ABSTRACT

As a preliminary investigation, we examined elite youth football academy players' perceptions of the quality of their development environment, at a crucial stage in their progression to the professional level. With institutional ethics approval, the Talent Development Environment Questionnaire (TDEQ) [1] was used to survey 50 elite players aged 16-18 (m 17.1, $\pm s = 0.6$ years) recruited from the academies of Premier League and Championship clubs in England. Overall, the results suggest that elite player development environments are perceived to be of a good quality. However, while academies appeared strong in areas related to coaching, organisation, and sport-related support; they were somewhat deficient in areas related to athlete understanding, links to senior progression, and key stakeholder relationships. In addition to the importance of establishing well-integrated youth and senior teams and positive working relationships with parents; the findings underline the necessity for academies to pay close attention to the psychosocial environments they create for developing players. Theoretical considerations and applied implications for those involved in elite player development are discussed.

Keywords: elite, environment, development, football, psychosocial

5 INTRODUCTION

6 The development of gifted young football players is paramount on the agenda for those
7 responsible for governing professional football in England (e.g., The Football Association,
8 Premier League). While the English Premier League (EPL) has enjoyed exponential growth
9 over the last two decades, concerns have been raised about the decreasing number of English
10 players that have been developed during this period. Supporting this notion, recent research
11 from the Centre International d'Etude du Sport (CIES) Football Observatory revealed that the
12 playing time of English under-21s in the EPL has fallen to its lowest level [2]. More precisely,
13 in the 2012/13 season, only 35 English under-21 players made appearances in the EPL; the
14 lowest figure since 2005. Despite much conjecture and vociferous debate regarding elite
15 player development within the game, what is clear is that the ever increasing quality of the
16 English Premier League (EPL), underpinned by the extraordinary financial power of elite
17 clubs, has led to a scenario where, to 'break through' to the elite level, young players not only
18 have to be one of the finest in England but also the world. For this reason, the director of
19 youth at the EPL has noted that, "the focus on youth has probably never been as intense or as
20 urgent since the inception of the Premier League as it is right now." [3].

21 This notable real world significance is reflected in the increasing amount of research
22 within the sport sciences that has been dedicated to the topic in recent years [4, 5, 6, 7].
23 Notwithstanding the different perspectives taken (e.g., sociological, motor control and
24 learning, stress and coping), this research is ultimately united by a shared focus on the
25 application of scientific principles to help those involved in elite player development.

1 While the development and eventual success of a gifted young player is considered to
2 be influenced by an intricate blend of innate, psychological, and behavioural factors [5], few
3 would dispute that it is also largely shaped by their environmental experience [8]. Indeed,
4 Williams and Reilly [9] contend that the very term "talent development" in football infers that
5 young players are provided with an appropriate learning environment to translate their
6 potential into excellence. Offering support for this view, in a study identifying factors
7 perceived to influence the development of elite academy players [5], providing a rich and
8 vibrant learning environment was considered central to successful progression. In coaching
9 psychology literature, as well as on the topic of developing talent, what constitutes a vibrant
10 learning environment has received increased interest [10]. Traditionally, coaching
11 environments have been criticised for adopting approaches in which young, developing
12 athletes are treated as "sponges", thereby reflecting a more passive style to learning. It is now
13 encouraged that to promote learning, coaches need to encourage active learning (e.g.,
14 questioning methods and problem solving type drills), as well as using strategies to help
15 athletes become aware of their performance (e.g., coach-athlete dialogue) and raise self-
16 awareness. Highlighting the role of such environments, Mills et al., [5] findings suggested
17 creating conditions that promote a number of intrapersonal factors associated with success
18 (e.g., resilience, confidence, competitiveness). Indeed, self-awareness was found to be one of
19 the key factors associated with the successful development of Academy football players.
20 Over all, this recognised need to cultivate appropriate developmental climates in which to
21 nurture young players underlines Gagne's [11] contention that exceptional natural abilities
22 can remain solely as gifts if not effectively nurtured via the developmental process into
23 systematically developed talents. Put simply, elite players would appear to be largely built
24 not born and, as such, points toward the environment created at a youth academy as one of
25 the most directly controllable factors in the life of a young player.

1 Despite the importance placed on a players' development environment, to-date, little is
2 known about the environments that are created for elite young players. Given that elite youth
3 football in England is considered to be inherently challenging and largely characterised by a
4 highly pressurised climate for success [7], the lack of research in this regard is somewhat
5 surprising. Notwithstanding the contributions of recent investigations [5, 6, 7] that underline
6 the necessity for developing players to be able to cope with the potentially wide-ranging
7 demands they encounter within academy environments; scant research has specifically
8 explored the development environments that are established to nurture players into the elite
9 senior level of the game. In an attempt to redress this imbalance, Mills, Butt, Maynard, and
10 Harwood [12] examined successful elite academy coaches' perceptions of factors considered
11 to underpin optimal development environments for players on the verge of the professional
12 level. Key themes identified included: (i) espousing a coherent philosophy with clearly
13 defined core values, expectations, and behavioural standards; (ii) promoting whole person
14 development; (iii) empowering key stakeholders (i.e., staff, players, and parents) to create a
15 sense of ownership and relatedness; (iv) forming positive relationships with key stakeholders
16 and prioritising player wellbeing; (v) maintaining well-integrated and stable personnel with
17 strong links to senior team operations (vi); establishing clear and effective lines of
18 communication; (vii) being adaptable and committed to innovation; and (viii) constructing an
19 achievement-focused climate with explicit opportunities to progress. Collectively, the
20 findings emphasised the importance of establishing strong, dynamic organisational cultures
21 within youth academies.

22 Despite the valuable insights generated from this research, our understanding of elite
23 player development environments is far from complete and some important questions remain
24 unanswered. Firstly, obtaining coaches' views of how they shape the environment, while
25 important, only represents one part of the equation. Given that coaching effectiveness is

1 largely considered to be a process-product phenomenon, it would also seem important to
2 elicit the perceptions of developing players to gain their perspectives on the academy
3 environment. Indeed, generating such player-driven insights would help to provide a more
4 complete picture of the environments elite young players are nurtured within. Importantly,
5 insights of this nature would also appear to bridge an evident real-world need. As Green [13,
6 p.10] observed, “despite the time, effort, and huge investment that has gone into England’s
7 youth development schemes, one thing the clubs, their leagues, and the FA have not been
8 very good at is finding out what the people who have been through the system felt about it.”

