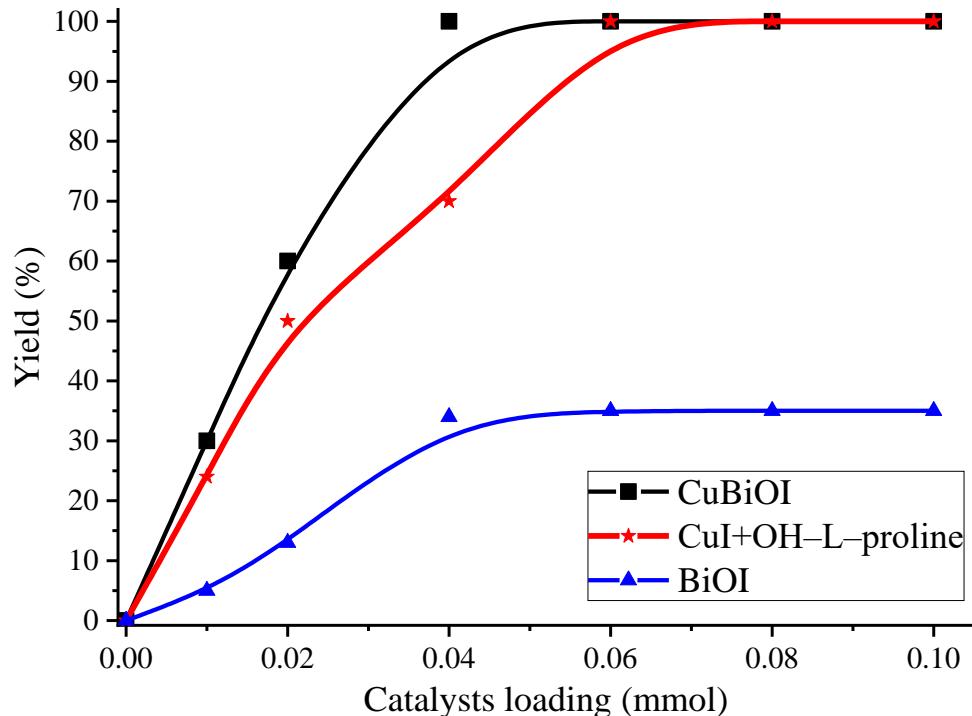

Fig. S4. Optimization of catalyst loading for Ullmann-type C–N coupling reaction between chlorobenzene and aqueous ammonia. Reaction conditions: 1.0 mmol aqueous ammonia; 0.5 mmol chlorobenzene; 0.5 mmol K₃PO₄; 3.0 ml DMSO; 0.05 mmol organic additive (hydroxy–L-proline, if it is necessary); T = 110 °C; t = 24 h.

Table S1

$\text{Cu}^{\text{I}}\text{BiOI}$ catalyzed coupling of chlorobenzene and aqueous ammonia in the presence of various bases.^a

Bases	Yield (%)
K_2CO_3	79
K_3PO_4	100
Cs_2CO_3	93
pyridine	59
piperidine	54

^a1.0 mmol aqueous ammonia; 0.5 mmol chlorobenzene; 0.04 mmol catalyst; 0.5 mmol base; 3.0 ml DMSO; $T = 110 \text{ }^{\circ}\text{C}$; $t = 24 \text{ h}$

