Cruise Report RV POSEIDON Cruise P468

Portimão – Bari
03. April – 28. April 2014
Chief Scientist: Dagmar Hainbucher

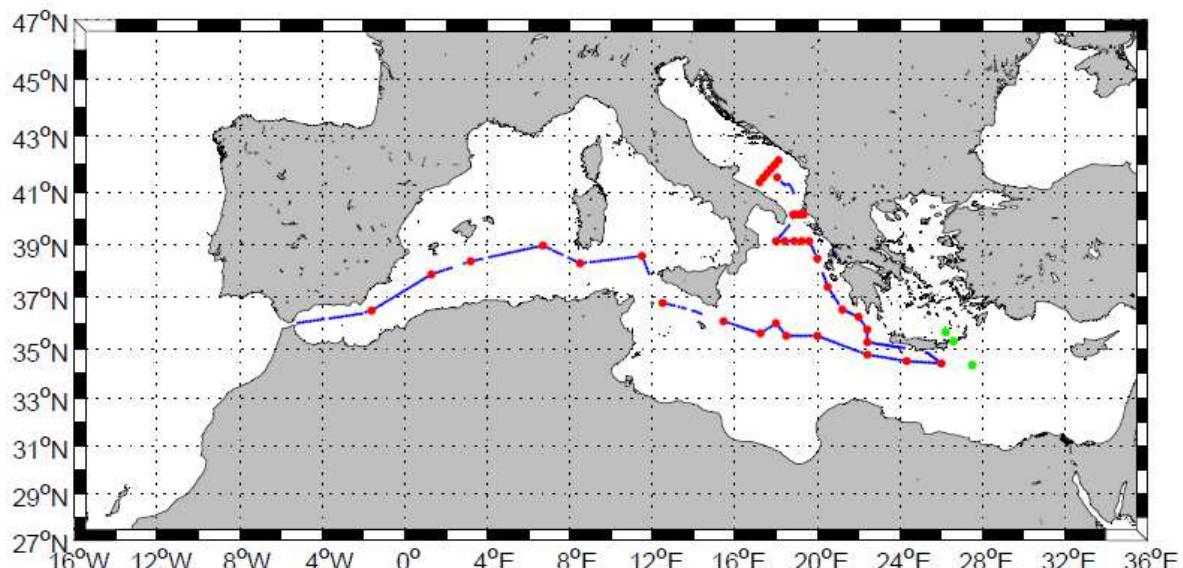

Fig. 1: Ship track of RV POSEIDON cruise P468 from Portimão to Bari. Red dots: CTD stations Green dots: cancelled CTD stations. Blue dots: U-CTD stations

1. Objectives

The purpose of the cruise was to investigate two hydrographic processes in the Mediterranean Sea:

- To determine long term variations of the Levantine Intermediate Water (LIW), the salinity of which not only influences the global circulation of the Mediterranean Sea but also contributes to the salinity distribution of the northern Atlantic in intermediate depths up to the coast of America.
- To investigate the deep water masses of the Eastern Mediterranean Sea. In the Eastern Mediterranean Sea drastic changes in the hydrography and circulation occurred during the last decades, which were known as the Eastern Mediterranean Transient (EMT). In particular, one prominent oceanic phenomenon related to the EMT was the shift of deep water formation from the Adriatic Sea to the Aegean Sea.

The impacts of the EMT are still noticeable and result in an ongoing changing thermohaline circulation.

To investigate these two issues, a high resolved east-west transection through the Mediterranean Sea was carried out within the upper 800m of the water column with an Underway-CTD. On special positions, already repeatedly sampled on other cruises, CTD/IADCP profiles down to the bottom were accomplished. By repeating measurements at special positions it is possible to investigate the long term temporal development of the different physical variables.

3. Narrative

Thursday, 3rd April

Noon position: 36° 51.05' N, 008° 11.82' W, 1010 hPa, WNW 5, cloudy, T_{air} 13.5° C

At 8:00 a.m. local time all scientists got a safety instruction before the ship left Portimão port at 9:00 a.m. At 10:20 a.m. everybody on the ship had to take part in a safety exercise. Until early afternoon the scientists continued to install the equipment. In the late afternoon they were instructed in the use of the U-CTD system. Additionally, they had to learn how to make the appropriate splices to connect the U-CTD with the rope on the winch. In the night ADCP and thermostalinograph which were already working since we had been out of the 3 nm zone of Portugal were switched off due to missing permissions for Moroccan waters.

Friday, 4th April

Noon position: 36° 0.83' N, 004° 35.76' W, 1021 hPa, WNW 6, blue, T_{air} 14.6° C

In the very early morning we sailed through the Strait of Gibraltar and entered the Mediterranean Sea, our actual area of interest. We started with our first U-CTD cast at 06:15 a.m. (UTC) on 36° 0.67' N and 5° 11.19' W, a bit east of Gibraltar. The time interval of the U-CTD casts was decided to be hourly. We did not spool rope additionally on the spindle of the probe, so we reached only depths less than 290 m while the ship was sailing with 6 knots, the speed we decided to keep in order to obtain a high resolved section through the Mediterranean Sea. The depths were presumably less than expected because of the strong currents in this area. The further we sailed away from the Strait of Gibraltar the deeper the maximum depths of our U-CTD casts became. Additional spooling led to depths of about 570 m. In between our U-CTD casts we still continued with the installation and testing of our CTD and lADCP. ADCP and thermostalinograph were also running.

Fritjof, our student, who participated for the first time in a scientific cruise, celebrated his birthday.

Saturday, 5th April

Noon position: 36° 28.78' N, 001° 41.02' W, 1020 hPa, WSW 5, blue, T_{air} 15.0° C

A smaller damage on the cable of the power supply of the U-CTD made a repair necessary and one U-CTD station had to be skipped. During our hourly U-CTD work we realized that the rope was always slightly damaged at the place where it is connected with the probe. This was caused by very thin scrapes on the head of the spindle. We removed the scrapes and the problem did not arise again.

We ran our first CTD cast on this cruise at around 12:00 p.m. (UTC) on 36° 30' N and 1° 36.' W. Depth of the station was about 1500m. The CTD worked well. Additionally, we started our on-board analysis of the data.

Sunday, 6th April

Noon position 37°33.51' N, 000° 35.27' E, 1000 hPa, light, blue, T_{air} 16.1° C

We continued with hourly U-CTD casts. During the casts dolphins and turtles were sighted. Besides the fact that this is always a nice view we feared for our U-CTD because the animals can damage our rope. Our second CTD was carried out at 5:00 p.m. (UTC) without any problems. We realized that the depth of the echo sounder of the ship and the depth given by the CTD differ by around 50m in a depth of 2500m.

