
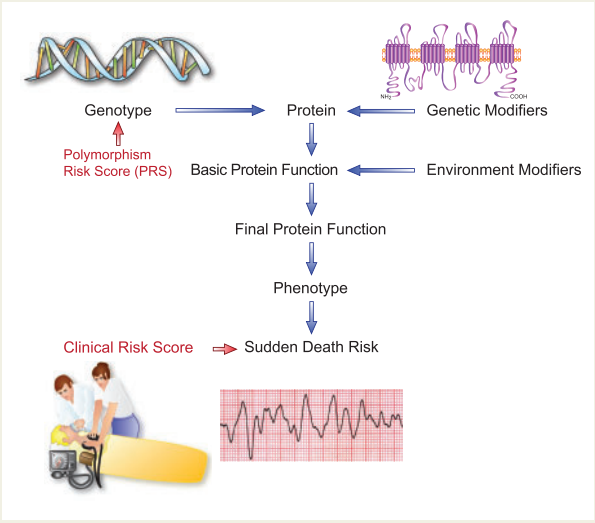

Figure 1 From genotype to phenotype.

sense, it would have been very interesting to analyse whether PRS combined with results of SCB and other risk factors[6] could better define the arrhythmic risk in BrS. In other words, an important study, an important first step that needs further scientific follow-up; an important analysis that, like all significant analyses, gives us some answers but opens up multiple new questions (*Figure 1*).

Conflicts of interest: none declared.
