14 **Abstract**

15 The purpose of this study was to explore how sport and exercise psychologists  
16 working in sport understand and use motivational interviewing (MI). Eleven  
17 practitioners participated in semi-structured interviews, and inductive thematic  
18 analysis identified themes linked to explicit use of MI, such as building engagement  
19 and exploring ambivalence to change; the value of MI, such as enhancing the  
20 relationship, rolling with resistance and integrating with other approaches; and  
21 barriers to the implementation of MI in sport psychology, such as a limited evidence-  
22 base in sport. Findings also indicated considerable implicit use of MI by participants,  
23 including taking an athlete-centred approach, supporting athlete autonomy, reflective  
24 listening, demonstrating accurate empathy, and taking a non-prescriptive, guiding  
25 role. This counselling style appears to have several tenets to enhance current  
26 practice in sport psychology, not least the enhancement of therapeutic alliance.

27 *Key words: motivational interviewing; applied sport psychology; therapeutic*  
28 *alliance; integration*

29           The relationship between sport psychology practitioners and the athletes they  
30 work with is recognised as vital (Petitpas, Giges, & Danish, 1999; Poczwardowski,  
31 Sherman, & Henschen, 1998). Yet, in comparison with clinical and counselling  
32 psychology, there is still a dearth of literature in applied sport psychology on the  
33 therapeutic alliance (Andersen & Speed, 2010) and as such it has been suggested  
34 that there is a need for the discipline to learn from wider areas within psychology  
35 (Sharp & Hodge, 2011).

36           Stemming from psychodynamic theory, the therapeutic or working alliance  
37 concerns the trust within the patient-therapist relationship, and relates to the nature  
38 and quality of collaborative, purposive work within the practitioner-client dyad  
39 (Hatcher & Barends, 2006). Therapist variability and contributions within the alliance,  
40 such as ability to be genuine, demonstrate accurate empathy and engage patients in  
41 collaborative work are widely recognised as consistent predictors of the outcome of  
42 psychotherapy, more so than either intervention type or recipient variability, and an  
43 essential component of any talking therapy (Baldwin, Wampold, & Imel, 2007). The  
44 therapist as *a person* is cited as being more critical than intervention type (Wampold,  
45 2001), and a collaborative and empathic consultation style is critical for building  
46 rapport, and managing discord (or discrepancy) in the alliance (Moyers, Miller, &  
47 Hendrickson, 2005). A clear overlap can be seen in the relationship which exists  
48 between a therapist and a recipient, and that which exists between a sport  
49 psychologist and an athlete. It is therefore important that sport psychologists attend  
50 not only to the content of their applied work but also to the alliances they cultivate  
51 with their athletes.

52           It has been argued that sport psychology interventions typically place more  
53 emphasis on intervention content than on the processes of relationship-building and

54 intervention delivery, and there is a need to better understand the mechanisms of  
55 action or mechanisms of change (Gardner & Moore, 2012; Poczwardowski et al.,  
56 1998) which lead to successful outcomes. What is perhaps missing from the sport  
57 psychology literature is specific detail on how to actually achieve these aims, beyond  
58 broad descriptions (e.g., Sharp, Hodge, & Danish, 2015). Despite this insight, it is  
59 clear that the relationship is of paramount importance in everything from therapy to  
60 mental skills coaching (Herzog & Hays, 2012). Further, Petitpas et al. (1999)  
61 proposed that the field of sport psychology would benefit from an interface with  
62 counselling psychology, due to its extensive research into adherence and positive  
63 outcomes based on the practitioner-client relationship. A decade later, it was  
64 suggested that while there is some recognition within the discipline that the  
65 professional relationship is the single most important aspect of service delivery, there  
66 had still not been the paradigm shift that Petitpas et al. (1999) intended, but rather a  
67 paradigm nudge (Andersen & Speed, 2010).

68         One counselling approach which seeks to maximise the alliance between  
69 practitioner and client is motivational interviewing (MI; Miller & Rollnick, 2013).  
70 MI is composed of the following: (a) a relational component (MI spirit); (b) a technical  
71 component (microskills), which mobilises the relational component; (c) four  
72 processes (engage, focus, evoke, plan), within which the relational and technical  
73 components exist; and (d) sensitivity to the language of behavior change (change,  
74 sustain and resistance talk) (cf. Breckon, 2015 for full descriptions of these key  
75 elements of MI). The first application of MI was in the field of addictions (Miller, 1983),  
76 although its delivery is now widespread across both behavior cessation (e.g.,  
77 addictions; Moyers & Houck, 2011) and behavior adoption (e.g., physical activity;  
78 Haase, Taylor, Fox, Thorp, & Lewis, 2010) contexts. In recent years, the evidence

79 supporting the efficacy of MI has grown exponentially across several domains, with  
80 several systematic reviews and meta-analyses now published (e.g., Copeland,  
81 McNamara, Kelson, & Simpson, 2015), reflecting the high number of applications of  
82 the approach in randomised and quasi-experimental trials. Additionally, the  
83 techniques and mechanisms by which MI influences client behaviors and outcomes  
84 are becoming better defined. For example, Apodaca et al. (2016) demonstrated that  
85 client change talk increased following practitioner use of open questions, complex  
86 reflections and affirmations. Hardcastle, Fortier, Blake and Hagger (2016) identified  
87 38 content and relational MI behavior change techniques, 22 of which were found to  
88 be unique to the MI approach. And, Riegel, Dickson, Garcia, Creber and Streur  
89 (2017) identified the relationship between MI techniques and increased self-care  
90 behaviors in patients with heart failure. MI techniques identified included reflections  
91 and reframing, exhibiting genuine empathy and affirmation, and individualised  
92 problem-solving. The mechanisms of change which were mobilised through these  
93 techniques were developing discrepancy and building self-efficacy, which are  
94 fundamental to the MI philosophy. Behavioral changes observed in patients included  
95 openness to setting goals, positive self-talk, perceived capacity to overcome  
96 obstacles and increased change talk.

