Running title: Prior ASCVD and post-stroke dementia

Abstract

Background: Prior atherosclerotic cardiovascular disease (ASCVD), including coronary heart disease (CHD) and peripheral artery disease (PAD), are common among patients with stroke, a known risk factor for dementia. However, whether these conditions further increase the risk of post-stroke dementia remains uncertain.

Objective: To examine whether prior ASCVD is associated with increased risk of dementia within stroke patients.

Methods: A retrospective cohort study was conducted using the Clinical Practice Research Datalink with linkage to hospital data. Patients with first-ever stroke between 2006 and 2017 were followed up to 10 years. We used multi-variable Cox regression models to examine the associations of prior ASCVD with dementia and the impact of prior ASCVD onset and duration.

Results: Among 63 959 patients, 7265 cases (11.4%) developed post-stroke dementia during a median of 3.6-year follow-up. The hazard ratio (HR) of dementia adjusted for demographics and lifestyle was 1.18 (95% CI: 1.12-1.25) for ASCVD, 1.16 (1.10-1.23) for CHD and 1.25 (1.13-1.37) for PAD. The HR additionally adjusted for multimorbidity and medications was 1.07 (1.00-1.13), 1.04 (0.98-1.11) and 1.11 (1.00-1.22), respectively. Based on the fully adjusted estimates, there was no linear relationship between the age of ASCVD onset and post-stroke dementia (all P-trend > 0.05). The adjusted risk of dementia was not increased with the duration of pre-stroke ASCVD (all P-trend > 0.05).

Conclusions: Stroke patients with prior ASCVD are more likely to develop subsequent dementia. After full adjustment for confounding, however, the risk of post-stroke dementia is attenuated, with only a slight increase with prior ASCVD.

Keywords: stroke, dementia, atherosclerotic cardiovascular disease, coronary artery disease, peripheral arterial disease, cohort study

Introduction

Stroke patients have a higher risk of dementia than the general population[1, 2], with 10% to 15% developing dementia five years after stroke[3]. Whether there are differences between stroke survivors that influence their likelihood of developing dementia and whether preventive interventions might be effective is to date unclear[4], although dementia is associated with multiple cardiovascular risk factors in the general population[5].

Coronary heart disease (CHD) and peripheral artery disease (PAD), the two major manifestations of atherosclerotic cardiovascular disease (ASCVD), often co-exist in people with stroke[6] and are associated with risk of dementia in the general population[7-9]. Dementia may be a consequence of underlying atherosclerosis or could be independent of atherosclerosis as a convergent disease process sharing major pathophysiological elements, such as cholesterol, inflammation and Apolipoprotein E polymorphism[10]. The myocardial dysfunction may contribute to subsequent cognitive impairment by affecting the maintenance of cerebral blood flow and cerebral perfusion homeostasis[11].

Previous research has shown a higher risk of future cardiovascular events in patients with stroke and prior ASCVD than those with stroke alone[12]. However, it is not clear whether the risk of dementia would also be increased in patients with stroke and prior ASCVD. A recent systematic review found that CHD and PAD were associated with dementia after stroke[13]. However, only two of the included studies provided adjusted estimates of the association, and there were other limitations of the included studies, including potential selection bias, small sample size and lack of long-term follow-up (median of maximum follow-up: 0.5 year; interquartile range (IQR): 0.25 to 4 years)[13]. The two studies[14, 15] that did adjust only took into account demographic covariates and stroke severity but not other potential confounders of dementia, such as lifestyle, cardiovascular risk factors, co-morbidities and medications[3, 4, 16]. It is not clear whether the association might vary with age at first diagnosis of prior ASCVD, with duration of prior ASCVD, or in different patient subgroups[13]. Whether the association of atherosclerosis with dementia varies by vessel affected

(e.g. coronary arteries or peripheral arteries) is not known for the general population[17], let alone in stroke patients[13]. Understanding the roles of prior ASCVD in post-stroke dementia may help inform the monitoring and prevention strategies for dementia in these patients.

We conducted this study to examine the overall association of prior ASCVD with dementia after stroke and explore whether the association differs by age at first diagnosis of prior ASCVD, by duration of prior ASCVD, or in different patient subgroups.

Materials and Methods

Data source

We conducted a retrospective cohort study using the Clinical Practice Research Datalink (CPRD), which provides anonymized data extracted from primary care medical records (including nursing home patients), with coverage of a representative sample of approximately 7% of the UK population from more than 670 general practices[18]. Patient-level data from the general practices (about 58% of all UK CPRD practices) which had consented to participate in the CPRD linkage scheme were linked to other existing data sources via a trusted third party (the Health and Social Care Information Centre). Where possible, we linked the CPRD data by unique patient identifier to Hospital Episode Statistics (HES), Death registration data from the Office for National Statistics (ONS), and Index of Multiple Deprivation (IMD).

Study population

We included patients aged at least 18 years with a diagnosis of first-ever stroke (ischemic stroke or intracerebral hemorrhage) recorded in the CPRD between 1 January 2006 and 31 December 2017 (Codes for stroke were listed in Supplementary Table 1). To ensure quality of recording of pre-existing diagnoses and medications, eligible patients were also required to have at least 12-month record information before the index date of stroke. We excluded patients with any dementia codes prior to the index stroke.

Post-stroke dementia

We defined post-stroke dementia as any type of dementia first recorded after the index stroke. In a sensitivity analysis, we further excluded patients having a first record of dementia within 6 months of the stroke to reduce the possibility of reverse causality. Dementia was identified using Read codes recorded in the CPRD and ICD-10 codes recorded in HES and ONS (Codes for dementia are listed in Supplementary Table 2).

Exposure

The exposure of interest in this study is atherosclerosis manifested by CHD and PAD. We defined the two conditions as any related Read codes or ICD-10 codes recorded before the index stroke (Codes for CHD and PAD are listed in Supplementary Tables 3 and 4 respectively). We defined ASCVD as the presence of CHD or PAD. Patients with ASCVD were then classified into mutually exclusive categories according to the ASCVD type (CHD plus PAD, CHD only and PAD only). We further considered as exposure level the age of first diagnosis of ASCVD (stratified into three age groups: young adults, <45 years; mid-life, 45 to 65; late life, >65) and length of pre-stroke ASCVD history (tertiles).

Potential confounders

We included potential confounders representing demographics, lifestyle, cardiovascular factors, neuropsychological conditions, immunity inflammation, health care utilisation and medications. Demographic variables included age, gender and socioeconomic status. Age was calculated on the date of index stroke and categorised into four groups (18-64, 65-74, 75-84 and ≥ 85 years) for subgroup analysis. Index of Multiple Deprivation (IMD) grouped by quintile was used as an indicator of socioeconomic status. The IMD includes seven domains: income; employment; health and disability; education, skills and training; barriers to housing and services; crime; and living environment. Where patient-level IMD was missing, we used the general practice-level IMD. Smoking status was classified as current, former or never smoker. Body mass index (BMI) was analysed as a continuous variable. For both smoking and BMI variables, the most recent data before the index stroke were used. Stroke subtype was classified into ischemic and haemorrhagic stroke (specific codes relating to ischemic stroke or unspecified stroke codes were regarded as ischemic stroke,

considering these patients shared similar characteristics[19] and 90% of stroke in the UK is ischemic stroke[20]). Prior comorbidity was defined as the presence of any relevant Read code or ICD-10 code before the index stroke. These conditions included atrial fibrillation (AF), alcohol problem, anxiety, asthma, chronic obstructive pulmonary disease (COPD), depression, diabetes, epilepsy, heart failure, hearing loss, hyperlipidaemia, hypertension, Parkinson's disease, rheumatoid arthritis, and transient ischemic attack (TIA). The codes for each condition were developed as part of a project developing the Cambridge Multimorbidity Score[21] and are publicly available on the website:

http://www.phpc.cam.ac.uk/pcu/cprd_cam/codelists/. We used number of consultations within 365 days before index stroke as a measure of healthcare utilisation. Pre-stroke medications, including statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs, were defined as any BNF codes recorded during the 365 days prior to index stroke. For comorbidity and medication, an absence of related codes was regarded as an absence of the condition.

Statistical analysis

We described baseline characteristics and calculated incidence rate of dementia for the overall stroke cohort and then separately by prior ASCVD history.

We estimated the hazard ratios (HR) with 95% confidence intervals (CI) for dementia over 10 years using cause-specific Cox proportional hazards models, in which death as a competing-risks event was treated as being censored. Robust standard errors that allow for intragroup correlation were used to account for possible clustering effects by general practice. Follow-up started from the index stroke until any dementia occurrence or censoring, whichever occurred earlier. Censoring included death, transfer-out from the CPRD, the end of 10-year follow-up, or the last update of CPRD (31 July 2018). The proportional hazard assumption was examined by a log-log plot and by testing the significance level of the interaction terms between ASCVD and time over 10 years in our primary model. The primary model was conducted with full adjustment for demographics, lifestyle, comorbidity, healthcare utilisation and pre-stroke medications. To explore how the association of interest was

influenced by the potential confounders, we also conducted two nested models with adjustment for parts of these confounder sets (demographics, lifestyle, and comorbidity; and demographics and lifestyle alone). Numerical variables (age, BMI and consultation) were treated as cubic spline variables with four knots in all the models to accommodate their potential non-linear relationships with dementia[22]. All these models in our main analysis were complete-case analysis.

