

Cellular Screening in 2D and 3D

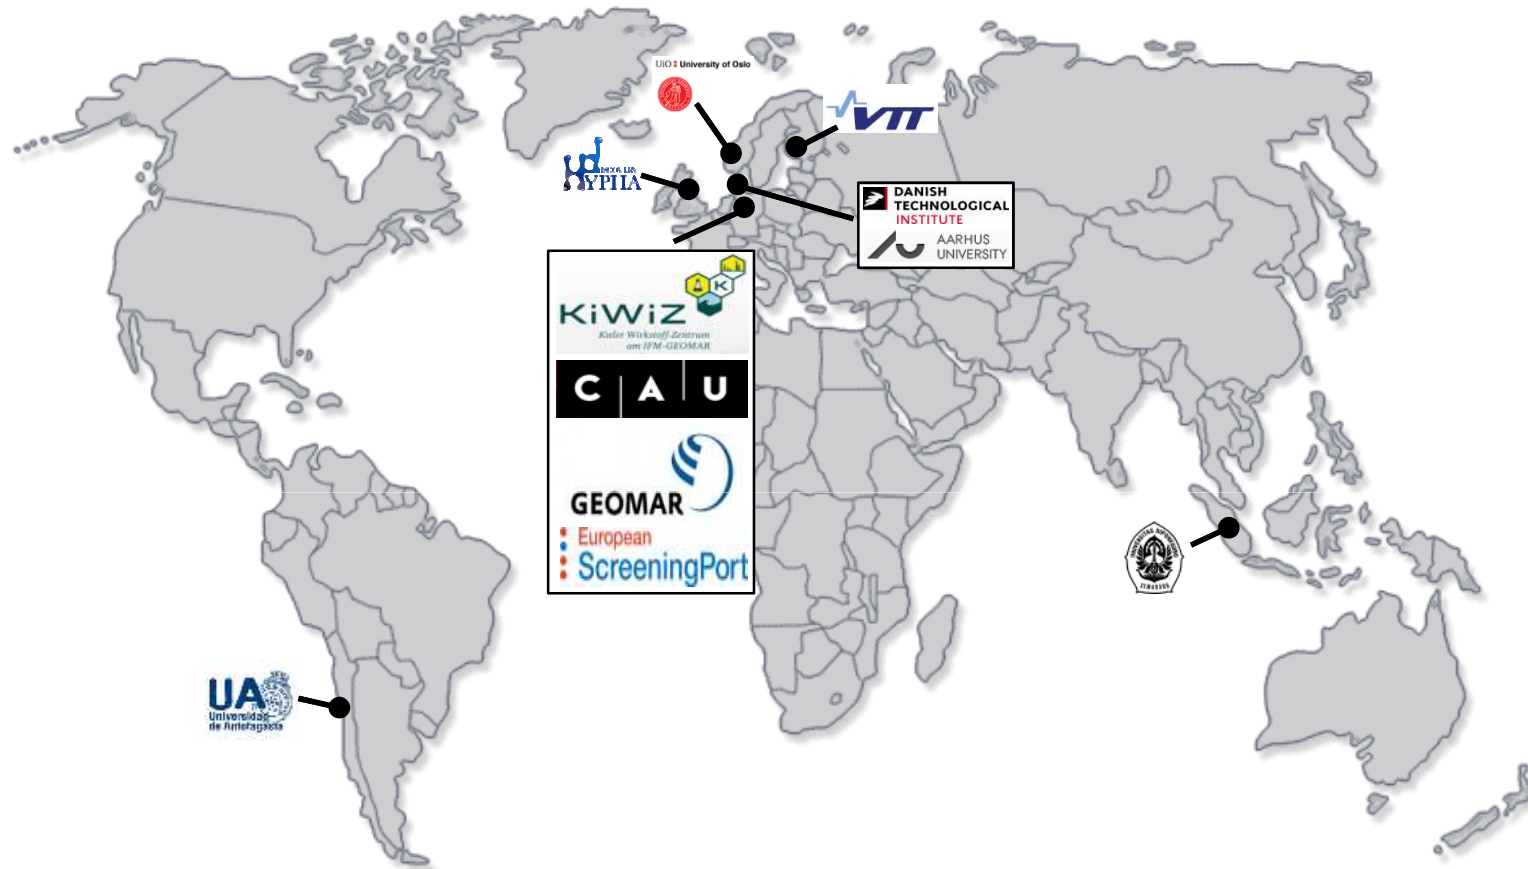

—

*Identification of cancer specific
modulators*

ELRIG.de, March 2013

Introduction

- International FP7 program
- Aim is the identification of novel compounds with anti-cancer properties from marine fungi
- Work packages include: isolation, fermentation and screening of marine fungi extracts and compounds