97         While MI has significant empirical support in several fields of psychology, very  
98 little is known about its application in sport psychology, and it is proposed here that  
99 much could be learned from this counselling approach. MI has received some  
100 attention in coaching psychology and sport coaching literature (Gustafsson, Edler,  
101 Sjostrom, & Claeson, 2015; Passmore, 2011), but minimal exposure in the sport  
102 psychology literature. This is perhaps because there is an assumption that all  
103 athletes are motivated for change. Yet, recent research (Massey, Gnacinski, &

104 Meyer, 2015) found that the largest portion of sampled athletes (37%) were  
105 considered 'precontemplators', and not ready to take part in psychological skills  
106 training. This finding offers support for the use of MI in sport, indicating that athletes'  
107 readiness to change should be taken into consideration by applied sport  
108 psychologists. In cases where MI has been reported in sport settings, there is a  
109 limited application of the relational and technical components which are fundamental  
110 to the MI approach, or assessment of practitioner competence and fidelity to the  
111 approach (e.g., Margarit, 2013).

112 Evidence suggests it is often just one aspect of MI being applied. For example,  
113 the use of 'scaling rulers' is advocated by Hays, Thomas, Butt and Maynard (2010) in  
114 relation to practitioners understanding athletes' perspectives, while Fader (2016)  
115 outlines the use of the 'value card sort' exercise, but these are specific tools which  
116 appear to have been used in isolation, and do not represent an approach  
117 underpinned by MI. Similarly, Morse (2013) briefly reports the use of MI techniques  
118 in sport psychiatry for athletes struggling with substance abuse, such as *rolling with*  
119 *resistance* and *pointing out pros and cons of substance use*, and refers to the stages  
120 of change from the transtheoretical model (TTM; Prochaska & DiClemente, 1983).  
121 Again, this represents erroneously singling-out certain techniques of MI, and perhaps  
122 not applying them in an MI-consistent manner. This also represents just one aspect  
123 of the transtheoretical model, upon which MI is not based. The issue here is perhaps  
124 not with blending aspects of different approaches into one's work, given the  
125 integrative nature of applied sport psychology (Poczwadowski et al., 1998), but  
126 rather a lack of structure for doing so in a way other than that which became known  
127 as "eclectic". It is plausible that, in keeping with research in other disciplines, (e.g.,  
128 Driessen & Hollon, 2011; Westra & Arkowitz, 2011), clear guidelines on how to

129 integrate complementary approaches with fidelity would be a step forward in sport  
130 psychology and should be a goal for ongoing research. Indeed, MI was conceived to  
131 be integrated with more action-orientated therapies (Miller & Rose, 2009), and there  
132 are relational and content techniques from MI which can be applied regardless of  
133 theoretical grounding (Hardcastle et al., 2017; Hardcastle, 2016). A framework for  
134 integrating MI with cognitive-behavioral therapy is becoming well understood in the  
135 treatment of a range of disorders, the principal of which being generalised anxiety  
136 disorder (Aviram & Westra, 2011; Kertes, Westra, Angus, & Marcus, 2011), and this  
137 is perhaps what we should be striving for in applied sport psychology. Given that  
138 aspects of the cognitive-behavioral and humanistic approaches are prevalent in  
139 applied sport psychology (Brown, 2011; McArdle & Moore, 2012; Petitpas et al.,  
140 1999), and that MI has been outlined as an ideal addition for practitioners in sport  
141 making use of behavioral, cognitive, and humanistic interventions in their applied  
142 work (Passmore, 2011), this calls for exploration to identify best practice for using  
143 and integrating MI in sport psychology. Initially however, the aim of the current study  
144 was to report how sport psychologists understand and use MI in their applied work.  
145 Specifically, their understanding of MI theory and principles; if, and how, MI is being  
146 used in applied sport psychology; the perceived value of MI; barriers to learning and  
147 implementing MI; how MI might be integrated with other approaches.

## 148 **Method**

### 149 **Design**

150 This study applied qualitative methods to capture an emic account (Jary &  
151 Jary, 2000) of practitioners' professional practice and understanding and use of MI.  
152 Data were collected in the form of one-to-one semi-structured interviews. This type

153 of informal interview permits the interviewer to use a conversational style and ask  
154 spontaneous questions while maintaining focus on a specific topic (Patton, 2002).

### 155 **Participants and sampling**

156 Participants were Chartered sport and exercise psychologists, Registered with  
157 the British Psychological Society (BPS) and the Health and Care Professions  
158 Council (HCPC). A purposeful sample (Patton, 2002) of 18 UK-based sport and  
159 exercise psychologists was contacted via email (available to the public through the  
160 BPS website) to participate voluntarily in this study. To qualify for inclusion,  
161 participants were also qualified to supervise sport and exercise psychologists in  
162 training, and currently working in an applied setting with athletes. Of the 18  
163 participants contacted, 11 (8 males, 3 females) aged between 37 and 65 years ( $44.5$   
164  $\pm 8.3$  years) agreed to take part in the study. Participants had between 10 and 35  
165 years ( $19.6 \pm 7.78$  years) of experience, and all had worked with professional,  
166 international or Olympic athletes. Participants had worked with athletes from team  
167 and individual sports, such as rugby, football, equestrian, judo and shooting.  
168 Participants had also worked with youth and adult athletes, and able-bodied and  
169 disabled athletes.

