Transition to marriage and parenthood among youth in Jharkhand

Delaying the transition to marriage and parenthood among young people has been a policy and programme priority for several years in India. For example, several national level policies formulated since 2000, including the National Population Policy 2000^a, the National Youth Policy 2003^b and the National Adolescent Reproductive and Sexual Health Strategy^c have advocated special programme attention to delay age at marriage and age at first birth.

Despite these commitments, substantial proportions of girls continue to marry in adolescence. As recently as in 2005–2006, more than two-fifths (47%) of women aged 20–24 were married by 18 years nationally.^d Likewise, over one-fifth (22%) of women aged 20–24 had given birth before age 18 and two-fifths (42%) before age 20. While the magnitude of early marriage and childbearing has been widely documented, far less is known about the extent to which young people are involved in planning their marriage, how prepared they are for married life and the nature of their married life.

This policy brief documents the magnitude of early marriage and early childbearing in Jharkhand and sheds light on young people's involvement in marriage-related planning and preparedness for married life, and the nature of married life.

The study

Data are drawn from the *Youth in India: Situation and Needs* study, a sub-nationally representative study undertaken for the first time in India of key transitions experienced by young people in six states of India. The study included a representative survey of young people in both rural and urban

settings. Respondents included unmarried women and men and married women aged 15–24 and, in view of the paucity of married men in these ages, married men aged 15–29.

In Jharkhand, the survey was conducted in 2006. A total of 8,814 married and unmarried young women and men were interviewed in the survey. These included 2,684 married young women, 2,730 unmarried young women, 1,259 married young men and 2,141 unmarried young men.

Child marriage continues to mark the lives of young women and men

Youth Study findings underscore that child marriage continues to characterise the lives of young women and men in the state. Of those aged 20–24, as many as one in four young women (26%) was married before age 15, three in five (62%) before age 18 and three in four (76%) before age 20. Young women in rural areas were almost three times as likely as urban young women to be married before age 15 (31% compared to 11%) and almost twice as likely to be married before age 18 (70% compared to 38%).

Even though early marriage was less prevalent among young men than young women, one in 10 (11%) young men aged 20–24 years was married before age 18 and one in four (26%) before age 20. In rural areas, as many as one in seven and one in three young men was married before age 18 and 20, respectively. Indeed, almost one-third of young men aged 21–24 (33%) were married before the legal minimum age at marriage of 21, ranging from 15% of those in urban areas to 40% of those in rural areas.

Of note is the striking difference in the proportion of young people married before the legal minimum age at marriage by years of schooling completed by young women and men. Over four-fifths of young women with no formal schooling were married before age 18. The proportion of young women married before the legal age declined to 42% among those who had some secondary education and 6% among those who had completed at least 12 years of schooling. Among young men, the proportion marrying before the legal age declined from 46% among those with no formal schooling or 1–7 years of schooling to 16% among those who had completed at least 12 years of schooling. Also evident are differences by religion and caste. Fewer than half of young women belonging to the *Sarna* religion had married before the legal age, compared with almost two-thirds of Hindu and Muslim women. Differences by religion are mild among young men. Caste-wise differences suggest that young women and men belonging to general castes were much less likely than others to have married before the legal age.

four in five (83%) married young men reported that their parents had sought their approval while determining their spouse-to-be, only half (51%) of married young women reported so. Indeed, as many as one in eight young men and two in five young women reported that their parents had not sought their approval at all.

Few young people have opportunities to get to know their spouse-to-be before marriage

Just 15% and 14% of young men and women, respectively, reported that they had ever had a chance to meet and interact with their spouse-to-be alone prior to marriage. Indeed, almost four in five youth reported that they had met their spouse for the first time on the wedding day. Moreover, just one in three young men (34%) and one in four young women (24%) reported that they were aware at the time of their marriage of what to expect of married life.

Communication between spouses is limited

Findings suggest that spousal communication, even on such topics as spending money, number of

Young people are rarely consulted in planning their marriage

Although marriage is a key marker of young people’s transition to adulthood, Youth Study findings highlight that young people were rarely consulted in planning their marriage. Just one in three married young men and one in 10 married young women reported that their parents had consulted them on the timing of their marriage.

With respect to selection of spouse too, young people’s involvement was limited. Almost all youth (92–95%), whether male or female, had married a partner chosen by their parents. While over

children they would like to have and contraception, was not universal. In total, 85–87% reported regularly discussing how to spend money and 70–77% reported having discussed whether and when to have a baby. Discussion was more limited on the topic of contraception, and notably, fewer young men (30%) than women (62%) reported that they had ever discussed contraception with their spouse.

Spousal communication: percentage of married young men and women who discussed various issues with their spouse

Marital life is marked by considerable violence

Findings highlight that marital life was marked by considerable violence, both physical and sexual. Over one in four (27%) married young women reported the experience of some form of physical violence within marriage. A similar proportion of married young men reported the perpetration of physical violence on their wife. For almost one in ten married young women, the experience of physical violence took place within the first year of marriage itself; similarly, one in ten married young men reported perpetrating physical violence within the first year of marriage.

Far more young women reported having experienced sexual violence than physical violence within marriage. Over the course of their marital lives, two in five young women reported the experience of forced sex within marriage. Almost one in four young men reported that they had ever perpetrated forced sex within marriage. Forced experience at sexual initiation itself was reported by one in three young women; one in seven young men reported that they had forced their wife to engage in sex the first time.

