mathrm{~g}, 0.13 \mathrm{mmol})$, and $\mathrm{AgNO}_{3}(0.05 \mathrm{~g}, 0.29$ mmol ) were suspended in 50 mL of methanol. After the solution was refluxed 2 h , AgCl was removed by filtration. The 5-methyl-2-(phenylazo)pyridine ( $0.03 \mathrm{~g}, 0.16$ mmol ) ligand was added into the solution mixture. Then the solution was refluxed for $7 \mathrm{~h}, \mathrm{AgCl}$ was removed by filtration. The solid was obtained by slow diffusion of ether in to a mixture of acetone and ethanol. The product was washed with hexane and ether respectively, and dried at $75^{\circ} \mathrm{C}$. The yield was $72 \%$.

### 2.4.11 Synthesis of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{azpy}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot \mathbf{4 \mathbf { H } _ { 2 } \mathrm { O }}$ complex

This complex was synthesized by using the same method as the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2}$ complex, but the 5-methyl-2-(phenylazo)pyridine ligand was replaced by 2-(phenylazo)pyridine ligand. The yield was 70\%.

### 2.4.12 Synthesis of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} \cdot \mathbf{6} \mathbf{H}_{2} \mathrm{O}$ complex

The saturated tetra-n-butylammoniumchloride in acetone was added into the solution of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ in a small volumn of acetone. After the solution was centrifuged, the solid was obtained. The product was washed with acetone and diethyl ether, respectively and dried at $50^{\circ} \mathrm{C}$. The yield was $72 \%$.

### 2.4.13 Synthesis of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{phen}\right] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ complex

This complex was synthesized by using the same method as the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2}$ complex, but the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex was replaced by $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$. The yield was $72 \%$.

### 2.4.14 Synthesis of the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot \mathbf{6 H} \mathbf{H}_{\mathbf{2}} \mathrm{O}$ complex

This complex was synthesized by using the same method as the [ $\mathrm{Ru}(5 \mathrm{mazpy})_{2}$ bpy $] \mathrm{Cl}_{2}$ complex, but the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex was replaced by $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$. The yield was $73 \%$.

### 2.4.15 Synthesis of the $\left[\mathrm{Ru}(\mathrm{phen})_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}$ complex

This complex was synthesized by using the same method as the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2}$ complex, but the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex was replaced by $\left[\mathrm{Ru}(\mathrm{phen})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$. The yield was $74 \%$.

### 2.5 DNA-binding and cleavage experiments

The DNA-binding and cleavage experiments were performed at room temperature. Concentrated stock solutions of DNA were prepared in buffer and sonicated for 25 cycles, where each cycle consisted of 30 s with 1 min intervals (Maheswari and Palaniandavar, 2004). The DNA concentration was determined by absorption spectroscopy using the known molar extinction coefficient value of 6,600 $\mathrm{M}^{-1} \mathrm{~cm}^{-1}$ at 260 nm (Reichmann et al., 1954). Solutions of calf thymus DNA in the buffer gave a ratio of UV absorbance at 260 and 280 nm in the range 1.8 to $1.9: 1$ indicating that DNA is free form protein (Marmur, 1961).

### 2.5.1 Absorption titration

This experiments were carried out in 10 mM Tris buffer pH 7.4. The absorption titration was carried out by keeping the concentration of the complex ( 40 $\mu \mathrm{M}$ ) and varying the concentration of CT DNA ( 3 to $300 \mu \mathrm{M}$ ). The metal-to-ligand charge transfer (MLCT) bands were monitored to follow the interaction of the complexes with CT DNA. Ruthenium-DNA solutions were allowed to incubate for 10 $\min$ before the absorption spectra were recorded.

### 2.5.2 Competitive binding

Fluorescence quenching experiments were conducted by adding small aliquots of $20 \mu \mathrm{M} \mathrm{Ru}(\mathrm{II})$ complexes solution to the samples containing $2 \mu \mathrm{M}$ ethidium bromide (EB) and $40 \mu \mathrm{M}$ CT DNA in buffer. This experiment was carried out using 5 mM Tris base and 50 mM NaCl pH 7.1 . Samples were excited at 340 nm and fluorescence spectra were recorded between 500-670 nm.

### 2.5.3 Viscosity measurements

This experiment was carried out using 5 mM Tris base and 50 mM NaCl pH 7.1 and maintained at a constant temperature at $29^{\circ} \mathrm{C}$. Data were presented as $\left(\eta / \eta_{0}\right)^{1 / 3}$ versus binding ration, where $\eta$ is the viscosity of calf thymus DNA alone.

Viscosity values were calculated from the observed flow time of DNA containing solution ( t ) corrected for that of buffer alone $\left(\mathrm{t}_{0}\right), \eta=\left(\mathrm{t}-\mathrm{t}_{0}\right) / \mathrm{t}_{0}$.

### 2.5.4 Cyclic voltammetry

The supporting electrolyte was 50 mM NaCl and 5 mM Tris base buffer at pH 7.1. Solutions were deoxygenated by purging with argon gas for 15 min prior to the measurements; during the measurements, a stream of argon was passed over the solution. The experiments were carried out in 0.5 mM ruthenium(II) complexes in the absence and presence of 2.5 mM CT DNA.

### 2.5.5 DNA cleavage study

In this experiment, supercoiled pBIND DNA $(0.5 \mu \mathrm{~g} / 8 \mu \mathrm{~L})$ was treated with ruthenium(II) complexes ( $20,40,60,80$ and $100 \mu \mathrm{M}$ ). The samples were analysed by electrophoresis for 1 h at 75 V on a $1 \%$ agarose gel in TAE buffer. The gel was stained with ethidium bromide and photographed under UV light.

### 2.6 Cytotoxicity assay

The cell lines used were the phoenix amphotropic packing cell lines ( $\phi$ NX-A cells). Cells were grown as adherent monolayers in medium (DMEM, RPMI1640) plus $10 \%$ (v/v) supplemented hyclone cosmic calf serum, $100 \mu \mathrm{~g} / \mathrm{mL}$ penicillin and $100 \mu \mathrm{~g} / \mathrm{mL}$ streptomycin in a humid atmosphere of $5 \% \mathrm{CO}_{2}$ at $37^{\circ} \mathrm{C}$ and unless otherwise stated. The cell lines used here were human breast cancer (MCF-7), human colon cancer (WiDr), human melanoma (sk-mel-28), human ovarian cancer (Igrov), human prostate cancer (PC3), human lung cancer (A549), and leukemia (CEM).

Cells were counted and seeded into 96 well at 1000 cells/well in 100 $\mu \mathrm{L}$ complete medium. Cells were allowed to attach for approximately 12 h . Each complex was added in a dilution series of 2 fold concentration steps to quadruplicate
wells in a final volume. $100 \mu \mathrm{~L}$ medium cells were allowed to 4 days when cells in control wells still subconfluent. Cells were lysed in a hypotonic buffer with detergent, ( 200 mM Tris $\mathrm{pH} 8.0,50 \mathrm{mM}$ EDTA, $2 \%$ triton X-100), also containing the nucleic acid stain Sybr I green (1:1000 molecular Probes). Fluorescence was read on a victor ${ }^{2}$ 1420 multilabel counter (wallac) with 485 nm excitation and 530 nm emission filters.

Because the ruthenium(II) complexes in this work are poorly watersoluble, a DMSO stock solution was used for all compounds to perform a proper comparison between the compounds. The positive control is cisplatin $(0.25,0.5,1.0$, $2.0,4.0,8.0$, and $16.0 \mu \mathrm{M})$.

## CHAPTER 3 <br> RESULTS AND DISCUSSION

### 3.1 Syntheses of the 5 mazpy ligand and the $\left[\mathrm{Ru}(5 \mathrm{mazpy}){ }_{2} \mathrm{Cl}_{2}\right]$ complexes

The 5-methyl-2-(phenylazo)pyridine (5mazpy) is used as ligand. The 5mazpy was synthesized by using literature procedure (Changsaluk and Hansongnern, 2005). This ligand was generally obtained by the condensation of nitrosobenzene with 6-amino-3-picoline in the presence of sodium hydroxide in dry benzene under refluxing condition for 8 h . Purification was carried out by column chromatography on silica gel. The reaction are shown in equation (1).

The yield of the 5mazpy ligand was $62 \%$. The 5mazpy is a new bidentate ligand and acts as an unsymmetrical bidentate chelating ligand.

Ethanolic solutions of 5mazpy with $\mathrm{RuCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ under reflux afford three isomers of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex (equation (2)). There are $c t c, c c c$, and tcc- $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$. Because the 5 mazpy has unsymmetric bidentate $\mathrm{N}, \mathrm{N}^{\prime}$-donor centres, the pseudo-octahedral dichloro species, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$, can occur in five geometrically isomeric forms: trans-cis-cis (tcc); trans-trans-trans (ttt); cis-trans-cis (ctc); cis-cis-trans (cct); cis-cis-cis (ccc) (Figure 3.1). Two (tcc and ttt) of these have the $\mathrm{RuCl}_{2}$ group in the trans geometry and the other three ( $c t c, c c t$, and $c c c$ ) have the $\mathrm{RuCl}_{2}$ group in the cis geometry. Either the ctc or cct configuration has been indicated
in the case of one blue isomer (herein refered to as the $C_{2}$ isomer, owing to the nominal two fold symmetry of the complex), while the other (the $C_{1}$ isomer) appeares to be of the Ccc variety (Goswami et al., 1981).

$$
\begin{equation*}
\mathrm{RuCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}+2(5 \text { mazpy }) \longrightarrow\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right] \tag{2}
\end{equation*}
$$

Figure 3.1 The five possible $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ isomers

The physical properties of the 5mazpy ligand and its complexes are summarized in Table 3.1.

Table 3.1 The physical properties of the 5mazpy ligand and the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes

| Compounds | Physical properties |  |  |
| :---: | :---: | :---: | :---: |
|  | Appearance | Color | Melting point $\left({ }^{\circ} \mathrm{C}\right)$ |
| 5 mazpy | Solid | Red orange | $77-78$ |
| ctc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ | Solid | Blue | $320-322$ |
| $c c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}[ \right.$ | Solid | Purple | $327-328$ |
| tcc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ | Solid | Green | $326-327$ |

### 3.2 Characterization of the 5 mazpy ligand and the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes

The chemistry of the 5mazpy ligand and the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes were investigated by using following techniques:

### 3.2.1 Elemental analysis

3.2.2 FAB mass spectrometry
3.2.3 Infrared spectroscopy
3.2.4 UV-Visible absorption spectroscopy
3.2.5 1D and 2D Nuclear Magnetic Resonance spectroscopy
3.2.6 Cyclic voltammetry
3.2.7 X-ray Crystallography

### 3.2.1 Elemental analysis

Elemental analysis is a technique to investigate the composition of elements in the compounds. Results from this technique show that the analytical data of the compounds correspond to the calculated values. The elemental analysis data of the 5 mazpy ligand and the $c t c, c c c$, and tcc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes are listed in Table 3.2.

Table 3.2 Elemental analysis data of the 5mazpy ligand and the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes

| Compounds | $\% \mathrm{C}$ |  | $\% \mathrm{~N}$ |  | $\% \mathrm{H}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Calc. | Found | Calc. | Found | Calc. | Found |
| 5 mazpy | 73.08 | 72.66 | 21.30 | 22.53 | 5.62 | 5.54 |
| ctc-[Ru(5mazpy $\left.)_{2} \mathrm{Cl}_{2}\right]$ | 50.89 | 50.82 | 14.84 | 15.27 | 3.91 | 3.96 |
| ccc-[ $\left.\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ | 50.89 | 50.71 | 14.84 | 15.40 | 3.91 | 3.99 |
| tcc-[Ru(5mazpy $\left.)_{2} \mathrm{Cl}_{2}\right]$ | 50.89 | 50.79 | 14.84 | 14.99 | 3.91 | 3.89 |

### 3.2.2 Fast Atom Bombardment (FAB) mass spectrometry

FAB mass spectrometry is a technique to confirm molecular mass of the compounds. The FAB mass spectra of 5 mazpy, ctc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$, ccc- $[\mathrm{Ru}$ (5mazpy $\left.)_{2} \mathrm{Cl}_{2}\right]$, and $t c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ are displayed in Figure 3.2, 3.3, 3.4 and 3.5 , respectively. The results from FAB mass spectrometric data of the 5mazpy ligand and the $c t c, c c c$, and $t c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes are summarized in Table 3.3.

Table 3.3 FAB mass spectrometric data of the 5mazpy ligand and the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes

| $\begin{gathered} 567 \\ 496 \\ 77 \end{gathered}$ | $\begin{gathered} \left.\left[\mathrm{Ru}(\mathrm{~L})_{2} \mathrm{Cl}_{2}\right]+\mathrm{H}\right]^{+} \\ \left.\left[\mathrm{Ru}(\mathrm{~L})_{2} \mathrm{Cl} 2\right]-2 \mathrm{Cl}+\mathrm{H}\right]^{+} \\ {[\mathrm{phenyl}]} \end{gathered}$ | $\begin{gathered} {[\mathrm{M}+\mathrm{H}]^{+}} \\ {[\mathrm{M}-2 \mathrm{Cl}+\mathrm{H}]^{+}} \\ {[\mathrm{phenyl}]} \end{gathered}$ | $\begin{gathered} 40 \\ 20 \\ 100 \end{gathered}$ |

$\mathrm{L}=$ Molecular weight of the 5mazpy ligand $=197.21 \mathrm{~g} / \mathrm{mol}$
$\mathrm{M}=$ Molecular weight of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex $=566.45 \mathrm{~g} / \mathrm{mol}$

The FAB mass spectrum of the 5mazpy ligand is shown in Figure 3.2 From the data, the most intense peak at $\mathrm{m} / \mathrm{z} 76$, which give $100 \%$ relative abundance
is assigned to the one protonation phenyl ring. The peak at $\mathrm{m} / \mathrm{z} 197$ consistents with the molecular weight of the 5mazpy ligand.

The molecular weight of the $c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex is 566 $\mathrm{g} / \mathrm{mol}$ and the mass spectrum exhibits peak at $\mathrm{m} / \mathrm{z} 566$. It means that the peak at $\mathrm{m} / \mathrm{z}$ 566 is used to confirm the molecular weight of this complex.

In the mass spectrum of the $c c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex, The peak at $\mathrm{m} / \mathrm{z} 495(54 \%)$ is observed which is assigned to this complex lost two chloride atoms from molecule.

The tcc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex gives the intense peak at $\mathrm{m} / \mathrm{z} 567$ (40\%) which corresponds to protonated tcc-[Ru(5mazpy $\left.)_{2} \mathrm{Cl}_{2}\right]$.

### 3.2.3 Infrared spectroscopy

Infrared spectroscopy is a technique to study functional groups in the compounds. Infrared spectra were recorded in a KBr pellet in the range $4000-370 \mathrm{~cm}^{-1}$ region. The infrared spectroscopic data of the 5mazpy ligand and the ctc, ccc, and tcc- $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes are listed in Table 3.4.

Table 3.4 Infrared spectroscopic data of the 5 mazpy $(\mathrm{L})$ ligand and the $\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ complexes

| Vibration modes | Frequencies ( $\mathrm{cm}^{-1}$ ) |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 5mazpy <br> (L) | $c t c-\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ | $c c c-\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ | $t c c-\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ |
| $\mathrm{C}=\mathrm{C}, \mathrm{C}=\mathrm{N}$ <br> stretching | 1586(m) | 1560(m) | 1560(m) | 1599(m), |
|  | 1485(m) | 1483(m) | 1482(m) | 1473(s), |
|  | 1443(m) | 1452(s) | 1453(s) | 1454(m) |
| $\mathrm{N}=\mathrm{N}$ stretching | 1389(s) | 1334(s) | 1299(s) | 1307(s) |
| C-H bending of monosubstituted benzene | $\begin{aligned} & 835 \text { (s) } \\ & 773 \text { (s) } \\ & 686 \text { (s) } \end{aligned}$ | $\begin{aligned} & 847(\mathrm{~s}), \\ & 776(\mathrm{~s}), \\ & 695(\mathrm{~s}) \end{aligned}$ | $\begin{aligned} & 830(\mathrm{~s}), \\ & 763(\mathrm{~s}), \\ & 692(\mathrm{~s}) \end{aligned}$ | $\begin{aligned} & 832(\mathrm{~s}), \\ & 761(\mathrm{~s}), \\ & 693(\mathrm{~s}) \end{aligned}$ |

$\mathrm{s}=$ strong, $\mathrm{m}=$ medium, $\mathrm{w}=$ weak

The free 5 mazpy ligand shows the medium peaks at $1605-1440 \mathrm{~cm}^{-1}$, corresponds to $\mathrm{C}=\mathrm{C}$ and $\mathrm{C}=\mathrm{N}$ stretching in the pyridine ring and phenyl ring in the free ligand. The sharp band at $1389 \mathrm{~cm}^{-1}$ is assigned to the $\mathrm{N}=\mathrm{N}$ stretching, which occurs at a lower frequency than that in azpy ligand $\left(1421 \mathrm{~cm}^{-1}\right)$ (Krause and Krause, 1980). The stretching frequencies of the $\mathrm{C}=\mathrm{C}$ and $\mathrm{C}=\mathrm{N}$ modes in the three isomers display three medium peaks in the range $1599-1452 \mathrm{~cm}^{-1}$. The most important peak is
the $\mathrm{N}=\mathrm{N}$ stretching mode which is used to be considered the $\pi$-acid property in the azo complexes. The $c t c, c c c$, and $t c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes exhibit $\mathrm{U}_{(\mathrm{N}=\mathrm{N})}$ at 1334, 1299, and $1307 \mathrm{~cm}^{-1}$, respectively, red shifted by $55-90 \mathrm{~cm}^{-1}$ from the free 5mazpy ligand. This suggests that less double-bond character in the $\mathrm{N}=\mathrm{N}$ group in the complexes. This is strong evidence for substantial $\pi$-bonding to ruthenium through an azo nitrogen (Krause and Krause, 1980). The infrared spectra of the 5mazpy ligand and the $c t c, c c c$, and $t c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes are shown in Figure 3.6, 3.7, 3.8 , and 3.9 , respectively.

### 3.2.4 UV-Visible absorption spectroscopy

UV-Visible absorption spectroscopy is a technique to study the electronic transitions of compounds. UV-Visible spectral studies of the compounds revealed absorptions within the range $200-800 \mathrm{~nm}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{CHCl}_{3}, \mathrm{CH}_{3} \mathrm{CN}$, DMSO, and DMF. The UV-Visible absorption spectroscopic data of the 5mazpy ligand and the $c t c, c c c$, and $t c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes are summarized in Table 3.5.

Table 3.5 UV-Visible absorption spectroscopic data of the 5mazpy (L) ligand and the $\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ complexes

| Compounds | $\lambda_{\max } \mathrm{nm},\left(\varepsilon^{\mathrm{a}} \times 10^{-4} \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{CHCl}_{3}$ | $\mathrm{CH}_{3} \mathrm{CN}$ | DMF | DMSO | $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ |
| 5 mazpy | $321(2.1)$ | $322(2.0)$ | $326(1.8)$ | $326(2.0)$ | $324(4.25)$ |
|  | $449(0.04)$ | $448(0.05)$ | $450(0.05)$ | $450(0.06)$ | $448(0.06)$ |
| $c t c-\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ | $322(2.9)$ | $318(2.5)$ | $322(2.4)$ | $322(2.9)$ | $322(2.1)$ |
|  | $582(1.3)$ | $588(1.1)$ | $588(0.9)$ | $594(1.2)$ | $582(0.9)$ |
| $c c c-\left[\mathrm{Ru}\left(\mathrm{L}_{2} \mathrm{Cl}_{2}\right]\right.$ | $342(3.1)$ | $332(2.0)$ | $322(2.2)$ | $336(2.4)$ | $338(2.1)$ |
|  | $576(1.7)$ | $578(10.1)$ | $578(1.1)$ | $576(1.3)$ | $576(1.2)$ |
|  | $302(1.9)$ | $300(2.9)$ | $304(1.5)$ | $302(1.8)$ | $302(1.8)$ |
| $t c c-\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ | $406(1.2)$ | $392(1.7)$ | $396(8.7)$ | $638(1.3)$ | $400(1.1)$ |
|  | $630(1.5)$ | $636(1.9)$ | $640(0.9)$ |  | $638(1.2)$ |

${ }^{\text {a }}$ Molar extinction coefficient

In $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, the 5mazpy ligand exhibits transition at $448 \mathrm{~nm}\left(\varepsilon \sim 600 \mathrm{M}^{-}\right.$ $\left.{ }^{1} \mathrm{~cm}^{-1}\right)$ and $324 \mathrm{~nm}\left(\varepsilon \sim 42,500 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$, corresponds to intraligand transitions, $\mathrm{n} \rightarrow \pi^{*}$ and $\pi \rightarrow \pi^{*}$, respectively, centred primarily on the azo group. Therefore, the transitions in the complexes at around 400 nm are probably of ligand origin and are not considered further. The trans (tcc) complex shows an intense band ( $\varepsilon \sim 12,000 \mathrm{M}^{-}$
${ }^{1} \mathrm{~cm}^{-1}$ ) in the region 636-640 nm , are assigned to the $\mathrm{t}_{2}(\mathrm{Ru}) \rightarrow \pi^{*}(\mathrm{~L})$ MLCT transition, where the $\pi^{*}$ orbital has a large azo character (Santra et al., 1999). The cis complexes (ctc and $\left.c c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]\right)$ exhibit hightly intense $\left(\varepsilon \sim 9,000-17,000 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ MLCT transitions at higher energies compare to the trans complex. The cis complexes display two different intense band characters. The most intense bands are in the range 318-342 nm and the less intense bands are in the range $576-594 \mathrm{~nm}$ while the spectrum of trans complex shows two similar band characters. The ccc$\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ isomer exhibits a transition at a higher energy ( $\sim 10 \mathrm{~nm}$ ) than that of the $c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ isomer. The UV-visible absorption spectra of the 5 mazpy ligand and the $c t c, c c c$, and $t c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ are shown in Figure 3.10, 3.11, 3.12, and 3.13, respectively.

