Who Is the New Consumer? The Identification and Construction of Consumers in a
Changing World

1. Ageing consumers

Brembeck, Helene, MariAnne Karlsson, Eva Ossiansson, Helena Shanahan, Lena Jonsson,
Kerstin Bergström, Pontus Engelbrektsson: Enjoyment and Concern. The Importance of
Food and Eating for Ageing Consumers

Gram, Malene: Pragmatic age, The meaning of age in relation to consumption of holidays
among Danish and German mature travellers: horror-vision or privilege?

Leskinen, Johanna & Helena Tuorila: The everyday life of the elderly in the cross-current of
services and self-service

Lövgren, Karin: "One recognizes ageing, but not becoming old" – On age categorizations in
marketing

Tuorila, Helena: An ageing wonderland of self-service?

Airola, Jouni: Regional strategy of Services for the Elderly People – Years 2015 and 2030
(Policymaker comment)

Peltonen, Anja: Ageing consumers and public services (Policymaker comment)

2. Children and teenagers as consumers

Bertilsson, Jon: The Enculturation of Young Consumers - Young peoples' dealings with the logic of brands and branding

Grønhøj, Alice & John Thøgersen: When action speaks louder than words - The effect of parenting on young consumers' pro-environmental behaviour

Ruder, Johanna, Annika Åström, Gunnar Hall & Maike Bruhn: Healthy Snacks for Adolescents – a Case for Consumer-Driven Product Development

Sandberg, Helena: Marketing of unhealthy food directed to children

Sparrman, Anna: Visual marketing of breakfast cereals to children – containers, gadgets and gender

Thorsted, Stine & Terese Anving: Food provisioning, anxiety and control, The process of feeding from the perspective of the mothers

Van Gorp, Jeremi: The role of parents in the socialization of consumption. Linking consumption of teenagers and their parents

Consuming Children: A panel based on the research project "Consuming children. Commercialisation and the changing construction of childhood"

Overview

Hagen, Ingunn: Playing on children's desires and fears: on creating brand loyalty among Norwegian children

Korsvold, Tora & Linda Bomann: On the track of Norwegian childhood and the consuming child. The history of marketing to children: a study of the Norwegian company 'Proper Toys' ('A/S Riktige Leker') founded 1946.

Tingstad, Vebjørn: The politics of food: Childhood, obesity and television advertising

3. Competition, (de)regulation, and consumer behavior

Aalto-Setälä, Ville & Anu Raijas: Five years after the euro changeover – How long does it take to learn prices?

Dulsrud, Arne, & Eivind Jacobsen: Modern Retailing and the Meaning of Body as a Technique of Discipline

Gamble, Amelie, E. Asgeir Juliusson & Tommy Gärling: Barriers to Consumer Switching in the Swedish Electricity Market

Holmberg, Ulrika & Merja Mankila: The consumer and the conglomerate – Consumers perceptions of retailers’ and insurance companies’ banks

Lundberg, Johan & Sofia Lundberg: Distributional Effects of Lower Food Prices in a Rich Country – Calculations Based on Household Demand for Food in Sweden

Poutiainen, Tanja: The Substitution Patterns of Pharmaceuticals: The Case of Statins

4. Consumer Culture

Aaltonen, Heli & Outi Uusitalo: Alcohol Advertising as a Consumer’s Resource

Cassinger, Cecilia: Disturbing the circuit through brand realization

Ekström, Karin M.: Zooming in the collector’s identity

Mikkonen, Ilona & Johanna Moisander: Online anti-Christmas communities as sites of consumer resistance

Moisander, Johanna & Joonas Rokka: Ordinary cosmopolitanism as a form of postmodern consumer identity in global marketplace cultures

Rokka, Joonas, Hanna-Kaisa Desavelle & Ilona Mikkonen: Appropriation of Western ideologies of beauty in Nordic consumer culture

Torell, Ulrika: Sweetstuff, Place and Cultures of Consumption. Confectioneries and Sweet Shops in the Urban Landscape of Stockholm, from 1850 to 1915.

Uusitalo, Liisa & Marja Rassi: Consumers as citizen – Do consumers value a landscape? A case study of the importance of cultural landscape in big environmental construction projects

Valtonen, Anu & Vesa Markuksela: Senses in Consumer Culture

Østergaard, Per & Suzanne C. Beckmann: Consumer Policy and Consumer Society: The Need for a Cultural Turn

5. Consumers and new technology

Kjørstad, Ingrid & Ardis Storm-Mathisen: Broadband Internet Access – Product or Service?

Repo, Petteri, Päivi Timonen & Kim Zilliacus: Insights from Self Regulation for Consumer Policy

Räsänen, Pekka: Structural Disparities of Media Consumption in the Nordic countries

Røpke Inge, Kirsten Gram-Hanssen & Jesper Ole Jensen: Households' ICT use in an energy perspective

Skaar, Håvard: Consuming to present the self – Social networking and commercial influence

Slette-meås, Dag: RFID - the 'next step' in consumer-product relations or Orwellian nightmare?

Throne-Holst, Harald, Eivind Stø & Unni Kjærnes: Governance issues for emerging technologies - The GM food – NANO discourses

6. Consumers in financial markets

Ahlström, Richard: The emotional impact of severe debts on the individual

Garðarsdóttir, Ragna B., Helga Dittmar & Vala Jónsdóttir: Psychological predictors of personal debt in Iceland

Järvinen, Raija & Uolevi Lehtinen: Innovative Consumer e-Services in the Financial Sector

Järvinen, Raija & Liisa Peura-Kapanen: Consumers as Private Investors in Financial Markets

Lehtinen, Anna-Riitta: Choice, freedom and responsibility - young consumers in credit markets

Nyhus, Ellen K. & Paul Webley: The relationship between parenting style and adolescents' future orientation and spending preferences

Tufte, Per Arne & Mary-Ann Stamsø: The demand for private insurance in the Norwegian welfare state - how do people adapt in a typical social-democratic welfare state system?

8. Design and fashion in consumption

Giertz-Mårtenson, Ingrid: Fashion Forecasting – Manipulating or Assisting the Consumer?

Hansson, Lena: Universal Design to Make a Difference

Klepp, Ingun Grimstad: Care and maintenance, a contribution to the planned Western Europe volume of Berg's Encyclopaedia of World Dress and Fashion

Markkula, Annu: Sustainable Consumption – Sustainable Ways of Consuming Fashion

Ryynänen, Toni: Design, Media and Consumer Culture? – The representations of design in Finnish economical press

9. Family consumption patterns and time use

Bonke, Jens & Martin Browning: Allocation of expenditures within the household: a new Danish survey

Grinfelde, Anda, Viola Korpa & Aija Eglite: The Influence of Income and Consumption on the Life Quality of Pensioners in Latvia

Gwozdz, Wencke: Why does less housework for women not (yet) lead to an equal division of housework between men and women?

Jalas, Mikko & Mika Pantzar: Backcasting energy conservation in everyday life; new and persistent patterns of time use

Niemi, Iris & Hannu Pääkkönen: Time Use Database in Analysing Consumption Patterns

Varjonen, Johanna & Kristiina Aalto: Combining time and money for family well-being – life cycle perspective

10. Food, market and politics

Bellner, Hanna & Maria Nyberg: "The empty nest" – food, meals, health and the life course

Boye, Heidi, Torben Hansen Torben & Thyra Uth Thomsen: Engender mental accounting: How cultural and social spheres affect the justification of hedonic food consumption

Denver, Sigrid, Tove Christensen & Signe Krarup: How vulnerable is organic consumption to information?

Forsman-Hugg, Sari, Juha-Matti Katajajuuri, Johanna Mäkelä, Jaana Paananen, Inkeri Pesonen & Päivi Timonen: Enhancing corporate social responsibility in the food chain with a stakeholder dialogue

Jacobsen, Eivind, Svein Ole Borgen & Arne Dulrud: Towards a theoretical taxonomy of food labelling

Linden, Anna-Lisa & Maria Nyberg: A dining room at work. An arena for multi-cultural eating

Mikkelsen, Bent Egberg, Gunnar Vittersø, Gun Roos, Lill Vramo & Kerstin Bergström: The public as political consumer - case findings from implementation of organic procurement policies in public food systems in Scandinavia

Mørkbak, Morten Raun & Jonas Nordström: Consumer perception of animal welfare and the effect of information

Nordström, Jonas & Linda Thunström: The Impact of Tax Reforms Designed to Encourage a Healthier Grain Consumption

Roos, Gun: Consumers, nutrition policy and simplified nutritional labelling of foods

11. Housing and consumption

Gram-Hanssen, Kirsten & Claus Bech-Danielsen: Housing and immigrants – consumer aspects of the meaning of the home

Oldrup, Helene: Paradoxical places, ambivalent feelings: between cosmopolitan and metropolitan spaces

Perrels, Adriaan & Elina Berghäll: Are summerhouse owners just wealthier or do they have an outgoing lifestyle? – Implications for sustainable holidays and leisure

Putman, Lenny & Sander van den Burg: Purchasing a house. Is there a place for environmental arguments?

Svane, Örjan: Helping, Informing or Coaxing the Consumer? – Exploring Persuasive Technology as applied to households' energy use

12. Inequality in consumption (including ethnicity and gender issues)

Berg, Lisbet & Mari Teigen: Gendered consumer competences in households with one versus two adults

Borgeraas, Elling & Espen Dahl: Low income and “poverty lines” in Norway – A comparison of three concepts

Ekström, Marianne Pipping & Inger M Jonsson: Women dining alone in restaurant rooms

Haanpää, Leena: Women's sporting events in Finland: from physical enjoyment to recreation of mind

Hjort, Torbjörn & Pernille Hohnen: Consumption as a field of participation

Hohnen, Pernille & Torbjörn Hjort: Towards a new model citizen? A qualitative analysis of new responsibilities and forms of individualized social security for consumer-citizens in the Nordic welfare state.

Rysst, Mari: Needs, wants and bicycles: Financial resources, cultural priorities and marginalization in Nordic families

Smed, Sinne: The Influence of Prices on a Healthy Diet

13. Political consumption

Autio, Minna & Visa Heinonen: Representation of Consumerism in the Finnish Consumer Policy Programmes 1983-2007

Boström, Magnus & Mikael Klintman: Green Labelling and Green Consumerism: Challenges and Horizons

Christensen, Tove, Sigrid Denver & Morten Raun Mørkbak: Food safety and the reversed political consumer

Dubuisson-Quellier, Sophie: From consumerism to the empowerment of consumers. The case of ethic food movement in France.

Kjærnes, Unni, Randi Lavik, Henric Barkmann & Michele Micheletti: Buying welfare friendly food – a case of political consumerism?

Pellizzoni, Luigi: Three challenges for political consumerism

Terragni, Laura: From the White Label campaign to the No sweat initiatives. A journey at the roots of political consumerism

van den Burg, Sander : The political modernization of sustainable consumption policies

15. Sustainable consumption

Berg, Annukka: European Forerunners of Sustainable Consumption and Production Programmes - Challenges and possibilities in an emerging policy field

Lähteenoja, Satu, Michael Lettenmeier, Tommi Kauppinen, Karoliina Luoto, Tiina Moisio, Marja Salo, Petro Tamminen & Sini Veuro: Natural resource consumption caused by Finnish households

Mont, Oksana: Sustainable consumption and lifestyles: contributions to the Marrakech process

Nurmela, Juha: Could the Household Budget Survey serve as a yardstick of sustainable consumption?

Solér, Cecilia: Sustainable Consumption as negotiation of sign-value

Thunström, Linda: Using Price Instruments to Affect Probabilities of Purchasing Healthy Labelled Breakfast Cereals

Thøgersen, John: The motivational roots of norms for environmentally responsible behaviour

Tukker, Arnold et.al.: Governance of change of Sustainable Consumption and Production – An Evidence Based View

Vittersø, Gunnar, Ingun G.Klepp & Eivind Stø: Holiday consumption and sustainable development - the cases of foreign holiday trips and Norwegian cabin life

16. The role of consumers in innovation policies

Grunert, Klaus G.: Consumer-based innovation: The analysis of consumer preferences in new product development, and the potential supporting role of consumer policy

Heiskanen, Eva & Raimo Lovio: User Knowledge in Housing Energy Innovations

Hyysalo, Sampsa: User innovation, design space, and everyday practices: Rodeo Kayaking case revisited

Johnson, Mikael & Kalle Toiskallio: Who Are the Habbo Hotel Users - And What Are They Doing There?

Saastamoinen, Mika, Eva Heiskanen, Kaarina Hyvönen, Tanja Kotro & Petteri Repo: Consumers in Product Development: Empowered or Exploited?

Consumer Ombudsman Session

Conveners: Nordic Consumer Ombudmen

Roundtable: Nordic consumer culture? Towards a research agenda

Conveners:

Søren Askegaard, University of Southern Denmark

Dannie Kjeldgaard, University of Southern Denmark

Jacob Östberg, Stockholm University

Overview of the roundtable

Special Session: European Consumer Policies Against Childhood Obesity

Conveners:

Professor Lucia A. Reisch, Copenhagen Business School (CBS), Denmark

Professor Suzanne C. Beckmann, Copenhagen Business School (CBS), Denmark

Overview of the session

Beckmann, Suzanne C. (CBS), Katharina M. Keimer (BIPS) & Lucia A. Reisch (CBS): Food Based Dietary Guidelines: National differences and the challenges of developing a standardised European guideline

Billaux, Cecile (European Commission, DG SANCO, Brussels): Childhood obesity – we have the policies but do we have effective monitoring?

Grunert, Klaus (Aarhus School of Business, Aarhus University (MAPP)): The role of nutrition labelling – a useful tool for consumer information?

Sjöström, Michael (Karolinska Institutet, Huddinge, Stockholm), Jonatan Ruiz, Fran Ortega, Toomas Veidebaum & Luis Moreno: Physical Activity, Fitness and Obesity in Childhood; Policy implications of the EU-projects HELENA and ALPHA

Special Session: Current Aspects of European Consumer Policy

Conveners:

Prof. Dr. Lucia A. Reisch, Copenhagen Business School, Denmark

Dipl. soc. oec. Sabine Bietz, University of Calw, Germany

Overview of the session

Jain, Angela, Lucia A. Reisch, Martin Schielfelbusch, Alexander Schulz & Dennis Tänzler: Sustainability as a consumer policy goal – results from an international study

Kyriacou, Akis: Evidence-based policy: Measuring consumer preferences, satisfaction and detriment

Raijas, Anu: Consumers' subjective views of well-being (abstract also available)

Foreword

Folke Ölander

University of Aarhus
Aarhus, Denmark
fol@asb.dk

Dear reader,

In this set of papers, you find a collection of current Nordic research on consumer issues, all with relevance for the conduct and development of consumer policy in our countries.

They will all be presented at the Nordic Consumer Policy Research Conference in Helsinki on October 3-5, 2007, and thus the set of papers also constitutes the proceedings of this conference.

The initiative for the conference was taken by The Nordic Forum for Consumer Research, a committee set down by the Nordic Committee of Senior Officials for Consumer Affairs to foster consumer research of relevance to consumer policy and to broaden the interaction between consumer researchers and policy-makers in government, agencies, and organizations. The Nordic Council of Ministers, the Ministry of Trade and Industry in Finland and the National Consumer Research Centre in Finland have provided substantial financial contributions to the organization of the conference.

The organizers are very happy that it has been possible to attract so many researchers, well-established as well as young and upcoming, to contribute to the conference. Together, the papers document that consumer research with a bearing on policy is well and alive in the Nordic countries.

In addition, we are happy to include a number of papers from a select group of researchers from other parts of Europe, papers that also are going to be presented at the conference.

You will also find abstracts describing the special sessions at the conference organized around European consumer policy and European projects to deal with childhood obesity, respectively, with participants from both Nordic and European universities and policy-making bodies, including the European Commission.

We are also very glad that it has been possible to include three key addresses in the conference programme, addresses given by prominent representatives of research and practice in the field of consumer affairs: Professors Steve Woolgar, University of Oxford, Frank Trentmann, University of London, and Edda Müller, former Director of the German consumer organization vzbv. Brief summaries of their addresses are also included here.

Folke Ölander
Chairman, Conference Programme Committee

Consumer Policy in Urgent Need of Empirical Consumer Research Support

Edda Müller
German University of Administrative Sciences
Speyer, Germany

Key address

EU-consumer policy and national consumer policies move into a more pro-active role in the overall EU-policy making process. Their success and impact will depend on support by consumer research. Consumer research should provide evidence based knowledge and relevant empirical data about the impact of EU-policies and EU-market processes on consumers. The presentation will describe the proposal of the establishment of a permanent observation system and regular reporting mechanism on the state of consumer protection and consumption in the EU. It will describe **why** a regular reporting mechanism is needed, **what** should be done and **how** it could be organised.

The main objective of the proposal is to improve **agenda-setting** and to help DG Sanco to bring consumer issues onto the political agenda. Furthermore, the need to organise a monitoring system within the Member States will help national consumer policy actors and consumer organisations to provide input and have a mandate to collect data from different sources.

The consumer information and observation system shall gather information to describe the present and foreseeable state of consumer demand from different point of views, for example the quality of consumer protection, the pressure (behaviour of the market forces) on consumers and the sensitivity of competition for new economic, technological and social developments. The concrete **topics** have to be identified together with **indicators** which allow a measurement of the success or failure of consumer policies. Consumer research support is urgently needed for the identification and formulation of indicators that are valid to describe the impact of policies on market processes from a demand side perspective.

The “European Environmental Information and Observation Network – **EIONET**” will be presented as **an example of how to organise the reporting mechanism** together with institutional changes needed for the implementation.

The speaker is a **political scientist**. She worked for many years in different governmental and administrative functions in Germany and the EU and was the Executive Director of the Federation of German Consumer Organisations.

Consumers, Practices, and Politics: Putting the Current Global Era in Historical Perspective

Frank Trentmann
Birkbeck College
University of London
London, UK

Key address

The central role of “the consumer” in policy and discourse more widely is frequently seen as a new phenomenon of contemporary society, associated with globalisation and post- or late modernity. This is a mistake. In this presentation I will place current debates about consumers and consumerism in a longer perspective. A more historical and more comparative approach can provide fresh insights for policy-makers and researchers alike. The presentation will draw on insights from the recent five-year long UK research programme “Cultures of Consumption”. Sections of the talk will highlight the on-going diversity of consumer cultures and consumer behaviour; the importance civic traditions and democratic culture played in the expansion of consumer politics and identity; and the need to return to a broader view of choice. The talk will end with a provocative note: consumer power has a more troubled and ambivalent past than new social movements tend to recognise: campaigns for FairTrade had their precursors in imperialism and Free Trade. Critics and champions of consumer sovereignty alike do well to give greater recognition to the uneven moralities and practices of consumption.

Frank Trentmann is Professor of History at Birkbeck College, University of London. From 2002 to 2007 he was director of the £ 5 million research programme Cultures of Consumption, funded by the two British research councils ESRC and AHRC (more information and research can be viewed at www.consume.bbk.ac.uk . Recent publications include: *Consuming Cultures, Global Perspectives* (2006); with John Brewer); *Governance, Consumption and Citizenship* (2007, with Mark Bevir). His new book *Free Trade Nation: Commerce, Consumption and Civil Society in modern Britain* is published by Oxford University Press. He is now working on a global history of consumption for Penguin entitled *The Consuming Passion*.

Who Is the New Consumer? The Identification and Construction of Consumers in a Changing World

Steve Woolgar
Science and Technology Studies
Saïd Business School
University of Oxford, UK

Key address

The world of consumers is changing rapidly – changes in the quality and quantity of relevant information, the different channels through which this information is made available, and the issues which matter. But the world of consumers is also changing in respect of who is identifying, defining and appropriating the figure of “the consumer”. Indeed, these latter aspects are arguably crucial: who speaks for and who defines the consumer heavily influences what counts as “relevant”, “information” and “issues which matter”. This paper explores some of the implications of changes in the figure of the consumer. It draws on theories from science and technology studies (STS), and from the sociology of the risk society; and is informed by the author’s experiences in his role as a Professor of Marketing in a Business School, and as a member of Council of one of the world’s leading consumers’ associations.

The paper begins by outlining some of the major societal changes over the last 50-60 (ie post war) years. These include changes turn on issues of affluence, choice, travel, technologies, and the emergence of the “risk society”. In what ways do these developments implicate changes in the conception of the consumer? To what extent have organisations which speak on behalf of consumers managed to respond to these changes? In order to address these questions, the paper takes from STS the notion of “configuring the user”: the practices and processes for identifying, defining, constructing, enabling and constraining users. It then considers the ways in which consumers are configured both in consumer movements and by consumer policy. Examples include: the figure of the consumer embodied in the exposure of “tricks” played by supermarkets on their customers; the image of the consumer in debates about the divide between consumer and citizen; the conception of the virtual (online) consumer.

The paper argues that such configurations draw on and reaffirm key assumptions about the consumer. These include depictions of the consumer as: 1) socially isolated, rather than a member of networks and communities; 2) a passive recipient of information; 3) lacking access to information and knowledge and 4) engaging in predominantly utilitarian consumption. The paper pays particular attention to the assumption that the consumer wants or needs certified objective knowledge as the basis for informed purchasing decisions.

The paper concludes that key social and technological changes in recent years oblige us now to revise our entrenched assumptions about the nature and identity of consumers. To do this, we need to consider the ways in which various agencies, government departments and

consumer organisations, construct and configure versions of consumers, who they are, what they want and need. This in turn requires us to develop a more interactive and discursive conception of the consumer.

Abstract

Sweden, as well as most Western European countries, faces an ever-growing older population. The overall aim of the project has been to contribute to an increased in-depth, knowledge and understanding of consumers' over 55 years of age, their views, preferences and expectations for food and food consumption. In three separate studies, each lasting a year and each applying qualitative, ethnographic methods, three groups of consumers +55 of special interest have been studied: city centre dwellers (n=29), new Swedes in the city suburb (n=24), and inhabitants in a rural area (n=28). The results demonstrate the importance of food and food consumption in the respondents' lives. Even so consumers +55 cannot be considered as one group but several. Different values and habits in relation to food have been shaped by a complex interrelation of experiences during earlier periods of their lives and their present situation: social, economical and physical. Healthy food – gourmet food; food as a necessity – food as pleasure; food as a mediator of change – food as a tool for holding on to traditions are only a few of the images resulting from the project.

1. Introduction

Sweden, as well as most other Western European countries, faces an ever-growing older population. In 2030 almost 23% of the Swedish population will be over 65 (SOU, 2003:91). The supposition is that these new generations will be different than old-age pensioners of former days; more youthful and healthy and with different lifestyles and demands. The baby boomers who born in the 1940's and considered wealthy, powerful and choosy, have particularly attracted attention as the largest generation in Sweden ever. No doubt will their approaching retirement pose new demands on society regarding products as well as services. The overarching challenge for society is to increase the knowledge of values and behaviours among these large groups of newly or soon-to-be retired people. This is essential in order to promote sustainable development, as well as a high-quality of living.

2. Aim

A number of statistical surveys have already been made regarding food and health-related issues on large populations in Sweden and provide broad overviews. The aim of the trans-disciplinary project described in this paper has been to contribute to an increased and more in-depth knowledge and understanding of consumers' over 55 years of age, their views, preferences and expectations for food and food consumption in relation to differences in socioeconomic status, ethnicity, gender and regionality. Special focus has been directed towards the role of food in relation to identity and relation building, demands on products and services, views on health and environmental issues and views on brands and store concepts.

3. Assumptions

The assumption has been that consumers' actions and beliefs are best understood when using a trans-disciplinary perspective, where different aspects such as the life stories and cultural background of the individuals, health issues and environmental concerns, the assortment in the grocery shops and domestic technology, are given the same amount of consideration and are seen as interlinked and cooperating. Furthermore, this kind of research requires a life course perspective, where life is seen as constant change (or 'becoming') and where ageing is regarded as a slow process with a huge variation among individuals, and without any predefined age limits; though there might be sudden gaps in relation to ill health or the death

of a partner etc. (Öberg, 2003). The household has been used as the unit for analysis. Consumers 55+ are not only individuals with their own personal life course. They are part of a household and a family, even though family members might be living at large geographical distances, and the ageing household might be single. The individuals are also part of other fellowships; of friend and interests. They have to relate to the categories of ageing where others are trying to capture them like 'older people' or 'the market segment 55-64 years of age'. Thus the food consumer +55 is an individual who is part of real and ascribed communities like household, family, interest group, market segment, and values and behaviour in relation to food consumption are a result of these identities and belongings that cross and interact with each other.

4. Method

In three separate studies, each lasting a year and each applying qualitative, ethnographic methods, three groups of consumers +55 of special interest have been studied (Table 1).

Table 1. An overview of the three studies completed in within the three years project

		Group of consumers	Number of households	Number of interviewees
Year 1	2004-2005	Well-educated, economically well-off city dwellers	24	29
Year 2	2005-2006	New Swedes in the city suburb	24	24
Year 3	2006-2007	Inhabitants of sparsely populated areas	21	28

In each study a combined trans-disciplinary method has been used, consisting of:

- personal interviews, focusing on food memories and special food events in the past life;
- food diaries in which the respondents have registered their food intake for one week and disposable cameras to document the social life revolving around food during that same week;
- follow-up interviews where the diaries and snapshots are discussed; and
- focus groups in which future life with food is discussed, and where mood boards have been produced, allowing the respondents to visualize hopes, dreams and desires for the future.

5. Wine, greenhouses and togetherness. Report from year one.

5.1. The households

The respondents of year one were active, well-off city dwellers, with academic occupations, living in attractive and expensive condominiums in Gothenburg city centre (Brembeck et al., 2005). Many of them were born in the 1940's but there was also a few respondents in their seventies and early eighties who had answered the call for "consumers 55+". Not many of them were born in Gothenburg, but had moved to the city from smaller towns to study at the university. All of them had been married (or corresponding), but now half of the households were single due to a divorce or the death of a partner. They had two or three children born in the sixties and/or seventies, and most of them had grandchildren. The women had been working or still worked in occupations such as a teacher/university professor, lawyer, or held managerial jobs at banks, in administration or healthcare. The few men taking part in the study (only 5 out of 29 individuals in total) included engineers, technicians, and one teacher.

5.2. Together: Identities and relations in regard to food

From a cultural perspective, the positions as woman/wife/mother and man/husband/father are not obvious, but constructed and changing the same way concepts like female and male are given different contents (Counihan & Kaplan, 1998; Meurling et al., 1999). It is obvious that the respondents have experienced large changes in these respects during their lives and that traditional links between gender and cooking have been questioned. Most of the women have had professional careers and cooking has not been an essential part of their identities as women. Equality has been a treasured value among the men as well as among the women and most couples have shared the responsibilities of housework and cooking with each other and with their children. However, the women have generally served as a supervisor of healthy

eating. Now approaching retirement, some of the men are skilled gourmet cooks, while some of the women are not very interested, eager or even skilled to do the everyday cooking.

The most treasured value in relation to food is togetherness: good food, good wine and good conversation with friends. Eating together is something more than an expression of identity and relation building. The meaning of food for the baby boomers (born in the 1940's) must be understood in a context of gastronomy, cookbooks, sensual pleasures, and beautiful table settings. Eating is an obvious part of an 'experience economy' (Löfgren & Willim, 2005), and as retirees they have time and money to spend. However, many of them are single or will eventually become single. A surprising fact was that almost no one wanted to have dinner or even lunch at restaurants or cafés on their own – although they lived in the very centre of the city with restaurants around every corner – because they felt awkward eating alone (also at their own homes in fact). Even more interesting was the finding that although they did not like eating alone, it was becoming less embarrassing. The respondents joked about it and about the way they used to eat in front of the TV or read a paper to get company, and some had invented their own rituals or used special furniture to be able to eat a proper meal on their own or in front of the TV. New strategies for pleasurable single dinners were invented. The single eater is finally 'coming out of the closet'.

5.3. Food, environment, and health: resource management in everyday life

Households are life support systems continuously exchanging resources with the environment for survival and wellbeing (Hook & Paulucci, 1970; Bubolz & Sontag, 1993). In doing so, households draw upon resources from the environment. For example, resources are needed for the production of consumer products and services, for use, as well as for the treatment of waste generated by the household.

The results from year one show that the management strategies used in the households have been shaped by a complex interrelation of experiences during earlier periods of the participants' lives – during their own childhood and/or when their children were small – and their present situation. They value habits that were shaped in the family of origin, often coloured by childhood experience in rural life situations and during the harsh times of crises. Food is never thrown away. Healthy food habits, in particular regular eating habits and having traditional home-cooked meals, are highly valued and believed to be fundamental to one's health and in order to age well. Even in the households that presently consist of only one person, the influence of the former family life shapes their present food habits. One wished to continue to prepare one's food even when growing older.

Fruit and vegetables and a glass of wine with one's dinner are appreciated for the sake of health and enjoyment. Care for others is often expressed by preparing food that is essential or highly appreciated by other household or family members; the spouse's health problems, the daughter's vegetarian eating habits, and the grandchildren's food allergies. Even in the households that presently consist of only one person, the influence of earlier family life clearly shapes their present food habits. Eating out is still considered a luxury and fairly uncommon (cf. above).

The households are loyal and enthusiastic waste separators and sort their waste into several fractions. The location of and distance to the recycling stations are, however, sometimes a barrier to frequent separation.

5.4. High tech, low tech, slow tech

Technology in terms of technical artefacts is very much a part of everyday life, also for storing, preparing, and consuming food. All respondents have a positive view of such technology that simplifies the storage and conservation of food. The introduction of fridges and freezers are often mentioned in the interviews as something that made a difference. However, while technology related to storage and conservation seems quite uncomplicated, the respondents' view of technology for food preparation and cooking seems much more filled with conflict.

Overall three different groups can be distinguished regarding the respondents and domestic technology. One group uses technology as a means for saving time. Cooking is not an interest per se; one prefers to pursue other activities. Pre-cooked dinners are an alternative to actually do the cooking. The type of technology that could characterize this group is the microwave oven. A second group uses technology to be able to process, e.g., vegetables in a way that conserves nutrients in the best possible way. This group chooses organic food if possible and is very interested in the health aspects of food. The type of technology that characterizes this group is the food processor. The third group is, as the previous one, very interested in food and cooking. The difference is that the individuals in this latter group do not necessarily care about the health aspect but are more interested in gourmet food. These households own the same technical artefacts as the other groups but use them more sparsely. Instead one prefers to do the work by hand. Preparing the food is as important as eating it, and cooking is allowed to take time. The type of technology that characterizes this mentality is the chef's knife and the common oven/stove. Thus, while the first two groups embrace new technology and regard it as a means to make cooking effective and nutritious, the third group is more sceptical. By working with their hands, they believe that they have more control over the results. There seems, however, also to be another reason, a norm that implies that real food should be cooked with raw materials and by hand, in the same way that one ought to eat at the table and not in front of the TV and that one ought to eat on a regular schedule.

There is an age difference of approximately 30 years between the youngest and the oldest respondent. It is difficult to draw any conclusions between the subjects based on age; the differences between respondents of similar age are as big as the differences between individuals of different ages. If there is any trend in the data, it is that older individuals seem to have a higher acceptance for technology that makes food preparation faster and easier than the (relatively) younger respondents. This is somewhat contrary to the common view of older people being averse to new technology.

In sum, technology is mainly associated with effectiveness and time-efficiency by the respondents. These concepts are, however, not entirely perceived as positive. Thus, the domestic technology shows a Janus face. For some of the respondents, saving time is positive, for others the idea of fast and effective cooking is stressful. For some types of cooking a high level of technology is accepted, for other types technology is actively excluded in favour of manual work.

5.5. To shop or not to shop – the unfaithful but sensible 'greys' striving towards the good life!

The 'greys', i.e., the consumers+55, are often overlooked. As a buying category they are considered as belonging to smaller households, mostly being in frail health, and lacking sufficient buying power for much beyond the necessities of life. Moreover, this stereotype

implies that they are set in their ways and thus not likely to switch brands or try new products. Today, marketers have begun to realize that the 55-and-over household represents a large and lucrative segment of the buying public and that these 'golden greys' will not just 'tag along'.

The study of the 55+ in the city centre reveals that these consumers appreciate an array of different stores when buying food with regard to how stores can create meaning to them. They visit smaller specialty stores as a way to revive memories from their childhood and youth. Still, they realize the need for rationalizations and how this has led to large self-service stores. Strong experiences from their past have shaped their view of what is good food of high quality and which stores that can deliver this feeling of the 'old genuine store'.

To understand these meanings, four contrasting buying groups could be observed along with their willingness to save or waste, as well as their willingness to possess or experience. Scarcity, economy, lower demands and preparing food from scratch were important aspects during the depression and, therefore, those participants born during the 1920's and 1930's think it is important to save, something which affects them in their food buying and consumption behaviour. However, the 'baby boomers' from the 1940's grew up during a time characterized by an increased economic growth, leading to a willingness among these consumers to spend their savings to fulfil their dreams as well as to do something good for the society. It is thus important to understand how experiences from the past unite or separate these groups as generation cohorts in order to understand their present food buying behaviour, choice of stores and brands.

6. Food and the new country. Report from year two.

6.1. The households

During year two, the project focused on immigrants coming to Sweden during the last 15 years (Brembeck et al., 2006). Most of the households taking part in the study were from Bosnia-Herzegovina but also a few from Serbia-Montenegro, Iraq and Afghanistan (the most common home countries for immigrants coming to Sweden the past years) (Brnic, 2004). The women (only women took part in the study) had all one thing in common: they were refugees and had left their home countries during severe hardship. Almost all of them were Muslims but most of them highly secularized after 50 years of socialism, and with a very "European" mentality and appearance. For instance only three of the Afghan women wear veils (chador). The respondents all had traumatic memories, having lost relatives in the wars, and several of them were widows. Their ages varied from 47 to 74. They had a considerable amount of health problems, e.g., obesity, even though they were on average ten years younger than the women in the former study. All of the Balkan women and a few of the others had professional occupations - ranging from teachers, office workers, and shopkeepers to factory workers – in their home countries. Most of them came from cities, where they had lived in their own houses and had had a good life prior to the war. Now, almost all of them were being supported through the help of subsidy, husbands' or children's salaries and some of them were old age pensioners. They were living in rented apartments in the same suburb in the outskirts of Gothenburg and they were all taking part in activities at a social meeting point for women (where this project got in touch with them). They had been living in Sweden for between 5 to 15 years and had been granted Swedish citizenships. Given the situation in their home countries the likelihood is high that they will spend their old age in Sweden surrounded by children and grandchildren.

6.2. A new start – food as a mediator

You have to eat to survive, the women argued. This was the main purpose of food for the women in the study who had all experienced wars and shortage of food. Cooking also represented skill and female knowledge. The women did not understand the researchers' wish to speak to the husbands as well, since cooking was their duty, pride and joy. Evidently properly cooked food looks delicious and has a nice taste and scent, but these aspects of food were self-evident and nothing much to talk about – that is just the way food is. Food, cooking and eating were not very much reflected upon (cf. Giddens, 1991), at least not until the arrival to Sweden.

As refugees in a new country food, however, took on new meanings, and most importantly it took on the meaning of keeping the family together – both in Sweden and in the home country – and of linking the family members to the Swedish society. The way food works as a mediator between old and new, habituated and unaccustomed, has been one of the most intriguing findings of this study (for an international comparison, see Al-Ali, 2002). Food is about sitting together and talking while having a tasty nourishing meal, and the preferences of children and grandchildren especially have a great impact on what is being served. Another interesting finding is the great interest the women take in Swedish food, and their readiness to mix Swedish and their national dishes with ease, as well as their eagerness to keep specialties, like the Bosnian pie, or Iraqi brijani that is very much associated with the home country and to the role as a skilled housewife and cook. Their wish is that their children (daughters) and grandchildren will learn to appreciate and prepare these symbolic foods and their fear is that they will not be able to pass these skills on because of their children's lack of time and interest. This way a vital link to the home country and to the traditional women's role and the skills involved will be lost. It could thus be argued that these families create 'frontier lifestyles' (Bryceson & Vuorela, 2002) or 'third cultures' with food as an active medium and women and children as agents.

6.3. Plenty of time – short of money

The resources households use in order to satisfy their needs and create a good a life can be classified as material and immaterial. Material resources are artefacts, equipment, housing, cars, etc. Immaterial resources are knowledge and skills, attitudes, values, empathy, all found within the individual. Time as a resource does not quite fit into either of these classes or into both.

The immigrant households were found to have plenty of time at their disposal, mainly involuntarily due to unemployment or sick leave but also through retirement. Also, when it came to food preparation, knowledge and skills were high. On the other hand, except for housing conditions, they were poorer than the average Swedish household when it came to income. Their consumption, especially food habits, shows some patterns which can be interpreted as the consequences of the availability or scarcity of different types of resources. A great deal of time is spent on grocery shopping in order to keep costs down. Meals are usually prepared at home and bread is often baked. Food preparation gives meaning and structure to the everyday life of the women.

Traditions from their home countries are maintained through preparing traditional food even though Swedish food culture has been integrated into their everyday diet and is also appreciated (cf. Jonsson, 2004; Koçtürk, 1990, 1997).

The women regard good food habits as an important way of staying healthy. Compared to Swedish households, their eating habits are of an equally good nutritional standard, if not better. An exception, in some households, is the excessive use of cooking oil and in some cases also sugar. There are some concerns about food safety and great care is taken in making sure that the food is not contaminated, too old or containing excessive levels of pesticides. Generally, though, environmental issues are not a main concern. The Swedish environment is experienced as very clean and healthy and the respondents do not see any need to change their everyday habits. Separation of waste is regarded as natural and is practiced in all households.

6.4. Technical artefacts – the same and different

If any major differences were expected between the technical artefacts that the households used to use before the move to Sweden and the artefacts they use today, such differences cannot be identified. In most cases, the technical artefacts that are available for the households are the same as the ones they had access to in the old country – even though the standard may have been different (and not always poorer). The socio-economic situation in the old country may partly explain the non-differences. A complementary explanation may be that domestic technology and the technical artefacts used for storing, preparing and cooking are part of what Riesman (1964) refers to as the ‘standard package’, i.e. a set of technical artefacts that is

common to most and can be found in most households in a culturally homogeneous area, independent of economic status.

Not always explicitly verbalized but through diaries, recipes, and the photos taken, was the fact that the households' food habits and the habits in preparing the food shape the usage of the technical artefacts, habits which at least to some extent have been established 'before Sweden'. The methods used for cooking are, evidently, the common ones but as the households often eat soup and different types of casseroles they most often use the stove for cooking rather than frying and the stove rather than roasting in the oven. The oven is primarily used for baking bread, pies and cakes.

One can detect certain changes, over time, in the possession of technical artefacts. Some of the respondents have, e.g., continued preparing coffee as they previously did and prefer Turkish coffee. Other members of their families, on the other hand, prefer Swedish coffee while still others drink espresso or cafe latte. This means that one, in addition to the Turkish coffee pan, also owns a coffee percolator and/or an espresso machine. This exchange of, or addition to the existing set of artefacts, may be a consequence of adopting new habits as part of moving to a new country but it may just as well be the consequence of a general globalization trend and would have occurred with or without the move to Sweden.

In general, the respondents have a fairly neutral opinion of technology in relation to cooking. Most respondents cook using basic ingredients, and have time to prepare and to shop (cf. above), some use slightly more advanced technical artefacts while others choose not to. Time-efficiency, which is often argued as a reason for increasing the use of technical artefacts, is not important (cf. above). Instead, the respondents are proud to be able to prepare food by using 'their hands'. One particular artefact, however, split the group into two: the freezer. One group is very positive to the freezer while the other is very sceptical referring to poorer quality as a consequence of deep-freezing the food. The major reason for using the freezer is economical since the freezer allows the households to buy larger quantities of, e.g. meat, when there is a "good deal" in the shop. Thus, technology related to storing food holds some conflict while the use of technology for preparing and cooking does not.

The respondents are from different countries and of different ages. Part of the differences in attitudes towards the use of technical artefacts may be explained by age or by nationality but overall identified differences seem more related to the specific socio-economic situation of the household, now as well as earlier. Thus, individuals with a background in a rural community in one country may have less in common with a person of the same nationality but from the city than he or she has with someone from a rural community in another country.

6.5. Shopping and consumption – a bridge to a new culture

Food is necessary for all human beings in order to survive. It is also a cultural expression. The symbolic meanings of food can consequently differ leading to different consumption patterns, buying behaviour and experiences of brands. Moving to a new country is part of a cultural change process that can include learning to shop and consuming new products and brands in a foreign cultural context. When immigrants are confronted with different cultures new hybrids of cultures may develop. They may want to consume specific products and brands in order to become accepted in the new culture. Integration agents, e.g. children, friends, family, media, social and religious institutions, may serve as bridges between different cultures. However,

marketing activities in stores can also be an integration agent that can play an important role when changing a consumption pattern when immigrants are confronted with a new culture.

The study reveals that food shopping and consumption within this new market logic is rather complicated. The stores are perceived as very modern with an amazing assortment, but the food does not taste the same as it used to in the home countries. The limited language skills make communication hard for the women and they have a tough time recognizing the products and brands.

Grocery shopping is a social activity giving the women meaning in their lives and they go to the store several times per day. They are, however, at the same time stuck in a consumption paradox. They have come to a consumption society with stores full of food, but they have little resources to buy the most wanted food and brands. They cannot shop as often as they want in typical Swedish food stores and have to buy most of their items at low price stores, where they cannot find the Swedish food and brands they are looking for.

In order to understand the shopping and consumption behaviour of immigrants, the development of a 'third culture' as a hybrid between different cultures is important. Integration agents in terms of store commercials and recipes play a crucial role in the process of learning and testing Swedish food and brands. The commercial forces could actively take part in these cultural change processes in order to integrate immigrants into a new society. Brands can enhance the 'third culture' identity, making the immigrants feel that they are part of both their old and new culture. Swedish brands and stores are seen as having a strong symbolic value for the immigrants in the study. Consequently, food stores ought to draw attention to how Swedish food customs and products could be introduced to immigrants along with a mix of all the other cultural food influences.

7. Coffee, fishing and community activities. Report from year three.

7.1. The households

The third year study focused on consumers in a sparsely populated area of southern Sweden. They were living in a small community in Dalsland, (here called) Dalofors, with only 700 inhabitants, surrounded by a woody countryside. Twenty-one households took part in the study, most of them couples, and in some cases both husband and wife were interviewed, resulting in 28 respondents altogether. Nine households consisted of only one person, most commonly a divorced or widowed woman. The majority of the respondents were between 59 and 70 years old. Most had children and grandchildren, some living within commuting distance, while others were living in larger cities in southern or middle Sweden. Of the respondents, only four had lived their whole life in Dalofors, the others were newcomers or had moved back after several years away from the community. As many as 19 of the interviewed individuals were born and raised in the countryside, most of them in the region of Dalsland. The impression was that many had returned to their roots, or at least to the countryside, where they once were born. On the other hand, two of the women were born abroad, but had married men from Dalofors, and now resided there. All of the respondents were or had been working in a professional occupation. Their occupations mirror the gender-segregated labour market of the Swedish countryside, with the women working in relatively low paid caring and service occupations, and the men in occupations like tractor driver, painter and policeman. There were examples of respondents with at least a college education,

like some economists and a librarian. The general impression, however, was that both occupational level and income of the respondents were lower than compared to year one, in many cases similar to the new Swedes' of year two. Compared to national statistics, Dalofors was a "typical" small community in a sparsely populated area (Glesbygdsverket, 2004).

7.2. The slow and comfortable pace of everyday life

When choosing Dalofors as the focus for the third year's study, the expectations were to meet a common countryside population with similar ideas and interests. Instead a diverse pallet of backgrounds, values and lifestyles was found. All the different 'foodstyles' from the first two years of the project and some additional ones were represented.

The general impression is that in Dalofors, older people have a good life – also in relation to food. Routines and rituals regarding meals and cooking make life stable and safe. The gardens are filled with grown berries, fruits, root vegetables and spices. In the lakes there are plenty of fish, and in the woods game, wild berries and mushrooms. The spouse and the dog or cat are good everyday companions. Thanks to strong communal ties and rich community activities, which all the respondents are more or less involved in, not many feel lonely and isolated. The coffee drinking culture that flourishes at community meetings of various sorts is an important sphere where the values of food and eating are generated, in addition to the home (for a comparison, see Døving, 2002). Traditional countryside life of the region remains in food courses and food memories. Here, the Dalsland's cake (Dalslandskakan) holds a special place connected to women's as well as regional pride. There are no recipes and the women have learnt how to make (or "fry") it from their mothers. They are proud and content when their children and grandchildren ask for a piece of "grandma's cake". It is, however, important not to overstate the importance of traditional cooking, and to view Dalofors as a reserve for old-fashioned food culture. New food impulses come all the time, especially from holiday trips abroad, from TV, magazines and the internet, making the global sphere (Appadurai, 1998) another place where knowledge and values of the inhabitants of Dalofors in regard to food are generated.

Just as in the city, in Dalofors there are plenty of couples that share the responsibility of cooking, especially among the newcomers, and also some men who are both competent and eager cooks. There are at the same time women who have had their daily meals at the workplace all their life and now, as retired, consider the daily cooking a burden that they want to do away with as quickly as possible. Not all women in Dalofors are immersed in cake making and mushroom picking.

Thinking of life with food in the future, they want everything to stay as it is for as long as possible. They want to stay at home, cook for themselves and take their daily trip to the grocery store as long as they can. Later on, the local old people's service centre is a good place to stay. There is no need for white tablecloths, lit candles and a restaurant menu, which the inner city dwellers requested. The main issue is just getting a room or small apartment at all when the time comes. The service centre is not an unknown place. Here one meets all the local friends and acquaintances. If one, in addition to getting good and nourishing meals, continue one's engagement in community activities and feel safe that the cat or dog is taken good care of, old age is nothing to worry about.

8.3. Healthy and active living

In many ways it is a healthy life the respondents live in Dalofors. Living in a rural area offers the possibility to wander in the woods and countryside and to enjoy exercise and fresh air. Most of the respondents do so and most are not hindered by any physical handicaps. The interviews and additional data show that the respondents have developed individual strategies to provide varied and balanced diets for themselves, either by preparing meals from scratch or by buying ready-prepared meals. There is a great variety of meal patterns and food choice among the respondents. Some prefer traditional Swedish meals with meat, sauce and potatoes, while others have exceeded to some special diet such as the vegetarian diets. Generally, they are aware of health issues. When someone in the family becomes sick it is usually the women who become responsible for making sure that the doctor's instructions regarding changes in food choices are followed.

Hunting, fishing and berry picking are greatly appreciated pastimes. The resulting delicacies are prepared for special occasions or given away as gifts. Eating out is not common. They usually eat at home but also away from home in connection to social activities. Then, togetherness is experienced and life feels meaningful (cf. Svensson, 2006). At such occasions food is an important component.

The respondents reflect over environmental degradation but do not take many conscious actions to change their behaviour. One thing practiced by all households, however, is the separation of waste, a habit that seems to have been established already during their childhood. A health aspect of life in Dalofors is the participation in many social activities in connection to the associations for different activities even though this could also cause some stress. The joy of being involved, particularly in developing their community and being grateful for having the opportunity to live there, seem to outweighed this (cf. Ingelstam, 2006).

The way of life of the inhabitants of Dalofors could be characterised with the words 'resourceful' and 'humble'. This is true particularly when it comes to environmental behaviour, whether it be recycling, reuse or use of local resources. Maybe this is a result of experiences from childhood in a semi self-subsistence economy. One could predict that the ever-increasing appeal of changing lifestyles towards more subsistence would receive a strong response in the 55+ group of the population. However, the accessibility of ecological and locally produced food is not greater here than in the city. The great reliance on car transport in the countryside is not an environmentally friendly side of rural life.

8.4. New technology – becomes old – become new

The relation between food and technology, or technical artefacts, was not obvious to the participating households in Dalofors, nor has it been in the interviews with the city dwellers or the new Swedes. The many technical artefacts used for storing, preparing, and consuming food are not consciously considered and reflected upon by the respondents until provoked – with one exception, the microwave oven. Stoves, ovens, freezers and fridges are domesticated (e.g. Silverstone & Haddon, 1996) to the extent that they have become part of the background. They are technical artefacts found in the household but they are no longer referred to as 'technical things'. Microwave ovens are, on the other hand, a technical artefact that can be described as still "undergoing domestication" even though a use pattern has been established. The micro-oven is used for defrosting and heating frozen food and leftovers but in very few

cases for 'cooking from scratch'. It tries to find its physical space in the kitchens, often dating before the 1990s, in a corner of the workbenches, or on an odd shelf. Again, though, this has been true for almost all respondents participating in the project.

When specifically asked if and how technical artefacts have had any influence on the respondents' relation to food and food consumption the microwave oven is, nevertheless, not in focus. Instead it is the freezer that is mentioned during this third year of the project - as it was during the first. The reasons described by the respondents with a rural background compared to those with an urban one, however, differ somewhat. For individuals brought up in an urban environment, the freezer is associated with preserving food but also, e.g., less dependence on the shops' opening hours and less visits to the shop. Many of the respondents from year three describe how, when introduced in the 1950's and 1960's, the freezer facilitated the once hard work involved in preserving large volumes of food, not food bought in shops but rather home-grown vegetables and fruit, or meat from the autumn elk hunt and the Christmas pig slaughter. A slightly different perspective.

New technology is often associated with change. When the respondents describe the introduction of the freezer they describe a change in terms of less work and less time being required but not a change in terms of radically new routines. Rather the new technology could be argued to have helped the respondents hold on to 'old' habits, saving and preserving, by facilitating them. The reason for technology's adoption and domestication may be explained thus. Also nowadays the freezer plays an important role for preserving the rural respondents' 'own produce' as well as, e.g., fish caught by the respondents' themselves, or their children, or even their neighbours and brought as gifts (cf. above).

One artefact found in Dalofors but not in the city of Gothenburg, nor in the suburb, is the wooden kitchen stove. Even though several respondents remember the wooden stove being thrown out when the rural areas of Sweden were electrified during the 1930's and 1940's (or later), several kitchens house an electric as well as a wooden stove. In one case, even, the household had fairly recently added a wooden stove to the "old" electric one. Affective aspects play an important role. The stove contributes to a "cosy" kitchen, it provides heating, but perhaps equally important is that it seems to be a safety device in that it provides heating and cooking facilities when the electricity is gone due to, e.g., bad weather.

Overall are the similarities between the rural households and the immigrants in the city suburb or the city centre dwellers are more obvious than the differences. Stoves, ovens, fridges and freezers, as well as food processors, coffee machines, and microwave ovens along with a number of additional household appliances are all part the 'standard package' (Riesman, 1964). Whether used or not, they are part of the domestic kit.

8.5. The great varieties cease to exist – the food store changes its shape

One important factor used to describe impoverishment in the countryside is the reduced access to service and above all the closing down of stores. Many stores provide citizens with important service and therefore the lack of stores lead to negative consequences. In Sweden the number of food stores have decreased by 19 % since the beginning of the 1990's (e.g., Glesbygdsverket 2004). In all, 1,016 food stores have closed down in Sweden between 1996 and 2005 and most of them had been situated in the countryside (Konsumentverket, 2006).

In Dalofors this development is very evident. The community has had a great variety of stores and some of the respondents described a lively village with almost 20 stores and a market every week. When cars were introduced people went outside the village to buy things and gradually stores began to close down. This became a vicious circle and when the service decreased more and more people took their cars to go to other places to do their shopping. Finally, Dalofors just had one food store left and its profitability was low. The food store chain then changed the store concept and the citizens of Dalofors found themselves left with a small city store with a narrow assortment and lots of sweets, soft drinks and crisps. The city store concept was a standardized concept for small service stores and while it may work very well in cities where people do not buy their main food supply in these stores, it was a negative change for the respondents, especially for people (typically older) who did not have the possibilities of using a car to go to other places to buy their food. An evident conclusion that can be drawn is that food store chains must adapt their small service store concepts and create a 'countryside concept' instead.