9 Second, despite Williams and Reilly’s [9] recommendation that a key area for research
10 in elite youth football is to provide guidelines for nurturing players through each stage of
11 development, few studies, to-date, have specifically focused on key stages along the player
12 development pathway. One such key stage along this pathway relates to the investment years
13 [14]. In talent development terms, this represents the specific transition from elite junior to
14 elite senior where training, competition, and the pursuit of elite level performance become the
15 major foci of a developing athletes’ life. In elite youth football terms, this represents the stage
16 where players who show real promise are signed to undertake a two year full-time youth
17 training programme known as an academy scholarship. This structured programme provides
18 young players with a finite window of opportunity to realise their ambition of becoming a
19 professional. Although elite athletes have frequently described this specific transition as the
20 most difficult stage they encountered [15], presently, little is known about players’
21 developmental experiences during this critical period in their early career. This point
22 highlights a gap in the literature that warrants attention. As such, it would seem important for
23 the continued advancement of the area that research begins to build a clear picture of elite
24 development environments as seen through the eyes of players at a pivotal, invariably ‘make
25 or break’, stage in their footballing lives.

1 Third, from a methodological perspective, the greater part of talent development
2 research has been retrospective in nature. Specifically, high-achieving elite adult athletes
3 have been asked to reflect on their athletic careers [16]. Notwithstanding these contributions
4 to the literature, research with athletes *in situ* would seem vital as it may reveal more
5 information about talent development than examining the recalled perspectives of those
6 already at the elite adult level [14]. Indeed, such research would help to identify the positive
7 and negative aspects associated with development so they can either be maximised or
8 minimised in the lives of young athletes [17].

9 In light of both the empirical and real-world need to better understand the environments
10 in which young players are nurtured, the purpose of the present study was to examine elite
11 academy players' perceptions regarding the quality of their development environment at a
12 decisive stage in their progression to the professional level. It is anticipated that such a
13 detailed, scientific insight will enable a clearer understanding of their current strengths and,
14 importantly, areas that might need improving. In the interests of bridging the gap between
15 research and practice, such information would provide those working within elite youth
16 football with actionable insights that might, in part, help facilitate the development process of
17 gifted young players.

18 METHOD

19 *Participants*

20 50 elite youth football academy players aged 16-18 years (m 17.1, $\pm s$ = 0.6 years)
21 participated in the study. Of these, 41 were English and nine were from overseas countries
22 (i.e., African $n=3$, Asian $n=1$, Eastern European $n=2$, Northern European $n=3$).

23 To capture balanced and geographically diverse perspectives of elite player development
24 environments, players were recruited from academies that were based in the North ($n=1$),
25 Midlands ($n=1$), and South ($n=1$) regions of England. For authenticity of the data, it was also

1 important to recruit a sample that could justifiably be considered elite. To this end, the
2 inclusion of players was based on two strict criteria. First, the players were recruited from
3 academies that participate in the top division of the EPL's Professional Development League
4 (PDL). Academies in this division have been awarded category one status by the EPL which
5 represents the highest tier of elite youth football in England. This category is only awarded to
6 select academies that meet stringent criteria in relation to their youth development
7 programmes [3]. At the time of data collection, only 20 academies held this status. There are
8 approximately 20 scholars (i.e., 1st and 2nd years) in each academy, thus, the present sample
9 equated to approximately 12% of all elite developing players in England. Second, it was a
10 prerequisite that all players were at the scholarship stage of development (i.e., 16-18 years),
11 and were contracted by the club on a full-time, day-to-day basis. This ensured that reliable,
12 stage-specific perceptions of the development environment could be gathered.

13 *Instrumentation : Talent Development Environment Questionnaire (TDEQ)*

14 The TDEQ was used to capture the players' perceptions. Developed by Martindale et al.
15 [1], the TDEQ is a 59 item questionnaire designed to measure the extent to which features of
16 good practice are experienced by athletes in their development environments. Based on key
17 features emanating from the extant talent development literature, the TDEQ has been
18 developed as a generic tool that evaluates the environmental features deemed useful for
19 facilitating development across sports, stage/age, gender, and culture. Specifically, the
20 instrument comprises seven factors: (i) Long-term development focus; (ii) Quality
21 preparation; (iii) Communication; (iv) Understanding the athlete; (v) Support network; (vi)
22 Challenging and supportive environment; and (vii) Long-term development fundamentals.
23 The internal consistency of the questionnaire shows adequate to excellent reliability and a
24 recent validation study also demonstrated robust structural properties and sound ecological

1 validity [1]. In light of its psychometric properties, the TDEQ is considered a tool that can be
2 used with confidence in applied talent development research settings.

3 *Procedure*

4 Following institutional ethics approval, the academy managers of youth academies that
5 met the stipulated inclusion criteria were initially contacted by email detailing the purpose
6 and nature of the study. For those who agreed to participate, convenient times were arranged
7 to collect the data. Before data collection commenced, informed consent was obtained from
8 the academy manager and players which confirmed their understanding of the purpose of the
9 study and their agreement to participate. For those under 18, parental and/or guardian consent
10 was also obtained. Administration of the questionnaires took place at the respective
11 academy's training facilities in quiet classroom conditions under the supervision of the
12 researcher and/or the academy manager and Head of Education and Welfare (HoEW). From
13 the total number of scholars that were invited to participate in the study, 50 completed the
14 survey, indicating an 85% completion rate. The supervised, on-site, data collection ensured
15 that all questions (i.e., each of the subscales) on the survey had been answered. At the onset,
16 players were also informed that there were no right or wrong answers, given assurances about
17 the confidentiality of their responses, and encouraged to provide honest answers. To further
18 reduce social desirability, the participants were not asked to provide any identifiable details
19 and were assured that any information emanating from the questionnaires would only be
20 displayed as a group average. The questionnaires took approximately 15 minutes to complete.

