REPORTS OF THE
US - USSR WEDDELL POLYNYA EXPEDITION

OCTOBER - NOVEMBER 1981

VOLUME 1

INTRODUCTION

L-DGO - 83 - 3

NATIONAL SCIENCE FOUNDATION GRANT DPP 80 05765

BRUCE A. HUBER

SARAH E. RENNIE

LAMONT - DOHERTY GEOLOGICAL OBSERVATORY
OF COLUMBIA UNIVERSITY
NEW YORK 1983

INTRODUCTION

Studies of the oceanography of the Southern Ocean have been limited to analyzing data collected mainly during periods when research vessels could operate unhindered by the seasonal sea ice cover. Since the Deutschland expedition in 1912, there has been no data obtained in the Weddell Sea under winter conditions, resulting in an unfortunate gap in the data base and, therefore, in our understanding of the physics of the ocean, sea-ice and atmosphere in this important area. Satellite images of the ice covered Weddell Sea obtained in the mid-seventies revealed a previously undetected ice-free region of some 250,000 km² occurring near the Greenwich Meridian. The discovery of this feature (called the Weddell Polynya) further emphasized the need for modern austral winter.

In an effort to partially fulfill this need, and in the hope of investigating the Weddell Polynya, a joint Soviet-American expedition was planned: The US-USSR Weddell Polynya Expedition.

The expedition took place during October and November of 1981, yielding a data set unique in its scientific scope which will serve as a valuable base for continued Southern Ocean research and for planning future field work. The data are reported in a series of seven volumes (listed in Table 1). This report is the first volume, and is intended to provide an overview of the expedition, as well as serving as an index for the subsequent reports. An hourly event log is provided at the end of this volume to guide the user in correlating information from the various reports.

6	Upper-Air Data	E. L. Andreas
7.	Surface-Level Meteorological Data	E.L. Andreas and A.P. Makshtas

Expedition Planning, Logistics and Cruise Objectives

Plans for the expedition were developed between the US Coordinator (A. L. Gordon) and the USSR National Coordinator for the USSR POLEX-South Program (E. I. Sarukhanyan) during June 1980 in Leningrad. Representatives of the US and Soviet participating programs continued to work out scientific and logistic details during meetings held in February and April 1981 at Lamont-Doherty Geological Observatory. The overall objectives of the expedition as developed during the meetings were to penetrate as far as possible into the Weddell Sea ice cover during the time of maximum ice extent obtaining physical, chemical and biological oceanographic data, sea-ice data and atmospheric data . In addition, it was hoped that a polynya would develop in 1981, and if so, the second objective of investigating the polynya could be met.

The expedition vessel was provided by the Arctic and Antarctic Research Institute of Leningrad; NES MIKHAIL SOMOV. The SOMOV is an ice-breaking supply vessel 133 meters in length equipped with modest laboratory spaces normally used for routine observational work performed during supply runs to Soviet Antarctic bases. The US team provided most of the instrumentation, including CTD's, 7000 meters of electro-mechanical cable, computers, an autoanalyzer, biology sampling gear, atmospheric boundary layer instrumentation, a salinometer, ice coring gear and atmospheric profiling gear. All scientific gear was shipped to Helsinki, Finland where three members of the US team met SOMOV and assisted with loading the 300 or so boxes on board on September 9, 1981. During the subsequent transit to Montevideo,

Uruguay, much of the equipment was installed and tested, including three motor-generator sets used to convert the ship's 50 Hz power to 60 Hz power required by the US instrumentation. In order to accommodate the large volume of science gear, substantial modifications were made to some of the ship's laboratory spaces.

The remaining 10 US participants were met in Montevideo on October 8. SOMOV left Montevideo on October 9, and headed to its first encounter with the outer fringe of the ice edge near 56°S, 5°E, on October 20. The vessel maneuvered until 14 November, leaving the ice near 57°S, 0°E, allowing 3 1/2 weeks of work time within the sea ice covered region. The expedition ended at Montevideo on November 25, 1981.