Monday, 7th April

Noon position 38° 20.85' N, 003° 00.00' E, 1022 hPa, SE 2, foggy, T_{air} 14.6° C

Bad luck in the morning! At our 5:15 a.m. (UTC) U-CTD cast we lost one of our three probes. We do not know why. The rope just ruptured somewhere in the middle. Exhaustion of

the rope or other outer influences like refuse in the water might be responsible. It was definitely no mistake in the handling of the winch and rope. We continued sailing while we replaced the broken rope on the winch. At 9:15 we started again with our U-CTD casts. During the night one of our probes did not acquire data twice, it seemed that it did not get enough power supply due to a broken recharger.

At around 12 p.m. we run another CTD cast.

Tuesday, 8th April

Noon position: 38° 49.33' N, 005° 39.52' E, 1023 hPa, SSE 3, blue, T_{air} 15.3° C

We continued with hourly U-CTD casts without any problems. In the afternoon a CTD station was carried out.

Wednesday, 9th April

Noon position: 38° 27.48' N, 008° 08.42' E, 1022 hPa, NW 4, blue, T_{air} 15.6° C

Again we got problems with our U-CTD in the morning. We run the cast with additional rope on the spindle (about 500m). This rope was not rewound correctly and knawels, partly big as a fist, were built. At the end we were lucky not to lose another probe but we had to recover the rope manually and to cut it by about 500m. After this incident we decided a new procedure for the U-CTD casts: The ship reduces speed to about 2-3 knots. During slow speed we let the probe fall for a maximum of 480 sec. The ship can gain speed again to our schedule speed of 6 knots during recovering. This way we reached minimum depths of about 500 and maximum depth of about 800 m.

In the afternoon another CTD station was carried out.

Thursday, 10th April

Noon position: 38° 32.65' N, 010° 53.87' E, 1020 hPa, NNE 2, blue, T_{air} 15.4° C

Luckily we had no problems with our U-CTD today, a turtle almost crashed into the probe. We managed to repair our second winch.

In the afternoon another CTD station followed. We got some difficulties with taking oxygen samples due to a broken dispensette. But this problem was solved quickly. During a CTD station we observed a very bizarre event: A big ocean sunfish was swimming at the water surface and a sea gull was resting on the fish.

In the night we reached the Strait of Sicily. U-CTD measurements had to be interrupted due to too shallow water depths.

Friday, 11th April

Noon position: 36° 46.04' N, 012° 39.37' E, 1020 hPa, S 2, blue/cloudy, T_{air} 15.2° C

At 8:00 a.m. (UCT) we ran a shallow CTD cast in the Strait of Sicily. We restarted the U-CTD casts but we had still to be careful because of the shallow water depths. Some casts had to be skipped.

Saturday, 12th April

Noon position: 36° 04.73' N, 015° 27.07' E, 1020 hPa, SSW 2, cloudy, T_{air} 16.7° C

During the night and in the morning U-CTD casts ran restricted due to shallow water depths. In the morning we run another CTD cast in the Strait of Sicily. We realized that our 1ADCP master respectively slave was announced wrong by the configuration files. We changed that.

Sunday, 13th April

Noon position: 35° 48.53' N, 017° 38.49' E, 1016 hPa, SSE 4, o, T_{air} 16.1° C

Today nothing to report from the U-CTD besides that some meat presumably of a fish was caught at the rope.

Oxygen sensors and the altimeter were not working well during the last CTD cast in the night. We solved this problem by cleaning the sensors and fixing the cables. Additionally, we installed a mechanical bottom detector at the CTD. We run a second CTD in the afternoon and the instrument was again working well.

In the early morning (06:33 UTC) we deployed the first of three ARGO floats at $35^{\circ} 36.02' N$ and $17^{\circ} 14.92' E$ directly after the CTD station.

Monday, 14th April

Noon position: $35^{\circ} 30.00' N$, $019^{\circ} 18.34' E$, 1016 hPa , NE 5, cloudy $T_{air} 16.4^{\circ} C$

Everything was going well. In the evening the chief scientist gave a lecture about the objectives of the cruise.

Tuesday 15th April

Noon position $34^{\circ} 57.81' N$, $021^{\circ} 43.89' E$, 1016 hPa , NNW 4, cloudy, $T_{air} 16.5^{\circ} C$

The U-CTD ran without any problems. Meanwhile there was a small competition between the shifts about who achieves the deepest depths. In the afternoon we carried out a CTD station and afterwards we deployed the second of the ARGO floats at 17:35 (UTC) on $34^{\circ} 45.01' N$ and $22^{\circ} 25.00' E$.

Wednesday 16th April

Noon position $34^{\circ} 30.57' N$, $024^{\circ} 15.70' E$, 1015 hPa , S 3, cloudy, $T_{air} 17.0^{\circ} C$

All measurements proceeded without any problems.

Unfortunately, we got bad news from the Federal Ministry of Foreign Affairs. Due to political reasons we are not allowed to carry out measurements east of Crete. We are even not allowed to sail through Kasos Strait without taking any measurements. We had to cancel three very important stations (green dots, fig. 1) which we intended to take in this area. The scientific success of the cruise regarding the detection and formation of deep water masses in the Eastern Mediterranean Sea is therefore questionable.

Thursday 17th April

Noon position $34^{\circ} 33.29' N$, $025^{\circ} 46.34' E$, 1009 hPa , SSE 5, cloudy, $T_{air} 17.9^{\circ} C$

In the morning we took our last CTD station before reaching the critical area east of Crete. We were observed closely by a Turkish war ship. At 6:10 a.m. (UTC) we deployed the last Argo Float on $34^{\circ} 24.04' N$ and $26^{\circ} 1.01' E$. Afterwards we set course north-westerly towards Crete still followed by the Turkish war ship. Instead of doing our measurements as planned we now had to turn back and sailed along the southern coast of Crete to the CTD station at $35^{\circ} 15' N$ and $22^{\circ} 25' E$. During the course towards Crete we continued with U-CTD casts. In the night we stopped the U-CTD work and celebrated the forthcoming Easter event.

Friday 18th April, Good Friday

Noon position $35^{\circ} 03.26' N$, $23^{\circ} 55.05' E$, 1010 hPa , W 5, cloudy, $T_{air} 14.9^{\circ} C$

We sailed along the southern coast of Crete back to the Ionian Sea. On this unplanned section we tried to make the best of a bad job and took U-CTD casts.