### 170 **Interview guide**

171 Two pilot interviews were conducted; one with a BPS chartered sport and  
172 exercise psychologist, and one with a BPS sport and exercise psychologist in  
173 training. The purpose of this was to test the interview guide, check clarity, and  
174 practise interviewer skills. Each member of the research team contributed to the final  
175 interview guide (Appendix). Questions in the interview guide focused on key themes  
176 concerning professional practice and applied techniques, therapeutic alliance, and  
177 awareness and use of MI. Questions included, "*When you first start working with a*

178 *client, how do you begin to build a relationship/alliance with them?" and "Which*  
179 *specific communication skills do you employ to underpin your work?". Interviews*  
180 *were then conducted with participants, using the finalised interview guide.*

## 181 **Procedure**

182 Participants were sent information sheets prior to their interviews, which  
183 stated the aim of the study and gave a brief description of the interview procedure. A  
184 consent form highlighted participant anonymity and detailed their right to withdraw.  
185 Voluntary, written, informed consent was given by all participants. Ethics approval  
186 was provided by the governing institution (HWB-S&E-38, Sheffield Hallam  
187 University). Participants were afforded an opportunity to ask questions prior to  
188 commencement of their interview, and demographic information was collected at this  
189 point. All interviews were conducted by the principal researcher, who has previously  
190 conducted interview-based research, is a sport and exercise psychologist in training  
191 with the BPS, and a member of the Motivational Interviewing Network of Trainers  
192 (MINT). Ten interviews took place using video conferencing software, and one was  
193 face-to-face. Video software was used in order to accommodate participants since  
194 they were spread across the UK. Interviews lasted approximately 60 minutes, were  
195 audio recorded and transcribed verbatim.

## 196 **Data analysis**

197 To enhance the credibility of data analysis and conclusions drawn, the  
198 methods of triangulation and member checking of data (Lincoln & Guba, 1985) were  
199 used in this study. For the process of member checking, all participants were sent a  
200 copy of their transcript to view and asked if the transcript was an accurate account of  
201 their perceptions and the interview that took place. Participants were asked to write  
202 on the transcript if any changes were necessary. No changes resulted from this

203 process. It is important to note that member checking used in this way (i.e.,  
204 validation of data) has recently been questioned because "it does not go beyond  
205 ensuring that the researcher got it right" (Tracy, 2010, p.884) and is therefore  
206 unlikely to generate new insights that can be used for further analysis (cf. Sparkes &  
207 Smith, 2013). Following the return of participant's transcripts, the interview  
208 transcripts were then inductively and deductively analysed using thematic analysis  
209 (Braun & Clarke, 2006). The aim of thematic analysis is to identify, analyse and  
210 report themes found in qualitative data (Vaismoradi, Turunen, & Bondas, 2013).  
211 Transcripts were analysed inductively to identify quotes that captured practitioners'  
212 preferred approaches and models, and their understanding and use of MI in their  
213 applied practice. The analysis then moved from inductive to deductive procedures to  
214 identify quotes regarding aspects of practitioners' applied practice which correspond  
215 with MI, but which are not labelled by practitioners as MI (i.e., implicit use of MI). As  
216 outlined by Braun and Clarke (2006), the following six phases were adopted in the  
217 present study: familiarising with data; generating initial codes; searching for themes;  
218 reviewing themes; defining and naming themes; producing the report. This process  
219 produced codes consisting of original participant statements, which were then  
220 grouped into sub-themes and themes (Vaismoradi et al., 2013). The lead researcher  
221 undertook several iterations of the first five phases to ensure richness and accuracy  
222 of the codes and themes being extracted from the data. A sample of the interview  
223 transcripts was then coded and triangulated within the research team to gain  
224 consensus on the findings. Any discrepancies within the research team were  
225 discussed until an agreement was reached. The number of participants that  
226 contributed to each sub-theme and theme was tracked throughout, to provide a  
227 detailed overview of the findings. The research team included two practitioners who

228 are untrained in MI, whose analysis was therefore not influenced by prior knowledge  
229 of MI. This ensured a reduced bias in the data analysis.

## 230 **Results**

231 The findings related to participants' explicit use of MI in their applied practice  
232 are presented first (Figure 1), followed by the findings pertaining to participants'  
233 views on the value of MI in applied sport psychology (Figure 2), and a brief summary  
234 of some of the barriers experienced in learning or applying MI in sport contexts.

235 There is some repetition of theme names between Figures 1 and 2; this is because  
236 while some participants indicated that they do employ aspects of MI in their work,  
237 others felt that they do not, but felt they knew enough about the approach to be able  
238 to describe how it might prove efficacious in their work, and so were referring to  
239 similar tenets as those who are reportedly using MI. Findings that represent implicit  
240 use of MI in applied practice are presented in Table 1; the purpose of this is to  
241 illustrate that while there is perhaps a lesser degree of overt understanding and  
242 application of MI in comparison to other approaches being employed, there is  
243 considerable overlap between what practitioners are reporting to be doing in their  
244 applied work, and the MI approach. Table 1 shows findings which illustrate implicit  
245 use of MI in applied practice, in accordance with components (global ratings and  
246 behavior counts) of the Motivational Interviewing Treatment Integrity code (MITI  
247 3.1.1; Moyers, Martin, Manuel, Miller, & Ernst, 2010).