The food store is a very important meeting place for the participants in the study and they often go to the store to meet friends and to hear the "latest news". One does not need an excuse to go to the store and it is not always a planned activity as are many other things that the respondents are involved in. One can clearly see the potential if these older citizens could be seen as resources in the food store and the local society. They would undoubtedly become involved in the development of the local country store if they were given a chance. For instance, as already mentioned, many of the participants cultivate their own vegetables, go fishing and hunting, bake their own bread and maybe these goods and locally produced food could be sold through their local food store making the assortment more interesting. Another possible solution to the problem with stores in the countryside could be to create a virtual store. Younger people involved in organizational activities could help older ones without

computers to order food through Internet and the rooms used for activities could then serve as the new meeting place for this virtual store.

In sum, the participants have accepted the fact that the degree of service is low and they have ended up with a store that they actually do not like. On the other hand, there is a possibility of changing the store concept with the help of the older and still very active citizens. They do not have any fancy demands – they just want to eat proper natural food and be able to feel the aroma and touch the food as they once used to do.

8. Discussion, conclusions and implications

The overall aim of the project has been to contribute to increased knowledge and understanding of consumers' +55 and their views, preferences and expectations for food and food consumption in relation to differences in socioeconomic status, ethnicity, gender and regionality. The project has revealed similarities as well as differences between the three groups of consumers that have participated; the well-educated and economically well-off city dwellers, the new Swedes in the city suburb, and the individuals living a more sparsely populated area of Sweden. These similarities and differences have implications for food producers, for food stores, as well as for consumer policy makers.

For instance, all of the respondents have one thing in common: that they want to stay at their homes for as long as possible and take care of the daily cooking themselves. A consumer policy for the ageing population should support this standpoint, not only regarding food quality and issues of health and distribution, but also regarding social issues. Nicely set tables and conversation with relatives and friends are important. This is when the meaning and values of food flourish. For the new Swedes this meaningful environment mainly consists of the family. For the inner city and countryside dwellers, family is also important, but even more so are friends (for inner city dwellers) and locals (for countryside). These are the people with whom they want to spend their old age and share their meals – although sometimes they want to enjoy them on their own and having this choice is important!

For the new Swedes, mainly Bosnian and Iraqi Muslims, cooking and sometimes also eating are gender segregated. Cooking is the women's doing and they take great pride in it. Family meals in the evenings and on holidays are very important, while lunches and snacks often are eaten together with friends of the same sex: the women have coffee or tea and cakes in their homes while the men have lunch together in small restaurants or cafés with food from their home country. Acknowledging this partly family-based, partly gender-segregated eating in old age is also important when planning for services for the elderly. Regarding the Swedish born respondents it is equally important to do away with gender-segregated thinking in terms of food. It should not be taken for granted that women are able to and/or like to cook tasty and healthy food and that men are novices at the kitchen stove. It might just as well be the other way round.

Both the city dwellers and the rural consumers +55 can imagine moving to a service flat, when they are not able to cook for themselves any longer but their respective expectations differ. In the countryside the respondents do not have any huge demands for the standard of the service flats. The local service centre is a satisfactory solution: there they have friends and neighbours of the same generation that they have known for all of their life and feel comfortable with. The inner city dwellers, on the contrary, place high demands for luxurious

and technically advanced flats, nice eating environments, restaurant menus and entertainment: all kinds of experiences, and they cannot imagine living in an old people's home of former days. Some of the inner city residents even plan for a common living before retirement, just for the joy of living and eating together with friends, some of them may not be as healthy as themselves. To be able to choose who you share flats with, when and how to eat – by yourself or together – is important. The immigrants in the city suburb do not talk about moving into a service flat or a retirement home but it is not an unlikely scenario. Considering that many of them may have limited knowledge of Swedish, it is important that, e.g., different staff are multilingual and, further, that they have knowledge of different cultures.

It is obvious that experiences during the respondents' life histories have shaped their strategies of resource management and memories of resource scarcity have developed resourceful individuals. Actually their values are close to the modern lifestyle concept of being "environmental friendly". It is likely the consumer 55+ will adhere to policy regulations and appeals of changing everyday habits towards more environmentally sound ones. However, the consequences of the individual getting older and loosing bodily functions must be taken into consideration when designing the new solutions. The distance to the recycling station must be in short reach, public transport easily accessible and available close by, and organic food available in the local shop.

Furthermore, many of the respondents are health conscious. It is of utmost importance to them that their demand for, e.g., fresh fruit and vegetables will be fulfilled in the future, particularly if and when ready prepared meals are served or delivered. At the same time there is a clear tendency to value the gastronomic aspects of food among the men who participated in the study. Overall, many of the men are in the risk zone of developing food-related diseases, having too much fat in their diets. This is also a risk among the participating immigrant women. Help with nutritional information and food preparation might also be needed. For example, in those cases where one spouse has become sick and needs a special diet it is important that this is recognised and that special support is given. This can be done by making special products available on the market as well as services in the home, commercially or supplied by the public sector.

In order for the consumers +55 to remain in their own home, a prerequisite is that they can manage both the acquisition and preparation of food. Going shopping is not any major problem for most of the participants – as yet – but to be able to get food, both ingredients for home cooking and ready-prepared delivered to the door, is a wish that many have expressed, particularly the respondents in the rural area. New and inventive systems need to be developed, at least in Sweden, to fulfil this future need for distant shopping and home deliveries. Here, information and communication technology can play an important role. However, there may be other options. Particularly in the rural community there is the potential of developing communal activities among neighbours to prepare meals for each other, complementary to public food service programs.

A common theme across the three years is how the respondents' life experiences have affected the way they want to buy and eat food. Two different paradoxes have been found: A willingness to save or waste versus a willingness to possess or experience. Scantiness and being economical and satisfied with small things in life are evident for the participants that have grown up during war times, while the ones that have experienced a period of high economic growth when growing up are more interested in realization of dreams. For the rational consumers (mostly born during the 1920's) it is important to buy food worth its price,

while the consumers that consider themselves food experts (mostly born during the 1930's) like to buy high quality food that can be quite expensive following rather rigid perceptions of what type of food to cook and eat. On the other hand, there are others enjoying life and food shopping (mostly born during the late 1930's or 1940's), seeking new food experiences and brands as well as moralists (mostly born the 1940's) that have difficulties buying food with reference to health, environmental issues etc.

Overall, stores are important arenas for consumers' perception of food. Food stores can create different symbolic meanings of food and food brands. Buying food is an important social event and a way to meet other people. The respondents buy food frequently and many visit their food store more or less every day. Especially in the countryside they often visit the local food store to meet friends and to hear the "latest news". The closing down of stores has, however, led to the lack of what is considered to be a good food store. Instead they face a store with a dull and inferior assortment adapted to a city service concept. Shopping food for the immigrant participants is, in turn, a social activity giving meaning to their lives and they may even visit the store several times per day. Their problem is, on the other hand, their lack of economic resources leading to a consumption paradox. They want to consume, but it is simply not possible.

Thus, in order to create a positive extra value for the consumers +55 through different brands and store concepts, it is necessary to understand the diversities among the older consumers and what they regard as a good life. There are no food stores or concepts targeting older consumers in Sweden, the stores are developed to attract all consumers. Consequently, there is room for improvements. Food stores could try to market products that interest older consumers. The results indicate that older consumers read store adverts and recipes that the food stores send out and tend to plan their food consumption with regard to it. Evidently, food stores can adapt this communication and have special pages in the adverts that suit the diversity of older consumers. The store adverts and recipes also appear to play a crucial role in the process of learning and testing Swedish food and brands for older immigrants. In addition, having a place in the store for older consumers to interact, sit down and rest while talking to other older consumers could be seen as one way to enhance social interaction. Another way is to have a manual service for, e.g., cheese, meat and delicacies. This creates a feeling of the past when all food was bought in stores with manual service as well as in interaction with store personnel. For immigrants it could be a way to learn and test Swedish food.

In sum, when it comes to providing food for the consumer 55+ the findings lead to some clear implications:

- There should be a variety of choices; traditional Swedish foods, foods of other ethnic origin, organic and/or vegetarian food, industrial large scale as well as locally prepared.
- The food should also be served in a variety of settings to fulfil needs. For the ones who wish and are able to prepare their food at home, there should be a facilitating delivery system of food items. For those not interested in food preparation there should be a variety of other possibilities; local restaurants and/or home delivered ready prepared meals, supplied by the public catering service or commercially.
- Food stores could adapt their stores with regard to the diversities of old consumers. However, the older consumers should not be treated as old, but as customers along with other customer groups.

- Using city store concepts in the countryside will lead to a store poorly adapted to the needs of old consumers forced to buy their food in the local store. Instead a country store concept should be added to the existing ones.
- Commercial forces could actively take part of cultural change processes for old immigrants and serve as a bridge to a new food culture. Consequently, food stores ought to draw attention to how Swedish food customs and products could be introduced to immigrants along with a mix of other cultural food influences.

What was found most impressive during the three years' project was the inventiveness regarding food and eating that the respondents showed. They had lots of ideas on how to improve their own eating situation as well as for elderly people in general, ranging from housing and transports to dishes and issues of health and sustainability, ideas well worth trying. The best proposition to policy makers is to listen to the 55+ consumers and support their local ideas. Consumers 55+ are the experts on how to create high quality eating conditions for older people.

Pragmatic age

The meaning of age in relation to consumption of holidays among Danish and German mature travellers: horror-vision or privilege?¹

Abstract

Growing old and being old is not associated with positive connotations in today's society. A number of stereotypes about the elderly confirm this. This might be part of the explanation why people dissociate themselves from being elderly or old, and an extensive body of literature documents that there is a clear difference between chronological and cognitive age. In this paper it is examined how Danish and German mature couples consider age, particularly with regard to consumption of holidays, and the use of young and elderly models in tourism marketing. The study is based on six focus groups and five qualitative interviews with mature couples. As a supplement to the well-known categories chronological versus cognitive age, the concept of pragmatic age is suggested to indicate that mature consumers can choose to negotiate the use of their age whenever they find it appropriate. The mature tourist can use age pragmatically – as the only one, the seller of tourism services cannot.

1. Introduction

“Great-grandmother, why do you have so many wrinkles”, a six-year-old's voice penetrates the dining room and all voices silence. The silence remains a few seconds, worried glances are exchanged among parents and grandparents. A great taboo has been touched upon, wrinkles being perhaps the most obvious signifier of old age. “It's because I'm so old, I'm almost 100 years old” the 84 year old woman answers courageously. The tension disappears, conversation continues. On the way back home in the car the 6-year old is being reprimanded: “Don't comment on people who look old, fat or strange when they are there, please”.

This little happening shows clearly enough that a taboo is tightly linked to being old and to looking old. At the same time as much research and demographic numbers document the segments of consumers who are not 18 anymore are growing and are at the same time affluent and active consumers.

Many issues are at stake related to mature consumers. An indignation can be seen related to the fact that older models are not represented in the media landscape, particularly in advertising and if they are present it is either as background figures or very well-kept young looking older people, but at the same time there is an obvious difficulty linked to showing elderly people, with all signs of age, because other studies show that people do not want to identify with being old. But how do mature consumers themselves view this? What is the

¹ The notion of 'pragmatic age' was inspired by the work of Robert Chr. Thomsen, Aarhus University, Denmark on 'pragmatic identity'.

meaning of age? And are mature consumers victims of negative and discriminating social constructions of age only or are they also experiencing or even using age as an empowering asset?

The main target groups of travellers in Denmark are German and Danish tourists. By the end of 2004, the Danish tourism board, VisitDenmark, decided to take a closer look at mature couples travelling without children, their second largest target group of visitors to Denmark among tourists after families with children. In this study mature couples were defined as couples older than 45 years.

The research objective of this article is to examine the meaning of age held by these consumers to know more about how these travellers perceive their own age and the signification of age when it comes to travelling and market communication promoting travelling. It is the assumption of the article that the one-sided perception of age being a taboo and only a horror-vision for mature consumers is too limited. This paper seeks to nuance this discussion.

2. The Meaning of Age

In the following relevant aspects of research, journalistic articles and various reports are presented regarding characteristics of mature consumers, myths of older people, and the concepts of chronological and cognitive age. By now a considerable body of literature exists written by researchers, marketers and journalists on the topic "mature consumers", a label, which most often covers consumers older than 50 years. The background of this interest is of course that the group of 50+ consumers is growing, they have got money and at the same time it is a large and varied group of people.

The grey segment (s)

Chris Evers, former director of the Danish organisation Ældresagen (The Cause of the Elderly) writes:

During the next 40 years the age pyramid will almost be turned around in significant parts of the western world, and for the first time in history the society will be in a situation where more than half of the population will be more than 50 years (Evers, 2004, p. 43).

In addition to this Evers notes that the group of people older than 50 years constitutes approximately 30% of the population in Denmark but that these people own 70% of the financial assets and have 56% of disposable income (Evers, 2004, pp. 48-49). In Britain 61% of new cars are purchased by people over 50 (Bashford, 2004). Various labels are used regarding the segment of consumers over 50. The youngest in the group the 50-65 year olds are by Chris Evers called "the large cohorts". He defines them as follows:

'The large cohorts' are characterised by a longer life span, most of them are strong and functional - both physically, psychologically and socially - they have a relatively highest standard of living, and they wish to keep it to live out their dreams. They feel young and their withdrawal from the labour market is not at all a withdrawal from life. They are used to getting things the way they want. They are well educated and have an enormous appetite for life. They seek experiences, new

challenges and knowledge. They emphasise quality and are willing to pay for it. They are looking forward to trying some of the things they have postponed while they were working or while the children were living at home. 'The large cohorts' are active, extrovert, ready to change, quality conscious and more than willing to spend their money on products, which can add to their active lifestyle and give them new experiences. 'The large cohorts' will turn perceptions of elderly people as a passive and needy group upside down (Evers, 2004, p. 45).

Obviously there is both a strong and a weak part of this group, and clearly not everyone has the energy Evers sketches. Jean-Paul Tréguer proposes that the group can be split up in four segments: The Masters (50-59 years), The Liberated (60-74 years), The Peaceful (75-84 years) and finally The Elderly (85+) (Tréguer, 2002, p. 32). Tréguer claims that age is the most important criteria of segmentation because a person is marked by the events, which take place while he or she grows up, e.g. a world war. Poul Røpke distinguishes between the baby boomers between 50 and 70 and the more than 70 year olds as the more traditional elderly people, the seniors, even though many of these are also well functioning (Røpke, 2004, p. 20). This distinction is shared by John Picket, director of the Saga Groups market and media research: *We also recognise that baby-boomers have a very different attitude from the war generation*" (quoted in Bashford, 2004). The new generation of elderly people are often not as worn-down physically speaking as earlier generations. The baby boomers are characterised by Røpke as a generation who have experienced an optimistic society in a very dynamic development in the 1950s and 1960s with wealth, education, consumption and tourism, which their parents did not know.

A number of other sources stress that the complexity of this group is so central that the focus on generation is too simplistic. E.g. Kreilkamp as well as Morgan and Levy focus on the signification of lifestyle and interests instead of age. Kreilkamp writes: "The chronological age is not appropriate for market segmentation because this target group is not homogeneous at all" (Kreilkamp, 2005).

No one is old...

When it comes to the categorisation of certain age groups one would be politically incorrect if anyone were called old. Being old has a number of negative connotations (life would soon be over, it would be going downhill, one would not be able to manage without help, you die when you are old, etc.). For that reason many other labels than old are used when mature consumers are discussed. "The grey gold" is one label, where "grey" is perhaps a negative world, whereas "gold" is of course interesting for the business world, with a clear focus on these consumers' money. "Olden Goldies" is more or less the same with a touch of ridicule. The "50+" age group is a much applied label, which is more neutral but obviously covering a huge group of consumers. Another definition is "mature consumers". Being mature originally covered the 18 year olds who become adult and get the right to vote, buy alcohol in bars and drive a car (in Denmark). This final label "mature consumers" seems to be one step away from slightly patronizing names such as the "Olden Goldies".

Bradley and Longino (2001, p. 17) write that old age cannot be seen as a unity, and age needs to be considered as part of a life-long process of development. This theory stresses that the context and the social relations into which an individual's life is spun is much more important than the chronological age as also argued above. Treas and Longino, (1997), stress the importance of gender, background, income, education, career and health as significant factors in people's self-understanding. Many different attitudes and lifestyles exist as in any other

segment. Still the very perception of being old and what one can do when one is old has been and is changing.

Myths and stereotypes about the group

A number of stereotypes exist regarding this group of 50+ consumers; for example that they are passive, conservative, stingy, submissive, fragile and helpless (Gunter, 1998). And even though mature segments have both socio-political and consumer power: “the emphasis on youthfulness in contemporary culture has meant that aged bodies have often been marginalized or subject to ridicule (Sawchuk, 1995; Thomas and Wolfe, 1995, Gunter, 1998)” Hodgetts et al, 2003, p. 418. Also it is documented by various studies that media images of elderly people constitute caricatures which do not correspond to the way elderly people live or perceive themselves (Hodgetts et al., 2003, p. 418).

Several sources (among others Evers 2004) maintain that the myths about the elderly die hard, and many do not understand why producers and marketers are not more focussed towards the group, and seem to focus on and give priority to younger segments, which is for example reflected in the use of young models in advertising. In recent literature about mature consumers most of these myths are rejected. Bashford writes: “Despite the stereotype of older generations as anti-change, they are a liberal bunch, with many wielding wallets full of cash they want to spend” (Bashford, 2004, p. 1). Bradley and Longino write that younger people have a much clearer image of how older people are, than older people have themselves (2001, p. 17). They mention an analysis of caricatures by ageing bodies carried out by Scarfe (1993). The caricaturists make deep wrinkles in the face, hanging skin under the chin, draw people bald or with grey hair, with shrunken lips, liver spots, bowed legs and stooped backs and with all kinds of accessories as walking canes, walkers or wheelchairs.

In a study from 2000 from the American National Council on the Ageing, researchers compared young and old people’s view on “old-age problems” such as health, income, loneliness and crime. It was found that more young than old worried about these problems. This indicates that the chronological age is no central indicator for the experience of ageing (Whitelaw, 2000, quoted in Bradley and Longino, 2001). Bradley and Longino write: “age is not very central in defining who older people think they are. Younger people tend to have a more defined idea about what old age is like than older people do”.

There has recently, however, been a change in the general presentation in the way elderly people are presented in media “to include the ‘active’ or ‘remarkably youthful elderly’” (Hodgetts et al., 2003, p. 419). Elderly people are slightly more present in media representations, but with a focus on the youthful and well-kept look (Carrigan and Szmigin, 2000).

Difference between chronological and perceived age

As mentioned above in the literature about the mature segment it is questioned whether age is at all a relevant criteria to work with because the chronological age does not at all seem to be central in peoples self-perception: “elderly people act much younger than their age would suggest (Lazer, 1985, quoted in Millian and Erffmeyer, 1989) of course revealing a clear idea of how elderly people ought to behave. And “Most rate their health as good to excellent and feel 10-15 years younger than they are (Hanson, 1987, quoted in Millian and Erffmeyer, 1989). In a Swedish study by Oberg and Tornstam (1999 also quoted in Bradley og Longino, 2001) 2000 Swedes between 20 and 85 years of age were asked if they think their bodies reflect who they are. It appears that more than 80 percent of all respondents and an even

bigger part of the respondents older than 65 answers positively. This indicates that most people seem to accept their bodies as reflections of themselves, and the older the better (Bradley and Longino, 2001).

Biggs (1999 quoted by Bradley and Longino) thinks that people create their identity later in life through what they have achieved in the past and according to which plans they have for the future, rather than from a set of stereotypes and most often negative characteristics of what it means to be old (Bradley and Longino, 2001, p.18). According to the authors people only feel old if they are sick or depressed and have a tendency of associating being old with people in a rest home. Bradley and Longino conclude that elderly people have not got a shared image of the meaning of getting old, and that there are huge differences within the group. The mature consumers identify themselves with several different aspects besides their age.

Market communication and models

"The day I have something to sell to this target group I will not mess up the message by letting an 18 year old assure a 60 year old that this or that product will keep her young and in shape"

(Extract from discussion group made by Chris Evers, Evers, 2004, p. 43).

Carrigan and Szmigin, 2000 offer a clear overview of studies that show that advertising do not reflect a balanced and equal view of the population in ads. Obviously, in connection to the discussion of cognitive or chronological age, it is clearly a problem when models have to be chosen for market communication. Which age should models reflect? "Body image", the perception of ones own body, is particularly difficult to handle when it comes to marketing targeted at older segments. According to Bradley and Longino in the current market communication it is claimed that elderly people worry about their changed physical appearance which is different from the "perfect bodies" which are cultivated in the consumer culture and are shown in ads (Morris, 1998 in Bradley and Longino, 2001). According to Featherstone and Hepworth (1993 quoted in Bradley and Longino, 2001), however, the physical observable appearance change with age, the core identity does not. There has not been a tradition for showing other than young people in ads. Older people have almost not appeared in ads, and if they have it has often been in caricatured roles (Gunter, 1998). As mentioned by Carrigan and Szmigin, 2000, more room has recently been accommodated for older models, but only the youthful and well-kept models.

The general perception of being old and elderly is negative. People do not identify with being old and probably why people tend to perceive themselves as 10-15 years younger than they really are. But at the same time they do not want to be perceived as pretending to be too young either. An example is Doug Garner, a consultant for the market research company OlderButWiser, who is 50+ himself. He explains that he has seen a new car, which he really fancies, but "I wouldn't be seen dead in a car like that - it's so obviously designed for a young person" (Bashford, 2004). Not perceiving one-self as old and not pretending to be too young either reveal a complex web of meanings related to age and consumption.

Summing up it is clear that mature consumers cannot be stigmatized as one group and not at all as "old". These consumers are heterogeneous just as other consumer age groups. Stereotypes about mature people (that they are passive, vulnerable, conservative, stingy, etc.) die hard but are out of tune with reality and these peoples' self-perception. The experience this group holds, the society in which they grew up, the resources they are in charge of and

the influence they are used to having, makes this group very different (active, anti-authoritarian, self-centered, fit, etc.) from mature people in earlier days. According to the literature these people do not identify with their chronological age, but they build their identity on what they have obtained in life till now and the plans they have for the future and rather identify with a cognitive age. Few older models than young models are used in the media landscape, recently more elderly models are being used, but only youthful and well-kept models. This indicates that chronological old age and being old are absolute taboos which no one identifies with at any point and that elderly and old people are mere invisible victims in the advertising and consumption game. The following empirical study on mature consumers show that this does not always hold true, but that age is also used as a means of bargaining and negotiation by empowered mature consumers.

3. Methodology

This paper is based on an empirical comparative study among Danish and German mature consumers, as these are a main target group in Danish tourism. As a first step, 5 qualitative interviews with couples were carried out in Aalborg, Denmark. Hereafter 6 roundtable discussions were carried out in Aalborg, Düsseldorf and Hamburg, with one group younger than 60 named “the empty nester group” and one group older than 60, named “the senior group” in each city. The informants were between 45 and 75 years of age, and a criterion of selection was that they were active travellers. The interviews were carried out in people’s homes, and the roundtable discussions in a market research institute in Aalborg. The participants were recruited by the market research institute and carried out by the author and assistants.

To generate talk about holiday and the meaning of age a number of relevant themes were brought up and participants were asked to make a collage by picking out 5-6 pictures from 47 promotional pictures featuring various holiday activities, accommodation and nature with both young and elderly models. Also the participants were asked to comment on 3 posters with various product offerings also featuring elderly to old models. Only at the end of the interview age was introduced directly by the moderators.

The analysis is built up thematically and the literature review functions as a conceptual framework with a special emphasis on how the participants talk about age, how this relates to the myths about being elderly, how shifts related to age influence on holiday consumption and finally how age from time to time can be used actively with a specific aim in mind. The data has been analyzed with an openness towards patterns and tendencies, which offers knowledge about the participant’s perception of age related to holiday consumption.

The target group, which is in focus in this project, is mature people who live in couples. Singles are thus not represented even though this without any doubt could have been interesting. Still the data material represents testimonies from a very broad group in Germany and Denmark from couples with teenage children, who have just left home, but still are very present in the home to couples who have grandchildren who are already grown-up. The study is obviously not directly generalizable due to the limited size of the sample, but the qualitative nature of the study allows for detailed and indepth understanding of the perception of age of the participants, and findings are considered in the light of other studies. Therefore it is plausible that the findings are valid not just in this specific context.

The participants in this study are people who travel several times a year. The findings and the view on ageing would possibly have been slightly different if couples who travel less or not at all had been chosen.

Travelling is considered a particularly interesting case study because this is a high involvement activity which people clearly use in their construction of self, and at the same time this is an area, which is a bit more strenuous than everyday life.

4. The Meaning of Age in a travelling Context

The travel preferences and forms do not seem to change much with age for the participants in focus groups and interviews. The participants are getting slightly more comfortable with age in certain areas, but many of them stress that they are actually more active now, that they used to be, when they were on holiday. Age is not mentioned much among the empty nesters, a bit more among the senior participants, who are often in the midst of a number of changes in their lives. A few empty nesters do however refer to age as a part of an argumentation “In our age...” but this is very few. Several participants in both kinds of groups seem to fit better into the other kind of group (empty nesters appearing much older, or seniors appearing much younger than the other members of their respective groups). In other words the appearance and preferences often seem to be much more a question about attitude and life style than age.

Myths about the mature consumers revisited

As found in the literature review a number of myths about mature consumers – particularly among the oldest – exist in society and in the media landscape, despite the fact that much research claim that these myths are out of tune with mature consumers self-perception and actual lifestyle. One such myth is that older consumers are stingy, conservative and passive.

Among the participants in the study there are a few ascetics. The oldest couple in the sample appeared to be very stingy were very concerned about costs. A few dollars of difference in the price of electricity can make them choose one campsite instead of another:

I think we are an age group who have been taught to think a little of.... [Being close-fisted] the ones who are there now, the young people...we can see that on our grandchildren. They are not really bothered...’Never mind, we’ll earn some more money tomorrow, right?’ We probably think a bit more about it because we have tried narrow circumstances (interview with senior couple 1 Aalborg).

A part from this couple, the participants give the impression that money is used and enjoyed – also on being spoilt. The ascetic couple also tells, in big contrast to the other participants that “We do not make big demands”, “We have not got big needs”, and this indicates that this couple represents as the only ones in the study “the war generation”.

Another myth is that mature couples should be conservative and less inclined to try out new products and activities is one of the myths which among others Carrigan and Smzigin, 2001, raise doubt about. On the questions regarding which activities that the participants in the groups wish to try in their holidays, Hans (senior group Hamburg) answers “Something new. To try it out”, which in this case indicates a certain open-mindedness towards new activities. This is also found by Lone (interview with empty nester couple 2, Aalborg): “I like to see something new, to experience something new”. When it comes to holiday destinations some

participants have certain places they return to every year, whereas others enjoy trying something new.

A third myth often mentioned is that older consumers should be passive. Several participants argue that they have become more active, and that they for example do not care to lie on the beach anymore, now when this is not demanded by their children: "We have found out that we are not as interested as we used to be in lying eight hours on the beach anymore. Those days are over. Today we want to be more active on our holiday. To go for a ride on a bike, or to play tennis. Or to go to towns and go shopping. Simply to do something" (Reinholt, empty nestergruppen Düsseldorf). For some participants age starts to burden a little, but several are very active, and some are even preoccupied by even very physical activity. Even though most participants in the senior groups have left the labour market, participants in these groups still express that they want to leave home to get away from their everyday lives filled with appointments and obligations.

The empirical data is thus in line with research that argue that the stereotyped image of older consumers do not represent an adequate image of the self perception of these consumers.

Shifts

For several participants there have been shifts compared to earlier. Particularly in the senior groups but also in some empty nester groups many have left the labour market. But there are also other shifts. Ole (senior group Aalborg) has just sold his boat, Lone and Kaj (empty nester couple Aalborg) have sold their holiday residence and their house and have moved into an apartment. Hans (senior group Düsseldorf) tells that he has started going skiing with his grandchild, because his wife cannot go skiing any longer. Carlo (senior group Aalborg) does not go skiing anymore because he was frightened by a crash last time he went skiing. For some the grandchildren take up a lot of time and energy and some bring their grandchildren on holidays. Others are longing to become grandparents and imagine what the holiday will be like when the grandchildren will be visiting. Deaths among old travel companions can also mean a shift. Many participants therefore have to redefine and reconstruct their holiday habits to some extent.

The participants are asked if and how their holiday has changed from earlier. Several participants emphasise that they are now travelling on their own terms. Hanne from the senior group in Aalborg thinks that the holiday now is more luxurious and more egoistic: "Now we don't have to take the needs of the children into account any longer". And Asta (also the senior group Aalborg) continues: "It was their [the children's] terms".

The new freedom (from work, from the kids) is considered a privilege: "This [new freedom] is our advantage now: we can do as we please, and then you should do it" (Ole, the senior group Aalborg).

Or: "If the weather is nice then we can just go. And when we are just the two of us, well then you can just say if you feel like staying somewhere then you can rent a room in a hotel. [...] Well, we like that, we are free now". (empty nester interview 2, Aalborg, who have just sold house and holiday residence and bought large apartment). Whether this is just talk or if the participants really live out this new freedom to the extent that they claim is not central here, they construct themselves as free and lucky in this context.

The participants travel a lot, and several of them seem to have (gotten) plenty of money. Alex tells about eating out: "30 years ago we couldn't afford it [eating out]. Today where we are alone, or without children that is, we treat ourselves to this luxury" (Axel, empty nester group Hamburg).

When the participants are asked if they think that their holiday habits will change in 5-10-15 years several they answer "No" spontaneously. When Susan from empty nester interview 1 is asked if the fact that she has become more comfortable has to do with age, she says, "I don't think it has to do with age". A few considerations are mentioned regarding whether their age will eventually limit them in their travelling – but not yet. Ole does not think that he will do horse riding in 10 years but then again: "In ten years, I don't think so, well, I don't know. There is someone I have been doing some evening rides with. He is 82. I won't be that in ten years. So maybe one should never say never".

Hanne (the senior group Aalborg) imagines that age might play a role for her legs: "Maybe you can't take all those walks you can now. If you are in Copenhagen for instance, or in another big city you have to see. Maybe you will have to take a cab or a tram or a bus at a certain point in time". It is interesting to notice that she does not intend to stop travelling, but to make use of e.g. transport facilities instead of walking, which witnesses of a continued and strong appetite on travelling.

Health

Particularly in the senior groups possible health problems are mentioned – both as a reality for some but also something, which from day to day can change one's life situation. As Ole from the senior group in Aalborg says: "This is perhaps exactly why we are so busy travelling right now while we can." A significant share of the Danish participants often travel outside Denmark and consider Denmark a safe but perhaps also slightly boring alternative, with places one can always see, when one gets too weak or unstable to go abroad, because the Danish health care system is perceived as the best in the world (another myth but that is another story).

Several interviewees in the German groups consider going on or do already go on health vacations, where the visitors can get medical check-ups, which by some participants is evaluated positively. There is a long German tradition for doing this, till recently sponsored by the German health insurance.

By some age has started to burden a little – and to play a role for the holiday: "You learn to live with what you can do, right? That is how it has to be. You don't jump and dance any longer" (Villy, senior interview 1 Aalborg). In this couple the wife is using a walker after having broken her thighbone. The couple experience that it makes great limits to where they can get, particularly it limits them from coming right down to the water at the beach at many places.

Participants do not consider themselves old or elderly, as reported in the literature study, but in the group discussion it turns out that age has a meaning. Above all an underlying anxiety and uncertainty about how long one will stay fit reign:

"The older you get, the more you will travel around at home [in Denmark]" and "You are inclined to say that as long as we can travel, we'll do it" (Elin, the senior group Aalborg).

I think it is a very big truth that this is why [because the health is good now] we travel so much. It is because we in good health as we sit here. And then I think it is important that we get to see all those things we did not see when we had the kids and went to work more or less stressed. Now we have the time, and we have the money, most people in Denmark. And we can go as pensioners, more or less. [...] We definitely have to do it now, it is not damned sure we can do it in 10-15 years (Ole, the senior group Aalborg).

“It is not damn sure” they can go in 10-15 years Ole argues. He does not just say “we can’t go in 10-15 years”, they probably will do it in the future, but to be sure they should not wait.

Some have had to change their ways already: [Carlo does not ski any longer]: “I’m too bloody old for that now” (the senior group Aalborg).

Travelling means a lot for the participants. At the thought of not being able to travel as much in the future, Hanne says: “Oh, it will be horrible”. In the senior group in Aalborg participants discuss that in the future they will again have to go places, where they were when their children were young. These are places, which are perceived as safe and accessible, such as Denmark, places in Germany like Hartzen and the Rhine, Austria, Norway and Sweden. The long flights start to become tiring. This reveals an anticipated image of themselves as in need of care and extra security as children are perceived to need. Particularly for the seniors it is getting a more and more pressing factor that they cannot count on that their health will still be fine in 10 or 20 years. On the other hand the seniors enjoy the biggest freedom, and several of them express that they feel privileged: “Last year I went on early retirement, then we got plenty of time” Carina (senior group, Aalborg). And: “We have time, we have money. We can drink our coffee more slowly” Hannelore, (senior group, Düsseldorf). We can drink our coffee more slowly, than we used to be able to, more slowly than the people who are working, this is clearly perceived as a new and privileged situation.

Becoming senior is not something, which just happens. Eva from the senior group in Aalborg has tried a “senior offer” in an inn and she says:

It is also kind of strange, this about being senior...because we were there at Vissenbjerg Kro, and we were actually some of the youngest ones. Not that it matters, but we just were. It is new that my husband stopped working and that I have. But that was just nice, peaceful and quiet. (Eva, Senior group, Aalborg).

This quote shows that Eva is not at ease yet with her life as a senior “this about being senior”. Statements as “we were actually some of the youngest”, “Not that it matters”, indicates that it does matter, and that one does not just slide over and become senior automatically. The empty nesters do not to the same extent mention considerations about age and health. The seniors feel this more closely on their own bodies and in their surroundings. The cognitive age is however not in tune with the chronological age as described in the literature.

Pragmatic age

Age leaves its marks. Even if the majority of the informants in this study are very well kept, fit and well-dressed, hearing aid, glasses, walkers, walking canes, and crutches are not a rare thing. They still do not consider themselves old. But age is an argument, which can be used in certain contexts. As mentioned in the literature review most people only feel old when they

are ill or depressed. The participants in this study do not perceive themselves as being old but in certain situations they designate themselves as old (even though they are neither ill nor depressed).

Iris from the senior group in Hamburg misses offers in holiday resorts as Yoga or Chi Gong. She says, "If this was offered I'm sure this would be very interesting. Especially for our age group". By using the argument that it is especially for our age group, without further argumentation, Iris plays up against the existing stereotypes of elderly people who have special needs, and peaceful activities are appropriate.

Carlo from the senior group in Aalborg tells about a recent trip to Malaysia, where they were two couples who had to go by night-train from Kuala Lumpur to Penang. He tells that the man at the booking office at the railway station said: "You look a bit grey in the top", and Carlo continued "But that's because we are old". Then they got the tickets at a very low price, which they were very happy about. This shows that when it comes to negotiating price age can be used as a powerful argument, where the informant aligns himself with the stereotypes of being a poor elderly in need of special reductions, even though that throughout the focus group he has staged himself as an active, empowered, independent traveller. Most of all maybe the small story above is a story of how he got himself a good and unexpected reduction in price and age was a trump he played.

Regarding not having one's own bathroom, almost all participants say: "This is something you don't want". Hanne from the senior group says: "No, not when you are past a certain age". Or Tove from the senior group in Aalborg: "I think we have grown away from that". These comments also appear in the empty nester groups. This is also an example of how, to obtain a privilege, age is used as an argument, again playing onto the traditional stereotypes of needs of special care and profiting from certain rights.

Hanne's husband does not want to go to cafés. Hanne does. She tells: "One of the things we discuss the most is...I love going to cafés and so on. Particularly in Paris or in Copenhagen. Then my husband says 'Arhh, that's only for young people and so'. Then I say: 'That doesn't matter, I would like to try that'. This is an example of how age is used as an argument between spouses to argue against an activity. Going to the café is by the husband presented as being inappropriate for not young persons, and for the sake of the argument he here accepts categorizing the couple as not young.

The data material thus indicates that the interviewees themselves can talk about being old when it suits them. In certain situations they can themselves use this label, to avoid doing something (not having one's own bathroom, not going to cafés, not sleeping in a tent) or to get something (attractive prices, special courses). Others – on the contrary – have to be very careful to indicate that they are old, as for example the findings below regarding market communication indicate.

Market communication and models

As found in the literature study the use of models in advertisements when targeting mature consumers is ambiguous. Age is cognitive and everything indicates that the participants do not identify with being mature consumers, unless they need it to legitimize certain rights or avoid doing something. To generate talk about models in market communication the participants were shown a number of posters with various offers where mature models had been used and the participants themselves were asked to make their own collage and pick 5-6

pictures from 47 promotional pictures, which had been selected to assure that there were mature models in a number of these. As a last question in the focus groups participants were asked directly about the age of models in promotional material for holidays. This was not necessarily something the participants had been thinking about before. Clearly mixed feelings occurred. On the one hand asked directly if they are bothered by the fact that the age of models in most promotional material is 18-25 years typically, the participants answer that yes this is actually wrong, but on the other hand a number of them mention that it does not bother them that the models are young.

Some argue that young models are beautiful and wonderful to look at, and other participants say that they do not notice the models at all; they concentrate on the pictures of the tourism destination instead. In this discussion several come to think of a poster with a product offering featuring quite old people in a holiday park: "The people in those pictures we just saw were too old for me personally" Uwe (empty nester group Hamburg) and another participant continues: "I thought so too actually" Beatrice (empty nester group Hamburg). The participants in the groups discuss how the use of models should be ideally. Most participants conclude that a good mix of ages would be preferable:

A good mix would be good. Even though you maybe already are older than the persons in the photo, you think 'that is old folks, I am not even going to look at that'. You still feel more attracted to the younger models than to the seniors (Axel, empty nester group Hamburg)

Asta claims "They could put some models [in the catalogue] with a bit of wrinkles here and there" (senior group Aalborg).

The strong feelings related to the issue of age is revealed in the following: "We have also seen some photos from the USA, where there are real pensioner towns. There they make promotional material with matching old people. That is a little bit my horror-vision" (Kai, empty nester group Hamburg). "Horror-vision" is a very strong word (shudder, shiver, scary) and indicates – even though he softens it a bit by saying "a little bit" that this is very deeply felt, that he dissociates himself from identifying with being old and living in towns with only other elderly people.

Another participant talks about a senior catalogue for travelling he has come across: "And that catalogue [senior catalogues] I am not even going to look at those. Not yet. In normal catalogues there should be a healthy mix [of models]" Axel (empty nester group Hamburg). In "normal" catalogues Axel says (so senior catalogues are not "normal") there ought to be a "healthy" mix. But "I am not even going to look at those" yet", he then says, and the question is if he will ever be ready to see himself as old.

Regarding the use of models some enjoy the aesthetic of the young beautiful models that are slim and suntanned. Hanne says: "I think many of them are so beautiful, so I think it is a delight to the eye to look at" (senior group Aalborg).

Asta tells: "If he [her husband] sees a large travel catalogue, with a big swimming pool with such a babe, then he says "Do you get her as well?" (Asta, senior group Aalborg). Peter in the empty nester group in Aalborg says the same, as a – slightly sexist - joke to the female

moderators of the discussion group and to the (male) person sitting next to him, about a young lady in a picture of a spa.

A promotional picture of a young man in front of a holiday cottage generates some talk. Christine (empty nester group Hamburg) creates a lot of amusement while the participant are choosing pictures for their collages by exclaiming "Isn't he just cute?" stressing that models matter.

Some participants think that promotional pictures have to be with young models: "It does not bother me if it is young people in the pictures. They are more photogeneous than us" (Rosemarie, senior group Düsseldorf). And: "But it is probably that [young models] which sells the best. We probably have to acknowledge that [...] such oldish ones like us with little hair, we sell nothing in comparison to those fancy ones, who pose with bodybuilders and cool ladies. That's perfectly clear. Perfectly clear" (Torkild, senior couple 2 Aalborg).

4. Conclusions

The concepts of chronological and cognitive age are certainly relevant to understand the life worlds of the German and Danish participants in this study. The participants in the discussion groups in Denmark and Germany do not consider themselves seniors or old folks. They are to a high extent living an active life and have a great appetite on travelling. Many tell that they have become more comfortable with age but at the same time that they have become more active. Instead of lying on the beach for hours they want to walk, bike and go sightseeing.

Getting away from stress is still an important argument for going on vacation. This indicates that life is not any less hectic, even though the children have grown up and that there is not necessarily a labour market job to care about. Even if a number of the participants have withdrawn from the labour market the majority of them are involved in many activities also in their everyday lives. Several talk with obviousness about exercising in their everyday life. The empty nesters in the study speak slightly more about the importance of having time on the vacation than do the seniors. This indicates that the seniors after all do have more time at this point in their lives. As Hannelore (senior group Düsseldorf) says "we can drink our coffee more slowly". Freedom, more time and for these people also more money come along with age, which is perceived as a privilege.

The health starts to be ailing for a few participants, primarily from the senior groups, and e.g. deaths in the circle of friends means that the thought that travel activities (and everything else) will not last forever becomes more present. There is a clear perception of that "we have to travel while we can", but it is also a clear perception that the travel activities can still go on for really long. The empty nester groups are not in the same way burdened by the thought about how long the health will last.

The concept of pragmatic age is added to the theoretical discussion on age to clarify how being old it not just a taboo and something which is not to be identified with as it is most often described in existing literature. Being of a high age can also be used as a means of negotiation to gain or avoid something, and to legitimize certain decisions or demands. This is a completely different and open way to talk about age unlike the chronological age studded with taboos. The cognitive age is to be considered and to consider one-self as younger (10-15 years is often mentioned) more dynamic and fitter (than one should think of a 70 year old for

instance) where as the pragmatic age is used to identify with the stereotypes of being old, poor, helpless, passive as a means of negotiation to obtain goods and special services or get one's will.

Models used in market communication clearly matter. Old models are not particularly popular, and particularly the participants in the empty nester groups dissociate themselves totally from senior catalogues – even classified as “not normal” or “horror-visions”.

At the same time several participants are annoyed with market promotion only using very young models. The old models in the test material do, however, give rise to significantly stronger negative reactions than the young models. The meaning of age in general and in relation to consumption of holidays is a complex zone with multiple negotiable borders, which can be crossed by some people in some situations. The mature consumers in this study appear to be empowered consumers using age, which is both a privilege and a horror-vision, in various ways as tools in their construction of selves as consumers of holidays.

The informants in this study are no doubt wealthier and travelling more and further away than other mature consumers. It could obviously be relevant to replicate this study with less affluent groups of consumers in the same age group. It is however interesting to see that even the affluent and active group use age as a means of negotiation.

The everyday life of the elderly in the cross-current of services and self-service

Abstract

This paper focuses on the everyday life of the elderly and their consumption of services. Little is known about how consumption is related to ageing people's conceptions of a good quality of everyday life or how electronic services and increasing self-service promote a good everyday life among the elderly. Consequently, the paper focuses on the characteristics and "statistical picture" of ageing consumers. Additionally, ageing theories and their applications that provide a picture of elderly people's consumption will be examined, such as activity theories, cognitive age and gerotranscendence. The use of household services, electronic services, self-service and self-provisioning will be further discussed as based on the latest studies by the National Consumer Research Centre. Finally, the article points out that the growing numbers of elderly people will increase their future influence in the service market.

1 Introduction

Public discussion on ageing has been dominated by elderly people's need for care and the provision of care. Less attention has been paid to ageing people in their consumer roles. No unified conception exists, either, on who can be classed as ageing. The definition of ageing is problematic because all who were born also grow old. Ageing is usually defined from the phase of life where the majority of each cohort leaves working life. It currently concerns those between 50-70 years of age (Simpura 2005, 9), meaning a whole array of consumers with a wide variety of economic, social and health resources (Myrskylä 2005, 17-33).

Ageing is characterized by an increasing need for services. The demand for services is growing in Finland under circumstances where the public provision of services is being challenged by economic problems and a shortage of labour. Service need is greatly affected by changes in the functional capacity and health status of the elderly. Additionally, the availability of family care and the willingness and possibilities of, for instance, a spouse or children to help their close ones affects the need for

services. However, market-based services become a necessary supply for public service production and the care services provided by families themselves. Care services and services that contribute to ageing people's independent living are especially needed.

The technologization of services has been considered an essential solution to the growing need for services. Human labour is increasingly being replaced by technology. According to technological optimism, elderly people's independent initiatives can be promoted by technological solutions, especially in housing (Elderathome 2003). Correspondingly, ageing people are being socialized to become members of the information society by teaching them computer skills and computer literacy. However, whether increasing technological development will promote equality among the elderly is another issue (Tuorila and Kytö 2005).

Expectations concerning the wealth, activity and especially the improving health of future cohorts make elderly people an important target for research and policy. The positive national trends in functional ability indicate that elderly people will be able to enjoy greater independence and a better quality of life in the future. The need for services will be postponed to a more advanced age (Sulander et al. 2006).

It is good to remember that the connection between old age and people's life course has been under consideration for a long time. Marcus Tullius Cicero (106-43 BC) asked in his splendid book about old age, friendship and duties "why collect more money for a trip which is getting shorter and shorter?" Our paper puts the following questions to the fore and attempts to find answers: Is there enough understanding of the consumer behaviour of ageing people and their consumer characteristics? How is consumption related to ageing people's conceptions of a good quality of everyday life? How do electronic services and increasing self-service promote a good everyday life among the elderly? The following chapters will address the above questions based on the latest studies conducted at the National Consumer Research Centre.

2 Consumption and consumer characteristics of ageing consumers

People's well-being is materialized to a great extent through consumption. Instead of goods and other material commodities, elderly people purchase more services. The statistical picture of ageing people's consumption is not surprising. Available income decreases in the course of ageing and necessities represent an increasing share of consumption. Expenditure on food (21% of consumption expenditure), housing (23%) and health (13%) dominate in the consumption budget of the elderly. Health care accounts for more than 10% of total expenditure of the oldest age groups, despite the availability of public health care, while the respective figure among the youngest age groups is a couple of percent. However, expenditure on transport (6.5%), beverages and cigarettes (1.5%) and restaurants (1.7%) decreases. Package tours and cruises form an exception: ageing consumers purchase them more frequently than younger age groups (Lindqvist 2006, 109-110).

Ageing theories and their applications enable a statistical picture of consumption among the elderly to be formed. Activity theory represents a strengthening interpretation of ageing and elderly

people in their role as consumers. Gerontological research has broken earlier stereotypes by emphasizing ageing as a normal phase of life that includes learning skills and other age-related developmental activities (Koskinen 1994, 24-25; Antikainen 2000). When examining consumption, chronological age is increasingly being replaced by cognitive ages such as feel-age, look-age, do-age and interest-age, which are considered more important than calendar age (Gunter 1988). Cognitive age is related to the experience of life-satisfaction: the more satisfied people feel the younger they feel themselves to be. Elderly people have been found to feel 10-15 years younger than their chronological age. Additionally, differences in consumption styles between age groups have been reduced and ageing consumers also differentiate in their consumption within the same segment.

Elderly people's locus of meanings differs from that of the younger, active population (Kangas 2003). Geriatric researchers (e.g. Thornstam 2003) talk about gerotranscendence, referring to value changes when material values are increasingly replaced by mental and spiritual values. The change is also characterized by increasing tolerance and generosity. Ageing people get rid of unnecessary social stress, unpleasant social ties or conventional rules. They do not have the same "duties" to invest in new information technology as other age groups. They are not afraid of new technology but they are more sceptical and think over the need for new devices more than younger consumers. The values of today's technology culture, especially the speed, effectiveness and the continuous replacement of devices and programs by new ones do not match the value systems of the elderly. Ageing people have, in the course of ageing, seen several trends come and go. Consequently, they can adopt a more tranquil attitude towards new technology than younger people. Instead of age per se, the point is the inconvenience of new technology to all age groups.

Ageing also brings changes to the means of searching for and processing information. Among others, elderly people's earlier experiences of goods and services, the familiarity of commodities and their ability to process information are decisive. As compared to younger people, the elderly search for less information in the purchase of large durables (Cole and Balasubramanian 1993, 157). Choices are based on previous life experience. However, one has to ask whether the experiences gathered in the "modern world" are good enough in the post-modern market of goods and services characterized by a rapidly changing information flood and the increasing technologization of the functional environment. Due to their weakened working memory and ability to process information, elderly people may have difficulties in the management of new situations, new commodities and related information.

Finally, it is more than important to recognize the diversity of ageing people as consumers and their diverse mental and physical capabilities. Ageing people represent a remarkable potential source of know-how, life-experience and tacit knowledge – capabilities whose importance has not been realized in today's societies. Accordingly, Koistinen (2003) considers elderly people the only growing natural resource in the sphere of care. Despite their mutual diversity and individual features, health and functional ability are unifying characteristics among the elderly from the perspective of a good everyday life and consumption behaviour.

3 A good everyday life and the use of services

A good everyday life can be defined by the concepts of a good life. The two are similar, but everyday life is more concrete and exists “here and now.” A good life includes, most comprehensively, cognitive development, participation in societal life, reasonable housekeeping, friendship, good human relationships, support of the arts, emotional development and sensual pleasure. Health is missing because, for example, Aristotle considered that living a good life promotes health, and health follows directly from a good life. The dimensions have often been reduced to the “four-leaved-clover” of good life: 1) material and mental safety or the feeling of safety; 2) autonomy, in other words the possibility to make one’s own decisions; 3) self-esteem due to the feeling of being accepted and appreciated; and 4) reasonability, the ability to understand one’s own life and the world (Palo 1992).

How do ageing people talk about a good everyday life and its elements? The dimensions of the “clover” are to be found in a joint study by the NCRC and SITRA (Varjonen et al. 2005). The study focused on the obstacles and preconditions in the outsourcing of domestic tasks based on qualitative focus group discussions. The informants came from the Consumer Panel of NCRC. Discussions with ageing panelists, retired or close to retirement, focused on meal, cleaning and laundry services, on elderly care and on the need for and provision of care services.

The discussions provided a clear definition of a good everyday life from the perspective of the elderly. One of the most essential factors was living in one’s own home or at least having one’s own room and furniture. Doing one’s own housework as long as possible was also considered important. As based on the life-cycle model of service use, the need for household services, cleaning, cooking, laundry and errands decreases from the “service intensive” child family phase to the so-called empty nest phase after children have left home. Those who have retired have the time and interest to do housework because they can choose the timing, which also increases the pleasure of doing housework. Additionally, freedom of choice is expressed by *the right not to clean in a month without a bad conscience*.

A good everyday life also includes access to household services, physiotherapy, a bath, health care and so on when needed. An active lifestyle, good neighbours, friends and hobbies are essential elements in a good everyday life. The ability to be prepared for one’s own ageing and the will to defend and fight for one’s rights strengthen people’s self-esteem. Autonomy in the organization of everyday life is one of its cornerstones (Leskinen 2006).

Ageing people in the empty nest phase are not heavy users of household services. However, they do have opinions on high-quality services and service workers. Multi-skilled workers are needed especially to provide cleaning, cooking and care services. Caretakers are given as an example of multi-skilled service providers. Increasing specialization raises considerable suspicion, especially in municipal home care, and the refusal of some workers to complete tasks. Ageing consumers strongly agree that it is the duty of the public sector to provide elderly care services because *they have paid taxes all their lives*. Additionally, many people unconsciously provide family care services to their close relatives. Family care is considered an appropriate duty and it has *meaning in the continuation of the life-cycle*. Family care is, however, *obligatory and without alternatives as expressed by the view that what else can one do if a close one needs help*. If the favourable development in men’s health continues, couples will be able to provide care for each other in the future. It bothers people to think about how a good everyday life is realized among ageing people, who are increasingly being polarized into well- and weakly-resourced service users. Consumers

believe that the *public sector will concentrate on those who would not otherwise survive*. However, a minority of about one percent of those with a high income are able to purchase private care services (Varjonen et al. 2005).

What about the technologization of services and care? Consumers have diverse conceptions of technological development. Some ageing people consider technology as a resource, especially safety technology such as meal robots, safety wrists and alarm systems. The Internet is considered a good solution to loneliness. Consumers are worried about decreasing human interaction and elderly people's increasing loneliness according to prevailing ageistic attitudes. Consumers want to have "human-sized" care solutions based on the Danish model. From the perspective of a good everyday life, human interaction, social interaction and godparent activities are becoming increasingly important on the side of traditional household services (Leskinen 2006).

