---

Seafood is high on the global trade agenda and has become particularly relevant in the light of the entry of fisheries into the WTO process (following WTO Doha Ministerial Conference in December 2002). International trading regimes are changing, with more open market access but with EU, US and other developed countries taking increasingly stringent measures for seafood safety. Changes in market access are likely to have significant implications for poor producers, and costs of implementation of international fisheries agreements, such as WTO sanitary and Phytosanitary (SPS) measures, HACCP standards, and market-driven labeling schemes may reduce livelihood options through barriers for participation of poor people. Liberalization of economies coupled with increasing demand for value added products and other product diversifications has resulted in structural changes of seafood industry in the last decade. Indian seafood exports declined to \$1.89 billion from 2.10 billion dollars during 2007-08. The global financial meltdown seems to have taken its toll on the export of marine products from India with the business recording a 10 per cent slump to \$1.9 billion for the year 2007-08. The country may even fall short of its target of \$2 billion set for 2009, reports which was hit mainly due to economic recession in Europe and America, which are the major importers of marine products from India. The provisions under the various WTO agreements are expected to have an impact on the different dimensions on the Fisheries sector.

Indian fisheries cannot escape from the stark reality of fierce competition emerging in the global scenario. Indian seafood industry, by and large, still remains as a supplier of raw materials to the preprocessors in foreign countries and 90 per cent goes in bulk packs, which is the prime reason for the drastic reduction in the unit value realization. Restrictions and levies imposed by both the exporting and importing nations acts as fiscal controls and hamper exports. The policy constraints often take the form of non- tariff barriers and generally relate to quality specification of the traded goods and also packing materials. India has taken a position that arbitrary as well as restrictive sanitary and phyto-sanitary measures continue to represent a major obstacle to international trade of agricultural products. Developing-country exports are usually affected because the Sanitary and Phyto Sanitary (SPS) measures are often developed in a non-transparent manner and developing countries invariably do not get adequate opportunity to respond to the proposed measures. A number of international standards are thus being developed without the participation of developing countries. As a result, standards are often being adopted without taking into

account the problems and constraints that developing countries face. The export to the European Union still poses serious threats due to the quality aspects raised by the importers and the characteristics of a buyer market. Recently there had been reports of rejections of consignments from the European Union due to the detection of antibiotic microbial and bacterial residues to the tune of 500-600 crores annually. The overall production from export-oriented aquaculture during last year was estimated to be 1.33 lakh tonnes, which was a fall by 41,000 tonnes in quantity and Rs 941 crore in value compared to the previous year. Shrimp production showed a decrease by 26 per cent and scampi production by nine per cent over the previous year. Disease outbreaks and natural calamities were reportedly the prime reasons for the shortfall in aquaculture production. In addition to all these the recent economic slowdown and recession for the last three quarters is for sure take a toll in the balance of payment in the country. Depreciating rupee notwithstanding, global economic turmoil has started taking a toll on the country's robust export growth story.

Economic Recession is "a significant decline in the economic activity spread across the country, lasting more than a few months, normally visible in real GDP growth, real personal income, employment, industrial production, and wholesale-retail sales. In the event of the economic slowdown coupled with the increase in the purchasing power of the consumers it is important to note that some of the high value fishes like the shrimp, seer fish and pomfrets fetches a premium price in the domestic market too. Low demand from the US and the EU - the two economies hit hard by the global crisis - has decelerated the country's export growth sharply in September 2008. Export markets are subject to risk in terms of detention and loss or damage in transit or variation in foreign exchange values. The setbacks experienced now and then in the export front which is imminent under the WTO regime can be supported only if a buffer is created by a well-developed internal marketing system

### **WTO and Indian fisheries**

With the implementation of the New Economic Policy in July 1991, and the subsequent focus on terms of trade and gains from trade, seafood was identified as a major source of foreign exchange earner for the country. The founding of the World Trade Organization (WTO) in January 1995 marked the culmination of a series of complex, arduous and long drawn out negotiations under the Eighth Round of General Agreement on Tariffs and Trade (GATT). It also marked the beginning of a distortion free multilateral trade among the economies of the World as the core principle of the WTO is institutionalization of global framework for deregulated competitions. India, being a founder member of the GATT, is a signatory to the commitments made during the negotiations.