### 3.2.5 1D and 2D Nuclear Magnetic Resonance spectroscopy

The Nuclear Magnetic Resonance spectroscopy is a technique to support the structure of compounds. The NMR spectra of compound were carried out in $\mathrm{CDCl}_{3}$ and the tetramethylsilane $\left(\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{4}\right)$ was used as an internal reference. The structures of compound were explained by using 1D and 2D NMR spectroscopic techniques ( ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, DEPT 135 NMR, ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR, and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR). The NMR spectroscopic studies of each compound were described as below.

## (a) Nuclear Magnetic Resonance spectroscopy of the 5mazpy ligand

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the 5mazpy ligand are listed in Table 3.6.

Table $3.6{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the 5mazpy ligand

| H-C Position | ${ }^{1} \mathrm{H}$ NMR |  |  | ${ }^{13} \mathrm{C}$ NMR |
| :---: | :---: | :---: | :---: | :---: |
|  | $\delta(\mathrm{ppm})$ | $J(\mathrm{~Hz})$ | Number of H | $\delta(\mathrm{ppm})$ |
| 6 | $8.56(d)$ | 2.0 | 1 | 149.81 |
| $8,8^{\prime}$ | $8.04(d d)$ | $7.5,2.0$ | 2 | 123.48 |
| 3 | $7.76(d)$ | 8.5 | 1 | 115.23 |
| 4 | $7.69(d d)$ | $8.0,2.0$ | 1 | 138.74 |
| $9,9^{\prime}, 10$ | $7.52(\mathrm{~m})$ | - | 3 | $129.11,131.88$ |
| 11 | $2.43(\mathrm{~s})$ | - | 3 | 18.39 |

Table 3.6 (continued)

| $\mathrm{H}-\mathrm{C}$ Position | H NMR |  | ${ }^{13} \mathrm{C} \mathrm{NMR}$ |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\delta(\mathrm{ppm})$ | $J(\mathrm{~Hz})$ | Number of H | $\delta(\mathrm{ppm})$ |
| Quaternary Carbons |  |  | $161.07,152.42,135.58$ |  |

$d=$ doublet,$d d=$ doublet of doublet, $m=$ multiplet and $s=$ singlet

The ${ }^{1} \mathrm{H}$ NMR spectrum of 5mazpy is shown in Figure 3.14. There are two types of protons, aliphatic proton and aromatic proton. The ${ }^{1} \mathrm{H}$ NMR spectrum exhibited six signals for eleven protons. The detail of each proton signal could be explained below.

The proton H3 appears at 7.76 ppm as doublet because of coupling with H4 ( $J=8.5 \mathrm{~Hz}$ ). The proton H 4 locates next to H 3 , the signal of H 4 appears at 7.69 ppm which doublet of doublet peak is observed due to coupling with H3 ( $J=8.0$ $\mathrm{Hz})$ and long range coupling with $\mathrm{H} 6(J=2.0 \mathrm{~Hz})$. The signals of proton H 6 exhibit at 8.56 ppm . The splitting pattern is doublet ( $J=2.0 \mathrm{~Hz}$ ) by long range coupling with proton H4. The proton H6 locates next to nitrogen atom on pyridine ring, therefore this signal appears at the most downfield. The proton H 8 and H 8 ' are two equivalent proton on the phenyl ring. The signal shows doublet of doublet peaks at 8.04 ppm . This signal appears at the lower field than other proton (H9, H9', H10) on the phenyl ring because it locates close to the azo nitrogen. The signal of proton H 9 occurs at 7.52 ppm . The splitting pattern is multiplet at the same position of proton H10. In comparison, the 5-methyl-2-(phenylazo)pyridine (5mazpy), 2-(phenylazo)pyridine (azpy) (Changsaluk and Hansongnern, 2005) and 5-Clazpy-2-(phenylazo)pyridine (Clazpy) ligands (Sahavisit and Hansongnern, 2005), the proton signals in 5mazpy appear at the highfield than azpy and Clazpy due to the effect of donating group (methyl group) in pyridine ring. The signal of protons on methyl group is observed at 2.43 ppm . In addition, all proton resonance signals are confirmed by ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR experiments and the ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectrum is given in Figure 3.15.

The results from ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.16) correspond to the results from DEPT 135 NMR spectrum (Figure 3.17). The ${ }^{13} \mathrm{C}$ NMR spectrum of the 5mazpy ligand shows ten signals for twelve carbons. The signals at 138.74 ppm (C4) and $115.23 \mathrm{ppm}(\mathrm{C} 3)$ are observed. The signals of carbon C6 (149.81 ppm) occur at lower field than that of other methine carbons because is located next to the nitrogen atom on pyridine ring. The carbons C8 and C9 (123.48 and 129.11 ppm ) in phenyl ring resonate symmetrically at different position. The carbon signal at 131.88 ppm is attributed to the carbon C10. The methyl carbon appears at the highest field 18.39 ppm. Furthermore, the ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy was used to assign all signals. Contour peaks in the ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum (Figure 3.18) in 5mazpy ligand, the absence of any contours at $161.07,152.42$, and 135.58 ppm assign them to the carbon C2, C7 and C5, respectively.

## (b) Nuclear Magnetic Resonance spectroscopy of the $\boldsymbol{c t c}$-[Ru(5mazpy) $\mathbf{2}_{2} \mathrm{Cl}_{2}$ ]

 complexThe ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the $c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex are summarized in Table 3.7.

Table $3.7{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the ctc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex

| H-C Position | ${ }^{1} \mathrm{H}$ NMR |  |  | ^{13}\mathrm{C}NMR}{$\delta(\mathrm{ppm})$} |

$d=$ doublet,$d d=$ doublet of doublet, $s=$ singlet, and $t d=$ triplet of doublet

The ${ }^{1} \mathrm{H}$ NMR spectrum of the ctc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex is shown in Figure 3.19. The signals of protons on the $c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex appear only one set of ligand peaks, indicating two equivalent 5mazpy ligands, so the complex must be symmetric due to its $C_{2}$ axis. The assignment was made with the use of ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy (Figure 3.20). The ${ }^{1} \mathrm{H}$ NMR spectrum shows that the pyridine protons are mostly affected when compares to the phenyl protons. The aromatic protons at $9.13,8.37,7.75,7.25,7.10$, and 6.80 ppm are attributed to H 6 , H3, H4, H10, H9, $9^{\prime}$, and H8, $8^{\prime}$, respectively on the basis of ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectrum. The signals of proton $\mathrm{H} 3, \mathrm{H} 4$, and H 6 are shifted to downfield while $\mathrm{H} 8,8^{\prime}$, H9, $9^{\prime}$, H10, and H11 are shifted upfield from those of the free ligand. The signal of proton H6 in pyridine rings occurs at the lowest field because of the influence of coordinated nitrogen atoms. One methyl signal is observed at 2.35 ppm (singlet). This indicates that the $c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex has $C_{2}$-symmetry.

The results of ${ }^{13} \mathrm{C}$ NMR (Figure 3.21) correspond to the DEPT 135 NMR (Figure 3.22). The ${ }^{13} \mathrm{C}$ NMR spectrum contains ten signals from twenty-two carbons. Three signals of quaternary carbon at $164.62,155.31$, and 136.61 ppm are assigned as quaternary carbon $\mathrm{C} 2, \mathrm{C} 7$, and C 5 , respectively. The methine carbons on the pyridine rings appear at the lower field than that the phenyl rings. It is due to the effected of nitrogen atoms. The methine carbons display at $150.93,126.10,137.94$, $129.72,128.36$, and 121.92 ppm which are assigned to carbon $\mathrm{C} 6, \mathrm{C} 3, \mathrm{C} 4, \mathrm{C} 10$, $\mathrm{C} 9,9^{\prime}$, and $\mathrm{C} 8,8^{\prime}$ positions, respectively. In addition, the ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy was carried out and the ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum is shown in Figure 3.23.

## (c) Nuclear Magnetic Resonance spectroscopy of the $\boldsymbol{c c c}$-[Ru(5mazpy) $)_{2} \mathrm{Cl}_{2}$ ] complex

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the $c c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex are summarized in Table 3.8.

Table $3.8{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the $c c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex

$d=$ doublet,$d d=$ doublet of doublet, $s=$ singlet, and $t d=$ triplet of doublet

The ${ }^{1} \mathrm{H}$ NMR spectrum of the $c c c-\left[\operatorname{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex is displayed in Figure 3.24. The spectrum of the $\operatorname{ccc}-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex is more complex than that of the $c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex. The peaks assignments are supported by using simple correlation ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy (Figure 3.25). The ${ }^{1} \mathrm{H}$ NMR spectrum of $c c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ shows twice the number of signals, as this isomer has no $C_{2}$ axis, which results in two inequivalent 5 mazpy ligands. From all 5 theoretically possible isomers only the ccc isomer has no $C_{2}$ axis; so already from this ${ }^{1} \mathrm{H}$ NMR spectrum the configuration has been proven. This is also confirmed by the methyl signals in aliphatic region. From the parent complex, $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$, only $c c c$-isomer has $C_{1}$-symmetry (Seal and Ray et al., 1984). Thus, the $c c c$-configuration should exhibit two $\mathrm{CH}_{3}$ signals of equal intensities. From the ${ }^{1} \mathrm{H}$ NMR spectrum $\mathrm{CH}_{3}$ signals appear as singlet at 2.56 ppm for proton 11A and 2.20 ppm for proton 11B. The $\mathrm{H} 3(\mathrm{~A}, \mathrm{~B})$ and $\mathrm{H} 6(\mathrm{~A})$ signals are shifted to downfield while $H 6(B), H 8,8^{\prime}(A, B), H 9,9^{\prime}(A, B)$ and $H 10(A, B)$ are shifted to upfield from those of the free ligand. The proton H6(A) appears at the lower filed than H6(B) because it is
trans to the $\mathrm{N}=\mathrm{N}$ mode (electron withdrawing group) while proton $\mathrm{H} 6(\mathrm{~B})$ is trans to chloride (Velder et al., 2004). This is similar to the result of ccc-[Ru(azpy) $\left.{ }_{2} \mathrm{Cl}_{2}\right]$ which was carried out in the same solvent $\left(\mathrm{CDCl}_{3}\right)$ (Changsaluk and Kanidtha, 2005). In comparison between $c c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ and $c c c-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ in the same solvent $\left(\mathrm{CDCl}_{3}\right)$, the proton signals of the 5mazpy complex occur at the higher field relative to azpy complex because of the electron donating substituent $\left(\mathrm{CH}_{3}\right.$ group) on the pyridine ring.

The ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.26) contains twelve methine carbons, six quaternary carbons, and two methyl carbons. This results support with the DEPT 135 NMR spectrum (Figure 3.27) which present only signal of methine carbons ( 14 signals) and methyl carbons ( 2 signals). The carbon $\mathrm{C} 8,8^{\prime} \mathrm{C} 9,9^{\prime}$ in phenyl ring A and B in this complex resonate symmetrically at different position. The signals of carbon C6 occur at a lower field than that of other methine carbons because it is located next to the nitrogen atoms on pyridine ring. The carbon C6(A), C3(A), C3(B), C4(A), C8, 8'(A), C4(B), C10(B), C9,9'(B), C10(A), C9,9'(A), C6(B), and C8,8'(A) are found at $149.48,124.19,125.82,139.62,125.61,139.27,130.87,127.60,129.63$, 128.71, 148.14, and 121.34 ppm , respectively. The signal carbons of $\mathrm{CH}_{3}$ appear at the highest field 19.02 ppm (ligand B) and 19.63 ppm (ligand A). The quaternary carbons are observed at $136.80,136.18,157.24,155.40,165.16$, and 163.45 ppm . In addition, the ${ }^{13} \mathrm{C}$ NMR signal assignments are based on the ${ }^{1} \mathrm{H}^{13} \mathrm{C}$ HMQC NMR spectrum (Figure 3.28).

## (d) Nuclear Magnetic Resonance spectroscopy of the tcc-[Ru(5mazpy) $\mathbf{2}_{2} \mathrm{Cl}_{2}$ ]

 complexThe ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the tcc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex are summarized in Table 3.9.

Table $3.9{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the tcc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex

| H-C Position | ${ }^{1} \mathrm{H}$ NMR |  |  | $\begin{gathered} { }^{13} \mathrm{C} \text { NMR } \\ \delta(\mathrm{ppm}) \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: |
|  | $\delta(\mathrm{ppm})$ | $J$ (Hz) | Number of H |  |
| 6 | 8.76 (s) | - | 2 | 148.92 |
| 3 | 8.48 (d) | 7.0 | 2 | 124.38 |
| 4 | 7.98 (d) | 7.0 | 2 | 141.31 |
| 8, $8^{\prime}$ | 7.52 (d) | 7.0 | 4 | 122.85 |
| 10 | 7.16 (m) | - | 2 | 129.43 |
| 9, $9^{\prime}$ | 6.97 (m) | - | 4 | 128.15 |
| 11 | 2.55 (s) | - | 6 | 19.40 |
| Quaternary Carbons |  |  |  | 164.33, 157.72, 134.73 |

$d=$ doublet,$m=$ multiplet, and $s=$ singlet

The ${ }^{1} \mathrm{H}$ NMR spectrum of the $t c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex (Figure 3.29) is similar to the $c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex which is simpler than that of the $\operatorname{ccc}-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex. The two 5 mazpy ligands in this complex are magnetically equivalent because this molecule also has $C_{2}$-symmetry. The proton spectrum is clearly divided in two portions; the downfield part is due to pyridine protons (H3, H4, and H6) and the upfield signals refer to phenyl protons ( $\mathrm{H} 8,8^{\prime}$, $\mathrm{H} 9,9^{\prime}$, and H10). The pyridine protons in the complex are shifted downfield by $0.20-$ 0.72 ppm compare to the free ligand values. This supports the tight binding of $\mathrm{Ru}(\mathrm{II})$ with heterocyclic-N. The singlet signal at approximately 8.76 ppm refers to H6 because of the closest position to the metal centre and deshielding effect of nearby Cl ligand follow by the $\mathrm{H} 3(8.48 \mathrm{ppm}, J=7 \mathrm{~Hz})$ and H 4 shows doublet at approximately 7.98 ppm (doublet, $J=7 \mathrm{~Hz}$ ). The proton H8,8' (7.52 ppm, doublet, $J=7 \mathrm{~Hz}$ ) appears at lower field compare to proton H9,9' (6.97 ppm, multiplet) and H10 (7.16 ppm, multiplet) due to the closest position of the electron withdrawing azo group. This complex displays single $\mathrm{CH}_{3}$ signal ( 2.55 ppm ), suggesting that the $C_{2}$-symmetry is retained. This complex is also confirmed by using simple correlation ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy (Figure 3.30).

The ${ }^{13} \mathrm{C}$ NMR spectrum is given in Figure 3.31. Ten carbon signals are observed in the spectrum. The signals of methine carbons and quaternary carbons are supported by the results from DEPT 135 NMR spectrum (Figure 3.32). The methine carbon signals appear in the range 122-149 ppm. The quaternary carbons C5, C7, and C2 are observed at $134.73,157.72$, and 164.33 ppm , respectively. The highfield resonance at 19.40 ppm belongs to methyl carbon (C11). In addition, the resonances have been assigned using ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy and this spectrum is given in Figure 3.33.

### 3.2.6 Cyclic voltammetry

Electron transfer properties of the 5mazpy ligand and the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes have been investigated by using cyclic voltammetry in dichloromethane ( 0.1 M TBAH ). In this experiment, the working electrode is glassy carbon. The reported potential data were compared with the values for the ferrocenium-ferrocene couple, under our experimental conditions. The voltammograms displayed metal oxidations at the positive side and the ligand reductions at the negative side. Voltammetric data are collected in Table 3.10 and representative voltammograms are displayed in Figure 3.34, 3.35, 3.36, and 3.37.

In order to check the couple or redox reaction, the different scan rate were used. The couple which have almost equal anodic and cathodic current was refered as reversible couple. While, the unequal currents were refered to the unequally transfer of electron in reduction and oxidation. This is irreverible couple. In addition, the different scan rates were applied, these currents gave anodic and cathodic currents at the higher scan rate. This led to quasi-reversible couple.

Table 3.10 Cyclic voltammetric ${ }^{\text {a }}$ data of the 5mazpy ligand and
the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.1 \mathrm{M} \mathrm{TBAH})$
at scan rate $100 \mathrm{mVs}^{-1}$

| Compounds | $\mathrm{E}_{1 / 2}(\mathrm{~V})\left(\Delta \mathrm{E}_{\mathrm{p}}(\mathrm{mV})\right)$ |  |  |
| :--- | :---: | :--- | :--- |
|  | Oxidation | Reduction |  |
| 5mazpy | - | $-1.62(94)$ |  |
| ctc- $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ | $0.65(65)$ | $-1.17(95)$ | $-1.65^{\mathrm{b}}$ |
| ccc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ | $0.60(85)$ | $-1.16(95)$ | $-1.61^{\mathrm{b}}$ |
| tcc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ | $0.47(90)$ | $-1.20(115)$ | $-1.57^{\mathrm{b}}$ |

[^0]
## Oxidation Range

In the potential range 0 to 1.0 V , the 5 mazpy shows no signal in this potential range and the complexes display a one-electron cyclic voltammetric response due to the electrode reactions shown in equation (3).

$$
\begin{equation*}
\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]^{+}+\mathrm{e}^{-} \quad \rightarrow \quad\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right] \tag{3}
\end{equation*}
$$

The data reveal that the ctc-isomer and ccc-isomer exhibit higher potentials by $0.13-0.18 \mathrm{~V}$ than the $t c c$-isomer. The ctc-isomer displays a slightly higher $\mathrm{Ru}(\mathrm{III}) / \mathrm{Ru}(\mathrm{II})$ couple $\left(0.65 \mathrm{~V}, \Delta \mathrm{E}_{\mathrm{p}}=65 \mathrm{mV}\right)$ than that the $c c c$-isomer $(0.60 \mathrm{~V}$, $\left.\Delta \mathrm{E}_{\mathrm{p}}=85 \mathrm{mV}\right)$. In the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes, the ability of the 5mazpy ligand to stabilize the complex is as follow cis (ctc and ccc) $>$ trans (tcc).

## Reduction Range

In the potential range 0 to -2.0 V at the scan rate $100 \mathrm{mVs}^{-1}$ in dichloromethane, all complexes display one reversible to quasireversible (peak-topeak separation peak $\Delta \mathrm{E}_{\mathrm{p}}=65-90 \mathrm{mV}$ ) and one irreversible peak. It is believed that the reduction peaks correspond to the reduction of the organic ligand possibility at the azo function. The free ligand displays one quasireversible two electron response with peak-to-peak separation at 94 mV , corresponds to the couple in equation (4).

$$
\begin{align*}
& 2 \mathrm{e}^{-} \\
& 5 \text { mazpy } \rightarrow 5 \text { mazpy }^{2-} \tag{4}
\end{align*}
$$

The free ligand, 5mazpy displays one reduction wave at $-1.62 \mathrm{~V}\left(\Delta \mathrm{E}_{\mathrm{p}}\right.$ $=94 \mathrm{mV})$. This value is slightly lower than azpy $(-1.60 \mathrm{~V})$ by 0.02 V and higher than 4-methyl-2-(phenylazo)pyridine (4mazpy) (-1.68 V, $\Delta \mathrm{E}_{\mathrm{p}}=94 \mathrm{mV}$ ) (Muaksang, K., 2005). All the three complexes exhibit one quasireversible and one irreversible peak of one electron. In addition, the potential shows a positive shifted from the free ligand
value. The first reduction couple of $c c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]\left(-1.16 \mathrm{~V}, \Delta \mathrm{E}_{\mathrm{p}}=95 \mathrm{mV}\right)$ occurs at the higher potential than that in tcc-[Ru(5mazpy $\left.)_{2} \mathrm{Cl}_{2}\right]\left(-1.20 \mathrm{~V}, \Delta \mathrm{E}_{\mathrm{p}}=115\right.$ $\mathrm{mV})$ and comparable to $c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]\left(-1.17 \mathrm{~V}, \Delta \mathrm{E}_{\mathrm{p}}=95 \mathrm{mV}\right)$. This results can be implied that the ccc isomer accepts electron better than the tcc isomer and comparable to ctc isomer. Table 3.11 lists the cyclic voltammetric data of the 4mazpy, and 5mazpy and its complexes in dichloromethane at $100 \mathrm{mVs}^{-1}$.