21 *Data analysis*

22 Due to the structure of the questionnaire, previous studies [1] using the TDEQ coded
23 responses on a 6-point scale ranging from 1 (strongly agree) to 6 (strongly disagree). For this
24 reason, a lower mean indicated a more favourable perception. However, for ease of
25 interpretation, and in line with Wang and colleagues [18], all items in the present study were

1 coded from 1 (strongly disagree) to 6 (strongly agree). This permitted higher scores to relate
2 to a perception of higher quality experience.¹

3 To add validity and accuracy to the interpretation of the data, the reliability of the
4 TDEQ was initially measured using Cronbach's alpha. Specifically, preliminary statistical
5 analysis was carried out to determine the internal consistency of the instruments factors. In
6 the present investigation, all but one of the subscale alpha coefficients were found to be
7 adequate and ranged between .60 and .92 (development focus, $\alpha = .92$; quality preparation, α
8 = .60; communication, $\alpha = .84$; understanding of athlete, $\alpha = .63$; support network, $\alpha = .78$;
9 and development fundamentals, $\alpha = .76$). Congruent with Wang et al. [18], the challenging
10 and supportive environment factor demonstrated low internal reliability ($\alpha = .40$), and thus
11 was omitted for interpretation at the subscale level.

12 After establishing reliability, the mean subscale scores were calculated for each of the
13 remaining six factors. Given Martindale et al.'s [1] recommendation to use item scores in
14 conjunction with subscale scores when using the TDEQ in applied research, descriptive
15 statistics were then calculated for all individual item scores within each factor². Following on
16 from this, all items were subsequently quartile ranked by proportion of agreement. This
17 process enabled a detailed, quantitative analysis of the key strengths and areas for
18 improvement as seen through the players' eyes. Items ranked in the top quartile (i.e., top 25th
19 percentile) were greater than 80% proportion of agreement, and as such were classified as
20 strengths (+) of the development environment. Conversely, items ranked in the bottom
21 quartile (i.e. bottom 25th percentile) were less than 70% proportion of agreement, and as such
22 were categorised as areas for improvement (^).

23 RESULTS

¹ Except for negatively phased items where a lower item mean relates to a higher quality perception of that aspect.

² Nine of the TDEQ's items are miscellaneous and, as such, are not used in calculating the subscale scores, nor have they been included in the item level analysis.

1 The results are structured in two parts. First, the mean subscale scores of the main
2 variables are displayed (see Table 1) to show how elite player development environments are
3 perceived at an overall factor level. Second, to provide a deeper and more meaningful
4 understanding of the players' perceptions beyond the subscale scores, each factor is presented
5 in more detail to elucidate trends in the data at an item level. Descriptive statistics for the
6 items within each factor are summarised in Table 2. In addition, Figure 1 displays the specific
7 features of the development environment identified as strengths and areas for improvement.
8 Interpretation of these key areas in light of assumptions derived from the extant talent
9 development literature will be provided in the discussion.

10 *Overall*

11 At an overall factor level, players reported that their development environment exhibits
12 a long-term development focus, provides robust support networks, and largely demonstrates
13 effective communication. However, features of the environment relating to athlete
14 understanding, long-term development fundamentals, and quality preparation were not
15 viewed as strong. These six factors are discussed in turn below beginning with the three
16 strongest factors.

17 *Long-Term development focus*

18 This factor comprises 27 items that relate to the extent to which development
19 opportunities are specifically designed to facilitate long-term success (e.g., on-going
20 opportunities, rounded development, and clear expectations). The items in this factor also
21 relate to the attitudes, psychological skills, and understanding required for long-term
22 progression (e.g. responsibility, dedication, coping skills). With a mean subscale score of
23 4.67, this factor emerged as one of the highest performing components of the development
24 environment and, as such, was viewed largely positively by the players.

25 Within this factor, nearly all players (96%) agreed to some extent that they were

1 expected to take more responsibility for their own development as they became more
2 experienced ($m = 4.83$). The players also largely indicated that their training was beneficial
3 and challenging ($m = 4.91$); and specifically designed to help them develop in the long term
4 ($m = 4.85$). With specific emphasis on the coach, the majority of players reported that their
5 coach cared more about them becoming a professional than having a winning team ($m = 4.81$);
6 constantly reminded them that dedication and desire would be key to how good a performer
7 they would become ($m = 5.00$); was good at making them understand their strengths and
8 weaknesses ($m = 4.98$); and emphasised the need for constant work on fundamental skills (m
9 $= 4.98$). Further, the players mostly agreed that there were people to help them deal with any
10 nerves or worries they experienced ($m = 4.60$); and reported that they were told how they
11 could help each other develop further in their sport ($m = 4.85$). Despite the largely positive
12 responses, approximately two-thirds of players (65%) agreed to some extent that developing
13 performers are often written off before they have had an opportunity to demonstrate their full
14 potential.

15 *Support network*

16 This factor comprises eight items that relate to the degree to which a coherent,
17 approachable, and wide-ranging support network is available to help support and develop
18 players in all areas. With a mean subscale score of 4.68, this factor was one of the highest
19 performing components of the environment. Within this factor, the players revealed that they
20 felt they could pop in to see their coach or support staff whenever they needed to ($m = 5.38$),
21 and that the coaches and support staff were largely approachable ($m = 4.77$). Players also
22 indicated that they had access to a variety of professional support staff to help their
23 development ($m = 4.98$). 83% of players reported that all the different aspects of their
24 development were organised into a realistic schedule; while the majority revealed that their
25 training programmes were specifically developed to their needs ($m = 4.51$). In addition,

1 players largely reported that their coach regularly talks with support staff about what they are
2 trying to achieve ($m = 4.68$); and predominantly considered the coaches and support
3 personnel to be on the same wavelength with what is best for them ($m = 4.49$). The majority
4 of players also revealed that their coach makes sure that their college understands about the
5 demands placed on them with regards training and competition ($m = 4.51$).