We then estimated the HR of dementia for each age group of first ASCVD diagnosis and each tertile of pre-stroke ASCVD duration. Only including patients with ASCVD, we tested the linear trend of the age of ASCVD onset and the length of pre-stroke ASCVD history associated with dementia by assigning the median values to each category and treating them as a continuous variable in the models[23]. We examined multiplicative and additive interactions between CHD and PAD by including their product term in the models and testing the product term and relative excess risk due to interaction, respectively[24].

To examine the robustness of the study results, we conducted a series of sensitivity analyses: (1) excluding patients having a first record of dementia within the first 6 months after stroke; (2) separating any unspecified stroke from ischemic stroke; (3) restricting to patients with linkage to HES data; (4) changing the missing value of BMI to the 5th or 95th percentile value and the missing value of smoking to never or current smoking, respectively; (5) using competing-risks regression models treating death as a competing-risks event.

Subgroup analysis by age group of stroke diagnosis, gender, stroke subtype, cardiovascular comorbidity and pre-stroke statin use was then conducted using the primary full model. We examined the significance of interaction terms between the stratifying variable and ASCVD.

All the data management and statistical analyses were conducted using Stata 15. Quality control was performed before analysis (Supplementary Table 5). The statistical significance was $P < 0.05$ two-tailed except for subgroup analysis, where a Bonferroni correction was applied to the significance level that divided 0.05 by 11 subgroups examined (i.e., 0.0045).

We repeated the same analyses as above for CHD and PAD separately. We reported the results according to the RECORD statement (in the Supplementary Checklist)[25].

Ethics approval and patient consents

Ethics approval was obtained from the Independent Scientific Advisory Committee of the CPRD (protocol number 17_201R), with no written consent from participants required.

Results

A total of 63 959 patients were included, of whom 16 900 (26.4%), 14 880 (23.3%) and 3886 (6.1%) had prior ASCVD, CHD and PAD, respectively (Supplementary Figure 1). The median age was 75 years (IQR: 64-83) and nearly half (49.2%) were women (Table 1, Supplementary Table 6). The median age at first pre-stroke diagnosis was 66 years (IQR: 58-75) for ASCVD, 66 years (IQR: 57-75) for CHD and 69 years (IQR: 61-77) for PAD. The median duration of ASCVD, CHD and PAD before stroke was 10 years (IQR: 5-17), 11 years (IQR: 5-17) and 7 years (IQR: 4-12), respectively. Patients with complete baseline information (n=57 902) were more likely to suffer comorbidities and receive pre-stroke medications (Supplementary Table 7).

During a median follow-up of 3.6 years (IQR 1.2-6.8), 17 373 patients died without a dementia diagnosis. They were more likely to be older, female, have comorbidities, use health care and receive pre-stroke medications (Supplementary Table 8). The patients transferred out from the CPRD with no dementia diagnosis (n=7446) shared similar baseline characteristics with those who stayed in the cohort. During follow up, 7265 patients (11.4%) developed incident dementia, with an incidence rate of 27.3 per 1000 person-years.

Patients with pre-stroke ASCVD had a higher incidence of post-stroke dementia than those without, regardless of age of stroke and gender (Table 2, Supplementary Tables 9 and 10, Supplementary Figure 2), with a crude HR of 1.52 (95% CI: 1.45-1.61) for ASCVD, 1.50 (1.42-1.58) for CHD and 1.47 (95% CI: 1.34-1.62) for PAD and a minimally adjusted HR of 1.18 (95% CI: 1.12-1.25), 1.16 (95% CI: 1.10-1.23) and 1.25 (95% CI: 1.13-1.37). However, the HRs were progressively reduced in each of our models, and in our full adjustment model the adjusted HR (aHR) was 1.07 (95% CI: 1.00-1.13; P-value:

0.04) for ASCVD, 1.04 (95% CI: 0.98-1.11; P-value: 0.20) for CHD and 1.11 (95% CI: 1.00-1.22; P-value: 0.05) for PAD (Table 2). No violation of the proportional hazard assumption was found over the 10 years as shown in the log-log plots (Supplementary Figure 3), with a P-value of 0.94, 0.71 and 0.25 for the interaction between time and ASCVD, CHD and PAD, respectively, in the full adjustment model. The crude estimates suggested age of ASCVD onset and the length of time with ASCVD exhibited linear relationships with the risk of post-stroke dementia (Supplementary Tables 11 and 12). Based on the fully adjusted estimates, however, there was no linear trend for the age of ASCVD onset (P-value for trend: 0.37 for ASCVD, 0.21 for CHD and 0.98 for PAD), although mid-life ASCVD (aHR: 1.13; 95% CI: 1.04-1.24; P-value: 0.005), CHD (aHR: 1.11; 95% CI: 1.01-1.21; P-value: 0.03) and PAD (aHR: 1.25; 95% CI: 1.03-1.53; P-value: 0.02) were both associated with dementia after stroke, unlike late life onset (Figure 1). The adjusted estimates also showed the risk of post-stroke dementia did not increase with the length of time with ASCVD before stroke (P-value for trend: 0.20 for ASCVD, 0.09 for CHD and 0.97 for PAD) (Figure 2). Neither multiplicative nor additive interaction between CHD and PAD was observed across the adjustment models (all P-values for interaction > 0.05) (Table 3). Our sensitivity analyses did not lead to any important changes to these results (Supplementary Tables 13 to 18). In subgroup analysis (Figure 3, Supplementary Tables 9 and 10), no patient characteristics were associated with variation in risk of post-stroke dementia in people with prior ASCVD based on the Bonferroni-corrected statistical significance of P-value <0.0045.

Discussion

Summary of principal findings

In this study, the crude and minimally adjusted estimates (only accounting for demographics and lifestyle) suggested stroke patients with prior ASCVD had a higher risk of dementia. After additional adjustment for multimorbidity and medications, the risk of post-stroke dementia was only slightly increased with ASCVD at a marginal significance level but not significantly associated with pre-existing CHD or PAD. There was no clear evidence that the risk of post-stroke dementia can increase with the age of ASCVD onset or the length of pre-stroke ASCVD, although the risk might be higher

among patients with mid-life ASCVD or longer history of ASCVD. Across the adjustment models, we did not find any interactions between CHD and PAD. A series of sensitivity analyses did not change these results appreciably.

Strengths and limitations

This is the largest patient record investigation to date of the association between prior ASCVD and post-stroke dementia, providing new evidence on how the association may differ by the onset of suffering ASCVD, by the length of pre-existing ASCVD, and by the baseline characteristics. It accounted for more potential confounders and attrition bias than previous studies. The study also benefits from the strengths of the UK's primary care record system, CPRD, in terms of representativeness of the study population, detailed prescription information, and long duration of follow-up[18].

However, there are limitations associated with CPRD data. Unspecified stroke accounted for 44.0% of stroke patients in our main analysis combined with ischemic stroke. However, this is unlikely to have had an important impact on the results as separating these patients did not change the results.

Second, BMI data were missing in 9.3% of patients. Sensitivity analyses assuming extreme values for BMI did not change the results. Third, some important potential predictors of dementia could not be included, such as education, ethnicity, physical activity, and diet, as these data are poorly recorded in the CPRD. Thus, there is the possibility that the modest associations that we observed might still be over-estimates. Furthermore, misclassification in baseline covariates may have resulted in overestimates due to residual confounding. Fourth, there is likely to be under-recording of both ASCVD and dementia in the CPRD[26-28]. It is possible that some patients in the reference groups had underdiagnosed ASCVD. This misclassification would shrink the real association towards the null if these diseases do increase the risk of post-stroke dementia. Conversely, underdiagnosis of dementia or early cognitive impairment might inflate the association as the underdiagnosis was more likely to occur in patients with no ASCVD due to their less contact with health services. In this case, the real association should be closer to the null than our estimates. Finally, the statistical power may

be not sufficient to detect significant difference for some of the interaction, trend and subgroup analyses.

Comparisons with other studies

While our crude and minimally adjusted estimates suggested a positive association of prior CHD and PAD with dementia after stroke, the association was not found based on the fully adjusted estimates. These findings are consistent with a recent systematic review[13]. It included 15 cohort studies and found a positive association between CHD and post-stroke dementia, with a pooled crude odds ratio (OR) of 1.32 (95% CI: 1.11-1.58)[13]. Only two studies included in this review report adjusted estimates for CHD (pooled HR: 1.11; 95% CI: 0.85-1.44)[14, 15]. Evidence focusing on post-stroke dementia associated with PAD is very limited, with two studies contributing to a pooled crude OR of 3.59 (95% CI: 1.47-8.76)[29, 30] and only one study reporting an adjusted estimate (HR: 1.27; 95% CI: 0.90-1.79)[15]. The smaller estimates in our study probably reflect that there was less attrition bias and more adjustment for confounding than in the previous studies.