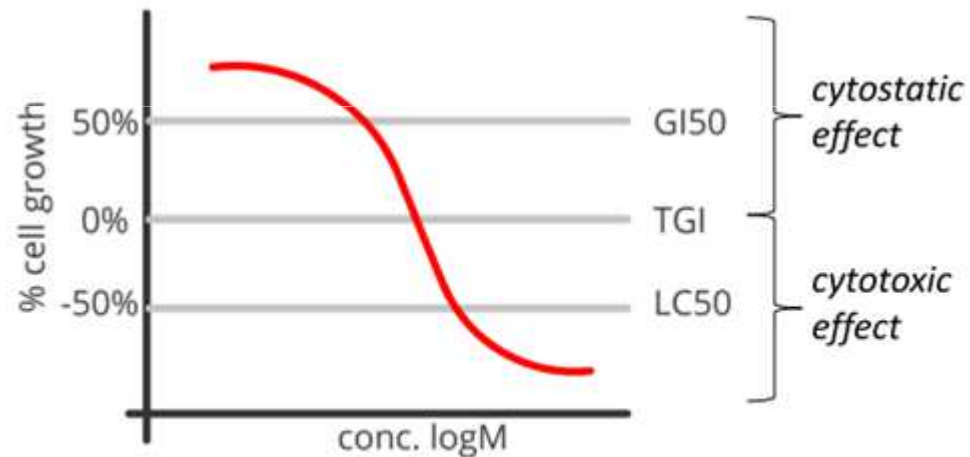

Marine natural products

Source	Extracts	Organisms	No. hits	Hit Rate (%)
Mediterranean sponge fungi	754	206	78	10.3
Chilean macro-algal fungi	125	125	48	38.4
Indonesian coral fungi	331	105	47	16.5
Totals	1210	436	173	14.3

- Hypha Discoveries Stimulation Fermentation technology gave rise to 1210 crude extracts from 600 fungal strains
- Bioactivity guided fractionation was used to identify individual active fractions.
- 78 pure (> 80% by weight) active natural product compounds were then obtained following strain re-fermentation, induction, isolation and purification.
- Compound structures were elucidated using NMR

Assay principle

- Recording of cytotoxicity profiles of the fungal extracts and compounds
- Obtain GI50, TGI and LC50 in the whole NCI 60 panel