6 *Communication*

7 This factor contains seven items that collectively relate to the degree to which the coach
8 communicates effectively with players in both formal and informal settings. With a mean
9 subscale score of 4.39, this component of the environment performed adequately. Within this
10 factor, the players largely agreed that their coach explained how their training and
11 competition programme work in tandem to help them develop ($m = 4.79$). The majority of
12 players also indicated that they talked with their coach about what current and/or past world-
13 class performers did to be successful ($m = 4.40$). While 83% of players agreed to some extent
14 that the feedback they receive almost always relates to their goals; a substantial proportion
15 (45%) of this agreement was tentative ($m = 4.21$). The players largely reported that they
16 regularly talk with their coach about the things they need to do to progress to the elite senior
17 level ($m = 4.49$); and that they regularly set goals that are tailored to their individual needs (m
18 $=4.49$). While the majority of players also indicated that they often discuss the connections
19 between different aspects of their training ($m = 4.51$); only 44% either agreed or strongly
20 agreed that they often worked with their coach to identify what their next big test will be ($m =$
21 4.15).

22 *Quality preparation*

23 This factor, consisting of five items, refers to the extent to which clear guidance and
24 opportunities are in place to provide and reinforce quality practice through training, recovery,
25 and competition experiences. With a mean subscale score of 4.16, this factor was viewed as

1 one of the weaker elements of the development environment. All items within this factor
2 were negatively phrased. To this end, a lower mean score relates to a perception of higher
3 quality experiences. Within this factor, the majority of players reported that they get good
4 quality competition experiences at the level they require ($m = 2.64$); and are taught how to
5 balance training, competing, and recovery ($m = 2.55$). However, approximately four out of
6 ten players (39%) revealed that they felt pressure from their peers to do things differently to
7 what the coach asks ($m = 3.04$); while a similar proportion (41%) indicated that they are
8 rarely encouraged to plan for how they would deal with things that might go wrong ($m =$
9 3.06). In addition, only around a half of all players (45%) reported with certainty (i.e. either
10 agreed or strongly agreed) that the guidelines regarding what they need to do to progress are
11 clear ($m = 2.79$).

12 *Understanding the athlete*

13 This factor comprises four items that collectively relate to the extent to which the coach
14 understands the player in depth, at a holistic level, and has developed a strong professional
15 relationship with them. With a mean subscale score of 4.15, this factor was one of the weaker
16 performing components of the environment. Congruent with the communication factor, all
17 items within this subscale were negatively phrased and, as such, lower item mean scores
18 indicate a more favourable perception. Within this factor, the majority of players felt that
19 their coach took time to talk with other coaches that work with them ($m = 2.68$), and mostly
20 indicated that they received help to develop their mental toughness ($m = 2.57$). However, a
21 third of players (34%) revealed that their coach rarely talks to them about their well-being (m
22 = 3.09); with a similar proportion reporting that their coach seldom takes an interest in their
23 life outside of sport ($m = 2.98$).

24 *Challenging and supportive environment*

1 This factor consists of four items that relate to the degree to which players are
2 appropriately challenged by, and supported through, their development experiences (e.g.,
3 links to higher level players, educational support). Due to an unacceptable alpha coefficient,
4 the mean subscale score was not computed for this factor. At an individual item level, the
5 majority of players reported that they are regularly told that winning and losing “right now”
6 will not determine how successful they will be in the future ($m = 4.38$). In addition,
7 approximately a third (36%) of players indicated that their college does not support them with
8 their sport when they need it ($m = 3.02$). As well as the largely tentative agreement regarding
9 the opportunities players had to train with players at a level they aspire to ($m = 4.02$); over
10 half (56%) of all players indicated that they do not often get help from more experienced
11 performers ($m = 3.51$).

12 *Long-Term development fundamentals*

13 This factor consists of seven items that collectively relate to the extent to which key
14 features for effective development are embedded in the programme (e.g., on-going
15 opportunities, parental support, and athlete autonomy). With a mean subscale score of 3.95,
16 this factor was the weakest performing facet of the environment. However, it is important to
17 note that this score might have been adversely impacted by an item (i.e., “I am encouraged to
18 participate in other sports”) that is not particularly relevant for the athletes in this study.
19 Within this factor, approximately 4 out of 10 players felt that they would not be given good
20 opportunities if they experienced a dip in performance ($m = 3.91$), while 50% of players felt
21 that their coach did not make time to talk with their parents about what they are trying to
22 achieve ($m = 3.43$). Moreover, only 47% of players agreed with conviction that they had
23 opportunities to discuss how more experienced players handled the pressures they face ($m =$
24 4.17). Though the greater part of players indicated that they were involved in most decisions
25 about their development ($m = 4.34$), a fifth (21%) reported that they were not. More

1 positively, the majority of players felt that they had their progress and performance reviewed
2 regularly on an individual basis ($m = 4.47$); and largely indicated that the advice their parents
3 provide fits well with the advice they get from their coaches ($m = 4.49$).

4 DISCUSSION

5 The purpose of the present study was to examine elite youth football academy players'
6 perceptions of the quality of their development environment at a key stage in their
7 progression to the professional level. To our knowledge, the current investigation is the first
8 to reveal the perspectives of such athletes within elite high-performance training
9 environments. As such, the findings offer a step forward in this area, not only within elite
10 youth football, but also elite youth sport in general. The aim of this section is to situate the
11 identified key strengths and areas for improvement (see Figure 1) in light of assumptions
12 derived from the extant talent development literature. Following on from this, we present a
13 number of applied implications and recommendations for those involved in elite player
14 development.

15 The majority of strengths emerged from the long-term development focus factor and
16 appear to largely relate to coaching practice (e.g., technical instruction, training plans). In
17 doing so, this emphasizes the high quality of coaching players feel they are receiving within
18 elite academies. Given the importance placed on high quality coaching in fostering a rich and
19 vibrant learning environment within football academies [4], this is an encouraging finding.
20 Additional strengths within this factor related to a focus on improvement rather than winning,
21 and the promotion of self-responsibility, both of which are considered key features of
22 effective development environments [12]. The other strong points emerged from the support
23 network factor. Specifically, access to a variety of different professionals (e.g., sport
24 scientists), and the availability of coaches and support staff were both identified as high
25 quality perceptions. Given that well-developed support systems have been shown to be

1 strongly correlated with performance [19], this is an important aspect of the environment that
2 academies are largely perceived to do well.