Compared with the findings of other systematic reviews from the general population (the pooled adjusted estimates were 1.26 (95% CI: 1.06–1.49)[7] and 1.45 (95% CI: 1.21–1.74)[8] for CHD and 1.50 (95% CI: 1.10–1.45)[9] for PAD), our study showed that the association with dementia was weaker for both CHD and PAD among stroke patients. These results suggest that stroke may lie on the causal pathway between atherosclerosis and dementia or that the direct impact of atherosclerosis on the occurrence of dementia among stroke patients may be different from that of the general population. Another possible reason for the weaker association is that deaths after stroke may be more common in those most vulnerable to dementia; however, this is not supported by our competing-risks analysis treating death as a competing-risks event (Supplementary Tables 17 and 18), which further pulled the estimates towards the null.

There has been a large body of literature linking dementia to a variety of mid-life vascular factors shared by ASCVD, such as blood cholesterol, blood pressure, blood glucose and overweight/obesity[31, 32]. However, our study did not find evidence that the risk of post-stroke

dementia in patients with mid-life ASCVD was significantly higher than that in patients with earlier or later onset of the disease. Although our study showed mid-life ASCVD and longer history of ASCVD were associated with an increased risk of dementia, whether the risk can be varied by the age of ASCVD onset or the length of ASCVD history requires further studies to confirm.

Implications for practice

The raised risk suggests that prior ASCVD could be used as a marker for clinicians to consider more monitoring of cognitive function post-stroke in this population subgroup. This risk is independent of age, gender, socioeconomic status and lifestyle, but is at least partly due to comorbidity. After additional adjustment for pre-stroke medications, the risk was only decreased by a small degree, suggesting these medications in patients with prior ASCVD may have limited protective effects on cognitive function following stroke. Given prior CHD/PAD (markers of atherosclerosis) is not independently associated with increased risk of post-stroke dementia beyond that associated with stroke itself, the potential effectiveness of statins in preventing post-stroke cognitive decline observed in previous studies may be due to their effect on reducing risk of recurrent stroke and other pleiotropic effects[13, 33].

Implications for future research

Our results highlight the importance of adequately adjusting for known risk factors for dementia when investigating the relationship between atherosclerosis (and possibly other cardiovascular risk factors) and dementia in stroke patients. Further research would help clarify whether the risk of post-stroke dementia depends on the timing and duration of prior atherosclerosis. Randomised controlled trials and real-world evidence are needed to determine targeted interventions to reduce the risk of dementia among stroke patients with prior atherosclerosis.

Conclusions

Stroke patients with prior ASCVD are more likely to develop subsequent dementia. After full adjustment for potential baseline confounding, however, the risk of post-stroke dementia is attenuated with only a slight increase with prior ASCVD. It is important to adequately account for

known risk factors for dementia when investigating the association of cardiovascular risk factors with dementia in stroke patients. The possibility that risk of post-stroke dementia might vary by age of ASCVD onset and length of ASCVD history could be explored in further studies.

Antihypertensive drugs	14 711	(87.0)	26 215	(55.7)	40 926	(64.0)
Antiplatelet	12 214	(72.3)	13 221	(28.1)	25 435	(39.8)

a. A total of 397 (0.62%) patients had missing value of smoking status: 48 (0.28%) and 349 (0.74%) for ASCVD and no ASCVD, respectively.

b. A total of 5924 (9.26%) patients had missing value of BMI: 821 (4.86%) and 5103 (10.84%) for ASCVD and no ASCVD, respectively.

c. A total of 28 000 (43.78%) patients had an unspecified stroke subtype: 7071 (41.84%) and 20 929 (44.47%) in ASCVD and no ASCVD group, respectively.

Abbreviations: ASCVD, atherosclerotic cardiovascular disease; BMI, body mass index; COPD, chronic obstructive pulmonary disease; IMD, Index of Multiple Deprivation; IQR, interquartile range.

Table 2. Association of prior atherosclerotic cardiovascular disease with dementia after stroke

	Prior ASCVD		Prior CHD		Prior PAD	
	Presence (n=16 900)	Absence (n=47 059)	Presence (n=14 880)	Absence (n=49 079)	Presence (n=3886)	Absence (n=60 073)
Cases with dementia	2300	4965	2038	5227	519	6746
Person-years	60 244	206 127	53 257	213 114	12 876	253 496
Rate ^a	38.2	24.1	38.3	24.5	40.3	26.6
Crude HR	1.52 (1.45-1.61)	Reference	1.50 (1.42-1.58)	Reference	1.47 (1.34-1.62)	Reference
Adjusted HR						
Model 1 ^b	1.18 (1.12-1.25)	Reference	1.16 (1.10-1.23)	Reference	1.25 (1.13-1.37)	Reference
Model 2 ^c	1.09 (1.03-1.15)	Reference	1.06 (1.00-1.12)	Reference	1.14 (1.03-1.26)	Reference
Model 3 ^d	1.07 (1.00-1.13)	Reference	1.04 (0.98-1.11)	Reference	1.11 (1.00-1.22)	Reference

Of 63 959 patients in total, 57 902 patients with complete baseline data were included in all the models for the HR estimates (6057 were excluded due to missing value in smoking or BMI): 16 046 and 41 856 patients in the ASCVD and no ASCVD group; 14 177 and 43 725 patients in the CHD and no CHD group; 3651 and 54 251 patients in the PAD and no PAD group, respectively.

a. Event rates reported in 1000 person-years calculated from 63 959 patients.

b. Model 1: adjusted for age (cubic spline variables), gender, IMD, smoking, and BMI (cubic spline variables).

c. Model 2: adjusted for the variables in model 1 plus comorbidities (stroke subtype, atrial fibrillation, alcohol problem, anxiety, rheumatoid arthritis, asthma, chronic obstructive pulmonary disease, depression, diabetes, epilepsy, hearing loss, heart failure, hyperlipidaemia, hypertension, Parkinson's disease, and transient ischemic attack). The CHD and PAD models additionally adjusted for PAD and CHD, respectively.

d. Model 3: adjusted for the variables in model 2 plus consultation (cubic spline variables) and medications (statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs).

Abbreviations: ASCVD, atherosclerotic cardiovascular disease; BMI, body mass index; CHD, coronary heart disease; HR, hazard ratio; IMD, Index of Multiple Deprivation; PAD, peripheral artery disease.

Table 3. Interactions between coronary heart disease and peripheral artery disease in the risk of dementia after stroke

	Crude estimate, HR (95% CI)	Adjusted estimate, HR (95% CI)		
		Model 1 ^a	Model 2 ^b	Model 3 ^c
CHD only	1.50 (1.41-1.59)	1.15 (1.09-1.22)	1.06 (1.00-1.13)	1.05 (0.98-1.12)
PAD only	1.53 (1.36-1.73)	1.25 (1.10-1.41)	1.18 (1.04-1.33)	1.13 (1.00-1.28)
CHD plus PAD	1.72 (1.50-1.98)	1.35 (1.18-1.55)	1.17 (1.02-1.35)	1.13 (0.98-1.30)
P-interaction*	0.002	0.51	0.47	0.60
P-interaction**	0.04	0.69	0.51	0.63

Of 63 959 patients in total, 57 902 patients with complete baseline data were included in all the models for the HR estimates (6057 were excluded due to missing value in smoking or BMI). The models included 41 856 patients without any ASCVDs (reference group), 12 395 with CHD alone, 1869 with PAD alone, and 1782 with CHD plus PAD. A product term for CHD and PAD was included in all the models.

a. Model 1: adjusted for age (cubic spline variables), gender, IMD, smoking, and BMI (cubic spline variables).

b. Model 2: adjusted for the variables in model 1 plus comorbidities (stroke subtype, atrial fibrillation, alcohol problem, anxiety, rheumatoid arthritis, asthma, chronic obstructive pulmonary disease, depression, diabetes, epilepsy, hearing loss, heart failure, hyperlipidaemia, hypertension, Parkinson's disease, and transient ischemic attack).

c. Model 3: adjusted for the variables in model 2 plus consultation (cubic spline variables) and medications (statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs).

*P-value for testing multiplicative interaction between CHD and PAD.

**P-value for testing additive interaction between CHD and PAD.

Abbreviations: ASCVD, atherosclerotic cardiovascular disease; BMI, body mass index; CHD, coronary heart disease; HR, hazard ratio; IMD, Index of Multiple Deprivation; PAD, peripheral artery disease.