Saturday 19th April

Noon position $35^{\circ} 31.88' N$, $022^{\circ} 25.00' E$, 1015 hPa , WSW 5, cloudy, $T_{air} 15.4^{\circ} C$

U-CTD casts proceed without any problems. As well in the morning as in the afternoon we carried out a CTD station. Since the beginning of the cruise, we observed that our 1ADCP system is not working correctly. The analysis of the data shows unreasonable high values in the lower layers of the profiles. Furthermore, the master 1ADCP tends to produce multiple

files for one cast and its pinging is also not clear to hear. We tried several slightly modified configurations but nothing worked. We now run out of ideas how to solve the problem.

Sunday 20th April, Easter Sunday

Noon position 36° 30.65' N, 021° 16.69' E, 1016 hPa, SSE 5, cloudy, T_{air} 16.4° C

This is a day without any news to report. U-CTD and CTD casts run without any problems. In the morning the cook and steward set the breakfast table easterly with coloured eggs and a chocolate present for everybody.

Monday 21st April, Easter Monday

Noon position 37° 49.93' N, 020° 18.54' E, 1008 hPa, SE 8, overcast sky, T_{air} 18.1° C

In the early morning two U-CTD casts were cancelled because the screw which blocks the rotation of the winch broke. It had to be replaced. During day the weather got very rough and we had to interrupt our U-CTD work. However, the CTD station in the evening was carried out as planned. The weather calmed down during the night very fast, so that we continued with U-CTD casts after the CTD station.

Tuesday 22nd April

Noon position 39° 10.02' N, 019° 15.05' E, 1015 hPa, SSE 3, overcast sky, T_{air} 16.7° C

During the night the U-CTD winch failed totally due to some problems with the electronics which seemed to be damaged by dirt and seawater. We had to change the winch with a second one which we fortunately carried with us as replacement. Some U-CTD stations were cancelled until the problem was fixed. It seemed that the U-CTD kept us always busy.

Now, we arrived in the area where the distance between CTD stations gets closer. Today we carried out four CTD stations on a section on 39° 10' N on which we deployed and recovered moorings during MS MERIAN cruises MSM 13/2 and MSM 15/4.

Wednesday 23rd April

Noon position 39° 39.72' N, 018° 32.67' E, 1008 hPa, NNE 5, overcast sky, T_{air} 16.3° C

In the morning we took the last CTD cast on our section along 39° 10' N and then set course to the Strait of Otranto. During our track we carried out U-CTD casts. Due to insufficient depth and also rough sea some of our planned casts had to be cancelled. In the evening we reached the Strait of Otranto and started our CTD section.

Thursday 24th April

Noon position 40° 56.24' N, 018° 51.89' E, 1010 hPa, NW 5, overcast sky, T_{air} 15.6° C

The CTD section through the Strait of Otranto run without any problems and was finished during night. In between the CTD stations we run always a U-CTD cast. The profiles of the last CTD casts are a bit spiky and therefore we cleaned all the connections and cables of the CTD during day. Hopefully, this will fix the problem. In the morning U-CTD casts had to be cancelled due to low water depths. The weather is still rough but did not affect our measurements.

Friday 25th April

Noon position Dubrovnik port, 1010 hPa, SES 3, overcast sky, T_{air} 16.6° C

At around 9:00 a.m. we laid alongside in Dubrovnik port.

As we had still problems with spiky profiles of our CTD casts, we changed all cables at the sonde and removed the worse working oxygen sensor.

In the afternoon most of us went into the old town of Dubrovnik. At around 6:00 p.m. the Croatian observer arrived at the ship and we spent the evening together having dinner somewhere in the old town. It was really a nice day and evening.

Saturday 26th April

Noon position 42° 25.72' N, 018° 04.22' E, 1010hPa, SE 4, overcast sky, T_{air} 16.2° C

We left Dubrovnik harbour at 9:00 a.m. (local time). It was raining heavily during our departure, so that we did not really regret leaving.

The ADCP was switched on at 10:00 a.m. (local time) after we left the 3 nm zone of Croatian waters. The U-CTD casts started as soon as waters were deep enough.

In the afternoon the computer of the thermosalinograph had a blackout due to a damaged serial port which provided the output with NMEA data. We had to switch off the computer. Bad luck seemed to chase us this day, in the late afternoon we had severe problems with the CTD. During the cast not only spikes appeared in the profile but also the pump stopped working. We cut 200 m of the single conductor cable and changed the plug, additionally we changed the y-cable leading to the pumps. The success was only short term because similar problems appeared again. Finally, we changed the whole CTD and rosette.

Sunday 27th April

Noon position 41° 21.01' N, 017° 12.27' E, 1008 hPa, SE 4, cloudy, T_{air} 15.3° C

After the change of the whole CTD system in the night before, everything was running without difficulties. We ran our last U-CTD and CTD casts in the morning. Station work was finished at lunch time. In the afternoon we started to dismount our equipment and to pack the container.

Monday 28th April

Bari port

At around 9:00 a.m. local time we arrived at Bari port and the cruise ended here.

4. Technical Information and Methods

CTD/Rosette and hydrographical samples

Altogether 37 full depth standard hydrographic stations were occupied during the cruise, employing a SeaBird SBE911 plus CTD-O₂ sonde, attached to a SeaBird carousel 12 bottle water sampler. All sensors except of pressure are sent to the factory once a year for calibration. The pressure sensor is sent to calibration as often as required. The serial numbers of the CTD are:

Instrument/Sensor	Serial Number (owner)
SBE 911plus / 917plus CTD	285 (IFM-CEN)
Temperature 1: SBE-3-02/F	1294 (IFM-CEN)
Conductivity 1: SBE-4-02/2	1106 (IFM-CEN)
Pressure 410K-105	50633 (IFM-CEN)
Temperature 2: SBE-3-02/F	1717 (OGS)
Conductivity 2: SBE-4-02/2	3442 (OGS)
Altimeter PSA 916D	885 (IFM-CEN)
Oxygen 1 SBE 43	1761 (IFM-CEN)
Oxygen 2 SBE 43	2513 (OGS)

At all stations water samples were taken from 12 depth levels within the water column. From all depth levels samples were taken for oxygen analysis, and always from five depth

levels samples were taken for salinity analysis. The salinity samples were analysed on board using a Guildline Autosal Salinometer. The batch-no. of the standard seawater samples is 38H11 which have a K15-factor of 1.07631 (24°C). Two of the water bottles were also equipped with reversing digital thermometers, providing temperature and pressure check values for the CTD sensors. The oxygen samples were analysed on board by the Winkler method with an automatic endpoint detection burette.