Table 3.11 Cyclic voltammetric data of 4mazpy, and 5mazpy and its complexes in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at scan rate $100 \mathrm{mVs}^{-1}$

| Compounds | Reduction potential (V) |
| :---: | :---: |
| 5 mazpy | $-1.62(94)$ |
| $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ | $(-1.16)$ to $(-1.20)$ |
| 4 mazpy | $-1.68(94)$ |
| $\left[\mathrm{Ru}(4 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ | $(-1.02)$ to $(-1.22)$ |

In comparison with the 5mazpy and 4mazpy complexes (Table 11), the $\left[\mathrm{Ru}(4 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes exhibit the first reduction couple in the range -1.02 V to -1.22 V , while the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes display at -1.16 to -1.20 V . So the 4 mazpy complexes show the higher potential than the 5 mazpy complexes. The $\pi$ acidity order of those ligand are as follows: 4mazpy > 5mazpy.

### 3.2.7 X-ray crystallography

The X-ray crystallography is the most important technique to identify the structure of compounds, 5 mazpy, ctc-, ccc-, and tcc-[Ru(5mazpy) $\left.)_{2} \mathrm{Cl}_{2}\right]$.

## (a) X-ray structure of the 5-methyl-2-(phenylazo)pyridine ligand

The single crystals of 5mazpy were grown by slow diffusion of hexane into ethanol solution of the 5mazpy ligand. The detailed measurement consitions and the crystal data are listed in Table 3.12. The selected bond lengths and bond angles are given in Table 3.13. Figure 3.38 shows the ORTEP and atom numbering scheme for the 5mazpy ligand.

| $\mathrm{C}(11)-\mathrm{C}(6)-\mathrm{N}(3)$ | $124.90(19)$ | $\mathrm{C}(8)-\mathrm{C}(7)-\mathrm{C}(6)$ | $120.0(2)$ |

Table 3.13 (continued)

| $\mathrm{C}(9)-\mathrm{C}(8)-\mathrm{C}(7)$ | $119.9(2)$ | $\mathrm{C}(10)-\mathrm{C}(9)-\mathrm{C}(8)$ | $119.8(2)$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{C}(11)-\mathrm{C}(10)-\mathrm{C}(9)$ | $120.6(3)$ | $\mathrm{C}(10)-\mathrm{C}(11)-\mathrm{C}(6)$ | $119.6(2)$ |

In the molecule, the benzene ring ( $\mathrm{C} 6, \mathrm{C} 7, \mathrm{C} 8, \mathrm{C} 9, \mathrm{C} 10, \mathrm{C} 11$ ), azo $(\mathrm{N} 2, \mathrm{~N} 3)$, and C 12 atom lie in a plane. The $\mathrm{C}-\mathrm{N}=\mathrm{N}-\mathrm{C}$ in 5mazpy is transconformation. The pyridine ring is also planar and the maximum deviation of any atom from mean plane passing through the ring is $0.008(3) \AA$ for C3. In addition, atom C 8 of benzene ring deviates from C6-C7-C8-C9-C10-C11 by $0.010(4) \AA$. The azo(N2, N 3 ) is in the same plane as benzene ring with torsion angle N1-C5-N2-N3 is $172.73(17)^{\circ}$ and $\mathrm{C} 7-\mathrm{C} 6-\mathrm{N} 3-\mathrm{N} 2$ is $170.89(19)^{\circ}$. In addition, the azo (N2, N3) is coplanar with pyridine ring. This is also reflected in the angle between planes of pyridine ring and benzene ring is $17.31(1)^{\circ}$. Then electrons from substituent can delocalize into the conjugated system in the molecule. This can give the some property of this compound for coordinating with metal ions in the future study.

The N2-N3 distance of the title compound is $1.228(2) \AA$, shorter than that of the protonated azpy $(1.248(4) \AA)$ due to the hydrogen bond interaction between N (azo) and the protonated proton (Panneerselvam et al., 2000). This results in decreasing the electron density in azo moiety and lengthening the azo bond. According to Harada et al, there are an orientation disorder in azobenzene, resulting in a shortening of the $\mathrm{N}=\mathrm{N}$ bond and elongation of $\mathrm{N}-\mathrm{Ph}$ bond. From this result the 5mazpy ligand could be orientation disorder in the crystal but we carried out the experiment only at room temperature (Harada et al, 1997). In addition, the C5(pyridine)-N2(azo) bond distance (1.442(3) $\AA$ ) is comparable to $\mathrm{N} 3($ azo $)$ C6(benzene) (1.445(3) $\AA$ ) which indicateds the same interaction of azo with pyridine and benzene group. However, in the case of 2-phenylazo-5-nitro-6-methyl-pyridine, both bond lengths are different (1.430(4), 1.421(4) $\AA$ ) which were confirmed by density functional theory (DFT) calculation (Michalski et al, 2005). Moreover, result from vibrational dynamics showed that vibration of the -CNNC- core are strongly
coupled with the vibrations of the pyridine, phenyl and their substituents. This means that strong $\pi$ electron aromatic systems influence the vibrations of the azo-bridging group (Michalski et al, 2005).

## (b) X-ray structure of the $\boldsymbol{c t c}$ - $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex

The single crystals of the $c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex were grown by slow diffusion of hexane into chloroform solution of the complex. The molecular structure of $c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ is shown in Figure 3.39. Table 3.14 lists the crystallographic data of $c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ and relevant bond distances and angles are given in Table 3.15.

The $\mathrm{Ru}(\mathrm{II})$ ion is six coordinated with four nitrogen atoms of bidentate ligand and two chloride atoms in a distorted octahedron geometry. The atomic arrangement around the ruthenium center involved sequentially two cis-chlorides, trans- N (pyridine), and cis- N (azo). If the coordinating pairs $\mathrm{Cl}, \mathrm{N}(\mathrm{py})$, and $\mathrm{N}($ azo $)$ are considered in that order, the configuration of this complexes is cis-trans-cis (ctc), the so-called $\alpha$-configuration. In the coordianation octahedra, the $\mathrm{Ru}-\mathrm{Cl}$ distances are
$2.410(1) \AA$, it is similar to those found in ctc-[Ru(azpy) $\left.{ }_{2} \mathrm{Cl}_{2}\right](2.399(1) \AA)$ (Seal and Ray, 1987). The Ru-N(azo) distances (1.972(2) $\AA$ ) are shorter than those of RuN (pyridine) (2.043(2) $\AA$ ). The shortening may be due to greater $\pi$-backbonding, $\mathrm{d} \pi(\mathrm{Ru}) \rightarrow \pi^{*}$ (azo), offered by the azo group. Moreover, in the title complex the average $\mathrm{N}=\mathrm{N}$ distance of 5mazpy is $1.284(3) \AA$ which is slightly longer than that of the free 5 mazpy ( $\mathrm{N}=\mathrm{N} 1.228(2) \AA$ ). The coordination of azoimine ligand leads to a decrease in the $\mathrm{N}=\mathrm{N}$ bond order due to the $\sigma$-donor and the $\pi$-acceptor character of the ligand. The angle $\mathrm{Cl}-\mathrm{Ru}-\mathrm{Cl}$ in this complex $\left(91.24(2)^{\circ}\right)$ is slightly bigger than in ctc-[ $\left.\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]\left(89.52(6)^{\circ}\right)$ (Seal and Ray, 1987). The chelate angles extended by 5mazpy were $76.87(8)^{\circ}$ reveal a considerable distorsion of octahedron, as was found for the complexes $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]\left(76.3(2)^{\circ}\right),\left[\mathrm{Ru}(\text { azpy })_{2}\left(\mathrm{NO}_{3}\right)_{2}\right]\left(76.5(1)^{\circ}\right)$ (Hotze et al., 2000), and $\left[\mathrm{Ru}(\mathrm{Hsazpy})_{2} \mathrm{Cl}_{2}\right]\left(77.2(3)^{\circ}\right)(\mathrm{Hotz}$ et al., 2004). As a consequence of the constraint of the bite angle, the ligands are bent back from the coordinated chlorides.

## (c) X-ray structure of the $\operatorname{ccc}-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex

The single crystals of the $\operatorname{ccc}-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex were obatined by slow diffusion of hexane into chloroform solution of the complex. The molecular structure of $\operatorname{ccc}-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ is shown in Figure 3.40. Tthe crystallographic data and selected bond lengths and bond angles for ccc$\left[\mathrm{Ru}(5 \mathrm{mazpy}){ }_{2} \mathrm{Cl}_{2}\right]$ are given in Table 3.16 and 3.17, respectively.

| $\mathrm{N}(3)-\mathrm{Ru}(1)-\mathrm{N}(6)$ | $98.6(1)$ | $\mathrm{N}(3)-\mathrm{Ru}(1)-\mathrm{Cl}(1)$ | $90.98(9)$ |
| $\mathrm{N}(3)-\mathrm{Ru}(1)-\mathrm{Cl}(2)$ | $100.83(8)$ | $\mathrm{N}(4)-\mathrm{Ru}(1)-\mathrm{N}(6)$ | $76.6(1)$ |
| $\mathrm{N}(4)-\mathrm{Ru}(1)-\mathrm{Cl}(1)$ | $93.46(9)$ | $\mathrm{N}(4)-\mathrm{Ru}(1)-\mathrm{Cl}(2)$ | $85.79(8)$ |
| $\mathrm{N}(6)-\mathrm{Ru}(1)-\mathrm{Cl}(1)$ | $169.59(9)$ | $\mathrm{N}(6)-\mathrm{Ru}(1)-\mathrm{Cl}(2)$ | $90.65(9)$ |
| $\mathrm{Cl}(1)-\mathrm{Ru}(1)-\mathrm{Cl}(2)$ | $91.65(4)$ |  |  |

The ruthenium(II) ion is six coordinated with four nitrogen atoms of bidentate ligand and two chloride atoms in a distorted octahedron geometry. The
atomic arrangement around the ruthenium center involved sequentially two cischlorides, cis- $\mathrm{N}($ pyridine $)$, and cis- N (azo). Therefore, the configuration of this complex is cis-cis-cis (ccc). The mononuclear complex is a neutral molecule due to the two coordinated chloride ions. The chelate angles extended by 5 -methyl-2(phenylazo)pyridine were $76.82(7)^{\circ}$ and $76.4(7)^{\circ}$ and deviate considerably from the ideal geometry $\left(90^{\circ}\right)$. As a consequence of the constraint of the bite angle, the ligands are bent back from the coordinated chlorides. The cis-chloro angle of $91.65(4)^{\circ}$ is very nearly the ideal octahedral angle and is comparable to the reported values (Seal and Ray, 1984). The angles between the pyridine ring and phenyl ring of complex are $39.146^{\circ}$ and $44.545^{\circ}$. In the complex $c c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$, the phenyl rings are inclined at angles of $40.591^{\circ}$ and $44.625^{\circ}$ relative to the chelated azo pyridine plane. The N-N distances of azo function are 1.286(4) and 1.288(5) $\AA$. The Ru-N(azo) distances (1.982(3), 2.009(3) $\AA$ ) are shorter than those of Ru-N(pyridine) (2.028(3), $2.060(3) \AA$ ). The shortening may be due to greater $\pi$-backbonding, $\mathrm{d} \pi(\mathrm{Ru}) \rightarrow$ $\pi^{*}$ (azo), offer by the azo group. The average N-N distance is $1.287 \AA$ which is longer than some reported values of free azo ligands ( $\mathrm{N}-\mathrm{N} \sim 1.248 \AA$ ) (Panneerselvam et al., 2000). The coordination can lead to decrease in the $\mathrm{N}-\mathrm{N}$ bond order due to both $\sigma$ donor and $\pi$-accepter characters of the ligand. Thus, the elongation of the $\mathrm{N}-\mathrm{N}$ distance and shortening of Ru-N(azo) bond length are an indication of the existance of considerable Ru-5mazpy $\pi$-bonding with major involvement of the azo group. The $\mathrm{Ru}-\mathrm{Cl}$ distance in this complex ( $2.397(1) \AA, 2.397(1) \AA$ ) is comparable with the reported values in $c c c-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right](2.401(4) \AA, 2.410(3) \AA)$ (Seal and Ray, 1987) and $c c c-\left[\mathrm{Ru}(\mathrm{papm})_{2} \mathrm{Cl}_{2}\right](2.394(1) \AA, 2.401(1) \AA)$ (Santra et al., 1999).

## (d) X-ray structure of the tcc-[Ru(5mazpy) $\left.\mathbf{2}_{2} \mathrm{Cl}_{2}\right]$ complex

The single crystals of the $t c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex were grown by slow diffusion of acetonitrile into chloroform solution of the complex. The molecular structure of $t c c-\left[\operatorname{Ru}(5 m a z p y)_{2} \mathrm{Cl}_{2}\right]$ is shown in Figure 3.41. The crystallographic data of $t c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ are listed in Table 3.18 and the relevant bond distances and angles are given in Table 3.19.

| $\mathrm{N}(1)-\mathrm{Ru}(1)-\mathrm{Cl}(1)$ | $84.94(14)$ | $\mathrm{N}(1) \# 1-\mathrm{Ru}(1)-\mathrm{Cl}(1)$ | $91.33(14)$ |
| $\mathrm{Cl}(1) \# 1-\mathrm{Ru}(1)-\mathrm{Cl}(1)$ | $173.97(9)$ |  |  |

The crystal structure of the $t c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex consists of a tcc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ and a lattice $\mathrm{CH}_{3} \mathrm{CN}$ molecule. The central ruthenium(II) ion is six-coordinated by four nitrogen donors of two 5mazpy molecules and two chloride anions. The atomic arrangement in $t c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ involves sequentially trans-
chlorides, cis-N(pyridine), and cis-N(azo) and corresponds to a tans-cis-cis (tcc) configuration. The ruthenium ion forms two five membered chelated rings with two 5mazpy ligands. The bite angles N3-Ru1-N1 and N3A-Ru1-N1A (75.52(2) ${ }^{\circ}$ ) reveal a considerable distortion in octhahedral around ruthenium and are similar ones found for $t c c-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$. The trans chloride angle is $173.97(9)^{\circ}$ and is corroborates with a distorted octhahedral structure. The Ru-N(azo) bond (1.990(5) $\AA$ ) is shorter than the Ru-N(pyridine) (2.102(5) $\AA$ ). The shortening may be due to greater $\pi$-back-bonding, $\left.\mathrm{d} \pi(\mathrm{Ru}) \rightarrow \pi^{*}(\mathrm{azo})(\mathrm{Bag} \text { et al., 1992). In the tcc-[Ru(azpy) })_{2} \mathrm{Cl}_{2}\right]$ complex, the $\mathrm{N}-\mathrm{N}$ distance is $1.286(7) \AA$ which longer than that the free 5mazpy ligand (1.228(2) $\AA$ ). This suggests that the coordination can lead to a decrease in the $\mathrm{N}-\mathrm{N}$ bond order due to both $\sigma$-donor and $\pi$-acceptor character of the ligands. The $\mathrm{Ru}-\mathrm{Cl}$ distance is comparable with the reported values (Bag et al., 1992).

### 3.3 Syntheses of the $\left[\operatorname{Ru}(5 m a z p y)_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\operatorname{Ru}(5 m a z p y)_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and <br> $\left[\operatorname{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes $\left(\mathrm{L}=\right.$ azpy, $5 m a z p y ; \mathrm{L}^{\prime}=\mathrm{bpy}$, phen $)$

The series of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes were prepared from the reaction of the $c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex with L ligands (L = 2-(phenylazo)pyridne (azpy), 5-methly-2-(phenylazo)pyridne (5mazpy); $\mathrm{L}^{\prime}=2,2^{\prime}$-bipyridine (bpy), and 1,10-phenanthroline (phen)) in refluxing methanol in the presence of $\mathrm{AgNO}_{3}$ to afford $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]^{2+}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ $\left.L^{\prime}\right]^{2+}$, respectively. These complexes were isolated as the $\mathrm{PF}_{6}{ }^{-}$salts, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]$ $\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$. The synthetic reaction is shown in equation (5).

$$
\begin{gather*}
\mathrm{AgNO}_{3}, \mathrm{NH}_{4} \mathrm{PF}_{6} \\
c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right] \longrightarrow\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2} \tag{5}
\end{gather*}
$$

$\mathrm{MeOH}, \mathrm{L}$ or $\mathrm{L}^{\prime}$

For the series of the $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes $\left(\mathrm{L}^{\prime}=\mathrm{bpy}\right.$, phen), the cis- $\left[\mathrm{Ru}(\mathrm{bpy})_{2} \mathrm{Cl}_{2}\right]$ and $c i s-\left[\mathrm{Ru}(\mathrm{phen})_{2} \mathrm{Cl}_{2}\right]$ complexes were used as precursor for synthesis of the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(\mathrm{phen})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes, respectively. The reactions of the cis- $\left[\mathrm{Ru}(\mathrm{bpy})_{2} \mathrm{Cl}_{2}\right]$ or cis- $\left[\mathrm{Ru}(\mathrm{phen})_{2} \mathrm{Cl}_{2}\right]$ complexes with 5mazpy ligand in methanol in the presence of $\mathrm{NH}_{4} \mathrm{PF}_{6}$ generated the $\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes, respectively. The synthetic detail is shown in equation (6).

The structures of the ligands, 2-(phenylazo)pyridine (azpy), 5-methly-2-(phenylazo)pyridne (5mazpy), 2,2'-bipyridine (bpy), 1,10-phenanthroline (phen), in this work are illustrated in Figure 3.42. The physical properties of the complexes of
$\left[\mathrm{Ru}\left(5 \text { mazpy }^{2}\right)_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}, \quad\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2} \quad$ and $\quad\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ are summarized in Table 3.20.

$M=$ Molecular weight (MW) of each complex
MW of $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}(\mathrm{M})=982.07 \mathrm{~g} / \mathrm{mol}$
MW of $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}(\mathrm{M})=968.07 \mathrm{~g} / \mathrm{mol}$
MW of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}(\mathrm{M})=941.07 \mathrm{~g} / \mathrm{mol}$
MW of $\left[\operatorname{Ru}(5 \text { mazpy })_{2}\right.$ phen $]\left(\mathrm{PF}_{6}\right)_{2}(\mathrm{M})=965.07 \mathrm{~g} / \mathrm{mol}$

The maximum molecular peak of the $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex is observed at $\mathrm{m} / \mathrm{z} 346$ (100 \%), which corresponds to the molecular ion, $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]^{2+}$. In addition, this complex exhibits peak at $\mathrm{m} / \mathrm{z} 838(10 \%)$ which is assigned to the $\left.\left[\operatorname{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)\right]^{+}$ion. In the ESI mass spectrum of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex shows the base peak at $\mathrm{m} / \mathrm{z} 339$ due to the complex cation, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \text { azpy }\right]^{2+}$. This complex also shows a peak at $\mathrm{m} / \mathrm{z} 824$ $(11.4 \%)$ which corresponds to the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $\left.]\left(\mathrm{PF}_{6}\right)\right]^{+}$ion pair. For the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex, its spectrum exhibits two major peaks at $\mathrm{m} / \mathrm{z} 797$ and 326 of which the response at 797 is assigned to $\left[\mathrm{M}-\mathrm{PF}_{6}{ }^{-}+\mathrm{H}^{+}\right](23.1 \%)$ while, that
at 326 is due to the $\left[\mathrm{M}-2 \mathrm{PF}_{6}{ }^{-}\right]^{2+}(100 \%)$. Similar to $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $]\left(\mathrm{PF}_{6}\right)_{2}$, the mass spectrum of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$ also shows two major ions, the most intense
 338 is assigned to the $\left[\mathrm{M}-2 \mathrm{PF}_{6}^{-}\right]^{2+}$ with $78.6 \%$ relative abundance.

### 3.4.3 Infrared Spectroscopy

The important functional groups in the complexes, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]$ $\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}=\right.$ azpy, $5 \mathrm{mazpy} ; \mathrm{L}^{\prime}=$ bpy, phen), are $\mathrm{N}=\mathrm{N}, \mathrm{C}=\mathrm{N}, \mathrm{C}=\mathrm{C}$, and $\mathrm{PF}_{6}{ }^{-}$. The characteristic group frequencies are collected in Table 3.23.