Figure 1. Association between age of atherosclerotic cardiovascular disease onset and dementia after stroke

All the models were adjusted for age, gender, IMD, smoking, BMI, stroke subtype, atrial fibrillation, alcohol problem, anxiety, rheumatoid arthritis, asthma, chronic obstructive pulmonary disease, depression, diabetes, epilepsy, hearing loss, heart failure, hyperlipidaemia, hypertension, Parkinson's disease, transient ischemic attack, consultation, statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs. The CHD and PAD models additionally adjusted for PAD and CHD, respectively.

* A total of 57 902 patients with complete baseline data were included, with the reference group being no prior ASCVD (n=41 856), no prior CHD (n=43 725) or no prior PAD (n=54 251).

** Tests for linear trend were conducted in patients with ASCVD/CHD/PAD only, by assigning the medians (ASCVD: 41, 58 and 74; CHD: 41, 58 and 74; PAD: 42, 59 and 75) to the age levels of onset from the lowest to the highest and treating the variable as a continuous variable in the Cox models.

Abbreviations: ASCVD, atherosclerotic cardiovascular disease; BMI, body mass index; CHD, coronary heart disease; IMD, Index of Multiple Deprivation; PAD, peripheral artery disease.

Figure 2. Association between length of time with atherosclerotic cardiovascular disease and dementia after stroke

All the models were adjusted for age, gender, IMD, smoking, BMI, stroke subtype, atrial fibrillation, alcohol problem, anxiety, rheumatoid arthritis, asthma, chronic obstructive pulmonary disease, depression, diabetes, eczema, epilepsy, hyperlipidaemia, heart failure, hypertension, irritable bowel syndrome, Parkinson’s disease, transient ischemic attack, consultation, statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs. The CHD and PAD models additionally adjusted for PAD and CHD, respectively.

* A total of 57 902 patients were included, with the reference group being no prior ASCVD (n=41 856), no prior CHD (n=43 725) or no prior PAD (n=54 251).

** Tests for linear trend were conducted in patients with ASCVD only, by assigning the medians (ASCVD: 3, 11 and 20; CHD: 3, 11 and 21; PAD: 3, 8 and 15) to the length tertile levels from the lowest to the highest and treating the variable as a continuous variable in the Cox models.

Abbreviations: ASCVD, atherosclerotic cardiovascular disease; BMI, body mass index; CHD, coronary heart disease; IMD, Index of Multiple Deprivation; PAD, peripheral artery disease.

Figure 3. Subgroup analysis for the association of atherosclerotic cardiovascular disease with dementia after stroke

A total of 57 902 patients with complete baseline data were included. All the models were adjusted for age, gender, IMD, smoking, BMI, stroke subtype, atrial fibrillation, alcohol problem, anxiety, rheumatoid arthritis, asthma, chronic obstructive pulmonary disease, depression, diabetes, epilepsy, hyperlipidaemia, heart failure, hypertension, Parkinson's disease, transient ischemic attack, consultation, statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs. The CHD and PAD models additionally adjusted for PAD and CHD, respectively.

Abbreviations: ASCVD, atherosclerotic cardiovascular disease; BMI, body mass index; CHD, coronary heart disease; IMD, Index of Multiple Deprivation; PAD, peripheral artery disease.

ICD-10 Codes used in HES and ONS

ICD Code	Description
I63	Cerebral infarction
I63.0	Cerebral infarction due to thrombosis of precerebral arteries
I63.1	Cerebral infarction due to embolism of precerebral arteries
I63.2	Cerebral infarction due to unspecified occlusion or stenosis of precerebral arteries
I63.3	Cerebral infarction due to thrombosis of cerebral arteries
I63.4	Cerebral infarction due to embolism of cerebral arteries
I63.5	Cerebral infarction due to unspecified occlusion or stenosis of cerebral arteries
I63.6	Cerebral infarction due to cerebral venous thrombosis, nonpyogenic
I63.8	Other cerebral infarction
I63.9	Cerebral infarction, unspecified
I64	Stroke, not specified as hemorrhage or infarction
I64.0	Stroke, not specified as hemorrhage or infarction
I61	Intracerebral hemorrhage
I61.0	Intracerebral hemorrhage in hemisphere, subcortical
I61.1	Intracerebral hemorrhage in hemisphere, cortical
I61.2	Intracerebral hemorrhage in hemisphere, unspecified
I61.3	Intracerebral hemorrhage in brain stem
I61.4	Intracerebral hemorrhage in cerebellum
I61.5	Intracerebral hemorrhage, intraventricular
I61.6	Intracerebral hemorrhage, multiple localized
I61.8	Other intracerebral hemorrhage
I61.9	Intracerebral hemorrhage, unspecified

46762	Eu00111	[X]Alzheimer's disease type 1
48501	Eu02z11	[X] Presenile dementia NOS
49263	Eu00000	[X]Dementia in Alzheimer's disease with early onset
49513	E001100	Presenile dementia with delirium
53446	Eu04100	[X]Delirium superimposed on dementia
54106	Eu02100	[X]Dementia in Creutzfeldt-Jakob disease
54505	E012.00	Other alcoholic dementia
55313	Eu01y00	[X]Other vascular dementia
55467	E004200	Arteriosclerotic dementia with paranoia
55838	Eu01111	[X]Predominantly cortical dementia
56912	E004100	Arteriosclerotic dementia with delirium
59122	Fyu3000	[X]Other Alzheimer's disease
60059	Eu00012	[X]Primary degen dementia, Alzheimer's type, presenile onset
61528	Eu00013	[X]Alzheimer's disease type 2
64267	Eu02y00	[X]Dementia in other specified diseases class if elsewhere

ICD-10 Codes used in HES and ONS

ICD Code	Description
F00	Dementia in Alzheimer disease
F00.0	Dementia in Alzheimer disease with early onset
F00.1	Dementia in Alzheimer disease with late onset
F00.2	Dementia in Alzheimer disease, atypical or mixed type
F00.9	Dementia in Alzheimer disease, unspecified
F01	Vascular dementia
F01.0	Vascular dementia of acute onset
F01.1	Multi-infarct dementia
F01.2	Subcortical vascular dementia
F01.3	Mixed cortical and subcortical vascular dementia
F01.8	Other vascular dementia
F01.9	Vascular dementia, unspecified
F02	Dementia in other diseases classified elsewhere
F02.0	Dementia in Pick disease
F02.1	Dementia in Creutzfeldt-Jakob disease
F02.2	Dementia in Huntington disease
F02.3	Dementia in Parkinson disease

F02.4	Dementia in human immunodeficiency virus [HIV] disease
F02.8	Dementia in other specified diseases classified elsewhere
F03	Unspecified dementia
F05.1	Delirium superimposed on dementia
G30	Alzheimer disease
G30.0	Alzheimer disease with early onset
G30.1	Alzheimer disease with late onset
G30.8	Other Alzheimer disease
G30.9	Alzheimer disease, unspecified
G31.0	Circumscribed brain atrophy
G31.8	Other specified degenerative diseases of nervous system

Table 3. Codes for coronary heart disease

Read codes used in CPRD

Medcode	Readcode	Description
240	G3...00	Ischemic heart disease
241	G30..00	Acute myocardial infarction
732	7928z00	Transluminal balloon angioplasty of coronary artery NOS
737	792..11	Coronary artery bypass graft operations
1204	G30..14	Heart attack
1344	G340.12	Coronary artery disease
1414	G33z300	Angina on effort
1430	G33..00	Angina pectoris
1431	G311.13	Unstable angina
1655	G340.11	Triple vessel disease of the heart
1676	G3z..00	Ischemic heart disease NOS
1677	G30..15	MI - acute myocardial infarction
1678	G308.00	Inferior myocardial infarction NOS
1792	G3...13	IHD - Ischemic heart disease
2155	G341000	Ventricular cardiac aneurysm
2491	G30..12	Coronary thrombosis
2901	7928	Transluminal balloon angioplasty of coronary artery
3159	792Dy00	Other specified other bypass of coronary artery
3704	G307.00	Acute subendocardial infarction
3999	G340000	Single coronary vessel disease
4017	G32..00	Old myocardial infarction
4656	G311.11	Crescendo angina
5030	ZV45K00	[V]Presence of coronary artery bypass graft
5254	G340100	Double coronary vessel disease
5387	G301.00	Other specified anterior myocardial infarction
5413	G340.00	Coronary atherosclerosis
5674	ZV45K11	[V]Presence of coronary artery bypass graft - CABG
5703	7928.11	Percutaneous balloon coronary angioplasty
5744	7927500	Open angioplasty of coronary artery
5904	792..00	Coronary artery operations
6182	7929y00	Other therapeutic transluminal op on coronary artery OS
6331	G341.00	Aneurysm of heart
6336	14A5.00	H/O: angina pectoris
6980	ZV45L00	[V]Status following coronary angioplasty NOS
7134	7921.11	Other autograft bypass of coronary artery
7137	7920y00	Saphenous vein graft replacement of coronary artery OS
7320	G343.00	Ischemic cardiomyopathy
7347	G311100	Unstable angina
7442	7920200	Saphenous vein graft replacement of three coronary arteries
7609	7921z00	Other autograft replacement of coronary artery NOS
7634	7920100	Saphenous vein graft replacement of two coronary arteries
7696	G33z200	Syncope anginosa