The provisions under the various WTO agreements are to have impact on the different dimensions on the Fisheries sector. The main provisions of WTO agreement that are applicable to fisheries are:

1. Trade related intellectual property right (TRIPS) and imposition of patent regime.
2. Trade related investment measures (TRIMS).
3. Reductions of domestic and export subsidies.
4. Tariff reduction and bindings to provide market access.
5. Removal of quantitative restrictions (QR).
6. Application of sanitary and Phyto-sanitary (SPS) measures.
7. Aggregate Measure of Support (AMS).

**The implications are discussed below under the following heads**

- (a) Export performance over the years
- (b) Recession and its impact on India seafood trade
- (c) Debate on Subsidy
- (d) Sanitary and Phytosanitary measures
- (e) Exporters profiling and constraint analysis of exporters
- (f) Tradeoffs between domestic marketing and international trade
- (g) Trade and resources
- A. Export performance over the years

There has been commendable increase in the Indian fisheries export in terms of quantity, value and unit value over the years. The results are given below in the following tables.

Table 6.1 Export growth of marine products – Post and Pre WTO (Commodity)

Year	Pre -WTO (1980-1995)	Post WTO (1995-2010)
<b>Total</b>		
Quantity (tonnes)	3.49*(1.53)	8.29* (2.763)
Value (Rs)	3.33** (1.50)	8.23* (2.58)

In order to examine quantitatively the effect of export quantity and the export unit value and their variability on the export value over the year's decomposition analysis was performed. For better understanding the variance of the export value was measured in two-time period *viz.*, pre WTO period (1980-1995) and post WTO period (1995-2010). The export quantity and export unit value of Indian fisheries were detrended for further decomposition analysis.

Decomposition analysis was done for decomposing the sources of growth on average export value and variance of export value of Indian marine products

Table 6.3 Decomposition analysis of the components of change in average export value of Indian marine products

Sl. No:	Source of Change	Percent Share
1	Change in Mean Export Unit Value	7.29
2	Change in Mean Export Quantity	81.21
3	Interaction between changes in (1) and (2)	9.42
4	Change in EQ-EUV covariance	2.08

The results indicated that the contribution of change in mean export quantity was the highest among the other components of change i.e. the increase in mean export quantity accounted for 81.21 per cent of the increase in average export value. This was as expected because the export quantity had recorded significant higher growth rates during both the period whereas the export unit value recorded a negative growth rate during the post WTO period. The changes in the covariance between the mean export quantity and mean export unit value accounted 2.08 per cent increase in the mean export value. The changes in the covariances could arise through the changes in the variance of export quantity and export

unit value. With regard to interaction effect the export quantity was benefited to a small extent (9.42 per cent) from both mean export quantity and mean export unit value. Among the various components, the contribution of change in mean export quantity of Indian marine products was the dominant source for the change in average export value followed by the interaction between changes in the mean export quantity and mean export unit value. The components of change that affected the stability of export value are shown in Table 5.9

#### A. Export performance over the years ( recession)

Recession is defined as the significant decline in economic activity spread across the economy, lasting more than a few months, normally visible in production, employment, real income, and other indicators which started in 2007-08 ( mostly in developed economies ) There exists a lag in recession especially with regard to food demand .The impact has been noticed since first quarter of 2009.

The impact of recession was studied and it was found that recession has not affected India's seafood trade. The major reasons for the same had been India- economic stimulus, strength of banking system, Developed countries - Purchasing power and employment rate decreased by around double digits as the demand for retailing gone up and lower demand for ready to serve and ready to cook .The demand for food stamps (PDS increased in the developed countries including US and EU amidst massive economic stimulus provided. The China - Stronger Yuan and remain unaffected. In the South East Asian countries was countered by more productivities and governmental regulation .The Indian seafood export wasn't affected due to the Increased demand for raw fish rather than value added products from the retail outlets , declining international market arrivals by over 10 per cent globally in the buyer countries .It was found that the quantity and value are on the high and the emergence of newer markets in Latin American, African ( 3.5 and 4.2 per cent Quantity and Value).However there are concerns of Unit value declining over the period - case of concern and Growing concern of depreciating rupee compared to dollar increased the earnings and the reduction in the import to China ( but channeled through Vietnam was a concern)