Underway CTD measurements

Underway measurements of temperature and conductivity profiles were made with an Ocean Science UCTD system. Altogether we took 378 casts. After some trouble with the system (see Narrative), especially the loss of the probe 068, we decided for following deployment procedure:

- a) Distance between U-CTD casts: ~ 6 nm or ~ 1 hour keeping a ship's speed of 6 knots
- b) No spooling on the probe's spindle
- c) Ship reduces speed to 2-3 knots while the probe is falling for a maximum of 480 sec
- d) Ship enhances speed again to 6 knots during recovery of the probe

We reached maximum depths of around 800m, minimum depths of 500m. The average depths were approximately 650m.

Details of the system are:

	Serial Number
UCTD winch	S/N WI-0033

Probe 1	Device Type	Serial Number
0068	90560 UCTD /SBE49 FastCat CTD	70200068
0155	90745 UCTD / SBE 37 MicroCat	70200155
0183	90745 UCTD / SBE 49 FastCat CTD	70200183

Current measurements

Vertical profiles of horizontal currents were made with a 1ADCP-2 system attached to the rosette water sampler. The system consists of two ADCPs of the Workhorse type (WHM300) manufactured by RD instruments and operating at a frequency of 300 kHz. The serial numbers of the 1ADCPS are S/N 141909 (Master) and S/N 14411 (Slave). The data are corrected for CTD movements and analysed with the LDEO LADCP software (A. M. Turnherr, 2010)

Reference: Turnherr, A. M., 2010: A Practical Assessment of the Errors Associated with Full-Depth LADCP Profiles Obtained Using Teledyne RDI Workhorse Acoustic Doppler Current Profilers. Am. Met. Soc. DOI:10.1175/2010JTECHO708.1

Underway measurements

Underway temperature and salinity measurements were made with a SeaBird thermosalinograph installed in the ship's port well. We took additional water samples for salinity calibration purposes.

Underway current measurements were taken with a vessel-mounted 75 kHz Ocean Surveyor (ADCP) from RDI, covering approximately the top 600-800m of the water column.

The bin size was set to 8 m, the ADCP ran in narrowband mode. The instrument was controlled by computers using the conventional VMDAS software under a MS Windows system. Pinging was set as fast as possible. No interferences with other used acoustical instruments were observed. Additional navigational data was available from the ship's DAVIS system. The ADCP data was afterwards post-processed with the software package ossi14 (ocean surveyor sputum interpreter), developed by the Leibniz Institute of Marine Sciences (GEOMAR), Kiel, which also corrects for the misalignment angle (Tim Fischer, pers. communication). The misalignment angle was calculated at approximately -3.5 degrees.

Argo Floats

During the cruise 3 Argo floats were deployed:

Type	WMO Nr	Serial Nr	IMEI Nr	Time	Pos. lat	Pos. lon	Project EUROS-Argo
ARVOR-I	6901846	OIN14 IT ARI 16	300234061527160	13.04.2014 05:25:00 UTC	35° 36.022'N	17° 14.915' E	Italy
ARVOR-I	6901847	OIN14 IT ARI 17	300234061528180	15.04.2014 17:36:00 UTC	34° 45.014'N	22° 24.993' E	Italy
ARVOR-I	6901848	OIN14 IT ARI 18	300234060257590	17.04.2014 06:10 UTC	34° 24.039' N	26° 01.018' E	Italy

5. Preliminary results

The following analyses were done on-board of the ship with the purpose to investigate how accurately instruments were working. No calibration of data has been done so far.

U-CTD:

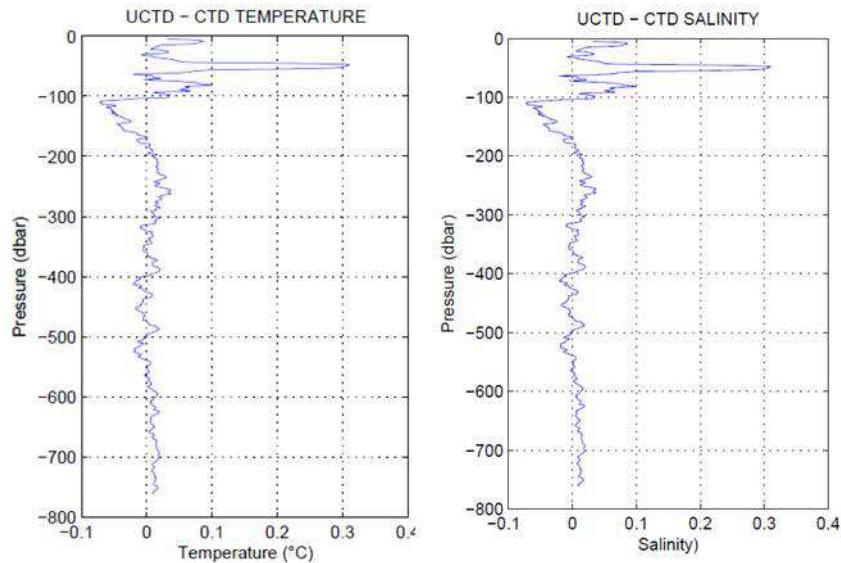

Figure 2: Difference between U-CTD and CTD cast for temperature and salinity, U-CTD probe 0155