8312	7920.11	Saphenous vein graft bypass of coronary artery
8568	G37..00	Cardiac syndrome X
8679	7920000	Saphenous vein graft replacement of one coronary artery
8935	G302.00	Acute inferolateral infarction
8942	7929400	Insertion of coronary artery stent
9276	G31y000	Acute coronary insufficiency
9413	G31y.00	Other acute and subacute ischemic heart disease
9414	7921	Other autograft replacement of coronary artery
9507	G307000	Acute non-Q wave infarction
9555	G33z500	Post infarct angina
10209	7921200	Autograft replacement of three coronary arteries NEC
10562	G307100	Acute non-ST segment elevation myocardial infarction
10603	792z.00	Coronary artery operations NOS
11048	G331.11	Variant angina pectoris
11610	7920300	Saphenous vein graft replacement of four+ coronary arteries
11983	G311500	Acute coronary syndrome
12139	G300.00	Acute anterolateral infarction
12229	G30X000	Acute ST segment elevation myocardial infarction
12734	SP07600	Coronary artery bypass graft occlusion
12804	G33z700	Stable angina
12986	G331.00	Prinzmetal's angina
13566	G30..11	Attack - heart
13571	G30..16	Thrombosis - coronary
14658	G30z.00	Acute myocardial infarction NOS
14897	G301z00	Anterior myocardial infarction NOS
14898	G305.00	Lateral myocardial infarction NOS
15661	G310.11	Dressler's syndrome
15754	G34z.00	Other chronic ischemic heart disease NOS
16408	G32..11	Healed myocardial infarction
17133	G30A.00	Mural thrombosis
17307	G311200	Angina at rest
17464	G32..12	Personal history of myocardial infarction
17689	G30..17	Silent myocardial infarction
17872	G301100	Acute anteroseptal infarction
18118	G311400	Worsening angina
18125	G330000	Nocturnal angina
18249	7920	Saphenous vein graft replacement of coronary artery
18643	ZV45800	[V]Presence of coronary angioplasty implant and graft
18670	7928000	Percut transluminal balloon angioplasty one coronary artery
18842	G35..00	Subsequent myocardial infarction
18889	G34z000	Asymptomatic coronary heart disease
18913	ZV45700	[V]Presence of aortocoronary bypass graft
19046	7929300	Rotary blade coronary angioplasty
19193	7923z00	Prosthetic replacement of coronary artery NOS
19402	7923	Prosthetic replacement of coronary artery
19413	7921100	Autograft replacement of two coronary arteries NEC

19655	G311.14	Angina at rest
20095	G330.00	Angina decubitus
20903	7A6G100	Peroperative angioplasty
21844	G31y300	Transient myocardial ischaemia
22020	792B000	Endarterectomy of coronary artery NEC
22383	G3y..00	Other specified ischemic heart disease
22647	7925311	LIMA single anastomosis
22828	7929000	Percutaneous transluminal laser coronary angioplasty
23078	G34y100	Chronic myocardial ischaemia
23579	G310.00	Postmyocardial infarction syndrome
23708	G361.00	Atrial septal defect/curr comp folow acut myocardal infarct
23892	G304.00	Posterior myocardial infarction NOS
24126	G360.00	Haemopericardium/current comp folow acut myocard infarct
24540	G34y000	Chronic coronary insufficiency
24888	7929	Other therapeutic transluminal operations on coronary artery
25842	G33z.00	Angina pectoris NOS
26863	G33z600	New onset angina
27484	G341.11	Cardiac aneurysm
27951	G31..00	Other acute and subacute ischemic heart disease
27977	G31yz00	Other acute and subacute ischemic heart disease NOS
28138	G34..00	Other chronic ischemic heart disease
28554	G33zz00	Angina pectoris NOS
28736	G30y000	Acute atrial infarction
28837	7925.11	Creation of bypass from mammary artery to coronary artery
29421	G344.00	Silent myocardial ischaemia
29553	G366.00	Thrombosis atrium,auric append&vent/curr comp foll acute MI
29643	G303.00	Acute inferoposterior infarction
29758	G30X.00	Acute transmural myocardial infarction of unspecif site
29902	G330z00	Angina decubitus NOS
30330	G309.00	Acute Q-wave infarct
30421	G30..13	Cardiac rupture following myocardial infarction (MI)
31519	7925100	Double implant of mammary arteries into coronary arteries
31540	7924200	Revision of bypass for three coronary arteries
31556	7922	Allograft replacement of coronary artery
31571	792y.00	Other specified operations on coronary artery
31679	7929z00	Other therapeutic transluminal op on coronary artery NOS
32272	G38..00	Postoperative myocardial infarction
32450	G33z400	Ischemic chest pain
32651	7922.11	Allograft bypass of coronary artery
32854	G30B.00	Acute posterolateral myocardial infarction
33461	7924	Revision of bypass for coronary artery
33471	792Dz00	Other bypass of coronary artery NOS
33620	792B.00	Repair of coronary artery NEC
33650	7929100	Percut transluminal coronary thrombolysis with streptokinase
33718	7925000	Double anastomosis of mammary arteries to coronary arteries
33735	7928100	Percut translum balloon angioplasty mult coronary arteries

34328	G311300	Refractory angina
34633	G34y.00	Other specified chronic ischemic heart disease
34803	G30y.00	Other acute myocardial infarction
34963	792D.00	Other bypass of coronary artery
34965	792A.00	Diagnostic transluminal operations on coronary artery
35119	G501.00	Post infarction pericarditis
35674	14A3.00	H/O: myocardial infarct <60
35713	G34yz00	Other specified chronic ischemic heart disease NOS
36011	7923.11	Prosthetic bypass of coronary artery
36423	G36..00	Certain current complication follow acute myocardial infarct
36523	G311.00	Preinfarction syndrome
36609	G342.00	Atherosclerotic cardiovascular disease
36854	G332.00	Coronary artery spasm
37657	G362.00	Ventric septal defect/curr comp fol acut myocardal infarctn
37682	7925	Connection of mammary artery to coronary artery
37719	7925y00	Connection of mammary artery to coronary artery OS
38609	G351.00	Subsequent myocardial infarction of inferior wall
38813	7A54500	Rotary blade angioplasty
39449	G312.00	Coronary thrombosis not resulting in myocardial infarction
39546	Gyu3000	[X]Other forms of angina pectoris
39655	G311.12	Impending infarction
39693	G31y200	Subendocardial ischaemia
40399	14A4.00	H/O: myocardial infarct >60
40429	G301000	Acute anteroapical infarction
40996	7929111	Percut translum coronary thrombolytic therapy- streptokinase
41221	G30y200	Acute septal infarction
41547	7928y00	Transluminal balloon angioplasty of coronary artery OS
41677	G341z00	Aneurysm of heart NOS
41757	7927z00	Other open operation on coronary artery NOS
41835	G384.00	Postoperative subendocardial myocardial infarction
42304	7929500	Insertion of drug-eluting coronary artery stent
42462	7928200	Percut translum balloon angioplasty bypass graft coronary a
42708	7921300	Autograft replacement of four of more coronary arteries NEC
43939	793G.00	Perc translumin balloon angioplasty stenting coronary artery
44561	7921000	Autograft replacement of one coronary artery NEC
44585	792Bz00	Repair of coronary artery NOS
44723	7925200	Single anast mammary art to left ant descend coronary art
45370	7922300	Allograft replacement of four or more coronary arteries
45809	G350.00	Subsequent myocardial infarction of anterior wall
45886	7922200	Allograft replacement of three coronary arteries
46017	G30yz00	Other acute myocardial infarction NOS
46112	G380.00	Postoperative transmural myocardial infarction anterior wall
46166	G35X.00	Subsequent myocardial infarction of unspecified site
46276	G381.00	Postoperative transmural myocardial infarction inferior wall
47788	7927	Other open operations on coronary artery
48206	7927300	Transposition of coronary artery NEC