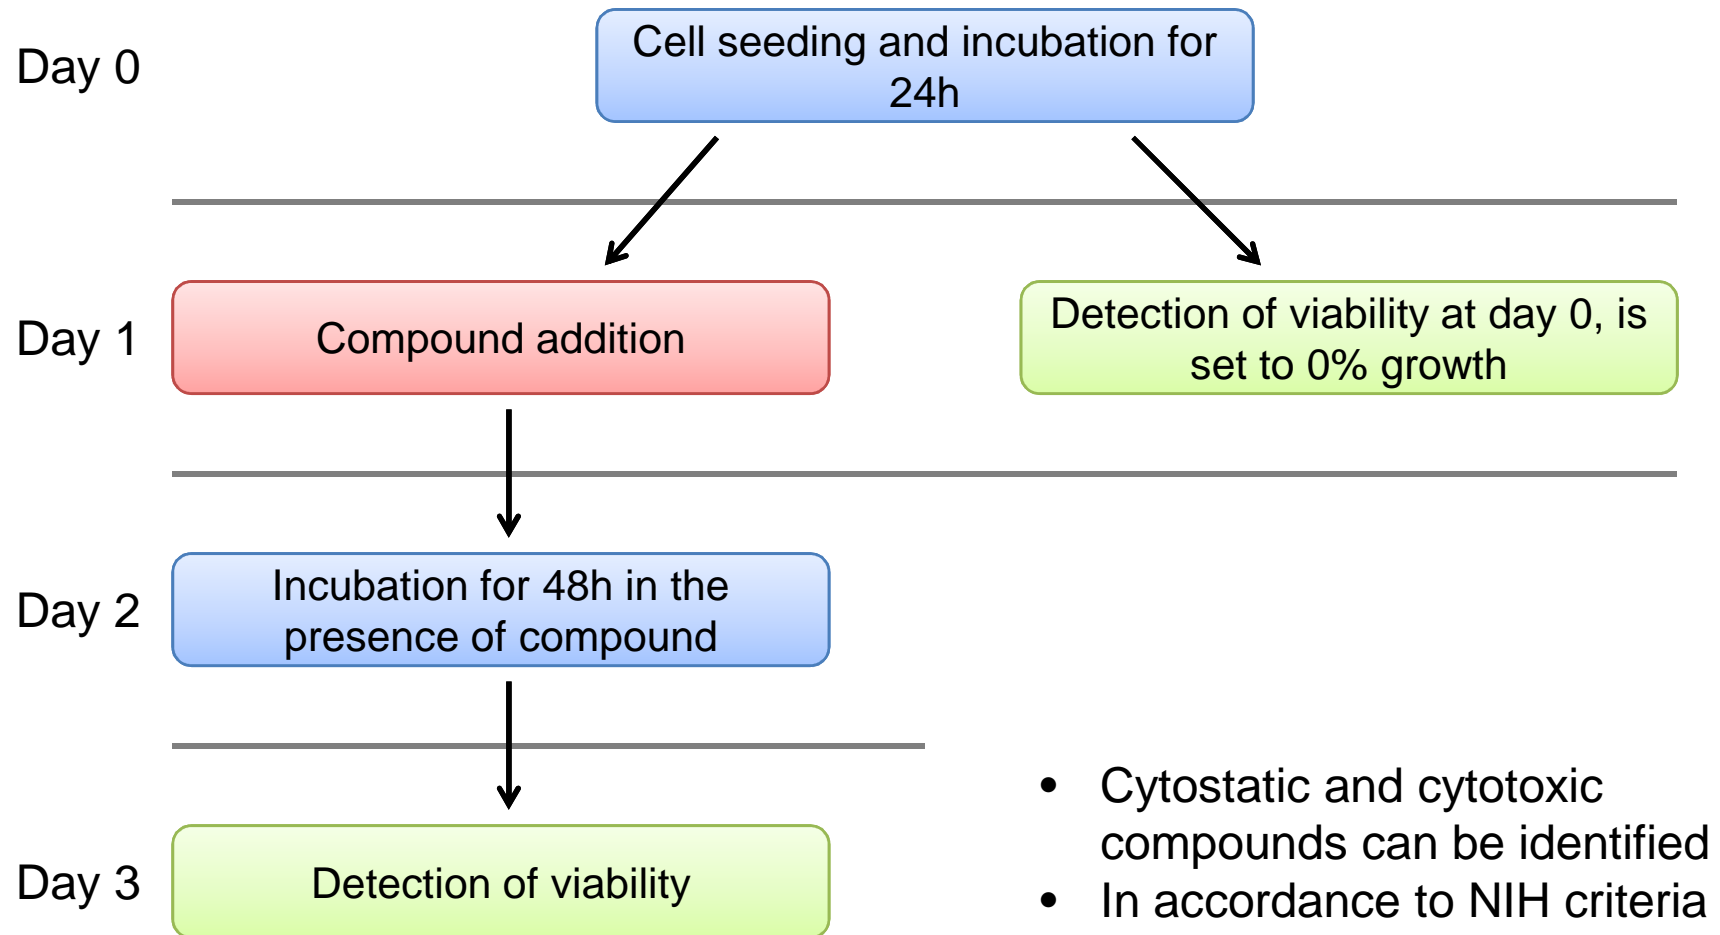

Concentration at:

- 50% cell growth = GI50
- 0% cell growth = TGI
- -50% cell growth = LC50

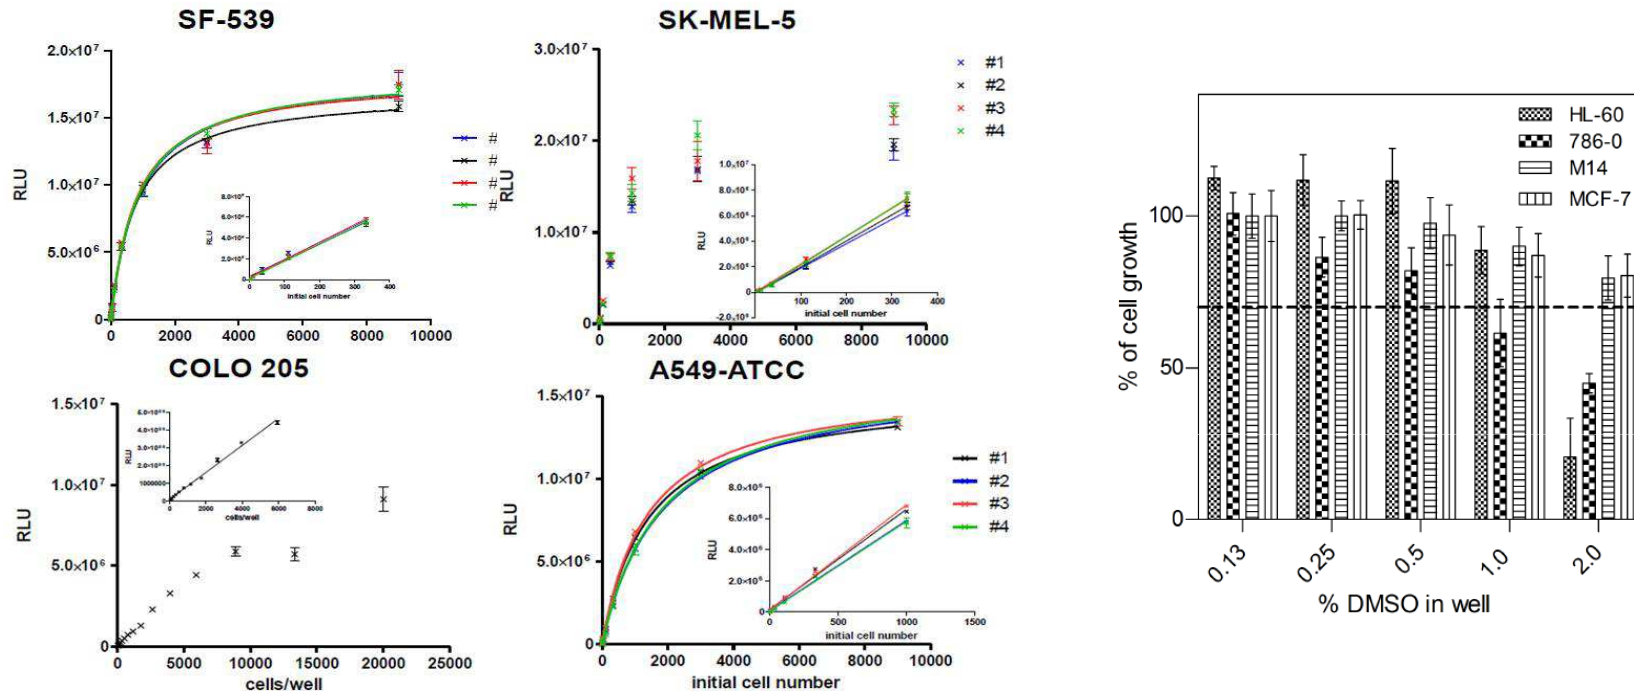

Tissue origin	No. of cell lines
Leukemia	6
Non-Small Cell Lung	9
Colon	7
CNS	6
Melanoma	9
Ovarian	7
Renal	8
Prostate	2
Breast	6