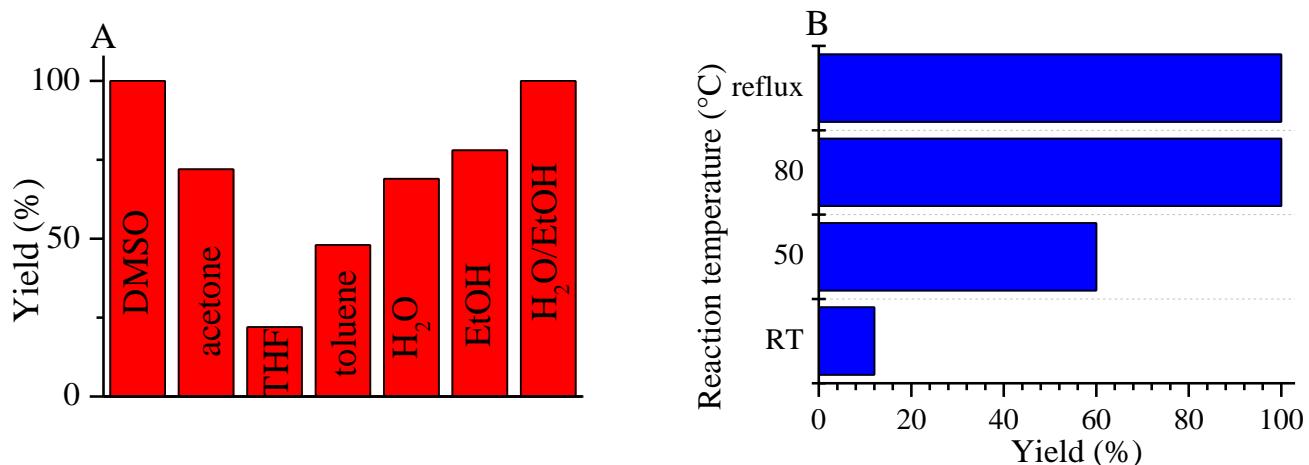

Fig. S5. Investigating various solvents and reaction temperatures in the $\text{Cu}^{\text{I}}\text{BiOI}$ catalyzed Ullmann-type reaction. Reaction conditions: 1.0 mmol aqueous ammonia; 0.5 mmol chlorobenzene; 0.04 mmol catalysts; 0.5 mmol K_3PO_4 ; 3.0 ml solvent ($\text{H}_2\text{O}/\text{EtOH}$ mixture for Fig. S5.(B)); $t = 24 \text{ h}$; reflux temperature (except for DMSO; $T = 110 \text{ }^{\circ}\text{C}$).

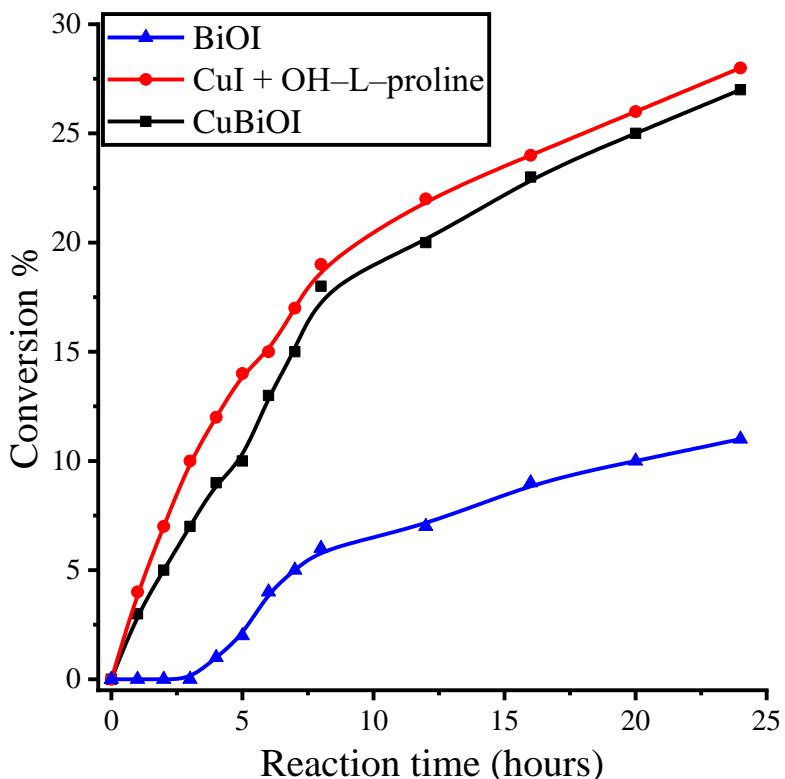

Fig. S6. Ullmann-type C–N coupling reaction between chlorobenzene and aqueous ammonia. Reaction conditions: 1.0 mmol of aqueous ammonia; 0.5 mmol of chlorobenzene; 0.04 mmol (0.06 mmol in the homogeneous case) of catalyst; 0.5 mmol of K_3PO_4 ; 3.0 ml of DMSO; 0.05 mmol of organic additive (hydroxy-L-proline, if it is necessary); $T = 80\text{ }^\circ\text{C}$.

