

## EDITORIAL

The third issue of **RETERM – Thermal Engineering** consolidates the journal as an official publication of the Brazilian Society of Mechanical Sciences (ABCM). The journal continues to be divided in two main sections: science and technology. The former is directed to publish complete articles that deal with fundamental advances in heat transfer and fluid mechanics, new physical insights, and novel experimental and analytical methods that have great appeal for the industry community, and the latter is designed to comprise informative articles that document modern engineering applications, or general advances in industry.

Particularly, in this issue, the best articles written in English language, presented at the 9<sup>th</sup> Brazilian Congress of Thermal Engineering and Sciences, ENCIT 2002, held in Caxambu, MG, from October 15<sup>th</sup> to 18<sup>th</sup>, 2002, were selected by the Associate Technical Editors of **RETERM**, according to the scientific criteria of the journal. The idea is to increase the industrial and scientific impact of the research results presented in the Congress.

The institutional support from the Brazilian Society of Industrial Machinery and Equipments (ABIMAQ), continues to strengthen our belief in the success of this enterprise. To open a perspective to the maintenance and continuity of **RETERM**, we invite the readers from the industrial community to contact our staff for subscriptions and publicity in **RETERM**.

For the next issues we continue to welcome technical articles from both the scientific and the industrial communities to either section of **RETERM**, and contributions to the other sections of the journal, and suggestions for new sections as well. We also welcome response and comments from our readers that will certainly help the success of **RETERM**.