#### Recession and India's export trade

Fig.6.1 Recession and India's export trade

## B. Export performance

The export performance was based on a matrix referred to as Growth Constancy Retention matrix ( GCR) based on the secondary data collected from secondary data from 1975-2011>the study covered the Geographic concentration of 35 countries and the commodity concentration- species and different forms .The matrix is represented below in Figure 8. The parameters used in the matrix include:

- Growth estimated using compound growth rate HG, MG, LG, MIG
- Constancy - using Stability index- HC, MC, LC, MIC
- Retention- brand loyalty of Indian products estimated using weighted average HR, MR, LR, MIR

The estimation of the parameters are done using G- Growth estimated using compound growth rate

$$r = (\text{Anti Ln of } b - 1) \times 100$$

C- Constancy done using Stability index

$$\text{The instability index} = (\text{antilog } g - 1) \times 100 \dots\dots\dots (g)$$

Where,

Xt = Value of exports in year t or volume of exports in year t

N = Number of years - 1, m =The arithmetic mean of the difference between the logs of Xt and Xt+1 , etc. ,V log = Logarithmic variance of the series

R- Retention- brand loyalty of Indian products estimated using weighted average )

### Growth -Constancy -Retention Matrix

Growth / Constancy	High		medium		Low		marginal	
High	HR	MR						
	LR	MLR						
Low								
Medium								
Marginal								

HR,MR,LR and MLR Indcates different levels of retention

Figure 6.2 Growth -Constancy -Retention Matrix

The analysis of the Growth Constancy matrix indicated that there exist stable partners across the export destination with sizeable export quantities

### ( C ) Antidumping

Anti-dumping duty had a major impact on shrimp exports to the US which plummeted from \$409 million in 2003 before the duty imposition to \$142 million in 2008. The exports to US have considerably increased after the reduction in the antidumping duty from 14.29 to 0.79 during 2008-09 ( Figure 27A).Subsequent increase from 0.79 to 2.14 per cent(2010-11) hadn't shown any effect on the shrimp exports to United States for now an increased to 452 million \$ during 2010-2011.

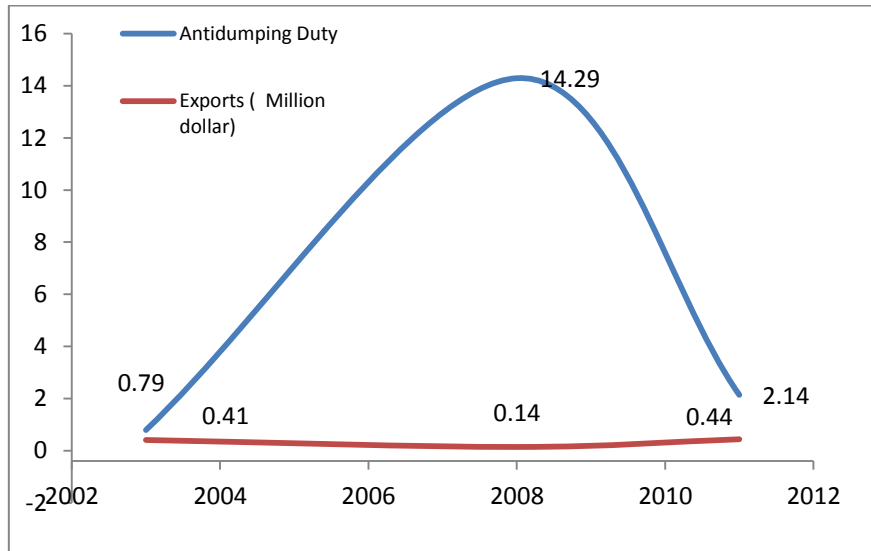

Fig. 6.3 Antidumping duties and changes in export quantum to US

### (D)Sanitary and Phyto sanitary measures

The analysis of the short run and long run gains on the SPS and compliance measures by the exporter's analysis indicated that with the huge cost of investment required for the compliance of EU approval and HACCP implementation the gains weren't significant due to non-capacity utilization of the processing plant and lack of raw materials. The processing plants which have implemented the compliance investment for the EU approval are yet to break even their cost of investment even after 8 -10 years on account of processing capacity utilization to the tune of 22-25 per cent.