NCI 60 panel

Measurement procedure

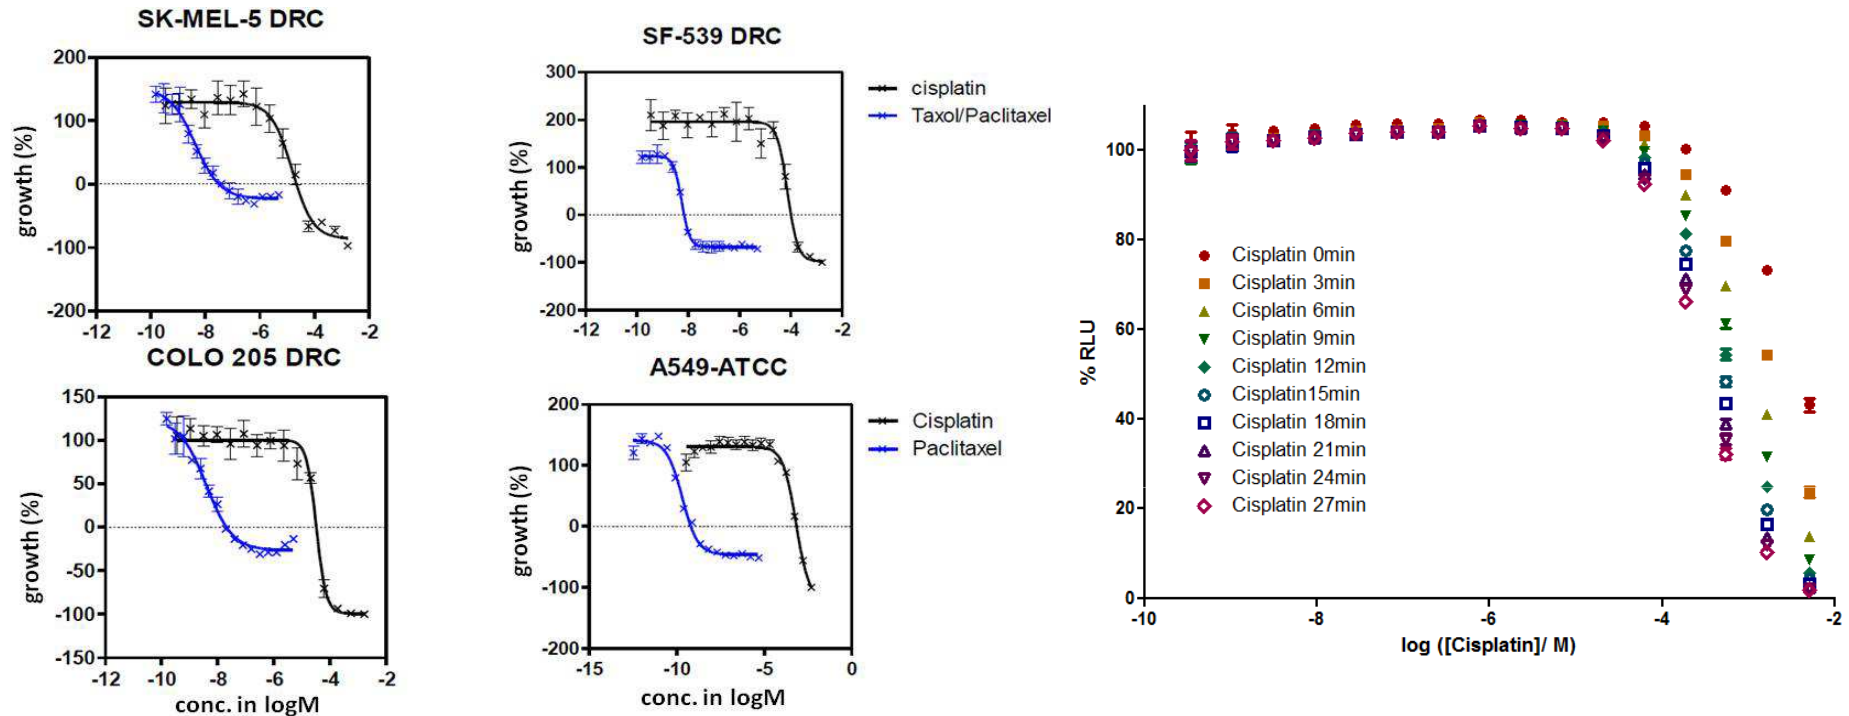

Assay development

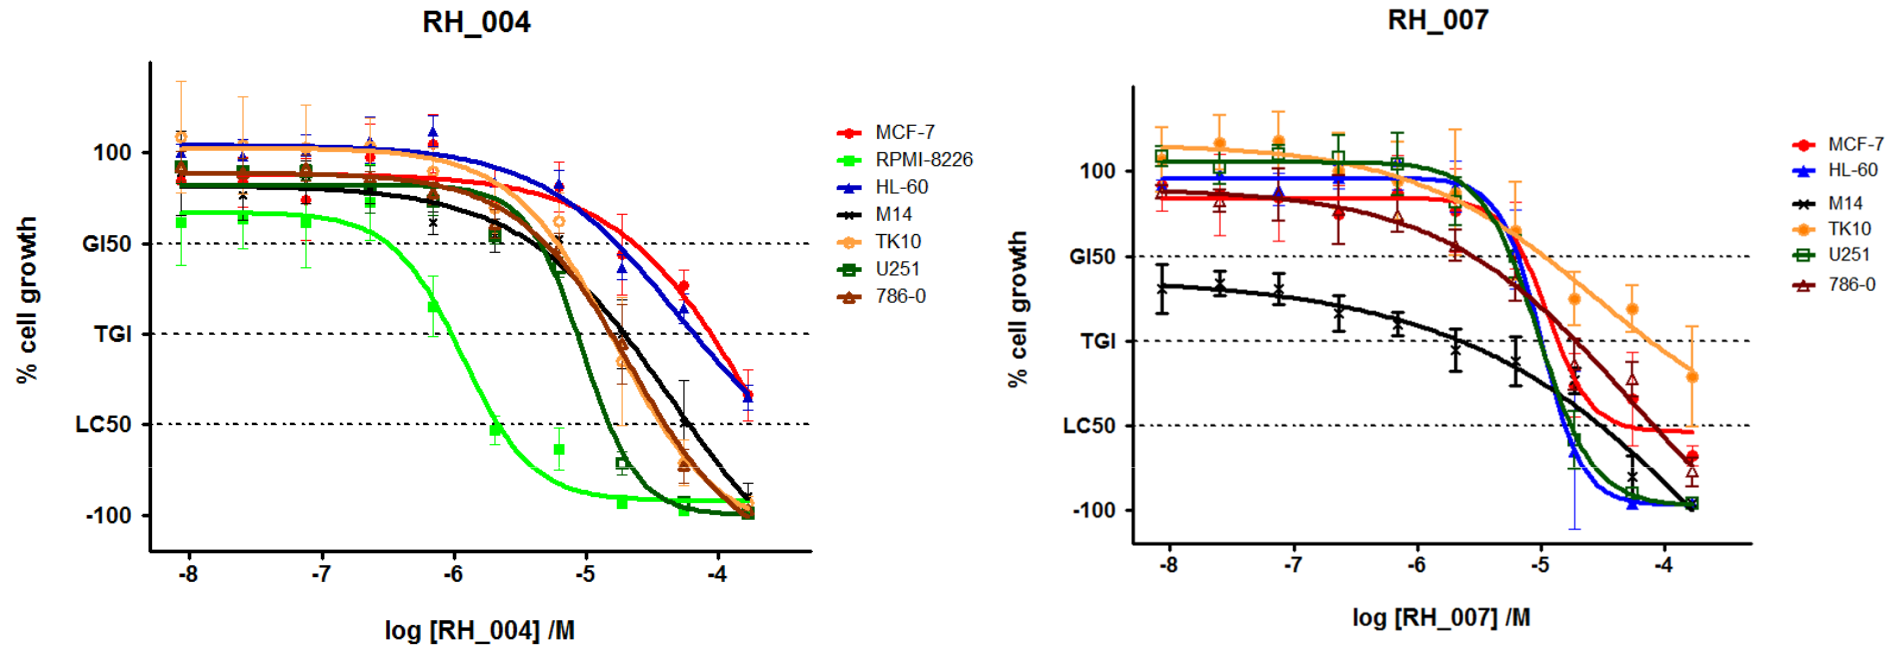

- RPMI1640 supplemented with 10% FCS and 2mM L-Glutamine
- doubling time between 18 and 80h
- NCI assay protocol includes 96 well plates, 200 μ l assay volume and a staining protocol
- current protocol includes 384 well plates, 25 μ l assay volume and ATP determination using CellTiter-Glo (Promega)

Assay development

- Assay development includes: cell titration, DMSO tolerance and standard compounds (Cisplatin, Paclitaxel, 6-Mercaptopurine, Staurosporine)
- Luciferase counter assay has to be performed for all tested compounds
- Cisplatin inhibits luciferase at a concentration of $100\mu\text{M}$