3 Highlighting the significance of these aforementioned factors, in a study examining the
4 impact of the development environment on young athletes' goal pursuits and life aspirations,
5 Wang et al. [18] found these factors positively predicted intrinsic goal striving. As such, these
6 two high-performing factors point toward the presence of conditions that facilitate intrinsic
7 motivational climates. Given that elite high-performance environments of this nature might
8 naturally align young players with externally driven goals, this represents a further
9 encouraging finding.

10 Notwithstanding these positives, the results also revealed a number of lower quality
11 perceptions. As displayed in figure one, these areas for improvement were more evenly
12 spread across the factors, and included issues pertaining to peer pressure, goal-setting,
13 feedback, contingency planning, diminished opportunities due to form, and college/school
14 support. While not overlooking the significance of these areas, three notable themes emerged
15 that specially relate to key factors identified in the literature as exerting a significant
16 influence on player development [12]. As such, we feel these merit particular attention.
17 Specifically, these central themes concerned athlete understanding, links to senior
18 progression, and key stakeholder relationships; each of which will be discussed in turn.

19 Although understanding the athlete and their world view is considered central to
20 appropriate support [1], this factor was not amongst the best performing components of
21 academy environments. Interestingly, while the aforementioned strengths might be linked to
22 intrinsic drives, a lack of athlete understanding is suggested to promote extrinsic goal striving
23 [18]. This suggests that opposing motivational forces might be at play in academy
24 environments. As previously mentioned, it is conceivable that these extremely competitive,
25 high-performance settings might influence players and coaches towards developing an

1 environment that fosters extrinsic goals and rewards (e.g., successful team, securing a
2 professional contract, getting players through). In such extrinsically motivated climates where
3 players are incessantly scrutinised, and coaches are often under pressure to ‘produce’; there
4 exists the potential for coaches to become ego-involved in their work and, in turn, emit
5 controlling behaviours that ultimately promote a controlling climate [20]. It is important to
6 note that in these environments it is likely that coaches are focusing on their primary role,
7 which is to develop players, and ultimately ensure that as many players as possible have the
8 abilities to make it to the professional senior level. Consequently, coaches may be unaware
9 that they are developing extrinsically-driven motivated climates, and thus, indicating a
10 potential area for future coaching education development in Academy football and in other
11 youth sports feeder systems.

12 In addition, while strong support systems are positively linked to performance, a lack of
13 perceived support can lead to poor coping mechanisms and stress [21]. Although high quality
14 perceptions of informational and tangible support emerged as key strengths in this study;
15 perceptions of emotional support were clearly not as strong. Indeed, while players largely
16 indicated that they had good coach-athlete relationships, it was clear that they did not feel
17 particularly understood at a holistic level with coaches seldom expressing an interest in their
18 lives outside of football. Given that young players find themselves immersed in an
19 environment that is fundamentally concentrated on being successful at football, coupled with
20 the tough and masculine culture that tends to characterise professional football, it is not
21 entirely surprising that players’ holistic needs might be compromised. To this end, one
22 wonders if these environments might "sow the seed" for an athletic identity and potential
23 identity-foreclosure for these adolescents [22]. If a strong athletic identity is developed,
24 education and the teaching of life skills can often be neglected [23]. To compound matters,
25 such is the strength of many young players’ desire to "make it" it is somewhat understandable,

1 despite the limited likelihood of success, why these adolescents might be susceptible to
2 prioritising their football education over their academic and/or general life skill education
3 [24]. Despite the fundamental importance placed by the FA and EPL on player welfare and
4 holistic development; the findings suggest that academies might not be doing enough in this
5 regard. To this end, it would be remiss of academies, both developmentally and ethically, to
6 "gloss over" the socioemotional needs of these individuals, especially given the demands this
7 key stage of development is considered to exert on young athletes. Considering the needs of
8 overseas players provides a cogent example in this regard. Although the present sample was
9 mainly comprised of English and home nation players, a small proportion of the respondents
10 were from overseas. This reflects the increasingly global nature of modern day elite youth
11 football [25]. In addition to the demands placed on local players, overseas players must cope
12 with an often large cultural transition. Indeed, it is highly probable that these players would
13 encounter a range of cultural and lifestyle related issues (e.g., language barrier, home-
14 sickness) that extend far beyond those associated with the football environment. It is likely,
15 therefore, that the demands are heightened for these players in their attempts to adapt to
16 academy life. From from an applied perspective, it would seem important that the
17 psychosocial environments created for these players are well-established to ensure that issues
18 linked to acculturation do not have an adverse impact on development.

19 The second noteworthy theme to emerge in the current study relates to continuing
20 opportunities and links to senior progression. Specifically, players indicated that
21 opportunities to train with senior performers, receiving help from more experienced players,
22 and opportunities to talk about how these players handled the challenges they now face were
23 not readily available. Possibly linked to this, there was a general perception that players are
24 often written off before showing their real potential. These findings might largely be
25 explained by the pervasive short-term "win at all costs" culture that exists in professional

1 football. Indeed, traditionally elite clubs have favoured ready-made, experienced players over
2 youth with a view to having an immediate impact or return on investment.

3 Nevertheless, from a developmental perspective, opportunities for athletes to
4 experience the advanced standard and increased pressure of higher levels (e.g., senior adult,
5 professional) is considered crucial for effective development [1, 5]. Indeed, highlighting the
6 link between environmental engineering and the development of attributes that fall under the
7 rubric of mental toughness, Mills et al. [5] revealed that challenging training environments
8 (e.g., training with senior team) helped promote key intrapersonal attributes associated with
9 successful progression at this key stage (e.g., resilience, coping with pressure, confidence).
10 As such, it appears crucial that youth and senior team operations are well-integrated. Indeed,
11 any semblance of dichotomy between the two might have serious repercussions for successful
12 player development. In real world operations, it does appear that those professional clubs
13 using well-established players (i.e., those players who are nearing the end of their careers and
14 might be moving towards a youth team coaching role) to bridge this gap, are successfully
15 “getting players through.”