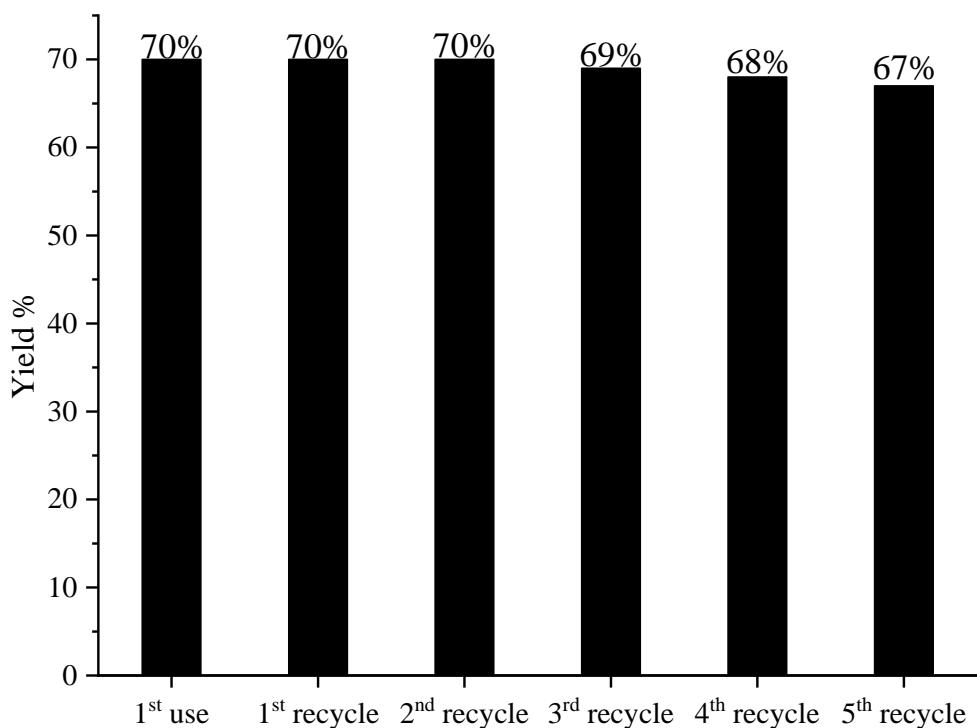

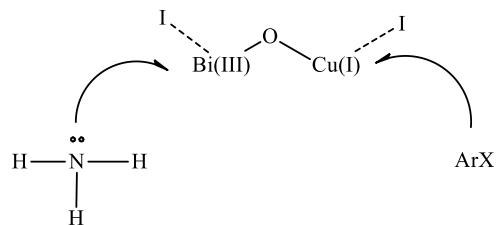

Fig. S7. Recyclability of the as-prepared Cu^I BiOI material tested in Ullmann-type C–N coupling reaction between chlorobenzene and aqueous ammonia. The optimized conditions: 1.0

mmol aqueous ammonia; 0.5 mmol chlorobenzene; 0.02 mmol catalysts; 0.5 mmol K₃PO₄; 3 ml EtOH/water (1:1; v/v%); T = 80 °C; t = 20 h.

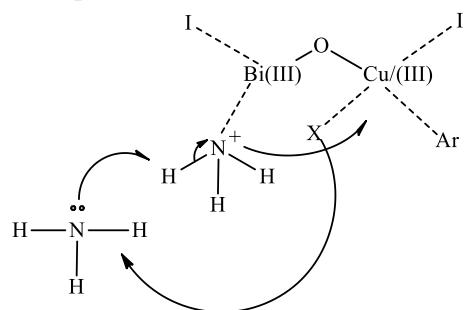

Mechanistic proposal

It is reasonable to assume that Cu(I) is the key active centre in the catalytic cycle for the Cu^IBiOI structure. The bismuth(III) component, as a Lewis acid centre, may accelerate the catalytic cycle through coordinating an ammonia molecule. Possible steps are as follows: step I – oxidative addition of aryl halide over Cu(I); step II – coordination of ammonia to the Bi(III) centre followed by proton abstraction by another ammonia molecule; step III – anionoid migration to the Cu(III) reducing to Cu(II) followed by reductive elimination producing the product and regenerating the Cu(I) centre.

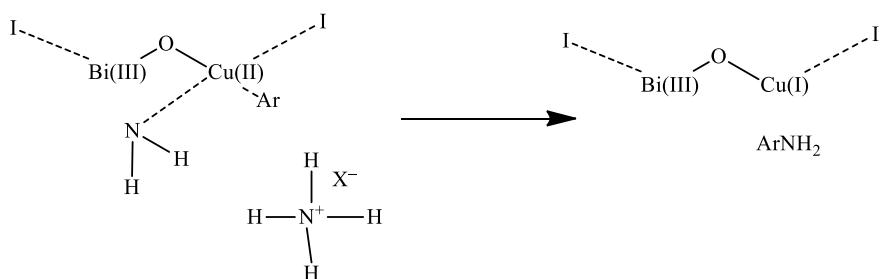

step I: oxidative addition

step II: coordination/proton abstraction

step III: anionoid migration/reductive elimination

Scheme S1 The schematic representation of the possible reaction mechanism of Cu^IBiOI catalysed Ullmann-type C–N coupling reaction between aryl halides and ammonia