Violence within marriage: percentage of young women aged 15–24 who experienced violence perpetrated by their husband

Violence within marriage: percentage of young men aged 15–29 who perpetrated violence on their wife

Contraceptive use within marriage is limited

Youth Study findings indicate that the practice of contraception at any time during marital life was limited among young people in the state. Just 22–24% of young men and women reported ever use of contraceptive methods, and at the time of interview, just 13% of young men and 17% of young women were doing so. Findings, moreover, indicate that the practice of contraception to delay the first pregnancy was almost non-existent; reported by only 12% of young men and 5% of young women.

Contraceptive practices: percentage of married young men and women who reported use of contraceptive methods

Given that few young people had practiced contraception, it is not surprising that as many as one in four young men whose wife had ever become pregnant (24%) and one in three young women who had ever become pregnant (31%) reported that their last pregnancy was mistimed or unwanted.

Childbearing in adolescence is extremely common

The pressure to prove fertility as soon as possible after marriage is experienced by considerable proportions of married youth. For example among young men and women who had cohabited for 12 months or more and for whom age at first pregnancy was known, the first pregnancy occurred within six months of marriage for 39% of young women and 31% of young men, and within a year of marriage for 62% of young women and 57% of young men.

Findings, moreover, highlight that childbearing in adolescence is extremely common in the state. A substantial proportion of young women had their first pregnancy at a young age. Among married young women aged 18 or above who were cohabiting with their husband at the time of the interview, as many as 63% had their first pregnancy before age 18. Among married young men whose wife was aged 18 or above who were cohabiting with their wife, 51% reported that their wife had her first pregnancy before age 18.

Early childbearing: percentage of married young men and women reporting first pregnancy within a year of marriage and by age 18

* Among those who had cohabitated with their spouse for 12 months or more
 ** Among young women and young men whose wife was aged 18 or above and were cohabiting with their spouse at the time of the interview

Utilisation of maternal health services is limited

Findings suggest that despite the early age at first pregnancy, utilisation of maternal health services by young women was limited. For example, just 23–24% of youth reported that the first—often the most risky—delivery took place in a health care facility. In rural areas, just one in five (19%) first deliveries took place in a health facility. Even in urban areas, only 45–55% of first deliveries took place in a health facility. Skilled attendance at first delivery was also limited, reported by just over two-fifths of youth.

Programme recommendations

Findings call for multi-pronged efforts to eliminate the practice of early marriage and support newly-wed young women.

Mobilise communities to eliminate the practice of early marriage

Strategies are needed that mobilise communities to help parents resist pressures that foster the practice of early marriage, and to establish new norms and practices with regard to marriage. Community mobilisation efforts must involve youth themselves, their families, as well as influential persons in the community, including religious and political leaders.

Enforce existing laws on the age at marriage and the registration of marriages

Equally important is to ensure greater commitment on the part of law enforcement agencies to enforce existing laws on the minimum age at marriage and the registration of marriages, and to levy penalties on violators. Allowing anonymous reporting, making law enforcement agencies and others aware that the practice of early marriage is not a minor violation, and making the guidelines for penalties clear to enforcement agencies and the wider community are possible steps in this direction.

Provide girls with viable alternatives to early marriage

Efforts to delay marriage also require providing girls with viable alternatives to early marriage in the form of accessible and quality schooling,

and opportunities to build and use livelihood skills. Working with the education sector to make schooling for girls more accessible, and to make classrooms gender-sensitive and responsive to the needs of girls and the concerns of their parents is important. At the same time, it is necessary to provide livelihood training within and outside the educational system and to provide those out-of-school a second chance at education.

Work with parents

Parents must be apprised of the need to involve children in marriage-related decisions and enable them to interact with their prospective spouse prior to the wedding day. Parents must also be made aware of the fact that early marriage compromises young women’s lives and reproductive health and choices in multiple ways.

Support newly-weds to postpone the first pregnancy and promote pregnancy-related care among first-time pregnant young women

Programmes are needed that inform youth about their pregnancy postponement options and enable them to access appropriate contraception. At the same time, providers must be trained and given the responsibility of reaching married young women and men—including those who have not yet experienced pregnancy—with information regarding contraception and other reproductive health matters as well as contraceptive supplies.

Findings, moreover, highlight that reproductive and child health programmes in the state need to build a demand for, as well as improve the availability of, maternal health services among young people.

Support newly-wed young women

Findings on the multiple vulnerabilities faced by young women who were married early underscore the need for programmes that support newly-wed young women, acknowledging that their situation and needs may differ from those of married adults. Efforts are needed that address the health and empowerment needs of married young women, enable young women to have greater control over resources, break down the social isolation they experience and encourage couple communication, negotiation and conflict management skills early in marriage.

Encouraging signs are evident. Policies and programmes—be they related to women and child development, youth or health and family welfare—have all recognised the importance of preventing early marriage and improving sexual and reproductive health and choice among young people, and have widely acknowledged the special vulnerabilities of young women. What is needed now is ensuring that programmes do indeed reach young people and the influential adults in their lives, and that promising lessons are assimilated and scaled up.