48767	7922z00	Allograft replacement of coronary artery NOS
48822	7925011	LIMA sequential anastomosis
50372	14AH.00	H/O: Myocardial infarction in last year
51507	7925300	Single anastomosis of mammary artery to coronary artery NEC
51515	7920z00	Saphenous vein graft replacement coronary artery NOS
51702	7927400	Exploration of coronary artery
52938	7924000	Revision of bypass for one coronary artery
54251	G311z00	Preinfarction syndrome NOS
54535	G33z100	Stenocardia
55092	792C000	Replacement of coronary arteries using multiple methods
55137	G311011	MI - myocardial infarction aborted
55598	792C.00	Other replacement of coronary artery
56905	792Ay00	Diagnostic transluminal operation on coronary artery OS
56990	7925z00	Connection of mammary artery to coronary artery NOS
57062	14AJ.00	H/O: Angina in last year
57241	7922100	Allograft replacement of two coronary arteries
57634	7924z00	Revision of bypass for coronary artery NOS
59189	G363.00	Ruptur cardiac wall w/out haemopericard/cur comp fol ac MI
59193	G341200	Aneurysm of coronary vessels
59423	7922y00	Other specified allograft replacement of coronary artery
59940	G364.00	Ruptur chordae tendinae/curr comp fol acute myocard infarct
60067	793G000	Perc translum ball angio insert 1-2 drug elut stents cor art
60753	7926300	Single implantation thoracic artery into coronary artery NEC
61208	793Gz00	Perc translum balloon angioplasty stenting coronary art NOS
61248	792Az00	Diagnostic transluminal operation on coronary artery NOS
61310	7921y00	Other autograft replacement of coronary artery OS
62608	7926000	Double anastom thoracic arteries to coronary arteries NEC
62626	G30y100	Acute papillary muscle infarction
63153	7924500	Revision of implantation of thoracic artery into heart
63467	G306.00	True posterior myocardial infarction
64923	7A6H300	Prosthetic graft patch angioplasty
66236	7923200	Prosthetic replacement of three coronary arteries
66388	G33z000	Status anginosus
66583	7929200	Percut translum inject therap subst to coronary artery NEC
66664	7923100	Prosthetic replacement of two coronary arteries
66921	7A6H400	Percutaneous transluminal angioplasty of vascular graft
67087	G341100	Other cardiac wall aneurysm
67554	7924100	Revision of bypass for two coronary arteries
67591	7926200	Single anastomosis of thoracic artery to coronary artery NEC
67761	7923300	Prosthetic replacement of four or more coronary arteries
68123	7925312	RIMA single anastomosis
68139	7925400	Single implantation of mammary artery into coronary artery
68357	G31y100	Microinfarction of heart
68748	G38z.00	Postoperative myocardial infarction, unspecified
69247	792By00	Other specified repair of coronary artery
69474	G365.00	Rupture papillary muscle/curr comp fol acute myocard infarct

70111	7922000	Allograft replacement of one coronary artery
70755	792Cz00	Replacement of coronary artery NOS
72562	G353.00	Subsequent myocardial infarction of other sites
72780	7926z00	Connection of other thoracic artery to coronary artery NOS
85947	793G200	Perc translum balloon angioplasty insert 1-2 stents cor art
86071	7928300	Percut translum cutting balloon angioplasty coronary artery
87849	793G100	Perc tran ball angio ins 3 or more drug elut stents cor art
91774	G341300	Acquired atrioventricular fistula of heart
92233	7925012	RIMA sequential anastomosis
92419	7923000	Prosthetic replacement of one coronary artery
92927	793G300	Percutaneous cor balloon angiop 3 more stents cor art NEC
93618	7929600	Percutaneous transluminal atherectomy of coronary artery
93706	793H000	Percutaneous transluminal balloon dilation cardiac conduit
93828	792Cy00	Other specified replacement of coronary artery
95382	7927y00	Other specified other open operation on coronary artery
96804	7926	Connection of other thoracic artery to coronary artery
96838	Gyu3400	[X]Acute transmural myocardial infarction of unspecif site
97953	7924y00	Other specified revision of bypass for coronary artery
99991	Gyu3600	[X]Subsequent myocardial infarction of unspecified site
101569	7924300	Revision of bypass for four or more coronary arteries
105250	G341111	Mural cardiac aneurysm
105479	G39..00	Coronary microvascular disease
106812	G383.00	Postoperative transmural myocardial infarction unspec site
109035	Gyu3500	[X]Subsequent myocardial infarction of other sites

ICD-10 Codes used in HES and ONS

ICD Code	Description
I20	Angina pectoris
I20.0	Unstable angina
I20.1	Angina pectoris with documented spasm
I20.8	Other forms of angina pectoris
I20.9	Angina pectoris, unspecified
I21	Acute myocardial infarction
I21.0	Acute transmural myocardial infarction of anterior wall
I21.1	Acute transmural myocardial infarction of inferior wall
I21.2	Acute transmural myocardial infarction of other sites
I21.3	Acute transmural myocardial infarction of unspecified site
I21.4	Acute subendocardial myocardial infarction
I21.9	Acute myocardial infarction, unspecified
I22	Subsequent myocardial infarction
I22.0	Subsequent myocardial infarction of anterior wall
I22.1	Subsequent myocardial infarction of inferior wall
I22.8	Subsequent myocardial infarction of other sites
I22.9	Subsequent myocardial infarction of unspecified site
I23	Certain current complications following acute myocardial infarction
I23.0	Haemopericardium as current complication following acute myocardial infarction

I23.1	Atrial septal defect as current complication following acute myocardial infarction
I23.2	Ventricular septal defect as current complication following acute myocardial infarction
I23.3	Rupture of cardiac wall without haemopericardium as current complication following acute myocardial infarction
I23.4	Rupture of chordae tendineae as current complication following acute myocardial infarction
I23.5	Rupture of papillary muscle as current complication following acute myocardial infarction
I23.6	Thrombosis of atrium, auricular appendage, and ventricle as current complications following acute myocardial infarction
I23.8	Other current complications following acute myocardial infarction
I24	Other acute ischemic heart diseases
I24.0	Coronary thrombosis not resulting in myocardial infarction
I24.1	Dressler syndrome
I24.8	Other forms of acute ischemic heart disease
I24.9	Acute ischemic heart disease, unspecified
I25	Chronic ischemic heart disease
I25.0	Atherosclerotic cardiovascular disease, so described
I25.1	Atherosclerotic heart disease
I25.2	Old myocardial infarction
I25.3	Aneurysm of heart
I25.4	Coronary artery aneurysm and dissection
I25.5	Ischemic cardiomyopathy
I25.6	Silent myocardial ischaemia
I25.8	Other forms of chronic ischemic heart disease
I25.9	Chronic ischemic heart disease, unspecified

Table 4. Codes for peripheral artery disease

Read codes used in CPRD

Medcode	Readcode	Description
1517	G73z000	Intermittent claudication
2760	G73zz00	Peripheral vascular disease NOS
3530	G73z.00	Peripheral vascular disease NOS
5943	G73..00	Other peripheral vascular disease
18499	662U.00	Peripheral vascular disease monitoring

ICD-10 Codes used in HES and ONS

ICD Code	Description
I73.9	Peripheral vascular disease, unspecified

Table 5. Criteria for quality control

Data item	Unacceptable value
ALL the records of a patient were excluded for any reason below:	
First registration date	Empty; invalid date; prior to year of birth; within one year before the first stroke diagnosis date
Current registration date	Invalid date; prior to first registration date; prior to year of birth
Transferred out date	Invalid date; present with no reason; prior to first registration date; prior to current registration date
A transferred out reason	Present with no date
Registration status	Temporary patients
Age	Over 125 years at the end of follow-up
Year of birth	Absent
Gender	Other than male, female or indeterminate
Death date	Prior to the first registration date; prior to the current registration date
RELEVANT episode records of a patient were excluded for any reason below:	
Event date	Invalid; absent; prior to birth year
Weight	<30kg; >300kg
Height	<1.1 metres; >2.3 metres
The date were CHANGED for any reason below:	
Change the death date and transferred out date to the first stroke diagnosis date	Death date prior to the first stroke diagnosis date; transferred out date prior to the first stroke diagnosis date
Change the death date and transferred out date to the first date of dementia diagnosis	Death date prior to the first date of dementia diagnosis; transferred out date prior to the first date of dementia diagnosis

Table 6. Baseline characteristics by coronary heart disease or peripheral artery disease

	Coronary heart disease, number (%)				Peripheral artery disease, number (%)			
	Presence		Absence		Presence		Absence

*Of 63 959 patients in total, 57 902 patients (14 182, 14 540, 18 407 and 10 773 for each age group, respectively) with complete baseline data were included in all the models (6057 were excluded due to missing value in smoking or BMI).

a. Event rates reported in 1000 person-years.

b. Model 1: adjusted for age (cubic spline variables), gender, IMD, smoking, and BMI (cubic spline variables).

c. Model 2: adjusted for the variables in model 1 plus comorbidities (stroke subtype, atrial fibrillation, alcohol problem, anxiety, rheumatoid arthritis, asthma, chronic obstructive pulmonary disease, depression, diabetes, epilepsy, hearing loss, heart failure, hyperlipidaemia, hypertension, Parkinson's disease, and transient ischemic attack). The CHD and PAD models additionally adjusted for PAD and CHD, respectively.

d. Model 3: adjusted for the variables in model 2 plus consultation (cubic spline variables) and medications (statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs). Abbreviations: BMI, body mass index; CHD, coronary heart disease; IMD, Index of Multiple Deprivation; PAD, peripheral artery disease.