Table 3.23 Infrared spectroscopic data of the $\left[\mathrm{Ru}\left(5 \text { mazpy }^{2}\right)_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$,
$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes

$\mathrm{s}=$ strong, $\mathrm{m}=$ medium

For IR spectrum of all complexes shows medium peak at 1601-1429 $\mathrm{cm}^{-1}$, corresponding to $\mathrm{C}=\mathrm{C}$ and $\mathrm{C}=\mathrm{N}$ stretching frequencies. The $\mathrm{N}=\mathrm{N}$ stretching frequencies of free ligand, 5 mazpy, occur at $1389 \mathrm{~cm}^{-1}$ which appear at a lower frequencies than that in azpy (Changsaluk, U., 2002). This stretching mode is used to be consider the $\pi$-acid property in azo complexes. The $\mathrm{N}=\mathrm{N}$ stretching frequencies of the azpy, 5mazpy ligands, the ctc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right],\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},[\mathrm{Ru}$ $\left.(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes are listed in Table 3.24.

Table 3.24 The $\mathrm{N}=\mathrm{N}$ stretching frequency in the azpy, 5mazpy ligands, the $c t c-\left[\mathrm{Ru}\left(5 \text { mazpy }^{2}\right)_{2} \mathrm{Cl}_{2}\right],\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes

| Compounds | $\mathrm{v}_{(\mathrm{N}=\mathrm{N})}\left(\mathrm{cm}^{-1}\right)$ |
| :--- | :---: |
| 5mazpy | 1389 |
| azpy | 1421 |
| ctc- $\left[\mathrm{Ru}\left(5 \text { mazpy }_{2}\right)_{2} \mathrm{Cl}_{2}\right.$ | 1334 |
| $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ | 1365 |
| $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ | 1363 |
| $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ | 1337 |
| $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$ | 1349 |
| $\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ | 1338 |
| $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ | 1332 |

The azoimine orbitals in these compounds are strongly involved in $\pi$ interactions. Thus the $\mathrm{v}_{(\mathrm{N}=\mathrm{N})}$ stretching frequencies in the complexes of 5mazpy are appreciably lower as compare to that for the free 5mazpy. In the precursor complex, ctc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$, the $\mathrm{N}=\mathrm{N}$ stretching frequencies appear at $1334 \mathrm{~cm}^{-1}$ which
lower energy than of mixed ligand complexes, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$. In addition, the $\mathrm{N}=\mathrm{N}$ stretching mode in the $\left[\mathrm{Ru}\left(5 \text { mazpy }^{2}\right)_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes occurs at the higher frequencies than those of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes. These may be due to better $\pi$-acceptor properties of 5mazpy, azpy, bpy, and phen. It results in less $\pi$ back donation to the azo function.

As the employed coligand becomes a better $\pi$-acceptor, there is competition for the ruthenium $\mathrm{t}_{2 \mathrm{~g}}$ electrons and less $\pi$ back donation to the azo ligand raising the azo bond order. Thus, with a very strong $\pi$-acid coligand, the azo mode could approach the free ligand value, while with a low $\pi$-acid coligand a single bond order might be approached for the azo linkage. In comparison of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}, \quad\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$, the $v(\mathrm{~N}=\mathrm{N})$ in $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}^{\prime}=\mathrm{bpy}\right.$, phen $)$ appears at the lower frequencies than that the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}^{\prime}=\right.$ bpy and phen $)$ because the $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]$ $\left(\mathrm{PF}_{6}\right)_{2}$ complexes contain one azo ligand. The infrared spectra of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ $\mathrm{L}]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes are shown in Figure 3.47 to 3.52 .

### 3.4.4 UV-Visible absorption spectroscopy

The complexes of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}=\right.$ azpy, 5mazpy; $\mathrm{L}^{\prime}=$ bpy, phen $)$, appear to be typical charge-transfer (CT) spectra with molar extinction coefficients of the lowest energy band near $10^{4} \mathrm{M}^{-1} \mathrm{~cm}^{-1}$. Absorption spectroscopic data of solutions of the complexes in $\mathrm{MeOH}, \mathrm{EtOH}, \mathrm{CH}_{3} \mathrm{CN}, \mathrm{DMSO}$, and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ are reported in Table 3.25.

Table 3.25 UV-Visible absorption spectroscopic data of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes in $\mathrm{CH}_{3} \mathrm{CN}$

${ }^{a}$ Molar Extinction coefficient

The electronic spectra of the complexes were recorded in the range 200-800 nm reveal that the absorptions $<400 \mathrm{~nm}$ are due to $\mathrm{n} \rightarrow \pi^{*}$ and $\pi \rightarrow \pi^{*}$ transitions. The visible region of the spectrum shows one high intense absorptions near 500 nm . The transitions are of typical metal-to-ligand charge transfer type (MLCT) with high molar extinction coefficients $\left(\varepsilon \sim 10^{4} \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$. The absorption spectra of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\operatorname{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $]\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $]\left(\mathrm{PF}_{6}\right)_{2}$ in $\mathrm{CH}_{3} \mathrm{CN}$ displays intense bands at $\lambda_{\max } 496,496,514$, and 506 nm , respectively. The MLCT band for the $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes occurs at the higher energies than that the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes. Owing to the azoimine ligands (5mazpy and azpy) are good $\pi$-acceptor ligand, and back bonding from $\mathrm{Ru}(\mathrm{II})$ to 5 mazpy or azpy results in stabilization of the $\mathrm{d} \pi$ levels relative to $\pi^{*}$ (bpy and phen) and an increase in the MLCT band energy. The $\pi^{*}$ orbital of azoimine ligand is lower than in imine ligand (Krause and Krause, 1980). Then, the lowest energy of each complexes is attributable to the MLCT transition
$\mathrm{d}(\mathrm{Ru}) \rightarrow \pi^{*}$ (azomine ligand). The lowest energy of MLCT absorptions bands of complexes in acetonitrile is listed in Table 3.26.

Table 3.26 The lowest energy of MLCT absorption bands of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes in $\mathrm{CH}_{3} \mathrm{CN}$

| Complexes | $\lambda_{\text {max }} \mathrm{nm},\left(\varepsilon^{\mathrm{a}} \times 10^{-4} \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ |
| :--- | :---: |
| $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ | 496 |
| $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ | 496 |
| $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $]\left(\mathrm{PF}_{6}\right)_{2}$ | 514 |
| $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ phen $]\left(\mathrm{PF}_{6}\right)_{2}$ | 506 |
| $\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ mazpy $\left.^{2}\right]\left(\mathrm{PF}_{6}\right)_{2}$ | 494 |
| $\left[\mathrm{Ru}(\text { bpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}{ }^{\mathrm{b}}$ | 450 |
| $\left[\mathrm{Ru}(\text { phen })_{2} 5 \mathrm{mazpy}_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}$ | 495 |
| $\left[\mathrm{Ru}(\text { phen })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}{ }^{\mathrm{c}}$ | 446 |

[^1]According to MLCT bands in visible region of the [Ru(bpy) ${ }_{2} 5 \mathrm{mazpy}$ ] $\left(\mathrm{PF}_{6}\right)_{2}$ complex only one intense band is observed in the visible region. In comparison of the MLCT band in this complex with $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}(450 \mathrm{~nm})$, the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}(494 \mathrm{~nm})$ complex displays at the lower energy than $\left[\mathrm{Ru}(\text { bpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ (Tempiam, S., 2002). Besides, the MLCT band in $\left[\mathrm{Ru}(\mathrm{phen})_{2}\right.$ 5mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ was compared with $\left[\mathrm{Ru}(\mathrm{phen})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$. The complex of $\left[\mathrm{Ru}(\mathrm{phen})_{2}\right.$ 5mazpy $]\left(\mathrm{PF}_{6}\right)_{2}(495 \mathrm{~nm})$ has MLCT band at the lower energy than that $\left[\mathrm{Ru}(\mathrm{phen})_{3}\right]$ $\left(\mathrm{PF}_{6}\right)_{2}(446 \mathrm{~nm})$ (Rattanawit, N., 2002). For the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $[\mathrm{Ru}$
(phen) $)_{2} 5$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes, they are expected that the $\pi^{*}$ levels of 5mazpy are lower than that bpy and phen. Therefore, the energy of the $\mathrm{d}(\mathrm{Ru}) \rightarrow \pi^{*}$ (azomine ligand) transition shifts to the red when compares with $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}(\text { phen })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$, respectively. The absorption spectra of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes are shown in Figure 3.53 to 3.58 .

### 3.4.5 1D and 2D Nuclear Magnetic Resonance spectroscopy

The ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, DEPT 135, ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY, and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum of the complexes, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}\left(5 \text { mazpy }_{2}\right)_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $[\mathrm{Ru}$ $\left(\mathrm{L}^{\prime}\right)_{2} 5$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}=\right.$ azpy, 5 mazpy; $\mathrm{L}^{\prime}=$ bpy phen $)$, were carried out in acetone- $d_{6}$ ( 500 MHz ) and tetramethylsilane $\left(\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{4}\right)$ was used as internal reference. The 1D and 2D NMR studies of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $[\mathrm{Ru}$ $\left.\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes were described as below.
(a) Nuclear Magnetic Resonance spectroscopy of the $\left[\mathbf{R u}(5 m a z p y)_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data are listed in Table 3.27.

$d=$ doublet, $d d=$ doublet of doublet, $m=$ multiplet, $s=$ singlet, and $t=$ triplet

The ${ }^{1} \mathrm{H}$ NMR spectrum of $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ is shown in Figure 3.59. As the complex of $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ has $C_{1}$ symmetry, all the three 5mazpy
ligands are inequivalent, resulting in eighteen resonances in aromatic region, which have been fully assigned using ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy (Figure 3.60). From ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR, the three sets of 5mazpy pyridine signals and three sets of 5mazpy phenyl signals have been distinguished. The protons on pyridine ring (H3, H 4 , and H5) appear at lower field than phenyl ring (H8, H9, and H10) due to the electron withdrawing, N atom on pyridine. Since two of the three 5 mazpy pyridine ring ( $\mathrm{A}, \mathrm{B}$ ) are trans to each other, the positions of protons are slightly different similar to the situation of the $\left[\mathrm{Ru}(\mathrm{azpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex (Hotze et al., 2005). While, the chemical shifts of the protons of 5mazpy pyridine ring C appear at the lowest field, because this pyridine ring trans to $\mathrm{N}=\mathrm{N}$ azo function. The complex of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ contains three 5mazpy ligands in molecule. Thus, this complex is expected to exhibit three methyl signals of equal intensities at $2.52,2.48$, and 2.47 ppm . In addition, the methyl signal at 2.52 ppm is due to the methyl on the pyridine ring C because trans to $\mathrm{N}=\mathrm{N}$ azo group.

The ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.61) provides direct information about the carbon skeleton of the molecule. The ${ }^{13} \mathrm{C}$ NMR signals have been fully assigned using ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy (Figure 3.63) which is generally used for studing large and complicated molecules. The ${ }^{13} \mathrm{C}$ NMR spectrum shows eighteen signals from twenty-four methine carbons, three signals from three methyl carbons, and nine signals from nine quaternary carbons which support by the results from DEPT 135 NMR spectrum (Figure 3.62). The carbon atoms neighbouring the nitrogen atom shift to downfield due to a decrease electron density resulting from the presence of electronegative nitrogen atom. The quaternary carbons are found at $163.42,163.13,162.45,156.60,153.52,152.94,144.86,144.71$, and 144.34 ppm which refer to the C2, C7, and C5, respectively. These results correlate with ${ }^{1} \mathrm{H}^{13} \mathrm{C}$ HMQC NMR spectrum which it absence of any contours at these positions. The carbons signals at $18.56,18.44$, and 18.40 ppm refer to methyl carbons from three 5 mazpy ligands. These signals are due to their interaction with proton resonances at $2.52,2.48$, and 2.47 ppm . It is noted that chemicals shifts of the complex move to downfield compared to those of the free ligand.
(b) Nuclear Magnetic Resonance spectroscopy of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{azpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data are listed in Table 3.28.

Table $3.28{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex

The ${ }^{1} \mathrm{H}$ NMR spectrum (Figure 3.64) of $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ shows three sets of pyridine ring signals and three set of phenyl ring signals. The assignments of all signals were made from ${ }^{1} \mathrm{H}^{-1} \mathrm{H}$ COSY NMR spectroscopy (Figure 3.65). The ${ }^{1} \mathrm{H}$ NMR spectrum of this complex in acetone- $d_{6}$ contains nineteen signals from twenty-five aromatic protons and two signals from aliphatic protons. The signals of pyridine ring appear in the range $7.99-9.26 \mathrm{ppm}$ and signals of phenyl ring are observed in the range $7.06-7.66 \mathrm{ppm}$. The methyl signals ( 2.51 and 2.48 ppm ) are particularly useful to account for the configuration of $\mathrm{N}(\mathrm{py})$ and N (azo) orientation from starting complex, ctc-[ $\left.\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$. The proton H 3 ( 9.26 ppm , doublet, $J=$

8 Hz ) on pyridine ring of azpy ligand occurs at the lowest field which is due to trans to azo group. The methyl groups are useful to support the structure of the complexes. Two 5mazpy ligands in this complex give two sets of separate signals of methyl which resonances at 2.51 and 2.48 ppm . This suggests that the ligands chelated around $\mathrm{Ru}(\mathrm{II})$ are unsymmetrically disposed.

The ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.66) displays nineteen methine carbons, two methyl carbons, and eight quaternary carbons. The signals of quaternary can not be observed in DEPT 135 NMR spectrum (Figure 3.67) which support ${ }^{13} \mathrm{C}$ NMR results. Eight quaternary carbons, C2A, C5A, C7A, C2B, C5B, C7B, C2(azpy), and C7(azpy), are observed. The carbon C2(azpy) occurs at the lowest field because this position located next to $\mathrm{N}=\mathrm{N}$ azo group and the pyridine ring C trans to $\mathrm{N}=\mathrm{N}$ azo group of 5 mazpy (B) ligand. In addition, the quaternary carbons unable to show any direct ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ heteronuclear multiple quantum coherence. The [ $\mathrm{Ru}(5 \text { mazpy })_{2}$ azpy] $\left(\mathrm{PF}_{6}\right)_{2}$ complex contains two 5mazpy ligands, thus two methyl carbons are observed at 19.18 and 19.13 ppm . This results consist with the proton of methyl group. This is because, they belong to the non-proonated carbon atoms on the pyridine, phenyl rings. Figure 3.68 shows ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum of this complex.
(c) Nuclear Magnetic Resonance spectroscopy of the $\left[\mathbf{R u}(5 m a z p y)_{2} b p y\right]\left(\mathbf{P F}_{6}\right)_{2}$ complex

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data are listed in Table 3.29.

Table $3.29{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

The ${ }^{1} \mathrm{H}$ NMR spectrum of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ (Figure 3.69) shows ten signals in aromatic region and one signal in aliphatic region. Due to the $C_{2}$ axis present in this complex, the two 5mazpy ligands are equivalent. The spectrum displays distinct eleven signals corresponding to one 5mazpy ligand and one pyridine ring of bpy ligand. The proton on pyridine ring in 5mazpy ligand exhibits at the higher field than in bpy ligand. Owing to the 5mazpy contains the methyl group which is electron donating group. This may be increase electron density on pyridine ring of 5mazpy. In addition, the bpy ligand is trans to $\mathrm{N}=\mathrm{N}$ electron withdrawing group, $\operatorname{azo}(\mathrm{N}=\mathrm{N})$. The proton H 3 and H6 of bpy appear as doublet at 8.97 , and 8.38 ppm, respectively. This $\mathrm{H} 6(J=5.5 \mathrm{~Hz})$ is easily recognised from the smaller $J$ coupling in comparison to the $J$ coupling of the $\mathrm{H} 3(J=8 \mathrm{~Hz})$. The signal of proton H6 of 5mazpy is found at 8.32 ppm as singlet. The methyl signal ( 2.87 ppm ) is observed only one signal due to the symmetry of molecule. The ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectrum in acetone- $d_{6}$ is displayed in Figure 3.70.

The ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.71) shows ten methine carbons, one methyl carbon, and four quaternary carbons. These data are confirmed by using DEPT 135 NMR (Figure 3.72). The methyl carbon, appears at 2.87 ppm . In addition, the signal of quaternary carbons occurs at $163.96,156.11,153.97$, and 143.53 ppm . The ${ }^{13} \mathrm{C}$ NMR signal assignments were based on the ${ }^{1} \mathrm{H}^{13} \mathrm{C}$ HMQC NMR spectroscopy (Figure 3.73). The observed peak at 19.06 ppm is assigned to the methyl carbon, due to the symmetry of molecule. Only one carbon from methyl group is found.

$d=$ doublet, $d d=$ doublet of doublet, $m=$ multiplet, $s=$ singlet, and $t=$ triplet

The ${ }^{1} \mathrm{H}$ NMR spectrum (Figure 3.74) of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $]\left(\mathrm{PF}_{6}\right)_{2}$ complex shows many sharp resonances. In total twenty-two resonances are observed for thirty hydrogens present in this complex. The ${ }^{1} \mathrm{H}$ NMR spectrum shows two sets of 5mazpy signals, and one set of phen signals which is indicated that this molecules
lack $C_{2}$ symmetry. The assignment of all signals is made from ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopic data (Figure 3.75). The pyridine protons appear in the range 9.08-7.99 ppm and the phenyl protons display in the range 7.69-6.36 ppm. The proton H3 of both 5mazpy ligands occurs at 9.08 and 9.05 ppm as $\operatorname{doublet}(J=8.0 \mathrm{~Hz})$. The methyl signal of the 5mazpy ligand is particularly useful to confirm the number of 5mazpy ligand. This spectrum shows two methyl signals at 2.49 and 2.18 ppm which equal heights. The appearance of two signals refer to the presence of two 5mazpy ligands in this molecule, resulting in nonequivalent 5 mazpy ligands.

The ${ }^{13} \mathrm{C}$ NMR signals (Figure 3.76) are assigned and compared with DEPT 135 NMR spectrum (Figure 3.77). The assignments of carbons on ligands are based on ${ }^{1} \mathrm{H}^{-13} \mathrm{C}$ HMQC NMR spectroscopy (Figure 3.78). Ten quaternary carbons are observed at $164.39,162.78,158.19,153.92,146.71,146.37,143.35,142.55$, 131.49, and 131.41 ppm . In addition, the two methyl carbon signals appear at 19.24 and 18.92 ppm which are corroborated with the presence of two 5mazpy ligands in molecule. In addition, these signals show contours with proton at 2.49 and 2.18 ppm , respectively.

$d=$ doublet, $d d=$ doublet of doublet, $d d d=$ doublet of doublet of doublet, $m=$ multiplet, $s=$ singlet, and $t=$ triplet

The ${ }^{1} \mathrm{H}$ NMR spectrum of the $\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex (Figure 3.79) shows signals in aromatic region and aliphatic region. Five sets of pyridine ring and one set of phenyl ring are observed. Due to the $C_{1}$ axis present in this complex, the two bpy ligands are nonequivalent. In each pyridine ring, proton H 3 appears at the most downfield. The resonances have been assigned using ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy (Figure 3.80). The resonances corresponding to the H 6 of both 5mazpy and bpy ligands have a smaller $J$ coupling than the resonances corresponding to the H 3 . The proton H 6 on 5mazpy ligand appears at 8.19 ppm as singlet. This is due to absence of any proton near proton H6. The resonance at 2.31 ppm (singlet), which is attributable to the proton at the methyl group from 5mazpy.

The ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.81) of the two bpy ligands are nonequivalent resulting in twenty-two methine carbons, one methyl carbon, and seven quaternary carbons. This results support by DEPT 135 NMR spectroscopy (Figure 3.82). The chemical shift of methyl carbon of 5mazpy is observed at 19.19 ppm which high field than that free 5mazpy ligand. The ${ }^{13} \mathrm{C}$ NMR signals assignments were based on the ${ }^{1} \mathrm{H}^{13} \mathrm{C}$ HMQC NMR spectrum (Figure 3.83), which exhibit correlation between ${ }^{1} \mathrm{H}$ NMR spectrum and ${ }^{13} \mathrm{C}$ NMR spectrum.

The ${ }^{1} \mathrm{H}$ NMR spectrum of $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ is depicted in Figure 3.84. As this complex has $C_{1}$ symmetry, two phen ligands are inequivalent, resulting in twenty-two resonances in aromatic region, which have been fully assigned using ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy (Figure 3.85). From ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectrum the 5mazpy signals display at the highest field which separate from the pyridine signal. In the spectrum, a singlet corresponding to three protons is observed
at 2.19 ppm . Appearance of the protons of methyl group as a singlet suggest that one 5mazpy ligand in this complex. The high field shift of the methyl group ( 0.23 ppm ) compares to the free ligand indicated a position of this group in the shielding region of the pyridine ring of phen.

The ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.86) consists with the DEPT 135 NMR spectrum (Figure 3.87). This suggests that eleven quaternary carbons in molecule. The carbon signal at 19.57 ppm is assigned to methyl carbon. The carbon chemical shifts of this complex have been assigned by using ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy (Figure 3.88).