### 248 **Approaches in sport psychology**

249 The cognitive-behavioral approach was often described by participants in their  
250 applied work (n=11), with humanism/person-centred counselling (n=9), and solution-  
251 focused therapy (SFT) (n=5) also prominent. Several practitioners (n=7) also made  
252 reference to a pragmatic, eclectic or integrated approach to their applied work. In

253 addition to MI, other approaches cited include psychological skills training (PST),  
254 acceptance and commitment therapy (ACT), psychodynamic therapy, neuroscience,  
255 and a positive psychology approach.

### 256 **Explicit use of MI**

257         Seven participants indicated that they consciously use elements of MI in their  
258 applied work. It should be noted that this is based on practitioners' perceptions, and  
259 not on formal assessment or coding of their applied work. Figure 1 shows how codes  
260 concerning explicit use of MI were combined to form five themes consisting of eight  
261 sub-themes. These themes are technical skills, processes, behavior change,  
262 integrative approach, and sport performance.

263         **Technical skills.** Five participants contributed to this theme, which contains  
264 the sub-themes verbal communication and applied tools, and indicates the specific  
265 skills and tools that practitioners have taken from their experience with MI and use in  
266 their applied work. These include reflections, summaries, scaling rulers and  
267 decisional balance.

268         **Processes.** These refer to different phases of the MI consulting process. Two  
269 participants contributed to this theme. One participant outlined how they would use  
270 MI to explore the client's current situation, begin to focus on what their client wanted  
271 to achieve, and start thinking about how they might achieve that:

272             I think it's... going through the interview process that assists or facilitates your  
273 clients to acknowledge how those thoughts or behaviors or emotions are  
274 impacting on their performance, or impacting on their identity as an athlete.

275             And it's then introducing, through effective questioning, the changes and  
276 outcomes your client wants to experience and how best those objectives and  
277 goals can be reached in a strategic way.

278           **Behavior change.** This theme consists of the following sub-themes:  
279 ambivalence to change, preparing for change and barriers to change, and illustrates  
280 how practitioners are conscious of using MI with their athletes at different stages of  
281 behavioral change. Four participants contributed to this theme.

282           **Integrative approach.** Two participants contributed to this theme, which  
283 indicates their view that MI can be enmeshed into the therapeutic process, and if MI  
284 is not being used as an intervention, aspects of MI can still be integrated into one's  
285 approach. One participant described the latter:

286           I've not used MI as an intervention, I've used elements of that approach, and  
287           integrated that into what I do... more than having a very structured MI process  
288           that I go through with clients. I sort of cherry-picked I guess and integrated it.

289 Linked to this, another participant describes working at different 'levels' of MI, similar  
290 to using different levels of cognitive-behavioral therapy (CBT), ranging from a  
291 superficial level to using it as an intervention.

292           **Sport performance.** This theme illustrates specific examples of how  
293 practitioners use MI to explore athlete issues relating to their sport performance. Two  
294 participants contributed to this theme, which consists of exploring the impact of  
295 maladaptive thoughts, behaviors and emotions on performance, and exploring the  
296 extent to which athletes wish to discuss personal issues which are impacting on  
297 performance.

#### 298 **Value of MI**

299           Eight participants described the ways in which they felt MI does, or potentially  
300 could, add value to the sport psychology consultancy process. Figure 2 illustrates  
301 participant responses organised into five themes consisting of 13 sub-themes. These

302 themes are spirit, technical skills, processes, role of MI in behavior change and  
303 integrative approach.

304       **Spirit.** This theme was created from responses from five participants, and  
305 contains the sub-themes 'partnership', 'autonomy support' and 'evocation', which are  
306 some, but not all, of the elements of the MI spirit (of which the full description  
307 includes partnership, acceptance, compassion, evocation). These sub-themes refer  
308 to the quality of the practitioner-client relationship, encouraging athletes to identify  
309 and initiate their own changes, and drawing answers from the athlete as much as  
310 possible, rather than instructing them. One participant spoke of the link between the  
311 spirit of MI and more traditional counselling principles:

312           ... some of the principles are very compatible with the other more traditional  
313 methods, being focused on eliciting information from the person rather than  
314 telling the person what to do and what you think and that kind of thing.

315       **Technical skills.** As shown in Figure 1, this theme consists of 'verbal  
316 communication' and 'applied tools' from MI that practitioners felt could be valuable in  
317 their work. These included the "language" of MI, active listening and scaling rulers.  
318 One participant talked of using MI for beginning to build a therapeutic alliance with  
319 athletes:

320           ... listen, and actively listen, which is where some of the tools and techniques  
321 that you learn in something like MI for example are really very helpful, making  
322 sure you've got those summaries and reflections that demonstrate to that  
323 individual that you're listening to them and you're not just hearing them, you're  
324 actually listening to them, and that's important.

325       **Processes.** Minimal reference was made to the value of the MI processes  
326 (i.e., engage; focus; evoke; plan), with the engaging and focussing processes being

327 explicitly acknowledged by two participants. One participant described the early  
328 engagement phase:

329       So I think the whole idea of engaging the client and increasing self-disclosure,  
330       that comes very clearly out of motivational interviewing, and I think it can be  
331       really helpful.