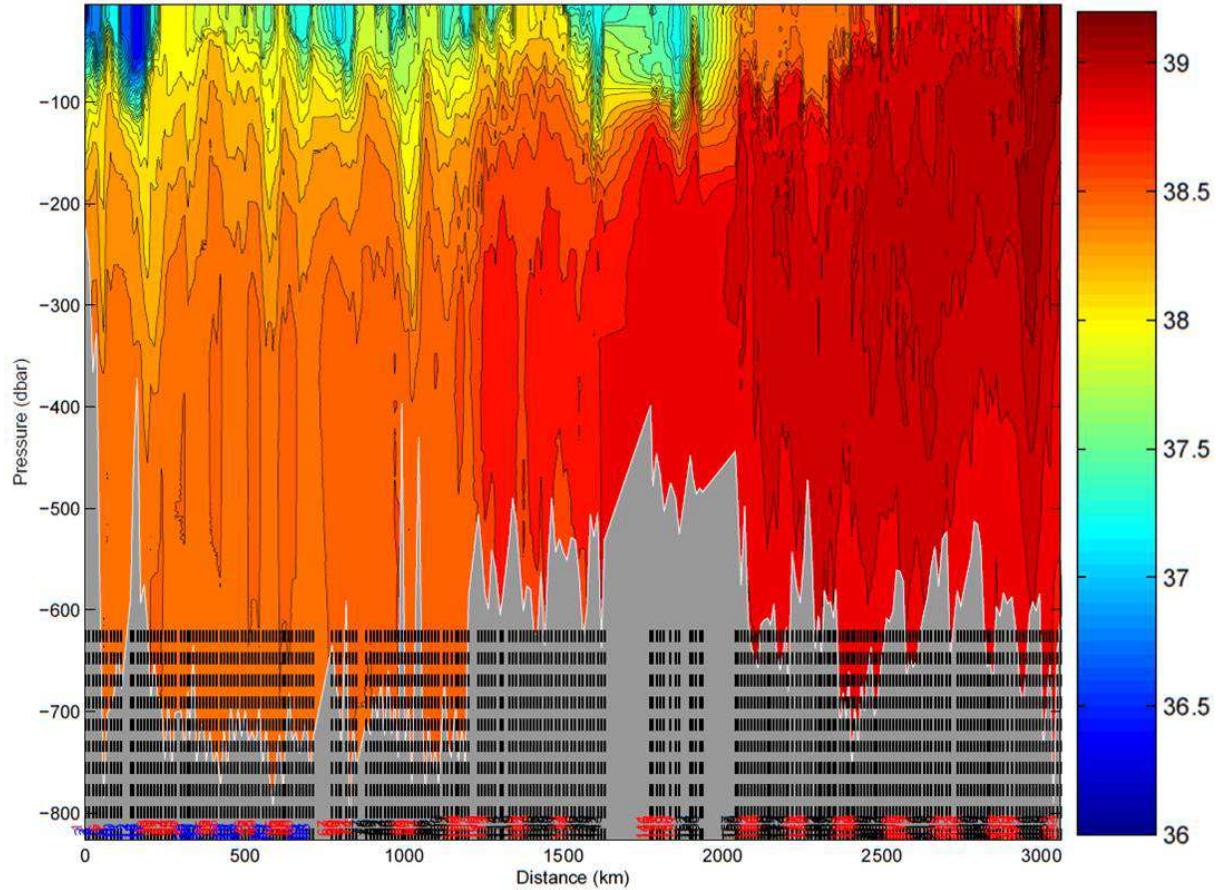

Figure 3: Salinity distribution of a U-CTD cast along a west-east section through the whole Mediterranean Sea (east of Strait of Gibraltar to southeast of Crete). Dashed lines: Location of U-CTD casts, different colours (read, blue, black) indicate areas of different probes.

Distances between U-CTD casts are on average 6 nm (fig. 1). Longer distances result either from interruptions due to technical problems (s. Narrative) or due to insufficient water depths. Most of the casts reached depths larger than 600 m (fig. 3). Never before, measurements of physical parameters on a section through the whole Mediterranean Sea have been carried out with such a high resolution.

In order to calibrate the U-CTD values, we always conduct parallel to a CTD station a U-CTD cast afterwards. Figure 2 shows the result of such a comparison for probe 0155. The mean temperature difference is $0.010375\text{ }^{\circ}\text{C}$ with a standard deviation of $0.039708\text{ }^{\circ}\text{C}$. For salinity a difference of -0.013499 with a standard deviation of 0.039708 was reached. For all of the compared stations the mean and standard deviations show values in this range. Also, the curve progression of the differences was always quite similar with highest differences in the upper layers. This might be caused by the fact that the casts of CTD and U-CTD were not taken exactly at the same position and time, and variances in the water characteristics are largest in the near surface layers.

On the section (fig. 3) a sharp interface between the inflowing Atlantic Water (AW) and the outflowing Levantine Intermediate Water (LIW) can be observed. The LIW shows high values in the eastern parts where its core is located closer to the surface. In the western part the interface between AW and LIW is most pronounced. However, some of the sharp gradients between water masses are artificial due to offsets between the different U-CTD probes. A careful calibration of the data for eliminating the differences between the probes and a comparison to the more accurate CTD data must be carried out in order to achieve finally reliable data.

CTD

The CTD was always run with double pairs of temperature, salinity and oxygen sensors. Most of the casts run without any problems. At the end of the cruise breaks of the pump accompanied with cumulative spikes in all parameters arose presumably due to a cable leakage somewhere in the system which we were not able to find.

Figure 4 is an example (station 459, deepest station of the cruise) of a comparison between sensors among each other and against the appropriate comparative measurement (salinometer, Winkler method). For temperature and salinity the results are very satisfying. The average difference for the whole profile is less than 0.005° C and for salinity it is less than 0.001. Differences are higher in the upper 1000 m, they achieve around 0.01 °C for temperature and around 0.02 for salinity. For oxygen differences result in values between 0.3.-0.1 ml/l, whilst in the upper 500m these values are also exceeded. The comparison for the salinity sensors against the salinometer shows that the CEN sensor is always closer to the salinometer, but for both sensors the difference is less than 0.02. For oxygen the OGS sensor is always closer to the comparative measurement and differences for both sensors are in a range between -0.1 and 0.7 ml/l. For all other CTD stations results are in a comparable range.

Fig 5 reveals the TS characteristics along the whole track of P468 in the Mediterranean Sea. As commonly reported previously, the difference in the TS evolution between western and eastern Mediterranean Sea is most noticeable. The western Mediterranean is always less salty throughout the whole water column and also colder in the surface layers. Adriatic water is densest but as we were not able to carry out measurements in the Aegean Sea and Kasos Strait, we cannot conclude that it was the densest water mass at all.