16 The third important theme to emerge centred on key stakeholder relationships with
17 specific emphasis on the coach-parent dyad. While some parents are considered to facilitate
18 player development, certain parental behaviours (e.g., conflicting coaching advice) are
19 considered to exert a negative influence [5]. As such, the prevailing view amongst coaches
20 appears to be one that considers parents as more of a hindrance than a help. In support of this
21 notion, the players in the present study indicated that their coach did not make sufficient time
22 to talk with their parents about their development. However, of particular note, players also
23 revealed that their parents’ advice was largely congruent with their coaches. These findings
24 suggest that academy coaches might be overlooking the important role parent's play in the
25 development process [16]; even through the investment years where the coach is considered

1 to exert a greater influence [14]. Indeed, forming positive key stakeholder relationships and
2 empowering parents to create a sense of ownership and relatedness are considered key factors
3 underpinning the creation of optimal player development environments and a high-
4 performance culture [12].

5 *Applied implications*

6
7 In the interests of bridging the gap between research and practice, the question remains
8 how academies can be helped to meet the needs of developing players at this decisive stage of
9 development. In this regard, the findings offer a number of practical implications for those
10 involved in elite player development. First, the findings underline the importance of building
11 strong links to the senior team. Although such relationships might ultimately rest upon the
12 senior team manager championing a pro-youth policy, it is recommended that links to senior
13 players could be established in the form of a mentoring scheme. Importantly, rather than
14 inviting 1st year or early career professionals - who may be reluctant to assist players that
15 could be viewed as a threat - such a scheme would lend itself to the participation of already
16 established/late career professionals who may be nearing the end of their careers and looking
17 to transition into coaching. Indeed, we contend that inviting established professionals to pass
18 down their knowledge, share their experiences of the development process, and provide
19 insights into how they met the challenges that young players now face could play a crucially
20 important function in the development of players at this key transitional stage.

21 Second, it is clear that academies need to pay close attention to the psychosocial
22 environments they create for developing players. From a developmental standpoint, this is a
23 serious ethical issue, especially if there is a risk that the nature of these academies might not
24 prepare these individuals for life outside of football. Consequently, we believe those
25 responsible for the design and implementation of academy programmes should not only be
26 mindful of young players' socioemotional needs; but also make a genuine, concerted effort to

1 prepare players for all eventualities. In this regard, for a truly balanced approach to player
2 development, we believe coaches at the youth level should be encouraged to ground their
3 practice around an athlete-centred model where performance excellence co-exists in the same
4 environment as personal excellence. When applied, this approach to coaching is considered a
5 powerful tool in empowering young athletes to learn and take more responsibility for their
6 own development, which ultimately, results in enhanced performance and a thriving,
7 supportive team environment [26].

8 Notwithstanding the importance of what essentially rests at the heart of the coaches'
9 role (i.e., technical instruction), in light of the players' perceptions, we feel an athlete-centred
10 approach would be more developmentally appropriate. We also acknowledge that some
11 readers may be cynical that such utopia is possible given the culture of the game. Certainly,
12 the efficacy of such an approach would greatly rest upon the club advocating a holistic policy
13 as part of their vision for player development. However, if the conditions can be created
14 whereby an academy manager feels secure in the knowledge that producing players is not the
15 sole outcome measure, we are confident that such a model of development could be
16 successfully woven into the fabric of an academy's culture.

17 The findings also offer a number of applied implications for sport psychologists
18 working in youth football settings. Specifically, the nature of these implications would
19 involve practitioners going beyond the traditional canon of mental skills training, as well as
20 performance enhancement techniques. For example, to overcome the influence of a largely
21 externally driven sport culture that is susceptible to the establishment of controlling climates,
22 sport psychologists could have an important role to play in the promotion of autonomy-
23 supportive coaching behaviours. Such coaching is considered to make players feel more
24 competent in their sport, more autonomous in their actions, and better related to significant
25 others from their environment [27]. Enhanced perceptions of these three basic psychological

1 needs help foster more intrinsic drives and adaptive goal orientations that are considered
2 fundamental to optimum functioning and positive self-growth [28].

3 Furthermore, as opposed to ostracising parents as a control measure, it would seem
4 important that academies strive to build more positive working relationships with parents. To
5 help accomplish this, we feel sport psychologists would be ideally placed to facilitate parent
6 workshops geared towards optimising their influential role as a football parent. In light of the
7 suggestion that the intensive journey of an academy player is mirrored by an equally
8 demanding journey for their parents [29], these workshops, could play a key function in
9 parental development by also acting as an organised forum for parents to share their
10 experiences.

11 *Strengths and limitations*

12 From a real-world perspective, a primary strength of this investigation is that a detailed,
13 scientific attention to elite players' perceptions regarding the quality of their talent
14 development environment might assist academies to optimise their programmes. In addition,
15 as a preliminary attempt to examine elite football academy players' perceptions of the quality
16 of their development environment at a key stage in their journey to the professional level, the
17 findings not only advance our limited understanding regarding talent development
18 environments; but also help to bridge an important gap in the knowledge base regarding key
19 stages of athletic development. Given the high quality sample, we also feel this investigation
20 was enhanced by ensuring accurate and reliable perceptions of elite high-performance
21 environments could be assembled. From a methodological viewpoint, by capturing "in the
22 moment" views of elite players presently involved in the talent development process on a
23 day-to-day basis, an additional strength of the study involved overcoming some of the
24 limitations of previous retrospective designs. Moreover, given the recommendation to
25 consider individual items as well as overall factor scores when using the TDEQ in applied

1 research, the present study was enriched by ‘drilling down’ to an item level which enabled
2 more meaningful and practical insights.