332       **Role of MI in behavior change.** Similar to Figure 1, this theme refers to the  
333 behavior change process. But, where Figure 1 refers to explicit use of MI in the  
334 behavior change process, this theme refers to the potential role of MI for behavior  
335 change in sport settings, and presents a more detailed account of this than in Figure  
336 1. This theme acknowledges the exploration of individual readiness and ambivalence  
337 to change; the need to be comfortable with, and be able to work with, resistant  
338 clients; the need to identify barriers and possible solutions to these barriers; and how  
339 to manage a change once it has been made.

340       **Integrative approach.** Once again, participants gave a more detailed account  
341 of the value of MI in an integrated consultancy approach than they did in describing  
342 how they explicitly integrate it into their own work. This perhaps indicates that more  
343 is known about the potential for integrating MI into applied sport psychology than  
344 about how to actually do it. Six practitioners referenced a link between MI and other  
345 approaches, including CBT and traditional counselling approaches, or acknowledged  
346 that MI may be a framework onto which other interventions could be built:

347       I can see how a cognitive therapy of Beck or the REBT approach can work in  
348       a complementary way with motivational interviewing to encourage movement  
349       from no awareness of an issue to being pre-contemplative, for example.

350 **Barriers to the implementation of MI**

351 Six participants outlined barriers to learning and applying MI. These related to  
352 the fact that MI has come from a different area of psychology, and so appears  
353 irrelevant to sport, and that there is limited information on how to transfer MI to sport  
354 psychology, with all known examples of the application of MI coming from outside  
355 sport. Additionally, it was felt that MI had an insufficient research base in comparison  
356 to other approaches, and that athlete motivation for sport psychology was not an  
357 issue. But, this final view was not held by everyone:

358 ... because they can come because their coach has told them to, and they  
359 don't actually want to be there, they don't think there's a problem, in which  
360 case it's not about that resolution of ambivalence it's just a conversation about  
361 what's going on.

#### 362 **Implicit use of MI**

363 While the findings above indicate that some aspects of MI are being applied in  
364 sport psychology consultancy, the approach does not appear to be applied  
365 consistently and with consideration of all the core elements. Participants were open  
366 about gaps in their knowledge and training with MI during the interview process, and  
367 all 11 participants acknowledged that they do not consider themselves to be MI  
368 practitioners, nor to be using MI as an intervention. Nevertheless, in an attempt to  
369 capture the active ingredients of their applied work, deductive analysis of their  
370 responses to broad questions about the strategies they use to build and maintain a  
371 therapeutic alliance, and the technical skills they employ in their work was  
372 undertaken. Table 1 demonstrates that there is much in common between applied  
373 practice and the relational, technical and process aspects of the MI approach. The  
374 global scales and behavior codes from the MITI code (MITI 3.1.1; Moyers, Martin,  
375 Manuel, Miller, & Ernst, 2010) were used as a framework for this, as this is the most

376 recent version of a frequently cited and refined measure of MI competence and  
377 fidelity, and in order to create consistent language for research and practice in this  
378 context from the beginning.

### 379 **Discussion**

380 The purpose of the current study was to explore the understanding and use of  
381 motivational interviewing by applied sport psychologists. The findings indicate that  
382 certain aspects of the MI approach are being used in sport psychology consultancy,  
383 but there are gaps in the knowledge and application of the approach. Specifically,  
384 findings indicate that practitioners are unclear on how to apply MI in sport, since its  
385 evidence-base is in other areas of psychology. And yet practitioners do appear to  
386 understand in theory its potential value, particularly as an integrative therapy.

387 Common factors can be seen between these participants' applied practice and the  
388 MI approach. While they are not labelling it as MI, much of what these participants  
389 say they are doing can be mapped onto the MI approach, largely the MI spirit and  
390 technical skills. This is perhaps not surprising for two reasons; firstly, given that a  
391 primary concern of MI is establishing a therapeutic alliance from the first encounter,  
392 with a view to collaborating with the client to identify and achieve behavioral change;  
393 and secondly, the recommendations that applied sport psychology should learn from  
394 research and practice in counselling psychology. This implies that MI does have a  
395 role to play in applied sport psychology, and that MI is one approach which would be  
396 of value to students and neophyte practitioners in this discipline for learning these  
397 athlete-centred principles. In the last few years, a body of research (e.g., Sharp et al.,  
398 2015; Sharp & Hodge, 2011) has emerged regarding key aspects and perspectives  
399 of the professional relationship in applied sport psychology. For example, Sharp and  
400 Hodge (2011) explored sport psychology practitioners' perspectives on how to build

401 an effective consulting relationship between the practitioner and the athlete. Their  
402 participants identified several characteristics of effective practitioners, including the  
403 ability to create connections with athletes by building and maintaining informal  
404 relationships. This is achieved through communication skills such as mirroring,  
405 specific questioning, and showing interest in the athlete as a person, and other  
406 aspects of the counselling approach, such as demonstrating empathy and  
407 understanding, building rapport, and being non-judgemental. Further, practitioners  
408 felt that athletes need to be active participants in the relationship, through their  
409 openness, willingness and commitment to learn and try new things, and need to be  
410 working with the sport psychologist by their own choice. This study concluded that  
411 practitioners should undertake counselling skills training early in their careers in  
412 order to facilitate their development of consulting relationships.