A nationwide survey (Varjonen et al. 2007) followed by a qualitative study indicated that the majority (81%) of those in Finland aged 75 years or older use household services. Additionally, the number of couples aged 75 years or older who bought services (14%) was twice as great as among those between 65-74 years of age (6%). The increasing demand for services is partly explained physical or other restrictions that make it more difficult for elderly people to do housework.

4 Electronic services in the promotion of well-being

Electronic services have become an essential part of Finnish society. Most transactions, or at least some of them, take place via the Internet. The increasing provision of electronic services may cause problems for ageing people who have not adopted them to be a part of their everyday life as compared to adolescents and families with children (Tuorila 2001). Several attitudinal and know-how obstacles prevent elderly people from using the Internet. However, in the future the largest user groups will be ageing people, because the majority of younger people already use the Internet. Attitudes towards the Internet have become more positive during the last couple of years. For example, the use of Internet has doubled among those aged 60-64 years (Tuorila and Kytö 2005).

Intensive use of the Internet and long trips related to errands increase people's positive attitudes toward the Internet. Savings in time and monetary costs are quite clear, as observed in a study focusing on virtual services in the promotion of elderly consumers' well-being (Tuorila and Kytö 2005), in which cost savings amounted to about 50%. One has to remember, however, that use of the Internet often requires significant investments in information technology. Overall, electronic services may be more expensive than traditional services. The Internet may also cause regional inequality: only people who can afford to purchase computers and use the Internet may inhabit remote areas, while non-users may have to move to population centres.

The development of information technology has created new demands and challenges for the elderly. Not everyone wants to use services provided via the Internet due to privacy and safety issues. However, there will always be people who do not want to use or lack the resources to use electronic services. Ageing people can be truly divided into those who are well-resourced and "young" ageing and those with limited resources. Consequently, the provision of services cannot only be based on electronic service distribution (Tuorila and Kytö 2005).

Tuorila and Kytö (2005) further determined that those who used computers and the Internet felt better than non-users. However, the majority of the elderly consider that the use of the Internet reduces the time spent on walking and other physical activities, which are emphasized in traditional errand. This may lead to a weakened physical condition and reduced everyday activity.

Technology cannot replace other people, and due to access to the Internet people might become separated from others and alienated. Policy makers must fight against the emergence of a new, alienated group that is unable to utilize new technology. National policy concerning the elderly is characterized by normality, respect for the elderly, safety, social integration, autonomy, freedom of choice, equality and justice. These principles must be considered and the alienation of the elderly in the information society actively prevented.

All in all, one has to ask the ageing consumers themselves what well-being means to them and how they see electronic services in their well-being. Is there any connection or does well-being mean the possibility to grow old in peace and quiet without any demands to acquire sufficient computer skills and computer literacy? (Tuorila and Kytö 2005).

5 Elderly people's good life in the self-service society

Alongside electronic services, self-service is increasing and spreading into new service fields, replacing personal services. Doing things by oneself has a strong cultural background (Tuorila 2002). Self-service is spreading especially in health services due to rapid technological development, and the measurement of blood pressure at home is just a beginning. As treatment methods develop, consumers are expected to take more and more care of their own treatment. Due to the increasing amount of day surgery and shorter times spent in care, patients must take more responsibility before and after treatment (Tuorila 2006b).

Increasing ageing will not slow down the advancement of self-service, because ageing people have adopted self-service throughout their life and behave accordingly. Personal services are required only when self-service no longer works. (See also Varjonen et al. 2005).

The ability and know-how of consumers when using self-service varies. Only those consumers who have enough know-how and sufficient appliance are likely to obtain benefit from self-service. Increasing self-service therefore challenges the development of equality among consumers. Due to the demands of cost-effectiveness and efficiency, some people's access to services may be threatened.

Present development favours the emergence of a "customer-servant" role among consumers. The new role brings new duties to consumers: they have to recognize possible mistakes and also correct them. In truth, service providers are unable to provide self-service that would not endanger clients' access to expert services.

Personal services include a strong social function. The use of services is not only related to errands but is also an important social happening and leisure activity. In self-service, on the contrary, the social aspect loses its traditional meaning and becomes strange to the elderly. The social aspect is important, especially to those who live by themselves, because it allows mutual interaction. As the number of one-person households is increasing, the demand for personal services will not diminish. According to Manssila and Koistinen (2006), personal services promote the growth of social capital, which promotes human health and functionality.

Increasing self-service makes one wonder how its development is affecting younger cohorts (Tuorila 2006a). However, it is clear that the elderly will be “consumer kings” in the future. The modes and habits of the elderly will have a strong influence on the development of self-service. Accordingly, it is important to recognize that elderly people’s present choices can be influenced by today’s activities: how people are taught to patronize and what kind of experiences self-service and personal services provide.

6 Closing words

Ageing consumers are in the role of conformists in the transmission of today’s service culture. They have been obliged to adapt themselves to the intensive developments in technology and the information society without any chance to affect the direction or the rapidity of change. Those who are in working life have the advantage of being obliged to learn basic computer skills to manage their professional duties. In addition, ageing people have adapted themselves to the contradictory development of the service society: public services have been replaced to an increasing degree by private services, service has become self-service and new markets have been created to replace, for instance, traditional housework. However, ageing people have more choices in the provision of a good everyday life. Choices between public or private services and between self provisioning or purchased services increase the feeling of freedom and autonomy.

Despite the daily routines and the repetitive nature of everyday life, people live their personal lives according to their available resources, values, goals, dreams and the possibilities provided by the living environment. In the future, ageing people will not be adaptors, but knowledgeable and demanding consumers “produced” by the development of the self-service society. While the growing numbers of elderly people will increase their influence in the future, they must be increasingly recognized in the service market. Even though their demand for health services and household services is greater, ageing people want to have services according to their own desires. The providers of electronic services should make efforts to provide services in a user-friendly way. The provision of services should not cause stress and problems to service users.

”One recognizes ageing, but not becoming old” – On age categorizations in marketing.

Karin Lövgren
PhD student
Linköping University
S- 601 74 Norrköping
karlo@isv.liu.se

Abstract:

Through analyses of interviews with people working in advertising and with popular magazines aimed at women of 40+, this paper focuses on how age and ageing are ascribed meaning.

At times the relevance of age is downplayed, included in target analyses because it has become a routine. At other times age is used as a unique selling point, an argument to reach desired consumer groups.

Hitherto young people have been the wished-for consumers. But as the baby boomers, the cohort born approximately 1945-1954, are growing older, they are becoming increasingly interesting for producers and advertisers, thus entailing a change in what age is attributed. One recognizes ageing, one brand expert formulates it, but not becoming old. Being “older” is described as being wiser, more experienced, having higher self esteem. This refers to people in their fifties, sixties and seventies. Real old age is said to commence once you re in your eighties, ill and dependent. Thus today fear of old age and ageing is postponed and transferred from entering the age of retirement to entering what some researchers call “deep old age” or the fourth age.

Another cultural conception concerns the changing impact of the life course. Ageing is regarded not as chronology or biology but as a question of attitude or mindset. Youth is still hailed – independent of chronological age.

”One recognizes ageing, but not becoming old”

Today the desperation to stay young at all costs is no longer as great as it was ten fifteen years ago. Or, well, fifteen twenty years ago. Instead one recognizes ageing, but not becoming old. And it’s two different things. To affirm ageing but not becoming old – it means you keep the youthful lifestyle and youthful attitude and so on.

Karin: “So what then does one affirm in ageing?”

You affirm the fact that you gain more experience, more certainty, more self confidence. You sort of know more who you are; you have been through more things. You can take some things more calmly, be more cool – and that self confidence creates an attraction in younger people. In the end there is nothing as attractive as self

confidence. /.../ So it's rather paradoxical, the phenomena that meet and are united in this question on ageing but not becoming old." (Interview with managing partner, advertising agency)

"One recognizes ageing but not becoming old". How can we understand this seemingly paradoxical statement? On the one hand ageing is not feared but affirmed. But becoming old is still an aberration. Experience, confidence and money combined with a youthful attitude and lifestyle make ageing no longer dreaded or despised. But whose ageing is it and what kind of ageing is this referring to? In this paper I will focus on different aspects of what age and ageing are said to mean as regards advertising. My starting point is interviews with people working in advertising or with magazines where the ads are published and material from web sites on advertising and marketing. This is a part of the empirical material I use for my PhD work.

My dissertation focuses on *cultural conceptions of age and ageing*. I study this departing from adverts in magazines aimed at women of 40 and upwards. My research design is based on three vantage points. One is the interviews with people working in advertising or with the magazines. I have tried to cover different parts of a chain of productions – that is from for example representatives of producers of cosmetics, through advertising agencies combining copy and visual image, on to media brokers advising on what channel or medium to use for a campaign, to advertising departments at the magazines and editors and journalists working there. Approximately twenty people have been interviewed, some twice. I have also downloaded material from web sites the interviewees have referred to. My second vantage point is the magazines, and specifically the ads, which consequently include the visual material. And the third consists of interviews with women on magazine reading, what they think of the ads; of consumption and on being in this part of life; on age and ageing.¹

The model is not meant to include any thoughts on flow of message from a producer to a receiver; it is a construction to limit and frame my empirical material. I don't think adverts *create* cultural conceptions – nor do I simply think they *mirror* values. Cultural notions are intertwined with other notions. The notions and values are fluctuating between producers/ texts / consumers. They are furthermore continually changing which means I am trying to

¹ I have interviewed seven women, and have letters from an additional few women, who have written me on these issues, departing from a letter with an invitation and some questions from me.

capture a process with parts slow and sluggish to change and others more rapidly evolving. The purpose of my PhD-work is to focus on cultural meanings ascribed to age and ageing in our society.

Through out my empirical material is distinguished by paradoxes and ambivalences. Sometimes my interview persons who are working with advertising take different stances on the same issue in the same interview, thus casting advertising as a powerful, manipulative force reminiscent of propaganda, having a profound influence on peoples values and habits, or – paradoxically, later on in the same interview – as weak, powerless, money thrown in the lake.² The same goes for what the interviewed women say about advertising. They themselves are critical, taking a distancing stance to the ads, talking of photo shopping and retouching of pictures, using words such as ridiculous and silly when describing the ads, but saying that *others* may be influenced by the ads and the values conveyed in them.

I have structured this paper around a couple of central quotations from the empirical material I am analyzing for my PhD work; primarily for this paper the interviews with people working in the chain of production around advertising and from web sites on marketing and advertising. My reasoning is based on what the interviewees have brought up during the loosely structured interviews and this is the ground for my conclusions. The quotes have been chosen because they exemplify certain themes or aspects. Firstly I touch upon how age is positioned as either an uninteresting category, merely included as a statistical factor, or as a point of departure in assessing and constructing target groups for products and thus advertisements. There are several overlapping – and at times even contradictory – age based categorizations in circulation. Next the focus is on what constitutes the desired group of consumer. A possible change from advertising addressing mainly young people to also displaying an interest in older groups of consumers is discussed. How can this be interpreted in terms of how ageing culturally is construed? Will whether or not people aged over 50 are noticed by the market have an impact on how age and ageing is ascribed meaning? I then return to the quote this paper commenced with: on ageing but not becoming old.

² I write more on these methodological issues in my thesis. See for instance Holstein, James & Jaber Gubrium (1995) on how interview persons can take different stances or roles in an interview; speaking for example as a parent, a consumer, a professional – and in dialogue with different public opinions on, in this case, advertising.

Age categorizations

At times the relevance of age is downplayed, and considered to be just an etcetera category, included in target analyses because it has become a routine. We have to include age, one media broker explains to me, in order to get statistics for comparison of the impact of different advertising campaigns. Age is known to have importance as regards television viewing habits and is therefore always part of standard reporting also when it comes to printed media. But, she says, age really implies little of consequence as regards target groups.

Age is a rough generalisation, a blunt tool. A 50 year old, without children, living in Stockholm and a 50 year old with children and grandchildren living in Skåne [the south of Sweden] might not have much in common. It's more about who you are as a person, where you move about, what you do. Whether or not someone plays golf or travels abroad on holidays discloses more. (Interview with media broker.)

Regardless of these objections, age is included in analyses to define target groups for different products and advertising campaigns. Age is thus attributed relevance simply by inclusion thereby contributing to age being a factor or category of weight. In other interviews age is talked of as a factor of importance when defining how to reach a relevant group of consumers or how to launch a product. Members of different age groups are even positioned as belonging to separate tribes.³

TWENTYSOMETHING™ Inc. is a prestigious, world-renowned marketing/strategy consultancy that uniquely bridges corporate goals with the realities of today's young adults. Generation Y. Generation X. 20-Somethings. Millenials. Echo Boomers. Teens. No matter what the label, today's global 14-35 year olds are evolving at warp speed. Each audience has its distinct lifestyle needs, language, mindset, and culture. Our firm focuses exclusively on this unique collage, advising forward-thinking organizations on how to fully realize their goals, visions, and overall potential. No smoke. No mirrors. No hype™. Only brilliant, executable advice backed by rock solid market data to drive results.” <http://www.twentysomething.com/> [070427].⁴

³ Otherwise certain consumer habits are used as evidence of tribal membership: Apple-use, ipod-use, owning Harley Davidson motorbikes are example of consumption habits where an object comes to define and include its owner in a tribal community of interests.

⁴ *Generation x* is a generational term, roughly used for persons born from 1961-1981. The term got popularized by Douglas Couplands novel *Generation X. Tales for an accelerated culture* (1991). *Generation Y* is a term used for the following generation, also called *Millenias*, or *Internet generation*. *Echo boomers* is a term coined for the children of the baby boom generation, said to be a demographic echo of their parents. Twenty somethings refers to the phrase “thirty something” originally used for boomers when they were in their thirties, and popularised

This quote is from a website for a research company giving advice to advertisers on how to capture the young audience. It testifies to an abundance of age categorizations – add to these all the terms for *baby boomers, baby busters, mappies, dinkies, +ers, golden agers, silver foxes, the grey capital* et cetera.

When I have analyzed all the categorizations used by marketers and advertisers I have sometimes felt almost as if reading about astrology.⁵ A few distinguishing characteristics, allusions to popular culture or a significant world political event are said to define a generation.⁶ The political events are thought to impact on a specific age cohort more than on others living in the same era. Age is used to assert a spirit of community amongst people growing up at the same historic time, regardless of other similarities or differences (for instance class, living in an urban or rural setting, gender, ethnicity or life style). The terms appeal to a desire to decipher riddles; to feel included and to be up to date on contemporary expressions like *generation Jones, and Y, Opals and mappies*.

In the quote above there is also reference to the “warp speed” with which the world is transformed. Childhood or youth today is different than an adult’s experience of it. One could frame growing up or being an adolescent as an experience that you carry with you as you grow older but by positioning the world as rapidly changing it is also implied that these experiences are of little relevance to understand or communicate with youth today. An age or generation gap is implied.⁷

The quote also alludes to scientific studies in the term of trustworthy market data, to be able to draw valid conclusions about the elusive consumers of today and tomorrow. The company

through a television program, called “Thirty something”. (www.wikipedia.org, www.cbsnews.com, <http://www.worldwidewords.org/turnsofphrase>.) *Teens* for teenagers has been supplemented with *tweens*, as in between child and adolescent to home in on yet another potential group of consumers – often positioned as the ones in real charge of household consumption decisions, either through nagging power or merely by being the ones most up to date on market novelties. (see Johansson 2005, Hillén 2006).

⁵ The definition of a generation is not made in ways that can be evaluated. The foundations for different categorizations cannot be compared. The confirming evidence for a certain conclusion is many times scant. Instead different features are used as characteristics in differing contexts.

⁶ The student revolts in 1968, Watergate, the fall of the wall in Berlin or the 11th of September 2001 are examples of world political events referred to. As regards popular culture the references can be to a novel like *Generation x*, or to a TV-show like *Thirty something*.

⁷ It is as if time is more rapid today – the speed has increased and is constantly increasing. These time dimensions are intertwined with age and ageing as time measurements.

uses different age categorizations – all of which can be said to be distinguished by a certain amount of hype – and at the same times disclaim the use of coining new terms or phrases as a way to gain credibility and build ones own trade mark. This is done in a rhetorical way by using and disassociating themselves from the concepts and notions.

Another thing I want to point out in the quote above is how young people are defined as an unknown and foreign people that need to be interpreted to be understood, and I would like to add – colonized. This is an example of a rendering of children or young people as exotic others. The aim is presented not to sell goods, increase profit or market shares, but for companies to “realize their goals, visions and overall potential.”⁸ An abundance of age related categorizations and terms have been referred to above. What follows is based on an analysis of these, and others that are referred to in my empirical material.

Generational terms

The age categorizations can be divided into different categories. The first is a categorization in generational terms. Here generation is not referring to biographical generation in the sense of grandparent, parent and children, different generations succeeding one another (Gerholm 1993). Instead generation here refers to cohorts born at different times in history, and that time being characterized by differing circumstances that impact upon living conditions in a formative way. Often in American contexts the terms “baby boomers” for the cohort born in the after Second World War era, or “baby busters” for their children (the first following cohort of similar size and magnitude). In between them is positioned the so called generation Jones, an anonymous and small cohort. These concepts are defined in differing ways – sometimes the boomers are said to include everyone born from the 1940’s into the 1960’s, at other times more divisions are used. In Swedish the terms “fyrtiotalist”, “femtiotalist”, “sextiotalist” et cetera, are widespread and commonly used. Literally this means people born in the 1940’s, 1950’s, 1960’s and so on and so forth with each ten year decade forming the ground for a new and different generation.⁹ These are used despite the fact that the notions

⁸ In my dissertation I discuss the reoccurring rhetoric in the empirical material where the message is: understand the consumer (not increase your profits or your sales.)

⁹ The term “fyrtiotalist” is said to have been coined by a Swedish journalist, Ludvig Rasmusson, in his book *Fyrtiotalisterna* 1985, followed by the book *Åldersupproret : om ungdomskult, fyrtiotalisterna och Sveriges framtid*. In the second one he himself claims copyright for the term. He notes that many have pointed out that “fyrtiotalist” hitherto mainly had been used as an established literary term for a generation of authors who had a

actually obscure as much as they clarify or identify members of the categories. Living conditions, number of members born approximately at the same time, commenced school at roughly the same period and later entered the labour market at the same phase differ significantly for those born in for example the early 1950's or the late 1950's, or say the early 1990's and the late 1990's. If the state of the market, the economic situation in the form of prosperity or depression, situation in the welfare state, world political events or significant regional political events are thought to form a generation and a generational awareness in the terms of Karl Mannheim– then these conditions vary significantly within the decades which should prevent forming a ten year cyclic generation (Mannheim 1952. Blehr 1993). Still these terms have had significant impact in the Swedish context, and have not been questioned or replaced by others in spite of some efforts to introduce for example “rekordgenerationen” – The Record Generation.¹⁰ It seems that the commencement of division in generational or cohort terms started with people born in the after Second World War era. Generational terms for people born in the 1930's or 1920's are circulated more rarely. Perhaps this has to do both with a modern way of thinking about and defining oneself, and a correlation with the historic situation. The people born in 1945 and onwards grew up as the first generation to be teenagers, in a consumer society. Divisions in smaller age related categories have a connection with the growth of consumption and a surplus in production resulting in a need to construct new target groups (Brembeck 2002. See also Lee 2001 on consumption and the change in cultural meaning of childhood and adulthood). It must be emphasized that it is not only marketers who use these categorizations. They occur in media, in research, and they are used in everyday language – many times in a vernacular way of placing oneself in historic time.

+’ers.

Another commonly used age related categorization is “+’ers” where a plus sign is added to an age. 45+, 50+ or 55+ for example. This division is less common as regards 65+, this having to do with the fact that this is the official retiring age and from this time of life, regardless of actual pension or not, people are in many ways included in the category of “pensioner”, which

breakthrough in the 1940's. I think the book *Hårda bud. Handbok för 60-talister* (Floyd & Lindqvist 1987) had significance for the spread of the “talist”-term in Sweden.

¹⁰ The term Rekordgenerationen was introduced by the research company Kairos Future and got a large media impact, not least when two books based on studies of values amongst this generation was published (Jaeger 2001, *Rekordgenerationen* 2005). They have also coined terms for other cohorts like the we/me generation (www.kairosfuture.com).

many times is taken as a synonym to “older”. The rhetoric impression of 45+ or 55+ is inclusive – after an approximate age, and onwards one is included in this category. Here there is no upper age limit. All members are thus conveyed to have common interests, once entering the +-age; some can be merely 45, 46, others 75, 76 or for that matter be in their 90’s.

Regardless of chronological age differences this age categorization includes all after the entrance date as if after a certain age differences were equalised and people more alike. This thus implies a thought of common interest after a certain age, or at a, fairly large, phase of life, that can in fact include parents of small children, with great great grandparents, people in active work force or people having lived as pensioners for many years, people born before the second world war with people born in the 1960’s. Thus after a certain age one is assumed to have common interests and years of growth, or youth, considered to be the founding stones of the previous age categorization in generational terms, is here regarded as unimportant. Instead people in the +-group are assumed to be more alike than previously.

Witty abbreviations and inventive acronyms

Hippie was followed by *yuppie* (young urban professional), by *dinkie* (double income, no kids), and in Sweden at the launching of a new magazine, aimed at the generation commonly denominated “fyrtiotialister” the term *mappie* was introduced. This term was said to have been adapted to Swedish from the American abbreviation “mature affluent pioneer”. In Sweden affluent was transformed to attractive – which I interpret as latching on to a cultural constraint against talking of money and affluence. But when searching on the Internet there is no evidence of the term *mappie* being used in an Anglo-Saxon context.¹¹ There are suggestions that the real coiner of the phrase is Amelia Adamo, chief editor of the *Magazine M*. Instead of launching it as a witty acronym invented by herself or her team, she claims it is a translation and import from the US, thus giving it legitimacy, credibility and a certain hip factor.

Opal (older people active life style) is another acronym also cleverly alluding to precious stones, just as “the grey capital” or “grey market” implies both affluence and high age, “silver foxes” suggests both silvery hair and cunning, wisdom or experience, “golden agers” hint at old age being the best years. The latter two again with reference to valuable materials. One Swedish magazine aimed at this segment of the market renamed itself “*Det ljuva livet*”,

¹¹ Whereas it is used for the new electronic road maps/navigators that can be used in cars. It has also been used as an abbreviation for “male-bashing angry professional women”.

(www.vassaeggen.se/2006/03/vassa_eggen_avsloelar_loegnen.html, www.scholar.lib.vt.edu/VA-news/VA-Pilot/issues/1995. http://tim.resume.se/pub/nyhet.asp?art_id=51147)

roughly “La dolce vita”, “The sweet years” from previously being called *Senior Sverige* (“Senior Sweden”). Many of these epithets are flattering, connoting wealth and a desire to enjoy it. Words like retired, pensioner, older, or even the fairly neutral senior are avoided. No one wants to be associated with pensioners or old age, as one of my informants told me. Paraphrasing is the rhetorical device to solve this. On a website aimed at potential advertisers a magazine refers to the terms “prime time women”, trade marked by a researcher/marketer. She has coined the phrase for women in midlife, said to be at the prime of their life, with a prime opportunity for consumption (homo consumans is a woman), and of course hinting at the term “prime time television” for the part of the TV schedule when most people watch TV and thus are susceptible for advertising (<http://www.kvinnopanelen.se>). On the same site the phrase “Tomorrows Mrs Wallet” is used which in a very upfront way explains what is at issue here: spending power, consumption decisions ([www. http://www.kvinnopanelen.se](http://www.kvinnopanelen.se)). I will come back to the rhetoric of the wallet. This is the way naming is handled when addressing the market.¹²

The acronyms or compounds of words are, as mentioned, often witty, and they gain quite an impact in the media, this not least by alluding to popular culture or by capturing the zeitgeist. “Adultescent”, for example, as a new expression captures a change in the normative life course – combining adult with adolescent to imply people refusing to grow up, take responsibility and become stable citizens.¹³

The terms are besides being many times witty and funny, attempts to grasp contemporary changes and to, in a sense, control or understand them by naming them. There is also for marketers the added bonus of yourself being put on the map or adding to your brand value by being the one who spots, names, conquers and puts the flag on, a newly discovered time territory.¹⁴ Just as with the generational terms the acronyms or abbreviations to a varying

¹² Talked of, not to, there are also derogatory epithets in use: raisin for someone with wrinkles, or “menopausal witch” about women in their fifties/sixties for example.

¹³ For this there are a number of terms like “peter pan generation”, “grups”, etc (www.nationalencyclopedia.se, www.gradvall.se. (column originally published in Dagens Industri 20060505). Gradvall writes about an article published in New York Magazine by journalist Adam Sternbergh April 3, 2006. <http://nymag.com/news/features/16529/>.

¹⁴ Actually this can be compared to the importance of coining concepts in academic circles – others will reference your work.

degree also get media impact, and are used in everyday talk. The terms many times can thus be said to have captured the spirit of the time, the contemporary.

Young regardless of age

There are also a range of age categorizations that are without chronological reference indicating other factors as the interesting common denominator. For example young in mind, young of heart, or young of all ages that imply a state of mind, or an attitude as the relevant and interesting aspect of the category, regardless of actual age. In these expressions having a young mindset is not condoned in the manner that it is in the expression “mutton dressed as lamb”. In the latter an age appropriate behaviour is referred to, together with an implication of the violation of age norms that is performed if one strives to appear to be younger than ones chronological number of years. Young in mind on the contrary hails staying young with all that it implies of remaining alert, curious and open to change.

The categorizations have an impact, not least in a mediated form. They are used in everyday use, but are more common in mediated contexts, and used by advertisers and marketers. They are many times attempts to capture changes in values and to capture the contemporary. Often allusions to popular culture are used, together with an abundance of inventiveness. Many are attempts to capture market segments following a logic of the market. In this age is often in fact a circumlocution for spending power when in fact trying to target and address mainly those with a certain income or fortune.

The continuing, perhaps even increasing, number of age related categorisations should be interpreted in relation to the category of “young regardless of age”. Here one can talk of a dissolving of age boundaries and a lifting of norms on time schedules and life course appropriate timing. On the other hand there is a counter movement with as said, an increasing number of overlapping age related divisions.¹⁵ Perhaps the insecurities of adulthood today make it even more important to interpret and divide life in age terms? The childhood researcher Nick Lee describes the ambiguities of adulthood today, when becoming an adult is no longer equivalent to having reached a final secure destination and completion, but instead is characterized by a forced flexibility (Lee 2001).

¹⁵ This is one of the themes I am pursuing in my thesis.

Age is used in differing ways vis-à-vis the market. Producers, marketing managers and advertisers construe age segments that differentiate between target groups on the grounds of age. Each segment or category is presented as different and as having different needs to be understood and addressed. Brembeck 2002 (referring to the anthropologist Astroff) discusses marketer's technique of "constructing, producing and maintaining similarity and difference. They simply construe different cultures which they assign specific consumption patterns and preferences that are separate from other consumption patterns and preferences in other presumed cultures". Differentiated products are aimed at different age groups with for example skin cream aimed at consumers in their teens, twenties, thirties, forties, fifties, or sixties and upwards. In a sense this can be understood as skin care addressing certain age related factors, increasing dryness with the years for instance. But the whole abundance of skin creams could also be interpreted in terms of finding an outlet for an ever increasing production of cosmetics and hygienic products. This in turn of course also impacts on consumers. The products in themselves communicate the importance of skin care and as an example, wrinkle avoidance at all costs.

New historic situation

Hitherto young people have been the wished-for consumers. But as the baby boomers, the cohort born approximately 1945-1954, are growing older, they are becoming increasingly interesting for producers and advertisers, thus entailing a change in what age is attributed.¹⁶ The baby boomers are described as the first generation of teenagers. They then experienced a short period of freedom from responsibilities. Today they are talked of as entering a second phase of freedom. The cohort born in the after war era is now retired or nearing retiring age, it is free from years of child rearing, and is said to have more money than any other generation so far. They are represented as a hedonistic, consuming generation, ready to enjoy their third age. It has been said that this is a new form of ageing. "We will never again see old people the way we used to", as one of my informants told me. The boomers, the first teenage generation, born and raised in a consumer society will not become old in the way earlier generations have. They are described as having money – and being willing to spend it.

Money should be spent to enjoy life

50+ own incredible 80% of all fortune in this country. Most have no debts and own their homes. They have 70% of the spending power, own 75% of all market

¹⁶ I am – as previously – basing this on my empirical material.

portfolios and two thirds assert that “instead of saving the rest of our lives, money should be used to enjoy life” (<http://www.senioragency.se>)

Over and over again the mantra is repeated: the boomers have 80% of the fortunes and 70% of the spending power. Therefore they must be seen and addressed. The argument is used by market and members of the age category alike. The right to be heard and taken into account is claimed with the wallet as an argument, not only by marketers, but by representatives for the category themselves.

In spite of the fact that you 50+ readers have 70% of the collected spending power and 80% of the fortune in society SEB wants to prioritize the young.

In the US this attitude has been given a name: C.Y.S. (Chronic Youth Syndrome – to be one-sidedly fixated on youth.)

We at the Magazine M will attract attention to companies like SEB who so obviously mark their lack of interest in their largest and most lucrative group.

M magazine knows that we 50+’rs are exiting, profitable and attractive. We want you as reader to feel this (M Magazine 2, 2006)¹⁷

SEB is one of Swedens largests banks. Their managing director at the last minute sent excuse to an interview with the Magazine M:s chief editor, Amelia Adamo. The reason they gave was that they were focused on younger age groups. Magazine M is one of the magazines using age as a selling point. They address readers of 50 and upwards. The rhetoric here is see us, hear us, not because we have rights as citizens, or human beings, but because we are potential customers, consumers and spenders. Another example of this can be seen in a quote from the website for an health oriented association for women over 45 years of age.

There is an exceptionally conservative perspective in media where 70% of the represented women are under 30 years of age. As regards Television the decision-makers are young men. TV schedules are aimed at women between 15 and 39 years of age, except on Fridays when they can stretch as far as 49 years. It is considered negative to have viewers older than 60 years.

It is us women who must challenge this attitude. Here is a tremendous consumer power, we can make choices and refrain from what we don’t like. We mustn’t just be kind and patient. The market will not change until we have stated our opinion and thereby forced advertisers to reconsider. (www.1,6miljonerklubben.com/omklubben. 2003-10-15)

¹⁷ The translation has been made by me.

Again the argument is not one of citizenship or human rights and values, but one claiming right to be heard due to monetary resources. The road to influence is through consumer choices not for instance by political lobbying.

To address young people vs. older people with ads

So far young people have been the ones represented in the advertisements, and the ones the market has concentrated its communication with.

They influence. They set trends. If you want to change something you can in those groups because they are curious about new things. /.../ It is more difficult to get older age groups to just run out and buy something. /.../ It is in the young years that many of the values that you keep for life are created. If you miss that time it is hard to come back later.¹⁸ (Interview with advertising and public relations bureau specialised on youth.)

Young consumers are positioned as the desired ones because they are out and about and meet more people whom they can influence. New forms of advertising, more effective than the traditional form like say print or TV commercials are launched: wom (word of mouth), ambassadors (advocates for a product or brand), guerilla marketing (marketing often without an apparent sender), events, blogs... the new channels are many. And, say the interviewed marketers, young people are critical of advertising, they can see through the messages. Therefore it is not a problem (for anyone but conservative baby boomers) that many of the new forms of advertising has no apparent sender.¹⁹

Today there appears to be a struggle over who influences whom. Young people have large contact nets, they meet new people and therefore messages to them reach many other potential consumers. One advertising agency specialised in addressing the older consumers expressed a counter rhetoric which I have found echoed also on other sites aiming at this target group. There they claim that a woman in her 50's is the most important person to reach since she can

¹⁸ A focal point in my thesis regards cultural notions on when and how one forms ones identity. This connects with notions on children as blank papers, as “becomings” to use the phrase childhood researchers have launched. (Lee 2001, Johansson 2005). Thus identities are formed during youth. Grown ups, middle aged or older people are positioned as dead but still standing, as one informant drastically expressed it; having “coagulated” in the words of an other informant. The underlying model of development is a central cultural notion on ageing. I pursue these issues in my dissertation.

¹⁹ The opinion that boomers are more conservative and hostile to advertising is conveyed in the interviews. Younger people were positioned as media competent, able to see through advertising. I write more on this in my dissertation.

influence several generations: her children, grandchildren, siblings and friends, and her parents.

It doesn't matter what you sell. You can not afford not to talk to Anna [the most common name among this generation of women]. She is very friendly, bright, loyal and above all wise. Very, very wise. (<http://www.senioragency.se/2007-07-26>. see also <http://www.kvinnopanelen.se/>)

The reason to turn to the comparatively older consumer is thus discussed in terms mainly of their affluence and spending power, but also in terms of their influence on significant others. This is also the case when the argument is to address young consumers: they influence more people, they consume more and spend more money on themselves.

In other interviews with people working in advertising a more harsh opinion is expressed. The market wants to reach the young crowd because that is more hip and gives more credentials to the copywriters or art directors themselves. In order to be seen and talked about in the right circles the issue is not how to reach the actual consumers. It doesn't matter who really buys the products as long as buzz is attained in the line of trade of advertising itself.²⁰

Another point can be made on this as regards consumption habits. For example commercial television has different pricelists for commercials with prices going up at prime time – considered to be the best spots in the television tableau with most potential viewers. Television viewing is measured – who watches what when – and statistics on whether or not it is a young person in their early twenties or someone in their eighties is accounted for. The price for the commercials is set accordingly. If a television program, and more precisely its commercials, can reach a younger audience – though not children – the prices are higher. Older viewers have up until today been depreciatingly referred to as “waste” as regards mainly commercial television viewing. The same goes for print media. An interviewed media broker explained that the tools to assess what magazine to advise a client to run their adverts in is based on consumption and media patterns for a population between 15 and 79. Older media users are disregarded. Further, the older of the included consumer groups are not rated as interesting when choosing a venue for an ad. Advertisers get them “for free” – they are not

²⁰ Stureplan, a location in central Stockholm is used as a sign of the hub or epicentre of advertising in Sweden. Here the young, well to do, hip crowd gathers. In this area people working in advertising are said to have their own watering holes. To attract attention here is according to some interviewees more valued than to really make a campaign that impacts on consumption.

the target group for which they pay. At the same time we know that older viewers watch more television than younger people, just as many magazines have older readers. Younger people have other consumption patterns as regards also other media: the use of the internet, chatting, downloading films or music for example. There is a link between consumption patterns of older consumers and traditional advertising: print ads or TV-commercials for example. There is also a changing link between consumption products and habits and different consumer groups as regards age. Middle aged and older consumers buy comparatively more CD-s and DVD-films than younger consumers, who have a different consumption pattern, and more frequently download these (at times without paying, illegal, but widely spread.) This indicates that older consumers can be more interesting for producers and advertisers since they are more easily reached by traditional, established advertising channels. And that their consumption pattern is more in line with for example the established production of the music industries. These factors, together with who has more money to spend on consumption all favours addressing the older consumers.

Struggle for the relevant consumer

In summary it can be said that there is an ongoing struggle over who is the most relevant consumer to reach; the young or the older – with the proviso: only relatively older. Let's emphasize that it is ageing in a certain part of life that counts. With more people living longer the meaning of ageing is changing. But there is still a taboo on what the sociologist Andrew Blaikie (1999) calls deep old age. Positive ageing becomes conditional on sufficient income, cultural capital, mental and physical health. Blaikie points out that a phase of active adulthood expands to embrace more seniors, but stronger taboos form around those in poverty, those without the right cultural capital, or those suffering from disability or diseases. Today fear of old age and ageing can be said to be postponed and transferred from entering the age of retirement to entering the so called fourth age, or as Blaikie expressively calls it, "deep old age".

Becoming "older" is described as being wiser, more experienced, having higher self esteem – and even, in some interviews, as attractive, not least because one supposedly has reached a pinnacle career wise and has money.²¹ This refers to people in their fifties, sixties and seventies. Real old age is said to commence once you are in your eighties, ill and dependent.

²¹ The interviewed women also talk of disadvantages of ageing. I will pursue this in my dissertation.

(see *Rekordgenerationen* 2005, this is a recurring line of argument when discussing values among the boomers.)

Many signs indicate an increasing interest in the – thus relatively – older consumer. Will this interest for the so called greying market entail a change in what cultural meaning age is ascribed? Will representations show more people over fifty, compared to ten, twenty or thirty years ago and will this have an impact on how we understand ageing? Will ageing no longer be feared and avoided but instead recognized, or even affirmed?

Representation in adverts

There are signs of a change in representation. One of my interview persons, a freelancing journalist, pointed out that Isabella Rossellini got fired as spokeswoman for Lancôme in the early 90's – then considered to be too old to represent the company's image. Today she is back modelling for as an example the Swedish clothes company Lindex. And there are several models aged 40, 50 and even 60.

The cosmetic company Dove has in 2007 launched a new range of products with the logo “Pro age”, together with an advertising campaign in TV-commercials, in print, outdoors, and on the internet. The women depicted are, it says on the website, in their 50's and 60's. The slogan is: Beauty has no age limit. The advertising campaign and the launch of the new products got attention in the media, not least through the concurrent introduction of a report on beauty ideals and ageing. In September 2006 “*Beauty comes of Age*” *Finding of the 2006 Dove global study on aging, beauty and well being* was published. It is based on a survey in ten different countries, with women aged 50-64.²² The reports all have prestigious, well renowned researchers behind them: For *Beauty comes of Age* it is dr Robert Butler (professor of geriatrics), dr Nancy Etcoff (Harvard Medical School and Dr Susie Orbach, (London

²² In 2004 Dove published a first report: “*The real truth about beauty: a global report*”. *Findings of the global study on women, beauty and well being*” based on a survey of women aged between 18 and 64, from ten different countries. This was published together with an advertising campaign and a website where users could participate by voting or discussing different beauty ideals. In 2006 “*Beyond Stereotypes: Rebuilding the Foundation of Beauty Beliefs*” *Findings of the 2005 Dove Global Study* was published focusing on beauty ideals and self esteem amongst especially young girls. The third report is the one on ageing and beauty mentioned above.

School of Economics, and well known not least through *Fat is a Feminist Issue* 1978).²³ This gives the company academic credibility. The reports have got attention in newspaper articles and editorials. When reading many of them it is impossible to know that the reports are not based on independent research but on research paid for and commissioned by a commercial company. In my interviews many advertisers assert that the best publicity is the one you get either with so called word of mouth – when people spread the message amongst themselves, or in newspaper articles, when journalists reports from press conferences; report on research initiated by a company or by getting an editorial accepted. This gets more attention than paid for advertising and thus has a higher value for the company.

The Dove report was launched with the mentioned advertising campaign – in both print, TV commercials, and on a website – and with the new range of products with the logo Pro age. On the site (<http://www.doveproage.com/>)²⁴ you can read more about the campaign, see all the ads, order free samples of the products and read about how to improve your life – by reading about “your spirit”, “your body”, and “your outlook”. The latter resemble the way popular magazines address these issues. Dove has got other attention on the internet as well: some of the commercials have been downloaded and published through for example Youtube.com or other comparable video sites. The ad campaign is said to have been made for television but got banned in some US states because the women “showed too much skin”; they were photographed in the nude.²⁵ The depicted women, posing in a sculptural way are superimposed with the words: “too old to be in an anti-aging ad”. The impression is that the campaign got stopped because the women were too old. The commercial ends with claiming that the products are not anti age but pro age and that beauty has no age limit. On bloggs and discussion forums on the net there is a debate over whether or not it was a deliberate measure to portray women in the nude and getting the commercials banned. In other words, saving money on paid for commercials but getting the so much more valued word of mouth as users click on the website and watch the film through Youtube.com and later talk about it.

²³ The report also cites Heidie D’Agostino from “StrategyOne” as author, but she is not presented in the report itself. StrategyOne is “a market research and strategic communications agency” (http://www.edelman.com/expertise/specialty_firms/research/070823)

²⁴ Also see www.campaignforrealbeauty.com

²⁵ “Does beauty have an age limit? See the commercial you can’t see on TV.” is the text on the company’s website www.proage.com

Dove claims they have taken a new approach to issues on ageing and beauty. The products and the adverts are not anti ageing, like all other products on anti wrinkle and anti age, but pro age. How can this be interpreted? The copy for the products talks of women in their best years, of beautiful skin having no age limit. The discourse here is one of hailing ageing and confirming older women's right to be seen. But the copy also speaks of ageing leading to age spots and wrinkles, thinner less abundant hair, without natural bounce and body. Skin needing work to be revived and renewed. Body work is required. Ageing diminishes beauty and appearance is of vital importance. This is in many respects the same message previously launched in ads portraying young models claiming they manage to look young due to the skin cream they are using (Lövgren 2005, 2007). Thus: same message on what is important for women, but a different package.

But the company goes against one of the cornerstones of advertising, judging from my interviews where it is claimed that women identify with others younger than themselves and look upon themselves as younger than their chronological age. In the interviews this is stated as beyond dispute – as a fact. “Research has shown this” was a recurring phrase in the interviews with people in advertising.²⁶ It is stressed in the interviews that women identify with women ten years younger than themselves. According to the interviewed marketers this explains why ads so often feature women younger than the target audience.²⁷ With their campaign of 2007 Dove ventured forward with depictions of women of approximately the same age category as the target group.²⁸ This indicates a change in representations of ageing in advertisements.

²⁶ One interview person sent me the research he based his opinion of this on; articles by gerontological researchers on chronological age, looked age and felt age, or ascribed age and age one identifies oneself with. (Öberg & Tornstam 2001, 2003)

²⁷ Some of the interviewees also gave examples of the disgust adverts portraying older people had evoked – evidenced also in discussions in a branch magazine for the advertising industry. The public want to disassociate itself from older people; they don't want to see them depicted it is claimed in the interviews. This could also explain why the portraits in the ads are of women looking younger than the target audience.

²⁸ On the web site www.dove.com the models for the campaign is presented together with their ages and quotes on how they think of their appearance and of ageing. The ages of the models are in the age range of the target groups whereas usually the models in ads in general are younger. It must be pointed out that practically all of the the models are adhering to beauty ideals of the western society: thin, taut skin, posing in almost classical poses reminiscent of statues or paintings. I analyze this further in my dissertation.

There is a balance walk to be performed in adverts. On the one hand the adverts promise change, transformation, hope of what can be done with a consumer product, exaggerated in the ads illustration of dream and fantasy. On the other hand the ads must have an element of realism, credibility and reliability necessary to convince the consumer of the efficacy of the product to convey the message that it is worthwhile to spend money on this product. The elements of fantasy and hope have to be counterbalanced by presumptive consumers' possibility to identify with the product and the promise made.

Women disregard their chronological age it is inferred in an article in *The Journal of Consumer Marketing* (Barak & Stern 1985). Marketing should therefore combine youthful images with mature models to reach the mature women who consider themselves as young in mind is the deduction made in the article. "It is a demographic fact of life that the most fashionable age to be is the age of the dominant population group (Barak & Stern 1985:42) thereby consequently pointing out that with a change in demographics, a change in representation might follow.²⁹

Young of all ages

Let me return to the ambivalences that characterize my empirical material. This also characterizes the cultural meanings of age and ageing. One interviewee formulates an opinion on this that I think touches upon core issues:

/.../ Partly I think it depends on how the baby boomers relate to themselves if you ponder why it is so important to concentrate on the young. Because if it works with young people the baby boomers think it is more attractive. /.../ Because youth is so important to them they don't want to think of themselves as pensioners. They compare themselves rather to a 25 year old who is travelling out in to the world, to see the world. It is rather that image they want to have of themselves.

So if you have two ways to present the same product in, if you have to choose one of them, don't say this is a product for pensioners but say that it's for those who are going out to conquer the world.

²⁹ O'Barr (1994) using ads from different historical periods has shown how the visual representation of black people has changed in the US. An equivalent of sorts could I am sure be shown regarding ads for skin creams. As the whole supply of creams has increased so tremendously in the last ten or twenty years – and still is increasing, it will together with the change in demographics at present, change the representations even more.

Perhaps this is a contributing reason for the concentration on youth. If it works on young people, it works as well on older. You, so to speak, kill two birds with one stone. (Interview with a market researcher specialising on trend and values.)

Young of all ages are praised. Everyone – regardless of age wants to appear young. It is important to emphasize that it is not young people that are being hailed, but “young”, and youthful mind. These are cultural values, linked with a period of time: adolescence or youth, but not equivalent to it. Remaining curious, still out conquering the world, beautiful after fifty – as long as you work hard at it and stay in shape –, are cultural notions on ageing at a phase of life. Ageing is recognized and affirmed, as long as one doesn't become old.

An ageing wonderland of self-service?

Helena Tuorila
National Consumer Research Centre
Helsinki, Finland
helena.tuorila@ncrc.fi

Abstract

The practice of self-service is increasing and expanding to totally new services at the expense of personal service. The growth of self-service is not being slowed by the ageing of the population, as the future elderly have already adopted self-service and will continue its use when aged. Self-service is growing on the terms of the younger age groups. Insecurity about their own future in an ageing Finland is encouraging young generations to take information society development into their own hands and shape it in their own likeness. In expanding self-service, special attention needs to be paid to the reliability of the service, since the user has to take on responsibility for many issues that used to be handled by customer service personnel. Doing it oneself must neither jeopardise the customer's health or financial safety nor his/her access to expert services.

1. Introduction

The debate about self-service is active, and the expansion of self-service at the expense of personal service often comes up especially in the media. The active debate has a solid foundation on daily life. For example, Finnair's various check-in services make it possible for passengers to check in in advance and speed up the departure procedures at the airport. Check-in can easily be completed on the Internet, by text message or at the self-service kiosks at Helsinki-Vantaa and Stockholm-Arlanda airports. (Finnair 2007.) As a second example, self-service is increasing in health services. Patients are expected to take responsibility for their own care as methods of treatment develop.

The practice of self-service is increasing and expanding to totally new services at the expense of personal service. No services are safe from self-service. Beauty bars are a good example of this. People usually go to beauty parlours to relax and enjoy themselves and to allow someone else to pamper them. The most trendy beauty parlours have started to offer self-service to their customers. A beauty bar is the answer to the skin care and beauty care needs of today's busy people. There is an interactive room where a customer can do her own facial or make-up under the guidance of a beautician.

It is worrying that alongside the above-mentioned examples it is almost natural to return dishes at cafes or shopping trolleys at supermarkets. Step by step, self-service is becoming part of our everyday life.

There are increasingly fewer opportunities to obtain personal service. This development has made exponents of personal service raise their voices. The Union of Insurance Employees in Finland has started a campaign for personal service. The employees working in the insurance business are concerned that large insurance companies are offering more and more electronic services. They are concerned not only for their jobs, but also for their customers' interests. A damaging event is often not only unique but also financially significant to the customer. Customers should always be able to have personal service when applying for compensation. The result of self-service must not be that customers are left without compensation only because they have not filled in the forms correctly.

The strong increase in self-service demonstrates that technically almost anything is possible. Only imagination sets the limits to new innovations. Engineers have not understood or do not want to believe that people's physiology sets limits to reasonable self-service and technical development. A human being cannot develop as fast as information technology, but eyesight, hearing, physical condition and mental capacity limit the wildest technical innovations. On the other hand, the production of physical products cannot be transferred to self-service without problems.

Self-service is not automatically a step towards better service. The e-ticket of VR (Finnish Railways) is a good example. In order to obtain a ticket you no longer have to queue at a station booking office but the ticket can easily be purchased in VR's Online Shop and you may then print the ticket yourself, have it sent by post or else call VR Telephone Service and pick up the ticket, for example, at an R-kiosk. It seems that in this case self-service really works, but in practice the development of the new e-ticket is incomplete. At least for the railway guards the e-ticket is more troublesome than an ordinary ticket. There is no point in such self-service that increases the workload of customer service personnel.

The goal of this paper is to examine the factors that increase or potentially decrease the use of self-service from the viewpoint of the users of services. It is important to take into account both possibilities, although it is very unlikely that self-service will decrease in the future. On the other hand, this paper aims to inspire readers to consider their own service behaviour. The original and more profound source of this text is a discussion paper published by the National Consumer Research Centre (Tuorila 2006).

The increase or decrease in self-service is examined through foresight and mind mapping. According to Skumanich and Silbernagel (1997) foresighting is the effort to assess future conditions based on current conditions and trends. Implicit

in the term foresighting is the notion that the future is uncertain and not directly predictable, so the focus is more on general conditions rather than specific events.

Foresighting is generally considered to be distinct from two related concepts: forecasting and strategic vision-setting. While both foresighting and forecasting involve trying to assess future conditions based on the present, the latter term also includes the connotation of predictability: as the forecasting method becomes more and more developed, it is expected to become more and more accurate in predicting future states. By contrast, a strong theme in foresighting is that large aspects of the future cannot be predicted, and so "accuracy" becomes a less meaningful concept in relation to foresighting. Foresight implies an active approach to the future. It invites us to consider the future as something that we can create shape, rather than as something already decided. (Skumanich and Silbernagel, 1997.)

There are literally dozens of methods for performing foresighting, ranging from "back of the envelope" approaches to highly structured methods. Experts often group foresighting methods into different categories according to various attributes. According to Skumanich and Silbernagel (1997) these methods can be grouped into six main categories. The first two categories – expert opinion and scenario building – emphasize human participation in the foresighting process. The second two categories – modeling and morphological analysis – emphasize the use of computer models or other analytic tools to provide analysis of future states. The third two categories – scanning/monitoring and trend extrapolation – emphasize the degree to which conditions of the future are based on conditions of the present.

Mindmapping is a very potential but seldom used foresight method. Joyce Wycoff (2004) describes mindmapping as a non-linear way of organizing information and a technique that allows you to capture the natural flow of ideas. In a Mind Map, the central theme is often illustrated with a graphical image. The ideas related to the main theme radiate in a clockwise direction from that central image as "branches". Topics and ideas of lesser importance are represented as "sub-branches" of their relevant branch. A mind map is similar to a semantic network or cognitive map but there are no formal restrictions on the kinds of links used. Mindmaps can be drawn by hand, either as 'rough notes', for example, during a lecture or meeting, or can be more sophisticated in quality. (Alueellisen ennakoinnin käytännön opas - Suomi 2002.)

2. The ageing of the population will not slow down the growth of self-service

The ageing of the population will not slow down the growth of self-service, as the future elderly have already adopted self-service and will continue its use when aged. The demand for personal service will not emerge until users are no longer capable of managing their affairs through self-service. By adding user-friendly technology this need for personal service can be postponed.

Changing consumer habits, rather than the ageing of the population, will affect the quantitative and qualitative development of self-service in the future. Citizens' consumer habits are not a static phenomenon but they change in the course of time as living conditions change. In the future, all age groups will use information technology. The difference between generations is based on the ability to adopt new evolving solutions provided by information technology. The adoption of lifelong learning will be the real future challenge so that the gap between older and younger generations does not grow too large.

An interesting feature of the changing consumer habits of Finns is whether self-service will be favoured in consumption or whether citizens will particularly consume personal service. The trends in consumer behaviour indicate that behavioural models of consumers will become increasingly diverse, as also will peoples lifestyles and the whole social development. Consumers want to have unique products and services, preferably made just for them. Standardized mass products are not suited to these needs. (Bentley – Wilsdon 2003.)

The growing emphasis on individualism in consumption habits hinders the acceleration of self-service because self-service users are treated as a group. However, the same emphasis on individualism forces suppliers to improve the quality of self-service. Self-service is not as flexible as personal service and it does not allow for customers' special desires.

The functional strength of self-service is the technology that enables huge numbers of people to do things for themselves. In self-service, customers are seen as customer groups with different self-service functions designed for their needs. An individual customer has no influence in self-service. In predicting the developmental trends in self-service it is inevitable that the increasing need of consumers for individuality might change the way individual customers are regarded in self-service processes. Self-service suppliers should be aware that the desire for services in accordance with individual wishes and needs also extends to self-service. The tailoring of services is not merely limited to personal service.