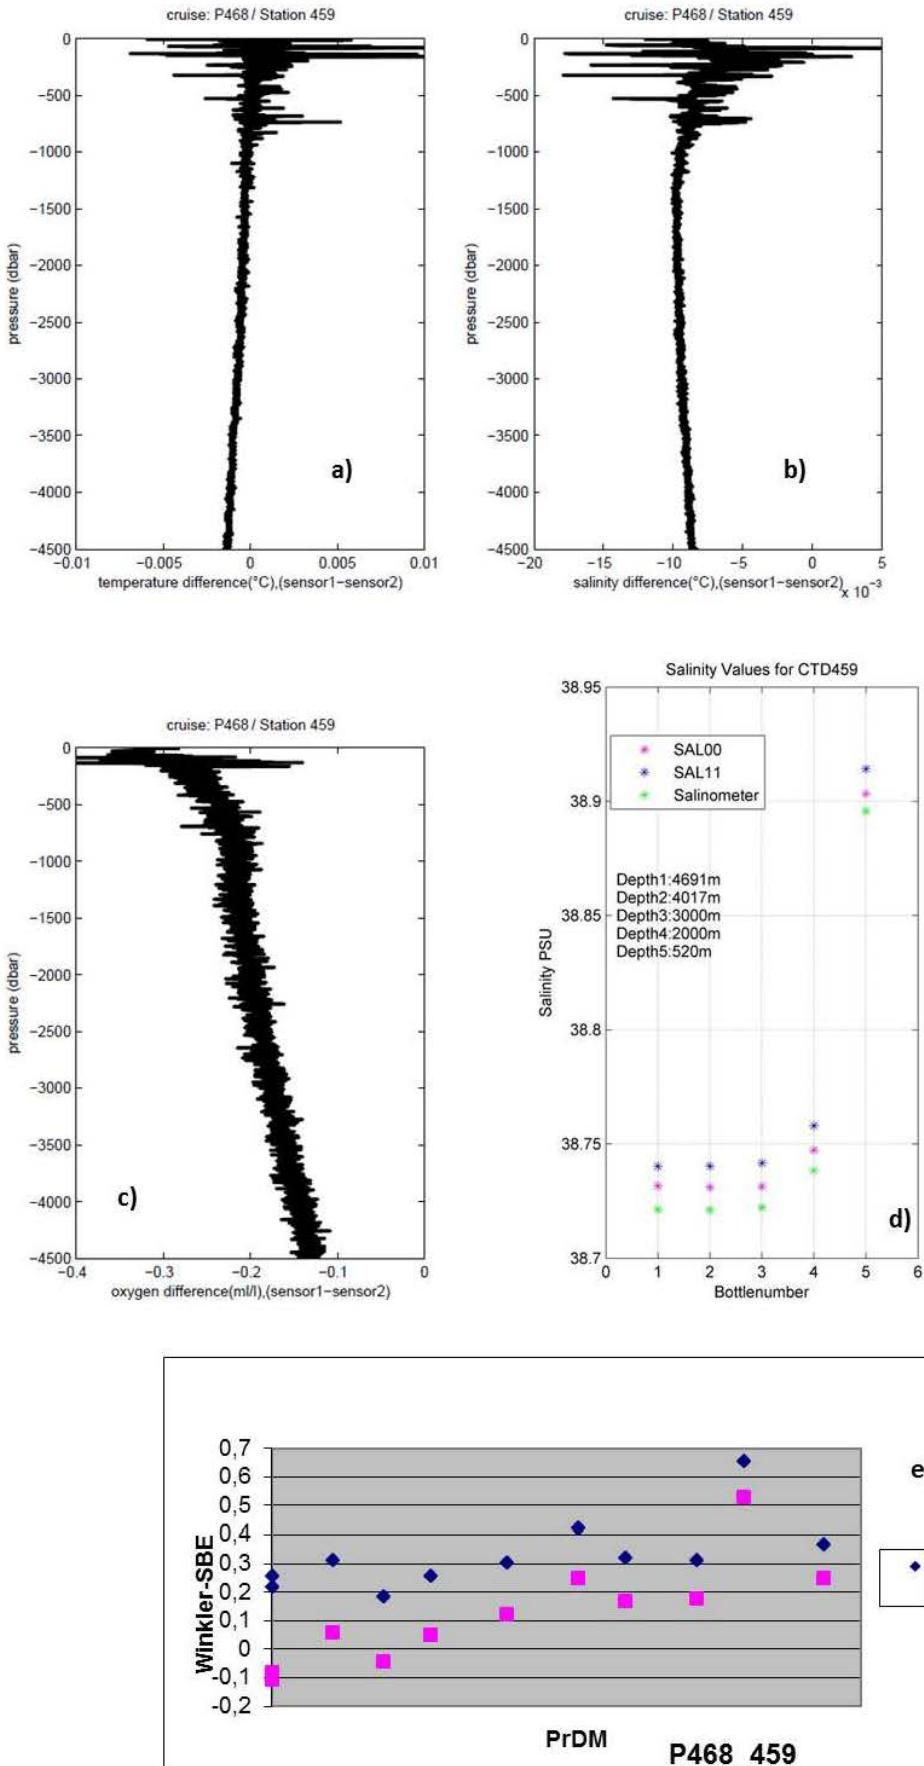

Figure 4: Comparison of CTD sensors for station 459: a) temperature difference (CEN-OGS sensor), b) salinity difference (CEN-OGS), c) oxygen difference (CEN-OGS), d) salinities of salinometer (green), CEN sensor (magenta) and OGS sensor (blue), oxygen differences between CEN oxygen sensor and Winkler measurement (blue) and OGS oxygen sensor and Winkler measurement (magenta).

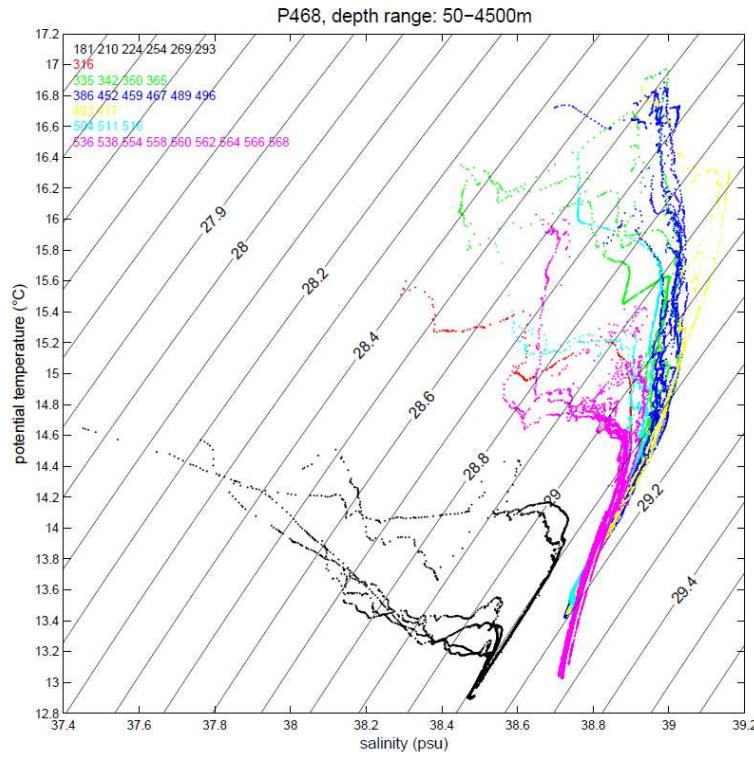

Figure 5: TS-diagram of most of the CTD stations done during cruise P468. Colours mark the different areas of the Mediterranean Sea. Black: Western Mediterranean. Red: Sicily Channel. Green: Central Ionian Sea. Blue: Eastern Ionian Sea / western Hellenic Trench. Yellow: Eastern Hellenic Trench. Cyan: Northern Ionian Sea. Magenta: Adriatic Sea.