413         While this study presents an in-depth exploration of practitioners' perspectives  
414 of what makes an effective consulting relationship, the findings represent the missing  
415 link of service delivery that exists in the discipline - the *how* of demonstrating  
416 engagement, empathy and acceptance, building rapport, and collaborating with the  
417 athlete, through effective communication. It therefore seems worth exploring further if  
418 the MI approach can potentially alleviate this "what" to "how" gap of service delivery  
419 in applied sport psychology, through enhancing and adding to the relational and  
420 technical skills outlined by practitioners in the current study. This could include  
421 different forms of complex reflective statements (e.g., reframing, double-sided,  
422 amplified), strategic use of summaries to tie together key pieces of information,  
423 offering affirmations of an athlete's strengths, efforts and behaviors to build self-  
424 efficacy, or being conscious of evoking and reinforcing athlete change talk to create  
425 momentum towards change. Recent research (Hardcastle et al., 2017) identified 38

426 distinct MI behavior change techniques (either relational or content), 22 of which  
427 were unique to the MI approach. The majority of these unique techniques were found  
428 in the engaging phase, where practitioners are attempting to demonstrate traits like  
429 accurate empathy, affirmation, acceptance, compassion and autonomy support in  
430 order to build an alliance with their client. This has clear implications for sport  
431 psychology practitioners for the early stages of forming a working alliance, cited as  
432 being the biggest predictor of providing effective support to an athlete (Keegan,  
433 2016).

434         It is argued here that the reality of applied sport psychology is that athletes will  
435 experience ambivalence towards making changes or trying new approaches, may  
436 have negative views of sport psychology support, and may be instructed to attend by  
437 a coach or other stakeholder (Martin, Kellmann, Lavallee, & Page, 2002; Massey et  
438 al., 2015), potentially giving rise to discord early in the psychologist-athlete  
439 relationship. Athletes can struggle not only to initiate psychological support, but also  
440 to persist with it, particularly in the case of a referral (e.g., Brown, 2011), and this  
441 view was echoed by participants in the current study. Gaining experience and  
442 competence in MI could potentially equip practitioners to work with athlete  
443 disengagement, and even resistance, in cases where athletes are not open and  
444 committed to change.

445 More recently, Sharp and colleagues (2015) explored the components necessary for  
446 consulting relationships between sport psychologists and athletes, noting that the  
447 relationship was a partnership, where athletes have an input, particularly to agreed-  
448 upon goals. It was also concluded that practitioners are required to have counselling  
449 skills such as viewing the athlete as a whole, and not only listening to the athlete's

450 story but *demonstrating* that the client is being listened to. Nevertheless, it is not  
451 made clear how a practitioner would go about demonstrating this, other than "not  
452 doing much of the talking" or "encouraging the athlete to speak" (p.363). Again, this  
453 is where MI can potentially add value to applied sport psychology through its  
454 underlying relational and technical components, such as accurate, empathic  
455 understanding to build effective client-practitioner partnerships (Miller & Rose, 2009),  
456 and this seems worthy of further investigation. It is clear from the behaviors identified  
457 in Table 1 that experienced practitioners are currently applying some of these  
458 components, and it is suggested here that applied practice can only be enhanced by  
459 making these MI-adherent behaviors more overt.

460         Given that a strong practitioner-client alliance is linked with client concord,  
461 maintenance, satisfaction and outcome, sport psychology should pay greater  
462 attention to the processes for building and maintaining this alliance, and perhaps  
463 consider ways of monitoring the strength of this on an ongoing basis. While the  
464 conceptualisation of the relationship between practitioner and client may differ  
465 according to the framework adopted by the practitioner, the strength of the  
466 relationship should always be a primary focus (Hill, 2001). If the relationship should  
467 experience a breakdown, the practitioner may find it beneficial to critically evaluate  
468 the approach and processes used (Anderson, Knowles, & Gilbourne, 2004), as part  
469 of structured reflective practice (Cropley, Hanton, Miles, & Niven, 2010), for which  
470 measures of fidelity and competence could prove invaluable. Treatment fidelity is a  
471 key consideration in the MI approach, with validated quantitative measures of both  
472 fidelity and competence available (e.g., MITI 3.1.1; Moyers, Martin, Manuel, Miller, &  
473 Ernst, 2010) as well as an assessment of efficacy of the intervention by the client  
474 (Client Evaluation of MI; CEMI; Madson et al., 2013). These may prove useful in the

475 sport psychology training process, as neophytes learn how to interact with their  
476 athletes, structure their support, and evaluate their own practice.

477         Participants indicated that barriers to using MI in applied sport psychology  
478 included a lack of relevance to this domain. While MI is known primarily for being  
479 used to build commitment and self-efficacy towards health behavior change (and  
480 managing addictions), the approach is not limited to this, and appears to have other  
481 applications beyond this in sport psychology. As outlined by Westra (2012), MI has  
482 several inherent principles which can be blended into one's professional practice and  
483 philosophy. These include becoming more evocative, increased respect for client  
484 autonomy, recognition of client resistance, assuming the role of a 'guide' as opposed  
485 to an 'expert', enhanced communication skills through the use of reflective listening,  
486 and being more attuned with the quality of the therapeutic relationship and client  
487 engagement with the dyad, throughout the interaction. Many of these principles can  
488 be seen in Table 1. These general principles may be thought of as some of the  
489 active ingredients of MI, which help a practitioner to adhere to the MI spirit, to  
490 develop this "way of being" with their clients and to maximise the interpersonal  
491 process. MI was conceived as an approach which lends itself to integration with  
492 other, more action-orientated approaches (Miller & Rose, 2009), and has since been  
493 described as a "...foundational framework into which other treatments can be  
494 integrated" (Westra, 2012, p.15). In this way, MI may provide the "how" that  
495 underpins the "what" of an integrated intervention that has in this study been argued  
496 as missing from applied sport psychology.

