A large cornet fish (*Fistularia petimba*) belonging to the family fistulariidae was collected on 3rd February 2009 from the Bidiya Fish Landing Centre, caught by trawler off Veraval coast at a depth of 60 m (Fig. 1). The body of the fish was elongate having depressed mouth at the end of a long tubular snout which was hexagonal in cross section and teeth in jaws with small ridges on snout with antrorse serrations, the upper ridges diverging anteriorly and the inter-orbital space flat. Dorsal and anal fins were short-based and opposite with 15 rays and 15 dorsal segmented rays; pectoral fins with 15 rays; pelvic fins

small and abdominal with 6 rays. Lateral line was arched, running anteriorly almost along the middle of back and then bending down to side and continuing posteriorly to an elongate filament produced by the middle of two caudal fin rays. Posterior lateral line was ossified without spines. The colour of the fish was brown, becoming lighter to silvery below. Dorsal and anal fins were with orange cast becoming transparent at base and caudal filament white. The following are the morphometric and meristic characters:

Total length	:	1480 mm
Total weight	:	2529 g
Length from snout to 1 st dorsal	:	1155 mm
Opercular length	:	100 mm
First dorsal to furcal	:	210 mm
Pelvic to pectoral	:	185 mm
Pelvic to anal	:	460 mm
Eye diameter	:	20 mm
Dorsal rays	:	15
Anal rays	:	15
Pelvic rays	:	6
Pectoral rays	:	15
Brancheostegal rays	:	8
Length of prolonged caudal fin ray	:	200 mm
