Negotiating on the price of a product or service is a daily activity in Gaza city. However, due to the nature of these transactions, it is domestically impossible for a seller to offer similar discounts because haggling is not a common practice; but they can do it for a large number of buyers in one-time deal. This project is an E-commerce system built on node.js technology. This idea originated from the hard economy in Gaza and the belief that technology can help solve this issue. In our web application, we combined e-commerce with traditional thinking in trade in the Gaza Strip to provide a simple prepaid card to charge customers' accounts. In addition, we are providing payment by PayPal compatible system so that our project can keep pace with the revolution of technology. We used modified waterfall methodology in order to develop this project, in addition to creating a responsive design interface that will allow the application to cater to different device interfaces.