Customers' special needs are not taken into account in the technological solutions of today's self-service. Self-service functions must be tailored to customers in order to improve the quality of self-service. Technically, this should not even be difficult to realise because there are many mobile functions that can be customised. The changing of attitudes is more difficult because it requires new kinds of personality with an accepting attitude towards self-service. Self-service must develop alongside other consumer cultures. Tomorrow's customers need and want more helpful self-service.

3. Self-service requires new skills

Self-service requires completely new skills compared to direct personal contact because customers themselves become customer servants. The better knowledge citizens have of information society, the better they adopt new forms of self-

service. In practice, the increase in self-service is being slowed down by the fact that not all people have equal opportunities to learn to use electronic services. Not everybody learns to use computers at school or at work. Such people must learn these new skills, for example at adult education centres. No organisation or person makes sure that citizens acquire the necessary skills. On the other hand, citizens have the freedom to be sublimely ignorant.

Self-service methods only benefit those who have the necessary skills and equipment. Moreover, the increase in self-service may lead to a reduction of personal service so that some citizens are left outside the services. For these people with poor service skills it would be best if the increase in self-service was also paralleled by an increase in personal service, although this is unlikely to happen. The most important consideration to service suppliers is to improve productivity at the risk of endangering some people's possibilities to use services. Humanity and service supply are often unfamiliar to each other in today's Finland.

The self-service – personal service combination creates inequality among citizens. In personal service the customer is helped by customer service personnel, whereas in self-service customers are left to cope on their own. In practice, the adoption of self-service by citizens is restricted by their insufficient information society skills.

Previously, the wealthy paid extra for special services. In today's Finland, people who have fallen behind in the development of the information society or are set against it must pay a higher price for their services, whether they are rich or poor. Could this combination return to its original form in the future? Self-service would be for the poor and personal service for the wealthy. The answer in all probability is "no". The role of consumers' financial resources in their choice between different service options will diminish in the future. Instead, their information society skills will become the primary differentiating factor in their choice of service. An indigent person skilled in the use of web services is in a better position than an affluent consumer with a poor knowledge of computers.

4. The confidence capital of self-service

In increasing self-service, special attention needs to be paid to the reliability of the service, since the user has to take on responsibility for many issues that used to be handled by customer service personnel. Doing it oneself must neither jeopardise the customer's health or financial safety nor his/her access to expert services.

The suppliers of services have loaded enormous expectations on self-service. Expectations are especially high in lines of businesses where self-service is seen as a solution to cut the costs of service supply. In order for self-service to fulfil expectations it has to be reliable. The reliability of services is important to everybody, no matter how old service users are or what kind of service expectations they have. Besides technical simplification and user orientation, it is essential for self-service to earn the trust of service users.

The confidence capital concept was originally proposed by Harisalo and Miettinen (1995). The concept is based on interaction between people. In the present case, confidence capital signifies the trust that service users place in self-service functions. Self-service suppliers cannot buy trust, but it has to be earned by offering positive self-service experiences. Compared to the original definition of confidence capital, the confidence capital of self-service is not based on interaction between people because there is no such interaction in self-service. Instead, trust is based on the functionality of technology and ease of buying services.

Even if the technology functioned flawlessly, trust in self-service could easily falter. Unsuccessful self-service experiences favour personal service. Increasing self-service does not always produce successful experiences. The experiment some years ago of Finland's postal service, where customers had to pick out their packages themselves, did not encourage the adoption of self-service. Customers did not always find their packages without the help of clerks. In fact, the frustrating and unsuccessful search for packages irritated customers even more. Nowadays, post office clerks hand over packages to customers as they used to do.

The customer's role is important in ensuring the reliability of self-service because they have to take on responsibility for many issues that used to be handled by customer service personnel. Customers have new responsibilities such as recognizing their mistakes and knowing how to correct them. This is not always possible. If you enter a wrong account number when paying bills, getting money back is not simple.

Customers do not always have enough expertise in order to definitely be part of skilled service production. Consequently, the customer's right and access to competent services in self-service is endangered. For example, increased self-service in insurance services must not cause customers to lose indemnities just because they have not given the right information in the correct way.

Self-service should be foolproof. In the real world, service suppliers are not always able to supply self-service that would not endanger the access of customers to competent services. Misunderstandings and unclarities are unfortunately part of human intercourse.

5. Will self-service grow on the terms of the younger age groups?

Globalisation is enabling consumers to improve their position in relation to service suppliers. The world is becoming a smaller place to live in. Thanks to the media and Internet, the world has also become more transparent than before. Citizens have more and more information about things that happen around the world. New values and likes transfer faster than before over borders. Consequently, international consumer trends contribute to the essence of Finnish consumers. By providing information on the actions of consumers elsewhere in

the world, electronic media also make Finnish consumers more demanding as consumers. Could it be possible that thanks to globalisation Finnish consumers will finally become demanding consumers? A demanding consumer does not mean a difficult consumer who complains about trivia, but a consumer who is aware of his/her rights and knows how to take advantage of them.

The hope of increasing the activity of Finnish consumers is alive. In summer 1999, customers loudly criticized long queues at the branches of banks. The criticism was successful because the popular movement and public pressure made banks hire more customer servants. Unfortunately, there have been less successful attempts, such as in spring 2004 when elderly people tried to rebel against high bank charges. The movement ended before it had properly started. The problem among Finnish consumers is their adoption of a passive mode of action.

The development of functional self-service processes requires the identification of people's needs and development and the realization of new needs-based processes. On the other hand, a prerequisite for successful self-service is active and spontaneous action that is integrated into the development of systems.

Self-service is growing on the terms of the younger age groups. Insecurity about their own future in an ageing Finland is encouraging young generations to take information society development into their own hands and shape it in their own likeness. However, the most influential era of ageing consumers still lies ahead. The ways in which the future elderly take care of shopping, banking and other activities will have a major impact on the development of self-service. It is important to realise that the choices of tomorrow's ageing consumers can be affected by today's actions: by how they are taught and accustomed to managing their shopping and other affairs, and by the kinds of experiences that self-service and personal service have to offer.

The immediate possibilities of ageing consumers to contribute to the development of services are insignificant. At most, their voice is heard through different customer feedback systems. And even though their voice is heard, they are not really paid attention to. It clearly seems that self-service is increasing and developing first and foremost on the terms of the younger age groups.

It often appears in the development of products and services that there is not enough information about the special needs of ageing consumers. However, this is not true, because there have been several studies on the special needs of ageing consumers concerning the use of computers and the Internet (e.g. Mäensivu 2002; Petäkoski-Hult et al. 2001; Tuorila 2004; Tuorila – Kytö 2005). On the other hand, youth has long been the ideal in marketing and young adults have been the main target group in marketing. Ageing consumers have been seen as sparing old men and women sitting in rocking chairs whose consumer behaviour is conservative and boring.

One possible explanation why the voice of ageing consumers is not heard in the development of products and services is the "battle" between generations.

Insecurity over their own future in an ageing Finland may further mean that young generations take information society development into their own hands. The service sector is becoming a generational battleground, because information technology is best adopted by younger generations. The majority of those responsible for the development of products and services are young or middle-aged.

There has been a lot of discussion about the growing influence of ageing consumers as their numbers increase year by year. The number of ageing consumers will peak in 2020-2040 when the age pyramid will be very upper-oriented (Wallenius – Hjelt 2004). After that the age pyramid will start to resemble an “age pillar”. The most influential era of the ageing consumers is very much ahead.

6. Conclusions

The future is shaped by decisions we make today. No-one can predict the future. What we can do is to look ahead and think about what might happen so that we can begin to prepare for it today. (Taipale 2005.)

Is Finland an ageing wonderland of self-service? The developmental trends of customer service sometimes suggest that self-service has become a living creature that duplicates itself and that there is no end to this on the horizon. However, the information society that is linked with self-service is a society of people not computers. The ultimate goal is not to manufacture technology or generate economic growth but to increase information, wisdom and understanding. Technology and money are only tools, not the end. (Hietanen 2005.)

Instead of seeing technology as the core of human life, the meaning of human interaction should be the focus in the formation of technology. It is important to include the interactional dimension in the definition of technology, because technology may only come to play an essential role as a dynamic of human life and economics through use and usability. The way consumers adopt technology as part of their lives is especially important. (Elinkeinoelämän keskusliitto 2005.)

From this we can conclude that there is no self-service without people, so we are the reason for the increase in self-service. Technical development should take note that people set the pace. Robots do not yet control this world, as is occasionally portrayed in movies and science fiction literature. Instead of investing in new technical inventions, the quality and functionality of self-service should be the main concern.

The suppliers of services seem all too easily to have forgotten the quality of self-service, especially the human features. Instead of quality, the centre of attraction is the application of self-service to wholly new services at the expense of personal service. Customers’ real service needs fall behind new technological inventions because it is easier for the suppliers of services to offer self-service on

technological terms than on the customers' terms. Self-service could be made more human by bringing it closer to the individual life of customers. The usability of self-service could be improved by listening to customers' needs, and on the grounds of their real user experiences the insecurity of self-service could be reduced. The suppliers of self-service still have a lot to learn.

Human action is not always rational. Although people complain about self-service, it is widely used. The simple explanation for this kind of conflict between thinking and action is that self-service is often the only real choice. Consumers are also directed to self-service because its good qualities are discussed much more than the bad ones. Good qualities are emphasized all the time, whereas negative features are highlighted from time to time. In the future, self-service will give us many reasons to be surprised because it will certainly diffuse into functions that we could not currently think of doing ourselves.

Nordic Consumer Policy Research Conference 2007

Finnish Consumer Agency ,
Deputy Consumer Ombudsman Anja Peltonen:

AGEING CONSUMERS AND PUBLIC SERVICES

Public services are defined here as services that are produced by local authorities or the state and financed mainly with taxes.

The principles arising from the Consumer Protection Act are applied when consumers acquire consumer goods or services in the markets. In market conditions, consumers have a choice between the goods being offered, but competition must be efficient for it to be in the interest of the consumer.

Transparency is therefore required of markets, in other words it must be easy for the consumer to perceive the price, quality and other factors of the alternatives offered. The division of responsibilities between the consumer and the business offering the service must also be reasonable. If the service is not what was agreed or what the consumer could reasonably expect, the consumer is entitled to compensation in accordance with the “access to justice” principle. The sanction system of consumer law aims to ensure on one the hand that the operations of businesses will in future comply with the law (so-called collective regulation), and on the other hand that consumers will receive compensation for any loss caused to them.

In the Finnish Consumer Protection Act, a business is defined as a natural person or a private or public legal person that deals on a professional basis in order to obtain income or other economic interest. The scope of the definition of a business also includes organizations, associations and foundations that aim to obtain economic interest through their operations. However, voluntary work and non-profit activities that do not entail entrepreneurial risk, for instance, remain outside the scope of the Consumer Protection Act. In this document, organizations and other bodies are not considered separately. According to the scope of its applicability set out above, the Consumer Protection Act applies to some of the organizations, but some remain outside the scope of the act.

Values behind consumer legislation regulations

Behind legislation concerning consumer rights lie the following principles and values, among others, from which individual provisions are derived and which guide decision making.

Availability of services and sufficient alternatives

In services of general interest such as electricity and water supply, availability of the services is a matter that will not be ensured by competition, so special attention has been paid to legislation governing them.

Transparency

The alternatives offered must make it easy for a consumer to perceive their content, price, delivery and other terms. The alternatives must be such that they can be compared and a consumer can foresee how the service might change in the future and how it can be discontinued. The service provider must in its marketing and in all steps of concluding a contract inform the customer of all essential information clearly. Withholding essential information and marketing misleadingly may create a liability to compensation.

Fairness of contract terms

In trading with consumers, the service provider is assumed to be more professional and therefore a stronger party than the consumer. The service provider in most cases drafts standard terms, the content of which the consumer cannot affect. The requirement of fairness of contract terms means among other things that, in principle, the service provider cannot unilaterally change a contract term. If contract terms are changed, the consumer must be notified of the changes in good time, and agreement by default cannot be used to get approval from a consumer, there must be expressed approval.

Good practice and taking the target group into account

Marketing must not be improper, for instance contrary to the general values of society. It must not, for instance, exploit the inexperience or distress of the target group, such as children or the sick. In debt collection, good debt collection practice must be followed.

Right to compensation

If a service is not what was agreed or the customer could reasonably expect, he or she is entitled to compensation, and there must be no cost to the customer for remedying the fault.

“Access to justice” and one-stop shop principle

It has been considered important in consumer legislation to ensure for citizens not only the rights enacted in an act, but also real opportunities to exercise their rights. Legislation alone is inadequate, “access to justice” systems are also required, such as local consumer advisory services, a consumer complaints board and a consumer ombudsman. Another important matter affecting the practical position of the consumer is the principle that a consumer can always present all his or her requirements to the party with which he or she has a contractual relationship, and that party must deal with them. A seller cannot oblige a customer to contact the manufacturer, importer or service subcontractor, even if a fault is due to their operations. A seller can of course negotiate its own compensation with its own contractual partners, but a customer cannot be sent around from one place to another.

Current situation

The legal position of users of social welfare and health services has traditionally been defined through the provisions of administrative laws, and primary and secondary complaint procedures relating to them. Rather new provisions are the social welfare customer act and health care patient act, which provide an opportunity for users of services to make a complaint. The requirements in providing a service professionally, in other words the quality standard requirements, have not been clearly set from the user's point of view. Users' rights following faults and delays have not been regulated.

Private-sector social welfare and health services come under the scope of the Consumer Protection Act, and its provisions cover among other things quality of services, marketing and contract terms. However, these provisions do not apply when the orderer of the service is a local authority.

Special features in regulation of services

Public services are regulated by aims and principles based on constitutional rights that cannot be required in private-sector markets, and there is no justification for abandoning or compromising on them in future public services even if the services are provided by a subcontractor. In that case too, the requirements of the Administrative Procedure Act concerning public sector services must be taken into consideration.

Orderer-provider model and service vouchers

The local authority is responsible for the availability of statutory social welfare and health services. The orderer-provider model is one way of providing the local authority's services. In this model, arranging the service and providing it are separated within the local authority. The service provider is an organization either within the local authority or outside it, such as a private-sector business or third-sector organization, association or foundation. Contracts govern operations between the provider and the orderer. The service voucher model increases choice for consumers because businesses and service providers can compete for customers provided they comply with the minimum standard of service that should be agreed with the local authority. It must also be emphasized that, in general, competition is not necessarily an effective solution for all customer groups.

Special attention to vulnerable consumers

Users of social welfare and health services may often be so-called vulnerable users, whose ability to secure their rights is weaker than the average consumer's owing to old age or illness. Vulnerable consumers cannot act as active consumers in competitive markets, and would need help and guidance when considering alternatives. It is therefore justified that under current regulations on service vouchers, a customer may refuse to accept a service voucher.

This imposes special requirements on the methods used in the orderer-provider model, for **acceptable performance and continually monitoring its quality**, for instance. It is important to ensure among other things that feedback on deficiencies received from residents in homes with services for the elderly is passed on to the right responsible party. Vulnerable groups of consumers do not necessarily know how to utilize existing procedures for primary and secondary complaint procedures.

As regards services in sheltered housing, old people's homes and other long-term services, **continuity of the contract** is a key issue for users. In tendering to be a service provider and when contracts for outsourced services are made, the contract periods should be long enough that the users need not change service provider unnecessarily often. The party seeking tenders for the service must naturally ensure that the service providers selected are financially sound and will be able to fulfil their commitments throughout the contract period. In any case, a **contingency alternative must be considered in case the service provider suddenly has to discontinue its operations**.

In sheltered housing, a customer may conclude with the service provider **contracts for other services too**, in addition to being a customer of outsourced services. As regards a contract of this type that also includes a rental agreement for living in the sheltered housing, it is important that the service provider does not unilaterally amend the contract in a way that fundamentally affects the service user's position. The starting point in consumer law is that the basis for the right to make amendments must be specified in the contract and the contract must not be fundamentally amended without both parties contributing to the amendment. As regards long-term contracts, frequent re-tendering facilitates fundamental changes to the content whenever a new contract period starts. From the consumer-customer's point of view, this is not necessarily useful; but then, active consumers cannot either in reality always affect the contents of a contract.

Theme 2. Children and teenagers as consumers

Jon.bertilsson@fek.lu.se

Abstract

This paper deals with how young consumers learn the logic and workings of brands and branding by analyzing textual accounts of conversations between young people between 13-20 years old collected on an online forum situated on a Swedish website. The findings indicate that people learn about these consumer cultural phenomena through an enculturation process involving conformity to norms of brand and consumer authenticity formed in peer interaction, and the reflexive evasion of punishments for breaking those norms. The enculturation process also involves brand story telling that affects the very meaning of brands, giving the consumers authorship over brand meaning, which is why consumers therefore could be regarded as a type of brand managers.

Introduction

Brands as a phenomenon in society has developed from merely being a mark on animals used by proprietors to mark their cattle and life stock (Aaker, 1991), or used by middle age craftsmen to signify and distinguish their created goods from other craftsmen (de Chernatony & McDonald, 1992), from industrialization and onwards functioning as symbols that both enable consumers to separate or identify one producer of goods from another, and to be able trace a particular good back to the producer holding it responsible for manufacturing goods with inferior quality (Koehn, 2001) to reach a high-esteemed position in contemporary society ascribed with almost divined characteristics serving as magic strategic business tools essential for firms if they are to compete successfully on a more globalized market, gaining market shares, increasing profits, and creating value for the corporation and its shareholders.

A lot of brand management research, generating fruitful concepts such as brand equity (Aaker, 1991), brand leadership (Aaker & Joachimsthaler, 2000), brand identity (Kapferer, 2004), brand image (Gardner & Levi, 1955), and corporate reputation (Gray & Balmer, 1998), has thus been conducted to understand and explain how successful brands are to be built, managed and developed by corporations and their brand managers in a way that would give firms a competitive edge over their adversaries. Brand strategies, tactics, and other brand building activities for building not just a strong brand but a right type of brand then needs to be developed and put into action if it is to add value to the firm. All the brand management strategies, techniques and concepts though rests on a certain logic of brands, a set of axiomatic assumptions and principles that lies behind how firms ought to and seeks to build, manage and handle their brands, which all together comprise what Holt (2002) refers to as a branding paradigm. As an outcome of the movement of managers between various firms, the normative and mimetic effects generated by peer interactions, and the communications and

information flow mediated or conveyed by consultants and educators, big firms are inclined to share a joint set of branding knowledge, conventions or principles serving as a groundwork from which certain brand strategies and techniques then are developed.

Consequently consumers are continuously subjected to several branding activities such as conventional advertising (Vakratsats & Ambler, 1999; Alden *et al*, 1999) product/brand placement in movies (Gould, *et al*, 2000; Balasubramanian, 1999), in TV-series (Russel, 2002; Avery & Ferraro, 2000; d'Astous & Seguin, 1999), the employment of celebrity endorsers (McCracken, 1989), the placement of brands in disinteresting life situations far removed from commercial sponsorship, and the placement of brands in cultural epicentres involving arts and fashion communities conveying particular authentic associations, all of them stressing that life needs to be channeled through brands to have value and meaning. However as brand managers aggressively press the branding techniques to their extreme consumers become more knowledgeable and reflexive concerning the earlier established mechanics and principles of branding, and the regular branding activities devised by the marketers (Holt, 2002), developing an improved brand literacy (Bengtsson & Firat, 2006) thus eventually learning about the logic of brands and how branding works, ultimately challenging the very accepted and taken-for-granted status of marketer's actions.

This paper deals specifically with how this learning process works – how consumers learn about the logic and workings of brands, and how they form knowledge, and norms about brands and branding, and what this consumer brand knowledge contain. I bring in the theoretical construct of enculturation to complement the consumer socialization construct for the purpose of improving the understanding of how consumers learn the logic of brands and branding. The empirical object of the study is young consumers in their teens primarily because teenagers, being neither children nor adults intensively are searching and forming identities often with the help of brands and consumer goods. Spending billions on consumer goods every year they are a very attractive group of consumers for firms and are therefore continuously subjected to heavy marketing and branding activities. A qualitative method involving interpretive analysis of textual accounts collected from online conversations taking place between young people (13 -20 years old) on a Swedish internet forum is used. The findings show that consumers learn about the workings of brands and branding through an enculturation process involving conformity to norms of brand and consumer authenticity formed in peer interaction, and the reflexive evasion of punishments for breaking those norms. The enculturation process also involves brand story telling that affects the very meaning of brands, giving the consumers authorship over brand meaning. Consumers may then also be regarded as a type of brand managers.

Youth culture and consumption

Youth as a socially constructed category, generally referring to what is considered young and new and therefore strongly connected to the future, being culturally determined in the discursive interplay with visual, musical, and verbal symbols and signs Fornäs (1995), is often considered as a product of the development of the Western modern society (Kjeldgaard & Askegaard, 2006). The concept of the teenager emerged in the Post World War 2 era of the 1950s and 1960s as a result of that time's economic growth where the rise of the middle-class young consumer generated a new, expanding, affluent and lucrative consumer group in its own right for corporations to attend (Willis, 1990). Since these teenage middle-class consumers were relieved from wage-earner responsibilities their identity as a social category

became inextricably connected to free time, fun, and hedonic consumption, thereby representing the emerging mass popular culture. Companies immediately seized the opportunity to capitalize on this new and quickly growing consumer segment. Marketers developed and employed marketing actions for products and brands sensitive to the particular characteristics of this particular group of consumers. Their increased independence from parents granting them with a greater autonomy concerning the purchase and consumption of consumer goods and brands, a greater influence on their discretionary income, and a bigger influence on the household purchasing decisions, has made teens and tweens a multi-billion-dollar market on which companies continuously struggle for market shares (Siegel, *et al* 2001). During 1998 teenagers between 12-19 years old allegedly spent an estimated \$94 billion of their own money on consumption items (Zollo, 1999). Teenagers are thus regarded both as a lucrative current market but are also viewed as the crucial future market since adolescence is the life stage when individuals tend to develop their identity they will draw on as adults, forming preferences and tastes that possibly will last throughout life. Consequently they are targeted as an important and profit generating market segment by companies and are heavily affected by commercialization and consumerism (Millner 2004).

However, despite being targeted heavily by marketers and their elaborate branding activities teenagers are not dupes entirely manipulated by media and marketing. Brands, products and styles marketed to teenagers repeatedly fail because “the kids” do not think they are “cool” Millner (2004). They are not only the ones that quickly adopt new brand and media images, but also reflexively create new styles of their own. Consumer goods, being not merely products, but instead the catalysts of cultural affairs are therefore not purchased and consumed uncritically or passively by young people; instead young people relentlessly transform the meaning of goods, re-contextualizing and appropriating mass-marketed offerings and styles. Young people thus bring their own particular and differentiated grounded aesthetics to bear on consumption, picking their own colors and matches and individualizing their purchases, most of them combining and re-arranging elements of clothing to create new meanings. Willis (1990) refers to this process as young peoples’ symbolic creativity or symbolic work, which pertains to the symbolic work that teenagers perform within the realm of the common culture and encompass the ways in which young people use, humanize, decorate, and invest with meanings their common and immediate life spaces and social practices. Cultural commodities and consumer goods are however also important tools for other realms of symbolic work in addition for their overall behavior. Millner (2004) means that although possessing little actual monetary or political power to affect their situation teenagers have absolute power to control the evaluation of each other, which means that the actual power they have is the ability to create their own status systems based on specific evaluation criteria. Status and foremost status differences is therefore a very important issue for teenagers, which is why teenage behavior then largely may be understood through the status systems, hierarchies and through the peer relationships forming in teenage peer interactions. Fitting in with peers, conforming to certain social norms simultaneously as one expresses individuality, is of importance for teenagers where clothing symbols such as brands may be used to symbolize the relation between the actual person and the social group he or she wants to affiliate with and be accepted, where refraining from certain symbols used and recognized by the majority actually may become a way to show individuality (Piacentini & Mailer, 2004). Younger people thus also make consumer choices based on the elimination of what is not acceptable (Auty & Elliot, 1998), which paradoxically mean young individuals then may conform to a certain subgroup, by being a non-conformant of the mainstream. (Piacentini & Mailer, 2004)

Method

I use a qualitative method where I collect and analyze textual excerpts from teenagers' discussions or verbal interactions taking place on an online forum situated on a Swedish website called "Hamster paj." On this forum it is possible to observe how teenagers' in naturally occurring discussions and conversations concerning brands and branding generate an understanding of how brands and branding works. The textual conversations are "natural occurring talk" since I as a researcher have not participated in the discussions and conversations prompting textual reactions from other users on the forum. I have thus affected neither the initiation, nor the outcome of certain conversations and discussions. From an ethnographic perspective, I have been there invisibly observing, but not interfering with the teenagers continuous brand conversations. The method is ethnographically informed and has common features with another method employed within consumer research called "Netnography" (Kozinets, 1997).

A netnography is an interpretive and qualitative method constructed for the specific purpose of investigating the consumer behavior of cultures and communities existing on the internet. It could be defined as a written account or story coming from fieldwork investigating the communities and cultures emerging from on-line, computer mediated, or internet-based communications, where both the textual description or story, and the fieldwork are methodologically informed by the techniques and traditions of cultural anthropology, which means full participation in the culture being studied, with the researcher as a recognized cultural member Kozinets (1998). The type of method I use however is more of a netnographic light version, referred to as electronic eavesdropping, where the researcher only listen and observes the talk/posted messages between the members of the online community on the online website, without interfering, posting messages and asking questions to the members of the community or culture.

The nature of the website

On the online website "Hamsterpaj" young people between the age of 13 and 20, meet, interact, chat, and discuss most things in today's society including consumption and brands. There are rooms about entertainment where you can download online computer games, cartoons, and film clips. You can find "fun spaces" containing funny stories, funny pictures, other "stupidities," and sex tests. There are sections where you can get links, and tips of where to find good computer programs to down load, and guides for how to do it. There are also places where people can meet new people, look up old acquaintances, look at a photo gallery including pictures of other users uploaded by themselves, and even listen to web radio run by the website.

The most important section on the website for my study is however the forum. The forum is a place where individuals discuss various on beforehand decided and categorized themes, such as e.g. the Cafe section that has subsequent topics such as e.g. music, food, humor, movies, and television. Every sub-topic (If one chooses to click into the topic of music a sub-topic or thread might be The Beatles) consists of a number of "threads" posted (introduced, issued) by any of the over 300 000 members of the website. People then post messages about the particular topic, and get replies from other users, the discussion thus starts and can continue for a longer time period, with a high intensity involving eloquent formulations, but also hard language, and the usage of smiley's to indicate underlying emotions, intentions, or sometimes

irony behind their posted messages. There are moderators on the forum that see to it that the posted messages from the user are not too “of topic” and they have the authority to erase messages that are inappropriate in some way or to close down the thread if it develops in a non-preferable direction leading to meaningless discussions.

Data collection and tools of analysis

This study is a part of a larger one in which I started my data collection in March 2006, frequently, and continuously visiting the website reading the discussions about brands and consumption taking place between the teenagers. The empirical material that is subjected to analysis in this study was collected between March 2006 and January 2007. The general procedure is that I first read through the conversations happening on the various discussion threads to, with a broad mind, make a first scan or selection of what I consider interesting and relevant. The selected threads are then downloaded to my computer, categorized, and printed out. I then read the discussions to find particularly interesting comments and accounts from the teenagers’ interactions. The analysis is informed by one of the key premises of discourse analysis, that our way of perceiving and understanding the world is created and maintained in social processes and that knowledge is constructed in social interaction, where we both form common truths and contest what is true and false (Jørgensen & Phillips, 1999) as a philosophical base when interpreting the text looking for underlying themes, similar to what Bryman & Bell (2003) refers to as content analysis.

Consumer learning

Within consumer research consumer learning or the process of how people become consumers, which also encompasses the processes of how consumers deal with and learn about branding, has been tightly connected to and understood through the theoretical construct of consumer socialization (Ward, 1974; Moschis, 1978; Moschis 1987). It is considered to be a process that starts early in life where people in young years not only start developing knowledge about marketplace concepts such as advertising, product categories and brands (John, 1999), but also about the meaning of materialism (Lipscomb, 1988), and the social significance and meaning of certain consumption products, the symbolism in consumption, how to communicate this to others, and the ability and skill to make inferences about others grounded in their consumer object choices (Belk *et al*, 1982). The majority of previous consumer socialization research has been based on the theoretical tenets of cognitive psychology, where the cognitive development of children during certain age spans in their lifecycle (Moschis, 1985), their knowledge acquisition capabilities (Peracchio, 1992), and the reinforcement from, the modeling of, and the social interaction with the socialization agents parents/family, media, school, and peers has served as explanation factors for how children learn to become consumers. The age or lifecycle position and social structural variables such as sex, social class, and family size are antecedents to the actual socialization process, which involves the agent-learner relationships of modeling, reinforcement and social interaction, leading to the out-coming consumer learning properties (Moschis, 1978).

Although peers as socialization agent and peer interactions have been acknowledged to have an important role in the socialization process the socialization agents that have received the most attention are parents/family, most likely because the previous consumer socialization research has almost exclusively focused on children, while peer interactions that according to

Ward (1974) increase in importance as people enter into adolescence and teenage years, has received little attention. Although some attention has been awarded peer influence concerning children's learning of consumer patterns and product preferences (Hawkins & Coney, 1974), the buying processes and consumption elements such as materialistic values and social motivation (Moschis & Churchill, 1978), it still has been studied in relation to peoples' life cycle and age spans. More research on peer influence and peer interaction especially in relation to the development of consumer symbolism and materialism would therefore be welcome (John, 1999). What is however perhaps a more extensive shortfall of prior consumer socialization research is that it is not sensitive to the cultural context where the socialization processes occurs.

Learning to become a consumer is however not only a matter of learning how to buy, consume, and dispose of products, and of perceiving, recognizing and distinguishing between various products and brands, or to become a member of smaller specified consumption communities such as brand communities (Muniz & O'Guinn, 2001; McAlexander *et al.*, 2002), neo tribes (Maffesoli, 1996) or subcultures of consumption (Schouten & McAlexander, 1995), but it means learning an entire community of brands, even an entire consumer culture, involving more wide/far reaching complex cultural processes and the knowledge and sensitivity to a large number of commercial symbols. To better capture these processes I therefore bring in the anthropological construct of enculturation.

Enculturation refers to the process by which individuals learn their own culture (Herskovits, 1972). Herskovits means that it is an all-pervasive process of which people for the most part are unconscious about. It is propelled by and perpetuates through the internalization of cultural symbols such as language. The internalization of these cultural symbols does not merely assure appropriate reactions to certain cues of behavior, it also organizes the enculturated restrictions concerning conscience, super-ego and guilt feelings. If culture then is to be regarded as what orders peoples' behavior in society, enculturation is the mechanism that organizes and decides for every of the culture's members the form and extent of accepted ways of conduct and aspirations, in addition to delineating the boundaries within which variation in individual behavior and conduct is sanctioned. The enculturation process enable according to Herskovits individuals to becoming fully functioning members into the society in which they have been born, simultaneously allowing them to grow into their culture as it is presented. The new members absorb the values, views, and norms of what is right or wrong, normal and abnormal, beautiful or plain by observing the behavior of the group, thus learning the counter-norms, the "Thou-shalt-nots" being the governor-bearings to conduct and the integral parts of the systems of moral values and ethical precepts of the culture. The enculturation process then provides new members with the knowledge of their society so that they may form a living, it socializes them through patterned punishments and rewards in order for them to function within the group they belong to, it equips them with a belief system which enable them to meet and handle the power of the natural and supernatural world with minor psychological anxiety, and guide their creative desires in dance, poetry, music and art.

Herskovits (1948) claims that the enculturation of individuals mostly takes place during the early years of life and that the powerful process of learning the culture is an unconscious conditioning containing characteristics such as automatic conformity to the cultural patterns and unconscious adjustment to social living. Enculturation is therefore by Herskovits considered to be an unconscious process of cultural learning largely taking place before the individual reaches maturity, and that it is the mechanism for the stabilization of culture. Enculturation is then to a large degree void later in life except when cultural innovations

exerts impact on him and her when meeting new situations they have never encountered before. Herskovits mean that, contrary to the unconscious childhood enculturation process, the adult enculturation process is symbolized by conscious reflection and active choice among alternatives. Enculturation in adult life thus opens up for change, enabling people to examine alternative possibilities, and therefore allowing for recondition to new ways of thinking and conduct. Hence enculturation on the mature level involves reorientation and recondition, rather than unconscious enculturation operating in preadult years containing purely automatic conditioning and the internalization of cultural patterns separated from reflexive and creative attitudes and behavior.

The discrimination Herskovits (1948) makes between preadult unconscious enculturation and adult conscious enculturation has been contested and questioned by other authors, especially the enculturation process on the preadult level. Goodman (1967) claim that a child when learning the culture of his or her society not only conforms in response to pressures of a forceful and insistent force, but also evades, resists, selects, and experiments, and becomes a member of the society rather through the process of “creative becoming” than of conformity to cultural patterns. The learning process is twofold involving both the creative modifying of culture in a microcosmic sense, and the creative adapting to it in a macrocosmic sense. It is therefore, hazardous to suppose that there needs to be a crack or distinction between preadult and later stages of enculturation since children in early years are able to think, select alternatives, and develop the habit of critical and reflective behavior within the cultural framework (Bramfeld, 1957). The Childhood enculturation process is thus not limited to unconscious automatic conditioning and cultural internalizing. It includes the creation of reflective attitudes that not only help to modify traditional patterns of attitudes, behavior and traditions, but also to set off cultural novelty (Shimahara, 1970).

The enculturation process is reflexive in that people is “other-directed” which means that the source of direction of character is externalized. People seek their directions and orientations in external sources such as mass media and peer groups, or “contemporaries,” rather than from traditional socialization agents and other reservoirs for idea systems (Riesman, 1961). In their enculturation process young people are therefore reflexively and consciously evaluating their relations with “contemporaries,” partaking in new cultural axiological value sets Shimahara (1970). Despite that the young ones automatically imitate, identify with and conform to their own cultural group as a crucial source of the standards for the values, expectations, and judgments, Piaget (1962) means that they simultaneously construct these standards and alter them if the group agrees. It is then possible to argue that children and adults, simultaneously as they internalize the traditional culture and conform to the underlying cultural patterns of values, attitudes, and behavior, they also re-create and reform it (encompassing the underlying cultural patterns of values, attitudes, and behavior) by initiating novelties that become accepted by the peer groups or contemporaries.

Enculturation during childhood then also contain reflexive and conscious processes where there is a continuity of creative becoming and conscious responses during both preadult hood and adulthood Shimahara (1970). This means that the enculturation process involves both unconscious acquiring of the inherent culture and reflexive/conscious responses to it, where the unconscious cultural conditioning and reflexive responses to the cultural environment are in a dynamic interplay. Enculturation of both adults and children cannot only then be regarded as cultural acquiring but also as the creative process of inquiry involving both the unconscious process of acquiring the traditional inherited culture, while simultaneously reflexively, deliberately, and creatively both forming it and learning it.

Analysis

The textual analysis of the conversations taking place on the Swedish online forum revealed interesting parts of the consumer enculturation process involved when consumers learn how brands and branding work in contemporary (Swedish) consumer culture. The data revealed two major themes, the learning of various forms of authenticity and how consumers learn the authorship over the construction of brand meaning.

Authenticity

An important part of the young peoples' learning process concerning the workings of brands in society involves establishing and learning perhaps not how the concept of "brand" are defined in a more exact academic and consultative manner, but instead what it actually implies and what the concept of brand encompass. These young people mostly discuss brands that are marketed to consumers, and fashion brands in particular since these are the brands that young people perhaps, due to their function as resources for identity construction (Elliot & Wattansuwaran, 1998), first come in contact with and may relate to in their every day lives. Discussing what kind of brands that is to be considered as a name brand within clothing then seems important if a person is to become a full member of the consumer culture. Defining and then learning what a real name brand means is though a quite problematic venture, which the following online conversation illustrates.

Willy:

Well, it is doubtful if JL¹ and WE² can be included in the category of name brand clothes...

Cactus:

Actually all clothes that are manufactured with anything else than a No-name, is in fact name brand clothes, since they are labelled with a brand :)

Rainbow replying the previous comment made Willy:

I just felt that I had to point this out. JL, WE and Bikbok are name brand clothes, however not in the same way as Lacoste. If you buy a JL sweater then I'm pretty sure you do it because everybody else does it, for god sake! A 1000 "kronor"-sweater: /.

Summer:

Why doesn't Bikbok count as name brand clothes?

Things that are printed or attached to sweaters do count as brands, don't they? (Well, not the note with the washing instructions though)

Sweet:

Yes of course that is a brand, but that types of clothes are not "name brand clothes," as in being expensive, are they? But hey I might be wrong.

Be well!

Jerry:

All clothes are not name brand clothes, are they?

¹ JL is (or was) an upscale fashionable Swedish name brand where the letters JL stand for J.Lindeberg a well-known clothing designer within the Swedish fashion industry. He made his brand known to the public by sponsoring his Swedish golf star friend Jesper Parnevik with his designed and conspicuous clothing.

² WE is a Swedish name brand with "street-cool" associations that was made aware to the public by giving its products for free to certain celebrities to wear so that the brand would gain a certain image. WE and JL have later together teamed up and co-branded different types of street wear.

But if you mean little more expensive clothes with a more recognized brand, I have one garment like that. It's a pair of Tiger-jeans, and when I tried them on they were far too small, but I love them now.

Rainbow's reply on the earlier comment made by sweet:

What I meant was that I regard Bikbok as name brand clothes since people purchase them because others wear them, and you can't really say that they are for free either, even though they are cheaper than many other name brands.

The previous discussion shows that there is a great amount of ambiguity and uncertainty involved when trying to reach a common understanding of what is to be considered as a real or authentic brand. This is important since brands need to be authentic if they are to be used by consumers as cultural resources adding value to their lives (Holt, 2002), such as serving as tools for individuals identity construction (Elliot & Wattanasuwan, 1998; Elliot & Percy, 2007). In addition if people meaningfully are going to discuss and understand consumption and brands they need a fairly shared understanding of what particular terms or phenomenon, such as name brands, means or refers to, they need a common sense knowledge or cultural knowledge to be able to communicate, understand, navigate, and even manipulate the consumer culture of which they are members.

Holly:

...We and JL är not expensive clothes, not Lacoste either for that matter, those are name brands clothes with a lower price if you ask me, neither are Peak Performance. If anybody thinks so I just say no, no, no, they are not! Expensive name brand clothes are Gucci, Burberry, DKNY, D&G and I think almost everybody owns something from those brands. Not long ago my dad gave me a Burberry dress that probably cost a couple of thousand "kronor" and it is fun to spoil your self with expensive clothes

Chaos replying Holly:

Do you know how much I hate people with that kind of attitude!?" "I'm so rich that I don't regard Lacoste, WE or JL as name brand clothes," they **all** are name brands, they are just more or less expensive. Moreover, I don't think ANYBODY cares that your father gave you a really expensive dress.

Lara:

Well, there are brands, and then there are brands. Those with ok prices for us ordinary people, and those design clothes such as Gucci, Versace, and Prada. I could never walk around in them myself; it would feel wrong in some way, very snobbish. I mean, people walking around in that type of brands, could they really give a sober impression. You probably have to work hard to show that you are not something more than a regular human being.

This conversation is particularly interesting since it reveals that name brands cannot be equated with luxury brands such as Gucci and Dolce Gabbana. It points to the fact that it is often easier to define what is not liked or not allowed than what is. Holly's deviating comment and the other users' reaction to it uncovers the implicit, and underlying norm of how you should think and reason concerning authentic and inauthentic brands. An authentic or real name brand may be defined in various ways, involving uncertainty and ambiguity of what it really means, but it is quite clear that it is not equated with luxury brands. One is thus not allowed to have the opinion that authentic brands are only the most expensive luxury brands, of which few can afford to buy, especially young people in their teens. Holly thus reveals what Herskovits (1972) refers to the counter norm by not conforming to what is considered to be right (although in this case with the authenticity of brands and what is right or proper is open for a fairly wide interpretation) or what is allowed within the culture. Holly is verbally abused after expressing her counter norm opinion of what is to be considered as authentic

brands, which may be understood as a form of punishment for improper thinking or behaviour, where this punishment serves to learn the individual what is right and wrong and to steer the individual back to proper thinking, and the conformity to the norms provided by the culture. The norm and counter norm of brand authenticity is thus something that needs to be and are learned by young consumers through a fairly elaborate enculturation process involving punishment, the formation of, and the conformity to norms of brand authenticity.

Learning about authenticity does however not only involve brands and name brands. It also includes learning how and what it means to be an authentic consumer and how that relates to the consumption of various clothing brands. It is recognized by the young people on the online chat forum that the clothes you are wearing tells a lot of you as a person, and that name brands are perhaps not a necessity but that it is as Pie puts it, "fucking important." It is really the clothes that make you and "that's that." There is a strong view that the reason for people buying name brands has to do with that it provides an individual with a certain status. Status then, and the need to fit in, to be accepted (buying name brands to emulate others), to show belonging, in addition to the giving an unsure person a confidence boost is considered among these young people to be the main explanation factors for why people are so anxious of buying those kinds of name brands. But buying and wearing expensive brands for these reasons are not always regarded in a positive light. People buying name brands to get a good confidence are considered just superficial and weak and it is just sad that people buy brands just because they are brands. Name brands are really unnecessary in that there are a lot of clothes or goods (often no-names) that have the same or at least almost the same quality as name brands. You should thus buy brands on basis on your own personal and free choice, not because you want to emulate others or to fit into a certain group of people by conforming to their brand preferences. There seem thus to be an established norm, as proposed by Herskovits (1948;1972), that name brands are really not essential, even unnecessary and that you should not buy name brands to conform to the groups' brand preferences and to the peer pressure because of the fear of being banned from it.

Rainbow

If you would buy a JL shirt then I'm pretty certain you do it because everybody else does it. For god sake, a shirt for 1000 "kronor"! Moreover I believe that the purchase of name brand clothes has to do with that it provides a certain status, depending on what circle of people one belongs to. To the people who acquires a good confidence thanks to branded clothes:

-Sure thing, be that superficial!

It's expensive, stupid, and unnecessary. I have never noticed any bigger difference quality wise between name brands and other clothes. Sure name brands might be 100% cotton and others might have 5% polyester, but can you tell a clear difference?

-No.

It should be pointed out that it's your own choice, but remember, if you purchase a Lacoste shirt, advertising has won a battle. Status symbols back and forth, buy at ICA !

Superman:

I will put forward my theory concerning the purchase of name brand clothes, and I mean it could be explained by on one thing only, and I now that I will get a "No" from the ones that wear name brand clothes but that is only because they know I speak the truth . The purchase of name brand clothes could be explained by one thing – Status. Hence, that you have spotted someone else wearing it, or you want to emulate the ones that already wear it. You can't say that it's nice. They have at least as nice clothes at Ullared, but to a 500 "kronor" lower price.

Rainbow replies the comment made by Superman:

That is exactly my opinion too. Often this have probably something to do with that you are unsure of who you are (roughly) and what you stand for, it becomes a lot easier to just "go

with the flow” instead of risking being banned from “the group.” This is expensive and stupid in the long run, so people please! Try to make your own choices.

Superman:

People are insecure about their personality and buy branded clothes to be accepted and to show belonging

A real or authentic brand consumer would then, preferably not buy name brands at all since they really are unnecessary, but if so they should adhere to the norm of not buying name brands for the sake of gaining status and confidence, fitting in, conforming to the social groups’ brand preferences or the fear of being shut out. Buying brands because its symbolic meaning may supply an individual with confidence, status, group belonging, and the feeling of fitting in is thus not accepted here by other contemporaries as a credible and acceptable justifications or accounts for an individual’s brand purchase actions. There are however other motives or even justifications for buying and wearing name brands that are credible enough to signal an individual as an authentic brand consumer. Claiming that one buys and wears name brands because they have a better fit and shape, higher quality and that they fit you the best, are credible justifications for buying expensive name brands, which really are unnecessary in the first place. Interestingly these credible justifications all have a functional nature that serves to stress the name brands’ functional superiority over other no-name or less known brands. Buying name brands because of their symbolic features and value providing the individual with status and a sense of fitting in are though considered as non credible justifications for name brand consumption. It thus becomes hard, or even impossible to state that you buy certain expensive name brands only for the symbolic properties and the symbolic values it provides you, such as status, increased confidence and the good feeling of fitting in.

Hornet comments:

Well, brands are pretty geeky if you think about how much you spend on them..but if you fell better doing so...then it’s not more wrong spending money on clothes than on any other interests that you have?? Then if you do it because of status or to fit in, it’s just sad for your own sake that you don’t have a better confidence than that...

I always buy name brand jeans myself, since they usually (with some exceptions) are more durable, and have a better fit. I often buy branded shoes too, but that is because I’m addictive to shoes so that does barely count .Sweaters is however unnecessary I think, I mean if you find a nice garment you shouldn’t hold yourself back just because it’s not a particular brand, and to my knowledge there is no bigger difference of quality when it comes to sweaters.

Trumpet:

It is usually like this: branded clothes have more often a nicer shape and fit but then you maybe pay 50% of the price just for the brand. When it comes to less known or smaller brands you on the other hand usually do not pay for the brand, you pay what it costs to make the garment.

Painkiller:

Principally branded clothes have much better quality than No-name clothes. No question about it. I have, actually, 100% experience of that branded clothes are a lot better and are much more durable than No-name clothes.

Trumpet again:

I believe that one should buy the clothes that fit your body the best and not based on what kind of brand it is. Nevertheless it’s a fact that name brand clothes have a better fit or shape.

The functional features of consumer products are thus used to rationalize the purchase of highly symbolic goods such as name brands, which seems a bit paradoxical. People are then free to buy name brands as long as they can provide the right type of motives for doing so. You would consequently need a vocabulary of motives Mills (1940) that is accepted by your

contemporaries that allows you to buy and wear name brands and still be able to convey yourself as an authentic consumer. Vocabularies of motive are stated words that accounts for past, present and anticipated future actions in various social situations, often when behaviour is questioned or criticized. An action or anticipated action or behavior may then appear justified or rational if the right type of motive is supplied by the actant. So what is really then an authentic consumer? Judging from the previous empirical excerpts and textual analysis of the justifications of name brand consumption an authentic consumer is a person that according to Holt (2002) buys consumer goods based on their own individual and sovereign choices, instead of being swayed by the marketing dictate, rendering them as consumer cultural dupes following the preferences of the masses. The counter norm - being mainstream, which in this case means buying name brands to emulate others, to fit in, and be accepted, then also becomes the sign of an inauthentic consumer, a wannabe that only follows the brand fashion and the brand preferences of the group.

Speedy:

One should wear shoes that are not in fashion :p

It's like a drag to walk around in the same shoes as everyone else.

Like this year for instance, white shoes are evidently considered popular and nice, so I bought black ones

Charlatan:

I love everything in high heels. Is there any reason for dressing comfortable when you can dress nicely? I feel much better if I know that I look nice. But for the moment Converse is in, thus there is no choice but to adapt.

Ronnie:

Why adapt?

Have the guts to go your own way...that is my opinion.

Almeyda:

Be your self!!

Aphrodite:

To put it clearly, everybody wears Converse now, which is boring according to me. Like, everybody in my class wears them except for me. I just think it's a drag when everybody wears the same thing.

Blender replying the comment made by Aphrodite:

I think so too.

Manny:

Converse used to be something special and different but now it is just mainstream, that all wannabe rebel kids wear

You should thus choose the brands that you really like and not because they are popular. Brands become deemed as mainstream as soon as they become too popular since they then no longer may be used that effectively by consumers as symbols of differentiation. This is in concert with the argument of Piacentini & Mailer (2004) that refraining from certain symbols recognized and used by the majority, instead of buying and using them is a way to show both individuality and affiliation, which paradoxically implies that young consumers may conform to a certain subgroup, by being a non-conformant of the mainstream. Younger consumers thus also make consumer choices rather on the basis of what is not acceptable (Auti & Elliot, 1998). Comments that conform to the authenticity norm are rewarded while comments stressing that one should follow the brand fashion by e.g. buying Gucci and Prada are punished with verbal abuse. These norms of authenticity, and the justifications and

vocabularies of motives that may be employed to evade punishment from other peers when breaking these norms, are part of a continuous, reflexive, and creative enculturation process, such as the one outlined by Shimahara, (1970), where the “contemporaries” rather than the parents according to Riesman (1961) serve as the socialization agents defining what is right or wrong, and good or bad in the culture, are thus both explicitly and explicitly played out, discussed and learned by young people at this Swedish online chat forum.

Branding reflexivity and brand meaning authorship

Prevalent in the young peoples’ online conversations, in addition to the norms of brand and consumer authenticity, was their interactive formation and display of elaborate knowledge and reflexivity both concerning the workings of the fashion process of brands and how branding works, and the branding activities employed by companies. Various branding activities, such as putting overly clear, obvious or oversized brand logos on the firm’s products, issuing limited editions of attractive products, and using celebrities to market and thereby spike or improve the brand image was dissected in the young consumers conversations. Using oversized brand logos will according to the discussions make the brand appear too obvious for everybody to wear, thereby running a greater risk of becoming too commercial and too popular, thus developing into a mainstream brand, losing its differentiating function for consumers and may therefore no longer be used as an authentic marker of individuality. Or as Lizzy states when discussing the brand Tiger of Sweden: “I think it’s a pretty elegant brand as long as they don’t put their Tiger head or name somewhere else than on the size patch.” If using big brand logos Tiger would be just like other brands, such as WE and JL that has become in vogue, they are “in” just because everybody else wears them, rendering them inauthentic. Issuing a limited edition of some brand model would only “cause every human being to walk around in a counterfeit.” The much used branding technique of celebrity endorsers (McCracken, 1989) that aims at transferring the attractive and sometimes glamorous cultural meaning of a certain celebrity to a product or a brand by persuading the celebrity to endorse it is discussed in the following conversation.

Punk:

God I hate those “Foppa³” shoes, I think it’s snobbish to pay 800 “kronor” for a pair of UGLY rubber shoes. But that’s just my opinion

Chrystal replying Punk:

If they hadn’t been named “Foppa” shoes, hardly nobody would have bought them. Everybody beliefs that he is the one that designed them, and hatched the idea. Personally I have always hated the “Foppa” shoe and I find it very uncomfortable, which most people don’t. They are plain and simple terribly ugly.

Punk replying Chrystal:

That is exactly what I think too!

By the way, do you know why they are named “Foppa” shoes? I mean, what has he REALLY got to do with the shoes. I haven’t figured that out yet. Is it just advertising?

Jerry:

What do they look like? Could anybody show a picture?

Chrystal replying Jerry:

³ “Foppa” is the nickname of a very popular Swedish hockey player Peter Forsberg who is considered to be one of the best contemporary hockey players in the world

This is what they look like. You can find them in other colors too. But this was the first picture I could find

Lizzy replying Chrystal:

They look like children's shoes?

Chrystal replying Lizzy:

Yes exactly. Still there are a lot of grown ups running around in them. I can actually understand them if they think that they are comfortable. But it's a pretty ugly shoe and the comfort is not enough to counterweight the ugliness. But 799 "kronor" for a plastic shoe is unreasonable. Considering the only reason for it to being expensive is that "Foppa" designed it. Bah! He hasn't done crap. He's only advertising

The dissection of the celebrity endorsed "Foppa" shoe shows that this is a branding technique, which has been well penetrated by young people and revealed as a marketing and advertising stunt employed by companies to sell more products. The reasoning that the high price of 799 "kronor" is a rip off being only a plastic shoe that is so incredibly ugly (exceeding the its remarkable comfort) and that the company only are allowed to charge that kind of price since it is connected to the celebrity, in this case a big ice hockey star, Peter Forsberg, show that these young people are very familiar with how this branding technique works. They are well aware that the celebrity generally doesn't do "crap" and that in this case the hockey star, although allegedly designed the shoe himself, is "only advertising. If it hadn't been for the celebrity nobody would have purchased it. This is though knowledge and insights which, simultaneously as it is displayed by some people it is collected and learned by others. Jerry did not first know about the shoe and what it looked like, but fellow actors participating in the discussion sorted him out by uploading a picture of it. Jerry was thus educated by contemporaries of another consumer good and its symbolic meaning that recently had been made available to him in the consumer culture. Punk did not first understand what the sport star "really" had to do with the shoes, asking if it just was an advertising trick. The other actors then educated her by stating that "he hasn't done crap" and that he is noting but advertising. Consumers thus do not only learn about branding, and branding activities through the dialectic interplay between the consumer culture and the branding paradigm, as proposed by Holt, (2002), or by the persuasion episodes continuously taking place in the interaction between the persuasion agent/marketer and the persuasion target/consumer (Friestad & Wright, 1994), but also through an thoughtful, conscious and creative enculturation process (Shimhara, 1970), where peers or young contemporaries in their conversations reflectively discuss and learn (from each other) the workings of brands and branding in the consumer culture.