ADCP

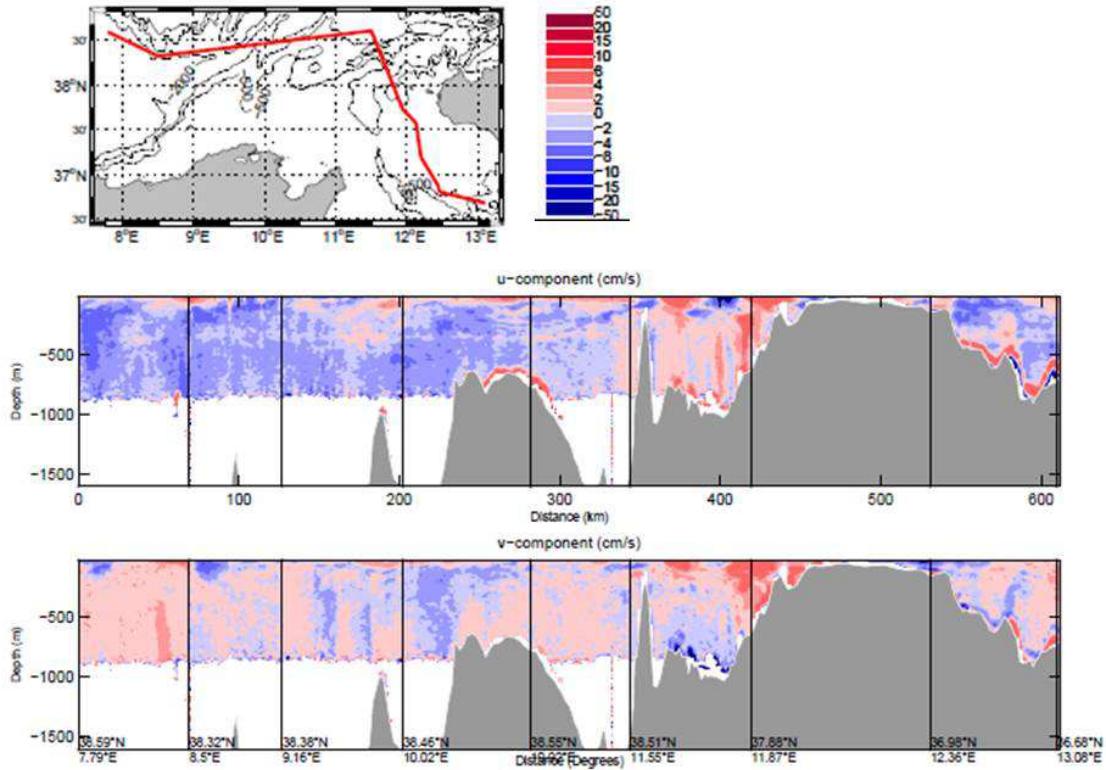

Figure 6: ADCP velocities in cm/s on a section across the Strait of Sicily. Upper left panel: Location of section. Middle panel: West-east velocity. Lower panel: North-South velocity.

The ADCP reaches with reliable results to depths about 700-800m. Calibration of data is not really possible as we do not have any data for comparison available (s. lADCP). Figure 6 shows the velocity distribution on a section through the Strait of Sicily. We can identify a strong current flowing at the south eastern tip of Sicily island to the north east into the Tyrrhenian Sea.

IADCP

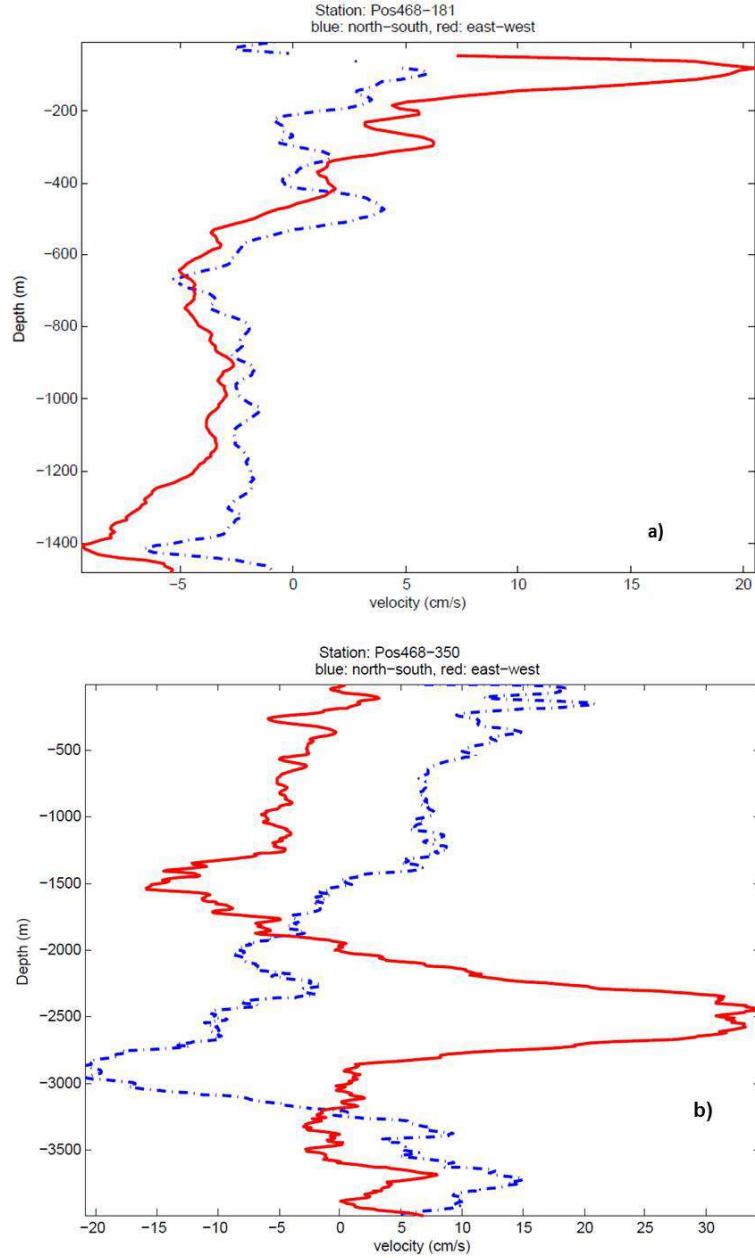

Figure 7: lADCP velocities for a) station 181 and b) station 350. Results achieved with LDEO LADCP software and vertical filtering. Blue, dotted: north - south component. Red, solid line: east – west component.