### 3.4.6 Cyclic voltammetry

The electrochemical activity of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$, $[\mathrm{Ru}$ $\left.(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes $\left(\mathrm{L}=\right.$ azpy, $5 \mathrm{mazpy} ; \mathrm{L}^{\prime}=$ bpy, phen), was studied in $\mathrm{CH}_{3} \mathrm{CN}$ solution by cyclic voltammetry at a scan rate of $100 \mathrm{mVs}^{-1}$. The voltammetric data are given in Table 3.33 and representative voltammograms are shown in Figure 3.89 to 3.94 . Voltammograms of complexes display metal oxidation on the positive potential and ligand reductions on the negative potential with respect to ferrocene. The one electron nature of oxidation or reduction is establihsed by comparing its current heights with those of standard ferroceneferrocenium couple under identical experiment.

Table 3.33 Cyclic voltammetric data of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complexes in $\mathrm{CH}_{3} \mathrm{CN}(0.1 \mathrm{M} \mathrm{TBAH})$ at scan rate $100 \mathrm{mVs}^{-1}$

$\mathrm{n}=$ cannot be observed; ${ }^{\mathrm{a}}=\mathrm{E}_{1 / 2}=\left(\mathrm{E}_{\mathrm{pa}}+\mathrm{E}_{\mathrm{pc}}\right) / 2$, where $\mathrm{E}_{\mathrm{pa}}$ and $\mathrm{E}_{\mathrm{pc}}$ are anodic and chathodic peak potentials, respectively; $\Delta \mathrm{E}_{\mathrm{p}}=\mathrm{E}_{\mathrm{pa}}-\mathrm{E}_{\mathrm{pc}}$

## Oxidation potential

The oxidation potenial range 0 to +1.50 V at scan rate $100 \mathrm{mVs}^{-1}$ one redox couple is observed for the $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}^{\prime}=\right.$ bpy, phen $)$ complexes while the $\left[\operatorname{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}\left(5 \text { mazpy }^{2}\right)_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2} \quad\left(\mathrm{~L}=\right.$ azpy, $5 \mathrm{mazpy} ; \mathrm{L}^{\prime}=$ bpy, phen) complexes are not observed because the redox of $\mathrm{Ru}(\mathrm{II}) / \mathrm{Ru}(\mathrm{III})$ is too positive to be observed within the solvent window.

For the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex, the oxidation couple at 1.14 V is reversible which is nature as in evident from the peak-to-peak separation, $\Delta \mathrm{E}_{\mathrm{p}} \leq$ 100 mV while the redox potential of $\mathrm{Ru}(\mathrm{II}) / \mathrm{Ru}(\mathrm{III})$ in $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ (Tempiam, S ., 2002) are found to be reversible at $0.91 \mathrm{~V}\left(\Delta \mathrm{E}_{\mathrm{p}}=85 \mathrm{mV}\right)$ which lower than that $[\mathrm{Ru}$ (bpy) $2_{2} 5$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$. The $\left[\mathrm{Ru}(\mathrm{phen})_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex undergo oxidation at $1.11 \mathrm{~V}\left(\Delta \mathrm{E}_{\mathrm{p}}=100 \mathrm{mV}\right)$. The response is attributed to the $\mathrm{Ru}(\mathrm{II}) / \mathrm{Ru}(\mathrm{III})$ couple. The oxidation potential of this complex is compared with $\left[\mathrm{Ru}(\mathrm{phen})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$. Results show that the potential of $\left[\mathrm{Ru}(\mathrm{phen})_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ more positive than that in the $\left[\mathrm{Ru}(\text { phen })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}\left(0.89 \mathrm{~V}, \Delta \mathrm{E}_{\mathrm{p}}=75 \mathrm{mV}\right)$ (Rattanawit, $\left.\mathrm{N} ., 2002\right)$. The results from this study and the reported oxidation potential values demonstrate that $\pi$ acceptance of 5mazpy is greater than bpy and phen. Thus the azopyridine ligand (L) can act as a
much better stabiliser of $\mathrm{Ru}(\mathrm{II})$ ion compare to the bpy and phen ligand, which is of course due to the stronger $\pi$-acid property of L. This results is in accordance with the earlier observations on other metal complexes of L. (Goswami et al., 1983).

## Reduction potential

The reduction potential range 0 to -2.65 V at scan rate $100 \mathrm{mVs}^{-1}$. Four or five successive reductions are observable within this potential window. The azopyridines are well known electron-transfer centres. Thus each ligand can accommodate two electrons in one electrochemically accessible lowest unoccupied molecular orbital (LUMO) which is primarily azo character (Goswami et al., 1983). In addition, the bpy ligand can successively accept two electrons in its lowest unoccupied molecular orbital. Since the ruthenium complexes contain three electroactive ligands, in principle, six successive reductions are expected for each complex.

For the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes, only five of the six couples are detected in this experiment. The interpretation of CV data may be carried out on comparison with the redox properties of ctc-[Ru(5mazpy $)_{2}$ $\left.\mathrm{Cl}_{2}\right],\left[\mathrm{Ru}(\text { azpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ (Changsaluk, U., 2002), $\left[\mathrm{Ru}(\text { bpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(\text { bpy })_{2}\right.$ azpy $]$ $\left(\mathrm{PF}_{6}\right)_{2}$ (Tempiam, S., 2002), $\left[\mathrm{Ru}(\text { phen })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(\text { phen })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ (Rattanawit, N., 2002 ). These are assigned to reductions of the coordinated ligands. Redox data in Table 3.34 reveal that the first reduction potential of the coordinated ligand occurs at a much less negative potential than that of other response and the oxidation potential of metal ion. The first reduction may be expected to involve the ligand having the most stable lowest unoccuiped molecular orbital (Dinda et al., 2006), which is dominated by azo function of azpy and 5mazpy than bpy and phen. The formal potential of the first reduction of the $\left[\mathrm{Ru}\left(5\right.\right.$ mazpy $\left._{3}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $]$ $\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes is $-0.52 \mathrm{~V}\left(\Delta \mathrm{E}_{\mathrm{p}}=60 \mathrm{mV}\right),-0.49 \mathrm{~V}$ $\left(\Delta E_{p}=60 \mathrm{mV}\right),-0.64 \mathrm{~V}\left(\Delta \mathrm{E}_{\mathrm{p}}=60 \mathrm{mV}\right)$ and $-0.68 \mathrm{~V}\left(\Delta \mathrm{E}_{\mathrm{p}}=100 \mathrm{mV}\right)$, respectively. Five couples at negative side of $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ are assigned to gradual addition of electron into one azoimine chelate from 5mazpy and two imine chelates ring in the complexes. In addition, the first reduction potential in [Ru(bpy) 25 mazpy]
$\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(\text { phen })_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ is $-1.03 \mathrm{~V}\left(\Delta \mathrm{E}_{\mathrm{p}}=70 \mathrm{mV}\right)$ and $-1.07 \mathrm{~V}\left(\Delta \mathrm{E}_{\mathrm{p}}=65\right.$ mV ), respectively.

Table 3.34. Cyclic voltammetric data of the ruthenium complexes with the azoimine and imine ligands in $\mathrm{CH}_{3} \mathrm{CN}(0.1 \mathrm{M} \mathrm{TBAH})$ at scan rate $100 \mathrm{mVs}^{-1}$

| Complexes | $\mathrm{E}_{1 / 2}, \mathrm{~V}\left(\Delta \mathrm{E}_{\mathrm{p}}(\mathrm{mV})\right)$ |  |
| :--- | :---: | :---: |

| $\left[\mathrm{Ru}(\mathrm{phen})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}{ }^{\mathrm{c}}$ | $0.89(72)$ | $-1.93(100)$ |

$\mathrm{n}=$ can not be observed, ${ }^{\text {a }}$ (Changsaluk, U., 2002),
${ }^{\mathrm{b}}$ (Tempiam, S., 2002), ${ }^{\mathrm{c}}$ (Rattanawit, N., 2002)

The first reduction potential in all ruthenium complexes, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ $\mathrm{L}]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$, is more positive than the free 5 mazpy ligand $\left(-1.62 \mathrm{~V}, \Delta \mathrm{E}_{\mathrm{p}}=94 \mathrm{mV}\right)$ which due to the positive charge of the metal ion. In the presence of methyl group (in 5mazpy) may shift ligand dominated orbitals to higher energy side than azpy ligand. From this table shows that, the relative values of the potential suggest that the $\pi$-acidity order is azpy $>5$ mazpy
$>$ bpy ~ phen.
The reduction potentials data of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ are listed in equation (7)-(11).
$\left[\mathrm{Ru}^{\mathrm{II}}(5 \text { mazpy })(5 \mathrm{mazpy})(5 \mathrm{mazpy})\right]^{2+}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}(5 \mathrm{mazpy})(5 \text { mazpy })\left(5 \text { mazpy }^{1-}\right)\right]^{+}$
$\left[\mathrm{Ru}^{\mathrm{II}}(5 \text { mazpy })(5 \text { mazpy })\left(5 \text { mazpy }^{1-}\right)\right]^{+}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}(5 \text { mazpy })\left(5 \text { mazpy }^{1-}\right)\left(5 \text { mazpy }^{1-}\right)\right]^{0}$
$\left[\mathrm{Ru}^{\mathrm{II}}(5 \text { mazpy })\left(5 \text { mazpy }^{-1-}\right)\left(5 \text { mazpy }^{-1}\right)\right]^{0}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}\left(5 \text { mazpy }^{1-}\right)\left(5 \text { mazpy }^{1}\right)\left(5 \text { mazpy }^{1-}\right)\right]^{-}$
$\left[\mathrm{Ru}^{\mathrm{II}}\left(5 \text { mazpy }^{1-}\right)\left(5 \text { mazpy }^{-1}\right)\left(5 \text { mazpy }^{{ }^{-}}\right)\right]^{-}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}\left(5 \text { mazpy }^{1-}\right)\left(5 \text { mazpy }^{{ }^{1-}}\right)\left(5 \text { mazpy }^{2-}\right)\right]^{2^{-}}$
$\left[\operatorname{Ru}^{\mathrm{II}}\left(5 \text { mazpy }^{1-}\right)\left(5 \text { mazpy }^{1-}\right)\left(5 \text { mazpy }^{2-}\right)\right]^{2^{-}}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}\left(5\right.\right.$ mazpy $\left.^{1-}\right)\left(5\right.$ mazpy $\left.^{2-}\right)\left(5 \text { mazpy }^{\left.2^{-}-\right)}\right]^{3-}$

Another one expected reduction is not observed presumably due to solvent cut off. The reduction for $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \operatorname{azpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ have been observed. The reductions are actually observed in experiments, equations (12)-(16).
$\left[\mathrm{Ru}^{\mathrm{II}}(5 \mathrm{mazpy})(5 \mathrm{mazpy})(\text { azpy })\right]^{2+}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}(5 \mathrm{mazpy})(5 \mathrm{mazpy})\left(\text { azpy }{ }^{1-}\right)\right]^{+}$
$\left[\mathrm{Ru}^{\mathrm{II}}(5 \mathrm{mazpy})(5 \mathrm{mazpy})\left(\text { azpy }^{1-}\right)\right]^{+}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}(5 \text { mazpy })\left(5 \text { mazpy }^{1-}\right)\left(\text { azpy }^{1-}\right)\right]^{0}$
$\left[\mathrm{Ru}^{\mathrm{II}}(5 \text { mazpy })\left(5 \text { mazpy }^{{ }^{1}-}\right)\left(\text { azpy }^{{ }^{1-}}\right)\right]^{0}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}\left(5 \text { mazpy }^{1-}\right)\left(5 \text { mazpy }^{1-}\right)\left(\text { azpy }^{1-}\right)\right]^{-}$

The reduction potentials of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes $\left(\mathrm{L}^{\prime}\right.$ $=\mathrm{bpy}$, phen) are listed in equation (17)-(21).
$\left[\mathrm{Ru}^{\mathrm{II}}\left(\mathrm{L}^{\prime}\right)(5 \mathrm{mazpy})(5 \mathrm{mazpy})\right]^{2+}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}\left(\mathrm{L}^{\prime}\right)(5 \mathrm{mazpy})\left(5 \text { mazpy }^{1-}\right)\right]^{+}$

The reduction potentials data of the $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}^{\prime}=\mathrm{bpy}\right.$, phen) complexes only four reductions are observed with one electron transfer in each equation (22)-(25).

$$
\begin{align*}
& {\left[\operatorname{Ru}^{\mathrm{II}}\left(\mathrm{~L}^{\prime}\right)_{2}(5 \mathrm{mazpy})\right]^{2+}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}\left(\mathrm{~L}^{\prime}\right)_{2}\left(5 \text { mazpy }^{1-}\right)\right]^{+}}  \tag{22}\\
& {\left[\mathrm{Ru}^{\mathrm{II}}\left(\mathrm{~L}^{\prime}\right)_{2}\left(5 \mathrm{mazpy}{ }^{1-}\right)\right]^{+}+\mathrm{e}^{-} \rightarrow\left[\operatorname{Ru}^{\mathrm{II}}\left(\mathrm{~L}^{\prime}\right)_{2}\left(5 \text { mazpy }^{2-}\right)\right]^{0}}  \tag{23}\\
& {\left[\mathrm{Ru}^{\mathrm{II}}\left(\mathrm{~L}^{\prime}\right)_{2}\left(5 \mathrm{mazpy}^{2-}\right)\right]^{0}+\mathrm{e}^{-} \rightarrow\left[\operatorname{Ru}^{\mathrm{II}}\left(\mathrm{~L}^{\prime}\right)\left(\mathrm{L}^{\prime-1}\right)\left(5 \text { mazpy }^{2}\right)\right]^{-}}  \tag{24}\\
& {\left[\mathrm{Ru}^{\mathrm{II}}\left(\mathrm{~L}^{\prime}\right)\left(\mathrm{L}^{\prime-1}\right)\left(5 \text { mazpy }^{2-}\right)\right]^{-}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Ru}^{\mathrm{II}}\left(\mathrm{~L}^{\prime 1-}\right)_{2}\left(5 \text { mazpy }^{2-}\right)\right]^{2-}} \tag{25}
\end{align*}
$$

The first reduction potential of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $[\mathrm{Ru}$ $\left.(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes $\left(\mathrm{L}=\right.$ azpy, $5 \mathrm{mazpy} ; \mathrm{L}^{\prime}=$ bpy, phen) was compared. Therefore, the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex could accept electron better than the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $]\left(\mathrm{PF}_{6}\right)_{2} \approx\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes, respectively. This is in accorded with the $\pi$-acidity order of the ligands: bipyridine < azopyridine (Santra et al., 1999).

### 3.4.7 X-ray Crystallography

The structure of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex was confirmed by X-ray crystallographic technique.

## (a) X-ray structure of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

The single crystals of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ were grown by slow diffusion of ethanol into acetone solution of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex. The detailed measurement consitions and the crystal data are listed in Table 3.35. The selected bond lengths and bond angles are given in Table 3.36. Figure 3.95 shows the ORTEP and atom numbering scheme for the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} b p y\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex. This complex was crystallized from methanol

The ruthenium ion of this complex is six-coordinated. The coordination geometry around ruthenium(II) is distorted octahedral with coordinating from two $N$-donor centers of bpy and four $N$-donor centers of two 5mazpy units. The pyridine rings of 5mazpy are at the cis position and the two pyridine rings of bpy ligand are trans to the azo groups of the 5mazpy ligands. The trans-angles around the ruthenium center in the plane ranged from $169.5(8)$ to $174.8(8)^{\circ}$ indicating distortions
from the rectilinear geometry. The chelate angles extended by two 5mazpy and one bpy are $74.2(9)$, and 78.1 (7) ${ }^{\circ}$, respectively.

The Ru-N(azo) (2.05(2) $\AA$ ) distances are shorter than Ru-N(pyridine) of 5mazpy (2.06(2) $\AA$ ). The shortening may be due to greater $\pi$-backbonding, $\mathrm{d} \pi(\mathrm{Ru})$ $\rightarrow \pi^{*}$ (azo). In this complex the $\mathrm{N}-\mathrm{N}$ distances of 5mazpy are 1.264(3) $\AA$ which are slightly longer than those of free 5mazpy ligand ( $\mathrm{N}=\mathrm{N} 1.228(2) \AA$, and azpy ( $\mathrm{N}=\mathrm{N}$ 1.248(2) $\AA$, Panneerselvam et al., 2000). In addition, the $\mathrm{N}=\mathrm{N}$ distances of 5mazpy in tris complex, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$, are shorter than that in starting complex, ctc$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right](\mathrm{N}=\mathrm{N} 1.284(3) \AA)$. The coordination could lead to a decrease in the $\mathrm{N}-\mathrm{N}$ bond order due to $\sigma$-donor and $\pi$-acceptor character of the ligands. The RuN (pyridine) of bpy is $2.15(2) \AA$ which longer than $\mathrm{Ru}-\mathrm{N}($ pyridine) distances in 5mazpy. Owing to pyridine rings of bpy is trans to azo function of 5mazpy. The results from the molecular structure of the this complex confirm that 5mazpy is a better $\pi$-acceptor than bpy. The chelate angles extend by 5 mazpy were $74.2(9)^{\circ}$ reveal a considerable distorsion of octahedron, as was found for the complexes [Ru(azpy) ${ }_{2}$ bpy $\left(\mathrm{PF}_{6}\right)_{2}\left(75.7(16)^{\circ}, 76.8(17)^{\circ}\right)$ (Kanidtha et al., 2007). As a consequence of the constraint of the bite angle, the ligands are bent back from the coordinated chlorides.

### 3.5 Syntheses of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and <br> $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}^{2} \mathrm{Cl}_{2}\right.$ complexes ( $\mathrm{L}=\mathrm{azpy}, 5 \mathrm{mazpy} ; \mathrm{L}^{\prime}=\mathrm{bpy}, \mathrm{phen}$ )

Reaction of the $c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex with L ligands (azpy, 5mazpy) in the presence of $\mathrm{AgNO}_{3}$ in methanol afforded tris-complexes, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$, as shown in equation (26).

The $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]^{2+}$ complexes $\left(\mathrm{L}^{\prime}=\mathrm{bpy}\right.$, phen) were isolated as chloride salt, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, by the reaction of $\left[\mathrm{Ru}\left(5\right.\right.$ mazpy $\left.\left.^{2}\right) \mathrm{L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ with tetra -n-butylammoniumchloride in acetone. The synthetic route is shown in equation (27).

Addition of the saturated tetra-n-butylammoniumchloride in acetone to an acetone solution of the complexes $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}^{\prime}=\right.$ bpy, phen $)$ had eliminated $\mathrm{PF}_{6}{ }^{-}$and gave $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ (equation (28)).

The complexes of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ ( $\mathrm{L}=2$-(phenylazo)pyridine (azpy), 5-methyl-2-(phenylazo)pyridine (5mazpy), $\mathrm{L}^{\prime}=2,2^{\prime}$-bipyridine (bpy), 1,10-phenanthroline (phen)) are readily soluble in water. These complexes were synthesized to study DNA-binding. All the
experiments involving the interaction of the complexes with DNA which were carried out using Tris buffer. The physical properties of these complexes are listed in Table 3.37 .

Table 3.37 The physical properties of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ complexes

| Complexes | Physical properties |  |  |
| :--- | :---: | :---: | :---: |
|  | Appearance | Color | Melting point <br> $\left({ }^{\circ} \mathrm{C}\right)$ |

### 3.6 Characterization of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 m a z p y)_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and <br> $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ complexes ( $\mathrm{L}=\mathrm{azpy}, 5 \mathrm{5mazpy} ; \mathrm{L}^{\prime}=\mathrm{bpy}$, phen $)$

All complexes were characterized by following techniques:
3.6.1 Elemental analysis
3.6.2 Infrared spectroscopy
3.6.3 1D and 2D Nuclear Magnetic Resonance spectroscopy

### 3.6.1 Elemental analysis

The elemental analysis data of the complexes were in very good agreement with the calculated values and thus confirmed the composition. The results are summarized in Table 3.38 .

Table 3.38 Elemental analysis data of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$,
$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ complexes

$\mathrm{s}=$ strong, $\mathrm{m}=$ medium

The IR spectral data of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]$ $\mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ complexes ( $\mathrm{L}=$ azpy, 5 mazpy; $\mathrm{L}^{\prime}=$ bpy, phen) were recorded in the range $4000-370 \mathrm{~cm}^{-1}$. The complexes exhibit a broad bands assignable to the water in molecule. at $3500-3400 \mathrm{~cm}^{-1}$ The IR spectra of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]$ $\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$ complexes have compared with the spectra of ctc$\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$. An intense band observes in the range $1604-1429 \mathrm{~cm}^{-1}$ corresponds to $\mathrm{C}=\mathrm{C}, \mathrm{C}=\mathrm{N}$ stretching modes.

