I. BACKGROUND

Santo Domingo

Nicaragua

Ozama River Eutrophication

Salinity: 3-10 PSU

Turbidity : up to 30 NTU

Phosphorus: > 0.1 mg/L

<u>Chlorophyll-a</u>: ~30 μ g/L, up to 75 μ g/L

Dissolved oxygen: ~6 mg/L, down to 0.29 mg/L

Results from 2011, https://conference.ifas.ufl.edu/EMECS9/Presentations/Wednesday/Salon%209-10/am/0835%20E%20Mino.pdf 6

Project Grant

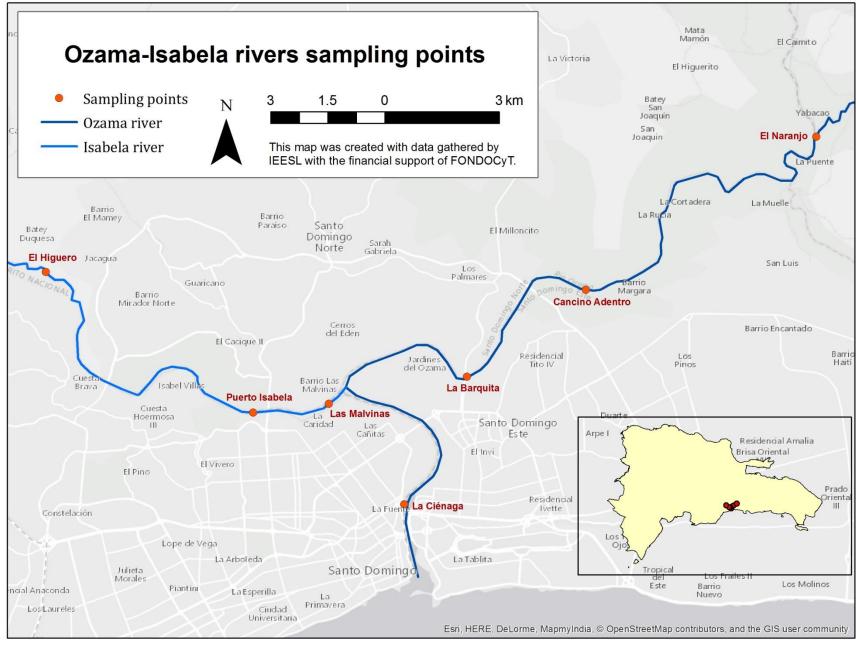

Use of Standardized Mix Inoculum in the Anaerobic Digestion of the Invasive Water Hyacinth from Ozama river for Biogas and Fertilizer Production.

This research is financially supported by the National Research Fund for Science, Technology, and Innovation [FONDOCYT 2015-2A3-123] of the Dominican Republic Ministry of Higher Education, Science and Technology (MESCYT).

II. Biomethanation of Water Hyacinth from Fresh and Brackish Waters as a Post Weed Management Practice

Castro, Y.A., Agblevor, F.A. Biomethanation of invasive water hyacinth from eutrophic waters as a post weed management practice in the Dominican Republic: a developing country. *Environ Sci Pollut Res* (2020). https://doi.org/10.1007/s11356-020-07927-w

Sampling points

La Ciénaga (brackish water)

- 1.5 km North of Caribbean Sea
- TDS ~ 1000 35,000 ppm
- High populated area
- Settlements on the riverbank

El Naranjo (freshwater)

- 23.14 km North of Caribbean sea
- Salinity barrier between
 Caribbean sea and the site
- TDS below 1000 ppm
- Low populated rural area

Objectives

- To determine the characteristics and biomethanation kinetics of water hyacinth from brackish and fresh waters within Ozama river.
- To compare the energy required for harvesting with the energy produced during anaerobic digestion of this weed.