Nitro furan metabolites, concentration of heavy metals, occurrence of histamine and bacterial inhibitors were the major reasons for the EU rejections of Indian marine products. Belgium, Spain, Greece and UK were the major countries which rejected the consignments during the period the present antibiotic residues level required by the EU for seafood exporters are extremely rigid and beyond the actual requirement of food safety

### (E ) Fisheries Subsidies

Fuel subsidies, preferential tax treatments, boat construction subsidies comes under the WTO definition of subsidies set forth in WTO Agreement on subsidies and countervailing measures. According to UNEP the different subsidies to fisheries sector consists of fishing infrastructure (construction of harbours and port-facilities, management services (monitoring and surveillance, management related research, subsidies to securing fishing

access, subsidies to decommissioning of vessels, subsidies to capital costs , subsidies to variable costs income supports and price supports. In India the different types of subsidies includes, subsidies to marine fisheries development (motorization of crafts and reimbursement of excise duty or sales tax exemption on fuel, subsidies for kerosene, construction of fishing harbours and other infrastructure, support for domestic marketing ,processing facilities, subsidies for promotion of aquaculture , subsidies for different institutions for research and development, and export subsidies. Among the different items, subsidies to marine fisheries development infrastructure and post-harvest operations and export subsidies are considered as harmful subsidies. The adverse effect of subsidies depend on the existing management regime and the bio economic conditions of the fishery. Subsidies lower the cost of harvest and raise the effective price of fish. As a management tool, cost-reducing or profit-increasing subsidies may result in increased productive efforts and hence considered as harmful through overexploitation of fish resources and unsustainable harvesting (eg. Export promotion subsidies results in targeted fishing and trade diversions).

### Classification of Subsidies

The classification of subsidies under the different head viz., Good (Beneficial), Bad ( Capacity enhancing) and Ugly ( Ambiguous)is furnished in Table

Table 6.4 Classification of subsidies

Sl.No:	Type of Subsidies	Details
1.	Good ( Beneficial)	Lead to investment in natural capital assets. They enhance the growth of fish stocks through conservation, and the monitoring of catch rates through control and surveillance measures to achieve maximum long-term sustainable net benefits
2.	Bad ( Capacity enhancing)	Programs that lead to disinvestments in natural capital assets such that the fishing capacity develops to a point where resource overexploitation makes it impossible to achieve maximum sustainable long-term benefits.
3.	Ugly ( Ambiguous)	Programs whose impacts are undetermined, i.e., they may lead to either investment or disinvestment in the fishery resource. These subsidy programs can lead to positive impacts such as resource enhancement programs or to negative impacts such as resource overexploitation.

Fig. 6.4 Fisheries Subsidies in the world ( Billn \$)

Table 6.5 Quantification of subsidies across the world

Type of Subsidies	Total	Share to total value
Bad Subsidies, including fuel	16.20	25.00
Fuel subsidies alone ( 27 per cent of bad )	6.20	9.57
Ugly Subsidies	3.00	4.63
Good Subsidies	8.00	12.35
Total subsidies	27.20	41.98
Developed ( Per county basis - 3 times)	18.50	68
Developing	8.704	32

Table 6.6 Categorisation of fisheries subsidies in the world

Countries	Beneficial - Good	Capacity enhancing - Bad	Ambiguous - Ugly	Total
Japan	0.59	3.39	0.65	4.64
EU	1.26	2.59	0.72	4.57
China	1.23	2.19	0.73	4.14
USA	1.16	0.44	0.20	1.80
Russia	0.32	1.04	0.12	1.48
India	0.18	0.85	0.04	1.07
WORLD	8.00	16.2	3.00	27.2

