<p>1966 Idea for a boolean taxonomic database described in, <i>A General Method of Taxonomic Description for a Computed Similarity Measure</i>, by developers of TAXIR</p>	<p>1969 "The Theory of the TAXIR Accessioner" published by George Estabrook</p>	<p>1975 University of Michigan Herbarium collection databased in TAXIR</p>	<p>1980-1990 Personal computer systems began to replace mainframe operating systems, making programs like TAXIR obsolete</p>		<p>1988 University of Michigan Herbarium collection migrated out of TAXIR</p>											<p>TAXIR</p>		
<p>Database curation to support future collection migration</p> <p>Through the "Migrating Research Data Collections" project, we are working to better understand and support data collection migration and change over time. We are developing case studies of database migration at a number of memory institutions, first focusing on Natural History Museums (NHMs; Thomer, Rayburn and Tyler, 2020; Thomer, Weber and Twidale 2018).</p> <p>In developing our case studies, we have found that there are surprisingly few published histories of database platforms and software – particularly for domain- or museum-specific platforms. Additionally, documentation of the function and format of legacy systems can be quite hard to find. This has motivated our efforts to reconstruct the development history of the data systems described by our study participants in interviews.</p> <p>The timeline presented on this poster has been developed through review of academic publications (if any) and other documentation of these data systems. Much of this has been found through digital archival research (e.g. the Internet Archive's Wayback Machine). The full dataset, with references, underlying this timeline is available at bit.ly/36vaEoM</p> <p>We are using this resource to contextualize the evolution of the data systems in each of our case studies, and we further hope this work will be of interest to others studying infrastructure development and change.</p>			<p>1980 dBASE hits consumer market, released by Ashton-Tate</p>	<p>1982 dBASE II is launched</p>	<p>1986 dBASE III+ is launched</p> <p>1988 dBASE IV is launched</p>	<p>1989 <i>Ashton-Tate stock falls by 43% in response to dBASE IV</i></p>	<p>1990 Ashton-Tate sues FoxPro for copyright infringement</p> <p>1991 Ashton Tate sold to Borland for \$439 million</p>											<p>2017 dBASE PLUS 11 released</p> 
			<p>1984 Initial design similar to dBASE II. Developed due to gaps in their market.</p>	<p>1985 Fox Software releases Multi-User FoxBase.</p>	<p>1987 Ashton-Tate tries to buy FoxPro.</p>	<p>1990 Ashton-Tate sues FoxPro for copyright infringement</p>	<p>1992 Microsoft merged with Fox Software</p>	<p>1995 FoxPro changes from a procedural language to an object-oriented language</p>	<p>2004 Visual FoxPro 9 is released, the last version of FoxPro.</p>	<p>2007 Company disbands</p>	<p>2015 Last iteration of FoxPro is supported</p>	<p>2020-2025 Planned obsolescence</p> 						
			<p>1985 First version released, originally called Nutshell, and owned by Nashoba</p>	<p>1987 Nashoba declined a Microsoft offer to buy Filemaker</p> <p>1988 Apple purchases Nashoba under their child company Claris International. Was renamed Filemaker</p>	<p>1992 Filemaker versions released for both Macs and Windows</p>	<p>1998 Apple dissolved Claris, which became FileMaker Inc.</p>	<p>2000 Debut of FileMaker Mobile</p>	<p>2011 Continued popularity U.S. public schools, universities and government agencies</p>	<p>2019 Can exchange data with SQL databases. Has functions for JSON and API requests.</p>									
			<p>Mid 1980's Project Omega was developed and a precursor to Microsoft Access. Not as efficient as dBASE, so not very successful</p>			<p>1992 First version released. First major relational database program for Windows.</p>	<p>1995 Microsoft Access 7.0 became part of the Microsoft Office Professional Suite</p>	<p>1997 Microsoft Access increased the maximum database size to 2GB from 1GB</p>	<p>2007 MS Access rolls out a new feature allowing it to connect to SharePoint</p>	<p>2018 Access 2019 is scheduled to be released as part of Office 2019 suite.</p>								
			<p>Late 1970's The University of Melbourne, the National Museum of Victoria and the Australian Museum, work to develop an electronic system for museums</p>			<p>1994 MySQL was created by a Swedish company, MySQL AB</p>	<p>1995 First code for My SQL is released</p> <p>1996 Version 3.19 is released</p>	<p>1998 Windows version released for Windows 95</p>	<p>2008 Sun Microsystems acquired MySQL AB for \$1 billion</p>	<p>2010 Oracle acquired Sun Microsystems</p>	<p>2018 Version 8.0 Released. Supported until April 2026</p>							
			<p>Late 1970's The University of Melbourne, the National Museum of Victoria and the Australian Museum, work to develop an electronic system for museums</p>			<p>1996 Website was created. Titan had evolved into KE Textpress. Their main database is KE Textpress</p>	<p>1998 KE Software website includes information on why KE Textpress is better than MS Access, Oracle, Alta Vista, and Folio Views</p>	<p>1999 Ke Software is willing to provide assistance for the "Year 2000" problem</p>	<p>2007 Growing adoption of KE Emu by a wide variety of organizations: museums, art galleries, historical societies, libraries, universities and colleges, corporations, botanical gardens and herbaria.</p>	<p>2014 KE EMu purchased by Axiell, Swedish company</p>	<p>2019 KE Emu currently hosts 200 sites in 13 countries</p>							