It is however not only various branding activities that are reflexively dissected in these conversations. The meaning of brands is also discussed with intensity and commitment. One possible reason why this indeed is relevant for these young consumers is that if brands successfully are to be used as means to differentiate and to individuate oneself, simultaneously as they become means to establish affiliation with others (Pavitt, 2000), being combined together as a brand bricolage (Thompson, 1997), serving as resources for identity construction (Elliot & Wattanasuwan, 1998), people need to know what kind of meaning the various brands have and convey to their peers and contemporaries.

Nina:

Tiger⁴ sucks monkey-as, they have ruined the brand to the degree that all their clothes are nothing but embarrassing

Rock:

Motivate your opinion. In what way has Tiger as a brand been ruined? By becoming too fashion oriented instead of being oriented towards older-men-confections?

Nina:

I mean that they sold themselves out.

And I strongly oppose that they have become more fashion oriented.

Tiger is for me incredibly much more white trash than fashion.

Rock replying Nina:

White trash? Oh really? If you check out the model pictures on their homepage many outfits are more "preppy" than white trash. I would probably rather describe it as a blend of "preppy" and "street."

Chip:

I don't know but I have gotten the vibe that Tiger is pretty.. "ghetto"?

Hmm, how should I explain? Oh well, I'm not that fond of Tiger, it doesn't feel right.

Nina replying the previous comment made by Rock:

Yeah surely that's the way it is, but they haven't been very smart, or alternatively, they have been very smart. The college sweaters, the t-shirts, and the belts ruined the brand image

When you wear a brand you make a statement, regardless of what it is.

Is it H&M you make one statement, if is Armani you make a different statement.

Personally I get rashes and I get pissed of only by seeing a garment and realizing that it is Tiger, I get irritated and immediately connect it to those hideous sweaters and belts. It's not so much the clothes themselves, but rather what the clothes/brand stands, or has stood for. And that's what I mean when I say that Tiger is white trash, and to me it has even ruined the entire Tiger brand as such. And I can assure you that I'm not the only one having that opinion.

Number 1:

This thing with statements, I would be happy if you could explain a little further what you mean by that.

Nina replying Number 1:

Well in principle yeah since it makes me associate to all the sins the brand has committed.

Hence, with all the garments you buy you signal something, if you then make those choices consciously or unconsciously is another matter. But if you buy a sweater at H&M it says a number of different things about you as a person. Everything from "it was at the end of the month and I was a bit low on cash" to "I don't care where I buy my clothes." It's usually relatively simple to understand what the deal is since it's explained by the person's other clothes. It's a bit tricky but what I mean is, is that you say something with all the garments you are wearing. It's supposed to give people an image and a first impression.

I make that connection, and I think that they have ruined their brand. Exactly in the same way as J.Lindeberg and to a certain extent Canada Goose.

⁴ Tiger, or Tiger of Sweden, having a tiger head as a logo is (or was) a more classic and elegant upscale Swedish brand that from the beginning marketed expensive suits, jackets and shirts but has lately moved in more to street wear.

The previous discussion really illustrates empirically how brand meaning is negotiated between consumers. It is what Elliot & Percy (2007) refers to as the discursive elaboration of the meaning of and advertising text, where a brand's symbolic meanings are not fully concretized until the mediated meanings and the lived experiences of the brand has been discursively elaborated. The discursive elaboration in this case refers to the social consumption of the brand as it is discussed, described, argued and laughed at. It is according to Ligas & Cotte, (1997) through the marketing environment induced brand meanings, interpreted by consumers in their individual context, and finally communicated to other consumers in their social environment, that the brand meaning is negotiated. They mean though that it is foremost in the social environment were different brand stories told by various authors are gathered and juxtaposed from which the brand meaning is constructed, and if there is no unambiguous brand meaning denominator negotiated it is not possible for and individual to express a social identity. The previous argument about an unambiguous brand meaning denominator put forward by Ligas & Cotte is based on a theoretical model with little or no empirical support. The empirical accounts provided here shows how this actually is played out in naturally occurring "talk" and it reveals that it seems very hard to reach an unambiguous negotiated brand meaning denominator. Rather the brand meaning seems to be dynamic and in constant flux, continuously re-negotiated in consumers' interactions. The brand Tiger was considered to be boring, white trash, a blend of "preppy" and street, and even "ghetto." Although one could argue that a brand meaning negotiation process took place, a common meaning denominator is hard to identify

The data also support the argument put forward by Holt (2003) that a brand should be looked upon as a culture of its own that is formed through the stories authored by four different actors, the firm itself, the popular culture, influencers, and the consumers. The young people here, in their online conversations, together author stories about the brand, thus affecting what it means. They consequently gain authorship of the brand meaning, providing them with consumer agency (Muniz & Guinn, 2001) of the ownership of the brand and what it stands for. It is not then, as proposed by Fournier (1998) only the actual brand behavior of the consumer that affects the brand meaning negotiated with the branding company, but also how people, talk, converse, and tell stories of a brand that affects its fluctuating meaning. What is also both obvious and intriguing is the content of the critique that the individuals deliver concerning the actual branding work performed by the firm in question. One can sense a kind of bitterness, frustration, even cynicism coming from the discussants being "pissed off" over the fact that the company has "ruined" the brand that before was authentic or even elegant to the degree that it has become "nothing but embarrassing." The over exposure of the brand coming from issuing collections including other types of garments than suites, shoes and jackets, such as college sweaters, t-shirts and belts/belt buckles with large logos has made it available for the majority of the masses, diluting the brand, or even downgrading it to a white trash image. There is still also enculturation and peer education involved in these discussions in that Nina, who is particularly negative to the Tiger brand, are when first stating her negative opinions urged by others to describe and motivate here reasons for having those opinions. When she then elaborates on her knowledge and thoughts of the brand, and also implicitly how branding works, the others are free to absorb this knowledge about branding and her opinion of the brand by simply what Herskovits (1972) claim, observing what others do in the culture.

Although not having the same business agenda as brand managers that consciously tries to build brands that adds value to the firm by developing various brand strategies and performing certain branding activities, consumers themselves by conversing and telling

stories about brands to keep up with what happens in the consumer culture actually perform branding work that affects the very meaning of the brand. When hijacking brands (Wipperfurth, 2005) and consuming them in other contexts intended by firms, perhaps with the purpose of showing group affiliation, a certain style or create and convey a social identity to others thereby affecting the meaning of the brand, they also become brand managers.

Conclusions

It was quite obvious that the young people engaged in conversations on the online forum are well “educated” consumers and skilled members of the Swedish contemporary consumer culture involving elaborate cultural knowledge of how brands work in society and the branding activities performed by various firms. Their knowledge seems almost elaborate and extensive enough for passing a brand management course on undergraduate level. Young consumers learn about the logic of brands and branding through an enculturation process taking place in online verbal interactions where the peers or contemporaries serve as the enculturation agents instead of parents or family as proposed by previous consumer socialization research. The enculturation process involves the establishment of, and the conformity to both implicit and explicit norms of brand authenticity and consumer authenticity, where accounts and acceptable motives may be employed by the individuals to justify and thereby evade verbal punishment for thoughts or brand behavior that would actually break the consumer cultural norm. The enculturation process through which young people learn the logic of brands and branding thus involves both features where this part of the consumer culture is unconsciously acquired through the conformity to various norms of proper behavior (Herskovits; 1948; Herskovits, 1972) and a conscious/reflexive inquiry involving features of creative becoming (Shimahara, 1970).

Simultaneously in the enculturation process, when conversing and discussing about brands, fashion and branding, consequently educating each other by expressing, sharing and acquiring various forms of brand and branding knowledge and telling various brand stories, brand meaning negotiation processes are at work. However the brand meaning negotiation does not seem, as proposed by Ligas & Cotte’s (1997) theoretical argument, to reach an unambiguous brand meaning denominator, but implies instead that the meaning is continuously in flux. The concept of negotiation, which in itself implies some sort of end between the negotiation parts, might then not be a fully adequate concept for explaining how brand meaning is constructed. The concept of brand meaning conversation may then be a more fruitful concept to account brand meaning construction since it connotes that the brand meaning formation process has no real or final end. Moreover, in the enculturation process, when the young consumers interact, converse and discuss brands and branding on the forum they tell stories about brands that thus affect the meaning of those brands. This provides the consumers with authorship over brand meaning, actually leading to the consumers doing branding work, thereby becoming brand managers themselves.

When action speaks louder than words: The effect of parenting on young consumers' pro-environmental behaviour

Abstract

The present study examines intergenerational transfers of pro-environmental behaviours between parents and children. In a survey study involving 600 Danish families, we examine whether children's pro-environmental behaviours can be determined by their parents' attitudes and behaviours with respect to three "green" consumption activities: buying organic/environmentally friendly products, handling waste responsibly, and energy saving activities. In addition, we examine the effect of parenting on adolescents' pro-environmental behaviours by including a particular aspect of parenting style: parental autonomy support. Results show that the adolescents are influenced by their parents' behaviour, and especially how they perceive parents' behaviour, which seems to depend on how visible these behaviours are to them. Furthermore, parenting style influences the adolescents' behaviour in various ways.

1. Introduction

Today young consumers are ascribed with responsibility for solving environmental problems through their role as consumers/citizens – just as is the older generation. Thus, young people are targets for environmental education activities, for instance through the school system (Nordisk Ministerråd, 2000; Rickinson, 2001) and more generally through public consumer education. Young consumers are assumed to be receptive to social influence, which is likely to include

informational and social influence related to environmental impacts of consumption patterns. Yet surprisingly little is known about the level of young consumers' environmental awareness relative to the older generation, how pro-environmentally responsible behavioural patterns are established, how young consumers' may be influenced to commit to pro-environmental practices, and who may be able to influence them. Previous studies indicate that the younger generation generally displays a lower degree of environmental awareness and commitment than does the parent generation (Grønhøj and Thøgersen, 2007; Grøn Information, 1995; Lavik and Enger, 1995). In addition, recent studies show that teenagers are heavy users of electricity and water at home: the average teenager uses 20% more electricity and 10% more water than the average adult energy consumer (Gram-Hanssen, 2005).

To encourage the development of societally beneficial consumption practices, such as responsible waste handling or careful use of non-renewable energy sources, we need to know more about how such behaviours are established. It seems highly likely that parenting plays a key role for teaching and passing on "desirable" consumer practices to the next generation of consumers. Still, there is a lack of research documenting the probable influence of parents on their children's pro-environmental practices. Further, the specific role of parenting style in transmitting pro-environmental behaviours to children (i.e., do certain parenting styles inhibit or foster children's environmental awareness and involvement in pro-environmental practices?) has hardly been researched at all. Besides helping us to understand why young people may be more reluctant to commit to pro-environmental practices than their parents, a deeper understanding of these questions may inform policy makers about steps needed to inform/educate young consumers about how to perform environmentally benign activities. A very basic question in this connection is whether such information should be targeted directly at the young people themselves, or they should be reached more indirectly through their parents. Further, research such as this is important for parents who want to raise their children to be "responsible" consumers.

3. Background

Consumer researchers find that parents are instrumental in transmitting consumer related orientations such as attitudes, values and beliefs about the marketplace (e.g., Moore-Shay and Lutz, 1988; Obermiller and Spangenberg, 2000) and behaviours such as product and brand choice (e.g., Olsen, 1993) to the next generation of consumers in what has been denoted a process of *intergenerational transmission*. Likewise, in the environmental domain intergenerational transmission of attitudes, values and behaviours are likely to occur (Grønhøj and Thøgersen, 2007). Thus, a number of studies document the transmission of consumption related behaviours at various levels of abstraction between generations. However, the formation of intergenerational effects are not very well studied in general (Moore, Wilkie and Alder, 2001), and in relation to the environmental domain, evidence of IG consumption related processes is rather scarce. In short, parents are likely to influence their children to act in more (or less) pro-environmental ways (Grønhøj and Thøgersen, 2007), but how this influence is exerted is not very clear. Moreover, establishing plausible causes of intergenerational transfers is challenging due to the difficulties of interpreting socialization outcomes. Thus, surveys generally assume that parent-child similarities indicate IG transfer. However, a lack of intergenerational similarity with respect to, e.g., consumption values may be caused by parents' failure to communicate their values *or* by the child's rejection of the same values (Viswanathan, Childers and Moore, 2000).

Consumer learning in the realm of family life is generally thought to occur through children's observation and modelling, through family members' "social interaction," that is, their direct and indirect communication, as well as by shopping and product use/consumption experiences (John, 1999; Moore-Shay and Lutz, 1988; Moschis, 1987). In order to achieve a broad picture of IG influences Moore and colleagues (Moore et al., 2001; Moore, Wilkie and Lutz, 2002) used qualitative, in-depth interviewing in a study, which revealed a number of forces that foster IG transfers in the household and facilitate the endurance of such influences into adulthood. Besides, the three major childhood learning processes: learning by observation, communication, and experience were all found to affect IG transfers.

Consumer socialization survey studies have particularly assessed the impact of family communication on IG transfers. Results of these studies suggest that communication effectiveness (Mandrik, Fern and Bao, 2005), communication environment, for instance the absence of conflicts in parent-child communication about money matters (Moore-Shay and Berchmans, 1996), and general communication patterns and frequency of consumption (Carlson, Walsh, Laczniak and Grossbart, 1994) affect the extent to which a consensus between parents and their children is formed with respect to a range of socialization outcomes. In consumer socialization studies, typologies of general *parenting styles*, that is, differences in parental rearing practices are sometimes used to predict socialization outcomes in children (e.g., Carlson and Grossbart, 1988; Moschis, 1985). An application of these typologies divides parents into different groups according to the parental values prioritized in rearing practices; for instance (Carlson and Grossbart, 1988) divided parenting styles along a permissive-restrictive and warmth-hostility dimension and found five distinct styles: authoritarian, rigid controlling, neglecting, authoritative, and permissive parenting. Another parenting typology which has been widely used in consumer socialization research categorizes rearing styles as laissez-faire, protective, pluralistic, and consensual (Moschis, 1985). Certain rearing practices are thought to foster independence and consumer related skills in children, for instance authoritative parenting practices that emphasize and encourage independent thinking and autonomous decision making.

The present study is aimed at extending our knowledge of IG transfers of pro-environmental behaviours in the environmental domain. For this purpose, we first examine the extent to which children's pro-environmental behaviours can be determined by their parents' attitudes and behaviours with respect to environmental issues, that is, whether parents' pro-environmental (or the opposite) attitudes and behaviours are transmitted from parents to children. Examining the relative importance of attitudes, respectively, behaviours in relation to the same consumption activity gives an indication of the nature of the socialization processes at work; the influence of parental attitudes on adolescents' behaviour would suggest that parents influence their children in communicative ways, while influence stemming from parents' behaviour would suggest that observation/modelling influences are (perhaps more) important for the IG transmission.

While consumer socialization implies learning the skills, knowledge, and attitudes relevant for functioning as consumers in the marketplace (Ward, 1974), effective socialization, including intergenerational transfer of socially and culturally acceptable behaviours, probably involves more than this. As noted by Grolnick, Deci and Ryan (1997) socialization agents may be able to force children to carry out behaviors, but "the real goal is for children to carry them out volitionally" (p.135). Therefore, in this study we included a particular aspect of parenting style, parental autonomy support (Deci and Ryan, 1985) to be able to examine the (direct or

moderating) effects of autonomy support with respect to adolescents' acquisition of a pro-environmental orientation.

4. The study

A total of 601 Danish families were interviewed in the spring of 2006 by means of internet-based questionnaires. Two representatives of each family, a parent and a teenager (living at home, between the age of 16 and 18) each individually completed a questionnaire related to three pro-environmental consumption practices: buying organic/environmentally friendly products, curtailing electricity use and handling waste responsibly. The final sample of parent-child pairs (n=1202) of questionnaires resulted in a response rate of 28%. The composition of the sample was 293(48.8%)/308 boys/girls and 243(40.4%)/358 father/mothers. The sample mirrored the Danish population in terms of relevant socio-economic characteristics, but was skewed towards a relatively higher participation by mothers than by fathers.

Measurements. Questions included attitudes and behaviours with regard to each of three behaviours (i.e., buying organic/environmentally friendly products, handling waste "responsibly," and curtailing electricity use). In addition, in case of the young respondent, questions included perceptions of his or her parent's attitudes and behaviours with respect to the same activities. *Attitudes* were measured on three 7-point semantic differential scales with the extremes 1=good/beneficial/wise and 7=bad/detrimental/unwise (Ajzen and Fishbein, 1980). Cronbach's alphas for the scales ranged from .89-.93. The adolescents' perceptions of their parent's attitude (with respect to the parent, who also participated in the study) were measured by one summary item, asking the adolescent to assess his or her parent's attitude towards each of the three behaviours on a 7-point scale including the extremes 1=positive and 7= negative. When measuring *behaviour* the aim was to include activities, in which both parents and adolescents were involved. The items included were: "When you do shopping for the family, how often are the goods that you buy organic or environmentally friendly," "How often do you make an effort to save on electricity consumption at home," and "How often do you save the waste correctly." Responses were measured on a 5-point frequency scale: 1=always to 5=never. Since one third of the youngsters claimed never to do any shopping for the family, this part of the sample had to be excluded for this part of the analysis. Furthermore, the adolescents were asked to assess their parent's involvement of the behaviour in question.

Based on Deci and Ryan's self-determination theory (Deci and Ryan, 1985), the teenagers were questioned about their perception of parenting styles (POPS-college-student version for late adolescents or older (Robbins, 1994)) relating to their parent's autonomy support. Eight items were included to measure adolescents' perceptions of autonomy support; e.g., one item was: "My mother (father) helps me to choose my own direction." Cronbach's alpha for the autonomy support scale was .84.

5. Results

The results are split into sections according to the consumer issues involved: Purchasing organic/environmentally friendly products, managing waste "responsibly," and curtailing electricity use. Hierarchical regression analysis is used to determine the effect on each behaviour of adolescents' own attitudes, their parents' attitudes and behaviour, adolescents' perception of

parents' attitudes and behaviours as mediating variables, and autonomy support as a direct and moderating variable.

Purchasing organic/ environmentally friendly products

According to the first calculation in Table 1, adolescents' own attitudes and parent's behaviour are of almost equal importance and together they account for 38% of the variation in adolescents' purchase of organic products. Parents' attitudes are positively correlated with the dependent variable (

Appendix

Table 4, appendix), but the former are fully mediated through parents’ (visible) behaviour and thus do not add any explanatory power to the equation.

Table 1 Determinants of adolescents’ purchase of organic/environmentally friendly products (n=828)

	Y- Attitude	P- Behav- -iour	P- Atti- -tude	Y- Percep- -tion of Parent Be- -haviour	Y- Percep- -tion of Parent Attitude	Y- Parental Autono- -my Support	Y- Perception of Parent Behaviour* Parental Autonomy Support	Y-Attitude *Parental Autonomy Support	Adj. R ²	Sig. F- Change

Sig.	.00	.42	.47	.00	.94	.00	.02	.05		

Next, adolescents’ perceptions of parents’ attitude and behaviour are added, which increase the explanatory power to 56%, which is a significant change (p<.000). Adolescents’ own attitudes remain important, but the largest amount of influence on adolescents’ behaviour is their perception of parents’ behaviour. Parents’ perceived attitudes are strongly correlated to both adolescents’ behaviour and attitudes (Table 4, appendix), but these seem to be mediated through adolescents’ perception of parents’ behaviour.

Finally, adding parental autonomy support, the interaction of autonomy support with (1) the adolescents’ perception of parents’ behaviour, and (2) adolescents’ own attitudes leads to a small, but significant (p<.05) improvement of the model, which now accounts for 57% percent of variation in the behaviour of interest.

Thus, behavioural modelling processes would appear to be very important in case of buying organic/environmentally friendly products. That is, adolescents’ perception of parents’ behaviour – whether they buy or do not buy such products – is the primary explanatory variable. However, parental influence seems also to be executed through parenting style: an autonomy supporting style makes the young consumers more prone to engage in this behaviour. Moreover, with autonomy support, adolescents’ are more likely to act upon their own attitudes and less receptive to the perceived parental behavioural influence. It is important to note, however, that with respect

to parental influence on youngsters, an autonomy supporting parenting style seems only to be of minor importance compared to the much stronger modelling influence.

Waste management

A somewhat similar picture as the one above is shown with respect to waste management: adolescents' own attitudes and parents' behaviour each explain an equal amount of variation, which is 23% in the first calculation.

Table 2 Determinants of adolescents' waste management (n=1202)

	Y- Attitude	P- Behav- iour	P- Attitude	Y- Percep- tion of Parent Be- haviour	Y- Percep- tion of Parent Attitude	Y- Parenta l Autono my Support	Y- Perception of Parent Behaviour* Parental Autonomy Support	Y-Attitude *Parental Autonomy Support	Adj. R ²	Sig. F- Change

Sig.	.00	.94	.29	.00	.99	.06	.06	.77		

Next, the adolescents' perception are added, which improves the model significantly ($p < .000$) to 66%. Again, perceptions' of parents' *behaviour* is the all important variable, which appears to be a much more important determinant of the behaviour than the adolescents' own attitudes towards the behaviour.

Adding parental autonomy support to the equation does not improve the model's explanatory power. Parental autonomy support is only marginally important ($p < 0.1$) as a direct influence and as a moderator of parents' behaviour, while it is not at all important as a moderator of the youngsters' own attitudes.

Curtailling electricity use

The model aimed at determining antecedents in relation to adolescents' energy saving efforts represents the relatively weakest explanation of the three models included. Thus, the final model for energy saving only explains 15% of the variation in the behavioral criterion (Table 3). Nevertheless, the data reveal almost the same pattern as in the previous two cases.

Adolescents' perceptions of parents' behaviour is the most important predictor of adolescents' energy saving efforts, but the young people's own behaviour contributes to explaining their behaviour. Autonomy support is also related to the adolescents' behaviour. However, in this case autonomy support makes the adolescents less inclined to engage in energy saving effort.

Table 1 Determinants of adolescents' electricity saving efforts (n=1202)

	Y- Attit- ude	P- Attitude	P-Be- ha- viour	Y- Percep- tion of Parent Be- haviour	Y- Percep- tion of Parent Attitude	Y- Parenta l Autono my Support	Y-Attitude *Parental Autonomy Support	Y- Perception of Parent Behaviour* Parental Autonomy Support	Adj. R ²	Sig. F- Change

Sig.	.00	.34	.27	.00	.06	.04	.49	.99		

To sum up: Although there are differences, a common pattern emerges across the three behavioural areas. First, adolescents' performance of pro-environmental behaviours can to a substantial extent be explained by their own attitudes. However, their parents' behaviour, as reported by parents, explains nearly as much behavioural variance as the adolescents' own attitudes. Secondly, the behavioural impact of parents' behaviour is mediated through the young person's *perception* of the parent's behaviour, and this perception is much more influential than the parent's self-reported behaviour. Moreover, adolescents' perceptions of their parents' behaviour are much more important as predictor of their environmentally responsible behaviour than their *own* attitudes. The strongest effect is found for waste handling, the lowest effect is found with respect to curtailing electricity use, and buying a green product is somewhere in between the two. In short, young people are very much influenced by their parents' actions and in

particular how they perceive their parents' behaviour, which probably depends on how visible behaviours are to them.

The analyses further reveal that adolescents' environmentally responsible behaviour depends on their parents' parenting style. Parenting styles affect young people's environmental behaviour in at least two ways. First, it seems that adolescents are more likely to commit to pro-environmental action when they experience autonomy support in their family surroundings. This result appears as a significant, direct effect with respect to buying green products, and a marginally significant effect with respect to waste handling. However, in the third case, electricity conservation, there is a marginally significant effect in the opposite direction. Secondly, parental autonomy support seems to moderate the influence of parents' behaviour as perceived by the adolescents. This was found with regard to two of the three behaviours: buying green products and handling waste. With increasing autonomy support, the adolescents become somewhat less likely to copy their parents' behaviour. Additionally, in one of the three cases, buying green products, children who experience a more autonomy supportive home environment are more likely to act upon their *own* attitudes. Still, the influence of parental style is only a caveat. Irrespective of parental style, parents' behaviour as perceived by their adolescents' remains the most important predictor of adolescents' environmentally responsible behaviour across all three cases.

There is also a significant and positive correlation between parents' attitudes and adolescents' environmentally responsible behaviour for organic buying and waste management (Table 4 and Table 5, appendix). However, the behavioural influence of parents' attitudes disappears when controlling for parents' behaviour, which suggests that the influence of the former is mediated through this/these latter construct. Hence, the old adage that actions speak louder than words is true also in this case!

6. Conclusion

Based on this study, we can conclude that parental influence on their children's propensity to act in favour of the environment is substantial, and that parents' influence as role models is important for the transmission of pro-environmental practices to the next generation. This effect is strong irrespective of parenting style, but there is some indication that an autonomy supporting parenting style strengthens environmentally responsible behaviour in children overall and in addition makes children's behaviour less dependent on the example set by their parents (for better and for worse!).

Because of the cross-sectional nature of the data analysis, the direction of causality cannot be settled by this study. That is, in principle, the results may – partly or wholly – reflect adolescents' influence on their parents' behaviour in a reverse socialization process. Arguments that support the notion that at least a part of the transfer goes from parents to adolescents is the influence of parental style on adolescents' behaviour and not least the moderating influence of parental style. In addition, the fact that adolescents have been found to be *less* committed to pro-environmental practices (Grønhøj and Thøgersen, 2007) suggests that family influences within this behavioural domain primarily runs from parent to child.

Abstract

Today's product development has to be consumer driven in order to increase the chances of ensuring product innovations are successful on the modern food market. The development of a healthy but palatable cereal based snack "bar" for adolescents was used as a scenario to put different methods of consumer-driven product development into practice. Several methods were applied, e.g. a quantitative questionnaire addressing issues such as attitudes to food and food and lifestyle habits; acceptance tests with nine-point hedonic scales of appearance, odour, taste, texture and overall liking of new products; questions regarding suitability of new products; a conjoint analysis of factors that influence choice. The overall conclusion is that the methods applied for determining consumer-driven product development have tremendous potential to improve the product development process and marketing strategies and should be combined to be even more effective.

1. Introduction

Adolescence is one of the most crucial periods in life during which many changes that affect both our nutritional needs and our eating habits occur. Poor food habits and a sedentary lifestyle are generally seen as the major contributors to the increasing number of overweight

and obese children and adolescents (Sjöberg, Hallberg, Höglund, et al. 2003, Rolland-Cachera, Bellise, Deheeger 2000, Serra-Majem, 2001). The limited availability of nutritious, healthy food products poses a challenge to the food industry spurring it on to develop, manufacture and market new healthy options. To be successful, products should not only have positive health effects, they should also have sensory characteristics that appeal to the target groups and be adapted to suit their habits, attitudes and patterns of behaviour.

The development and marketing of new food products is an important although risky strategy for a modern food company. A major contributor to the success of new food products is extensive knowledge of the consumer group being targeted. There has been an increasing focus on so-called consumer-driven product development and one often hears about the need to listen to the voice of the consumers. This can be done in different stages of the development process by applying appropriate methods geared to elicit the answers required. The product development process can be divided into three main stages as illustrated in Figure 1: (1) Opportunity identification (2) Development (3) Optimization. After the optimization stage, the product is ready to be launched. In this study attention was focused on the third stage.

Figure 1: Overview of stages of new product development (Kleef, Trijp, Luning, 2005, p. 182)

In modern product development different tools have to be used in a more flexible way (Moskowitz, Reisner, Itty et al., 2006). In line with this postulation, it was the objective of this study to evaluate different methods that can be applied in consumer-driven product development by putting them into practice in the development of a healthy attractive snack for adolescents. The project was conducted in close cooperation with Cederroth International AB, parallel to the EU-funded project HELENA (Healthy Lifestyle in Europe by Nutrition in Adolescence).

2. Material and Methods

The product was a new type of cereal-based “bar” with clearly defined health benefits and varied sensory features. Three different flavour versions: apple-vanilla, blueberry-lemon and chocolate-coconut, each in two textures (smooth, crispy) were created. Each bar had a portion size of 40g. The apple-vanilla and the blueberry-lemon bars were coated with white yoghurt and the chocolate-coconut bars with brown chocolate (Figure 2).

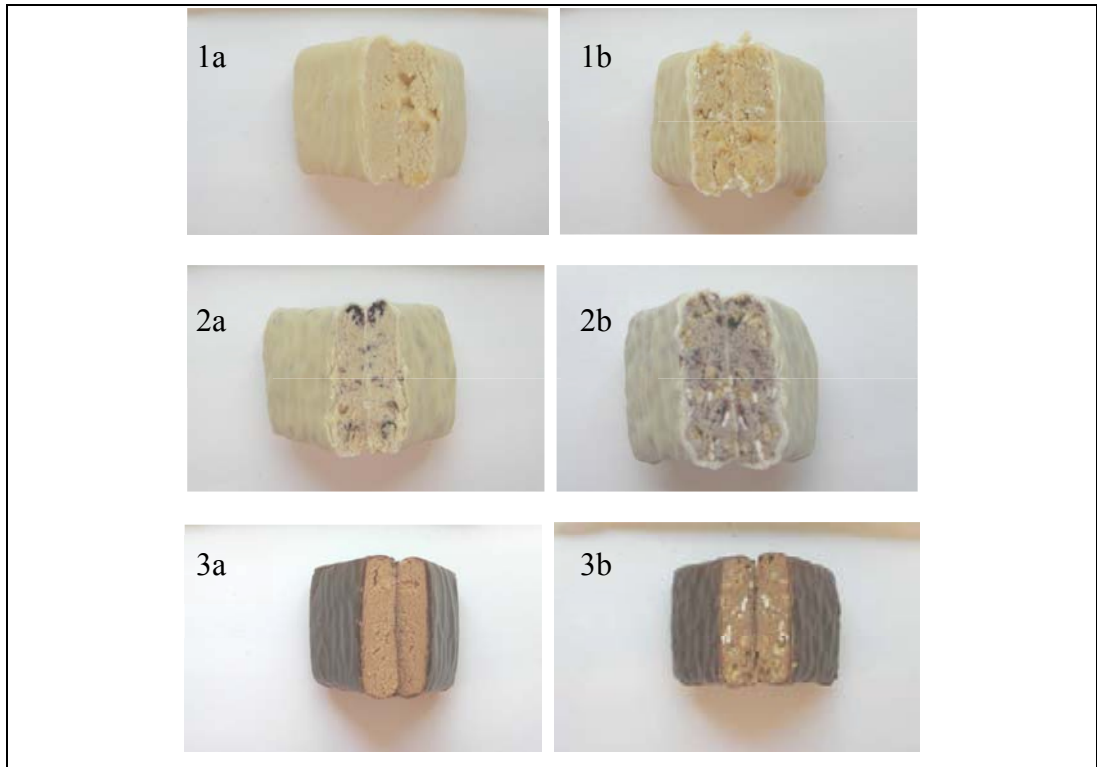

Figure 2: Six versions of the cereal bars 1a: Apple-vanilla smooth, 1b: Apple-vanilla crispy, 2a Blueberry-lemon smooth, 2b: Blueberry-lemon crispy, 3a: Chocolate-coconut smooth, 3b: Chocolate-coconut crispy

The products were developed to meet the need for a low energy, fibre and micronutrient rich snack bar. The nutrient and energy contents are shown in Table 1.

Table 1: Nutrient and energy contents of the smooth and the crispy versions of the cereal bars.

Nutrient and energy contents	Textures			
	Smooth		Crispy	
	In 40g	In 100g	In 40g	In 100g
Energy (kJ)	579.6	1453.2	592.2	1482.6
Energy (kcal)	138	346	141	353
Protein (g)	9,2	23	11	27
Carbohydrates (g)	17	42	16	40
Fat (g)	3.5	8.8	3.8	9.4
Fibre (g)	3.6	9.0	3.3	8.2

The subjects were adolescents aged 13 to 17 years; one group in ordinary home environments and one in classroom environments. The adolescents taking part in the tests at home were recruited from a data base of volunteers residing in two Swedish cities, Umeå and Stockholm, while the adolescents who took part in the tests at school were recruited from two schools outside Gothenburg: Furulund School in Partille and Aby School in Mölndal. The demographic data of the participating adolescents are presented in Table 2.

Table 2: Demographics. Numbers of subjects in different groups

Hometown	Age in years					Gender		Total
	13	14	15	16	17	Male	Female	
Umeå and Stockholm	33	26	17	7	10	52	41	93
Partille (Furulund)	1	46	1	0	0	23	25	48
Mölnadal (Åby)	0	32	1	0	0	14	17	33

A number of traditional and non-traditional research methods used in consumer-driven product development were selected and evaluated for the optimization of various perceived characteristics of a healthy snack intended for adolescents. The different test methods used in the study are summarized in Table 3, together with the numbers of subjects who took part in the tests.

Table 3: Methods and test locations

3. Results

The importance of the results will be discussed in relation to how data collected by different methods can aid both the product development itself and the formulation of marketing strategies for new healthy products for adolescents. This means that listening to the consumer does not end after the product development process. Consumer response strategies are also powerful tools in marketing (Verbeke, Van Oeckel, Warnants et al., 1999).

Food and health-related habits, attitudes and behaviours

Information about food and health-related attitudes and behaviours of the adolescents was compiled through questionnaires (see Table 3, research methods [1] and [2]). Questionnaires are the most common data collection tools in quantitative research. Questions posed in a questionnaire have to be selected carefully in order to elicit the information needed. Not just the question itself but also the way it is posed has an impact on the answer (Barrios, Costell, 2004).

In those tests conducted at the schools, the HELENA health awareness questionnaire was used. This questionnaire, which comprises an extensive set of questions that can be summarized under the categories “adolescents, food and health”, “eating behaviour in adolescence” and, “snacking habits in adolescence”, has recently been developed in the ongoing EU-Project HELENA. In those tests conducted in the home environment, a questionnaire developed together with Cederroth was used, focusing on the adolescents’ physical activities, together with their breakfast and snacking habits. The following presents a compilation of the results.

Table 4: Adolescents’ agreement with statements about eating habits and attitudes – data collected at school. Numbers of subjects

Statements about eating habits and attitudes	Degree of agreement							N	Mean
	1	2	3	4	5	6	7		
The taste of a food is very important to me	1	0	0	5	10	24	40	80	6.2
I like the food my parents prepare at home	2	0	1	2	11	20	45	81	6.2
I like the food I eat when I am out with my friends	3	0	0	6	14	27	30	80	5.9
I choose my own snacks	3	0	1	7	14	26	30	81	5.8
I enjoy eating fruit and vegetables	4	0	5	6	14	18	34	81	5.7
Food I eat at home is healthy	2	1	3	10	22	20	22	80	5.5
What I eat now will have a big impact on my future health	11	1	0	7	11	22	29	81	5.3
I think that my diet is healthy	2	0	3	15	32	16	13	81	5.2
Snacking is a necessary part of a healthy diet	4	4	3	17	19	17	14	78	4.9
I feel well informed about what are healthy foods	10	3	4	9	16	18	19	79	4.9
If there is the option to choose a low-fat version of a food, I will choose it	8	5	3	17	18	17	13	81	4.7
The taste of food is more important to me than if it is healthy	12	2	3	20	16	12	16	81	4.6
I have little choice over what I eat at home	10	5	5	18	15	13	15	81	4.5
If there is the option to choose a wholegrain version of a food, I will choose it	9	5	11	17	13	12	13	80	4.4
A high-fat food tastes better than the low-fat version	12	2	9	28	9	10	9	79	4.1
Most snacks I eat are healthy	7	4	15	22	20	7	6	81	4.1
Information regarding healthy eating is difficult to put into practice	8	5	8	35	10	10	3	79	4
Food I eat at school (in the canteen) is healthy	18	4	9	16	13	9	10	79	3.9
Most healthy foods do not taste very nice	13	11	8	23	8	6	12	81	3.8
Sugar-reduced products taste better than the 'regular' version	18	3	8	29	13	4	6	81	3.6
Food I eat when I am out with my friends is healthy	14	7	15	20	14	5	5	80	3.6
Healthy foods do not satisfy me	18	13	9	18	11	3	7	79	3.4
I tend to eat whatever my friends are eating	20	10	15	15	6	10	4	80	3.3
I often try foods that I see advertised in the media (TV, magazines etc.)	22	11	9	18	12	7	2	81	3.2
I often skip breakfast	32	12	4	7	8	6	13	82	3.2
I worry about what I eat because I do not want to gain weight	21	11	5	12	10	7	0	66	3
I like the food prepared in the school canteen	34	14	10	10	6	5	2	81	2.5

1=Strongly disagree, 2= Moderately disagree, 3=Slightly disagree, 4=Neither agree nor disagree, 5=Slightly agree
6= Moderately agree, 7= Strongly agree

As indicated in Table 4, adolescents’ agreements with statements referring to eating habits and attitudes show that the taste of a food product is very important and that adolescents are aware of the importance of healthy eating. However, they are not particularly involved in choosing healthy foods and they are not sure whether snacking is an important factor in

healthy eating. These adolescents claim that they take responsibility for their own eating habits and that their choice of foods is not influenced by friends or advertisements. They choose the foods they like. Neither the fat, the wholegrain nor the sugar content is of any particular interest to these adolescents when determining their choice of snacks. They like to eat fruit and vegetables and they consider their diet to be healthy. The food they eat at home is considered to be palatable and healthy. These adolescents like the food they eat together with friends. They stated that they eat snacks and that they have regular breakfast. In general they claim not to worry about gaining weight and clearly dislike the food served in the school canteen.

Table 5 shows that adolescents consider fresh fruit, vegetables and porridge to be healthy foods. They perceive nuts, dried fruits, milk products, pasta dishes, a bowl of cereal, cereal bars and pasta snacks as “neither healthy nor unhealthy”. Fast foods, popcorn, meat-based snacks, crackers, crisps, sweets and cake are perceived as unhealthy foods.

Table 5: Adolescents’ perception of health value of various foods – data collected at school. Numbers of subjects

Food items	Perceived health value					N	Mean
	1	2	3	4	5		
Fresh fruit	4	0	1	16	56	77	4.6
Vegetables (e.g. celery, carrots, tomatoes etc.)	4	0	3	8	62	77	4.6
Oatmeal / porridge	5	1	4	37	30	77	4.1
Nuts, peanuts, seeds (e.g. sunflower, pumpkin)	5	5	12	29	26	77	3.9
Dried fruits (eg. raisins)	8	0	12	40	17	77	3.8
Pasta dishes	4	5	14	34	20	77	3.8
Yoghurt / yoghurt products	7	5	21	26	18	77	3.6
Bowl of cereal	4	4	25	34	10	77	3.5
Cereal bars	4	8	20	32	11	75	3.5
Pasta snack foods e.g. pot noodles	10	4	32	19	11	76	3.2
Cheese products (e.g. cheddar, brie, cheese strings)	12	14	15	24	12	77	3.1
Bread / toast	6	15	31	18	7	77	3.1
Sandwiches / toasties / pannini	12	21	28	11	5	77	2.7
Popcorn	21	24	23	3	6	77	2.3
Meat-based snacks (e.g. meat sticks)	20	22	27	5	3	77	2.3
Crackers / rice cakes / salty sticks	25	22	20	6	4	77	2.2
Hot dogs / sausage rolls	22	30	16	4	5	77	2.2
Biscuits / cookies	30	31	11	3	2	77	1.9
Pizza	33	30	6	2	6	77	1.9
Hamburgers	32	27	10	1	5	75	1.9
Cakes / muffins / pastries	34	31	6	2	4	77	1.8
French fries	41	23	5	2	6	77	1.8
Chocolate / chocolate bars / turó rudi	43	22	6	3	3	77	1.7

Sweets / candy	49	18	4	1	5	77	1.6

1=Very unhealthy 2=Slightly unhealthy 3=Neither healthy nor unhealthy
4=Slightly healthy 5=Very healthy

Table 6 shows the factors that influence adolescents’ choice of snacks. The results indicate only small differences in the mean values, but there is a tendency for adolescents to choose snacks primarily based on the taste of the food. Health reasons and the degree of hunger influence the choice of snack more than parents, convenience (availability, preparation),

habits, friends or the school environment. The price of the food or another reason (e.g. medical reason) is of less importance in this case.

Table 6: Factors influencing choice of snacks – data collected at school. Numbers of subjects

Factors influencing choice	Degree of influence					N	Mean
	1	2	3	4	5		
The taste of the food	7	7	21	27	11	73	3.4
Concern for your health	10	11	28	12	11	72	3
How hungry you are	14	8	22	22	8	74	3
Your parents or guardian	14	12	25	11	12	74	2.9
The food is readily available	11	12	28	20	3	74	2.9
The food is easy to prepare	11	12	31	17	3	74	2.9
Your habits or daily routines	12	12	34	10	6	74	2.8
Your friends	18	9	29	14	3	73	2.7
School environment	17	9	37	7	4	74	2.6
Price of the food	21	8	31	9	4	73	2.5
Other, e.g. medical reasons	28	2	30	5	5	70	2.4

1=No influence 3=Moderate influence 5=Very strong influence

2=Slight influence 4=Strong influence

The quantitative questionnaires showed that adolescents in general are health conscious. They are also aware that they do not always follow recommendations regarding choice of foods and lifestyle behaviour. Taste is more important than health when they choose what to eat, and they want to have the freedom to make their own choices.

Relevance and applicability to product development and marketing

The product developer can utilise this type of data to improve the product development process. The high importance given to taste shows there is a need for information about adolescents’ sensory acceptance and preference of new products. Considerable effort needs to be invested in the product development in order to collect substantial data about the consumers’ sensory perception of the characteristics of any new products. This information can then be used for the optimization of the product concept (Table 10; research method [1] und [2]). However, the health awareness of adolescents and their knowledge about healthy foods lead to the conclusion that adolescents probably prefer a healthy product that tastes reasonably good to a more palatable but less healthy product. Efforts that increase the nutritional value of a product will only enhance the products value in the eyes of the adolescent consumer if the product is palatable, as well. This information can be used for supporting the product positioning (Table 10; research method [1] und [2]).

The data about food and health related habits, attitudes and behaviours also provide guidelines for marketing. In marketing, the taste of a product and its appropriateness for a self-determined lifestyle have to be communicated to adolescent consumers. The nutritional aspects are an additional value but not the main feature on which to focus attention.

Sensory acceptance and preferences

When conducting sensory analysis different test methods are available. If a detailed description of the sensory features is needed a descriptive sensory analysis (analytic) can be a suitable method of evaluation (Moskowitz, Beckley, Resurreccion, 2006). In a case where information about consumers’ acceptance is required, an affective (hedonic) test should be chosen. Affective tests are used to get beyond a customer’s personal response. Consumer

tests are highly effective product development tools for determining preferences and the acceptance of a new food product (Meilgaard, Civille, Carr, 1991).

Sensory acceptance and preference of cereal bars were evaluated in both test environments, at home and at school (see Table 3, research methods [3], [4] und [5]). All six versions of the cereal bars were evaluated for their preferences in the home environment. These adolescents were asked to judge the appearance, smell, taste, consistency and total impression of six coded samples on a nine-point hedonic scale (dislike extremely, dislike very much, dislike moderately, dislike slightly, neither like nor dislike, like slightly, like moderately, like very much, like extremely). To avoid order effects the six cereal bars were evaluated in a random order by the different adolescents.

Figure 3 shows the adolescents' total impression of the six flavoured cereal bars. The chocolate-coconut cereal bars were the ones most liked, both the smooth and the crispy version. The mean values of liking were higher than for the other cereal bars and the percentage of adolescents who "liked moderately" or liked very much was higher for these products than for the other cereal bars. The apple-vanilla cereal bar with the crispy texture was "liked slightly" on average but the percentage of adolescents who "liked moderately" or liked very much was lower than for the chocolate-coconut bars. The apple-vanilla cereal bar with the smooth texture and the blueberry-lemon cereal bars in both textures were on average "disliked slightly". The percentage of adolescents who "liked moderately" or liked very much was lower here than for the other cereal bars and the percentage of adolescents who "disliked moderately" or disliked very much was higher.

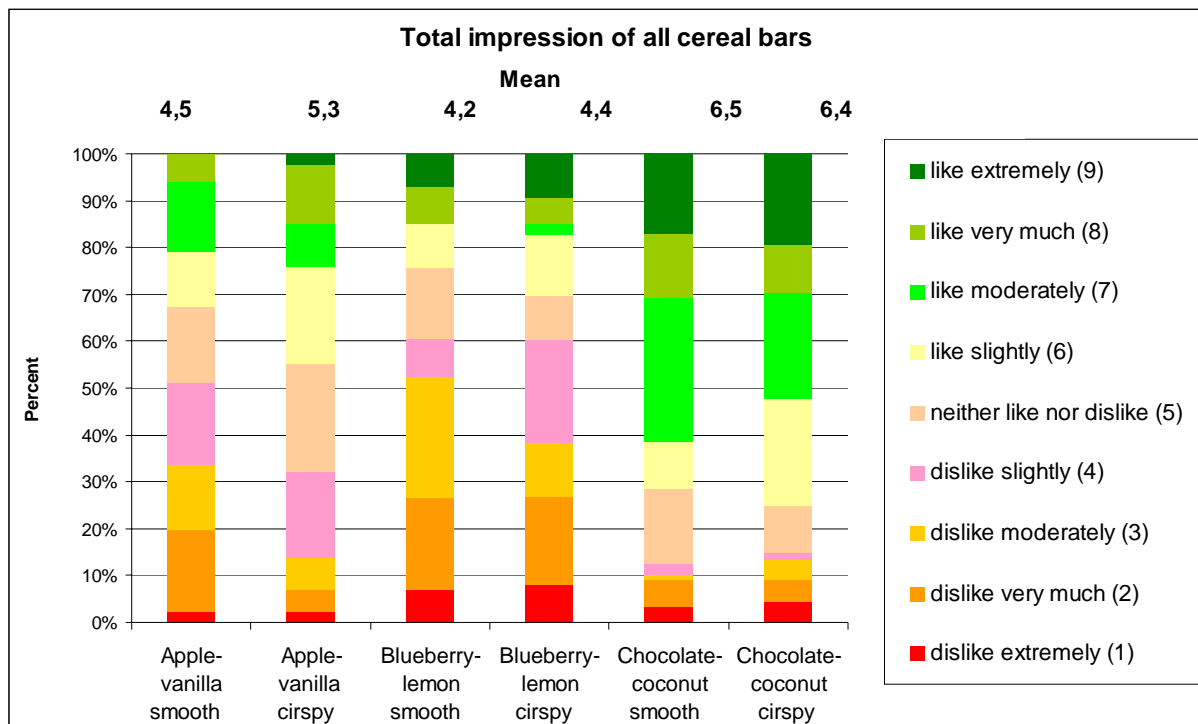

Figure 3: Sensory preferences of six flavoured cereal bars in total impression

Taking the apple-vanilla cereal bar with the smooth texture as an example, Figure 4 shows that its sensory characteristics were on average "liked slightly" or "neither liked nor disliked". However, it can be seen that there were some adolescents who really liked this sample while others really "disliked it" or disliked it more. On average the characteristics of

the chocolate-coconut cereal bar with the smooth texture were most highly appreciated by all subjects.

Figure 4: Hedonic sensory testing - Apple-vanilla smooth

These findings clearly demonstrate that there might be preference segments among the adolescents. A cluster analysis based on the acceptance data showed that there were five sensory driven clusters. The cluster analysis was done on the mean values for total impression of the six cereal bars by k-means clustering with Euclidian distances. Table 7 summarizes the mean values of the five segments in comparison with the overall mean values of all respondents.

Table 7: Sensory preferences overview of total impression and segmented in clusters

Type of bar	Total impression (Mean score)					All respondents
	Cluster 1 <i>Chocolate-coconut consumer</i>	Cluster 2 <i>Positive consumer</i>	Cluster 3 <i>Average consumer</i>	Cluster 4 <i>Not-keen-on blueberry-lemon consumer</i>	Cluster 5 <i>Negative consumer</i>	
Apple-vanilla smooth	3.0	6.2	4.9	6.4	2.0	4.4
Apple-vanilla crispy	4.9	7.6	4.5	5.9	2.4	5.3
Blueberry-lemon smooth	3.9	6.4	2.9	2.7	1.8	4.2
Blueberry-lemon crispy	4.6	7.0	2.5	2.8	2.0	4.4
Chocolate-coconut smooth	6.7	7.7	6.1	8.1	1.8	6.5
Chocolate-coconut crispy	6.8	7.9	5.4	7.7	1.7	6.3

The five sensory-driven clusters can be explained by the mean score differences in total impression:

- “The chocolate-coconut consumer” in **cluster 1**, the biggest cluster comprising 30% of the adolescents (n=28), were those who liked the chocolate-coconut cereal bars and disliked the other bars. This group of adolescents liked the crispy version of all cereal bars slightly more than average and also the smooth chocolate-coconut cereal bar. The smooth apple-vanilla cereal bar and the smooth blueberry-lemon bar were rated slightly below average.
- “The positive consumer” in **cluster 2**, comprising 24% of the adolescents (n=22), were those who liked all samples. This group of adolescents showed higher mean values of the total impression even for the blueberry-lemon cereal bars.
- “The average consumer” in **cluster 3**, comprising 23% of the adolescents (n=21), were those who neither liked nor disliked most of the cereal bars. This group of adolescents only “liked slightly” the chocolate-coconut cereal bar with smooth consistency, “neither liked not disliked” the crispy chocolate-coconut cereal bar, “disliked moderately” the apple-vanilla products in both consistencies and they “disliked very much” the blueberry-lemon cereal bars in both consistencies.
- “The not-keen-on blueberry-lemon consumer” in **cluster 4**, comprising 13% of the adolescents (n=12), were those who disliked the blueberry bars but liked the others. This group of adolescents was extremely negative about the blueberry-lemon cereal bar in both consistencies and extremely positive about the chocolate-coconut flavoured cereal bar. They showed higher mean values in total impression for the apple-vanilla flavoured cereal bars and for the chocolate-coconut flavoured products in comparison with the overall mean values.
- “The negative consumer” in **cluster 5**, comprising 10% of the adolescents (n=9), were those who disliked all samples. This group of adolescents showed lower mean values in total impression even for the chocolate-coconut cereal bar.

In the tests conducted at school only one of the cereal bars was evaluated for its preference. The chocolate-coconut cereal bar with the smooth texture was chosen for these tests, based on the results from the hedonic test with all six cereal bars in the home environment. To evaluate the influence of product information on the adolescents preferences for the chocolate-coconut cereal bar, the tests at school were first conducted without any product information and then with, First, without receiving any product information, the adolescents were asked to judge the appearance, smell, taste, consistency and total impression of the sample on the nine-point hedonic scale. These results were compared to the preference data collected in the home environment. As illustrated in Figure 5 the preference for the cereal bar was higher when tested in the home environment together with other samples. The appearance was “liked slightly” both at school and at home. Smell, taste, consistency and total impression were rated lower in the tests at school than those at home.

Figure 5: Hedonic sensory test with one product and with six products in test

The second hedonic sensory testing at Furulund School, Partille was done after the subjects had received some additional information ('cues'). The tests were carried out after two different claims had been presented: the sample was said to be either "extra tasty" or "extra healthy". Both cues were illustrated with pictures. The "tasty" sample was coded with "X" and the "healthy" sample with "Y". Half of the respondents evaluated the samples in the order "XY" and half of them in the order "YX", by using the nine-point hedonic scale described above. The results showed that none of the cues provided had any effect on the preference for the chocolate-coconut cereal bar.