497         Several participants acknowledged MI as potentially being suitable for  
498 integration with other approaches in their work, but there is currently a lack of clarity  
499 on how to do so. An MI-solution focused therapy integration has been proposed in

500 family medicine (Stermensky & Brown, 2014), and an MI-CBT integration is  
501 becoming well understood in the treatment of a range of mental disorders, including  
502 depression and anxiety (Arkowitz & Westra, 2004), suicide prevention (Britton,  
503 Patrick, Wenzel, & Williams, 2011), substance abuse (Moyers & Houck, 2011),  
504 eating disorders (Geller & Dunn, 2011), and in using physical activity as a treatment  
505 for depression (Haase et al., 2010). This treatment integration has been investigated  
506 not just from the perspective of the practitioner, but also from the perspective of the  
507 recipient (Aviram & Westra, 2011; Kertes et al., 2011), with results indicating that  
508 patients who receive an MI pre-treatment before CBT for generalised anxiety  
509 disorder viewed their therapist as an evocative guide, felt they played an active role  
510 in their therapy themselves, and experienced significantly reduced levels of  
511 resistance compared with a non-MI pre-treatment group. Clients who only received  
512 CBT viewed their therapists as more directive, and felt they played a more passive  
513 role themselves. These findings support those of the previous studies regarding  
514 patient engagement in treatment, and echo those of Sharp and Hodge (2011)  
515 regarding athlete active participation in the athlete-sport psychologist relationship.  
516 While the value and processes of applying this MI-CBT integration are becoming  
517 understood in clinical settings, there is little awareness of its potential in sport  
518 psychology settings, beyond cherry-picking specific elements, as indicated by one  
519 participant in the current study. Clearer guidelines on how to enhance cognitive  
520 behavioral interventions in sport psychology, by underpinning them with MI, are  
521 required and warrant further investigation.

522         Participants in the current study outlined a range of approaches which  
523 underpin their applied work, and several of these can be seen to fall within the  
524 frameworks and models proposed by Hill (2001) and Poczwardowski and colleagues

525 (2004). What remains unclear is how a practitioner should integrate different  
526 approaches in a complementary, considered, faithful manner. It seems that sport  
527 psychology could perhaps learn from other areas of psychology about how to truly  
528 integrate different approaches: "First, there needs to be in-depth learning of the  
529 substance of two or more theoretical traditions, and second, there must be an  
530 orienting framework for theoretical and/or technical assimilation and accommodation"  
531 (Boswell, 2016, p.5). Consideration must also be given to the philosophical  
532 underpinnings of MI, and how these may or may not be congruent with different  
533 action-orientated, directive, or instruction-based interventions which may be common  
534 in applied sport psychology. Nevertheless, it has been suggested that relational  
535 techniques from the MI approach can be used alongside content-based interventions,  
536 irrespective of theoretical stance (Hardcastle et al., 2017; Hardcastle, 2016).

### 537 **Recommendations for future research**

538         This study investigated the level of understanding and use of MI with applied  
539 sport psychologists who are not experts in the MI approach, and identified some  
540 explicit understanding and use, and much implicit use of MI. It is now pertinent for  
541 future research to investigate this area with practitioners who are experts in MI and  
542 are working in sport. This will begin the process of identifying best practice around  
543 applying MI in sport as part of an integrated approach, and as an intervention in its  
544 own right, which might then inform the training curricula of students and neophyte  
545 practitioners in this discipline. Participants in the present study cited a lack of  
546 research on this approach in this domain, and a lack of sport-specific examples for  
547 practitioners, as barriers to learning and using MI in sport psychology. As such, it will  
548 be important for future research to fill these knowledge gaps. Based on existing  
549 literature highlighting the important role of relationships between practitioner and

550 athletes (e.g., Sharp et al., 2015), one avenue for future research could be in the  
551 development of a sport-specific measure of the therapeutic alliance, as an ongoing  
552 assessment of the strength of the consultancy relationship from the perspective of  
553 the client. Another avenue worthy of exploration would be adaptations to MI for  
554 working with different sporting populations, including groups (teams) and  
555 adolescents. Finally, an exploration of integrating MI with different action-orientated  
556 approaches in sport psychology (e.g., rational emotive behavior therapy (Wood,  
557 Barker, & Turner, 2017); solution focused therapy (Hoigaard & Johansen, 2004))  
558 may further enhance professional practice.

### 559 **Limitations**

560         Although this study has generated novel information about the role of MI in  
561 applied sport psychology, there are some limitations which must be acknowledged.  
562 The practitioners sampled are well established in the discipline and are currently  
563 working at the elite level. Therefore, their experiences are perhaps not  
564 representative of those who are just beginning their careers, regarding the level of  
565 athlete that they work with, and the nature of the work itself. At the elite level,  
566 practitioners are perhaps less likely to encounter disengagement and resistance, for  
567 example. When neophytes are beginning the training process, they may experience  
568 increased levels of ambivalence or disengagement, given that they are unlikely to be  
569 working with elite athletes. Additionally, the participants sampled in the present study  
570 are working primarily with athletes individually. Again this is perhaps not  
571 representative of the neophyte's experience, where they are potentially delivering  
572 workshops and seminars to teams or groups of athletes and coaches. Both of these  
573 examples support the need to explore MI in sport psychology when working with  
574 resistant athletes and for adaptations for working with teams.