The $\mathrm{N}=\mathrm{N}$ stretching band of $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 5 \mathrm{H}_{2} \mathrm{O}$, $[\mathrm{Ru}$ (5mazpy) ${ }_{2}$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ phen $]$ $\mathrm{Cl}_{2} \cdot 5 \mathrm{H}_{2} \mathrm{O}$ is observed at $1363,1360,1341$, and $1338 \mathrm{~cm}^{-1}$, respectively. In ctc$\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$, the $\mathrm{N}=\mathrm{N}$ band appears at $1334 \mathrm{~cm}^{-1}$. However, this band shifts to
higher in the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}$, and $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$ complexes. This results can be implied that the third ligand is competition for the ruthenium $\mathrm{t}_{2 \mathrm{~g}}$ electron and less $\pi$ back-bonding to azo ligand raising the $\mathrm{N}=\mathrm{N}$ bond order.

The $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ complexes contain one azoimine ligand an two imine ligands. From the previous works, the azoimine ligand is the better $\pi$ acceptor than that the imine ligand. Therefore, we have observed that the $\mathrm{N}=\mathrm{N}$ stretching mode in these complexes shifts to lower frequencies than that free 5mazpy ligand $\left(1389 \mathrm{~cm}^{-1}\right)$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$.

The $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $^{2} \mathrm{Cl}_{2}$ complexes were synthesized from the reaction of tetra- $n$-butylammoniumchloride in acetone solution and the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes, respectively. The $\mathrm{v}\left(\mathrm{PF}_{6}{ }^{-}\right)$in complexes of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ disappears in the IR spectra. This results can be used to confirm that the $\mathrm{PF}_{6}{ }^{-}$counter ions were replaced by chloride ions.

### 3.6.3 1D and 2D Nuclear Magnetic Resonance spectroscopy

The ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, DEPT 135, ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY, and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectra of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ complexes were carried out in $\mathrm{CD}_{3} \mathrm{OD}(500 \mathrm{MHz})$ and tetramethylsilane $\left(\mathrm{SiMe}_{4}\right)$ was used as internal reference. The 1D and 2D NMR data of these complexes were described as below.
a) Nuclear Magnetic Resonance spectroscopy of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$ complex

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data are listed in Table 3.40.

Table 3.40 ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR of the $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 5 \mathrm{H}_{2} \mathrm{O}$ complex

$d=$ doublet,$d d=$ doublet of doublet, $s=$ singlet, and $t=$ triplet

The ${ }^{1} \mathrm{H}$ NMR spectrum (Figure 3.102) of the $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{NO}_{3}\right)_{2}$. $5 \mathrm{H}_{2} \mathrm{O}$ complex shows three sets of pyridine ring and three sets of phenyl ring signals. As this complex has $C_{1}$ symmetry, all three 5 mazpy ligands are inequivalent, resulting in eighteen resonances in aromatic region and three resonances in aliphatic region. The pyridine protons appear at the lower field ( 9.10 to 7.96 ppm ) than that the phenyl protons ( 7.57 to 6.85 ppm ). The proton $\mathrm{H} 3(9.10 \mathrm{ppm})$ in pyridine ring C occurs at the lowest field because this pyridine ring is trans to azo group. The protons H6 of 5mazpy ligand exhibit at 8.33 (doublet, $J=1 \mathrm{~Hz}$ ), 8.09 (singlet), and 7.96 ppm (singlet) which are easily recognised from the smaller $J$ coupling in comparison to the $J$ coupling of the proton H 3 and appear at 9.10 (doublet, $J=8 \mathrm{~Hz}$ ), 8.50 (doublet, $J=$ 8 Hz ), and 8.47 ppm (doublet, $J=8 \mathrm{~Hz}$ ). The methyl resonances of 5mazpy ligand in this complex are observed at $2.52,2.51$, and 2.49 ppm . The methyl signal has been particularly confirm that this complex contains three 5mazpy ligands. The assignment of all signals was made from ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopic data. The ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectrum is shown in Figure 3.103. Results from 2D NMR, the three sets of 5mazpy pyridine signals and three sets of 5mazpy phenyl signals have been distinguish.

The ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.104) shows eighteen methine carbons, nine quaternary carbons, and three methyl carbons which supports by the results from DEPT 135 NMR spectrum (Figure 3.105). Carbon atom neighbouring the nitrogen atom shifts to downfield due to the electronegative nitrogen atom. The protonated carbon atoms at C6 of 5mazpy moiety are shifted to downfield in the spectrum ( $153.45,151.38$, and 152.83 ppm ). These signals are used to confirm that this molecule contains three 5mazpy ligand. The assignment of all signals was made from ${ }^{1} \mathrm{H}^{13} \mathrm{C}$ HMQC NMR spectroscopic data. Figure 3.106 displays ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum of the $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$ complex. The ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum provides information regarding the interaction between the protons and the carbon atoms which they are directly attached. In the present complex, the absence of any countours assign to the quaternary carbons. Therefore, this result corresponds to the ${ }^{13} \mathrm{C}$ NMR and DEPT 135 NMR spectroscopic data.
b) Nuclear Magnetic Resonance spectroscopy of the [Ru(5mazpy) 2 $_{2}$ azpy] $\left(\mathbf{N O}_{3}\right)_{2}$.

## $4 \mathrm{H}_{2} \mathrm{O}$ complex

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data are listed in Table 3.41.

Table $3.41{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$ complex

$d=$ doublet,$d d=$ doublet of doublet, $m=$ multiplet, $s=$ singlet, and $t=$ triplet

The ${ }^{1} \mathrm{H}$ NMR spectrum of $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$ (Figure 3.107) in $\mathrm{CD}_{3} \mathrm{OD}$ contains twenty-one proton resonances, which indicates the formation of the mixed-ligand complex. The pyridine protons appear at the lower field ( 9.22 to 7.86 ppm ) than that phenyl protons ( 7.59 to 6.88 ppm ) due to the nitrogen atom in pyridine ring. The protons on pyridine ring of azpy ligand occur at the lower field than protons on pyridine ring of 5mazpy due to trans to $\mathrm{N}=\mathrm{N}$ azo
group. In addition, the 5mazpy ligand contains methyl group which is electron donating group. The signal at 9.22 ppm (doublet, $J=8 \mathrm{~Hz}$ ) is assigned to the proton H 3 of the azpy ligand because this signal has a bigger $J$ coupling than the resonances corresponding to the proton H6 ( 8.53 ppm , doublet of doublet, $J=5.5,1 \mathrm{~Hz}$ ). Besides, the protons H 3 on pyridine ring of the both 5mazpy ligand exhibit ( $8.51,8.48 \mathrm{ppm}$ ) at the downfield than the other protons on pyridine ring. The assignment of individual proton resonances have been assigned using ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy (Figure 3.108). The both pyridine rings of 5mazpy ligand in parent complex, ctc$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$, are trans. If the third ligand (unsymmetric ligand) coordinates to ruthenium ,the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$ complex lacks of $\mathrm{C}_{2}$-symmetry. Therefore, two methyl signals are observed ( 2.50 and 2.49 ppm ).

The ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.109) shows nineteen methine carbons, eight quaternary carbons, and two methyl carbons. This results are supported with DEPT 135 NMR spectroscopy (Figure 3.110). The two carbon signals in aliphatic region are observed at 19.10 and 19.03 ppm which are assigned to methyl carbons. All signals have been assigned using ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy. The ${ }^{1} \mathrm{H}^{13} \mathrm{C}$ HMQC NMR spectrum is displayed in Figure 3.111.
c) Nuclear Mmagnetic Resonance spectroscopy of the[Ru(5mazpy) $\left.\mathbf{2}_{\mathbf{b}} \mathbf{b p y}\right] \mathrm{Cl}_{2} \cdot \mathbf{6 H} \mathbf{2} \mathbf{O}$ complex

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data are listed in Table 3.42.

Table $3.42{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ complex

$d=$ doublet, $d d=$ doublet of doublet, $d d d=$ doublet of doublet of doublet, $s=$ singlet, and $t=$ triplet

The ${ }^{1} \mathrm{H}$ NMR spectrum of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ complex (Figure 3.112) displays eleven protons resonances from thirty protons in molecule. Due to the $C_{2}$ axis present in this complex, the two 5mazpy ligands are equivalent $(\mathrm{A}=\mathrm{B})$ and even the two pyridine rings of bpy ligand are indistinguishable. Form ${ }^{1} \mathrm{H}$ ${ }^{1} \mathrm{H}$ COSY NMR spectrum (Figure 3.113), the two sets of pyridine (bpy and 5mazpy) are observed. They can be assigned using ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy. The proton H 3 (doublet, $J=8 \mathrm{~Hz}$ ) of bpy ligand is easily recognised from the $J$ coupling in comparison to the proton H 6 (doublet, $J=5.5 \mathrm{~Hz}$ ). The signal at 7.93 ppm (singlet) is assigned to proton H6 of 5mazpy, as this resonance exhibits weak COSY NMR cross peak with proton $\mathrm{H} 4(8.12 \mathrm{ppm}$, doublet, $J=1.5 \mathrm{~Hz})$. The assignment of the resonances at 7.52 ppm (triplet, $J=8 \mathrm{~Hz}$ ), 7.33 ppm (doublet of doublet, $J=8,8 \mathrm{~Hz}$ ), 7.23 ppm (doublet, $J=8 \mathrm{~Hz}$ ) as proton $\mathrm{H} 10, \mathrm{H} 9,9^{\prime}$, and $\mathrm{H} 8,8^{\prime}$, respectively. Only one methyl signal iss observed at 2.39 ppm (singlet) because the effective $C_{2}$ symmetry is retained.

The ${ }^{13} \mathrm{C}$ NMR spectrum is illustrated in Figure 3.114. The DEPT 135 NMR spectrum (Figure 3.115) agrees with the carbon spectrum. As [Ru(5mazpy) ${ }_{2}$ bpy] $\mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ has $C_{2}$ symmetry, ten methine carbons, four quaternary carbons and one methyl carbon are observed. The carbon signals at 153.70 and 150.68 ppm are
expected carbon C6(bpy) and C6(5mazpy), respectively. The ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum is shown in Figure 3.116. This ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR data are in correspondence with the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data.
d) Nuclear Magnetic Resonance spectroscopy of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{phen}\right] \mathrm{Cl}_{2} \cdot \mathbf{7 \mathbf { H } _ { 2 } \mathrm { O }}$ complex

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data are listed in Table 3.43.

Table $3.43{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ complex

$d=$ doublet, $d d=$ doublet of doublet, $d d d=$ doublet of doublet of doublet, $m=$ multiplet, $s=$ singlet, and $t=$ triplet

The ${ }^{1} \mathrm{H}$ NMR spectrum of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ complex (Figure 3.117) shows one set of 5mazpy and four protons of phen. The coordination of phen ligand (symmetric ligand) to the isomeric bis(ligand) complex, ctc$\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right]$, results in a complex that has $C_{2}$ axis, resulting in equivalent 5 mazpy ligand. The assignment of all signals was made from ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopic data. This spectrum is shown in Figure 3.118. The protons of pyridine ring from 5mazpy and phen are assigned by using ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopic technique, and NMR spectroscopic data of parent complex, ctc-[Ru(5mazpy) $\left.)_{2} \mathrm{Cl}_{2}\right]$. The resonances corresponding to the proton H6 of 5mazpy ( 7.65 ppm , doublet, $J=$ $1.5 \mathrm{~Hz})$ and proton $\mathrm{H} 2(8.60 \mathrm{ppm}$, doublet of doublet, $J=5,1 \mathrm{~Hz}$ ) of phen have a smaller $J$ coupling than resonances corresponding to the proton H3 of 5mazpy (8.61 ppm , doublet, $J=8 \mathrm{~Hz}$ ) and proton H 4 of phen ( 8.94 ppm , doublet of doublet, $J=8,1$ $\mathrm{Hz})$. The proton $\mathrm{H} 4(8.94 \mathrm{ppm})$ of phen ligand occurs at the lowest field because of trans to the azo nitrogen of the 5mazpy ligand. The phenyl protons of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{phen}\right] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ display at the downfield (7.53 ppm (H10), 7.37 ppm (H9,9'), $\left.7.31 \mathrm{ppm}\left(\mathrm{H} 8,8^{\prime}\right)\right)$ when compared with the $c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right](7.25 \mathrm{ppm}$ (H10), $7.10 \mathrm{ppm}\left(\mathrm{H} 9,9^{\prime}\right), 6.80 \mathrm{ppm}\left(\mathrm{H} 8,8^{\prime}\right)$ ). This results can be implied that the coordination of phen ligand. The phen ligand is $\sigma$-donor and $\pi$-acceptor while the Cl
ligand is $\sigma$-donor. Only one single sharp methyl signal is observed at 2.19 ppm (singlet). It is then resonable to assume that the effective $C_{2}$ symmetry is retained.

The ${ }^{13} \mathrm{C}$ NMR spectrum is displayed in Figure 3.119 which is used to support with DEPT 135 NMR spectrum (Figure 3.120). Ten methine carbons, five quaternary carbons and one methyl carbon are found. The carbon C2(phen) appears at 154.90 ppm and carbon C6(5mazpy) exhibits at 150.85 ppm due to the coordination of nitrogen atom to ruthenium. The carbon signal at 18.82 ppm is assigned to the methyl carbon. Appearance of the carbons of methyl group as one signal suggest that two methyl groups of this complex are magnetically equivalent. This observation is consistent with the ${ }^{1} \mathrm{H}$, DEPT 135, ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY and ${ }^{1} \mathrm{H}_{-}^{13} \mathrm{C}$ HMQC NMR spectroscopic techniques. The ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum is illustrated in Figure 3.121.

$d=$ doublet, $d d=$ doublet of doublet, $d d d=$ doublet of doublet of doublet,
$m=$ multiplet, $s=$ singlet, and $t=$ triplet

The downfield region ( 8.82 to 7.44 ppm ) of ${ }^{1} \mathrm{H}$ NMR spectrum (Figure 3.122) exhibits five sets of pyridine ring. The fact that the two bpy ligand are nonequivalent upon coordination of 5mazpy. With the use of ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR experiment, the bpy and 5mazpy signals are assigned. The protons on pyridine ring of 5mazpy was assigned using the cross peak at the ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectrum (Figure 3.123). The proton H 4 ( 8.16 ppm , doublet, $J=8 \mathrm{~Hz}$ ) of 5mazpy displays intense cross peak with proton H3 ( 8.80 ppm , doublet, $J=8 \mathrm{~Hz}$ ) and weak cross peak
with proton H6 (7.86 ppm, singlet) in COSY NMR spectrum. The proton H3 on pyridine ring C of bpy occurs at the lowest field ( 8.82 ppm ) due to trans to nitrogen atom of azo group. The assignment is performed by comparison with $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right]$ $\left(\mathrm{BF}_{4}\right)_{2}$ (Tempiam, S., 2002). In pyridine ring of bpy, proton H3 appears at lowest field, this is similar to the $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right]\left(\mathrm{BF}_{4}\right)_{2}$ complex. The phenyl protons occur at the highfield region ( 7.33 to 7.16 ppm ). The triplet peak at 7.33 ppm corresponding to proton H10 are observed. The protons methyl signal are assigned at 2.34 ppm as singlet peak.

The ${ }^{13} \mathrm{C}$ NMR spectrum (Figure 3.124) consists with the DEPT 135 NMR spcetrum (Figure 3.125). Twenty-two methine carbons, seven quaternary carbons, and one methyl carbon are observed. The ${ }^{1} \mathrm{H}^{-13} \mathrm{C}$ HMQC NMR spectrum (Figure 3.126) shows cross peak which supports the ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, DEPT 135 , and ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopic experiments.

## f) Nuclear Magnetic Resonance spectroscopy of the [Ru(phen) $\left.\mathbf{2}_{2} \mathbf{5 m a z p y}\right] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$ complex

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data are listed in Table 3.45.

$d=$ doublet, $d d=$ doublet of doublet, $m=$ multiplet, $s=$ singlet, and $t=$ triplet

The ${ }^{1} \mathrm{H}$ NMR spectrum of $\left[\mathrm{Ru}(\text { phen })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ is shown in Figure 3.127. As this complex has $C_{1}$ symmetry, all ligands are inequivalent. Twenty-two proton signals are observed at aromatic region, and one proton signals is found at aliphatic region. The ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectrum is shown in Figure 3.128. Using COSY connectivities the other resonances are assigned. Assignments of proton resonances are made by spin-spin splitting, comparative integration and chemical
shift. The proton H7 of phen (A) is assigned the resonance at 8.90 ppm (doublet, $J=8$ $\mathrm{Hz})$ which occurs at the lowest field due to trans to the azo nitrogen. The 5mazpy signals are clearly present in the ${ }^{1} \mathrm{H}$ NMR spectrum, the proton H 6 at 7.83 ppm (singlet), the proton H 4 at 8.16 ppm (doublet, $J=7.5 \mathrm{~Hz}$ ), and the proton H 3 at 8.85 ppm (doublet, $J=8 \mathrm{~Hz}$ ), and the methyl at 2.24 ppm , respectively. The phenyl protons occur at highfield region ( 7.09 ppm (H10), $6.92 \mathrm{ppm}\left(\mathrm{H} 8,8^{\prime}, \mathrm{H} 9,9^{\prime}\right)$ ) which are similarly to $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $\left.)\right]\left(\mathrm{PF}_{6}\right)_{2}$.

The ${ }^{13} \mathrm{C}$ NMR spectrum of this complex (Figure 3.129) correlates with the DEPT 135 NMR spectrum (Figure 3.130). There are twenty-two methine carbons, eleven quaternary carbons, and only one methyl carbon in this molecule. Besides, the assignments of all signals were made from ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy experiment. This spectrum is depicted in Figure 3.131.

### 3.7 DNA binding

The numerous biological experiments performed so far suggest that DNA is the main cellular target of antitumor drugs because the interaction between small molecules and DNA can cause DNA damage in cancer cells, blocking the division of cancer cells and resulting in cell date (Quiroga et al., 1998). In this experiment, we interested to study interaction of ruthenium complexes with calf thymus DNA (CT DNA). The DNA binding of ruthenium(II) complexes, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2}, \quad\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}(\mathrm{~L}=$ azpy, 5mazpy; $L^{\prime}=$ bpy, phen), with CT DNA had been monitored by absorption titration, competitive binding and viscosity measurements.

### 3.7.1 Absorption titration

Absorption spectral titration of the complexes with CT DNA was followed by monitoring the MLCT bands. The absorption spectra of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} .4 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ bpy $] \mathrm{Cl}_{2}$. $6 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Ru}(\text { phen })_{2}\right.$ 5mazpy] $\mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}$ complexes in the absence and presence of increasing amounts of CT DNA are shown in Figure 3.132 to Figure 3.137. As the DNA concentration is increased, the MLCT transition bands of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(\text { bpy })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Ru}(\text { phen })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$ at 494 nm and $\mathrm{Ru}(5 \text { mazpy })_{2}$ bpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $] \mathrm{Cl}_{2} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ at 515 nm exhibited hypochromism. The binding constant $\left(\mathrm{K}_{\mathrm{b}}\right)$ for binding of the ruthenium(II) complexes to CT DNA are summarizes in Table 3.46. In the all complexes, although no red shift is found, notable hypochromicities are observed. To compare quantitatively the binding strength of the six complexes, the intrinsic binding, $\mathrm{K}_{\mathrm{b}}$, was determined according to following equation (29) (Wolfe et al., 1987).

$$
\begin{equation*}
[\mathrm{DNA}] /\left(\varepsilon_{\mathrm{a}}-\varepsilon_{\mathrm{f}}\right)=[\mathrm{DNA}] /\left(\varepsilon_{\mathrm{b}}-\varepsilon_{\mathrm{f}}\right)+1 /\left(\mathrm{K}_{\mathrm{b}}\left(\varepsilon_{\mathrm{b}}-\varepsilon_{\mathrm{f}}\right)\right) \tag{29}
\end{equation*}
$$

The $\varepsilon_{\mathrm{a}}, \varepsilon_{\mathrm{f}}$ and $\varepsilon_{\mathrm{b}}$ correspond to $\mathrm{A}_{\mathrm{obs}} /[\mathrm{Ru}]$, the extinction coefficient for the free ruthenium complex and the extinction coefficient for the ruthenium complex in fully bound form, respectively. The slope and y intercept of the linear fit of [DNA] $/\left(\varepsilon_{a}-\varepsilon_{f}\right)$ versus [DNA] are $1 /\left(\varepsilon_{b}-\varepsilon_{f}\right)$ and $1 / K_{b}\left(\varepsilon_{b}-\varepsilon_{f}\right)$, respectively. The binding constant $\left(\mathrm{K}_{\mathrm{b}}\right)$ can be obtained from the slope to the y intercept.