Trends and observations

Surprisingly, the oldest database mentioned by our participants was not a commercial platform, but rather, was TAXIR, an information system developed to share taxonomic descriptions. TAXIR was developed in the 1960s – a full two decades before the launch of any of the other systems. This underscores our previous observation that NHMs were quite early adopters – and indeed, innovators – in database technology and information systems.

Most of the NHM-specific databases were initially funded by the National Science Foundation. Additionally, several grew out of the same research groups and grants; for instance, both Muse and TAXIR were developed by researchers at the University of Michigan, one of whom went on to build Specify at the University of Kansas. We hope to build on this observation to further explore the evolution of the biodiversity informatics community as a subset of the NHM community in future work.

In general, the commercial databases were less well documented than the NHM-specific databases. Where we found documentation for commercial systems in the form of technical specifications and archived websites, the NHM-specific platforms are typically documented through grant proposals, user manuals, and academic publications. In both cases, there is a clear need for more systematic archival of documents describing these platforms' evolution and technical specifications.

Few of the defunct platforms we surveyed reached their "end of life" in a particularly intentional way; rather, they simply went out of business with little warning. Memory institutions must take heed of this legacy, and be sure to plan for their collections management platforms' demise, as well as adoption.

<p>1999-2002 3-year NSF grant awarded to Specify to create tools that assist in research analysis and synthesis of natural history collections</p> <p>1999 Specify 1.0 is available</p>	<p>2002-2005 NSF awards Specify another 3-year grant for \$860,181.00. It is stated in the proposal that the software used by 55 collections.</p> <p>2000-2003 Specify awarded another 3-year NSF Grant for \$897,508.00 to keep Specify current with commercial software components</p>	<p>2005-2010 Software supports 112 biological research collections. Awarded a 5-year NSF grant for \$2,085,906.00.</p>	<p>2010-2016 Awarded a 6-year NSF grant for \$1,858,718. Supports 189 U.S. collections located at 90 institutions.</p> <p>2016 Software is used by 284 U.S. research collections to digitize, manage and publish specimen holdings data.</p>	<p>2016-2019 Awarded a 3-year NSF grant to derive and implement a business model to financially support its core software engineering and technical support activities.</p> <p>2019 Specify still open source, now managed by a consortium that charges for collection management</p>	
<p>1999-2003 NSF Awards Arizona State University a 3-year grant for Networking our Research Legacy; Infrastructure to Document, manage, and Access Ecological Data.</p>	<p>2008-2012 Arizona State University awarded a 3-year grant to develop a computer-based identification system for plants and animals.</p>	<p>2009 Idea of Symbiota presented at various biological conferences nationally</p>	<p>2013-2017 Symbiota adds a variety of modules to their platform, making it much more suitable to the needs of their community</p>	<p>2018-2021 NSF awards Symbiota a 3-year grant for \$283,231.00 to assist in the development of Symbiota2</p> <p>2018 NSF funding for Specify ends</p>