**575 Conclusion**

576           This study has begun the process of exploring the application of MI in sport  
577 psychology, and identified the need to clarify the system of integrating different  
578 approaches. It is proposed here that this counselling approach can underpin the  
579 delivery of sport psychology's dominant action-orientated interventions, and enhance  
580 the practitioner-athlete relationship. Discrepancy between responses related to  
581 explicit and implicit use of MI indicates that the MI approach has more to offer  
582 applied sport psychology - to the training curricula for students of the discipline, and  
583 ongoing professional development of neophyte practitioners and established  
584 practitioners alike.

MITI component	Practitioner behaviors
Evocation (6)	Non-prescriptive approach (4) Athlete-centred approach (3) View the athlete as the expert on themselves (1) Athletes have transferrable skills and resources (2)
Autonomy/Support (4)	Athlete owns the intervention (1) Athlete chooses to engage with support (2) Build athlete autonomy (1)
Collaboration (5)	Collaborative relationship (4) Practitioner as a guide (2)
Direction (10)	Explore athlete history (4) Explore core values/beliefs (2) Understand the athlete's current needs (2) Work to the athlete's agenda (2) Guide the athlete in identifying their own solutions (7) Practitioner offers another perspective (3) Find the best strategy to achieve objectives (1)
Empathy (8)	Active listening/reflective listening/accurate empathy (6) Practitioner non-judgement (4) Empathy (3) Unconditional regard (2) Practitioner genuineness (2)
Giving information (4)	Instruct the athlete when appropriate (4)
Questions (6)	Open questions (6)
Reflection (9)	Paraphrasing (5) Reframing (3) Summarising (4) Identify/track/link/summarise major themes (4)
MI-Adherent (10)	Normalising (3) Decisional balance (5) Intent listening (3) Explore core values/beliefs (2) Scaling rulers (2) Provide a strategy with permission (1)

880 Appendix

881 Interview Guide

882 What is your educational and training background (the pathway that has led you to  
883 where you are)?

- 884
  - Psychology (clinical?)/sport science?

885 Which theoretical orientation or perspective underpins your work with clients?

- 886
  - For example: humanistic/psychodynamic/clinical/behavioral/cognitive  

887 
  - Why have you chosen this approach?  

888 
  - If CB - is it CBT? - CB strategies, or CB therapy?  

889 
  - If a blend/mixture of approaches - is it an integration or are the approaches  

890 
  - discrete?

891 Do you have experience or qualifications in psychotherapy or counselling?

- 892
  - If yes - which type? Why did you get this? How is this valuable?  

893 
  - If no - why not? Do you see any value in obtaining this?

894 Which therapeutic approach underpins your interventions with clients?

- 895
  - For example: cognitive-behavioral; mindfulness and acceptance;  

896 
  - positive/strengths-based;  

897 
  - Prompt: Which specific type? (e.g. which type of CBT (REBT; NLP); ACT vs.  

898 
  - MAC?)  

899 
  - Why have you chosen this approach?  

900 
  - Do you have a method for ensuring you are delivering this approach  

901 
  - consistently?

902 What is your understanding of a therapeutic/working alliance?

903 When you first start working with a client, how do you begin to build a  
904 relationship/alliance with them?

- 905
  - How do you demonstrate that you are engaged in what they are saying?  

906 
  - How do you use your client as a resource?  

907 
  - How do you identify what the target of your session or intervention might be?  

908 
  - Do you employ any specific tools/techniques/approaches for doing this?

909 Which specific communication skills do you employ to underpin your work?

- 910
  - Where did you learn these?

911 If your relationship gets stuck, or you begin to experience some incongruence or a  
912 disconnection in the relationship, how do you manage that?

- 913       • Do you employ any specific tools/techniques/approaches for doing this?  
 914       • Link back to the **alliance**
- 915       How do you decide which intervention to use with each client?
- 916       If you feel that a blend/integration of approaches would be appropriate/beneficial,  
 917       how do you go about that?
- 918       When you feel like you have information/knowledge that you need to share with your  
 919       client, how do you do that?
- 920       How do you work with a client who is in two minds about something or who has an  
 921       issue and is unsure how to proceed?
- 922       • Do you employ any specific tools/techniques/approaches for doing this?
- 923       How do you work with a client who simply doesn't want to be there?
- 924       • Do you employ any specific tools/techniques/approaches for doing this?
- 925       Do you attempt to measure the quality or strength of the relationship you build with  
 926       your clients?
- 927       • How do you do this?  
 928       • How do you judge whether or not you are working well with your clients?  
 929       • Link back to the **alliance**
- 930       How do you measure the progress/impact of the work you do with your clients?
- 931       How does your approach change when delivering a session to a team, such as a  
 932       seminar or workshop, as opposed to a 1:1 consultation with an athlete?
- 933       Now, I'd like to ask you specifically about motivational interviewing:
- 934       What is your experience with motivational interviewing?
- 935       How do you use this with athletes?
- 936       Which aspects of MI do you use with athletes?
- 937       How do you measure the impact of this work?
- 938       Is it that MI is an efficacious intervention in its own right, or are the relational and  
 939       technical aspects relevant in sport?
- 940       • Where are these learnt if not through MI?