To summarise, the sensory acceptance and preference tests showed that the cereal bar most liked on average was the chocolate-coconut flavoured bar, but that there were subgroups of adolescents showing different preferences. The cluster analysis showed that there were five sensory driven clusters or segments of adolescents. One cluster (24%) liked, and another cluster (10%) disliked all the cereal bars. The other three clusters had preferences related to specific sensory characteristics of the cereal bars. The biggest cluster (30%) was those who liked the chocolate-coconut bars. The context in which the sensory acceptance and preference data are collected is known to influence the results (Frewer, Risvik, Schifferstein, 2001), which was also observed in this study. Higher liking scores were observed for samples tested in the home environment than for those at school. Information about food products is also reported to influence the expectation and the perception of the products (Deliza, MacFie, 1995). This could not be verified in our study, but it should be noted that the sample size in our experiment was quite small.

Relevance and applicability to product development and marketing

Product development can use these types of results to design products especially for the preferences of different target groups. Characteristics that are not liked can be changed and flavours as well as other product features can be designed to suit certain subgroups. In case of the cereal snack bar, it was the version with the chocolate-coconut flavour that was liked by most of the subjects. The texture was not so important to them. The data collected here can be used to optimize the sensory features of the product (Table 10; research method [3] and [4]). Marketing can utilise these data to create a product image suitable for the target group, with slogans and information that fit the product. Based on the data compiled from the sensory testing of the bars it appears that the chocolate taste is a sensory feature that should be highlighted. The information obtained here can be used for product communication (Table 10; research method [3] and [4]).

The environment and testing conditions definitely had an impact on the liking of the products, which means that for product development, and marketing, data about the respondents' acceptance and preferences always have to be interpreted in the context. The comparison of results obtained in different test environments is difficult. The more the test environment resembles a real life situation, the more realistic the results.

The results from this study indicated that none of the product cues had any effect on the perception of the chocolate-coconut cereal bar, which implies that this kind of product information did not have an impact on food perception. This result is useful for product development because it confirms the importance of the products' sensory features. The taste of the product has a great influence on the degree of liking and different types of information cannot be considered reliable tools to influence the respondents' perception. The knowledge gained here can be used to optimize the sensory features of the product (Table 10; research method [5]). The information is even more interesting for marketing because it emphasizes that product data may not be effective tools for influencing consumers. The knowledge can also be used for product communication (Table 10; research method [5]).

Product choice studies

Experimental analyses of choice range from simple choice models with real choice objects to more complex choice experiments. For market research in particular conjoint analysis is used as a tool for getting behind the consumers' food choice behaviour. This more complex choice analysis provides information about preferred alternatives (Bastell, Louviere 1991). Choice-

based conjoint analysis is a tool for investigating consumers' responses to different stimuli by presenting them different profiles with different attribute levels (Moskowitz, Silcher, 2006). Consumers' preferences are revealed by allowing test panels to choose from among these sets. Choice-based conjoint analyses can be used either in full profile or in partial profile. Full profile experiments display a level of every attribute in every profile, whereas partial profile experiments display only a subset of attributes to the respondent. Choice-based conjoint analyses can be designed manually, computerized or randomized. Manual designs are carried out in shifted or in "mix and match" design (Chazan, Orme, 2000). The results of a conjoint analysis are quantitative data. The count of different attribute levels chosen leads to relative attribute importance and to path-worth utilities (Orme, 2006).

In this study two different types of food choice experiments were carried out: a choice-based conjoint analysis and an experiment about the actual selection of food products. Both experiments were conducted at the schools, in Partille as well as Mölndal (see Table 3; Research methods [10] and [11]).

Concerning conjoint measurements, there was one main difference in the experiments carried out at the two schools. The adolescents at Furulund School, Partille had previous experience of the products since they had first carried out the sensory acceptance tests. In contrast, the adolescents at Åby School, Mölndal had no previous experience of the products. Different sets of combinations of three different product features (taste, health and price), each at three levels, were presented on one page together with a picture of a cereal bar. The three taste levels were "extra chocolate", "extra coconut" and, "extra smooth". The health levels were "calcium enriched", "iron enriched" and "with fibre". The price levels were 10.50, 11.50 and 12.50 SEK. The sets on the cards were presented in a 3³ shifted design with 3 sets per card and 3 cards per person.

Table 8 shows the relative attribute importance with and without prior experience of the products. Without any previous experience of the product the "taste" was the most important product attribute and "price" more important to the adolescents than "health". With sensory product experience, the "price" was the most important attribute and "health" as important as "taste".

Table 8: Attribute importance choice-based conjoint analysis

Attribute	Attribute importance	
	Without product experience	With product experience
Taste	50.0%	25.0%
Health	12.5%	25.0%
Price	37.5%	50.0%

Table 9 shows the relative importance of the different attribute levels. Without any prior product experience, "extra chocolate" was the most important taste level with "extra coconut" and "extra smooth" being less important. Among the health attributes, "iron enriched" was more important than both "calcium enriched" and "with fibre". Without having previously tasted the product, the highest price of 12.50 SEK was the most important price level. The price of 10.50 SEK was less important and the middle price of 11.50 SEK least important. With product experience, the most important taste level was "extra coconut" while "extra chocolate" and "extra smooth" were equally important. The most important health level was "iron enriched", with "calcium enriched" being as important as "with fibre". In this case the two lower price levels of 10.50 SEK and 11.50 SEK were more important than the highest price of 12.50 SEK.

Table 9: Counts and part-worth utilities choice-based conjoint analysis

Attribute	Level	Part-Worth Utilities					
		Count		Count/102*	Count/126**	Percentage (%)	
		Without experience	With experience	Without experience	With experience	Without experience	With experience
Taste	Extra chocolate	57	43	0.6	0.3	60	30
	Extra coconut	21	44	0.2	0.4	20	40
	Extra smooth	24	39	0.2	0.3	20	30
Health	Calcium enriched	31	34	0.3	0.3	30	30
	Iron enriched	40	49	0.4	0.4	40	40
	with fibre	31	43	0.3	0.3	30	30
Price	10.50 kr	31	46	0.3	0.4	30	40
	11.50 kr	25	47	0.2	0.4	20	40
	12.50 kr	46	33	0.5	0.2	50	20

*Count/102 3 sets per card and 3 cards per person and 34 adolescents at Åby School - Number of times an attribute level was available for choice: (34*3) = 102

**Count/126 3 sets per card and 3 cards per person and 42 adolescents in Furulund School (6 respondents did not answer in an appropriate way) - Number of times an attribute level was available for choice: (42*3) = 126

In addition to the choice-based conjoint analysis, an experiment to determine the products preferred was carried out at Furulund School, Partille. After having tasted and evaluated the chocolate-coconut flavoured bar, first without and then with two types of product information (cues), the adolescents were invited to choose five cereal bars as a reward. They had free choice between the “tasty” version and the “healthy” version. The numbers of the “tasty” and “healthy” samples chosen by each respondent were recorded. Most of the respondents chose to take five “tasty” cereal bars (31%), with 19% choosing three “tasty” and two “healthy” bars, and 21% choosing three “healthy” and two “tasty” bars.

It may be difficult to draw too many conclusions from the conjoint analysis due to the limited size of the samples and different groups of respondents. However, certain effects of previous product experience and product information on food choices can be seen. The results indicate that product experience may have an impact on the attribute importance and part-worth utilities in choice-based conjoint analyses. Regarding the importance of the taste, health and price attributes of the chocolate-coconut cereal bar in this test, product experience seemed to lower the importance of the taste, to have no effect on the importance of health and to increase the importance of the price. Part-worth utilities seem also to be influenced by product experience. The main taste component “extra chocolate” also seemed to lose its utility after product experience. In contrast, the taste component “extra coconut” increased in significance.

Relevance and applicability to product development and marketing

For product development, these results show that a product may be judged differently depending on its features and consequently each product feature has to fit the product concept. In this case the product developer has to pay more attention to the sensory features and has to find the right nutritional value of the product. The knowledge gained here can be utilised to improve general product features (Table 9; research method [10]). For marketing, the importance of good communication of the product’s taste features and the potential of

additional health information is emphasized. Pricing is a complex issue, dependent on different variables. Indications are given here that the product experience will influence an efficient pricing concept. The knowledge can also be utilised to optimize product positioning and communication (Table 10; research method [10]).

The experiment with actual product choice indicates that the adolescents preferred the product which was said to be “extra tasty” and not the product said to be “extra healthy”. This confirms that the sensory features are considered more important than the nutritional value of the product and provides invaluable information to be considered in both product development and marketing. The information obtained here can be utilised to optimize general product features, product positioning and communication (Table 10; research method [11]).

Table 10 summarizes the application areas for the research methods evaluated in this study. Product development and product optimization can utilise them to develop or improve product concepts, the sensory features and general product features. Marketing can utilise this information for product positioning and communication.

Table 10: Application of research methods in product development and marketing

Research method	Application	
	Product development – Product optimization	Marketing
Health awareness questionnaire [1]	product concept	positioning
General questionnaire [2]	product concept	positioning
Hedonic sensory testing (6 products) [3]	sensory features	communication
Hedonic sensory testing (1 product, without information) [4]	sensory features	communication
Hedonic sensory testing (1 product, with information) [5]	sensory features	communication
Sensory projective (6photos) [6]	product concept	Communication
Emotional statements [7]	product concept	Communication
Product features [8]	general product features	positioning and communication
Motivations / occasions statements [9]	general product features	positioning and communication
Choice-based conjoint [10]	general product features	positioning and communication
Choice experiment [11]	general product features	positioning and communication

4. Conclusions

The results show that every method tested can be utilised to compile useful data for different aspects of the product development process. From the findings in this study it can be concluded that questionnaires may be good tools for collecting data on general behaviours, knowledge and attitudes. Background information of the target group is important to be able to create a product that fulfils the needs and wants as well as fits into the lifestyle of the intended consumers.

The importance of hedonic sensory testing for collecting data about consumer acceptance and preference is evident. The sensory features of the product are one of the most important factors in developing and marketing food products. In the case of the cereal snack bar, one product was definitely preferred. However, in every hedonic sensory test the circumstances and the testing context in which the data are collected can influence the test results and consequently, the test environment should resemble as closely as possible the real consumption situation. When hedonic sensory data are being interpreted one has to consider

the context of the test. Choice experiments are powerful tools for acquiring information about the respondents' real opinions and behaviours.

The overall conclusion is that the methods of consumer-driven product development have tremendous potential to improve the product development process and communication strategies.

Marketing of unhealthy food directed to children

Helena Sandberg
Department of Media and Communication Studies
Lund University
Lund, Sweden
Helena.Sandberg@mkj.lu.se

Abstract

This paper reports on a Swedish research project *Marketing of unhealthy food directed to children*, the aim of which was to survey the nature, amount and placement of advertisements that encourage children to buy food in different media. We found that a lot of the marketing of foodstuff concerned unhealthy food. The Internet is a particularly seductive channel and the limits between advertisements, editorials and non-profit information is vague and difficult to define. Children are encouraged to devote themselves to consumption through the offered on-line activities, games, kids-clubs and competitions on the net: “Eat as many sweets as possible”, “Fry as many hamburgers as you can and you will win the game”. Internet is a commercial arena with huge marketing potential and no regulations. Undeniably it needs further attention and close observation, and we can’t expect our children to be the watch dogs.

1 Introduction

There are few things today that set off public debate as easily as issues about food, children, and advertising. Research in this field is controversial no matter what stand is taken. This paper presents a recent Swedish research project: *Marketing of unhealthy food to children*. This is the first extensive survey on child-targeted advertising in Sweden and the project gained a lot of attention in the Swedish media in 2006.

The project has framed within two research discourses. The first discourse deals with the rising rate of obesity in children and is concerned with public health, while the second discourse is about children as consumers, advertising and an increased commercialised childhood. The two perspectives are briefly outlined below.

2 Obesity and food advertising

The rising rate of obesity in children is now a well-known fact in western countries. In Sweden, the numbers are as worrisome as in many other countries. Obesity in ten year-old children has increased by six fold in Sweden during the last twenty years. Studies show that between 15 and 25 % of Swedish children (8–10 years old) suffer from being overweight, and approximately 5 % of children are obese (Jansson & Danielsson, 2003; Livsmedelsverket, 2005a). From a European perspective, Sweden is still however not among the top countries (we are number eleven), that has the highest numbers of overweight children. Mediterranean countries top the list for obese children, according to a survey by the International and

European Association for the Study of Obesity (EAOS) (Lobstein, Rigby et al., 2005). Politicians and health professionals are worried about this ‘epidemic’, but the citizens themselves seem little worried about the issue. They neither worry about their personal health nor their children’s health. Surprisingly, a recurrent European consumer survey shows that European mothers neither rank ‘being overweight’ nor ‘obesity’ as particular concerns when it comes to their children’s health status (GfK, 2006), although they may take this into consideration with children other than their own.

The mass media may have one of their strongest effects in society by putting an issue on the agenda. The Theory of Agenda Setting can help us explain the public’s risk awareness. The theory postulates that people’s awareness and fear of a certain social problem depends on the media coverage of that particular topic, the amount of space the issue gets and the frequency of reporting (Rogers, Dearing et al., 1991). A Swedish study (Sandberg, H, 2004) shows that the issue of obesity was scarcely reported in the Swedish press until 2001 despite it’s growing proportions. Moreover, obesity was framed as an aesthetic rather than a health problem. This might explain why the Swedes themselves didn’t take excess weight and obesity as a serious health issue.

In November 2003, as a result of the increase in prevalence of obesity in Sweden, the Swedish National Institute of Public Health (SNIPH) and the National Food Administration were commissioned by the Swedish government to produce a plan of action for healthy eating habits and increased physical activity in the Swedish population. The plan was presented in February 2005 and proposed more than seventy measures to be taken (Livsmedelsverket, 2005b). A few of them concerned food promotion directed to children. It was recommended, for instance, that Sweden should initiate work at the EU level to ensure that TV food advertising targeted at children be banned throughout the EU. The prerequisites for restricting food marketing activities targeted at children need to be examined and trends in marketing must be continually monitored. No systematic analysis by independent parties of Swedish food marketing¹ had been carried out until November 2005.

3 Children and advertising

Ever since children in the early 1900s were recognized as a distinct group of consumers, marketers have been interested in developing strategies to influence children’s demands (Brembeck, Berggren Torell et al., 2001). The significance of marketing, advertising and public relations has steadily increased on a global scale and higher values are attached to these activities. Communication has been defined as the most important product, or raw material, in our society (Schultz, 2007) and in Sweden alone approximately 70 billion Swedish crowns (SEK)² are annually invested in marketing and communication efforts (IRM, 2007). Marketing and advertising have become more sophisticated with new marketing strategies (e.g. product placement in movies, SMS-marketing, use of tween trendsetters, false Web sites³) and it is even referred to in war-like terms such as “guerrilla” marketing (Linn, 2005).

¹ In Sweden, 3 billion SEK (ca. 3 250 000€) are invested in food advertising each year and a third of the sum is spent on marketing of unhealthy food stuff, compared to the Swedish Food Agency’s budget for food and health promotion which is about 15–20 million SEK a year (ca. 2 millions €) (Ekström & Sandberg, 2007).

² About 7 000 000 000 €

³ Some companies create ‘false’ web sites so it looks as if a kid has created it. It is an ad but it looks as if it is a child being personally about life, friends, hobbies and so on. Brands are mentioned in passing with links to commercial sites and young people are in this way misled by clever marketers (Lindstrom & Seybold B, 2003).

Since the distinction between items has diminished, it is increasingly difficult today to persuade the consumer about the excellence of a particular product. In many cases, the only variation is to be found in the brand name or in the colour of the packaging. Diversity is instead a construction, and the vision of the good life is being drilled into the audience by colourful and exciting advertisements and TV-commercials. Consumerism is the religion of late modernity, some say, and its most devout followers are the children (Unnikrishnan & Bajpai, 1996).

With the last decades of heavy commercialisation of childhood comes a strong shift, then, from children's objective needs (an adult understanding of what a child needs) to children's subjective preferences and desires (Olesen, 2004). Children persistently nag their parents to buy new things and as a result, mothers say they spend 30% more than they intended when they go shopping with their children (Wilson & Wood, 2004). This kind of influence or harassment is referred to in the consumer literature as children's pester power (Johansson, 2005). An American survey suggests that even when parents say no to their children's demands, 60 % of the kids keep asking for things they want on an average of nine times more. This strong influence of children on household purchases is estimated to a direct value of US\$188 billion, and a further US\$300 billion coming from indirect influence when parents takes a child's needs vs desires in account when buying things such as home computers, cable television etc (Lindstrom & Seybold B, 2003). Children are today well aware of brands and products and the social status attached to them. They know what is trendy and cool and which brands are not socially acceptable to buy. The peer group is deemed to be a more important source of influence when it comes to brand consciousness and brand sensitivity than media and parents, at least among teenagers in the US, but the latter two are also related to consumption attitudes and consumer socialisation (Nelson & McLeod, 2005).

Research into children as consumers is today an extremely vast area (Gunter & Furnham, 1998; Sonesson, 1999; Valkenburg & Cantor, 2001; Hansen, Rasmussen et al., 2002; Jacobson, 2004; Johansson, 2005). Paralleled with the increased interest in children as consumers is the increased concern about the implications of advertising upon children (Fox, 1996; Unnikrishnan & Bajpai, 1996; Furnham, 2000; Linn, 2005).

The current body of advertising research is immense and complex. Three main dimensions are usually involved but even so, if only advertising effects in the last few decades, there are nevertheless a considerable number of different studies that vary greatly with respect to paradigms, perspectives and methodology. Valkenburg (2000) divides studies on the impact of advertising into three groups:

1. cognitive
2. affective
3. behavioural effects.

Cognitive effect studies concentrate on a child's ability to differentiate commercials from other media content and his or her capacity to understand the purpose of advertisements. Affective studies focus on the appeal of commercials and the trust they generate in children, while studies on behavioural effect examine the extent to which the child is persuaded (Valkenburg, 2000).

Tufte (2006) splits research on the effects of advertising into two camps: one financed by industry and one by public means (Tufte, 2006). The former usually states that children are

critical readers of advertising and learn at an early age to define, understand and see through the commercial purpose of advertisements and hence they claim that the effects upon children are small. Spokesmen for the latter argue for a more cautious attitude. They claim that children are sensitive to the influence of advertisements and only gradually learn to recognize commercials, still lacking a critical perspective on ads in preschool and primary school. By the age of 10 most children have developed an ability to differentiate editorial material from advertising and can distinguish TV-commercials from TV-programs, yet they still might not be able to explain the purpose. There is no international consensus about the way in which advertising influences children and youth. There is however, a consensus among Nordic researchers in the field that not until the age of 12 do children fully understand and are able to critically scrutinise advertisements and promotional material (Jørgensen, 1992; Jørgensen Schultz, 1993; Bjurström, 1994; Tufte, 1999; Furnham, 2000; Jarlbro, 2001). This opinion is shared among the participants in the Swedish research project as well. This is not to say that children are seen as naïve, but they are often innocent to the workings of the world of persuasion.

There is no doubt that advertising plays a crucial role in introducing new products, brands and demands among children. There is also empirical evidence that children's exposure to advertising may lead to undesired effects such as purchase requests (harassment), materialistic attitudes, unhappiness and family conflict. These unwanted effects can nevertheless be reduced by parental mediation of advertising: explaining how advertising works, commenting on commercials, and explaining consumer matters (e.g. purchase decisions) (Buijzen, Moniek & Valkenburg, 2003a; Buijzen, M & Valkenburg, 2003b; Buijzen, Moniek & Valkenburg, 2005)

4 The competent child

The Childhood literature is also vast (Postman, 1982; Brembeck, Johansson et al., 2004) and steadily growing. There has been an increased societal and political interest in children as a social category, since the mid 1980's, and the notion "competent child" is today a widely used term by researchers. It is used in popular language and also by advertisers when it comes to children's interaction with advertising and promotion of consumer goods. The competent child is presented in the literature as a container concept (Ellegaard, 2004), in opposition to earlier representations of the child as a vulnerable and mouldable person in need of guidance.

The competent child is characterised as an actor taking part in the construction of her social reality, not only an object of adult socialisation. Moreover, the competent child is perceived as almost equal to grown-ups with their own economic lives. The competent child is defined as a 'social being' (Solberg, 1994; Levinson, 2000; Zelizer, 2002) in comparison to a 'social becoming' (Buckingham, 2000; Cross, 2002; Cook, 2005). Children have, in early ages, developed many adult skills, and are not in need of special protection from the adult world, which has been claimed earlier. The description of the competent child binds up with the position of the Association of Swedish Advertisers, the organisation that promotes and maintains the advertisers' interests on the Swedish advertising market. The organisation make claims about marketers' law full right, according to the freedom of speech, to address children with "information" about products in the form of advertising campaigns or other promotional activity. They also maintain, not surprisingly, that there is no need of further regulations of advertising, since children are clever, and not at all easy to lead astray. They regard children to be competent and independent consumers.

The idea of the competent child is present in the media research literature as well (Livingstone, 2002; Strasburger & Wilson, 2002), and binds up with the current view on the media audience. The paradigm among media researchers has shifted over the years from transmission and effects (a passive view on the audience which actually reduces it to a container) to reception and interpretation (an active critical audience) (Carey, 1989; McQuail, 1997) as to culture and the use of media in everyday life (Lull, 1980; Morley, 1992; Gauntlet & Hill, 1999; Nightingale & Ross, 2003). The audience interaction with and use of media differs, as does the interpretation of the media content. Any person who confronts a media message (be it news, fiction or commercials) must make sense of and interpret the message, which is far from simple and unproblematic. Livingstone says (p. 4) that: "...both interpersonal and mediated communication have been increasingly recognised as a complex, rule-governed, constructive set of processes" (Livingstone, 1998). The interpretation is different across the life span and dependent on the individual background, lifestyle, and context, and so on. Children probably construct various meanings from a certain media content, than do teenagers and grown ups. The view of the passive receiver as a black box or 'tabula rasa', ready to be filled with ideas and beliefs, is obsolete and replaced by an active and critical reader – a competent audience. This idea does not however contradict our attitude stated above. Advertiser's purpose is far from evident and crystal-clear to a child since children are not on the same cognitive level as teenagers and adults. Children, below the age of twelve, are not as skilled as an adult to see through the ads and keep the flirting images at a distance.

5 The Study

The project *Marketing of unhealthy food directed to children* was initiated by the Swedish Consumer Association in 2005. The project received funding from the Nordic Council of Ministers as well as the Swedish Consumer Agency. Researchers at the Department of Media and Communication Studies, at Lund University, were then hired to do the survey. The aim of the project was manifold:

1. to survey food advertising directed to children
2. to construct a survey tool for comparative purposes in other Nordic countries and
3. to procure information for political decisions and actions.

Since there is a ban, in Sweden, on TV-commercials directed to children below the age of 12, the target group was limited to children below this age. The Swedish legislation against TV advertising is considered to be the strictest in the world (Furnham, 2000). It has, not surprisingly, been criticised a lot by The Association of Swedish Advertisers. A common argument against the ban is that most TV-channels avoid the ban simply by overseas broadcasting, where a more liberal view on child-targeted advertising for long has prevailed. The Swedish law might be ineffective nevertheless it has a considerable symbolic value, since it gives evidence of what is socially accepted and what is not, when it comes to advertising and children. There is however a change to be expected, in view of the fact that Ofcom⁴ has put forward a strengthening of the regulation of food and drink advertising on TV, recently. The new restrictions have the effect of removing all advertisements for products that are high in fat, salt and sugar (HFSS) from all programmes, broadcast at any time, which hold

⁴ Ofcom is the independent regulator and competition authority for the UK communications industries, with responsibilities across television, radio, telecommunications and wireless communications services.

particular appeal for children up to the age of 16 (OfCom, 2006). This will have impact on several actors among others the Swedish TV-channels TV3 and Channel 5, which are broadcasted from London.

Limitations and sample

Several media were included in the study:

- Direct advertising (8 households spread all over Sweden)
- TV-commercials (TV3, TV4, Channel 5, Cartoon Network)
- Comic papers for children (about 60)
- Internet Web sites.

The different sub-studies have been reported in several publications (Sandberg, H., 2006a; Sandberg, H, 2006b; Ekström & Sandberg, 2007). This paper will discuss some of the results from the Internet study. The Internet survey focused on describing the amount, nature and placement of advertising on several Web sites. Data collection took place during a week in November 2005. The procedure was tricky since Internet is perpetually transforming and never the same. Almost 100 Web sites were visited, and 277 screenshots were saved for the analysis. The sample included two different kinds of Web sites. 60% of the sample consisted of (I) food related Web sites (e.g. the food industry, restaurants, grocery stores, particular food brands) and 40% of the sample was made up of (II) Web sites visited by children for sure⁵, but with no relation to food (e.g. communities, chat-rooms, entertainment sites with on-line games).

6 Results

The *Unhealthy food index* (UHF) will be introduced before the results are presented and discussed. In the survey all food advertisements were categorised into one of 12 different food categories (see list below).

- Soda-drinks*
- Pastry and cookies*
- Desserts and snacks*
- Candy, crisps and chocolate*
- Prefabricated dishes
- Cereals
- Other beverages
- Animal products
- Fruits & vegetables
- Dairy
- Bread
- Other provisions

The Unhealthy food index, which is an additive index, was then constructed and used consistently in the project no matter which media studied. The index measures the proportion of advertisements for unhealthy food, here defined as food which shouldn't be over

⁵ This part of the sample procedure was done by the consultancy firm Nielsen Netrating. The food related Web sites were selected by the assigner, the Swedish Consumer Association.

consumed, and which are high in fat and or sugar. The food categories marked with an asterisk (*) in the list, were included in the index.

The Unhealthy food index (UHF)

= % soda-drinks + % pastry and cookies + % desserts and snacks + % candy, crips and choclote

Given that the research was done by media researchers, not nutritionists or food experts, the exact nutritive value of each product was not known and couldn't be measured. Since there are prefabricated dishes of good nutritional value, and others that are considered unhealthy and of very poor value, prefabricated dishes as well as fast food were excluded from the index. The UHF-index is therefore a rough measurement and gives us an indication of the minimum proportion of unhealthy food advertisement in different media. If the prefabricated dishes and for instance some of the very sweet or fat dairy products, in addition to cereals high in sugar, would be included, the index would for sure raise.

It turned out that the Internet had the highest UHF-score of all the media studied (Sandberg, H, 2006b). This means that we found the largest proportion of marketing of unhealthy food on the Internet compared to the other media (see below).

Direct advertising	UHF =18
TV	UHF =20
Internet	UHF =52

The proportion of ads for unhealthy foods was the same no matter which kind of Web site visited. We found proportionally as much unhealthy food marketing for children in the chat-rooms and on the free game sites, as we found on the sites of the food industry themselves (see table 1).

Table 1. Food advertisement on the Internet (%)

	Food related site	Not food related site
Candy, crips, chocolate	25	23
Desserts & snacks	15	0
Soda-drinks	9	15
Pastry & cookies	3	15
Animal products	2	0
Prefabricated & fast food	11	0
Fruits & vegetables	0	0
Cereals	6	8
Dairy	7	0
UHF-index	52	53

One way of getting children's attention in marketing is to use children as models in the ads. In TV-commercials as well as in the direct mail advertisements we found several examples of this. On the Web sites however, children were rarely pictured. This doesn't mean that they were not present on the Web sites. If there weren't any pictures of kids there were instead

traces of them (e.g. toys, clothes, drawings, cartoons, hand or footprints of a child), which of course also appeals and attracts attention from a child who visit the site.

In many cases we found that the food marketed on the Internet didn't get as much space as the food exposed in other advertising media. The food sale impetus was not as pushy then as it was in the mail advertisements and the TV-commercials. In fact in many cases the advertisement or the marketing of food was hard to discover and tell apart from other kind of media content such as information on the web. And in some instances the marketing was concealed and transformed into pure entertainment.

We found particular brand incentives related to a food item for sale in 70 % of all cases. It could be a food mascot, comics strips, membership in children's club, e-cards, birthday-party tip, pottering to keep a child busy, and plenty of material for free download. A few examples are presented below.

Picture 1. A Web site for unhealthy food directed to children

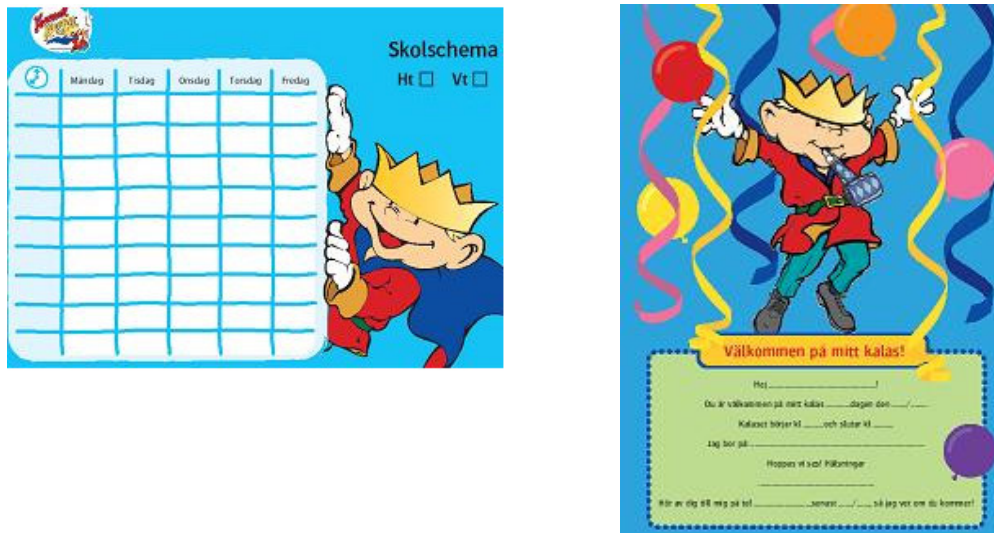

Picture 1 is a Web site and advertisement for unhealthy food (candy & chocolate) directed to children below the age of 12. The child can interact on the Web site with the "Candy Family" seen in the picture above, and get to know the family members, all of which are named cleverly after different pieces of chocolate bars and sweets: mother *Marianne*, father *Karl F(azer)*, the daughter *Polly* and finally the son *Plopp*. They are on top of that dressed in the product's brand colours and resemble thereby the wrapping of the candy.

On the linked Web site the child is addressed friendly and cheerfully – "Hello buddy" ("Hej kompis!") –and then invited to click on the various persons to get to know them better (their background, hobbies, job and aspirations or lifestyle). The visitor can play "Candy Memory" and make her or his own cut-out candy car, a bright red "Dumle-car" (Dumle is also a well known brand for sweets) which is the same as the one the Candy Family drives. (See picture 2).

Picture 2. A cut-out car from Cloetta Fazer a manufacturer of sweets

Many of the Web sites studied offer pottering for kids, and subsequently make them interact with the brands in a non-intrusive way, on-line as well as off-line. The Candy King (“Karamellkungen”) offers the visitor plenty of activities, games and birthday invitation cards as well as school schedules for download (see picture 3). The Candy King also had a nursery tale (ghost-story) published on the Web site. The story included several well-known brands of sweets. The brands were intertwined in the story in a, at the first glance, natural way. The story wasn’t a common fairy tale for kids however, but an extensive and well covert advertisement.

Picture 3. Examples of pottering from the Candy King.

Children were offered membership in clubs, in several places on the Web. The Tiger club (see picture 4), for instance, is a club for children between 5 and 12 years. The Tiger himself is the mascot of a dairy in the northern part of Sweden. The dairy’s Web sites are in many ways worthy of imitation and offer plenty of useful health information to children, parents, and teachers; nevertheless, they have a clear goal to drill into the child’s head a particular brand. The Tiger club offered for instance plenty of items to buy, e.g. Tiger towels, Tiger bags, Tiger pins, Tiger caps and so on, through the club site.

The food mascots, such as Tiger, are usually small, cute and innocent in their presentation and character. Soon they become children’s personal friends on the Internet. They give life to and personify the brand or the product. In this way marketers build long lasting relationships between the brand and the child from an early age and on. They create at the same time a positive attitude towards consumption. Children are urged by the food mascots to “taste this”,

“ask your parents to buy this”, “feel the taste of this yummy bar”, while seeing the mascots gorging, munching, sipping and licking their mouths, and at the same time listening to the sound of crisps breaking or cereals popping in milk. In the on-line games the mascots also guide the child through the game and maybe not surprisingly the kids who fry the most hamburgers will win, and the kid who eats or collects as many sweeties as possible gets the highest score. It is worrisome, considering the increased number of children suffering from overweight and obesity, that the marketers in this way urge children repeatedly into over consumption, and also that they do it in a way which is far from obvious for the child.

Picture 4. The Tiger club, a club on the Web for kids 5–12 years old.

It is troublesome that so many of the examples of advertising of unhealthy food to children on the Internet are difficult to discover (even for an adult), and to keep apart from other material on the sites. Children are not stupid. They are sensible and critical in many ways, but marketers don't have to make it more difficult for them than necessary to maintain their role as competent consumers.

It could be argued that it is a democratic right to know when you are exposed to trade influence. On TV there is at least a warning or announcement before and after a commercial break. Children's lack of experience, kindly reception and approving attitude towards advertisement (which many consider to be entertaining even if they report it being annoying too) should not be exploited the way it is in many of the Web sites studied.

Finally we found many examples of how the food industry make use of kids and turn them into unpaid “junior marketers”, probably without their awareness, at least without deeper consideration doing the industry's errands. Children are persistently requested to send advertisements, campaign offerings, games (see an example in picture 5) et cetera on to their friends, as if they did them a favour (“why don't you give this tip to a friend” or “invite a friend to this” or “challenge your pal in the game”), and thereby the marketers get access to the kid's peer groups, extended networks of friends, and relatives for further influence. And no doubt many kids want to do their friends a favour and be a good pal.

Picture 5. On this Web site the child is asked to tip-off/send the Basketbots game from 7up to a friend by typing her or his e-mail in the square.

Discussion and conclusion

Material aspirations are reaching unrealistic heights. “While consumerism is spreading like wildfire, access to the basics of life remains a serious problem for many” (Unnikrishnan & Bajpai, 1996:20). Increased commercialism may hold negative consequences for society as a whole. There are critics warning that commercial and materialistic values can lead to decreased civic responsibility. Soon (if not already) young people find shopping more fun than helping others and engage in political activity. In the Swedish press this summer we read about kids’ luxury consumption and parent’s indebtedness. 12 year-old children wear D&G-sweaters, Gucci sunglasses and Armani jeans.

An average consumer in the US is exposed to 30000 brands a day (Nelson & McLeod, 2005). The average 12-year-old child spends about 48 hours per week exposed to commercial messages, but not more than 1,5h in a significant conversation with a parent, Nelson and McLeod also report. These figures may not give us the whole truth about the power of marketers and the advertising industry, and they may not be valid for the Nordic countries. Yet, they say something about the commercial pressure the industry puts on us, and our kids, to consume – not only food any kind of stuff. Still the advertising association maintains that children would pester their parents for products even if there were no advertising at all. Peer pressure is to be held responsible, not the advertisements or the advertisers (Preston, 2004).

TV has for long been considered to be the most important media influencer, and has in Sweden been surrounded by severe regulation. But what if it no longer is the main influencer? Young people have varied and changing patterns of media consumption and they spend more and more time with their computers, on online media use. In Sweden kids that have access to and use the Internet spend about 73 minutes a day, and some off course spend even more in front of the screen (Nordicom-Sverige, 2006). Internet is also the media that children use

alone, not in the company of others. More than a third of Swedish children between 9 and 11 years old report having access to a computer in their own bed room, and as many as 40% of the children are chatting with persons they know on the net or meet them in different cyber communities (Medierådet, 2005). Off course they still watch a lot of TV as well, and almost all children watch TV on a daily basis. On an average children watch about 90 minutes a day in Sweden (Nordicom-Sverige, 2006). But we can see that the amount of online media consumption is getting closer and closer to the amount of TV consumption. Then it is legitimate to start discussing regulations and ethics of ads and marketers even on the Web.

The Swedish TV-ban on commercials in the early 1990s was deemed to be a necessity because of the strong impact TV had on the audience caused by its colourful visual effects and sound effects (Jarlbro, 2001). The Internet is everything that a TV is, and much more. On the Internet there are virtual effects, designed visual effects, moving pictures, music et cetera. The Web offers immediate and direct interaction across time and space. The user can choose between unlimited numbers of options, activities, commodities served in an alluring and fun context. TV commercials seem harmless compared to the marketing potentials of Internet, and yet we trust the advertisers to know the limits and expect them to voluntarily clean up what is regarded unethical, unmoral, and misleading advertisements to children on the Web sites.

Some media might offer a higher proportion of marketing of unhealthy food than others. The results from the Swedish study point out that Internet was the advertising media with the highest score on UHF-index, among several media. The proportion of advertising of unhealthy food directed to children was 52% on the studied Web sites, compared to 20% on TV and 18% in the mail advertisements (Ekström & Sandberg, 2007).

An important conclusion from the Internet study is that marketing efforts and advertisements on the Web are often hidden and transformed to something else. It takes the shape of a party invitation card, a mobile signal for free download, games and competitions. The Web advertisements are more sophisticated than the direct advertising that comes in your mailbox or in the press. The Web advertisements are not telling you to run off and immediately buy 3 tins of mashed tomatoes for a song, and save some money. Instead the Web marketing works in the long run. Steadily marketers build positive attitudes around particular brands, and when it is time for the child to actually buy something he or she knows exactly which brands are simply the best. It is more difficult to keep the critical eye open and act as a competent child/consumer, since the brand interaction on the Internet also is voluntary. The child decides by herself where to click and which pictures and links looks the most interesting to explore further, and thereby stays illusively in control. Obviously it gets even harder when the advertiser name things differently from what they are. An example of this is when the ice cream-company asks the child on the Web site if he/she would like to get "fun mail" from the Ice cream producer in his e-mail, instead of just asking if he/she wants advertisements or sales offerings each month. In the study we found several cases where the marketers exploit children and where they mislead children and unnecessarily promotes over consumption of unhealthy food.

There are no particular restrictions on the marketing of unhealthy food to children, but the food industry has to shoulder their part of the responsibility and take actions to solve the problem of obesity, just as several other actors and social institutions (politicians, schools, parents, health care institutions, and the media). Their contribution to this huge health problem could for instance be to stop marketing of unhealthy food directed to children, and to stop spurring over consumption of unhealthy food. We don't want the gloomy prophecy

which tells us that our children might be the first generation to live shorter and healthier lives than their parents, to come true.

The Internet study evidence the need to closely follow the development of marketing of unhealthy food directed to children. The marketing potential is huge and there are still very few signs of self-regulation. There is one good example though, among the Web sites analysed, which could serve as a model for the rest of the food industry, and that is Kraft Foods Inc. This company has decided to keep their Web sites free from advertisements and enticements for kids and has developed a policy not to unnecessarily stimulate consumption of unhealthy food on the Web. We hope that there are more to follow. The Internet survey was focused on describing the amount, nature and placement of advertising on the Web sites. Next step will be to study children's perceptions, understanding and use of food advertisements in relation to their food intake and lifestyle.

Visual marketing of breakfast cereals to children – containers, gadgets and gender

Anna Sparrman
Department of Child Studies
University of Linköping
Linköping, Sweden
annsp@tema.liu.se

Abstract

A growing research field concerning children and consumption concern food. In Sweden many different interest groups engage against food marketing to children. On a political level the engagement concern children's health. Centrally situated in these discussions are breakfast cereals and the visual design of cereal containers. The present paper presents the public debate concerning visual marketing of cereal containers to children. The main contribution of the paper does however concern children's own approaches to visual layouts of cereal containers targeted specifically at them. Focus group interviews with children discussing cereal containers (present at the interview situation) have been carried out. The paper illustrates how the visual child address is gendered. It also implies that children's meaning construction of consumption never is isolated. It is dependent on social relations and parental values.

1. Introduction

Since the Second World War a major market strategy for targeting children as consumers has been to use cartoons on, for example, breakfast cereal boxes (Hill and Tilley, 2002; Nelson & Steinberg, 1997). Another strategy is to include extra sometimes secret gifts, gadgets, collector cards or CD-games as treats (Nelson & Steinberg, 1997). A third strategy is to offer pottering for children on the back of the cereal containers. As there is no large divide between advertising and product design today food products are more often designed to address young people directly. One reason is that young people in Western countries have an increased influence on family economy. That does not necessarily mean that children possess more money, rather they have more influence on family decision-making and in that way on consumption (Buckingham, 2000).

A growing research field concerning children and consumption is about food (cf. the 2nd international conference *Child and Teen Consumption* 2006), above all bad food. In Sweden there are also many different interest groups who engage against food marketing to children, for example *The Swedish Consumer Coalition*, *Minister of Consumer Affairs*, *Stockholm's Co-operative Consumer Society*, *Children's Ombudsman*, *National Board for Consumer Policies* and finally the Swedish advertising law prohibiting TV-advertising to children under the age of 12. On a political level the engagement for food marketing to children concern children's health. Centrally situated in these discussions have since 2004 been breakfast cereals and the design of the cereal containers. One critique towards the cereal containers is the way in which the child consumer/user is addressed visually. *The Swedish Consumer Coalition* wants to put the visual layout of the boxes on an equally footing to advertisements (*Sveriges konsumenter i samverkan*, 2004). Their argument is that the visual layout of the

cereal containers as well as the gadgets is contributing to child stoutness since toys and images lure children into too an extensive sugar consumption.

A member of *The Swedish Consumer Coalition* and an engaged national actor in food marketing to children is *Stockholm's Co-operative Consumer Society* (Sw: Konsumentföreningen Stockholm). Since 2004 they have made four different reports concerning marketing and health aspects of among other things breakfast cereals for children. As a result of their engagement certain brands today display less sugar and more grains on the containers. Some producers have in agreement to the critique put forward by *Stockholm's Co-operative Consumer Society* (Konsumentföreningen Stockholm, 2005a) also excluded the gadgets in the packages. An addition to the reports is the questionnaires done through the aligned *Parents Jury* (Konsumentföreningen Stockholm, 2005b). To participate in the Parents Jury is voluntary as long as you are a member of the Consumer Co-operation. The questionnaires carried out by Parents Jury concern parents' attitudes towards marketing of for example breakfast cereals with toys and gadgets to children. The result from these questionnaires will be discussed further in a forthcoming article. But what the debate imply and what is of importance for the discussion in the present paper are how the arguments made by the Consumer Coalition and Co-operation as well as the Parents Jury can be understood from the point of view of children.

The debate initiated by the consumer associations' stress visual marketing as not only very powerful but also as a constitutive force in society. As a result their argumentation entails the visual layout of the breakfast cereals direct or even govern people to act in specific ways. The potency the involved parties put on the visual is probably never reflected upon. Neither has the actors reflected upon the notions and values of children and childhood constructed by their debate.¹ The debate also lacks insight into how children themselves approach the market strategies designed for them.

Within consumer research both children, childhood (Cook, 2006) and visuality (Schroeder, 2002) for a long time has been neglected. The present paper will analyse children's own approaches to breakfast cereal boxes marketed at them. The aim of the paper is to understand the visuality of consumer culture and the symbolic values (Cook, 2004) interlinked to visuality from the point of view of the child (James & Prout, 1990; Halldén, 2007).

2. Theoretical perspective

Children and consumption is a growing area of knowledge. Literature based on research with children is written both by marketers and within traditional academia. Often with both common and different purposes. Both fields want to understand children. The difference however is that research done within the frames of business marketing (Lindstrom, 2004) has a purpose to help marketers reach groups of children with their brands. While academia on the other hand wants to study children as consumers to develop theoretical insights to understand consumption beyond the market (Martens, 2005).

Research about children and consumption has for a long time been characterized by a developmental viewpoint (Cook, 2006). During the last xxx years has interest both among researchers within the field New Sociology of childhood and within consumption started to show interest in the combination children and consumption (Cook 2005; Martens, Southerton & Scott, 2004). However, while childhood sociologist take the perspective of the child

researching settings for children's consumption or children as consumers. The consumption researchers do the opposite; they start with consumption theories and then approach children. The two research fields rarely refer to one another but keep to their own specific research fields (Cook, 2005). Unfortunately, according to Daniel Thomas Cook (2005), since the two research fields implacably are connected. Valérie Inès de la Ville (2006) has one foot in consumption research and the other in childhood sociology and she argues the importance of not researching children's consumption as an isolated element. She shows how consumption for children in the majority of cases is a collective act since the process of consumption takes place together with friends, parents, in institutional consumption arenas and within socio technical design systems. The meaning of consumption in this way is a joint meaning construction. Focus on meaning and meaning construction in consumer research is also put forward by other researchers.

Like de la Ville Vivian Zelizer (2002) argues, based on reviews of research, in favour of focusing children's acquisition of goods and services rather than their actual final disposition. She stresses the importance to comprehend how children understand the economy constructed by adults for children from the point of view of the child. In turn this means to consider children as active economic agents (Zelizer, 2002). Zelizer describes three different regular economic relations children engage with; (1) members of their household, (2) children outside the household and (3) agents outside households such as schools, stores, firms, churches and voluntary associations. This division also highlights how economic activities vary depending on social relations. It also points at how people's meaning construction becomes central to understand consumption.

Also Lydia Martens, Dale Southerton and Sue Scott (2004) argue that a lot of earlier research has focused on the relationship between children and the market and neglected other relevant social relationships. They stress the reason to this is the lack of interest in the symbolic meanings people create around consumer goods and services. That is the consumers' own meaning systems. They quote J. Best (1998) who stress that studying material culture means studying people – not objects. Finally they emphasize, just like Zelizer (2002), the shortage and lack of research investigating children's own participation in commercial space. That is the lack of knowledge about children's engagement in practices of consumption. More focus should be put on the significance consumption has in children's everyday life and how they are part of broader issues of social organization. When focusing on children's own practices it becomes obvious how objects and processes defined as commercial interlink with other aspects of children's lives (Sparrman, 2002; Sparrman & Aronsson, 2003; Sparrman, 2007).

In this article focus is on what is called ordinary consumption and the practice of consumption as in contrast to research focusing production (Martens et. als., 2004). According to Martens et. als. consumption of practice focuses on rules and competent conduct in processes of consuming, belonging or fitting in to social groups, production of routines, power and dynamics that define the relational social values of consumption practices. That is how consumption mediates social relations, represent structural inequalities and how it connects to and sustain cultural ideologies. Another aspect highlighted is also how children's consumption always is intimately connected to parents' consumption. All together de la Ville (2006), Zelizer (2002) and Martens et. als. (2004) encourage researchers to put focus on the everyday life of children's consumption. Their theories and methods argue in favour to understand the complexity of consumption. They stress the importance to study consumption as consisting of a conglomerate of meaning making dependent on social relations as well as social and cultural capitals.

3. Methods and empirical material

Focus group interviews with children talking about breakfast cereal containers (present at the interview situation) have been carried out.

Eighteen cereal boxes have been collected from three different Swedish food stores, ICA Maxi, Coop and Willys (see appendix 1). The ownership of the three stores differs. ICA is a privately owned franchise store, Coop is owned by the Cooperation and Willy is a Swedish owned cheap food market chain. The selection of cereal containers has been made based on earlier research about using cartoons as marketing strategies to address children (Hill & Tilley, 2002).

Four focus group interviews have been carried out (Morgan, 1998). Two video cameras were used to be able to see what visual aspects of the containers the children pointed at. Every interview session consisted of four children age 8-9 years old. Out of thirty-eight children sixteen choose to participate. All children were approached thru the after-school centre they visited every afternoon. Consent to participate in the research project was given in writing by parents on the behalf of the child. Each interview lasted between 45-55 minutes. The interviews were carried out in a classroom after school hours. The groups were composed due to days and hours spent on at the centre. Group 1 consisted of four boys, group 2 held three boys and one girl, group 3 fours girls and finally group 4 three girls and one boy. The after-school centre was situated in a school in a middle sized Swedish town. Out of 62 after-school centres in the city 35 received extra community money above the basic amount assigned each child. The concerned after-school centre was ranked in the tenth position out of the thirty five centres receiving money. The amount of extra money is based on the sum of immigrant children, their parents' educational level and background. The money is supposed to cover extra costs for interpreters, extra staff, personal assistants and damages.

In total the children were introduced to 18 different cereal containers (see appendix 1). The children were first asked to organize the cereals from the best to the least preferred box design. The aim was to let the children get accustomed to the boxes and find a relaxed approach to them. It was also used as a strategy to establish a dialogue between the children themselves. To bring the packages into the interview situation is inspired by photo elicitation techniques (Harper, 2002; Heisley & Sidney, 1991; Epstein, Stevens, McKeever & Baruchel, 2006). But instead of using photos of cereal containers to talk about I decided to bring the real objects. It turned out to be a good decision. To see the way the children handled the containers also give knowledge about their approach to them. One item which turned out to be important was that the containers actually contained cereals. The children commented on this and it seemed to make the situation more real to them.

Before starting the focus group discussions a set of rules were presented. Four themes of open questions were prepared concerning children's own consumption of cereals, the images on the cereal boxes, the toys/gadgets in the cereal boxes and finally questions related to children and advertising.

After finishing all interviews all children, even the ones who had not participated in the study, were invited to a snack with cereals and milk. The after-school centre provided milk and I served the cereal. The children could try more than one brand of cereals if they wanted. The

get together was a result of some children asking me if they could taste the cereals during the interviews. It was also a way to thank all parties for participating in the research project.

All interviews have been analyzed and at the moment five comprehensive themes have been identified, i.e. toys and gadgets, consumption patterns, sugar and nutrition and finally the visual layout of the containers. Across these themes is the notion of gender explored. In the empirical presentation below gender issues related to the containers and the toys will be investigated. In this present text gender is only dealt with when the children explicitly talk about it. There is a possibility to make gender analysis of the interview groups as well as the discursive space. That will, however, not be done in this paper.

4. Empirical analysis

Most food products produced for children are commonly known to be gender neutral (Childs & Maher, 2003). To address girls and boys as different market groups within other market areas have on the other hand a long tradition (Brembeck et. als., 2001, Cooks, 2004). When making an analysis of all eighteen containers it was found that the majority (12) of the containers address boys. Either boys are exposed playing street-hockey (see image 2). Or the cereal producers offer toys inside the containers marketed towards boys, like Bionicles by Lego (see image 3-4). Finally some of the cartoon characters are personalized with names like Tony the Tiger on Frosties by Kellogg's. Only one girl is illustrated, that is Lisa. Lisa is dressed in a red dress showing parts of her underpants (see image 9). Lisa is a helper around the Kalaspuffar container by Quaker. On the front of the container is a speech balloon with Lisa saying: "Check out the crossword and fun ingeniousis on the container" (see image 9). Accordingly Lisa has a commission, still her activity is to help others. While the street hockey picture illustrates and emphasize how boys are active for their own sake playing street hockey. Two containers can be said to be gender neutral Honey Bees with bees on it (see image 8) and Spooks with ghosts on it (see image 6). Both produced by Coop. Due to the fact that a gender imbalance prevails between the visual layouts of the containers one of the interview questions was made to concern gender.

When the children were asked if the eighteen breakfast cereals could be divided into girls and boy's cereals the following containers were mentioned:

Boy's cereals: (numbers after the image number relates to the interview groups and their choices)

Image 1: 1, 2, 3, 4

The argument about what is 'boyish' and 'girlish' goes along sport, action, thrills and coolness for boys. While girlishness rather is defined as nice, cute, happy, sweet, pink, flowers, bees, glitters and pottering. To define what is boyish and girlish is however delicate and contested. Below some interview excerpts are presented illustrating the direction and potential of analysing the interview discussions with the children. They consider how the children reason and how the completed analysis will be carried out. That is they are not yet finalized.