Physiological relevance of NCI60 panel – kinase inhibitors

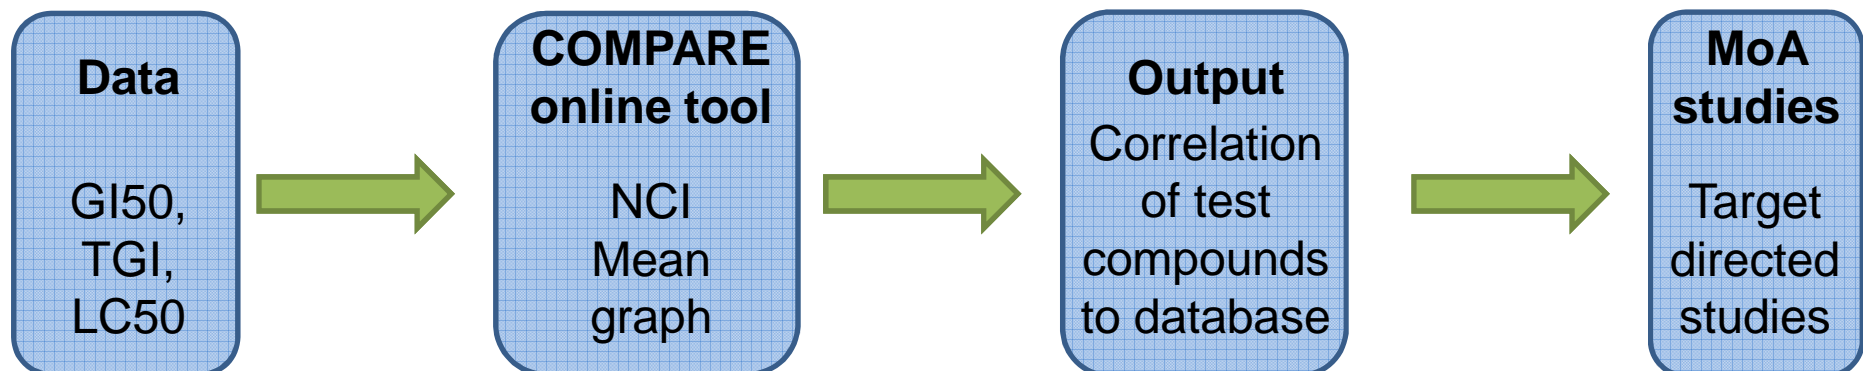

- RH004 selective kinase inhibitor against VEGFR2
- RPMI-8226 cells do express VEGFR2
- RH007 selective kinase inhibitor against V600E BRAF-mutation
- only the M14 cell lines has this mutation

Physiological relevance of NCI60 panel – COMPARE algorithm

- Mean values and deviation from the means has to be calculated
- All data have to be transformed to be uploaded to the NCI COMPARE database
- Output is a likelihood analysis of similar compounds and involved pathways
- Data is shared within the consortia by an encrypted web portal

NCI mean graph analysis

Physiological relevance of NCI60 panel – COMPARE algorithm

Rank	Compound	Common cell lines	Description of mode of action
1	glycoxalic acid	30	natural exfoliant
2	asaley	25	alkylates and crosslinks DNA
3	methyl-CCNU	29	alkylates and crosslinks DNA
4	AZQ	28	alkylates and crosslinks DNA
5	cisplatin	30	crosslinks DNA

- Cisplatin data from 30 cell lines were used to perform a COMPARE analysis
- Cisplatin was found within the top 5
- 18 of the top25 alkylate or crosslink DNA

Automatisation of the cell culture processes

SF-593

A549-ATCC

M14

786-0

The bead – the core of the technology

scheme of a bead

Brand name	Specification
GEM	Dextran beads with iron particles for magnetic separation
Cytodex 1	Dextran beads with positive-charged DEAE groups throughout matrix
Cytodex 3	Dextran beads coated with denatured porcine-skin collagen bound to surface.

Cell line	Tissue type	Bead type
M14	Melanoma	Cytodex 3
786-0	Renal	GEM or Cytodex 1
A549/ATCC	Non-Small Cell Lung	Cytodex 1
SF-539	CNS	Cytodex 1

Optimisation – cell number

cell seeding
 1×10^6 cells in
25 ml media

- Doubling times between 18 to 80 hours
- Bead coating is also critical for growth

Optimisation – counting

Measurement
by Millipore
Scepter

- Direct addition of trypsin to the beads not possible
- Dextranase has to be removed before trypsin addition

Optimisation – known drugs

- 4 known compounds used for comparison of 2D and 3D
- Reference compounds for HTS screening

Data from 3D experiment using A549-ATCC

			GI50	TGI	LC50
Cisplatin	M14	2D	10	15.00	20
		3D	22	30.81	42
	A549-ATCC	2D	31	42.85	60
		3D	13	20.45	34
Paclitaxel	M14	2D	0.2	0.4	0.8
		3D	NA	0.7	2
	A549-ATCC	2D	0.06	0.1	NA
		3D	NA	0.3	0.9

Fold difference

1 – 1.5

1.5 – 2.5

> 2.5

Screening in 2D and 3D

- 241 compounds of marine origin were screened in 2D and 3D
- $R^2 = 0.95$
- 50 μM compound concentration, single point
- Known drug: 5 mM cisplatin

Dose-Response curves

- 56 dose response curves where recorded
- No significant differences are observed
- 3D data confirm 2D experiments

Difference in percent

- 0 – 5
- 5 - 10
- > 10

	3D – GI50	2D – GI50		3D – TGI	2D – TGI		3D – LC50	2D – LC50
compound 1	62.4	69.1		80.6	86.6		93.8	100.6
compound 2	74.5	97.4		87.2	98.7		96.8	99.7
compound 3	85.8	87.5		92.8	93.3		97.3	97.3
compound 4	28.4	22		59.5	52.9		107.5	99.6
compound 5	86.7	88.3		98	98.6		111.3	105.9
compound 6	84.9	69		92.8	86.8		97.7	101.5
compound 7	88.2	71.2		96.3	89.7		100.9	114.9
compound 8	64.2	56.7		84.8	80.6		100.6	99.8
compound 9	83.1	84.8		89.8	91.2		95.1	95.9
compound 10	89	85		97.9	95		103.4	101.4
compound 11	100.5	93		109.5	107.1		115.1	115.1
compound 12	97.2	94.4		101.9	105.8		105.1	113.2