The Scientific Programs

Twenty-six scientists participated in the cruise, 13 each from the United States and Soviet Union. The participants and their institutional affiliations are listed in Table 2. Six programs were represented, with Americans and Soviet scientists integrated into teams to carry out the work. Funding for the US participating programs is acknowledged in Table 3, which lists program titles and principal investigators.

A total of 37 stations were occupied within the ice, entailing a variety of data collection activities. Expendable bathythermographs (XBT's) were deployed along the cruise track, especially as the ship crossed from open water to ice and back. Station operations near the ice edge were impossible due to large

CRUISE PARTICIPANTS

Chief Scientist: Ed I. Sarukhanyan (AARI)
Deputy Chief Scientist: Arnold L. Gordon (L-DGO)

Physical Oceanography:

US:	Bruce Huber, L-DGO	USSR:	Ivan Chuguy
	David Woodroffe, L-DGO		Nikolai Antipov
	Walter Richter, SIO		Nikolai Bagriantsev
	Jan Szelag, URI		Vladimir Romanov

Chemistry:

US:	Arthur Chen (carbonate system), OSU
	Joe Jennings (nutrients and silicon), OSU
	Gerry Metcalf (oxygen, carbonate system and Radon), WHOI
USSR:	Victor Haritonov
	Vladimir Feodorov

Biology:

US:	Jeanne Stepien (zooplankton), L-DGO
	Bavid Boardman (chlorophyll, primary productivity), L-DGO
	Diane Clarke (diatoms), L-DGO
USSR:	Valyeri M. Zhuravlev (zooplankton)

Sea Ice:

US:	Stephen Ackley, CRREL
USSR:	Boris Sustenov
	Alexandre Samoshkin

Meteorology:

US:	Ed Andreas, CRREL
USSR:	Alexandre Makshtas
	Ed Lysakov

Velocity of Sound in the Ocean:

USSR: Peter Bogarodski

All Soviet participants from Arctic and Antarctic Research Institute (AARI), Leningrad, except Zhuravlev from VNIRO, Moscow.

L-DGO: Lamont-Doherty Geological Observatory
CRREL: Cold Regions Research & Engineering Lab
OSU: Oregon State University
URI: University of Rhode Island
SIO: Scripps Institution of Oceanography

DOE - Department of Energy

amplitude, long period swell propagating into the ice edge zone. The XBT lines thus extend the temperature data set across the ice edge. Station positions and the cruise track are presented in Figure 1, with station activities summarized in Table 4.

Discussions of the programs have been published in an issue of the Antarctic Journal (Table 5). A brief summary of the content of the programs is presented here.

Physical Oceanography

The main objective of the physical oceanography program was to resolve the major horizontal and vertical scales of variability in the thermohaline structure of the ice-covered Weddell Sea. Continuous profiles were obtained with a Neil Brown Instrument Systems CTD/O₂ equipped with a General Oceanics rosette water sampler. Several casts extended to within 10 or so meters of the bottom. Temporal variability was investigated by repeated short casts (Yo-Yo stations) and by suspending the CTD at a fixed depth for up to 13 hours while on station. Soviet current meters were deployed during the CTD time series. Profiles of sound velocity were obtained with an instrument of Soviet design on several stations. Dissolved oxygen profiles were available on some of the stations, and discrete water samples were titrated for oxygen on most casts. The data was recorded in digital form and partially processed during the cruise using a Hewlett-Packard computer system.