When pointing out a cereal for girls the boys in group one chose Honey Bees by Coop (image 8). As a matter of fact Honey Bees is appointed by all groups as girlish or for girls. When Rickard, Bjarne, William and Samuel answer the question why they picked Honey Bees they stress that it is girlish:²

EXAMPLE 1: *Girl's cereals*

Interview 1: Participants Rickard (year 2), Bjarne (year 3), William (year 3), Samuel (year 3) and ANNA

- ANNA: Wait you have to explain to me 'cause I don't really know (point towards the Honey Bees) what girlish is?
- Rickard: It's like sweet and that
- Samuel: Yea and then sweet
- Bjarne: Sweet and then they're happy
- ANNA: Aha cute
- Bjarne: Cute and that
- ANNA: Aha
- Bjarne: Children why like scary things, x
- Rickard: Lads and that, thrilling
- Bjarne: Yea thrilling and that
- William: Action
- ANNA: But don't girls do that?
- Bjarne: Noe
- William: We know one girl who we played with before (A: ehm) she, she liked like so star wars
- Bjarne: Who?
- ANNA: Okay
- William: Erika

Bjarne: Noe
William: Well yes
Bjarne: Noe
William: Sh, she why does she play with star wars then?
Bjarne: (smiles)
William: There things fell

Rickard, Bjarne and Samuel agree that sweetness “and that” as well as smiles explains what girlish is. To strengthen the argument Bjarne contradicts girlish with what children in general likes. Or does he mean boys? Rickard interprets children as lads. Lads are fond of thrills and scary things and William ads action. According to Bjarne this does not go for girls. His voice is not uncontested though. Due to own experiences William mentions a mutual friend, a girl, who they used to play with and who liked Star Wars. Her engagement in Star Wars throws Benjamin’s argument overboard. Girls can obviously like scary and exciting things.

More than once girlish is defined by its contradiction, i.e. what is boyish. This strategy is used by both boys and girls. In this way boyish can be said to become a norm. One boy (group 4) thinks the Honey Bees are girlish because it looks silly and corny. The girls in the same group do not think any of the cereals are for girls. They agree that Honey Bees are cute and can be for girls but for baby girls. Group three, consisting of four girls, follow this line of argument and assert Honey Bees as babyish. When settling what is girlish with Rice Krispies by Kellogg’s (image 10) the girls in a very indifferent way more or less try to come up with aspects that makes it girlish; flowers (the grains), glittery stars at the corners of the letters and a horseshoe at the bottom. At the same time they easily settle which cereals are for boys (image 1, 3, 4). Accordingly it seems as if both boys and girls are insecure when defining criteria’s for girlishness. One explanation is that the boy theme is displayed straight forward on the containers. Boys are visualized participating in sports. The girl-theme supplied by the children is relatively well embedded in the illustrations. It never becomes obvious and clear cut what is silly, sweet or cute.

When asked if any cereals can be established to be boy’s cereals all groups pick the Fifa container (image 1) produced by Nestlé. Once again girls are used to strengthen what is boyish.

EXAMPLE 2: *Boy’s cereals*

Interview 1: Participants Rickard (year 2), Bjarne (year 3), William (year 3), Samuel (year 3) and ANNA (interviewer)

ANNA: (looks at B&W), grabs B to get attention then turns to S) And this one why is it boyish?
Samuel: Well yes it’s more sport like lads like
Bjarne: And then it’s ice-hockey
William: Yea lads have it surely
Samuel: Noop it’s street hockey
Bjarne: It’s mostly boys (leans head and looks at A) who do ice-hockey
ANNA: Yea but there are girls who do ice-hockey
William: Yes I’ve seen that on TV
ANNA: Yes
William: Yes there are loads of girls that
ANNA: Yes and soccer right (raises the Fifa container)
Bjarne: Aha
William: Aha
Bjarne: Aha (grabs the container) but it’s mostly for lads
ANNA: Is it mostly for lads?
Bjarne: (Grabs the package and embraces it)

Sport is recognized as being liked by boys and in this case ice-hockey, street hockey as well as soccer are considered. When argued by the interviewer that girl's also play hockey William is the one who picks up on an a-stereotypical gender approach. He says he has seen loads of girls on television playing hockey. Bjarne uses a more traditional line of arguments. It is as if he knows the interviewer/I will add another argument when he leans his head over and looks at her/me and stress that ice-hockey is mostly something boys do. He also stresses soccer as more of a boy's activity. At the end of the discussion he also embraces the Fifa container to strengthen his argument. By embracing the container he lets himself and the container reinforce the male discourse and down seize the female streak. He and the object are positioned closer to one another than he and girls. This creates a continuance with the argument that consumption is not simply about objects but about people and people's use of objects (Best in Martens et. als., 2004). The Fifa container confirms Bjarne's opinion as well as his position as a "man".

In another sequence (group 2) it is argued that the Fifa container is boyish due to its coolness. This is questioned by the only girl in the group who asks if girls are not "coolish". The four girls in group three start right off by singling out three containers for boys the; Fifa (see image 1), Cheerios (see image 3) and Nesquik (see image 4), all by Nestlé. As an addition to the sport argument they add the Bionicle gift toys by Lego included in Cheerios and Nesquik to illustrate what are boy cereals. They argue that Bionicles are boy toys. When I ask them if girls never play with Bionicles a unison no is delivered. Kajsa imply that it might happen but that they are mainly produced for boys. Both boys and girls are in this way arguing along the same line. Boys do boy things and use boy objects and girls do not do boy things or use boy toys. When girls do sports and use boy toys it is more or less described as an exception. None of the interviews offer any clear cut characterization of girl's doings and toys. This once again illustrates how boy's activities are put forward as a norm. All discussions about whether the cereal containers can be considered to be boy or girl cereals tend to end up in a dichotomisation between what boys and girls can and cannot accomplish.

The gender aspects of the toys are emphasized also in group four.

EXAMPLE 3: *Gendered toys*

Interview 4: Participants Chris (year 2), Ava (year 2), Erika (year 3), Annika (year 2), ANNA

Ava: If you should get a toy I think it should be bigger ia if you get a toy
ANNA: It should be bigger? x
Ava: Yea at least a little bit
Chris: I I welll
Ava: And more usable
ANNA: More usable usable in what way? Can you tell?
Ava: As ehh as you might like the cereals but it might is as girls not like bajonkoj (bionicles)then it could be both for girls and and boys
Erika: Yea we like we like we might like these cereals but then we get one of those bionicle and what if you are only girls in the family
Chris: Yea but you said you had a younger brother, two younger brother and then
Erika: Yea but that doesn't have to mean that I think bionicle is fun? And what if there are only girls in one and they think those cereals are very tasty
Chris: Well but you could throw them away
Ava: Yea but that's kind of un-necessary
Chris: Give it your neighbours you could throw them out your window

Ava: You could make it it becomes usable for both girls and boys
ANNA: Ccan
Chris: Can you take yet another bionicle out?

This discussion starts out with a discussion about the size of the toys in the cereal containers and the usability of them. Usability relates to the possibility to be used by both girls and boys. Ava and Erika argue that it is a waste to put gender specific toys in the containers. One argument is that girls do not necessarily like boy toys, as Bionicles by Lego. For a family with only girls boy toys is a real waste since it is not used and to throw them away would be a real squander. To Ava there is obviously not an option to see this as a “gender bending” situation and play with boy toys. It is rather an equality issue where respect should be taken to different kinds of family constellations and different genders. Instead of squander it is better to become gender neutral. The toy should be able to be used by both boys and girls. From the point of view of the girls the argumentation becomes a question of equal rights and no un-necessary waste of goods. Accordingly it implies that the girls have an awareness of the gender imbalance demonstrated by the layout of the breakfast cereal containers. An imbalance that emphasizes reactions. When asked further on in the interview both the girls and Chris can come up with non-gendered toys that could be used instead; small books, stickers and computer games.

When group three is asked if they choose cereals based on gender the following discussion took place.

EXAMPLE 4: *How do children themselves do?*

Interview 3: Participants Katrin (year 3), Gunilla (year 3), Anne (year 2), Layal (year 2), ANNA

ANNA: But when you are going to buy cereals or if you can choose cereals do you think like this then that you should have do you think like this for example eh I am not going to have that one 'cause that's like boyi=
Layal: Yea bb
Gunilla: Noo
Katrin: Noo I think you see
Gunilla: I think of the taste
Katrin: Yes I think of of the taste and the company=
Gunilla: Me too
Katrin: = a little
ANNA: The company?
Katrin: Ehm
ANNA: Which company is this? (holds the Nesquik container up)
Katrin: Nestlé
ANNA: Nestlé did the rest of you know that?
Layal och
Gunilla: Yea
Katrin: But I don't like Nestlé
ANNA: Oh well you don't? Why don't you do that?
Katrin: You see I can like you see on the taste but I don't like the company as such
ANNA: No what's wrong with the company?
Katrin: It makes advertising in ehh Africa about gruel and then the mums buy even though they have for free in the breasts
ANNA: Okay did you know that girls?
?: Noo
Katrin: Mum told me about it
ANNA: Aaa so it's not such a good company (puts the container baack) /.../

Accordingly these children do not chose breakfast cereals based on notions of gender. The choice is, argued by Katrin, based on the taste of the cereals and which company that produces them. Katrin's dislike for Nestlé relies on the fact that Nestlé advertise for gruel in Africa. The gruel is bought by the mothers who have the same product for free in their breasts. This fact is not known by the other girls and Katrin says her mother told her about it. Katrin draws on a commonly known discourse about Nestlé. This stresses the importance parents play for children's values and morals. Katrin acts in relation to this knowledge on the market. If possible she would probably not chose Nestlé as an option. Her market awareness is in this case not established through school but by a parent. In other parts of the interview material can parents importance for children's market awareness and values also be seen.

5. Conclusion

When placing the children's discussions alongside the theories presented in this paper it is possible to see the continuance in the arguments of the authors. It is obvious that the children make both individual and collective meanings of the cereal containers. The process of meaning construction is accomplished in relation to available gender discourses as well as parents, friends and visual layouts. The younger the child the more influence from the market goes through the parents. At the same time parents ideological standpoints are highlighted as important for children's values and actions on the market.

The discussions consider tensions and power relations on the market. In this case gender is concerned from a child perspective. One issue dealt with is fitting or not fitting into social groups of being a girls or a boy and to consider where the boarders between the two actually runs. When talking about gender issues in relation to the visual layout and the toys gender differences rather than likeness are established. When likeness is approached it is as gender neutral toys. In these discussions the children stand out as highly competent agents being able to discuss and come forward with their own thoughts. Still it is of importance to see that parallel to this they are constructed by, for example the markets rhetoric and use of gender. Discourses they have problems to contest. One assumption that can be made from the children's arguments is that consumption of breakfast cereals mediate structural inequalities. They also sustain gender discourses positioning boys as active and girls as passive.

Food provisioning, anxiety and control

The process of feeding from the perspective of the mothers

Abstract

Food and feeding is an important part in bringing up children. It is one way in which children become socialized; it gives rise to both pleasure and anxiety. In this article Marjorie DeVault's understanding of food management is combined with the concept of responsabilisation. Building on in-depth interviews with mothers from different socio-economic backgrounds and focusing on their different experiences, we see the work of food managing as processual and interactional. There is a tension between trying to put norms into practice and at the same time dealing with specific, often uncertain, situations. In such a circumstance feelings of anxiety and the exertion of control manifest themselves in direct as well as indirect ways.

1. Introduction

1.1 Food consumption as a social practice

Consumption and feeding a family constitute a social phenomenon, extending beyond the practical aspects of food purchasing and preparation. The providers also have to deal with their feelings and responsibilities towards the family. It is a practice that calls upon emotional as well as physical resources. Food therefore not only fills a physiological need but is also an important part of doing family (DeVault, 1991), doing the 'proper' family (Charles & Kerr, 1988) and caring for the family. Consequently what is considered good or 'proper' parenting and a 'good' mother comes to be a highly relevant issue which can be studied in both consumption and feeding practices (Bugge & Almås, 2006; DeVault, 1991; Charles & Kerr, 1986). But it is not only in the family itself that the image of the proper meal is (re)produced; socialization agents from the world of commerce are also busily at work. For instance, food advertisers, women's magazines, and cookbooks broadcast a message that providing a

‘proper’ meal is a key to family well-being and is a central goal for women aspiring to achieve a successful home life (Charles & Kerr, 1988; Warde 1997).

When it comes to consumption, researchers have pointed to the significance of looking at the activity of food consumption as an act including more than one actor (Ellegård, 2002; Engstrom & Larsen, 1987). As Evan and Chandler have shown, managing consumer culture is a highly important aspect of parenting, not only in a discussion of the intrafamilial dynamics of children’s consumer culture (2006) but rather with regard to the consumer culture in the family as a whole. The meal can be seen as a discursive act built up from social and cultural conventions and norms. There are certain products you are and are not supposed to serve your children, which constitutes a meal discourse (Bugge & Almås, 2006, p. 210). In creating the meal, therefore, one has to consider various norms and ideals surrounding it, implicit though they may be, in addition to the tastes of the family. Consequently a great deal of adaptation comes into play. Food management can be seen as the process of buying from a generalized marketplace and incorporating the groceries into the turbulence of family life (see Miller, 1987, 2003; Cheal, 1987). Moreover, the act of consuming food in families includes an intrinsic social dynamic which needs to be analysed in relation to structural aspects of gender, class and race/ethnicity (Charles & Kerr, 1988; DeVault, 1991; Warde, 1997),¹ which this article does.

This article takes as its point of departure the consumption of food and meal practices in families with children in the age range of 3-8 years old and 13-19 years old², respectively, focusing on the experiences of the parents. Not surprisingly it shows that, in relation to food provisioning, the parenting most often represented the mother’s point of view³. This result is supported by Ekström and Fürst’s (2001) research. They find that for the most part cooking in the household is done by women. Today men in Sweden do take a greater responsibility in terms of food and feeding⁴, but in most cases women still have the greater responsibility for feeding the children (Thorsted & Sellerberg, 2006) which also has been remarked upon by others (Fürst, 1993; Dean, 1991).

Although in many families the work of cooking is taken for granted as woman’s work, it is not just a simple set of chores but a kind of job that gives rise to feelings of guilt and issues of control (Murcott, 1983, p. 85). It is in this area of inner experience that we want to focus this

¹ When discussing class and ethnicity in this paper we draw from the discussion in which ethnicity has come to be seen as a social category and not a signifier for common cultural characteristics and traditions within a certain group of people (de los Reyes & Molina 2003). We see class as a discursive, historically specific construction (Skeggs, 1999). Without entering into a deeper discussion we want to emphasize the material and cultural consequences of class position and how the middle class in turn both creates and reflects the norm. The exact definition of what middle class means is however harder to identify and like Skeggs (1999) we consider it easier, and as relevant, to identify people through what they are not.

² The criteria of selection was that at least one child in each family should be in one of the age groups, some of the families had children in both groups and children younger, older or in between the groups of focus.

³ In our research, where we made clear that we wanted to talk to the person responsible for the meal (not specifically asking for the woman), 55 out of 62 interviews ended up being with women.

⁴ Of the men who reported living together with another adult, 41% reported that they had done the cooking the day before, while 73% of the women reported that they had. Probably there is a tendency toward over-reporting by both genders.

article: on an invisible job that has been undertaken mostly by women throughout the ages, but also on the feelings this invisible job evokes, and how this experience can be understood in relation to the position of women from different backgrounds. In this article we build on a framework of sociological analysis of routine food practices to show what the actors themselves think about their anxiety and control issues and how food practices also are a part of what is considered responsible parenting. The further aim is to see what social norms are consequently being (re)produced and how the interviewees respond to them. In the following section we describe our methodological approach and our material.

2. The research method

This paper is based on an interview study of Swedish families⁵ with young children (between 3-8 years old) and families with teenage children (13-19 years old). During the period of September 2006 to May 2007 we conducted qualitative interviews with the person(s) in the family who considered themselves as most responsible for the food practice. As might be expected, we mostly ended up interviewing women. We carried out 40 in-depth interviews and held three focus groups, altogether 62 individuals are included in the study. The interviews were done with families in the south and southwest area of Sweden, in and around the city of Malmö (the inner city as well as the suburbs) and in the countryside on the southwest coast of Sweden. Altogether the interviews have given us a broad range of different stories from people with different ethnic as well as socio-economic backgrounds. By listening to narratives from people with different backgrounds we aimed to more fully examine different types of problems and ways of handling everyday life. Interviewees were contacted through daycare centres, schools and immigrant associations. We also asked interviewees to put us in contact with their friends. The snowballing method came to be very useful and a productive way of contacting people. The two groups most represented in the material are middle-class women from a Swedish background and immigrant women from non-European countries, the latter often having more children than the former.

Our purpose with the interviews was to take as our point of departure the experiences of the families and their daily life, with our focus being on food, feeding and food shopping. Using day-to-day experience as our keystone means that we do not want to make any claims for presenting 'the truth' but rather strive to look into how individual actions reflect and shape social practices and *vice versa* (Smith, 1987, 1990; DeVault, 1991, 1996). We consequently want to align ourselves with a feminist perspective on research which dictates that experience is a primary focus of research. As Acker, Barry and Esseveld write:

Although we view people as active agents in their own lives and as such constructors of the social worlds, we do not see that activity as isolated and subjective. Rather, we locate individual experience in society and history, embedded within a set of social relations which produce both the possibilities and limitations of that experience. (Acker et al., 1983, p. 425)

⁵ When speaking about *the family* we take as our point of departure the concept of 'doing family'. That is, we do not consider *the family* as something static and synonymous with the heterosexual nuclear family; rather we see the family as a practice constantly being (re)produced (DeVault, 1991, Morgan, 1996).

Thus we consider the people interviewed as experts, experts on their own families, and we follow the tradition of Dorothy Smith who argues that: '[...] to start inquiry from women's experience is a way of pointing the feminist researcher to material sites where people live their lives' which implies that anyone's experience can be seen as a starting point for inquiry (DeVault, 1996, p. 40). Focusing on experiences meant that we approached the interviews with an unstructured interview guide. Although based around a number of themes, the guide left considerable room for the conversation to take different turns depending on what the people interviewed were most interested in talking about. Questions asked during the interviews ranged from how our subjects' daily food practice was conducted to what led to their experiencing pressure in relation to food and feeding. Our strategy in interviewing was to let the interviewees talk about the presented themes and continue the conversation from there. This form of interviewing meant that it had more the character of a conversation rather than of a formal interview.

At times we interviewed as a team of two and at times separately. We regard our different experiences and ways of identifying with—and distancing ourselves from—the person interviewed as useful tools, the utility of which depended on the situation under discussion and on the interaction at a particular moment. The interviewee's experiences in many cases turned out to reflect our own and in other cases, as the conversation revealed, were at variance with ours. Relating our own experiences (in our case, experiences from a middle-class background, one of us being a mother and one not) was one way to connect with the interviewees, through our common identity as mothers or coming from the same background. But not sharing experiences was also be a way to connect: our not having children or having only one child, our not living with teenagers, our working full-time outside the home, turned the interviewees into the experts. Whatever the dynamics of the interviews, we do want to clarify that as researchers we recognize that in the end we stand as the interpreters of the interviewees' everyday life.⁶

3. Theory – interactional and processual food management

3.1 Food managing an act of creating a collective event

Management of food is a gender issue, as mothers usually manage the planning, buying and preparation of food eaten at home. The relationships within the family, however, are what determine the outcome of this process, since family members and their expectations and preferences most likely affect the home manager's purchase and preparation of food. Food choice in the family derives not only from the preferences of an individual, but also from the collective (Pettersson et al., 2004, p. 317). As DeVault (1991, p. 90) says, management of food reconciles the diverse schedules and activities of individuals so as to produce points of intersection when they come together for group events (ibid). The ongoing task is to prepare food regarded as 'proper' and at the same time to prepare something that the household

⁶ For a further discussion about this methodological issue, see for example Smith, 1987, 1990; DeVault, 1991; Skeggs, 1999.

members will eat. Food management is influenced by perceptions of how the food *should* be and a constant need to be flexible toward the likes and dislikes of household members. This takes continual adjustment since children's orientations toward food are especially mercurial and short-term. Their tastes change and activities outside the home and away from the eating table affect a child's willingness to sit down at the table.

Food management is an activity of care and it is the work associated with this kind of activity that DeVault investigates. Activities of care, she says, rely on a generous concept of work (Smith, 1987, pp. 165-166). The expanded concept extends beyond paid labour in order to incorporate more easily than standard definitions the variety of women's often 'invisible' work activities (Daniels, 1987). DeVault traces this expanded concept of work to the feminist attention to previously neglected activity. Studies insisting on the analysis of housework as work often add an interactionist perspective. They examine a variety of activities not usually recognized as work including, for example, 'emotion work' in service jobs and in personal life (Hochschild, 1983), 'kin work' (Di Leonardo, 1987), volunteer work (Daniels, 1988), and the 'interaction work' that women do in conversation (Fishman, 1982) (DeVault, 1991, p. 19). The studies all refer quite broadly to social interaction rather than primarily to economic transactions (ibid). All these investigations examining female work point towards a new, more sociological definition of work (Wadel, 1979) and DeVault denominates the epistemological backgrounds of these investigations as an effort to see the processual, constructed character of work.

From this framework it follows that we regard food praxis and food management as an interactional process. We are applying this view to the theme of food and the parent-child relation. Two views can be distinguished when one focuses on how the relation is structured. The first one can be called family consumption as a battlefield. Grieshaber (1997) and Miller (1997) represent this view. In her article *Mealtime Rituals: Power and Resistance in the Construction of Mealtime Rules*, Grieshaber investigated power and opposition in parent-child relations in mealtime rituals. She demonstrates how children actively challenge and resist parental authority as part of their daily domesticity while engaged in the social practice of consuming food (ibid, p. 650). In Miller's article (1997), *How Infants Grow Mothers in North London*, the identification of confrontation in consumption arenas is one important result. In another view on the consumption practice of food, socialization is emphasized: what are the children's points of view and how are children socialized to parental perceptions and norms. Socialization of consumption and how food culture is reflected in children's views and behaviour has been studied (Wesslén et al., 2002; Fieldhouse, 1995; Thorsted & Sellerberg, 2006). In our view both aspects are important and there is a need to combine them to fully understand the character of food consumption and the task of food management. The social interaction is reflected in food management and it also forms children's attitudes towards food.

3.2 Food managing as responsabilisation

DeVault (1991, p. 2) explains how women, through caring work, have participated in the activities that structure their subordinated position. They have participated not only because of

social coercion, but also because of deeply held beliefs about connection and people's responsibilities to one another, as well as commitments to fostering growth and relationship. The activities of care, in short, spring from more than a single source and have potential effects that both enrich and limit the course of group life (ibid). The work women do in feeding is an expression of an external process of division of labour, but also an internal process. The internal process corresponds to the female experience and relates to feelings about doing food management. Subscribing to this view we will apply a concept of responsabilisation. Dean (1991) applied the concept to gender socialization in relation to the division of labour. He sees responsabilisation as the social process that imposes responsibility on categories of social agents. Dean develops this concept in his account of how the nineteenth-century notion of the male breadwinner made fathers responsible for the economic well-being of their children while mothers were deemed responsible for their nutrition and moral well-being. For our purposes it is useful to expand the concept: Responsibilisation is a concept that regards women and men, respectively, as having particular kinds of work imposed on them, but also recognizes particular kinds of emotions called forth by the work. Responsibilisation is about certain types of actions in which people engage with the division of work but also about feelings and experiences that are engendered as a result of their specific position within that division.

We are interested in investigating the concept of responsabilisation in relation to food management and the whole process of planning, buying, preparing and serving food in families. In our material we saw two rather distinct expressions of feeling arising out of the process of food management: anxiety and control. These dimensions were expressed frequently and were variously associated with feelings of satisfaction or emotional distress by the interviewees. We investigate the process of responsabilisation in the practical and mental work of food management. We examine the dimensions of anxiety and control in food management from the perspective of women. What is controlled and what do they worry about? How is this related to norms in different socioeconomic groups? First we will describe the concepts of anxiety and control.

3.3 Consumption, anxiety and control

Modernisation theories have a rather loose concept of anxiety (Warde, 1994, 1997 p. 69). We find that there is a need to focus on the meaning of anxiety as well as to look at how anxiety is socially distributed. That people actually *feel* anxious when choosing and eating a meal is a moot point. What interests us is the normative distribution of food values and how it is handled in everyday life. Norm systems can be defined as the preservation of a certain mode of behaviour that is in turn evaluated by a reference group. In our view, this is the context, in which anxiety and control should primarily be understood.

To create and serve your family a 'proper' meal is thus an act that can be filled with anxiety. Warde writes that the anxiety may be greater for the person providing and preparing a meal than for its other final consumers (Warde, 1997, p. 178). Food provisioning roles create anxiety. Warde gives examples related to different types of provisioning: women cannot be satisfied with maximizing either care or convenience, since both generate anxiety and guilt.

(ibid p. 176), shopping for food is another example of a practice filled with feelings of anxiety. Anxiety and control are both part of responsabilisation. They are related to each other in much the way that experiences, feelings and actions bear upon one another. In the feeding process this is evident. A continual task in provisioning is to apply control in feeding management and to handle the accompanying anxiety. McKendrick et al (2000) finds that the parents, especially the mothers, have the role as controllers of the preparation of meals and of what is purchased. And as Anne Murcott (1983) finds, mothers frequently complain about the eccentric food tastes of their children and their own inability to provide a balanced diet. Parents are gatekeepers and it is in this role that they negotiate with their children (Zelizer, 2002; Morrow, 1994). Limitations on the ability of a parent to feed a child, such as the preferences and the dislikes of the child, appropriately are a source of anxiety and emotional distress (Morgan, 1996, p. 163). According to the concept of responsabilisation, food management involves both anxiety as well as a striving to control: anxiety about not being able to provide 'proper food' and a striving to control what the family eats. Our empirical task in this paper is to understand what parents are trying to control and to identify their anxieties in connection with food management. In the following section we apply our theoretical framework to our empirical material.

4. Analysis

It's just that we're so unbelievably conscious about it [Talking about healthy food, children and their bodies, our remark] Everything we do is so extremely thought out More often than not we try to prevent it from happening, but it happens anyway, more than it really should. Because food is for eating and people exercise. We practically never have sweets at home. Marie Cookies are the sweetest thing we have.
(Kristina, mother of a daughter aged 3)

The quote above is significant in that it suggests both the anxiety surrounding the meal and how one as a parent is constantly aware of, and wanting to control, what the children eat. Kristina wants food to be something 'natural' in their home but focusing on that means that it will not be so natural, she concludes. Reflecting on her own actions Kristina makes explicit the complexness of anxiety and how food is something to be controlled. Considering the meal as an interaction process between parents (here focusing on the mothers) and children implies that feelings of various kinds are involved. Despite our focus on the parents, we want to stress that even though children are not present in the analysis, their responses are in fact prime determinants of the parents' actions in the food arena.

We will discuss feelings and expressions of anxiety and control as different aspects of responsabilisation (Dean, 1991). The analysis concentrates on the two main groups of interviewees: non-European women and women originally from Sweden who come from a middle-class background. Our intention is not to point out differences as such but rather to construct a more complex narrative that looks at differing experiences both from the individual's point of view, such as expectations of what the meal is supposed to be like, and from a point of view that factors in the relation between particular events, structural conditions and the expectations that surround food management. Our paper takes as its point of departure how the interviewees talk about food and feeding, thus we make no attempts to

say what the meal and the interaction during the meal is like in 'reality'. In our focus on class we discuss the (re)production of norms but not the material conditions as such, that is, whether or not money is an issue for eating healthily or not eating healthily. What is interesting to us are people's experiences, what an individual is anxious about, what an individual is controlling, how an individual's actions can be seen in relation to structural settings, and the implications of that relationship.

4.1 Feeding and feelings of anxiety

Emotional expressions of anxiety appear throughout our material, though it is more common that anxiety is described in more moderate tones, indirectly, and often in relation to a tentative or intended solution. The respondents describe a way of being observant and efforts to handle upcoming problems. They describe problems regarding children's unwillingness to eat certain things and their efforts to deal with the resistance. Meanwhile they don't always judge their efforts as being good enough. We are interested in exploring different attitudes and ways of being worried, and we also want to discuss this in relation to various aspects of the situation of the interviewee.

4.1.1 Parenting and 'proper' food

Being a parent is a task surrounded by many demands and expectations, and for a mother living up to what it means to be a 'good' and a 'respectable' mother can be an even tougher task (DeVault, 1991; Skeggs, 1999). But what does it mean to be a good parent? There is of course no single right answer, but still the ideal of the good parent is constantly present in the minds of the interviewees. Feelings of anxiety and questioning of whether or not one is a good enough parent are recurring themes in the interviews. This insecurity surfaced often when discussing how and what to feed the children.

When discussing her daughter's eating habits Louise, a child minder at a nursery and mother of Sara aged six, keeps coming back to the feeling of the pressure and anxiety that surround being a 'good' mother:

Sara is a little picky or whatever you want to call it. Maybe we're the ones who made her that way. For the most part I make something...how can I describe it...something simple on weekdays. Something that's fast to make. [...] Like it is with her not wanting to eat vegetables. That can really get to me, because I often think to myself we've got to be sure she gets a few vegetables into herself. But she doesn't like the carrots maybe and maybe she doesn't like the corn. All she likes is, say, the cucumber and tomatoes, and you think that's as good as nothing. I keep thinking about the vegetables I wanted her to eat more of. That can make me feel a little...uneasy.
(Louise, mother of a daughter aged 6)

Picky children often result in preparing food that one, as a parent, knows the children will eat. At the same time it does not solve the problem of having a feeling that one should be able to do more, which becomes clear in Louise's statement. Consequently her anxiety about being able to give her children what is demanded of her as a mother concerns issues such as bringing up a child in the 'right' way and teaching the child to eat the 'right' food. Feeling anxious about being a good enough parent is also an issue for Nadia, a 40-year-old woman with three children, all boys, 17, 13 and 5 years old. Nadia is originally from Iraq and when

the interview took place she was unemployed but was going to school where she studied Swedish. She tells the interviewer about visiting her ex-husband's relatives in Iraq and their response to her children not liking Arabic food:

But my husband's family say I'm the one who taught them to eat that kind of food, but I have to force them to eat (our kind of food). But I tell them that, no, they're in Sweden, they go to school (where) they cook that kind of food for them, and so they don't want to. But they (nag) bla bla bla, 'you're not a good mom, you have...'. They just don't think.

(Mother of three children aged 17, 13 and 5 years old)

Thus Nadia expresses feelings of not being a good enough mother when visiting in Iraq. Comparing Louise and Nadia (as examples from the two major groups), they share the feeling of outside pressure about how a mother is supposed to feed her children. Still, they are not always anxious about the same things and they express their anxiety in different ways. Nadia is very explicit when talking about her worries while Louise reflects more upon what is expected from her. While Louise refers to what can be said to be the discursive Swedish knowledge about what is expected from a parent in terms of food and health, Nadia does not consider the health issue as much. What is especially interesting is rather how the cultural context from which one speaks can say something about what is expected from a mother. In this article we are not able to explore this issue in depth but want to at least raise the issue. The responsibility that parents have becomes obvious when Lisa, who is a mother of two boys, four and fifteen years old, talks about the difference between her two boys, her own part in their upbringing, and her oldest son's not eating, in her point of view, a 'proper' breakfast:

I think it's since I separated from his father, when I was alone with him for a few years and it was awfully stressful in the mornings. It's still that way now. [Explains about the children's dads, our remark.] I was studying in Copenhagen when he was little. I had to leave him off at daycare and get to the boat on time. He had a sandwich in his hand when we were bicycling to the daycare centre, and I guess it's my fault he learned to eat this way.

(Mother of two sons aged 4 and 15)

To sum up, Lisa tries to understand her own role in her son's behaviour, and she reaches the conclusion that she is the one raising the children and that in the end whatever is going to happen is up to her. She considers the fathers of the children, but still sees herself as being the mother, having the biggest responsibility (DeVault, 1991; Charles & Kerr, 1988). In this section the aim has been to shed light on how food is closely related to feelings of what 'good' parenting/mothering is. Getting one's children to eat what one believes they are supposed to eat seems to give rise to a feeling of satisfaction, but our study indicates that it is more common for parents to be dissatisfied with their children's eating.

4.1.2 Eating or not eating – a constant worry

Food taste is not only something personal (Mennell, 1985 and Bourdieu, 1986), rather it is the result of the ways in which social distinction, such as gender, class, ethnicity and age, operates. Children learn to eat certain things and they develop certain tastes, and in this social process the acts of parents come under scrutiny by others as well as by themselves, which is what we focus on here. Anxiety about the work of feeding is expressed by the interviewees,

often in an indirect way, but the most unambiguous way in which it has been manifested in our interviews is when the interviewees talk about what children are supposed to eat and not eat. In discussing this subject, Louise says:

Yeah, that's how you get, that's for sure, and it gets thrown at you all the time that that's what's it like, that this is no good and that's no good. And so, when you're making fish fingers and frozen dinners, you think about what kind of nutrition they contain, you think about things like that all the time. Oh, darn, that wasn't so good and now you've given them cinnamon buns, and she gets to eat things that aren't so good for her, that you maybe don't want, and you wish things were a little different. But it's not so easy and you know that otherwise she wouldn't eat anything, so she eats a little bit of that stuff. So it's really hard, you wish she was more...that she ate more (Mother of a daughter aged 6)

To Louise, raising her child as a healthy eater is of importance and she often feels that she should do better in terms of getting her daughter to eat more vegetables and to eat the same food as the grownups. During one of our focus group interviews with a group of women studying Swedish, Zara, a young mother who grew up partly in Lebanon and partly in Denmark and Sweden, says:

Zara: The girl eats more at daycare than she does at home. She wants Swedish food. [...] She wants to have sandwiches and cultured milk and crispbread all the time.

I: Yes, that's very Swedish.⁷

Zara: Her father prefers Arabic food, our food; it's hard to make. The children don't like it. I myself do.
(Mother of a son and daughter, 4 and 1.5 years)

In contrast to Louise Zara not only talk about anxiety surrounding whether or not her children eat food considered healthy or not, but also about how she navigates around different tastes. We have come to understand anxiety as something that is present among all our interviewees, but what one worries about and the intensity of that worry differs in relation to one's position, the material conditions and how one relates to that position and those conditions. Almost everyone seems to worry about their children not eating enough vegetables, but they differ in how much they emphasize this in the interviews. We want to argue that the difference in emphasis derives from different discourses of knowledge and ways to express that knowledge and that is one way in which the Swedish middle-class thinking is (re)produced.

4.1.3 Dealing with anxiety – situational solving of a problem

In relation to food and feeding, anxiety takes different forms in different families but also differs within the family depending on the situation. Lisa, who earlier in the interview talked a lot about the importance of eating healthily, says later on:

We talked about Hannes and that we had to do something about his food. He's grown. He's become thin. Sometimes we let him eat junk food just so he'll eat.

(Mother of two sons aged 4 and 15)

In this statement it becomes clear that eating food that is not so 'proper' is all right when there is something more important causing concern, in this case when the parents consider their son

⁷ Here and below 'I' refers to the interviewer.

to be too thin. Altogether there are two perspectives to be considered: *that* the children eat and *what* the children eat. Mealtimes are filled with a great deal of insecurity in that one can never know what will happen. Will the children eat the food being served or will something unexpected occur? Consequently, anxiety is a constant presence in the dialogue with children and teenagers as one confronts their wishes and their responses to one's caring work (DeVault, 1991). Parents end up acting as gatekeepers (Zelizer, 2002; Morrow, 1994), opening up for certain foods, especially when the fact that children eat at all is considered more important than what they eat. Parents try to transfer norms about what is considered as 'proper' food but in the process they respond to their children's reactions and unanticipated things can happen. We would argue that anxiety and parenthood must be understood in relation to each another. As for motherhood, we can see how mothers are constantly put under pressure; they are seen as the ones obligated to fulfil certain norms in the family, and they are the ones who are blamed when this does not occur (DeVault, 1991; Morgan, 1996). We would also argue that although the feeling of anxiety can be more or less emphasized in the reflections of a parent, it is in any case an essential part of parenthood and a socially (re)produced phenomenon. Through our analysis it is clear that what a person is feeling anxious about can only be understood with reference to the context that person speaks from.

4.2 Control in food management

Types of actions and feelings tied up with responsabilisation relate to the division of work. Above we explored how a feeling like anxiety was related to norms of feeding and mothering. In this section we look at a type of action in food management, namely control. In the interviews, anxiety and control were often brought up in the same context. Often control was presented as a solution to worries about children not getting enough 'proper food'. Efforts at controlling were frequently articulated in the interviews and described in relation to how food should be bought, prepared and eaten. In our interview material we found that narratives of controlling were always explicit. An explanation for this is the almost universally held perception that a meal should be pleasant and a collective event, enjoyed by all household members (Ekström, 1991) and it is supposed to be adjusted to the household members' individual schedules (DeVault, 1991). As Lisa says about feeding her teenage son:

We have no control. I can force him to come home, but how nice can that be?

In the following section we show how respondents relate to various dimensions of control in food management. The section consists of three parts. The first is how the interviewee in different ways tries to exercise control in purchasing, food preparing and eating. The second is how the interviewee uses different strategies of control at different times. And the third is how being separated and being together during the day affect the need for control.

4.2.1 Control achieved through purchasing, food preparing and meal situations

The respondent women looked upon food purchasing with a great sense of responsibility. Lisa relates that her teenage son is difficult to get to join in the dinner and that he does not have an appetite for the meals.

I: Are you finally able to find something for dinner that he can...?

Lisa: Yes, he eats something. Yesterday I was at a daycare centre board meeting and Anders [Lisa's husband] said that when they were supposed to eat he didn't want to. When he comes home from school he can put away three bananas and a package of cookies. So you see, he eats really poorly and then he's stuffed and he doesn't want to have a hot meal. So Anders had to force him to sit down to eat. Then, when he did sit down, he ate loads of food. Actually, he was hungry. You have to sort of... He's more difficult to manage than the little one. You've got to watch him more like you would a child. Now it's time to eat. What have you eaten?
(Mother of two sons aged 15 and 4)

She explains how she makes him eat, encourages him to eat dinner, and asks him what he ate when he was away from home. Zara describes a dilemma with food culture, how she approached it with a feeling of great responsibility, and how she feels an obligation to control her daughter's food habits.

I: What's your solution when the kids want to have certain things?

Zara: I want them to eat the same food we do. That's important. I think there's good nutrition in our food [Arabic food] too. I force her. What I mean is I tell her she has to eat. But if I don't go to the trouble, she doesn't eat.

Zara finds food from her home country to be better regarding nutrition. Both women in the examples above describe the need they feel to constantly see to their children's eating and to try to affect their food habits.

Controlling food in relation to household members is often about eating a healthy diet. Women seemed to use different strategies in trying to manage food according to their perceptions of proper food. Some women described how they controlled the intake of 'unwanted stuff' very practically. As in the case of Sandra:

I: What role do the children have in choosing the food you buy?

Sandra: A certain role; they can make a list but it's not certain that's what (we buy). Musli, eggs and stuff like that. And they might say: 'Can't we buy honey puffs? Can't we have that?' So I think about it. Maybe it's a half year since we last had it. They write it down [on a backboard in the kitchen]. So they have a good chance just by writing things down. (Mother of four children aged 4, 11, 17 and 18)

Sandra describes how the children are encouraged to participate in decisions about what to buy, but also that she decides when to let the children have a say. The example she gives of imposing restrictions is related to not getting sugary cereal too often. Choosing when to let the children decide is also a strategy used by Zara. She says:

I: Do the children have any influence on what food you cook? Do they have a lot to say about what you're going to eat?

Zara: I usually ask them: What do you think we should eat today? She usually says spaghetti. She wants the same food every day. It's a problem. We've just had that.

Zara: Otherwise it's pretty good. I'm the one who does most of the cooking.

I: ... decides the most, even if they have an opinion?

Zara: I usually ask when it's time for her to eat a particular kind of food, but not when she always wants the same thing. Dad usually says what he would like, but he doesn't force me, and I say yes if I have the energy to make it. I decide.

The example shows how knowledge about food and taste is complicated and involves both implicit and explicit forms of knowing. Knowledge about food concerns knowing about the

children's specific tastes as well as perceptions of what 'proper food' is. Controlling in relation to what is regarded as healthy is also articulated in the interview with Filippa. To our question about what is important when buying food, she replies:

Filippa: Like if I should buy a fruit drink, not the diet kind because the sugar they use is not good for you; and if I should buy a different kind of pasta, one with whole grain. I try to sneak in healthier stuff. Bread with grain in it, I try to get it in.

I: They put up a bit of resistance?

Filippa: Yes, they prefer white bread.

(Mother of three children aged 15, 17 and 19)

Through the purchasing activity she tries to affect the children's diet. The example of what is desirable here is 'less sugar, more fibre', a wish very similar to the recommendations of public health officials. How to avoid unwanted sugar, in ketchup for instance, is also a theme discussed in the focus groups. There is a consensus among members of the focus group about this, and Fadi, originally from Morocco and a mother of four, tells us about a strategy she uses.

I usually buy..., but we use so much of it, it makes me sick. My son, he takes like [laughs and demonstrates how much he usually takes] [... can't hear]. I usually let a week go by without buying it. I want them to take a pause and they go: 'Mom, buy ketchup.' (Everyone laughs.) 'I will, tomorrow. I buy a couple of bottles but hide one of them.'

(Mother of four children, 17, 16, and twins aged 10)

In most of the interviews the need for controlling children's eating was brought up by the interviewee. In one focus group with immigrant women this topic did not come up and the interviewer questioned the women about how to look upon the children's influence at meals and whether or not the parents regarded the children's choices as 'proper'. The women in the focus group were studying Swedish at elementary school level (*grundskolenivå*) and were not fluent in Swedish. It became clear that they did not understand the words 'healthy', 'wholesomeness' and 'vitamins'. But when the interviewer gave the examples of her own child choosing sweets and chocolate all the time it became clear that they were not unfamiliar with these issues and that they did try to control their children's eating habits. There was consensus in the focus group about the need for restrictions. What to eat and when seemed to be important.

Knowledge about food includes norms about what proper eating is. Intentions, however, are hard to live up to, since practices of proper food have to be embedded in the everyday life and preferences of the household members. The women sometimes were in need of hidden strategies to make the food appear more in line with the children's preferences. The women had perceptions of what the children should eat but they also bent these in the direction of the children's wishes. How this is done in relation to time structure is the subject of the next section.

4.2.2 Certain times, certain levels of control

How products regarded 'less or more' healthy are distributed in the time and meal structure of the family is another side of controlling. Following are examples that show how control is exercised in relation to meals and what snacks are allowed on weekdays as opposed to weekends. Eva says:

Most of the time these days I look to see that there's not too much hydrogenated fat or sugar in it (snacks). And we seldom have... I mean, she doesn't get to eat potato crisps as a between-meal snack, only fruit. So, it's only on the weekends when we can eat cookies or buns. We try, you see, and so I don't eat it either.
(Mother of two children aged four and six months)

Trying to make the children eat during meals is important and in some families it also seems important to have a structure for weekdays and weekends, respectively. Eva says:

But then you hear that when they're a bit bigger it's a good idea to have a Friday menu. And that's all right, but then you have to put it into small bowls and when it's all gone it's gone. So that's what we try to do and so far it's worked; she knows she can get candy only on Saturdays.
(Mother of two children aged four and six months)

Vakava also makes a distinction between weekdays and weekends.

Sometimes I ask, not every day. On Saturdays and Fridays they get to decide [what the family is to have for dinner]. They get to decide everything.
(Mother of children aged 14,12, 9 and 5)

Controlling is mostly about not eating too much fat and sweets. All of the citations above show an effort to keep in check what is to be eaten on weekends and on 'ordinary' days, respectively. The examples show different strategies for controlling and different views on how to control. Eva represents a very restrictive view. She has rules for when to eat sweets and snacks and how much will be served. Vakava allows a more 'free line' on weekends. This result corresponds with our finding – that generally ethnic Swedes from a middle-class background are more informed about health information and they present themselves as eager to put it into practice (DeVault, 1991).

4.2.3 Strategies of control in relation to separation and gathering in meal events

The mothers in our material often described collective meals in the household as something pleasant. Family dinners were seen as special moments in everyday life. It was a chance to gather in the household whereas individuals often are located at different places during the day. Coordinating collective meals in relation to individual schedules were described as hard, especially by the mothers of teenagers. The need to control what was served in those meals eaten together is another subject discussed below.

We start by quoting two women who have a rather different view on this subject. Some find that dinner served at school gives a basic level of 'proper food' which allows more freedom in dinners on weekends. Fadi tells in a focus group that her children choose the food on

weekends.

Fadi: I ask the children [what they want to eat] only on Saturdays and Sundays and on holidays. The rest of the week they eat at school. They eat. I cook what they want.

Zara: I don't trust... I don't know how much... I know they eat, but not how much.

Fadi: When they were small... before it was the same. Now they are grown up and 10 years old, the school teacher tells you if your kids eat or not. Now they eat at school, if they don't they come home and you make them sandwiches.

Fadi, who has older children than Zara, tries to convince Zara that one can trust the children's eating in daycare. Zara does not agree with this perception. The separation from the children makes her worry and she feels obliged to control the dinner on weekends even more strictly. A Swedish woman, Emma, has the same perception as Zara and she is specific about what is wrong with the food in daycare. She says:

And if they have (at preschool) cultured milk, it's with jam, otherwise they have sweet yoghurt. And that's not so healthy either. So they acquire a sugar dependency at daycare. And you try to cut down on it at home and, so it doesn't taste good just because it's not sweet. Or, just because they're so used to it.

(Mother of one, aged 4 years)

Dinner is seen by Emma as a time to correct what one thinks was done wrong during the day, a time to make up for the deficiencies of the daytime fare. However, others in our material, such as Fadi, seem to see the nursery- or school-lunch as a salvation, in that they did not have to worry about what they serve in the evening or on weekends. Different views are presented on how trustworthy food provision is away from home. Zara and Emma represent a view similar to the result Iversen and Holm (1999, referred in Holm, 2005, p. 183f) hold to. In a Danish study done by families with teenagers, they found that when parents were separated from children during the day they worried about their food intake. The parents did not make an issue out of the dinner as long as the children were present. The demarcation lines in our material do not seem to coincide with lines of ethnicity. Both ethnic Swedes and those with other backgrounds describe the problems of separation in relation to food and the need to exert control. What we see above is that Emma, contrary to Zara, is very specific in what the unwanted ingredients (sugar) are and what they can cause (sugar addiction).

For the families with teenagers, a different set of problems and efforts at control are presented. Separation from youngsters during the day and night is common. The children have their own activities and visit friends outside the home. The material shows how parents try to invest more effort in meals when everybody is gathered and how they try to continually maintain control over food despite children's spending time outside the home. Filippa explains how she calls her children to find out their meal situation.

I: Do you usually take some of your meals together? Do you have a kind of schedule?

Filippa: Yes, we try to eat at 5 o'clock every day, but it's not so easy. Sometimes they're at a friend's home,... Because when they were small, we always got together, it was much easier to keep track. You can't do that anymore, otherwise they say I've already had a kebab and they don't tell me before I've already cooked the meal and set the table, and then I have to call them all up, 'Where are you?' 'Yeah, I've already had a kebab.' And here I've gone and cooked food that would suit them... what I'd thought would suit them and then I get angry

and say 5 o'clock every day. And that's the way it is for a few weeks, we meet at 5 o'clock, and then the same thing happens all over again (laughs).

(Mother of three children aged 15, 17 and 19)

She also explains her intentions and how she tries to achieve control over what her children eat.

Fillipa: I want them to eat dinner every day. As long as they've eaten somewhere, that they've had something to eat. Like if he eats at his girlfriend's place or has gone out somewhere.

I: How do you find that out?

Fillipa: The mobile phone rings and I check, 'Did you eat today?' They're used to it ever since they were small ... at least one hot meal a day. Otherwise I know they won't feel well. They get in a bad mood in the evening when their blood sugar drops.

(Mother of three children aged 15, 17 and 19)

Lisa is another mother who describes how she tries to get information about her youngsters eating outside the home.

I always ask, 'What did you eat? [if the boy hadn't been home for dinner] And he says 'a Chinese take-out or a pizza'. I always ask him.

(Mother of two children aged four and fifteen)

Later in the interview she says:

I: So what can you do? (It is difficult to get Lisa's son, Hannes, to eat what his parents eat.)

Lisa: I don't know. Just that there's good food available. And to be really strict. Sometimes he comes home and if he has his own money so he's bought... They have soda pop and candy and potato crisps. That's not good. He gets an upset tummy. You nag: 'Stop doing that'. Sometimes I find empty Coca Cola cans he's drunk on the sly.

(Mother of two sons aged 4 and 15)

Control is a part of the ongoing task of managing food. It is part of responsabilisation and it is both a practical and a mental task. From the examples above, we see how mothers try to exercise control over food and their children's diet. Three aspects of controlling are found. The first is that food management includes control in the purchase and preparation of meals. A second aspect of controlling is how mothers try to keep in check what the children eat, when and how much. A third aspect is that the control is related to the structure of the week (weekdays vs. weekends) as well as to the time of the day. The mothers describe how they try to gather together household members at certain times and make children save their appetite for family meals.

Managing food in families is a work task that contains what Zerubavel (1979) calls continuity maintenance. Continuity maintenance is the constant maintenance of caring, knowing and dealing with household members' eating habits and individual schedules, and trying to coordinate them. Food management is about continually maintaining proper eating and meanwhile being flexible about the individual schedules and preferences of the household members.

5. Concluding remarks and discussion

Children do not provide their own food. Parents, and especially mothers, are the main actors in purchasing and preparing food in families (Bonke, 1998; Thorsted & Sellerberg, 2006). Guiding, controlling and encouraging in relation to food are essential parts of the role of being a mother (Dean, 1991). Socialization follows norms of taste and behaviour related to class and ethnicity. Meanwhile, feeding or food management is intrinsically interactional. Depending on the caring role, norms are also subordinated to the children's decision of whether or not to eat. As Cook (2004) describes, this results in parents seeming to be in a state of ambivalence, struggling to satisfy children's desire while acting as gatekeepers.

Food management is a meeting between preferences of the family and norms regarding 'proper food' and 'proper feeding'. Knowledge about food and taste is a complicated mix of both implicit and explicit forms of knowing. What one wants to do might not be possible and what one actually does might in turn not correspond to what is expected. Feelings of anxiety and actions of control are thus related to the overall discursive knowledge of what 'good' parenting and 'good' mothering is considered to be. The work of feeding is a constant labour, it is situationally bounded and involves constant insecurity in dealing with situations, demands, needs and wants.

In this article the overall theme has been the concept of *responsibilisation*. Starting out with *responsibilisation* we have discussed *anxiety* and *control* as the two component parts of *responsibilisation*, as a set of acts and a set of experiences and feelings related to the division of work in food management among women. *Responsibilisation* permeates food management. Food management comprises both the types of actions and the types of feelings related to this kind of work. The concept of *responsibilisation* articulates the meaning of food and accounts for the role of mental and practical efforts. It includes both feeling, experiences, and practical work such as carrying bags, cooking and cleaning up. In the work of feeding, feelings of anxiety and control are articulated. These categories derive from the women's position in the division of work. It is the experiences of living in this position, bodily and mentally, that we wanted to emphasize in this article. Through investigating descriptions of anxiety and control we have aimed to show that *responsibilisation* is an amalgam of feelings and actions that in turn constantly influence each other. The mothers identify problems and potential solutions and tell how to control what food is eaten at home. With regard to feeding, anxiety was mainly expressed in terms of worries about being a good enough parent, anxiety about how and what to feed children, and concern about dealing with that anxiety in specific situations. In discussing control, our aim has been to present different strategies of control and how these are situationally bounded. Expressions of anxiety and control are given voice by all the mothers in the material. They often refer to the same kind of risks: that the children do not eat enough healthy food and that they, as parents, are not restrictive enough about unhealthy food. Food management in families is never described as easy to control, and the control is never total. Control is always conditioned by the surroundings, by the acceptance by others of one's perceptions of food, and by the incorporation of new ideas. Women tell about how they secretly introduce ingredients that are regarded as wholesome and sanction ingredients regarded as unhealthy. Among the groups with different social backgrounds we find that

ethnic Swedes from the middle class are more explicit about their striving towards wholesomeness, about getting health information and about devising strategies to incorporate this information in everyday life. They are tuned in to the discourse of food provisioning. They often emphasize the importance of proper nutrition and refer specifically to ‘bad stuff’ like sugar and added fat. Nonetheless, we see in both groups that mothers most often strive to keep in check and control what their children eat. Among our segment of mothers not born in Europe we are not able to present a full description of their way of controlling and preparing ‘proper’ food. This may be due to an inability on our part to recognize their strategies and what these strategies mean. Another explanation is that our segment is very broad, with women from Vietnam, China, Morocco and Lebanon.