The lADCP results (fig.7) are questionable, especially for the deeper stations (fig. 7 b). For depths larger than 2000 m the lADCP velocities always show maximum values (almost exceeding 20 cm/s) in the deeper layers which is quite implausible, all the more as this curve progression (fig 7 b) is visible for all stations where depths exceed 2000 m. For stations with depths lower than 2000 m (fig 7 a) velocities are reliable at first sight. We assume that hardware problems with the master lADCP (see Narrative) caused these results.

Thermosal

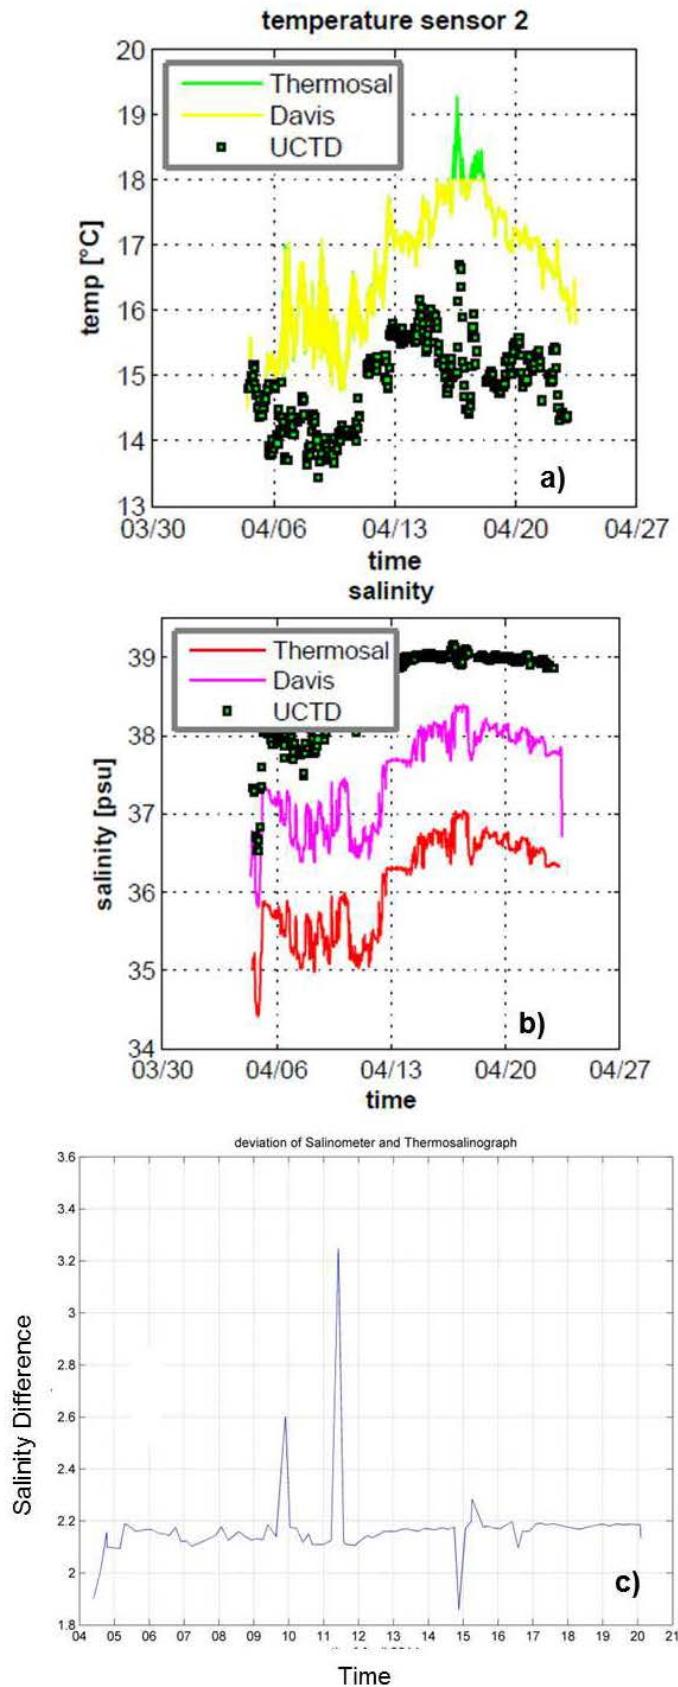

Figure 8: a) Timeseries of temperature of the thermosalinograph (green), of the thermosalinograph given by the DAVIS system (yellow) compared to the appropriate sea surface values of the UCTD (green dots). b) Timeseries of salinity of the thermosalinograph (red), of the thermosalinograph given by the DAVIS system (magenta) compared to the appropriate sea surface values of the UCTD (green dots). c) Difference of Salinometer – Thermosalinograph salinity values for one day

Figure 8 reveals clearly that the thermosalinograph needs a severe calibration for the temperature as well as for the salinity sensor. On board there were two applications available by which thermosalinograph data were made accessible: a) by the Seabird application SEASAVE and b) as output of the ship's data base DAVIS. Figure 8 a) shows the development of temperature. We would expect thermosalinograph data given by Seasave and by DAVIS to be the same but we find slight differences. For the salinity comparison (fig.8 b) the difference is nearly always large. An explanation could be that the programs are supplied with different (and wrong) configuration files. A comparison with the uncalibrated UCTD data shows that the thermosalinograph underestimates salinity and overestimates temperature distinctly.

Acknowledgements

We would like to thank Captain Matthias Günther, his officers and the crew of RV POSEIDON for the support of our scientific programme, for their unending competent and friendly help. We always enjoy staying on board of R/V POSEIDON.

The ship time of R/V POSEIDON and the transport of equipment were provided by the University of Hamburg. The financial support for the journey of scientists and the facilities of the cruise like consumption were provided by the project of the "Deutsche Forschungsgemeinschaft" DFG Qu46/16-1. We gratefully acknowledge their supports.

Finally, I would like to thank Prof. Dr. D. Quadfasel, my supervisor, who always supports my research in the Mediterranean Sea.

List of Stations