*Of 63 959 patients in total, 57 902 patients (28 488 for female and 29 414 for male, respectively) with complete baseline data were included in all the models (6057 were excluded due to missing value in smoking or BMI).

a. Event rates reported in 1000 person-years.

b. Model 1: adjusted for age (cubic spline variables), gender, IMD, smoking, and BMI (cubic spline variables).

c. Model 2: adjusted for the variables in model 1 plus comorbidities (stroke subtype, atrial fibrillation, alcohol problem, anxiety, rheumatoid arthritis, asthma, chronic obstructive pulmonary disease, depression, diabetes, epilepsy, hearing loss, heart failure, hyperlipidaemia, hypertension, Parkinson's disease, and transient ischemic attack. The CHD and PAD models additionally adjusted for PAD and CHD, respectively.

d. Model 3: adjusted for the variables in model 2 plus consultation (cubic spline variables) and medications (statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs). Abbreviations: BMI, body mass index; CHD, coronary heart disease; IMD, Index of Multiple Deprivation; PAD, peripheral artery disease.

* All eligible patients (n=63 959) were included in all the models: 16 900 and 47 059 patients were in the ASCVD and no ASCVD group; 14 880 and 49 079 patients were in the CHD and no CHD group; 3886 and 60 073 patients in the PAD and no PAD group, respectively.

**Tests for linear trend were conducted in patients with ASCVD/CHD/PAD only, by assigning the medians (ASCVD: ; CHD: 41, 58, and 74; PAD: 42, 59 and 75) to the age levels of onset from the lowest to the highest and treating the variable as a continuous variable in the Cox models.

***Tests for linear trend were conducted in patients with ASCVD/CHD/PAD only, by assigning the medians (ASCVD: 3, 10 and 20; CHD: 3, 11 and 21; PAD: 3, 8 and 15) to the length tertile levels from the lowest to the highest and treating the variable as a continuous variable in the Cox models.

a. Model 1: adjusted for age (cubic spline variables), gender, IMD, smoking, and BMI (cubic spline variables).

b. Model 2: adjusted for the variables in model 1 plus comorbidities (stroke subtype, atrial fibrillation, alcohol problem, anxiety, rheumatoid arthritis, asthma, chronic obstructive pulmonary disease, depression, diabetes, epilepsy, hearing loss, heart failure, hyperlipidaemia, hypertension, Parkinson's disease, and transient ischemic attack). The CHD and PAD models additionally adjusted for PAD and CHD, respectively.

c. Model 3: adjusted for the variables in model 2 plus consultation (cubic spline variables) and medications (statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs) Abbreviations: ASCVD, atherosclerotic cardiovascular disease; BMI, body mass index; CHD, coronary heart disease; IMD, Index of Multiple Deprivation; HR: hazard ratio; PAD, peripheral artery disease.

-----------------	------	------	------	------

A. Including 56 533 patients with complete baseline data: 40 980 patients without any ASCVDs (reference group), 13 836 with only one ASCVD (12 015 with CHD and 1821 with PAD), and 1717 with two ASCVDs (CHD plus PAD).

B. Including 57 902 patients with complete baseline data: 41 856 patients without any ASCVDs (reference group), 14 264 with only one ASCVD (12 395 with CHD and 1869 with PAD), and 1782 with two ASCVDs (CHD plus PAD).

C. Including 31 623 patients with complete baseline data: 22 089 patients without any ASCVDs (reference group), 8422 with only one ASCVD (7378 with CHD and 1044 with PAD), and 1112 with two ASCVDs (CHD plus PAD).

D. Including all 63 959 patients: 47 059 patients without any ASCVDs (reference group), 15 034 with only one ASCVD (13 014 with CHD and 2020 with PAD), and 1866 with two ASCVDs (CHD plus PAD).a. Model 1: adjusted for age (cubic spline variables), gender, IMD, smoking, and BMI (cubic spline variables).

b. Model 2: adjusted for the variables in model 1 plus comorbidities (stroke subtype, atrial fibrillation, alcohol problem, anxiety, rheumatoid arthritis, asthma, chronic obstructive pulmonary disease, depression, diabetes, epilepsy, hearing loss, heart failure, hyperlipidaemia, hypertension, Parkinson's disease, and transient ischemic attack).

c. Model 3: adjusted for the variables in model 2 plus consultation (cubic spline variables) and medications (statins, other lipid-lowering drugs, anticoagulant, antiplatelet, antihypertensive drugs, and antidiabetic drugs).

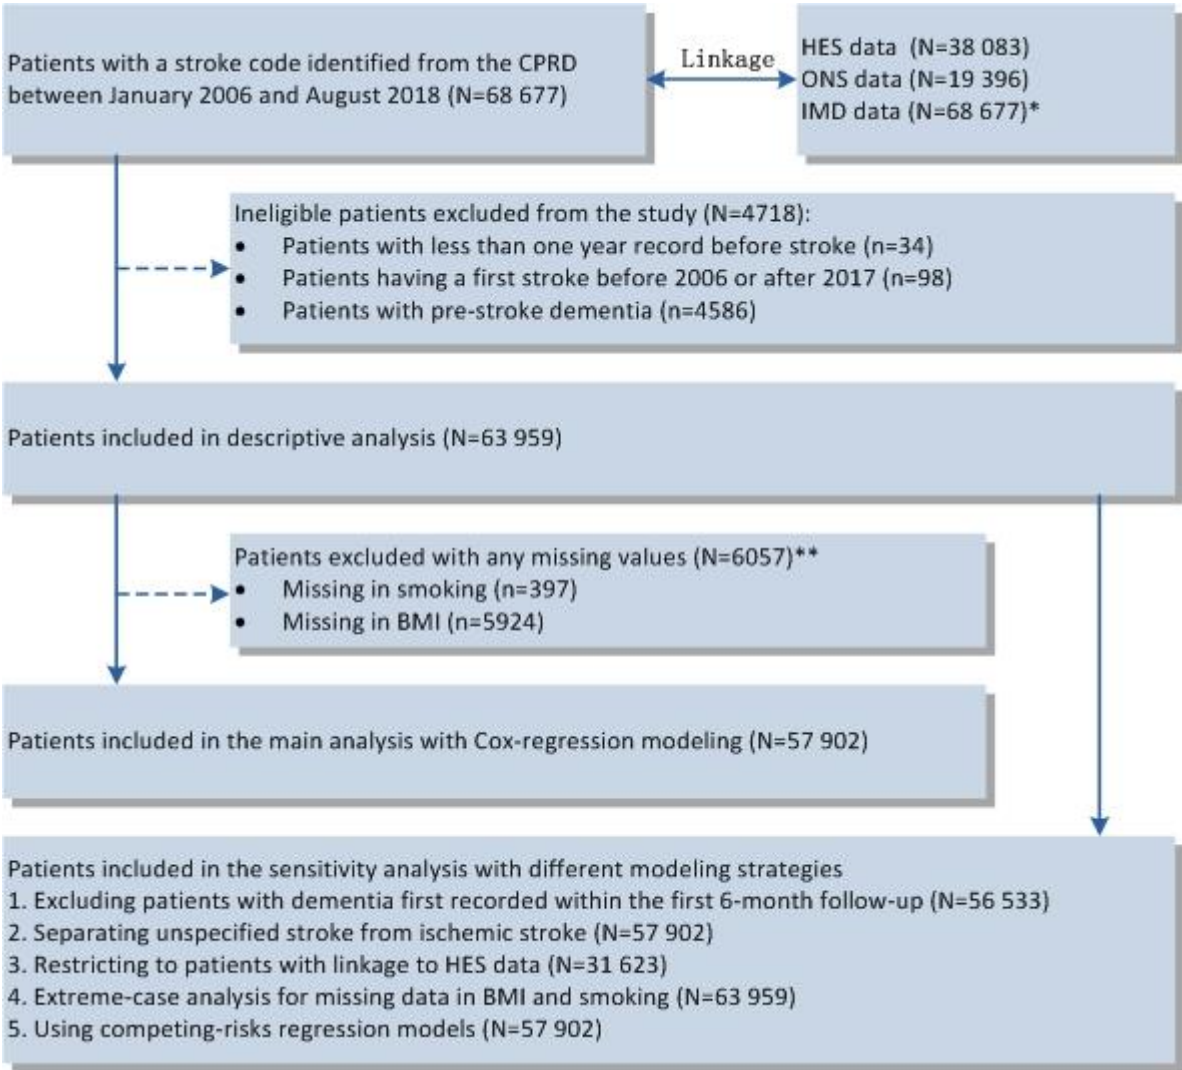

A product term for CHD and PAD was included in all the models.

*P-value for testing multiplicative interaction between CHD and PAD.