Water quality

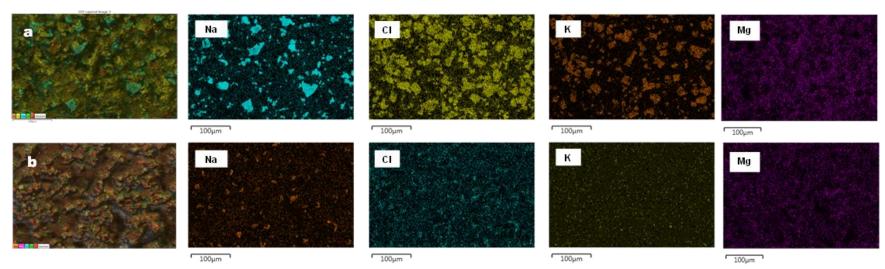

<u>Method</u>: Water quality indicators were measured in situ during harvesting using a YSI DSSPro (YSI Incorporated).

	La Ciénaga (brackish water)	El Naranjo (freshwater)
Salinity [ppT]	1.23	0.09
Dissolved oxygen [mg/L]	1.37	2.50
Nitrate [mg/L]	11.76	2.6
Total dissolved solids [mg/L]	1550	122

Salt Accumulation

<u>Method</u>: Ethanol extractives of water hyacinth from **a**) La Ciénaga and **b**) El Naranjo were analyzed with SEM-EDX (FEI Quanta FEG 650).

	Map Sum Spectrum (%wt)			
	Cl	К	Na	Mg
La Ciénaga	18.6	9.7	4.1	1.4
El Naranjo	6.6	1.7	1.1	0.7

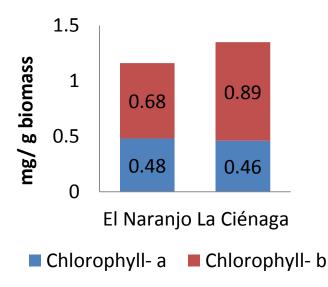

Stress factors and productivity

Total dissolved solids (TDS) are organic solutes and salt ions that could act as stress agents for water hyacinth and be detrimental for anaerobic digestion when they accumulate in the plant biomass [1-6].

Bulk density

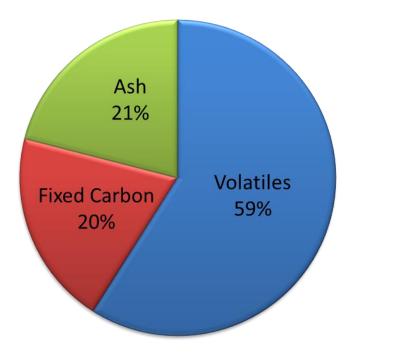

Photosynthetic pigments

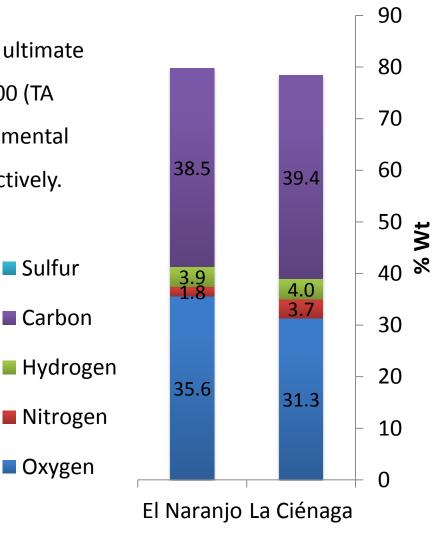

Proximate and Ultimate Analyses

Sulfur

Method: Water hyacinth's proximate and ultimate analyses were conducted using a TGA-Q500 (TA Instruments,) and FLASH 2000 Organic Elemental Analyzer (Thermo Fisher Scientific), respectively.