Table 3.46 Absorption spectral data and binding constant $\left(\mathrm{K}_{\mathrm{b}}\right)$ for binding of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ complexes with CT DNA

| Complexes | MLCT <br> $\lambda_{\max }(\mathrm{nm})$ | Hypochromism <br> $(\%)$ | $\mathrm{K}_{\mathrm{b}}\left(\mathrm{M}^{-1}\right)$ |
| :--- | :---: | :---: | :---: |
| $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$ | 494 | 6.08 | $1.5( \pm 0.1) \times 10^{5}$ |
| $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} .4 \mathrm{H}_{2} \mathrm{O}$ | 494 | 7.73 | $1.2( \pm 0.2) \times 10^{5}$ |
| $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ bpy $] \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ | 515 | 10.82 | $8.5( \pm 0.2) \times 10^{4}$ |
| $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ | 515 | 7.04 | $9.0( \pm 0.3) \times 10^{4}$ |
| $\left[\mathrm{Ru}(\text { bpy })_{2} 5 \mathrm{mazpy}^{2}\right] \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ | 494 | 9.17 | $6.5( \pm 0.2) \times 10^{4}$ |
| $\left[\mathrm{Ru}(\text { phen })_{2} 5 \mathrm{mazpy}^{2}\right] \mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}$ | 494 | 9.01 | $1.5( \pm 0.2) \times 10^{5}$ |

${ }^{\mathrm{a}}$ In MLCT band; Hypochromism, $\left[\left(\mathrm{A}_{\text {free }}-\mathrm{A}_{\text {bound }}\right) / \mathrm{A}_{\text {free }}\right] \times 100 \%$

The complexes of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy] $\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$ exhibit MLCT transition at 494 nm which show a decrease in intensity that a maximum value of $6.08 \%$ and $7.73 \%$, respectively as the amount of DNA is increase. Intrinsic binding constants, $\mathrm{K}_{\mathrm{b}}$, of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} .4 \mathrm{H}_{2} \mathrm{O}$ complexes are obtained as ca. $1.5( \pm 0.1) \times 10^{5}$, and $1.2( \pm 0.2) \times 10^{5} \mathrm{M}^{-1}$, respectively. Then the binding constants of [ $\mathrm{Ru}(5 \text { mazpy })_{2}$ bpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $] \mathrm{Cl}_{2} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ are calculated by the ration of slope to intercept as $8.5( \pm 0.2) \times 10^{4} \mathrm{M}^{-1}$ and $9.0( \pm 0.3) \times 10^{4} \mathrm{M}^{-1}$, respectively.

In addition, the percentage hypochromicities of MLCT band upon binding to DNA are found to be $10.82 \%$ and $7.04 \%$ for $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$, respectively. The binding constants of $\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$, with calf thymus DNA were determined from the decay of the absorbance monitor at 494 nm of both complexes. The determined binding constants are about $6.5( \pm 0.2) \times 10^{4} \mathrm{M}^{-1}(\% \mathrm{H}=$ 9.17) and $1.5( \pm 0.2) \times 10^{5} \mathrm{M}^{-1}(\% \mathrm{H}=9.01)$ for $\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ and [ Ru (phen) $)_{2} 5$ mazpy $] \mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}$, respectively.

These values are comparable to that observed for $\left[\mathrm{Ru}(\mathrm{phen})_{2} \mathrm{phi}\right]^{2+}(\mathrm{phi}$ $=9,10$-phenanthrenequinonediimine) $\left(4.7 \times 10^{4} \mathrm{M}^{-1}\right)$ (Pyle et al., 1989), but smaller than those observed for $\left[\mathrm{Ru}(\mathrm{bpy})_{2}(\mathrm{dppz})\right]^{2+}\left(>10^{6} \mathrm{M}^{-1}\right)$ (Friedman et al., 1990) and $\left[\mathrm{Ru}(\mathrm{ip})_{2}(\mathrm{dppz})\right]^{2+}(\mathrm{ip}=\operatorname{imidazo}[4,5-f][1,10]$ phenanthroline $)\left(2.1 \times 10^{7} \mathrm{M}^{-1}\right)($ Jenkins et al., 1992). The strength of the interaction of complexes with DNA increases in order $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 5 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ru}(\text { phen })_{2}(5\right.$ mazpy $\left.)\right] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]$ $\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $] \mathrm{Cl}_{2} \cdot 7 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, and $[\mathrm{Ru}$ (bpy) 25 mazpy$] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$. The moderate binding for these complexes was comparable to those observed for many ruthenium complexes (Zou et al., 2001), but smaller than the classical interactions and metallointercalators whose binding constants are in the order of $10^{7}$ (Cory et al., 1985).

### 3.7.2 Competitive binding

No luminescence is observed for all of complexes, $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]$ $\left(\mathrm{NO}_{3}\right)_{2} \cdot 5 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ bpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}, \quad[\mathrm{Ru}$ (5mazpy) ${ }_{2}$ phen $] \mathrm{Cl}_{2} \cdot 7 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(\text { bpy })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Ru}(\text { phen })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} .9$ $\mathrm{H}_{2} \mathrm{O}$ at room temperature in aqueous solution. Hence competitive binding studies using ethidium bromide (EB) bound to DNA were carried out for these complexes. The quenching extent of fluorescence of EB bound to DNA was used to determine the binding of complexes and DNA. Binding of complex results in the displacement of bound EB molecule with a reduction of emission intensity. The addition of the complexes to DNA pretreated with EB caused appreciable reduction in the emission intensity, indicating that the displacement of EB fluorophore by the complexes results in a decrease of the binding of EB to DNA. The data form this experiment were fited into the classical Stern-Volmer equation (30) (Lakowicz and Webber, 1973).

$$
\begin{equation*}
\mathrm{I}_{0} / \mathrm{I}=1+\mathrm{Kr} \tag{30}
\end{equation*}
$$

The $\mathrm{I}_{0}$ and I are the luminescence intensities in the absence and presence of complex, respectively; K is a linear Stern-Volmer quenching constant; r is the ration of total concentration of complex to that of DNA.

The emission spectra of EB bound to DNA in the absence and presence of complex and the fluorescence quenching curves of EB bound to DNA by the ruthenium (II) complexes and are shown in Figure 3.138-3.143. The Emission spectral data and linear Stern-Volmer quenching constant (K) on binding to CT DNA are summarized in Table 3.47.

In the plot of $\mathrm{I}_{0} / \mathrm{I}$ versus $[\mathrm{Ru}] /[\mathrm{DNA}], \mathrm{K}$ was given by the ratio of the slope to the intercept. The K values for $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$, $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} .4 \mathrm{H}_{2} \mathrm{O}$ were estimated using equation (2) which are $4.92(\mathrm{R}=0.997)$ and $4.47(\mathrm{R}=0.992)$ respectively, and suggest that the interaction of the complex $[\mathrm{Ru}$ $\left.(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$ with DNA is strong as compared to that with $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$ which is consistent with the above absorption spectral results.

In comparison of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}^{2}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ phen $] \mathrm{Cl}_{2} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ complexes, the K of $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ phen $] \mathrm{Cl}_{2} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ are 4.04 and 4.68 , respectively; the R values of their linear fit plot of $\mathrm{I}_{0} / \mathrm{I}$ versus [Complex]/[DNA] are 0.994 and 0.995 , respectively. The data suggest that the interaction of $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ with CT DNA is stronger than $[\mathrm{Ru}$ $\left.(5 \text { mazpy })_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ which correspond to the data absorption titration.

The K values for the complexes $\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and [ Ru (phen) $)_{2} 5$ mazpy $] \mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}$ were 4.37 and 4.46 , respectively. According to these data, the magnitude of binding affinity of both complexes with DNA is $\left[\mathrm{Ru}(\text { bpy })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}<\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$. All of these results are consistent with the above absorption spectral results.

Table 3.47 Emission spectral data and linear Stern-Volmer quenching constants (K) for binding of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right] \mathrm{Cl}_{2}$ and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2}$ complexes with CT DNA

### 3.7.3 Viscosity measurements

Further clarification of the interaction between the ruthenium complexes and DNA was carried out by viscosity measurements. Hydrodynamic measurements that are sensitive to length change (i.e., viscosity, sedimentation) and are regarded as the least ambiguous and the most critical tests of binding in solution in the absence of crystallographic structural data. A classical intercalation model results in lengthening the DNA helix, as base pairs are separated to accommodate the binding ligand, leading to the increase of DNA viscosity. In contrast, a partial and/or non-classical intercalation of ligand could bind (or kink) the DNA helix, reducing its effective length and, concomitantly, its viscosity (Satyanarayana et al., 1992). Effects of the complexes together with $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ and Eithidium Bromide EB on the viscosity are shown in Figure 3.144-3.146. Ethidium bromide (EB) is a known DNA classical intercalator and increase the relative specific viscosity for the lengthening of the DNA double helix through the intercalation mode; while for complex $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right]^{2+}$ which has been well known to bind with DNA only through the electrostatic mode, it exerts essentially no effect on DNA viscosity.

The effects of $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2}$ $.4 \mathrm{H}_{2} \mathrm{O}$ on the viscosity of CT DNA is shown in Figure 3.144. The viscosity of CT DNA bound with the both complexes and EB increase dramatically, indicating that both complexes intercalate the base pairs of DNA but is still smaller than those bound with EB. The experimental results suggest that the relative viscosity of CT DNA increase, which follows the order $\mathrm{EB}>\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}>\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy] $\left(\mathrm{NO}_{3}\right)_{2} .4 \mathrm{H}_{2} \mathrm{O}$.

The effects of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, together with $[\mathrm{Ru}$ (5mazpy) ${ }_{2}$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$, on the viscosity of rod-like DNA are shown in Figure 3.145. Upon increasing concentration of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ and $[\mathrm{Ru}$ (5mazpy) $\left.{ }_{2} \mathrm{phen}\right] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$, the viscosity of the DNA also increase but is smaller than those bound with EB. The results indicat that $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ can intercalate into DNA base pairs slightly stronger than $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$.

Figure 3.146 shows the effects of $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$ on the viscosity of CT DNA. On increasing the
amounts of $\left[\mathrm{Ru}(\text { bpy })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$, the relative viscosity of DNA increase steadily, this is similar to the behavior of EB. The increase degree of viscosity, which may depend on its affinity to DNA, follows the order of $\mathrm{EB}>\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}>\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$. The results from the viscosity are consistent with the spectroscopic results.

Figure 3.144 Effects of increasing amount of the complexes of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2}$ $.5 \mathrm{H}_{2} \mathrm{O} \quad(\ominus), \quad\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}(\boldsymbol{\wedge}),\left[\mathrm{Ru}(\text { bpy })_{3}\right] \mathrm{Cl}_{2}$. $6 \mathrm{H}_{2} \mathrm{O}(■)$ and Ethidium Bromide $(\diamond)$ on relative viscosities of CT DNA at $25^{\circ} \mathrm{C} .([\mathrm{DNA}]=300 \mu \mathrm{M},[\mathrm{Ru}] /[\mathrm{DNA}]=0$ to $0.24 \mu \mathrm{M})$

### 3.7.4 Cyclic voltammetry

The application of electrochemical methods to study of metallointercalation and coordination of metal ions and chelates to DNA provides a useful complement to the previously used methods of investigation, such as UVVisible spectroscopy. A summary of the voltammetric results is given in Table 3.48 and typical CV responses of ruthenium complexes in Tris-base buffer in the presence and absence of CT DNA are shown in Figure 3.147 to Figure 3.152.

On the addition of DNA $(\mathrm{R}=5)$ to all the complexes, the peak potential seperation $\Delta \mathrm{E}_{\mathrm{p}}$ decrease or increase depending on the ligand. The $\mathrm{E}_{1 / 2}$ values of the DNA-bound complexes follow the same order as that for free complexes. Analogous to the treatment of the association of small molecules with micelles (Kaifer and Bard 1985). In addition, the positive shifts of peak potentials indicate that this interaction mode may be intercalation between ruthenium complex and DNA (Carter and Bard, 1987). The formal potentials, ( $\mathrm{E}_{1 / 2}$ ) were taken as the average of the anodic ( $\mathrm{E}_{\mathrm{pa}}$ ) and cathodic peak potentials ( $\mathrm{E}_{\mathrm{pc}}$ ) obtained from cyclic voltammetry. The net shift in $\mathrm{E}_{1 / 2}$ can be used to estimate the ratio of equilibrium constants for the binding of $\mathrm{Ru}(\mathrm{II})$ and $\mathrm{Ru}(\mathrm{III})$ complexes to DNA using the equation (31) (Maheswari and Palaniandavar, 2004).

$$
\begin{equation*}
\mathrm{E}^{0,}{ }_{\mathrm{b}}-\mathrm{E}_{\mathrm{f}}^{0{ }_{\mathrm{f}}}=0.059 \log \left(\mathrm{~K}_{2+}+\mathrm{K}_{3+}\right) \tag{31}
\end{equation*}
$$

The $\mathrm{E}^{0{ }_{\mathrm{b}}} \mathrm{and} \mathrm{E}^{0 \prime}{ }_{f}$ are the formal potentials of the $3+/ 2+$ couple in the free and bound forms, respectively, and $\mathrm{K}_{2+}$ and $\mathrm{K}_{3+}$ are the binding constants for the respective binding of $2+$ and $3+$ species to DNA.

All of complexes, the cyclic voltammetric data of complexes in the absence and presence of DNA showed only reduction peak. In this work, the first reduction peak was used to estimated the $\mathrm{K}_{2+} / \mathrm{K}_{3+}$ value. In the absence of DNA, the ligand based reduction is observed at -0.53 V and -0.54 V for $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2}$ $.5 \mathrm{H}_{2} \mathrm{O}$ (Figure 3.147) and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} .4 \mathrm{H}_{2} \mathrm{O}$ (Figure 3.148), respectively. In the absence of DNA this peak shifts to -0.50 V and -0.52 V for the former and latter complexes, respectively .

The cyclic voltammograms of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} b p y\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $[\mathrm{Ru}$ (5mazpy) $\left.{ }_{2} \mathrm{phen}\right] \mathrm{Cl}_{2} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ in the absenc and presence of DNA are displayed in Figure 3.149 and 3.150, respectively. In the absence of DNA, the $\mathrm{E}_{\mathrm{pc}}$ of -0.71 V for $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O},-0.67 \mathrm{~V}\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{phen}\right] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ and the $\mathrm{E}_{\mathrm{pa}}$ of both complexes occurs at -0.64 V and -0.61 V , respectively. The formal potential $\mathrm{E}_{1 / 2}$, take as the average of $\mathrm{E}_{\mathrm{pc}}$, are -0.64 , and -0.63 V , respectively. In the presence of DNA, the formal potential $\mathrm{E}_{1 / 2}$ of $\left.\left[\mathrm{Ru}(5 \text { mazpy })_{2}{ }_{2}{ }^{2}{ }^{2}\right]\right]_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$ are -0.57 , and -0.55 V , respectively. In the solution at the same concentration of both complexes caused a shift to positive potential.

The $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ (Figure 3.151) and $\left[\mathrm{Ru}(\mathrm{phen})_{2}\right.$ 5mazpy] $\mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}$ (Figure 3.152) complexes shows the irreversible wave peak. The anodic peak potential in the absence of DNA of $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(\text { phen })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}$ at -0.96 V , and -0.98 V , respectively. The anodic peak potential of the reduction of ligand has been found to shift to a more positive value of $-0.92 \mathrm{~V}\left(\left[\mathrm{Ru}(\text { bpy })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}\right)$ and $-0.90 \mathrm{~V}\left(\left[\mathrm{Ru}(\text { phen })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}\right)$ in the presence of DNA.

${ }^{\text {a }}$ Measured vs ferrocene methanol, scan rate $100 \mathrm{mVs}^{-1}$; supporting electrolyte (pH 7.1); complex concentration $5 \times 10^{-4} \mathrm{M}$.
${ }^{\mathrm{b}} \mathrm{R}=[\mathrm{DNA}] /[$ Ruthenium $]$
${ }^{c}$ Based on $E_{1 / 2}$ values from cyclic voltammetry measurements.

On the addition of DNA $(\mathrm{R}=5)$ to all the complexes, the reduction peak shifts to less negative potential and slightly drop of the voltammetric currents which can be attributed to diffusion of the metal complexes bound to the large, slowly diffusing DNA molecule. The results parallel to the above spectroscopic and viscosity data.

Figure 3.152 Cyclic voltammograms of the $\left[\mathrm{Ru}(\mathrm{phen})_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}$ complex in absence (solid line) and presence (dash line) of CT DNA in 5 mM Tris $/ 50 \mathrm{mM} \mathrm{NaCl}$ buffer ( pH 7.2 ) at scan rate $100 \mathrm{mVs}^{-1}$.

### 3.7.5 DNA cleavage study

The potential of the present complexes to cleave DNA was studied by gel electrophoresis using pBIND DNA in TAE buffer. When circular plasmid DNA was subjected to electrophoresis, relatively. Fast migration will be observed for the intact supercoil form (Form I, ccc form). If scission occurs on one strand (nicking), the supercoiled will relax to generate a slower-moving open circular form (Form II, OC form). If the both strands are cleaved, a linear form (Form III) will be generated (Selvakumar et al., 2006).

Figure 3.153 reveals the conversion of Form I, II and III in the presence of varying concentrations of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$. No DNA cleavage is observed for controls in which the complex was absent (lane 0 ) with increasing concentration of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 5 \mathrm{H}_{2} \mathrm{O}$ (lane 1-5) diminish gradually, whereas Form II increase. In addition, linear form, Form III, are observed.

Figure 3.154 shows the gel electrophoretic seperation of pBIND DNA with different concentrations of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{phen}\right]$ $\mathrm{Cl}_{2} \cdot 7 \mathrm{H}_{2} \mathrm{O}$. Control experiment (lane 0) suggests that untreated DNA does not show any cleavage, with increasing concentration of rutenium(II) complexes (lane 1-5 for $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ bpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, lane 6-10 for $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ phen $\left.] \mathrm{Cl}_{2} \cdot 7 \mathrm{H}_{2} \mathrm{O}\right)$. The amount of Form I of pBIND DNA decreases whereas that of Form II increase and slightly increase Form III. Under comparable experimental conditions, $\left[\mathrm{Ru}(5 \mathrm{mazpy}){ }_{2}\right.$ phen] $\mathrm{Cl}_{2}$ $.9 \mathrm{H}_{2} \mathrm{O}$ exhibits more effective DNA cleavage activity than $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} .6$ $\mathrm{H}_{2} \mathrm{O}$.

Figure 3.155 exhibits gel electrophoresis separation of pBIND DNA after incubation with $\left[\mathrm{Ru}(\text { bpy })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$. For pBIND untreated with complex, no cleavage is observed (lane 0 ). On the other hand, formation of the open circular form, Form II, of DNA is found when DNA is treated with $\left[\mathrm{Ru}(\text { bpy })_{2} 5 \mathrm{mazpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ (lane $1-5$ ) and $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$ (lane 6-10). The different DNA cleavage efficiency of the six complexes is due to the different binding affinity of the complexes to DNA.

Figure 3.153 Electrophoresis behavior of the pBIND DNA in the presence of complexes on $1 \%$ agarose gel electrophoresis. Lane 0 : plasmid DNA; lane 1-5: plasmid DNA was incubated with 20, 40, 60, 80, and $100 \mu \mathrm{M}$ of $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$, respectively; lane 6-10: plasmid DNA was incubated with $20,40,60,80$, and $100 \mu \mathrm{M}$ of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]$ $\left(\mathrm{NO}_{3}\right)_{2} .5 \mathrm{H}_{2} \mathrm{O}$ respectively. Form I, II and III refer to supercoil form, open circular form, and linear form, respectively.

Figure 3.154 Electrophoresis behavior of the pBIND DNA in the presence of complexes on $1 \%$ agarose gel electrophoresis. Lane 0 : plasmid DNA; lane 1-5: plasmid DNA was incubated with 20, 40, 60, 80, and $100 \mu \mathrm{M}$ of [ $\mathrm{Ru}(5 \mathrm{mazpy})_{2}$ phen $] \mathrm{Cl}_{2} .7 \mathrm{H}_{2} \mathrm{O}$, respectively; lane 6-10: plasmid DNA was incubated with $20,40,60,80$, and $100 \mu \mathrm{M}$ of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ bpy] $\mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ respectively. Form I, II and III refer to supercoil form, open circular form, and linear form, respectively.

Figure 3.155 Electrophoresis behavior of the pBIND DNA in the presence of complexes on $1 \%$ agarose gel electrophoresis. Lane 0: plasmid DNA; lane 1-5: plasmid DNA was incubated with 20, 40, 60, 80, and $100 \mu \mathrm{M}$ of $\left[\mathrm{Ru}(\text { phen })_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2} .9 \mathrm{H}_{2} \mathrm{O}$, respectively; lane 6-10: plasmid DNA was incubated with $20,40,60,80$, and $100 \mu \mathrm{M}$ of [ $\mathrm{Ru}(\text { bpy })_{2} 5$ mazpy $^{2} \mathrm{Cl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ respectively. Form I, II and III refer to supercoil form, open circular form, and linear form, respectively.