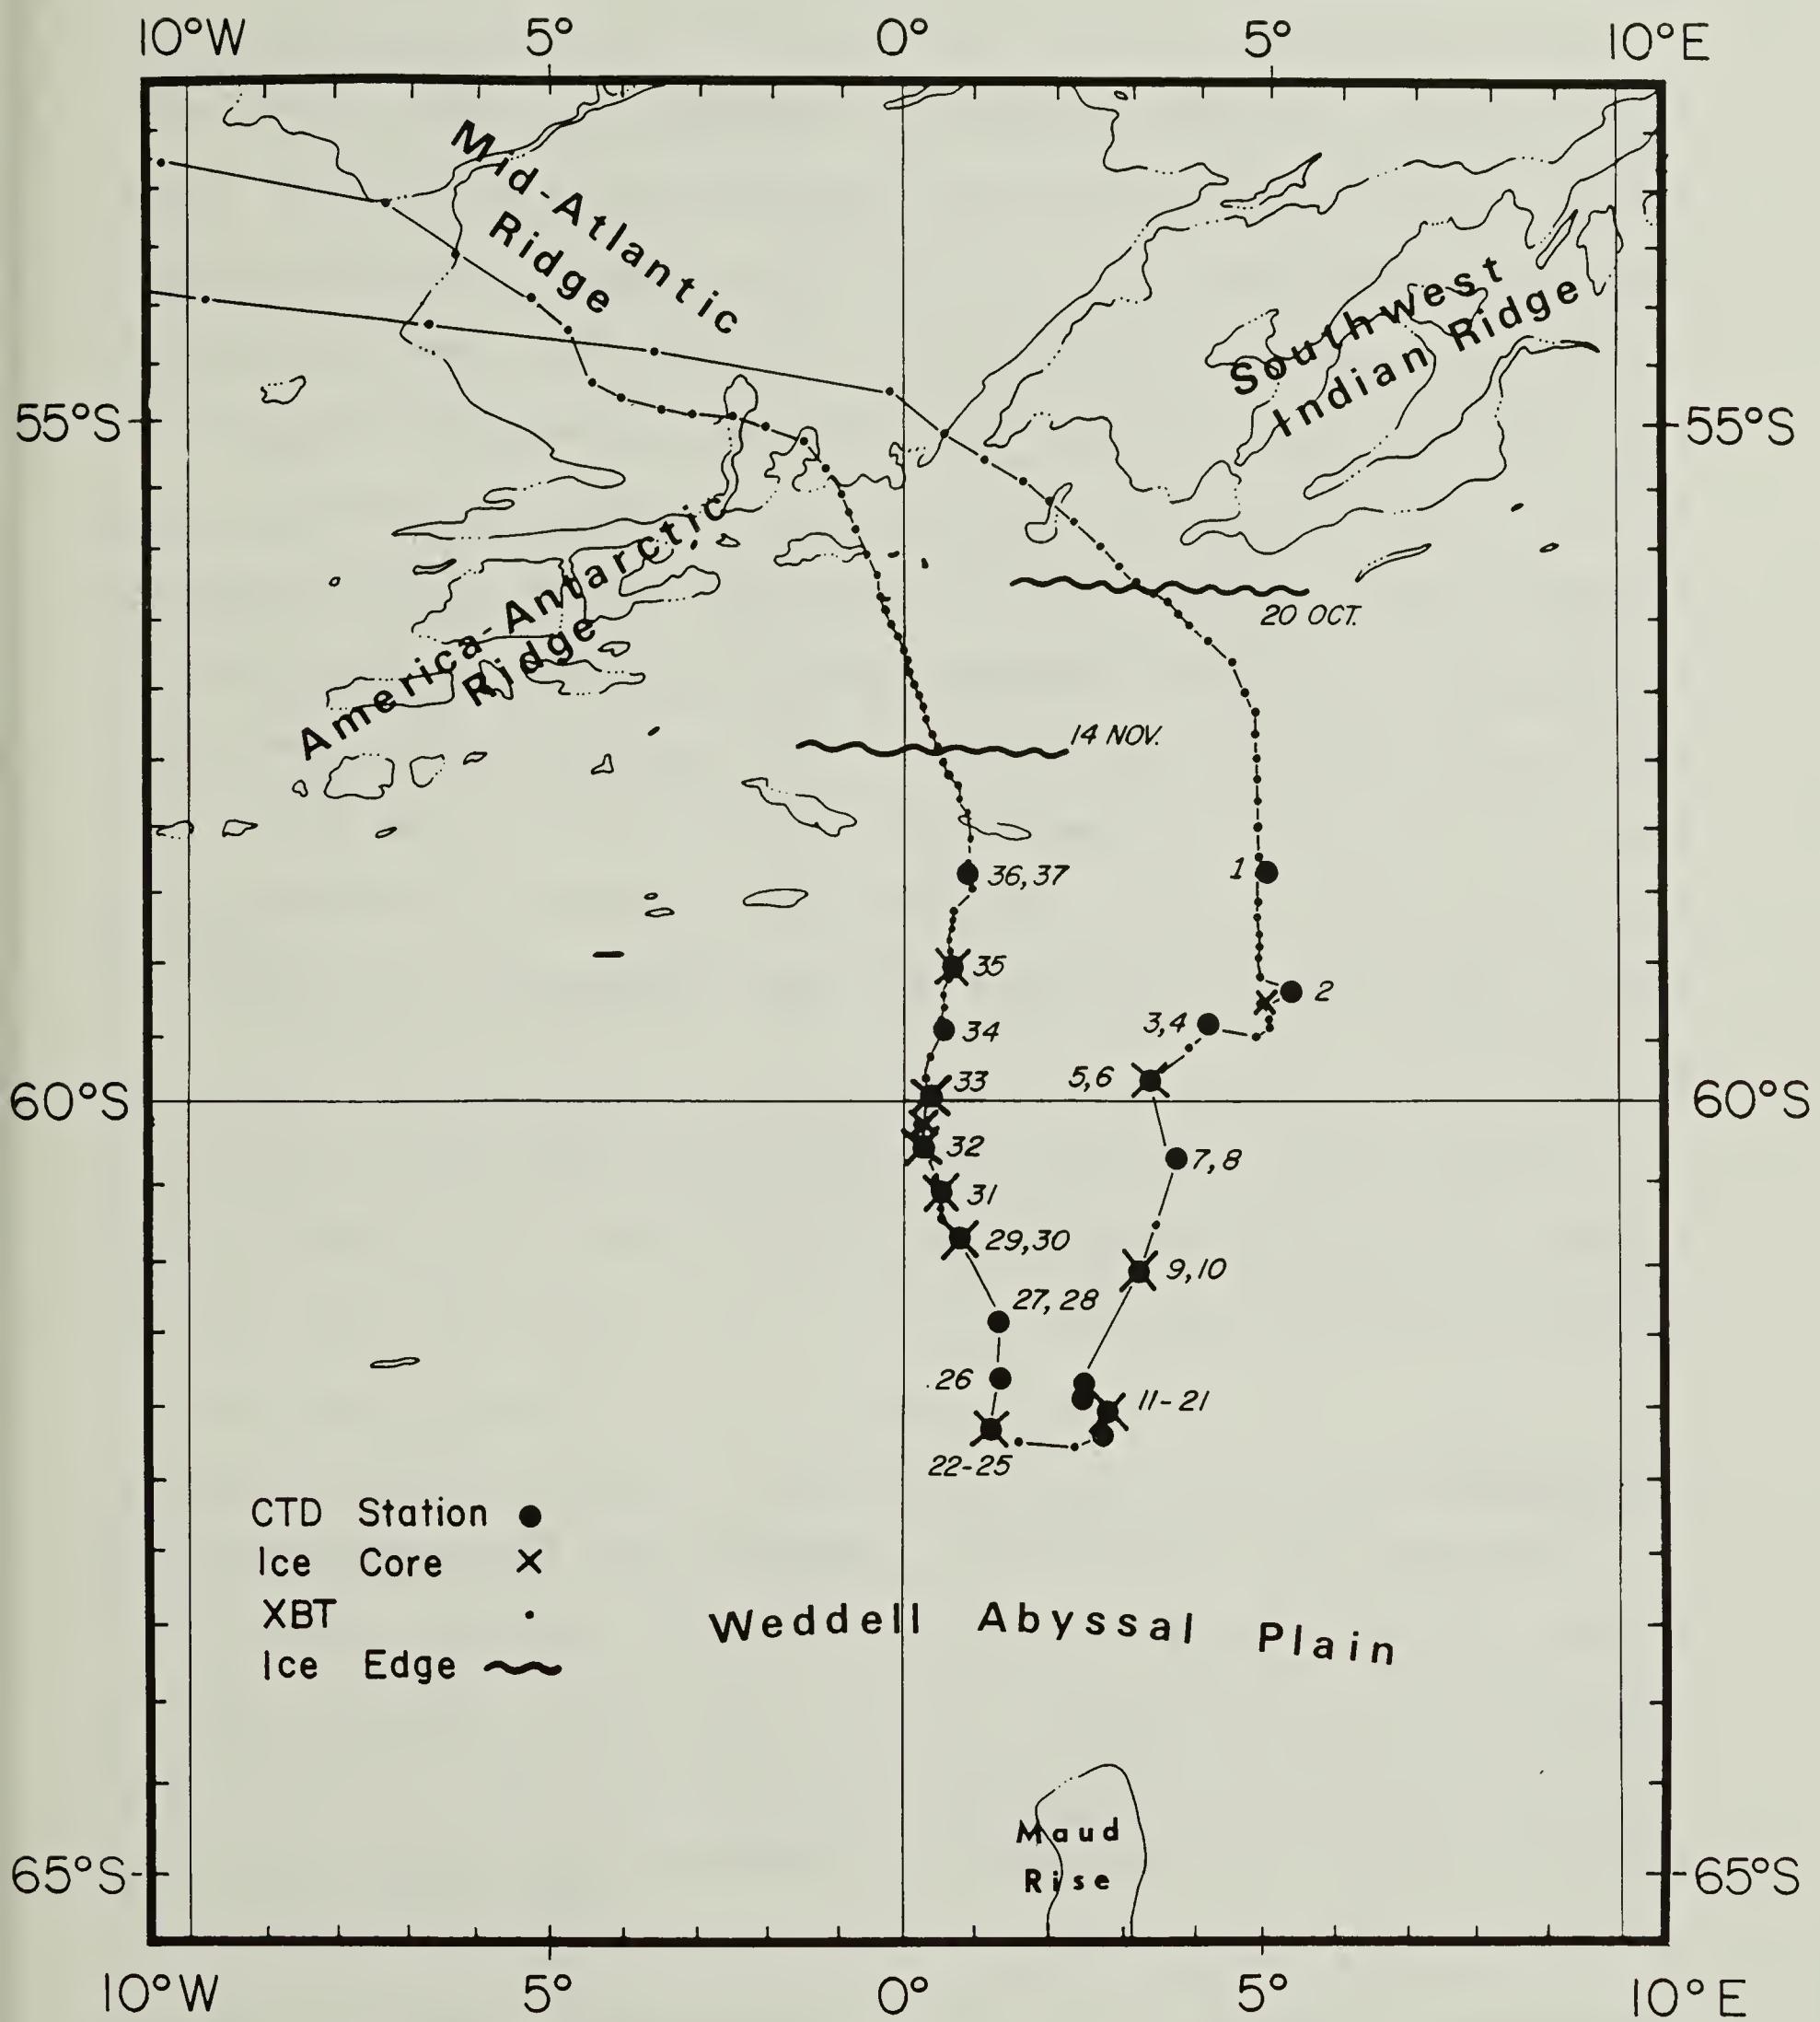

Figure 1

Atmospheric Physics

The atmospheric study was comprised of four distinct, but complimentary programs: upper-air soundings, surface layer profiling, routine meteorological observations and surface layer turbulence measurements. A MicroCORA Automatic Sounding System (leased from Vaisala of Helsinki, Finland) was used to provide wind velocity, temperature, humidity and pressure profiles twice daily. More frequent profiles of temperature, humidity and pressure were obtained with an Airsonde system manufactured by A.I.R., Inc. Standard meteorological observations were made at three hour intervals, and included wind speed and direction; air, water and dew point temperatures; ice conditions; and cloud type and cover. Total sun and sky radiation, reflected shortwave radiation, net all-wave radiation and ice temperature were recorded hourly.

Surface layer profiles and turbulence measurements were obtained from an instrumented boom deployed from the helicopter deck above the stern of the ship.