Beneficial (Good)	M\$
Fisheries management and services	117.84
Fisheries research and Development	60.00
Maintenance of MPAs.	1.32
Sub total	179.16
Harmful (Bad)	
Boat construction,	27.17
Fishery development and support services	29.14
Fishing port construction and renovation	133.38
Marketing support and storage infrastructure	24.44
Tax exemption	0.31
Foreign access agreements.	0.00
Fuel subsidies ( Annual consumption of 1000 million litre)	45.00
Sub total	259.45
Ambiguous (Ugly)	
Fisher assistance	4.15
Vessel buyback	0.00
Rural fisheries community development	39.15
Sub total	43.30
Grand total	481.91

Table 6.9 Fisheries Subsidies

A.	Value of landings at landing centre- crores ( Marine Landings -3.12 Million tonnes)	19573	25773
B.	Value of marine landings at landing centre- M \$	4893.25	6443.25
C.	Total subsidy breakup		
(i)	Beneficial (Good)	179.16	37.18
(ii)	Harmful (Bad)	259.45	53.84
(iii)	Ambiguous (ugly)	43.30	8.99
(iv)	Grand total	481.91	
D.	Percentage of subsidies	9.85	7.48

- Fishery subsidies greatly impact the sustainability of fishery resources. Subsidies that reduce the cost of fisheries operations and those that enhance revenues make fishing enterprises more profitable than they would be otherwise. The global fisheries subsidies are estimated at 30 billion dollars which comprises of good bad and ugly subsidies on account of their role in investment or disinvestment to the natural capital assets. The global subsidies are valued at 35-40 per cent of the value of total fisheries production. Fuel accounts to more than 27.7 per cent. The good subsidies account to 27 per cent of the total subsidy in terms of fisheries management, research and conservation programmes. Developed countries account for more than 68 per cent of subsidies, and developing countries the remaining 32 per cent. However on a per country basis, developed countries provide more than three times as much subsidy as developing countries.
- In the context of India the amount of subsidies provided is much less with less than 8 per cent of the total value even though challenged internationally .The marine fisheries sector in India is a subsistence fishing and much different from the factory / commercial fishing of developed countries. In addition the fuel subsidy provided contributes to less than 5 per cent of the total value of landings. But on the other side the welfare measures, saving cum relief, housing and other transfer payment adds to the subsidy component in the Indian context. Further it is important that the good subsidies don't feature in Indian fisheries subsidy regime.
- The subsidies to fisheries development, infrastructure and post-harvest infrastructure and export subsidies which were considered as harmful in the WTO definition were Rs. 62.8 crores and Rs.34.22 crores respectively during 2010-11. The total amount of support to fisheries sector was Rs.259 crores only (including both beneficial and harmful subsidies) which was less than one per cent of the fisheries GDP in India

The different items of subsidy in the Indian fisheries sector (Centrally sponsored schemes) are as follows:

Table 6.10 Subsidies in the fisheries sector in India (2010-11)

Items	Amount (Rs.lakhs)
1. Marine fisheries development	
a) Motorization of traditional crafts Central share (50 per cent): State share (50 per cent)	498
b) Rebate on HSD (central share-80 per cent state share 20 per cent)	936
2. Establishment of fishing harbours and other infrastructure	5282
3. Welfare measures	746
4. Institutes	4376
5. NFDB	8675
6. Aquaculture	2000
Total	22513

The various fishery development measures like motorization of crafts and rebate on HSD oil and fishing harbor development are included under the subsidy class of WTO as they directly promote fishing operations. The assistance for fishing harbor development is considered as an indirect subsidy in the WTO definition.