### 3.8 Cytotoxicity assay

The ruthenium(II) complexes exhibit a widely applied foreground in the search of new anticancer drugs (Velders et al, 2000; Hotze et al, 2004 ). Recently, some ruthenium(II) complexes, ctc-[Ru(azpy) $\left.{ }_{2} \mathrm{Cl}_{2}\right](\alpha)$, ccc- $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right](\beta)$, tcc$\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right](\gamma)$, have been reported. The $\alpha-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ complex shows a very pronounced cytotoxicity, higher than that of cisplatin in all cell lines. The $\beta$ $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ complex was approximately a factor of 10 less active than the $\alpha$ $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ and, in contrast to literature data (Velders et al, 2000), $\gamma$ $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ showed an activity comparable to that of the $\alpha-\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$. To further investigate the cytotoxic activity, the rutenium(II) complexes with 5-methyl-2(phenylazo)pyridine ligand have been studied. The first part of cytotoxicity was studied at Cancer Drug Resistance Group, Centenary Institute of Cancer Medicine \& Cell Biology, University of Sydney, Australia. There were several human tumor cell lines (A549, CEM, IGROV, MCF-7, PC3, SK-MEL-28, and WIDR). The compounds in the second part were tested $\mathrm{IC}_{50}$ at National Center for Genetic Engineering and Biotechnology, Bangkok, Thailand, with three cell lines (Anti-NCI-H187, BC, and $\mathrm{KB})$.

The in vitro cytotoxicity effects of the parent complexes, $\alpha, \beta, \gamma-$ $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$, and the $\alpha, \beta, \gamma-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes were compared with cisplatin (positive control), in a series of human tumor cell lines are listed in Table 3.49. A DMSO stock solution was used in the cytotoxicity tests of all complexes, as these complexes are poorly water soluble. The $\mathrm{IC}_{50}$ values represent the concentration of a drug that is required for $50 \%$ reduction of cellular growth. The $\alpha-$ $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex is more active in all cell lines, while $\gamma-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ is less active in all cell lines. In addition, the $\alpha-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex shows higher activity in the lung cancer (A549) and colon cancer cell lines (WIDR) cell lines than that of cisplatin. However, this isomer shows activity slightly below that of cisplatin in ovarian cencer (IGROV), breast cancer (MCF-7), and prostate cancer (PC3), melanoma cancer (SK-MEL-28), and leukemia (CEM) cell lines. In comparison to the parent complexes, $\alpha, \beta, \gamma-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$, the $\alpha, \beta, \gamma-\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$
$\left.\mathrm{Cl}_{2}\right]$ complexes show a lower activity than the $\alpha, \beta, \gamma-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ complexes in most cell lines. The $\mathrm{IC}_{50}$ curves of $\alpha, \beta, \gamma-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right], \alpha, \beta, \gamma-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$, and cisplatin are illustrated in Figure 3.156-3.162, respectively. Results from these data showed that the $\alpha$-isomer of $\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ ( $\mathrm{L}=$ azpy, 5 mazpy) displayed a high cytotoxicity.

Table 3.49 $\mathrm{IC}_{50}$ values ${ }^{\mathrm{a}}(\mu \mathrm{M})$ of a series of ruthenium(II) complexes and cisplatin against a resies of tumor cell lines (A549, CEM, IGROV, MCF-7, PC3, SK-MEL-28, and WIDR)

Figure 3.162 $\mathrm{IC}_{50}$ curves of cisplatin against a resies of tumor cell lines A549 (a), CEM (b), IGROV (c), MCF-7 (d), PC3 (e), SK-MEL-28 (f) and WIDR (g)

Besides, the $\mathrm{IC}_{50}$ values of ruthenium(II) complexes, in small cell lung cancer (Anti-NCI-H187), breast cancer (BC), and oral human epidermal carcinoma (KB) cell lines were determined. The cytotoxicity of ruthenium(II) complexes in a series of human tumor cell lines are listed in Table 3.50. In comparison to the parent complexes, $\alpha, \beta, \gamma-\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$, the $\gamma-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex is slightly active only in small cell lung cancer cell line. In addition, the $\gamma$ isomer shows a higher activity than ellipticine which is positive control. The $\alpha, \beta, \gamma-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes are inactive in oral human epidermal carcinoma and breast cancer. The tris chelates complexes, $\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{3}\right]$ $\left(\mathrm{NO}_{3}\right)_{2} \cdot 5 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ azpy $]\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$, are active in all cell lines (Anti-NCI-H187, BC, KB). The $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(\mathrm{phen})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes show weakly active in small cell lung cancer. The $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{phen}\right]$ $\left(\mathrm{PF}_{6}\right)_{2}$ complex displays moderatly active $\left(\mathrm{IC}_{50}=7.64 \mu \mathrm{~g} / \mathrm{mL}\right)$ in oral human epidermal carcinoma. The complexes of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right] \mathrm{Cl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and $[\mathrm{Ru}$ (5mazpy) ${ }_{2}$ phen $] \mathrm{Cl}_{2} \cdot 9 \mathrm{H}_{2} \mathrm{O}$ show weakly active in oral human epidermal carcinoma with $\mathrm{IC}_{50} 17.64$ and $15.41 \mu \mathrm{~g} / \mathrm{mL}$, respectively.

Table 3.50 $\mathrm{IC}_{50}$ values $^{\mathrm{a}}(\mu \mathrm{g} / \mathrm{mL})$ of a series of ruthenium(II) complexes and cisplatin against a resies of tumor cell lines (Anti-NCI-H187, BC, and KB)

$<5 \quad$ Strongly active

## CHAPTER 4

## CONCLUSION

The new a symmetric bidentate ligand, 5-methyl-2-(phenylazo) pyridine (5mazpy), was synthesized and it reacted with $\mathrm{RuCl}_{3} .3 \mathrm{H}_{2} \mathrm{O}$ in ethanol under refluxing condition. Three isomers of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ were isolated by column chromatography. There are cis-trans-cis (ctc, $\alpha$ ), cis-cis-cis (ccc, $\beta$ ), and trans-cis-cis (tcc, $\gamma$ ) by the order of coordinating pairs of $\mathrm{Cl}, \mathrm{N}(\mathrm{py})$, and $\mathrm{N}($ azo $)$, respectively. In addition, the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]$ $\left(\mathrm{PF}_{6}\right)_{2}$ complexes ( $\mathrm{L}=2$-(phenylazo)pyridne (azpy), 5-methly-2-(phenylazo)pyridne (5mazpy); L' = 2, 2'-bipyridine (bpy), and 1,10-phenanthroline (phen)) were also synthesized. They have been characterized by elemantal analysis, mass spectrometry, UV-Visible absorption spectroscopy, infrared spectroscopy, ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, DEPT $135,{ }^{1} \mathrm{H}$ ${ }^{1} \mathrm{H}$ COSY, and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy and their electrochemical properties were also studied by cyclic voltammetry. The structures of 5mazpy, ctc-, ccc-, tcc-[ $\left.\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$, and $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ have been confirmed by $\mathrm{X}-$ ray crystallography.

Results from X-ray crystallography show that the N-N distances in ctc, ccc-, $t c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$, and $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ are longer than those in the free 5mazpy ligand. In addition, the average $\mathrm{Ru}-\mathrm{N}$ (azo) distances are shorter than average $\mathrm{Ru}-\mathrm{N}(\mathrm{py})$ distances. The $5 m a z p y$ ligand exhibits a sharp band at $1389 \mathrm{~cm}^{-1}$, corresponding to $\mathrm{N}=\mathrm{N}$ stretching mode. In the ctc-, ccc-, and tcc-[Ru(5mazpy) $\left.)_{2} \mathrm{Cl}_{2}\right]$ complexes the $\mathrm{v}_{(\mathrm{N}=\mathrm{N})}$ is red shifted by $1299-1334 \mathrm{~cm}^{-1}$, which is a good indication of N -coordination. The $\mathrm{v}_{(\mathrm{N}=\mathrm{N})}$ in $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ is also shifted to lower energy than that of the free ligand. In addition, in $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}^{\prime}=\right.$ bpy, phen $), \mathrm{N}=\mathrm{N}$ stretching mode occurs at lower energy than $\left[\mathrm{Ru}\left(5\right.\right.$ mazpy $\left._{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2}(\mathrm{~L}=$ azpy , 5mazpy $)$. As the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2}\right.$ $\mathrm{L}]\left(\mathrm{PF}_{6}\right)_{2}$ complexes contain more azoimine group than the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complexes. Besides the $\mathrm{v}_{(\mathrm{N}=\mathrm{N})}$ in $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}\left(\mathrm{~L}^{\prime}=\right.$ bpy ,phen) appears at lower frequencies than that $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$ because the former complexes
contain one azo imine ligand and the latter complexes contain two azoimine ligands. Solution electronic spectra of the complexes revealed that the ctc-, and ccc$\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes exhibit highly intense MLCT transitions at higher energy than the tcc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex. Only one intense band is observed in the visible region for $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2}\right.$ 5mazpy] $\left(\mathrm{PF}_{6}\right)_{2}$. The ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, DEPT 135, ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY, and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectroscopy are used to supported the structure of compounds. All the three isomers of $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ exhibit one reversible peak and one irriversible peak. Furthermore, The reduction potential in negative region shifts from the free ligand value. In $\left[\mathrm{Ru}\left(5 \text { mazpy }^{2}\right)_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}\left(5 \text { mazpy }^{2}\right)_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$, the $\left[R u(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex can accept electron better than those of $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2} \approx\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$.

The water soluble complexes, $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ $\left.\mathrm{L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $] \mathrm{Cl}_{2}$ ( $\mathrm{L}=$ azpy, 5 mazpy; $\mathrm{L}^{\prime}=$ bpy, phen) were also synthesized for study DNA binding properties. The interaction of a series of mixed ligand complexes with Calf thymus DNA has been monitored by absorption titration, competitive binding, viscosity measurements and cyclic voltammetry. Furthermore, the cleavage experiment was also investigated by argarose gel electrophoresis.

The ctc, ccc, tcc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right],\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2}\right.$ 5mazpy $]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}\right]\left(\mathrm{NO}_{3}\right)_{2},\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{~L}^{\prime}\right] \mathrm{Cl}_{2}$, and $\left[\mathrm{Ru}\left(\mathrm{L}^{\prime}\right)_{2} 5\right.$ mazpy $\left.^{2}\right] \mathrm{Cl}_{2}$ complexes were investigated the activity against a series of tumor cell lines (A549, CEM, IGROV, MCF-7, PC3, SK-MEL-28, WIDR, Anti-NCI$\mathrm{H} 187, \mathrm{BC}$, and KB$)$. The results show that the $c t c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex is high activity than that $c c c$ - and $t c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ in all cell lines.

## APPENDIX

## Cut off solvents

Table A. 1 The solvents for UV-Visible spectrum and the their cut-off

| Solvents | $\lambda(\mathrm{nm})$ |
| :---: | :---: |
| $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ | 230 |
| $\mathrm{CH}_{3} \mathrm{COCH}_{3}$ | 330 |
| DMF | 270 |
| DMSO | 265 |
| $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ | 195 |
| $\mathrm{CH}_{3} \mathrm{OH}$ | 195 |
| $\mathrm{CH}_{3} \mathrm{CN}$ | 195 |

Figure A. 1 Cyclic voltammograms of the 5mazpy ligand in the reduction range with various scan rates ( $50-1000 \mathrm{mVs}^{-1}$ )

Figure A. 2 Cyclic voltammograms of the $c t c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex - couple (a), couple II (b) in the reduction range and couple $\mathrm{Ru}(\mathrm{II} / \mathrm{III})$ (c) in oxidation range with various scan rates $\left(50-1000 \mathrm{mVs}^{-1}\right)$

Figure A. 3 Cyclic voltammograms of the $c c c-\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} \mathrm{Cl}_{2}\right]$ complex - couple I (a), couple II (b) in the reduction range and couple $\mathrm{Ru}(\mathrm{II} / \mathrm{III})$ (c) in oxidation range with various scan rates $\left(50-1000 \mathrm{mVs}^{-1}\right)$

Figure A. 4 Cyclic voltammograms of the $t c c-\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ complex - couple I (a), couple II (b) in the reduction range and couple $\mathrm{Ru}(\mathrm{II} / \mathrm{III})$ (c) in oxidation range with various scan rates $\left(50-1000 \mathrm{mVs}^{-1}\right)$

Figure A. 5 Cyclic voltammograms of the $\left[\mathrm{Ru}\left(5 \text { mazpy }^{2}\right)_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex - couple I (a), couple II (b), and couple III (c) in the reduction range with various scan rates (50-1000 mVs ${ }^{-1}$ )

Figure A. 6 Cyclic voltammograms of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex - couple IV (a), and couple $\mathrm{V}(\mathrm{b})$ in the reduction range with various scan rates (50$1000 \mathrm{mVs}^{-1}$ )

Figure A. 7 Cyclic voltammograms of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex couple I (a), couple II (b), and couple III (c) in the reduction range with various scan rates ( $50-1000 \mathrm{mVs}^{-1}$ )

Figure A. 8 Cyclic voltammograms of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2}\right.$ azpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex couple IV (a), and couple $V(b)$ in the reduction range with various scan rates ( $50-1000 \mathrm{mVs}^{-1}$ )

Figure A. 9 Cyclic voltammograms of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex - couple I (a), couple II (b), and couple (III) (c) in the reduction range with various scan rates (50-1000 mVs ${ }^{-1}$ )

Figure A.10 Cyclic voltammograms of the $\left[\mathrm{Ru}(5 \mathrm{mazpy})_{2} b p y\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex couple IV (a), and couple $V(b)$ in the reduction range with various scan rates ( $50-1000 \mathrm{mVs}^{-1}$ )

Figure A. 11 Cyclic voltammograms of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex couple I (a), couple II (b), and couple (III) (c) in the reduction range with various scan rates $\left(50-1000 \mathrm{mVs}^{-1}\right)$

Figure A. 12 Cyclic voltammograms of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{phen}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex couple IV (a), and couple $V(b)$ in the reduction range with various scan rates ( $50-1000 \mathrm{mVs}^{-1}$ )

Figure A. 13 Cyclic voltammograms of the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5\right.$ mazpy $]\left(\mathrm{PF}_{6}\right)_{2}$ complex couple I (a), couple II (b), and couple (III) (c) in the reduction range with various scan rates $\left(50-1000 \mathrm{mVs}^{-1}\right)$

Figure A. 14 Cyclic voltammograms of the $\left[\mathrm{Ru}(\mathrm{bpy})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex couple IV (a), in the reduction range and couple $\mathrm{Ru}(\mathrm{II} / \mathrm{III})$ (b) in oxidation range with various scan rates $\left(50-1000 \mathrm{mVs}^{-1}\right)$

Figure A. 15 Cyclic voltammograms of the $\left[\mathrm{Ru}(\mathrm{phen})_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex couple I (a), couple II (b), and couple (III) (c) in the reduction range with various scan rates ( $50-1000 \mathrm{mVs}^{-1}$ )

Figure A. 16 Cyclic voltammograms of the $\left[\mathrm{Ru}(\text { phen })_{2} 5 \mathrm{mazpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex couple IV (a), in the reduction range and couple $\mathrm{Ru}(\mathrm{II} / \mathrm{III})$ (b) in oxidation range with various scan rates $\left(50-1000 \mathrm{mVs}^{-1}\right)$

Table A. 2 Bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ of the 5mazpy ligand

Bond lengths ( $\AA$ )

| Atoms | Distances $(\AA)$ |
| :---: | :---: |
| $\mathrm{N}(1)-\mathrm{C}(5)$ | $1.329(2)$ |
| $\mathrm{N}(1)-\mathrm{C}(1)$ | $1.330(3)$ |
| $\mathrm{N}(2)-\mathrm{N}(3)$ | $1.228(2)$ |
| $\mathrm{N}(2)-\mathrm{C}(5)$ | $1.442(3)$ |
| $\mathrm{N}(3)-\mathrm{C}(6)$ | $1.445(3)$ |
| $\mathrm{C}(1)-\mathrm{C}(2)$ | $1.381(3)$ |
| $\mathrm{C}(2)-\mathrm{C}(3)$ | $1.382(3)$ |
| $\mathrm{C}(2)-\mathrm{C}(12)$ | $1.500(3)$ |
| $\mathrm{C}(3)-\mathrm{C}(4)$ | $1.373(3)$ |
| $\mathrm{C}(4)-\mathrm{C}(5)$ | $1.385(3)$ |
| $\mathrm{C}(6)-\mathrm{C}(7)$ | $1.379(3)$ |
| $\mathrm{C}(6)-\mathrm{C}(11)$ | $1.381(3)$ |
| $\mathrm{C}(7)-\mathrm{C}(8)$ | $1.379(3)$ |
| $\mathrm{C}(8)-\mathrm{C}(9)$ | $1.378(4)$ |

Table A. 6 Bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ of the $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{bpy}\right]\left(\mathrm{PF}_{6}\right)_{2}$ complex

## Bond lengths ( $\AA$ )

| Atoms | Distances $(\AA)$ |
| :---: | :---: |
| $\mathrm{Ru}(1)-\mathrm{N}(1)$ | $2.15(2)$ |
| $\mathrm{Ru}(1)-\mathrm{N}(2)$ | $2.06(2)$ |
| $\mathrm{Ru}(1)-\mathrm{N}(4)$ | $2.05(2)$ |
| $\mathrm{Ru}(1)-\mathrm{N}(1)$ | $2.15(2)$ |
| $\mathrm{Ru}(1)-\mathrm{N}(2)$ | $2.06(2)$ |
| $\mathrm{Ru}(1)-\mathrm{N}(4)$ | $2.05(2)$ |

Table A. 6 (continued)

| Atoms | Distances $(\AA)$ |
| :---: | :---: |
| $\mathrm{N}(1)-\mathrm{C}(1)$ | $1.30(5)$ |
| $\mathrm{N}(1)-\mathrm{C}(5)$ | $1.30(3)$ |
| $\mathrm{C}(1)-\mathrm{C}(2)$ | $1.41(5)$ |
| $\mathrm{C}(2)-\mathrm{C}(3)$ | $1.38(5)$ |
| $\mathrm{C}(3)-\mathrm{C}(4)$ | $1.35(6)$ |
| $\mathrm{C}(4)-\mathrm{C}(5)$ | $1.34(4)$ |
| $\mathrm{C}(5)-\mathrm{C}(5)$ | $1.57(4)$ |
| $\mathrm{N}(2)-\mathrm{C}(6)$ | $1.37(4)$ |
| $\mathrm{N}(2)-\mathrm{C}(10)$ | $1.26(3)$ |
| $\mathrm{C}(6)-\mathrm{C}(7)$ | $1.36(4)$ |
| $\mathrm{C}(7)-\mathrm{C}(71)$ | $1.56(6)$ |
| $\mathrm{C}(7)-\mathrm{C}(8)$ | $1.33(5)$ |
| $\mathrm{C}(8)-\mathrm{C}(9)$ | $1.39(6)$ |
| $\mathrm{C}(9)-\mathrm{C}(10)$ | $1.39(4)$ |
| $\mathrm{C}(10)-\mathrm{N}(3)$ | $1.38(5)$ |
| $\mathrm{N}(3)-\mathrm{N}(4)$ | $1.26(3)$ |
| $\mathrm{N}(4)-\mathrm{C}(11)$ | $1.40(5)$ |
| $\mathrm{C}(11)-\mathrm{C}(12)$ | $1.51(4)$ |
| $\mathrm{C}(11)-\mathrm{C}(16)$ | $1.40(6)$ |
| $\mathrm{C}(12)-\mathrm{C}(13)$ | $1.39(9)$ |

## VITAE

| Name | Miss Uraiwan Changsaluk |  |
| :--- | :---: | :---: |
| Student ID | 4623017 |  |
| Educational Attainment |  |  |
| $\quad$ Degree | Name of Institution | Year of Graduation |
| Bachelor of Science | Prince of Songkla University | 2001 |
| $\quad$ (Chemistry) |  |  |
| Master of Science | Prince of Songkla University | 2002 |
| (Inorganic Chemistry) |  |  |

## Scholarship Awards during Enrolment

1. Center for Innovation in Chemistry: Postgraduate Education and Research Program in Chemistry (PERCH-CIC) (2003-2005).
2. Teaching Assistant

## List of Publication and Proceeding

Publications

1. Hansongnern, K., Changsaluk, U., and Pakawatchai, C. Crystal Structure of 5-Methyl- 2-(phenylazo)pyridine Analytical Sciences, Accepted for publication.
2. Hansongnern, K., Changsaluk, U., and Pakawatchai, C. Crystal Structure of the ccc- $\left[\mathrm{Ru}(5 \text { mazpy })_{2} \mathrm{Cl}_{2}\right]$ Complex Analytical Sciences, submitted.
3. Hansongnern, K., Changsaluk, U., Wu, J.-S., and Lu, T.-H., Crystal Structure of the $\left[\mathrm{Ru}(\mathrm{azpy})_{2}(\mathrm{bpy})\right]\left(\mathrm{PF}_{6}\right)_{2}$ Complex (azpy $=2$-(phenylazo) pyridine, bpy $=2,2^{\prime}-$ bipyridine) Analytical Sciences, 2007, 23, x131-x132.
4. Changsaluk, U., and Hansongnern, K. Dichlorobis(5-Methyl-2-phenylazopyridine) Ruthenium(II) Complex: Characterization and NMR Spectroscopy Songklanakarin J. Sci. Technol , 2005, 27, 739-749