**P-value for testing additive interaction between CHD and PAD.

Abbreviations: ASCVD, atherosclerotic cardiovascular disease; BMI, body mass index; CHD, coronary heart disease; HR, hazard ratio; IMD, Index of Multiple Deprivation; PAD, peripheral artery disease.

Figure 1. Flow chart of patient inclusion

*In the IMD dataset, 38 616 patients had patient-level IMD and the other 30 061 patients had practice-level IMD.

**Missingness in smoking and BMI was not mutually exclusive.

Abbreviations: BMI, body mass index; CPRD, Clinical Practice Research Datalink; HES, Hospital Episode Statistics; IMD, Index of Multiple Deprivation; ONS, Office for National Statistics.

The RECORD statement – checklist of items, extended from the STROBE statement

	Item No.	STROBE items	Location in manuscript where items are reported	RECORD items	Location in manuscript where items are reported
Title and abstract					
	1	(a) Indicate the study’s design with a commonly used term in the title or the abstract (b) Provide in the abstract an informative and balanced summary of what was done and what was found	(a) Abstract (b) Abstract	RECORD 1.1: The type of data used should be specified in the title or abstract. When possible, the name of the databases used should be included. RECORD 1.2: If applicable, the geographic region and timeframe within which the study took place should be reported in the title or abstract. RECORD 1.3: If linkage between databases was conducted for the study, this should be clearly stated in the title or abstract.	RECORD 1.1: Abstract RECORD 1.2: Abstract RECORD 1.3: Abstract
Introduction					
Background rationale	2	Explain the scientific background and rationale for the investigation being reported	The 1 st to 4 th paragraphs in the Introduction		
Objectives	3	State specific objectives, including any prespecified hypotheses	The 4 th paragraph in the Introduction		
Methods					
Study Design	4	Present key elements of study design early in the paper	Key elements including “Study population”, “Post-stroke dementia”, “Exposure” and “Potential confounders”		
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and	All have been described in the Materials and Methods: setting (general		

		data collection	practices and hospitals), location (UK), dates (1 Jan 2006 to 31 Dec 2017), exposure (see “Exposure”), follow-up (10 years) and data collection (from the CPRD, HES, ONS, and IMD).		
Participants	6	<p>(a) <i>Cohort study</i> - Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up</p> <p><i>Case-control study</i> - Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls</p> <p><i>Cross-sectional study</i> - Give the eligibility criteria, and the sources and methods of selection of participants</p> <p>(b) <i>Cohort study</i> - For matched studies, give matching criteria and number of exposed and unexposed</p> <p><i>Case-control study</i> - For matched studies, give matching criteria and the number of controls per case</p>	(a) <i>Cohort study</i> – the first two paragraphs in the Materials and Methods	<p>RECORD 6.1: The methods of study population selection (such as codes or algorithms used to identify subjects) should be listed in detail. If this is not possible, an explanation should be provided.</p> <p>RECORD 6.2: Any validation studies of the codes or algorithms used to select the population should be referenced. If validation was conducted for this study and not published elsewhere, detailed methods and results should be provided.</p> <p>RECORD 6.3: If the study involved linkage of databases, consider use of a flow diagram or other graphical display to demonstrate the data linkage process, including the number of individuals with linked data at each stage.</p>	<p>RECORD 6.1: Stroke codes were provided in Supplementary Table 1.</p> <p>RECORD 6.2: The methods were specified on the website provided in the “Potential confounders” section in the Materials and Methods.</p> <p>RECORD 6.3: Supplementary Figure 1.</p>
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable.	In the sections of “Post-stroke dementia”, “Exposure” and “Potential confounders” in the Materials and Methods.	RECORD 7.1: A complete list of codes and algorithms used to classify exposures, outcomes, confounders, and effect modifiers should be provided. If these cannot be reported, an explanation should be	RECORD 7.1: The codes for the outcome (post-stroke dementia) are listed in Supplementary Table 2. Codes for the exposures are listed in all the factors

				provided.	of interest were listed in Supplementary Tables 3 and 4. Codes for potential confounders were listed on the website provided in the "Potential confounders" section in the Materials and Methods.
Data sources/ measurement	8	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	The 1 st paragraph in the Materials and Methods.		
Bias	9	Describe any efforts to address potential sources of bias	Specified in each paragraph in the Methods, for example, rigorous procedure in codes development, quality control in data cleansing, examining proportional hazards assumption, and coping with missing data.		
Study size	10	Explain how the study size was arrived at	In the section of "Study population" in the Materials and Methods. We included all eligible patients from the CPRD.		
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen, and why	In the section of "Potential confounders" in the Materials and Methods.		
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding (b) Describe any methods used to	(a)-(e) The section of "Statistical analysis" in the Materials and Methods.		

		<p>examine subgroups and interactions</p> <p>(c) Explain how missing data were addressed</p> <p>(d) <i>Cohort study</i> - If applicable, explain how loss to follow-up was addressed</p> <p><i>Case-control study</i> - If applicable, explain how matching of cases and controls was addressed</p> <p><i>Cross-sectional study</i> - If applicable, describe analytical methods taking account of sampling strategy</p> <p>(e) Describe any sensitivity analyses</p>			
Data access and cleaning methods		..		<p>RECORD 12.1: Authors should describe the extent to which the investigators had access to the database population used to create the study population.</p> <p>RECORD 12.2: Authors should provide information on the data cleaning methods used in the study.</p>	<p>RECORD 12.1: the section of “Data source” in the Methods.</p> <p>RECORD 12.2: The section of “Statistical analysis” in the Materials and Methods and Supplementary Table 5.</p>
Linkage		..		RECORD 12.3: State whether the study included person-level, institutional-level, or other data linkage across two or more databases. The methods of linkage and methods of linkage quality evaluation should be provided.	RECORD 12.3: Supplementary Figure 1.
Results					
Participants	13	(a) Report the numbers of individuals at each stage of the study (<i>e.g.</i> , numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study,	(a) The first two paragraphs in the Results and Supplementary Figure 1.	RECORD 13.1: Describe in detail the selection of the persons included in the study (<i>i.e.</i> , study population selection) including filtering based on data quality, data availability and	RECORD 13.1: Supplementary Figure 1.

		<p>completing follow-up, and analysed)</p> <p>(b) Give reasons for non-participation at each stage.</p> <p>(c) Consider use of a flow diagram</p>	<p>(b) Supplementary Figure 1.</p> <p>(c) Supplementary Figure 1.</p>	<p>linkage. The selection of included persons can be described in the text and/or by means of the study flow diagram.</p>	
Descriptive data	14	<p>(a) Give characteristics of study participants (<i>e.g.</i>, demographic, clinical, social) and information on exposures and potential confounders</p> <p>(b) Indicate the number of participants with missing data for each variable of interest</p> <p>(c) <i>Cohort study</i> - summarise follow-up time (<i>e.g.</i>, average and total amount)</p>	<p>(a) Table 1 and Supplementary Tables 6 to 8 .</p> <p>(b) The footnotes of Table 1.</p> <p>(c) <i>Cohort study</i> – the first two paragraphs in the Results.</p>		
Outcome data	15	<p><i>Cohort study</i> - Report numbers of outcome events or summary measures over time</p> <p><i>Case-control study</i> - Report numbers in each exposure category, or summary measures of exposure</p> <p><i>Cross-sectional study</i> - Report numbers of outcome events or summary measures</p>	<p><i>Cohort study</i> –the first two paragraphs in the Results, Table 2, and Figures 1 to 3.</p>		
Main results	16	<p>(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (<i>e.g.</i>, 95% confidence interval). Make clear which confounders were adjusted for and why they were included</p> <p>(b) Report category boundaries when continuous variables were categorized</p> <p>(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period</p>	<p>(a) Table 2 and Figures 1 to 3.</p> <p>(b) Figures 1 to 3.</p> <p>(c) Not applicable.</p>		
Other analyses	17	<p>Report other analyses done—<i>e.g.</i>, analyses of subgroups and</p>	<p>Table 3 and Supplementary Tables 6 to 16 and</p>		

		interactions, and sensitivity analyses	Supplementary Figures 2 and 3.		
Discussion					
Key results	18	Summarise key results with reference to study objectives	The 1 st paragraph in the Discussion		
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	The Strengths and limitations section.	RECORD 19.1: Discuss the implications of using data that were not created or collected to answer the specific research question(s). Include discussion of misclassification bias, unmeasured confounding, missing data, and changing eligibility over time, as they pertain to the study being reported.	RECORD 19.1: The Strengths and limitations section.
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	The 4 th to 8 th paragraphs of the Discussion.		
Generalisability	21	Discuss the generalisability (external validity) of the study results	Specified in the strength of CPRD regarding its representativeness.		
Other Information					
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	Specified in the Sources of Funding section.		
Accessibility of protocol, raw data, and programming code		..		RECORD 22.1: Authors should provide information on how to access any supplemental information such as the study protocol, raw data, or programming code.	When applicable, the links to any relevant information or any supplementary were provided in the Methods or Results.