Table 6.11 Export subsidies (2010-11)

Export subsidies	Amount (Rs.lakhs)
Sea freight assistance scheme-for import of raw materials for preparation of value added products	
Tuna long lining	100.00
Development of potential farming area	679.00
Organic aquaculture	14.19
Digital data base on aqua farms	37.00
Ornamental fish breeding	209.00
Subsidy for promotion of aqua culture	414.00
Acquisition of processing machinery	1200.00
Technology for up gradation of marine products	105.00
Basic facilities for chilled fish/tuna	148.00
Effluent treatment plant	18.00
Promotion of aquaculture societies	177.00
Labs for quality certification	21.33
Landing centres/ fishing harbours-ice making machines and chill rooms	300.00
PCR lab	40.68
Total	3422.52

NFDB also promotes fisheries through development of fishing harbours, assistance to fish markets and deep sea fishing. The total assistance for marine fisheries development was Rs.998 lakhs in 2010-11. The support to institutes like fishery survey of India, Central institute of fisheries nautical engineering, NIFPHATT, Central coastal engineering institute, integrated fisheries projects etc. are considered as favorable subsidies as they promote sustainable fishing practices. Export subsidies are provided through various export promotion schemes of MPEDA. The total export subsidies amounted to Rs.34.22 crores in 2010-11

The expenditure on subsidies for marine fisheries development, infrastructure and post-harvest operations declined from 60.85 crores in 2005-06 to 41.49 crores in 2007-08 and then increased to 62.8 crores in 2010-11. The total amount of subsidies to fisheries sector is 259 crores only which is less than one per cent of the fisheries GDP in India. Figure 34 Growth in subsidies in marine fisheries development, infrastructure and post-harvest operations

5.	Percentage of subsidies	8.51	7.19
6.	Subsidy per tonne of fish ( Rs)	5806	5150

The implications on the study of subsidies indicated the following

- The amount of subsidies provided is much less with less than 8 per cent of the total value even though challenged internationally.
- The marine fisheries sector in India is subsistence fishing and much different from the factory / commercial fishing of developed countries.
- In addition the fuel subsidy provided contributes to less than 5 per cent of the total value of landings.
- But on the other side the welfare measures, saving cum relief, housing and other transfer payment adds to the subsidy component in the Indian context.

## H. Trade and Resources

The relationship between the landings, export, CPUE were estimated and depicted graphically in the following figures. During 1985-2010, the marine products export has been increasing proportionate to the marine fish landings. The share of export has steeply increased from 2001 onwards compared to the previous period.

Figure: 6.8 All India landings and export (1985-2010)

Figure: 6.9 Share of landings to Domestic and Export market (1985 - 2010)

There is positive relationship between quantity exported with that of total CPUE of the vessels. Whenever a landing increases, the CPUE also increases logarithmically.

Figure 6.10 Exports vs CPUE

There is a step increase in CPUE of mechanized vessels of India with the increase in export quantity (Fig.). However, the CPH of mechanized vessels showed a decreasing trend with increase in quantity exported (Fig.). This can be attributed to the induction of more number of multiday mechanized vessels to target the key resources of high demand in export market, which in turn reduced the CPH of vessels.

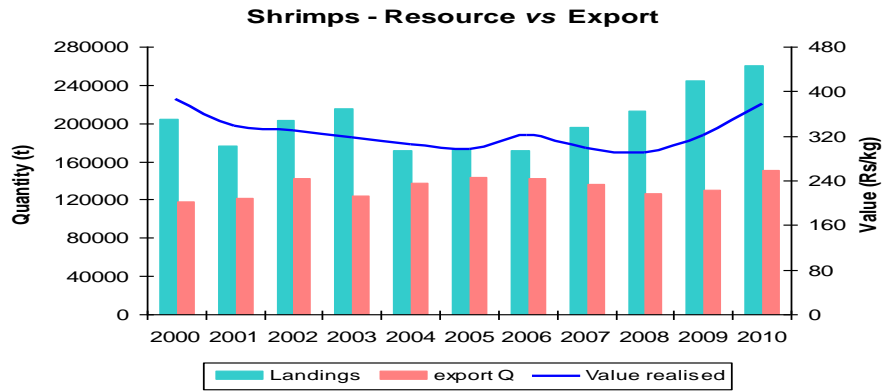

Figure 6.11 Shrimps- Resource vs Export 1985-2010

Figure 6.12 Percentage landings exported 1985-2010

The value realized for shrimps during the last decade decreased with increase in landings. In the case of cephalopods, there is a marginal increase in the value with the increase in landings. This has resulted in the increase of per cent share of landings of cephalopods during the last five years.