All data in µM

Automatisation of the measurement processes

Confluence analysis using Cell Metric

- A549-ATCC cell line shown
- analysis done by Cell Metric from Solentim
- non-invasive measurement enables the recurrent analysis of a single plate
- no additional day 0 plate necessary

Confluence and viability analysis

brightfield

whole cell analysis

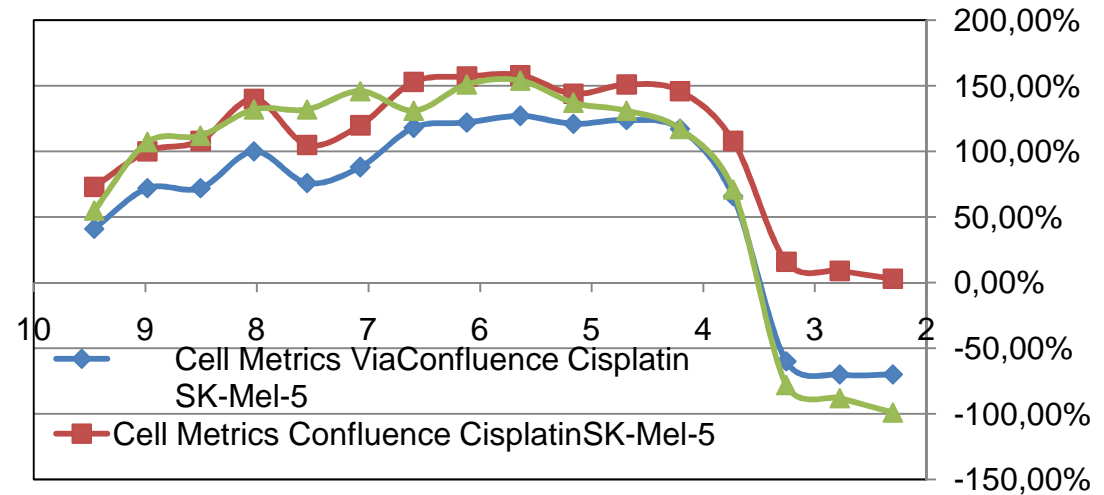

live/dead analysis

composite image

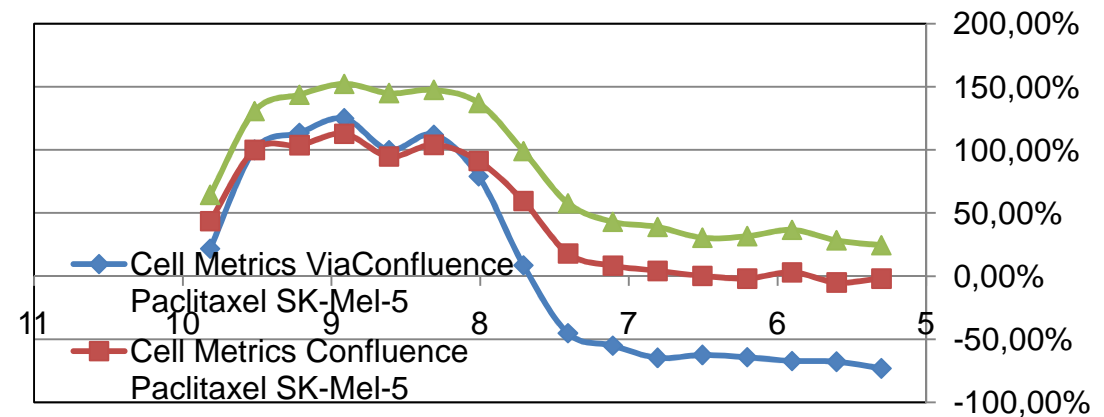

- Two measurements necessary for live/dead analysis
- Fast confluence analysis, image stacks to identify dead cells (diffraction index and roundness)
- 5 min per plate

Analysis of standard compounds

Cisplatin analysis

- SK-MEL5 cell line shown
- Viability analysis performs superior over confluence analysis
- good comparison in the case Cisplatin
- discrepancies in the case of Paclitaxel/Taxol

Paclitaxel analysis