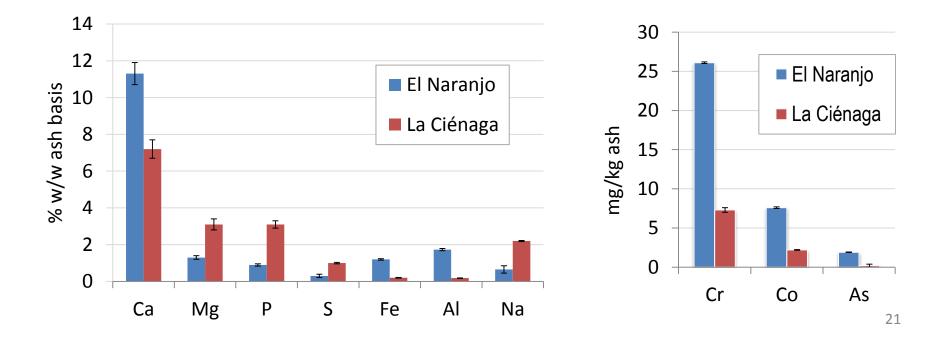

Inorganic Elemental Analysis

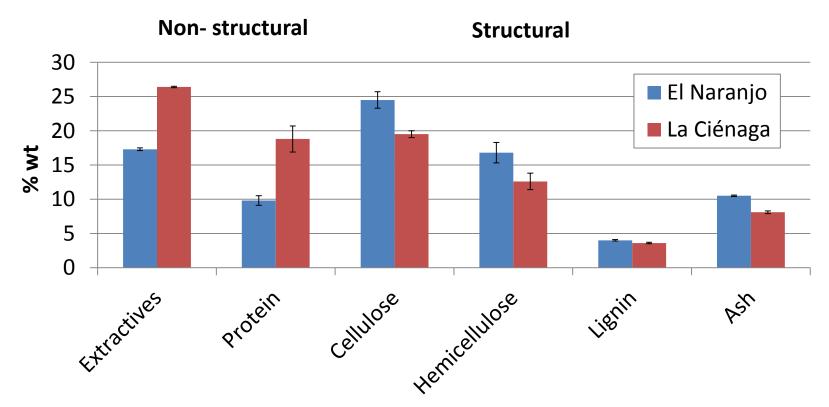

<u>Method</u>: The ash of water hyacinth was digested according to EPA 3050 and analyzed using ICP-AES by Utah State University Analytical lab (USUAL)

Nutrients (% w/w)			Heavy metals (mg/kg)				
K	Mn	Si	Cu	Ni	Мо	Zn	Cd
19.9 ± 2.6	0.25 ± 0.06	1.04 ± 0.3	47.6 ± 8.4	30.9 ± 15.5	4.2 ± 2.4	128.4 ± 21.1	0.22 ± 0.6

Summative Analysis

Water hyacinth's composition was determined following ASTM guidelines (E1756-08, E1690-08, E1755-01, E1758-01 and E1721).

Energy Assessment

Energy consumed

 $E_c = (FC/HR) * HHV_{fuel}$

Energy Produced

 $E_p = BMP * (1000kg/t) * (VS/100) * (TS/100) * HHV_{CH_4}$

	Parameters	Value	Energy (MJ/t biomass)
	FC [L/h]	15	
Consumption	HR [t _{biomass} /h]	10	$E_{c} = 57.9$
	HHV _{Diesel} [MJ/L]	38.6	
Production	BMP _{Mean} [L CH ₄ /kg VS]	399.2	
	HHV _{Methane} [MJ/L]	0.0398	E _p = 846.5
	VS _{Mean} [%]	59.2	

Conclusions

- The brackish water (La Ciénaga) had <u>3 times higher nitrates</u> and <u>phosphorus</u> than freshwater (El Naranjo).
- The <u>higher salt content</u> in the biomass from La Ciénaga did **not affect** the plant productivity (photosynthetic activity , and density).
- The <u>non-structural compounds</u> (extractives and protein) are higher in the biomass from La Ciénaga.
- The **methane yield and production rate are higher**, and the doubling time shorter in the biomethanation of the biomass from <u>La Ciénaga</u>.
- The **energy** from the biodigestion of the Ozama river water hyacinth is <u>more than 10 times</u> that required for harvesting.