Ice Studies

Underway ice observations, surface ice floe sampling, and coring of the ice pack comprised the ice program. Soviet and American ice observations have been compiled to create a map of daily ice conditions and a companion narrative log. A total of 27 cores and 13 surface samples were obtained from 11 stations. The cores have been analyzed for ice structure, nutrient content, fluorescence, chlorophyll a and phaeopigment, diatom species enumeration, bacteria content, and salinity.

Nutrient Chemistry

The program was designed to study the distribution and cycling of nutrients under end-of-winter conditions and to obtain the first data set describing the distribution and production/-dissolution rates of particulate silicate in the Weddell Sea.

Water samples obtained from the rosette sampler and from hydrocasts were analyzed for nitrate, nitrite, silicate and phosphate using an auto analyzer. Several large volume samples from hydrocasts were partially processed at sea and returned to the laboratory at OSU for analysis of particulate silicate.

Biology

Biological sampling consisted of measurements designed to ascertain the abundance, distribution, and activity of bacteria, phytoplankton and macrozooplankton in and under the ice. Water samples obtained by bucket and from sampling bottles at various depths, and ice samples were analyzed for chlorophyll a, diatom species and abundance and bacterial content. Surface samples were incubated with ^{14}C under a variety of light conditions to measure photosynthesis/light relationships.

Zooplankton collections consisted of vertical net hauls at the ice edge and within the ice pack. Observations of krill distribution, abundance and biomass, feeding habits and reproductive state were emphasized.

Carbonate Chemistry and CO₂ Studies.

Water samples were analyzed for pH, total alkalinity, total CO₂ and CO₂ partial pressure. Atmospheric CO₂ was also measured.

The objectives of these programs were:

- a. To assess the utility of calcium, carbonate and pH as water mass tracers;
- b. To estimate the penetration depth of fossil fuel produced CO₂; and
- c. To assess the degree to which Southern Ocean waters are a sink or source of atmospheric CO₂.

Comments

Basic Biology - Zooplankton vertical tows from 500 and 200 m. Radiolarian tows 200-100 m, and 100 m to surface.

Diatom samples from upper 100 m.

Sound velocity profiles of upper 100-200 m obtained at each station.

CRREL atmospheric sampling boom deployed at a number of station sites.

ACKNOWLEDGEMENTS

The success of an endeavor of this magnitude required the cooperation of a great many talented people. We are especially grateful to Captain F. A. Pesyakov and the officers and crew of the NES MIKAIL SOMOV. They provided us with much needed help in establishing laboratory space on the ship, offering materials, advice and technical assistance wherever needed. Equally important, we were welcomed aboard and were provided with a living environment in which we felt at home.

The collection of the data was truly a cooperative effort. Our Soviet colleagues worked with diligence and care to ensure the high quality and scientific value of the data collected.

Funding for the production of this report was provided by The National Science Foundation, Division of Polar Programs, as part of Grant DPP 80-05765 to Columbia University. A. L. Gordon is the principal investigator.

APPENDIX

Hourly Event Log

Navigation during the cruise was provided by satellite navigator fixes and dead reckoning. The following tables list hourly positions computed from the available good fixes by interpolation. Underway events and observations and station activities are entered to the nearest hour. All times are GMT.

Key to event log

Labels and Entries:

CTD	- CTD station number (biology station #)
XBT	- XBT number
SST	- Sea surface temperature ($^{\circ}$ C) from bucket sample
SSS	- Sea surface salinity from bucket sample
CL	- Total cloud cover in OKTAS
WIND	- Direction (ten degrees) speed (meters/sec)
WX	- Weather type (WMO code 4677)
PRESS	- Atmospheric pressure (millibars)
AIRT	- Air temperature ($^{\circ}$ C)
DEW	- Dew point temperature ($^{\circ}$ C)
SST	Sea surface temperature ($^{\circ}$ C) from Soviet underway system.
VAP	- Water vapor pressure (millibars)
MET.PRFL	- Meteorological profile (type and #) SLPnn - surface layer profile number Mnn - MicroCORA profile Ann - Airsonde profile BIOnn - Biology station number

Other events indicated by text comments at right.
