Abstract

Purpose

The study examined library personnel awareness of the availability of emergency response plans, their forms and roles in safety routine preparedness and control in federal and state university libraries in Southwest Nigeria.

Design/methodology/approach

The survey research design alongside a multi-stage sampling procedure comprising purposive, randomisation and total enumeration techniques guided the study. The population consisted of 327 library personnel drawn from 12 federal and state university libraries (i.e., six each). The questionnaire and structured interview methods were used for data gathering. Of the 327 copies of the questionnaire administered, 249 copies, representing 76.1%, were duly completed and found valid for analysis. Whereas the acceptance threshold of $\geq 90\%$ response rate and a criterion mean of 2.50 were adopted for making judgements regarding the research questions, while the hypothesis was tested using chi-square statistics with cross-tabulation.

Findings

The state university libraries in the studied region are extremely lagging behind their federal counterpart in terms of emergency preparedness, judging by the availability of emergency response plan (ERPs). However, documenting the plans for routine emergency response is not widespread among the university libraries; thus, the extent of response preparedness is both simplistic and doubtful. Despite the seemingly proactive nature of the federal university libraries over their state counterpart, librarians in both settings do not perceive effectiveness and preference in either the written emergency response plan (WERP) or unwritten emergency response plan (UERP) as an emergency preparedness and control measure.

Originality/value

The research increases knowledge of emergency preparedness in university libraries beyond the mere availability of ERPs. Through a comparative empirical analysis, the desirability of the WERP as a measure of emergency response preparedness in university libraries has been strengthened.