3 Notwithstanding these strengths, some limitations must also be acknowledged. Firstly,
4 given the culturally specific focus on the English academy system, the transferability of our
5 interpretations to player development environments in other countries is speculative. As such,
6 readers should be circumspect in any attempt to relate the findings to other contexts. Second,
7 as the TDEQ has been designed as a generic tool, its developers recognise that a range of
8 context-specific issues may be apparent which might necessitate the development of sport
9 and/or stage specific versions [1]. Given the complex, idiosyncratic sub-culture of elite youth
10 football, we concur with this suggestion. Indeed, to fully evaluate the experiences of
11 developing players, a sport-specific diagnostic tool unique to the sporting population might
12 need to be developed, which we feel would have far greater precision as an applied diagnostic
13 tool. To illustrate our point, although cross training or participating in other sports is
14 considered important for athletes in the sampling years of development, this item would not
15 be appropriate for those in the investment stage. However, in the TDEQ’s current form,
16 disagreeing with this statement would relate to a low quality perception of the environment,
17 and as such might influence the reliability of the overall subscale score. Despite this potential
18 limitation, given the robust questionnaire development process, ensuing level of
19 psychometric properties, and sound ecological validity, we are confident in the insights
20 generated by the current instrument.

21 *Concluding remarks*

22

23 Although academies were generally viewed positively, the findings suggest that these
24 elite high-performance environments might not be fully meeting young players’
25 developmental needs. Indeed, given that player welfare, links to senior progression, and
26 positive key stakeholder relationships are all suggested to be vital for the creation and

1 regulation of an optimal development environment, it would seem imperative that academies
2 pay closer attention to these potentially problematic areas. Encouragingly, as elite players are
3 largely considered to be “built” not “born”, the academy environment would appear to be one
4 of the most directly controllable factors in the life of a young player. To this end, we have put
5 forward a number of suggestions for how these areas might, in part, be addressed. From a
6 broader talent development perspective, there remains a clear need for substantiated,
7 evidence-based practice concerning the creation of optimal talent development environments.
8 With a particular emphasis on football, establishing such environments would appear crucial
9 if the FA and Premier League wish to realise their aspirations of improving current youth
10 development programmes. While we believe the present study represents a step forward in
11 achieving that goal, it is imperative for future research to continue to determine the key
12 processes and mechanisms that underpin effective player development with a view to
13 bridging the gap between research and practice, and ultimately helping young players
14 transform their gifts into systematically developed talents.

Table I. Mean subscale scores for player perceptions of the quality of the development environment

TDEQ Subscales	M	SD
Long-Term Development Focus	4.72	0.87
Quality Preparation	4.18	1.11
Communication	4.43	0.92
Understanding the Athlete	4.17	1.13
Support Network	4.73	0.92
Long-Term Development Fundamentals	3.98	1.10

Table II Means and standard deviations for TDEQ items within each factor

	Mean	SD
Factor 1: Long-Term Development Focus		
My coach is good at helping me to understand my strengths & weaknesses	4.98	0.97
My coach is good at helping me understand what I'm doing & why I'm doing it	4.85	0.88
My coach emphasises the need for constant work on fundamental skills	4.98	0.77
The more experienced I get the more my coach encourages me to take responsibility for my own development	4.83	0.79
My development plan incorporates a variety of physical preparation	5.02	0.71
If I got injured I believe I would continue to receive a good standard of support	5.06	0.99
I am constantly reminded that my personal dedication & desire will be key to how good a performer I become	5.00	0.83
My coach constantly reminds me what he expects of me	4.64	0.92
My coach is a positive supporting influence on me	4.57	1.21
My coaches care more about helping me to become a professional than they do about having a winning team right now	4.81	0.82
My coach plans training to incorporate a wide variety of useful skills & attributes	4.83	0.96
My training is specifically designed to help me develop effectively in the long term	4.85	0.66
My coach emphasises that what I do in training & competition is far more important than winning	4.60	0.83
I am being trained to be ready for almost anything that is thrown at me in sport & life	4.70	0.86
I spend most of my time developing skills & attributes that my coach tells me I will need to compete at the pro level	4.85	0.62
My training sessions are normally beneficial & challenging	4.91	0.78
Me & my sports mates are told how we can help each other develop further in the sport	4.85	0.66
My coach allows me to learn through making my own mistakes	4.70	0.75
I am encouraged to keep perspective by balancing frustrations in one area with thinking about good progress in others	4.36	0.87
Organisation is a high priority to those who develop my training programme	4.66	0.81
There are people who help me/teach me how to deal positively with any nerves or worries that I experience	4.60	0.83
If it didn't work out for me here, there are other good opportunities that would help me to keep progressing	4.64	1.05
Developing performers are often written off before they have had a chance to show their real potential*	3.72	1.35
My coaches and those who support me give me straight answers to my questions	4.68	1.02
Factor 2: Quality Preparation		
I struggle to get good-quality competition experiences at the level I require*	2.64	1.03
I am rarely encouraged to plan for how I would deal with things that might go wrong*	3.06	1.13
The guidelines in my sport regarding what I need to do to progress are not very clear*	2.79	1.14
I am not taught that much about how to balance training, competing, & recovery*	2.55	1.18
I feel pressure from my mates in sport to do things differently from what my coaches are asking of me*	3.04	1.06
Factor 3: Communication		
I regularly set goals with my coach that are specific to my individual development	4.47	1.04
My coach & I regularly talk about things I need to do to progress to the top level	4.49	0.93
My coach often talks to me about the connections/overlap between different aspects of my training	4.51	0.78
My coach & I talk about what current &/or past world-class performers did to be successful	4.40	1.10
My coach and I often try to identify what my next big test will be before it happens	4.15	1.08
My coach explains how my training & competition programme work together to help me develop	4.79	0.72
Feedback I get from my coaches almost always relates directly to my goals	4.21	0.81
Factor 4: Understanding the Athlete		
My coach rarely talks to me about my well-being*	3.09	1.25
My coach doesn't appear to be that interested in my life outside of sport*	2.98	1.13
My coach rarely takes the time to talk to other coaches who work with me*	2.68	1.07
I don't get much help to develop my mental toughness in sport effectively*	2.57	1.06
Factor 5: Support Network		
I have access to a variety of different professionals to help my development	4.98	0.92
I can pop in to see my coach or other support staff whenever I need to	5.34	0.84
My coaches talk regularly to the other people who support me in my sport about what I'm trying to achieve	4.68	0.81
My training programmes are developed specifically to my needs	4.51	1.08
My coaches ensure that my college understands about me & my training/comp	4.51	0.86
Those who help me in my sport seem to be on the same wavelength when it comes to what is best for me	4.49	0.98
My coaches & others who support me in my sport are approachable	4.77	0.98
All the different aspects of my development are organised into a realistic timetable for me	4.55	0.90
Factor 6: Challenging & Supportive Environment		
My school/college doesn't really support me with my sport when I need it*	3.02	1.26
I am regularly told that winning and losing just now does not indicate how successful I will be in the future	4.38	1.05
I have the opportunity to train with performers who are at a level I'm aspiring to	4.02	1.36
I don't often get any help from more experienced performers*	3.51	1.38
Factor 7: Long-Term Development Fundamentals		
I would be given good opportunities even if I experienced a dip in performance	3.91	1.08
I am encouraged to participate in other sports and/or cross train	3.09	1.32
I often have the opportunity to talk about how more experienced performers have handled the challenges I face	4.17	1.05
My coaches make time to talk to my parents about me & what I'm trying to achieve	3.43	1.31
The advice my parents give me fits well with the advice I get from my coaches	4.49	1.00
My progress & performance is reviewed regularly on an individual basis	4.47	0.93
I am involved in most decisions about my sport development	4.34	1.05

