Quality of Information for Quality of Life: Healthcare Big **Data Analytics**

G.G.T. Dantanarayana¹, Tony Sahama², G. N. Wikramanayake³ ¹Department of Computer Science, Faculty of Science, University of Ruhuna, Sri Lanka ²School of Electrical Engineering and Computer Science, Faculty of Science and Engineering, Queensland University of Technology, Australia ³University of Colombo School of Computing, Sri Lanka

Motivation

Big data analysis in healthcare sector is still in its early stages when comparing with that of other business sectors due to numerous reasons.

- Accommodating the volume, velocity and variety of healthcare data
- Identifying platforms that examine data from multiple sources, such as clinical records, genomic data, financial systems, and administrative systems

Electronic Health Record (EHR) is a key information resource for big data analysis and is also composed of varied co-created values.

Successful integration and crossing of different subfields of healthcare data such as biomedical informatics and health informatics could lead to huge improvement for the end users of the health care system, i.e. the patients.

Arguments and Findings

- The healthcare information sources and their transmission will be examined while quality Healthcare data analytics is implemented.
- This will facilitate the information flow from a public to professional view while the Information exchange measures are implemented.
- The research will specify how EHR could be adopted to meet the requirements of being a key information source for big data analysis.

Objective

systematic healthcare data Propose analytic а approach to investigate potential approaches or analytic tools appropriate for analysing healthcare big data focusing on EHR in order to provide quality information to improve the quality of life for patients.