* Refers to negatively phrased item where a lower mean score relates to a better quality perception

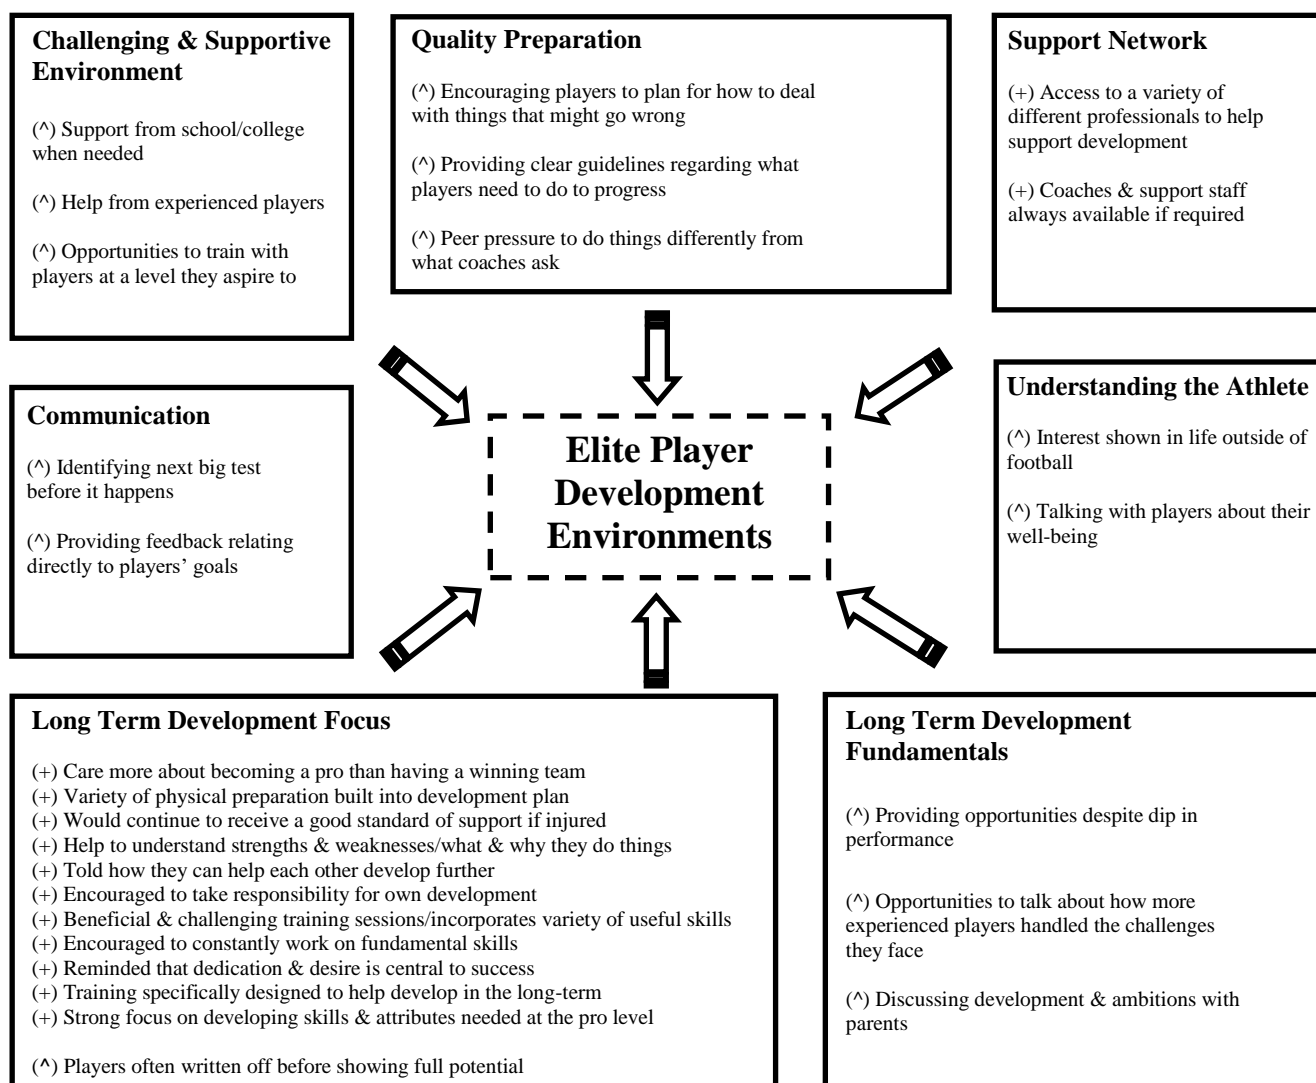

Figure 1. Features of elite player development environments perceived as key strengths (+) and key areas for improvement (^). Note: For the purposes of calculating sub-scale scores and ranking proportion of agreement, all negatively phrased item raw-scores were reverse coded.