One result in the material is that the controlling by mothers is a delicate balance in everyday life – too much controlling makes for harshness and coldness in family relations, and too little control is taken as nonchalance, irresponsibility, and failure to live up to the role of mother. Ironically, the cultural construction of mothering and feeding can make it hard for a researcher to get close to the practice of feeding. Despite our spending several hours talking with women about food and feeding, we do not know, through direct observation, how control is actually exercised at their dinner tables. What we can see is that Swedish middle-class mothers are very familiar with the discourse of the need to control food and can be very explicit in expressing this familiarity.

We have combined two perspectives that are normally separated in consumer research. We have described how knowledge about food and consequent actions figure in the process of social (re)production, and we have explored how this process comes to be expressed in the family. From this study we can see how norms are involved in the processes of food management and how these norms, always in the process of being redefined though they may be, are an important part of socialising to attain specific eating patterns. Combining our two perspectives helps us understand feeding in everyday life and understand how a conflict around the dinner table articulates norms about ‘proper’ food and ‘proper’ mothering.

Abstract

Everyone is a consumer. Each person has capacities as a consumer. These skills differ from person to person, but every individual has acquired them in some sort of way. How people learn to become a consumer remains somewhat unclear. In this paper, the role of the parents is scrutinized. Corresponding and contrasting elements in a selection of consumer attitudes and practices are put forward. As attitudes, materialism and consumer styles are included. As practices, being influenced by others and basing purchasing decisions on commercials are included. Also more direct questions on parental influence are used. The preliminary results of the analyses in this paper are seen as a step towards a discussion on the role of economic socialization by parents and possible policy issues that could be at stake.

1. Introduction

Being a “good” consumer can be interpreted in all kinds of ways. Nevertheless, it comes a few steps after becoming a consumer *tout court*. Children and teenagers grow to become adult-consumers. At a certain age, they will receive pocket money. At least, most of them do. This money is money of their own, which they can spend the way they want it, of course within the limitations of common sense. Said differently, for the first time in their lives they can theoretically buy something independent of their parents. They can save pocket money for a few weeks to buy a computer game or those earrings that were just calling them from inside the shop. When becoming a consumer, a child or teenager enters the economic market. The market seems to be a “place” where an ever-lasting war seems to be raging. From very different corners, a player in the economic market is called to do this or to buy that or to certainly not buy those things. It is not easy to get used to these things and to cope with them. One could even ask if a human being ever gets used to it.

Being a consumer is one thing. Being a “good” consumer is something else. When using the word “good”, one could think of a *green* consumer, consuming with respect to nature. This is not what is meant here. We use the word “good” to point to the socializing aspect of consumption. More specifically said, people are learned in some way to consume in a certain way. Not spending money one does not have is one

aspect that can serve as an example. There are very different paths to all these different ways. Economic socialization, as this is what it is all about, recognized four main socializing agents for teenagers. First, there is the economic market itself which can indeed serve as tutor for beginning consumer. But also other agents are taken into account: peers, parents and the media. In this paper, the focus will lie on the parents.

Using data on consumption values and practices of as well teenagers as their parents, a first step is taken towards further analysis on the specific role of parents in the economic socialization of their teenaged children. Also the discussion on the possible role of policy in the creation of “good” consumers, can use data like these as a starting point. After a brief review about some main ideas on economic socialization, the method and data are scrutinized. Afterwards, results of bivariate analyses are presented. They are discussed to some extent in this paper, but they mainly serve as an opening towards a discussion on the role of parents in economic socialization on the whole and on a possible intervening or guiding role of policy in these matters. Does policy have to interfere in economic socialization and the *creation* of consumers or do they not?

2. Theoretical Framework

As outlined in the introduction, the theoretical background of this paper is to be found in economic socialization. Having money might be the most important element in this process (Cohen 1993). A lot of educational literature has partly to do with giving pocket money as element of economic socialization. The reason for this prime attention towards pocket money also has to do with the fact that having money is not only important because using it, one can learn how to handle it, but because money can also serve as a symbol of power and the struggle for independence when growing up (Weinstein 1975; Miller and Yung 1990). Money gives the people who use it four kinds of freedom in the economic system. First, the person who has money can choose what he will buy. Second, he has the choice from whom to buy this. Third, he can himself make out when he makes the purchase. And fourth, he has the freedom to accept or reject the selling conditions (Parsons in Ganssmann 1988). Apart from the specific distinction between the several kinds of freedom, one thing can be surely concluded from Parson’s analysis and this is that money means freedom. This freedom is not absolute, but money in the economic system works as fuel for a car. Without it, one can not even think of participating. Some work has been done on the meaning of money and the uses of it, not only from economic but also from sociological perspectives (e.g. Wernimont and Fitzpatrick 1972; Stacey 1982; Furnham and Lewis 1986; Zelizer 1989; Mortimer, Dennehy et al. 1994; Kerr and Cheadle 1997; Furnham 1999; Mayhew 1999; Furnham and Kirkcaldy 2000; Desodt 2002). However, as ever, there is not always a lot of agreement among these perspectives (Belk and Wallendorf 1990) and there is also no systematic sociology of money (Baker and Jimerson 1992).

The freedom that is entangled with money is also present in the economic socialization. Socialization is not a determining system. Otherwise, we would all be more or less the same kind of consumer and it is quite obvious that we are not. Giving pocket money is said to arise consumer skills (Ward, Wackman et al. 1977; Furnham 1999). Receiving pocket money however, is still something else than growing up to

become a consumer. As written in a report of the Belgian Research and Information Centre of Consumer Organisations on the protection of youth in the consumer market: “Must we give youngsters a fish, or must we learn them how to fish” (OIVO 2002).

Becoming a consumer does not start in teenage years. Also children develop certain consumer skills (Abramovitch, Freedman et al. 1991). Growing up to be a consumer supposes skills in different fields. On the one hand, it is supposed to have (practical) knowledge on income, expenses and savings (Noordmans, van Gelder et al. 1995). On the other hand, there is a need for introduction to and experience in the shops, the shopping street, the malls etcetera. Also, there is a need for a capacity to deal with commercials. All this, has to do with economic socialization.

But what is (economic) socialization? Baumrind (1978) defines it as the process that is initiated by the parents and through which children acquire their “culture” through education, training and imitation. They also acquire the habits and values that come with the adaptation to that particular culture. Lassarre and Roland-Levy (1989) define socialization as a general term for the whole process through which an individual develops his specific pattern of socially relevant behaviour and experience, based on transactions with other people. Mainly, two different visions on socialization are discerned. The first is called authoritarian and approaches children as *tabulae rasae* who have to be programmed from the very beginning. The second vision is more permissive and presumes a natural inclination towards self-actualisation. This last approach states that children will learn everything they need to know if one just let them to find it all out themselves. A constructivist inspired view on education and learning is never far away in this.

According to Furnham (1986), economic socialization occurs in three ways. First, there are parental instructions and practices. One example – giving pocket money – has already been discussed to some extent. But parents do also influence and socialize their children in other ways, some of which indirectly and perhaps not intended. For example, when parents go shopping with their children, children will learn a lot about this shopping, even when parents are not directly giving instructions or information to their children (Underhill 2000). A second way is the more formal schooling in economy and related areas, like politics, sociology, accountancy etc. Indeed, in school, children and teenagers sometimes learn about the economic system. A third way of economic socialization is the personal experience through shopping on their own or with friends, through work experience and so on. As Furnham indicates, these aspects can hardly be clearly discerned. Moreover, economic socialization is often seen as something that goes automatically and may not need special attention.

Literature on economic socialization concentrates on two different areas. One area concerns studies about the way children pick up economic concepts and at what age this occurs. These studies often follow the scheme of emotional development as developed by Piaget (1954) (Lassarre and Roland-Lévy 1989). These studies often have a psychological line of approach (Furnham 1986). Examples can be found with Stacey (1982), Jahoda (1983), Ward (1977), Sutton (in: Furnham 1986), Berti (1981), Danziger (1958), Furth (in: Sherman 1986) and Furnham (1984; 1986).

A second group of literature on economic socialization tries to find out how economic concepts can be taught to children and youngsters. Studies on how giving pocket

money can make children find their way on the economic market certainly fall under this heading. Studies on the influence of parental socialization in childhood and adolescence on later knowledge of money and money behaviour are also part of this group (Furnham 1999). To get to know how teenagers handle money and consumption, it is indeed of importance to know the attitude of their parents towards money and consumption (Furnham and Thomas 1984). This does not mean that all children have the same attitudes towards consumption and other things as their parents do. Some research even suggests that parents who have attitudes that are centred around money, have children with less knowledge of money and less experience with it and also have attitudes that are not centred around money to the same extent (Marshall and Magruder 1960).

Both groups are not neatly set apart from each other. Parents and teachers for example, are particularly interested in studies on the acquisition of economic concepts, so that they can teach them to children at the appropriate age (Kourilsky in: Furnham 1986). It also has to be admitted that research in the area of economic socialization is hampered by the fact that most economic processes are not open for direct observation (Jahoda in: Furnham and Thomas 1984). For example, we can see that teenagers buy a certain product in a certain store for a certain amount of money, but the thinking processes that have lead to this behaviour, can not be observed.

Parents are one, but of course not the only socializing agent for children and teenagers. Also media and certainly peers can be labelled as socializers of youngsters. Certainly when teenagers grow up, go to school and develop a life in which parents are not ever present anymore, peers are said to be more important in the economic socialization. Peer pressure can be seen as a special aspect of this socialization. Nevertheless, this paper will focus on the role of parents.

3. Method and Data

Data

Data for this paper come from a large scale study among 3.472 teenagers in Flanders. The original dataset contains data on for instance social background, identity, friends, income, parental influence, consumption, shopping and media use of the teenagers. Only a selection of data will be used here.

Data gathering started in November 2005 and lasted until June 2006. Based on data given by the Department of Education of the Flemish Government, a sample of secondary schools was selected, representative on education year (1st to 6th (or 7th)) and educational type (general, technical, vocational or art). The schools in the sample were asked to participate in the study. Participation consisted of having all students in a specific year of a specific education type completing the questionnaire "Youth & Consumption". Due to the fact that for this study a lot of time was needed and due to the fact that we were not the only ones asking for participation, a second, third and fourth sample had to be constructed, in order to make and keep the sample representative on type and year.

The first sample was constructed in October 2005, the second in December 2005, the third in January 2006 and the fourth in March 2006. Finally, 3.472 usable questionnaires were collected.

All teenagers in the study also received a questionnaire for their parents. Teenagers answered their questionnaires in the school and were asked to give a separate questionnaire to their parents. Parents could send this questionnaire back by mail with a pre-stamped envelope. Of 3472 contacted parents, 1659 returned the questionnaire, resulting in a response-ratio of 48%. It was asked that one of the parents would complete the questionnaire. In 77% of the cases, this was the mother; in 22% the father. For only 1% this was the step-mother, step-father, the guardian or someone else.

All questionnaires were scanned electronically using OMR-software. Afterwards this scanning was controlled and completed where it had originally failed. A dataset for teenagers and a dataset for parents were constructed. Both datasets were combined using the unique numbers of the respondents. On the questionnaires of the parents a number was written, which was the same as the one on the questionnaire of the teenager. In the construction of the variables, all respondents for teenagers or parents will be used. In the analysis of the connection, only the cases where we have data from as well parents as teenagers are taken into account.

This paper will not focus on socio-demographic or socio-economic background of teenagers and their parents. We will speak of *the* teenagers and of *their* parents, making no distinction whatsoever on background differences. This might be seen as setback, but as these analyses are a first step, no problems are foreseen.

Measures

The attitudes of teenagers and their parents regarding consumption are measured in three different ways. An important remark is that it was necessary to use the same items for both teenagers and their parents. The construction of the scales however, was based on an analysis of the results of teenagers. Afterwards, the same selection of items for that particular scale was used for the parents.

First, the attitude towards money was taken into account using a selection of the items of the Money Attitude Scale by Yamauchi and Templer (1982). The selection of these items was based on the pilot study among teenagers. For teenagers, five items were used, but for parents it was decided to leave one item out of these small list, because of possible misinterpretations. The item referred to is "Sometimes I pay others to do things for me". For teenagers, this item worked well, but we were afraid to use it for parents. Therefore it was left out, as well for teenagers as for parents.

For teenagers, the scale reached an alpha of ,76. For parents, a Cronbach's alpha of ,78 was reached. An overview of the items and their factor loadings can be found in Table 1. For the analysis, sum scores are used as measures of the importance attached to money.

Table 1: Money Attitude Scale: items and factor loadings for teenagers and parents

Items	Factor loading	Factor loading
	teenagers	parents
I try to find out whether others have more money than me	,575	,660
I sometimes buy things because I know they impress others	,761	,662
I possess nice things to impress others	,737	,771
I sometimes brag about the money I have	,588	,644
	Cronbach's alpha	,76
		,78

Second, a more general measure of materialism was used. The two most well-known scales that measure materialistic attitudes are created by Belk (1985) and Richins and Dawson (1992). Both scales consisted out of subscales of which the several dimensions have been discussed above. However, the scales constructed by Belk and Richins and Dawson do not always work well with teenagers. Previous research (Mortelmans, Van Assche et al. 2002) and other small investigations in Flanders in which this scale was used, gave proof of this. Also in this research, the materialism scale did not really work well. After the pilot study, a selection of 12 items of both scales was used in the questionnaire. An analysis on these 12 items in the final dataset came to a subset of three items, measuring a kind of comparative materialism. This subscale only reached a Cronbach's Alpha of ,67 for teenagers and ,70 for parents. An overview of the items and their factor loadings can be found in Table 2. For the analysis, sum scores are used as measures of this comparative materialism, which might be labelled as jealousy.

Table 2: Comparative Materialism Scale: items and factor loadings for teenagers and parents

Items	Factor loading	Factor loading
	teenagers	parents
I can't stand it when friends buy things I can't afford	,681	,720
When friends have more than me, I'm jealous of them	,718	,724
I can't stand it when I see people who can buy anything they want	,552	,584
	Cronbach's alpha	,67
		,70

Third, five shopping styles are measured with as well teenagers as their parents. The items came from the Consumer Style Inventory, developed by Sproles and Kendall (1986). This inventory originally discerns eight shopping styles: perfectionist, brand conscious, fashion conscious, recreational, price conscious, impulsive, overwhelmed and brand loyal. The original CSI makes a distinction between these eight styles with 39 items. All the items were used in the pilot study and based on those results, the best fitting 30 (in several subscales) were used in the final questionnaire. In the pilot study, only 3 factors with acceptable Cronbach's alpha's were found. Therefore, some wording of some items was adapted, hoping to get more than three acceptable factors. To this, it has to be added that, according to Bearden (1999), also in the original CSI not all styles or factors reached an acceptable reliability. For example, four of the eight styles did not reach a Cronbach's Alpha of ,50.

In the analyses, the approach was not a blind following of the original distinction of the items of the CSI. Some items could theoretically be appointed to a different factor

as the original CSI puts forward. It was decided to let the data of the teenagers speak. Principal Axis Factoring with Varimax-rotation revealed seven factors, of which five reached an acceptable reliability. The same factors were searched for in the data of the parents. An overview of the factors, the items and their factor loadings can be found in Table 3. As for the other scale variables, sum scores were used as measures of the specific attitudes.

Table 3: Consumer Styles: items and factor loadings for teenagers and parents

Items	Factor loading teenagers	Factor loading parents
Fashion Conscious Shopping		
I mostly choose well-known brands	,783	,865
I prefer buying products of well-known brands	,762	,761
Brand products are of better quality	,586	,598
I have my favourite brands I buy over and over again	,575	,538
I prefer buying the best selling brands	,540	,536
Cronbach's alpha	,83	,79
Overwhelmed Shopping		
There are so many brands, I don't know what to choose	,519	,608
All the information on different products confuses me	,518	,610
The more I know about products, the harder it is to choose	,511	,719
Sometimes it is hard to choose in which stores to shop	,496	,502
I should plan my shopping in a better way	,465	,380
I often regret the purchases I made	,418	,473
Cronbach's alpha	,68	,72
Recreational Shopping		
Shopping is one of the most enjoyable activities I can imagine	,721	,770
I enjoy shopping for the fun of it	,656	,831
Shopping trips do not last long with me* ¹	,533	,261
Shopping the stores is a waste of time*	,326	,356
Cronbach's alpha	,72	,63
Perfectionist Shopping		
I always try to choose products with the best quality	,652	,712
Getting good quality is very important to me	,651	,639
I try to get the best value for my money	,556	,471
I try to make the very best or perfect purchase	,448	,481
Cronbach's alpha	,71	,66
Fashion Conscious Shopping		
I usually have more outfits of the very newest style	,469	,832
My wardrobe sticks closely to fashion	,539	,828
Fashionable styling is very important to me	,519	,759
Cronbach's alpha	,84	,85

As practices, buying based on advertisements, the degree of influence by friends and mutual influences between parents and their teenage children are included. The first refers to buying things because one has seen them in advertisements, most often commercials on television. As well the parents as their teenage children have

¹ Items with an asterisk require reverse scoring

answered to this question, referring to themselves. A frequency analysis of the answers that were given, gave the results that are presented in Table 4.

Table 4: Frequency analysis of buying things after seeing them in advertisements or on television (teenagers and parents)

	Teenagers		Parents	
	N	%	N	%
Have you ever bought anything after seeing it in an advertisement?				
Yes	1202	36,9	1189	71,7
No	2054	63,1	469	28,3
Total	3256	100,0	1658	100,0

The degree of influence by friends, as said by teenagers or parents themselves, is a second measure of consumer practice. It is closely connected to influence by commercials, but still something different. As friends can be an important agent in socialization, they certainly find their place in this exploratory analysis. Four answering categories were discerned when teenagers and parents were asked: "To what extent are you influenced by your friends when choosing products and brands?" Table 5 gives the results of the frequency analysis on those variables.

Table 5: Frequency analysis of perceived influence by friends (teenagers and parents)

Degree of influence by friends	Teenagers		Parents	
	N	%	N	%
Never	756	22,6	534	33,3
Seldomly	1006	30,1	475	29,6
Sometimes	1233	36,9	504	31,4
Often	349	10,4	93	5,8
Total	3344	100,0	1606	100,0

Third, regarding the mutual influence, we have asked the teenagers in how far they are controlled by their parents as far as their expenses are concerned. Three answers were possible: yes, sometimes, no. We have also asked the teenagers whether they ever are criticized regarding their expenses and we have asked whether or not their parents have ever forbidden a certain purchase. In the questionnaire of the parents, we have asked whether they have ever controlled, criticized or forbidden an expense of their children. These two viewpoints are contrasted. A frequency analysis of the answers given is presented in Table 6.

Table 6: Frequency analysis of controls, critiques and bans of expenses as seen by teenagers and parents

	Teenagers		Parents	
	N	%	N	%
<i>Is there control of your parents regarding your expenses? / Do you control the expenses of your children ?</i>				
Yes	730	21,1	546	32,9
Sometimes	1786	51,7	695	41,8
No	940	27,2	420	25,3
Total	3456	100,0	1661	100,0
<i>Are you criticised by your parents regarding your expenses? / Do you criticise the expenses of your children ?</i>				
Yes	495	14,3	58	3,5
Sometimes	1675	48,5	694	42,0
No	1283	37,2	901	54,5
Total	3453	100,0	1653	100,0
<i>Do your parents forbid you do buy certain things? / Do you forbid your children to buy certain things?</i>				
Yes	964	28,0	72	4,4
Sometimes	1322	38,4	879	53,6
No	1159	33,6	690	42,0
Total	3445	100,0	1641	100,0

In the results-section, we make a step further and we will compare the answers of teenagers concerning attitudes and practices of teenagers with the answers of *their* parents. Therefore, we will only work with teenagers whose parents have returned a questionnaire.

A final word, before turning to the section where results of connection will be given, has to be said on causality. One could easily state that attitudes of parents do have a causal influence on the attitudes of teenagers, as the attitudes of the parents exist for a longer period, are formed in a more strong way and also, this is partly what economic socialization is about. Nevertheless, causality is not the issue in this paper. Thus, we will not state that attitudes or practices of teenagers are causally related to attitudes or practices of teenagers or the other way around. We will only state things on existing relations.

4. Results

Attitudes of teenagers and their parents

In a first part, we will compare attitudes of teenagers with those of their parents, using only correlation analyses. As fundamental analysis, this would not be sufficient, but as exploration in view of this paper, correlation analysis will serve well.

The attitude attached to money by teenagers and their parents does somewhat correlate in a positive way, but one can not say this correlation is strong (pearson correlation is ,080; $p < ,01$; $N=1590$). Another positive but rather small correlation is found between the so-called comparative materialism scale. Teenagers who are more

materialistic also have parents who are more materialistic, but again the relation is rather small (pearson correlation is ,113; $p < ,001$; $N=1565$).

A correlation analysis of different consumer styles between teenagers and their parents, revealed the results as presented in Table 7.

Table 7: Correlation analysis of consumer styles of teenagers and their parents

Teenagers	Parents				
	Brand Conscious	Overwhelmed	Recreational	Fashion Conscious	Perfectionist
Brand Conscious					
Pearson Correlation	,181	,035	,089	,181	,058
Sig.	,000	,184	,001	,000	,025
N	1489	1482	1492	1494	1490
Overwhelmed					
Pearson Correlation	,014	,135	,064	,031	,007
Sig.	,581	,000	,013	,234	,784
N	1479	1472	1483	1487	1482
Recreational					
Pearson Correlation	-,005	,027	,127	,023	-,003

Fashion Conscious					
Pearson Correlation	,073	,039	,142	,189	,039
Sig.	,005	,137	,000	,000	,132
N	1499	1493	1503	1507	1501
Perfectionist					
Pearson Correlation	,013	-,043	,040	,045	,024
Sig.	,611	,100	,117	,083	,350
N	1495	1489	1500	1504	1498

As can be read from Table 7, four of the five discerned consumer styles among teenagers do correlate with the specific attitudes among parents. A brand conscious, overwhelmed, recreational and fashion consumer styles of teenagers goes hand in hand with the same attitude among their parents. Nevertheless, most of these attitudes of teenagers do not correlate *only* to that specific attitude of their parents. A brand conscious style of teenagers does also correlate with a recreational, fashion conscious and even a perfectionist style of parents. An overwhelmed style of teenagers does also correlate – to a small positive extent – with a recreational style of parents. Third, the fashion conscious style of teenagers does correlate with the recreational style of parents. So, even though the relations between the consumer styles of parents and their teenaged children are not as clearcut as one would like to see, the relations that exist do point in that direction.

Practices of teenagers and their parents

The first practice that was included concerned whether or not teenagers and their parents have bought something after they had seen it an advertisement, whether or not in a commercial. In Table 8 it can be read that teenagers of parents who state that they

have bought something after seeing it in a commercial have a higher chance of also having done this than with parents who have never engaged in such behaviour.

Table 8: Crosstabs: Buying things after seeing them in a commercial (column percentages)

		Buying after commercial - Parents					
		Yes		No		Total	
Buying after commercial - Teenagers		N	%	N	%	N	%
Yes		417	38,3	140	31,7	557	36,4
No		672	61,7	301	68,3	973	63,6
Total		1089	100,0	441	100,0	1530	100,0

Chi² = 5,81; p < 0,01

The second included practice was the influence of friends that was – in a way – admitted by teenagers and their parents when choosing brands or products. A crosstabulation of these two variables however, did not reveal significant relations (Chi² = 12,21, p = ,202).

Direct mutual influences

The third group of aspects is somewhat more direct. We have asked teenagers whether their parents control the way they spend their money, whether their parents sometimes have critique on the way they spend their money and whether their parents sometimes forbid them to buy something. We have also asked the parents whether they have done that. Contrasting these viewpoints can shed an interesting light on these ideas of direct interferences.

Table 9: Crosstabulations of three different aspects of interference in expenses by parents, contrasting viewpoints of parents and their teenagers (column percentages per item)

Controlling expenses – viewpoint teenagers		Controlling expenses – viewpoint parents				
		Yes	Sometimes	No	Total

One thing that can already be concluded based on a mere overview of Table 9, is that viewpoints differ. Of the parents who state that they, for example, forbid to buy things, only 36% of their teenaged children gave the same answer. There are even 29% who say that their parents do not forbid to buy certain things, when these parents themselves answer yes to the very same question. But also they other way around, these differences exist. Of all parents who say that they never give critique on the way their teenaged children spend their money, 8% of these teenagers say that their parents do.

It is not stated that there is no agreement at all concerning this contrast. On the contrary, a lot of agreement does exist, especially because one can discuss the difference between answering sometimes and answering yes on these particular questions. Taking these elements of analysis into account, it is time to turn to a discussion and conclusion. Why are these results important?

5. Discussion and Conclusion – Linking Research and Policy

Education by parents is in very different kinds of ways a free something to a large extent. There are no specific rules when educating children in the process of growing up. Markets and book stores are filled with books for mothers and fathers to help them during the growing up of children and teenagers, but these books do not have to be necessary. Fathers and mothers do not have to pass an exam before they are allowed to raise children. Parents who are candidate to adopt children have to pass exams, but these exams do not ask for an education or socialization plan. In very rare cases, and after sentence by a judge, parents are sometimes “releaved” from their parental responsibilities, but no cases are known were “bad introduction to the consumer market” was the reason for this sentence.

So, parents are free in whether or not and to what extent they introduce their children to the economic market. They can bring along their children when they go shopping but they don't have to. They can give pocket money to their children, but they don't have to. They can mingle in what their children do with their money, but they don't have to. So many degrees of freedom make it impossible to create one single path for economic socialization by the parents. And as said before, such a path is not necessary. But still, an introduction to the consumer market and a teaching of consumer skills, sometimes seems necessary. Is it then a task of policy to interfere? Saying no is the obvious answer, and this is the situation we live in now. Governments often provide for information and sometimes governmental research

and control centres and association exist, like for example the Belgian “Child and Family”, but they do not focus at all on consumer skills.

On the other hand, there might be a need for more interference when consumption seems to go the wrong way. Often, later financial problems of persons and households have roots in the economic socialization (apart of course from bad economic situations to be raised). Nevertheless, consumption of teenagers is not a topic that should raise worries these days. From a constructivist viewpoint, one could state that all individuals have to learn from consumption by trying, trying and trying. Government’s role remains in informing all individuals and in controlling the observance of agreed economic rules by industries, shops etc. But they do not have to take individual consumers by the hand.

In this paper, some connections between attitudes and practices of the consumption of teenagers and their parents were focussed upon. Some connections do seem to exist but the story of socialization is not straightforward. Teenagers who are more materialistic also have parents who are more materialistic, but the link is not so strong. Also consumer styles seem to gave some agreements, but not in a determining way. Practices gave the same ambiguous results. Some seem to have a connection, others don’t. We must be cautious with these results as they are only bivariate and we stay as far away as possible from any statements on causality, but they might be seen as pointing in some direction.

Also the more direct questions on parental interferences in the expenses of their teenage children state that parents mingle – to a large extent – in what teenagers spend their money on. Sometimes teenagers think differently in saying that their parents do or do not interfere, but one can not put forward that parents on the whole do not seem to mind. Thus, most parents are indeed involved in raising their children as consumers. Of course, more analyses are needed to make a distinction between parents who do and parents who do not.

This paper contained only preliminary results with quite some setbacks. We only included parents. In a true story on economic socialization, also other agents like media and peers have to be included in a more profound way. Also, only one of the parents is included and often, teenagers live with two parents, both having a possible socialializing influence. More and more families no longer are a typical father-mother-children-houshold. Divorces, one-parent-families and other demographic possibilities grow in importance. In our sample, 70% of the teenagers, live with father and mother, so they are still the majority, but in our analyses, no account is made of other possibilites and this can be important. We also did not include any reference whatsoever to socio-economic background and the like.

Therefore, this paper is not intended as “state-of-art” regarding economic socialization, but as a preliminary starting point towards more analyses of existing differences between parents and their teenaged children, not only on the subject of consumption, but also on the subject of choice of friends and perceived influence by the peer group. If one thing is to be concluded from these analyses, it is: parents matter.

Consuming Children: A panel based on the research project "Consuming children. Commercialisation and the changing construction of childhood"

Commercialisation and the Changing Construction of Childhood is a research project at the Norwegian Centre for Child Research, Norwegian University of Technology and Science, Trondheim, Norway. This is an interdisciplinary project which includes the disciplines Media Education, Early Childhood Education, History, Media Science, Psychology and Childhood Studies. The project will last in the period 01.09.2006 - 31.08.2009. Project directors are Professor David Buckingham and Associate Professor Vebjorg Tingstad who runs the project together with Senior Researcher Tora Korsvold and Associate Professor Ingunn Hagen. The Research Council of Norway is the financial supporter of the project.

The main aim of the project is to study marketing to children, and to assess the role of commercialisation and consumer culture in changing the definitions and lived experiences of childhood. The project seeks to integrate three aspects of this phenomenon - namely, marketing, the product and the consumer. The project will include the theoretical focus on the relation between structure and agency, the analysis of gender issues and childhood identities, and the use of ethnographic research methods and forms of discourse analysis. In addition, we establish and run an interdisciplinary international network and aim to develop comparative research projects during the project period.

We are doing six sub-projects altogether and three of them will be presented at the conference.

Proceedings of the Nordic Consumer Policy Research Conference:

**PLAYING ON CHILDREN'S DESIRES AND FEARS: ON CREATING
BRAND LOYALTY AMONG NORWEGIAN CHILDREN**

Abstract:

The purpose of this paper is to examine and discuss some of the strategies applied to create brand loyalty among children in Norway for Captain Sabertooth. I will focus on the brand based on this fictional character – a pirate - who has been (and still is) enormously popular among Norwegian children - especially boys preschool age - for the last 17-18 years. What are the reasons for this popularity?

The Captain Sabertooth character, his men and their fictional universe are one of the main attractions in Kristiansand Zoo (a theme park and zoo in Southern Norway). Captain Sabertooth has – through annual summer shows (theatre performances), video releases, and numerous other media texts and spin-off products - become a “must” for Norwegian children and thus a great economic success. Captain Sabertooth has become an important identification figure and also part of especially pre-school (boy's) play culture in Norway.

One challenge in this paper is to explain the long-lastingness of this “craze” among Norwegian children. Thus, the strategies used to create brand loyalty among children for Captain Sabertooth will be compared to the strategies used by global central actors who try to promote their products to children in different countries, including Norway. Examples of such brands are Pokemon and Disney products.

1. Introduction

“-Mum, is it true that the Pokemon cards are made so that some people should make lots of money when we buy them? The mum of my friend said so.”

“Yes, this is true,” I responded to my son in order to support this mother's attempt to make the children aware of the commercial pressure behind some of the `crazes` they take up.

-“No, I don't think so; the cards must be made in order for us to have fun when we play with them. I really like them.”

Pokemon is a global “craze” which has had its peak with children (see Tobin, 2004), but as the above quote indicates, new generations are still being recruited, despite some resistance from parents. This paper is, however, not about Pokemon's rise and fall. It is about another, national “craze” which is very intense in Norway, particularly among preschool boys. Indeed, Captain Sabertooth has been a national “craze” almost since the figure was created in 1989.

This pirate and the stories, songs and products related to him are enormously popular among Norwegian children - especially boys. And this craze has had a surprising longevity, being able to fascinate new generations of boys (and girls) for almost two decades. Thus, the purpose of this paper is to examine and discuss some of the strategies applied to create and maintain brand loyalty for Captain Sabertooth.

Captain Sabertooth has - since the beginning - been a great success story. The story about this pirate – Captain Sabertooth – was created by Terje Formoe, the former Director of Marketing and Entertainment of Kristiansand Zoo (see Hjemdahl, 2003). He started to develop annual summer shows (theatre performances) for Kristiansand Zoo, with himself as Captain Sabertooth. In Kristiansand Zoo, where Captain Sabertooth’s famous nightly summer shows still take place, there are now several areas dedicated to this pirate. There he has his ship (the Black Lady), and his castle near the “pirate harbour/village” called Captain’s Sabertooth’s World, where daily small shows take place, and where one can find numerous restaurants, cafés, and souvenir stores in a “pirate environment”.

However, from the beginning, Captain Sabertooth has not been limited to Kristiansand Zoo. Soon the creator and the growing number of companies added numerous Captain Sabertooth media products like films (on video and later DVD), cartoons, books, music (in the shows, films, CDs and audio tapes), TV series, activity books, magazines, and computer games. In addition to the various media products, there are numerous Captain Sabertooth spin-off products; like swords, pirate robes, T-shirts, nightgowns, Captain Sabertooth’s ship, plastic pirate figures, Sabertooth purses, food boxes, bags, pirate jewellery etc.

In addition to all the media outlets and spin-off products, Terje Formoe as Captain Sabertooth often visited different cities in Norway, and also hospitals. According to Hjemdahl (2003), it is almost like Norway has been “piratized”: You find Captain Sabertooth everywhere and in all forms; as ice-cream, as potato chips, as bread, as cod liver oil, on children’s bed linens etc. In his “search for gold”, the pirate and its creator also conquered a large audience in Norway, perhaps especially through the rather catchy Captain Sabertooth music. What started out in Kristiansand as a summer family show and later a tradition has developed into a national craze and something that could be regarded as a children’s classic in Norway (see Nakken, 2007).¹

Thus, it is hardly surprising that Captain Sabertooth has also become an important character for identification and thus a part of especially preschool (boy’s) play culture in Norway. In her analysis of Nordic theme parks and how the figures from them are present in children’s everyday lives, Hjemdahl finds that it is especially Captain Sabertooth who is present in the preschools (Kindergartens) she visited. She found the presence of Captain Sabertooth through numerous spin-off products, through songs that the children sing, through acting out the stories, and especially through sword battles all over the preschool playgrounds. “Some children even *are* Captain Sabertooth,” Hjemdahl writes (p. 128). It was especially the boys age two to six years who were the most eager Sabertooth fans. Captain Sabertooth is a permanent part of the boy’s role play (in addition to cowboy and “police and thieves” games).

My own son was no exception. It was through his and his friends’ embrace of the Captain Sabertooth that I became aware of the intensity of the children’s relationship to this figure. Young boys (and girls) in my son’s preschool pretended to be Captain Sabertooth or one of

¹ I have functioned as the academic advisor for Øivind Nakken’s case study, which is written up as his MA thesis. We have both been part of the “Consuming Children” research team.

his men and constantly involved themselves in sword battles and play fights. These role plays and battles took place with or without the Sabertooth clothes and swords that the children had picked up in Captain Sabertooth's world in Kristiansand Zoo or in the local toy store. Most children knew the stories and the songs well - from CDs, films or theatre performances.

In my son's preschool the obsession with Captain Sabertooth was so intense, especially among the boys, that the pirate play fights often got out of hand. Thus, the pre-school staff at one point forbid the children to dress up like Captain Sabertooth for the annual Carnival in the Kindergarten. But then there were so many disappointed boys that being dressed as their favourite pirate had to be allowed for the following pre-school summer party.

As already indicated, a major aim in this paper is to understand the strategies that are used to promote the intensity of the relationship that children seem to have to this fictional character. Another challenge is to explain the long-lastingness of this "craze" among Norwegian children, compared to more short-lived international crazes. Thus, the strategies used to create brand loyalty among children for Captain Sabertooth will be compared to the strategies used by other central actors who try to promote their products to Norwegian children. Some relevant brands for comparison are for example Pokemon and Disney.

2. Commercial Childhood and "Crazes"

The case study of Captain Sabertooth (and the strategies used to create brand loyalty among children) is part of the larger research project "Consuming Children: Commercialization and the Changing Construction of Childhood" (see the project website: www.svt.ntnu.no/noseb/Consuming/, and also Buckingham and Tingstad, 2007). The point of departure for this research project is the fact that commercial culture and consumption is very present in the lives of today's children, from a very early age (cf. Cook, 2004; Kline, 1993). The increased commercialization of childhood has been much discussed in Norway in recent years, both in the media, in academic literature and in public reports (e.g. BFI, 2001; Hagen, 2001; and Tingstad, 2006).

Marketing to children involves larger questions related to contemporary childhood. For example, the commercial influences or pressures are often contrasted with notions of a free and "natural" childhood. What does children's participation in the intensified global, mediated consumer culture mean for the continuity between generations? In stead of reducing these questions to dichotomous claims about children as "natural" or "exploited", or as "agents" or "victims", the aim of the Consuming Children project is to get a deeper understanding of children and their parents' role in consumer culture. The premise of this project is that it is most fruitful to theorize the relationship between the structural market forces and children's active negotiation of these forces and the identity definitions available to them (see also Buckingham and Sefton-Green, 2004).

Due to global trends like globalization and media convergence, there has been increased market competition. Thus, different commercial actors are looking for new customers and niches. The child market is particularly interesting for several reasons: children are getting increased allowances of their own, and from an early age children have considerable "pester power" in their families. By creating brand loyalty among children at an early age, companies can secure a profitable future. Thus, marketers will try to identify children's desires, fears, and group norms; their worshipping of (often very masculine or feminine) heroes, their

fantasies and dreams (like their love of pets and animals), their (often slapstick) humour and their peer group identities (wishing to be “cool” and included, fearing to be excluded) (cf. Kline, 1993; Seiter, 1993).

In the above-mentioned, multi-disciplinary Consuming Children research project, the aim is to integrate analysis of three aspects of children’s consumption; marketing, the cultural product/text and the child consumer (Buckingham, 2000, cf. Hall, 1992/1980). In the Consuming Children project, the empirical focus is on two age groups that are currently of particular interest to marketers and marketing research – preschool children and “tweens”. For the Captain Sabertooth products, the primary target group is preschoolers, or more specifically 2-8 year old children. But efforts are also made to target the whole family, something I will return to.

The case study of Captain Sabertooth is part of subproject 1b in the Consuming Children project, where the purpose is to explore the contemporary practices of the media, advertisers and related industries. One of the aims in this subpart of the Consuming Children project is to understand how marketers respond to the often fragmented markets by global ambitions and the development of “synergies” – where successful products often are adapted to a number of media platforms; like TV, film, computer games and printed material. In contrast to what has been the case with Captain Sabertooth, typically products targeted at children often become short-lived “crazes”, of which Pokemon is a well-known example (see Tobin, 2004). Disney is another example (see Wasko, 2001; and Wasko et al., 2001), where movie characters like Pocahontas, Winnie the Pooh, Narnia and the Incredibles often lead to crazes.

The global, commercial media environment and its intensive marketing is a precondition for cross-media products, where brands cross media borders, organizations and national borders. There are numerous such cross-media phenomena or crazes like Teletubbies, Bob the Builder, the Little Pony, Teenage Mutant Ninja Turtles, Barbie, Bratz, Super-Heroes, and Harry Potter are some of the recent ones. These crazes are brands or multimedia trends that spread on a global scale, based on inter-textual references and integrated marketing (cf. Lindstrom and Seybold, 2003). After a movie or another media product, these brands spread like fire across countries and across media and product categories. The successful crazes become part of children’s everyday lives and play practices. To have the products in question and be part of the “craze” is important for children, since this relates to processes of inclusion in or exclusion in the peer group, especially in institutional settings like preschools or schools.

Our point of departure is an interest in understanding the marketing strategies related to Captain Sabertooth, since he is a figure of central importance in the lives of pre-school children, particularly boys, in Norway (see Hjemdahl, 2003). Indeed, Captain Sabertooth is clearly a national craze among pre-school children in Norway. And it is a craze which has received little academic attention in Norway, except for as part of Hjemdahl’s ethnographic study of three Nordic theme parks, and by Nakken’s case study of Captain Sabertooth as part of the Consuming Children project.

As indicated, I want to understand the reasons that this Norwegian “craze” has been so surprisingly long-lasting among Norwegian children. Our concern is especially how brand loyalty has been and is created among the children (and their families). For this purpose one needs to examine the encoding processes related to the brand and the products or texts. Through analysis of interviews with central actors behind the Sabertooth phenomenon and the numerous products and texts, three key categories emerge: synergies, inclusion and brand

control (Nakken, 2007). These categories will be elaborated below. Our hope is that the insights related to the case study of the Sabertooth brand may also illuminate mechanism that could be present in marketing of other products and brands to children.

3. Captain Sabertooth and Brand Loyalty

Despite the meagre academic interest in Captain Sabertooth so far, it is a phenomenon worth studying. As a multi-media child culture phenomenon and an intense craze in at least preschool boy's lives, Captain Sabertooth should be of interest to at least media researchers, pedagogs, psychologists, cultural analysts, and marketing researchers. But the Captain Sabertooth phenomenon is also interesting because it differs clearly from a number of the crazes mentioned earlier.

The most obvious aspect is that Captain Sabertooth is a national craze, not a global one, even though some attempts are made to introduce the products to children in other countries. It is also noteworthy that Captain Sabertooth was created by one person – the singer and at that time Director of Marketing and Entertainment at Kristiansand Zoo Terje Formoe – while most global crazes (like Pokemon) often have large global media conglomerates (like Nintendo or Disney) to promote their products. As mentioned earlier, compared to other well-known crazes, the craze around Captain Sabertooth has been unusually long-lived. Many global crazes as indicated, have spread in a fire-like speed to new audiences and consumers, Captain Sabertooth has expanded gradually from the start as a theatre show and had an almost constant growth for the last 18 years (see Nakken, 2007). Thus, it is of interest to understand what is particular about the Captain Sabertooth brand and what strategies producers and marketers have used to create strong brand loyalty.

According to Blindheim (2003), branding is so important because products often have little real differences. Thus, control over a brand is a way to play on the desires and fears that consumers have, often unconsciously (for example; “what do I need to have? “Who should I be?”). Naturally, to create brand loyalty will be a very important goal of marketing. Such brand loyalty means that a consumer will buy products related to the brand numerous times (repurchase behaviour), often without considering alternative brand choices. Another indicator of brand loyalty is when positive experiences with the brand lead consumers to recommend the brand to family and friends (word-of-mouth). The concept of brand equity is often discussed related to brand loyalty, referring to the extra value a brand can add to products (see Nakken, 2007). For example, how consumers perceive a product depends on much more than the concrete products, it also depends on the reputation and public image of the company. Is the toy produced by Disney, for example, we may associate it with nostalgic childhood innocence. The brand will create certain associations and expectations. Thus, to achieve brand loyalty will mean great competitive advantages for the company behind it.

In Nakken's MA thesis on Captain Sabertooth, brand loyalty is the main topic. This is signalled already in the title: “Captain Sabertooth – Adventurous Brand Loyalty”. Nakken claims that it is unquestionable that Captain Sabertooth has high brand equity, since it has developed into such an integrated part of children's culture (cf. Hjemdahl, 2003). The stated research purpose of this thesis is: “... to identify and understand more deeply the fundamentals of the brand loyalty to Captain Sabertooth among Norwegian Children.” He formulates the research question: “How has the brand loyalty been created through structures and processes, and how is this loyalty related to other components of brand building and brand equity?”

(Nakken, 2007: 24). He sets out to analyse what is particular about Captain Sabertooth – the stories, songs and products – that make them appeal so much to young children. He also pays attention to the structure and nature of the organizations behind the Sabertooth success. The results from this case study of Captain Sabertooth will be discussed below.

4. Synergies

The concept of synergies includes the cross media properties of a brand like Captain Sabertooth and the organizational structure and networking surrounding the products (cf. Nakken, 2007). Thus, it becomes possible for the audience to consume the texts and products through a number of channels and also via several sensory modalities.

It is easy to understand that children feel at home in the Captain Sabertooth's concept culture or universe (cf. Hjemdahl, 2003). The same – simple and almost archaic - pirate stories are told over and over again in different ways and in various forms. This reuse of the stories and also the songs may be central in making the different products recognizable and thus likeable to small children (who often love repetition). In his study, Nakken finds organisational support for such a concept culture: There is a well-developed network of production and marketing supporting the Sabertooth Brand, crossing both media and company borders. Like emphasized by Lindstrom and Seybold (2003), appealing to different senses – like sound, sight, smell, taste, and touch - is an important part of brand building. These authors highlight sound as particularly powerful in stimulating the imagination. The Captain Sabertooth brand - or the various connected products - appeals to several senses, and also creates synergies between them. Sound, both in form of music and talk, is available both on CDs, in the theatre show, in movies, the theme park, in sound books and in computer games. Visually, one can take in “powerful images, characters, costumes, scene settings and animation” (Nakken, 2007: 37).

The relationship between sound and image can be described through the concept of anchoring (cf. Seiter, 1992/1987), indicating that the verbal text or sound directs the readers' attention towards specific aspects of the image, while ignoring others. In the case of Captain Sabertooth, songs, music and sound effects often make the images subordinate. For example, one may look at the official website (www.captainsabertooth.com), where the familiar music and Captain Sabertooth's voice are very prominent. But children today do not only want to listen to songs, they also want to sing along (cf. Lindstrom and Seybold, 2003). As emphasized by Hjemdahl (2003), singing is an important and integrated part of Captain Sabertooth's appeal, and the songs seem especially fit to inspire bodily movements, battles and role-play. There are also Captain Sabertooth Songbooks available to support this aspect.

Other senses – like smell, taste and touch – are also stimulated by various Captain Sabertooth products. These senses are used related to licensed Captain Sabertooth products like ice-cream, bread, or liver cod oil. But it is especially the theme park in Kristiansand Zoo that children come close to have physical contact with the whole pirate adventure. There children (and their parents) can eat Sabertooth dishes (like pizza, hotdogs or popcorn) and drinks (like brain coolers) in restaurants and cafés. They can hear the familiar voices and songs, and ever meet their heroes for a photo opportunity. They can also enter the Sabertooth ship, the Black Lady, which when crossing the “Grass Ocean” is firing at the meeting “enemy ship”. When the children come home with their newly acquired (and old) Sabertooth gear, like movies on DVD, songs and sound books on CD, and perhaps costumes, this will remind them of the

whole sensory experience from the theme park. According to Nakken (2007), these synergies between the senses that may have been created, probably have strengthened the whole Captain Sabertooth adventure.

In her book, Hjemdahl (2003) points to the overlapping of scene setting, production, promotion and consumption of Captain Sabertooth, something that may strengthen the experience and accessibility of the brand. According to Nakken (2007), synergies include this overlapping, and he tries to explain this in terms of the two interconnected sub-categories Synergies of Production and Integrated Marketing. The concept Synergies of production refers to the structure of the production network related to Captain Sabertooth. According to Terje Formoe, the author and copy right owner of Captain Sabertooth, this network consists of 24-25 different companies of various sizes.

Some concretization may be illuminating: Terje Formoe owns Captain Sabertooth A/S – which is at the centre of the network. Formoe also has shares in Piratprodukter A/S and Seven Seas Production A/S. Piratprodukter A/S is managing the Captain's Sabertooth's World (in Kristiansand Zoo), and they own the restaurants and the spin off shops in the theme park. Until recently, the majority of spin-off products were also licensed to Piratprodukter A/S. Seven Seas Production A/S is a film company, producing the Captain Sabertooth cartoon in 2003. Svensk Film A/S, another film company, has produced, distributed, and marketed the DVDs (based on the theatre performances). Moreover, Captain Sabertooth books are licenced to two publishers, Gyldendal and Cappelen Forlag. The Captain Sabertooth comics are licenced to Egmont A/S, while the audio and video-material are licenced to Grappa Musikkforlaget A/S. Barneselskapet A/S (a Grappa-Egmont daughter company) distribute and market this material. The computer game was produced by Artplant A/S and distributed and marketed by Panvision A/S (see Nakken, 2007; appendix F and E for more detailed and extended lists).

These organizational synergies can be illustrated by the close cooperation between Terje Formoe, Kristiansand Zoo, and Piratprodukter A/S. These people and companies work closely together, and the effect appears to be stronger and more profitable companies that if they had worked independently (Nakken, 2007). Kristiansand Zoo was, as mentioned, the birthplace of Captain Sabertooth. This Zoo is still the site of the nightly theatre summer shows. In 1995, there was a dispute between Terje Formoe and Kristiansand Zoo about Captain Sabertooth. When Terje Formoe removed the Captain Sabertooth summer shows to Asker (near Oslo), both he and Kristiansand Zoo experienced fewer visitors. Kristiansand Zoo was worst hit, with a 65 000 decrease in visitors and a deficit of 17 million NOK. The following year, when Terje Formoe and Captain Sabertooth were back in Kristiansand Zoo, the visitors returned. No wonder that the new director of Kristiansand Zoo was eager to cooperate: "It is essential in our co working that our ways of thinking are not different from the ideas of the originator Terje Formoe. We must all pull in the same direction" (Managing Director Reidar Fuglestad, in Nakken, 2007: 40). This cooperation may also result in equity transfer, since both Captain Sabertooth and Kristiansand Zoo are strong brands, they may both gain more equity by cooperating.

Such organizational networking is also valuable when it comes to the next sub-category, integrated marketing. According to Lindstrom and Seybold (2003), a cross-promotion or marketing in several channels is important for brands to survive. Organizational networking ala the one around Captain Sabertooth brand usually works as a basis for more flexible communication and marketing strategies (cf. Stohl, 2001). According to Nakken (2007), the

integrated marketing strategies are characterized by cooperation between different companies in the way that campaigns in one company may have indirect effects on the others. For example, when Panvision A/S marketed and distributed the computer game (produced by Artplant), this would also indirectly market the whole Captain Sabertooth brand. Similarly, when Svensk Film A/B marketed and distributed the Captain Sabertooth cartoon movie in 2003, it also indirectly promoted the whole Captain Sabertooth industry. Otherwise, there is not a very aggressive marketing of the different Captain Sabertooth media and spin-off products. This brand also relies heavily on the indirect effects of press coverage and “word-of-mouth”. Entertainment institutions like theme parks need to stay in the public mind, for example through media coverage (Hjemdahl, 2003). Such media coverage is almost secured by Kristiansand Zoo’s role as a cultural institution in Norway, strengthened by even Royal presence at several occasions, so the cultural context of Captain Sabertooth is ideal for promoting the brand. Terje Formoe’s own position as a national celebrity is also adding positive brand value. And again, there are possible synergies from the two, also related to positive media coverage. Thus, there is less reason to smooch journalists in Norway related to Captain Sabertooth, in the way Wasko (2001) reports is the case for Disney.

5. Inclusion

Inclusion in this paper refers to the brand’s ability to involve the audience (e.g. children of different ages and gender, and their parents) in a variety of ways, through intertextual references, and also through textual strategies like creating closeness and presence, and through characters for identification. Based on his textual analysis of the different Captain Sabertooth products, Nakken (2007) finds these entertainment products to be very including. In order to understand how the Captain Sabertooth texts may be inclusory, I will present a summary of their main characteristics.

Central features in all stories are events, characters and setting. Nakken (2007) uses these concepts from Kozloff’s narrative theory to discuss the Captain Sabertooth stories. The setting is the Seven Seas, the ocean where several mystical islands are located. Captain Sabertooth – the most feared pirate of the Seven Seas – and his men sail his ship (the Black Lady) here for different adventures and treasure hunts, often assisted by a map. Thus, the events of these stories are predictable and easy to grasp. Complications happen when others are looking for the same treasures. The main character is the same in all the stories – the cruel and greedy Captain Sabertooth. He is feared by his men, Longfinger (also called Captain Sabertooth’s shadow), the fat, and hopeless twins Wimp and Wally, the often clumsy and foolish Benjamin, and the chef Tully (who uses everything for his cooking, including rats and insects).

Another central character in the Captain Sabertooth stories is Tiny, a small boy who often assists Captain Sabertooth, although the latter would never admit this. Thus, Tiny is often the real hero of the stories. As suggested by Nakken “the relationship between Captain Sabertooth and Tiny might be considered the core of the whole adventure” (2007: 53). Tiny is the youngest of Captain Sabertooth’s crew. At first, he dreams about becoming a feared and respected pirate. But life is hard since none of the older crew takes him seriously, despite his active role in the successful achievements of Captain Sabertooth and his men. Tiny misses someone to talk to who respects him. In several of the stories, Tiny is teamed up with Veronica – a young, cute girl his own age from the cosy village Luna Bay. This friendly place of “ordinary people” is contrasted with Abra – the invisible island of Captain Sabertooth and

his men, where Tiny grew up as an orphan. Despite her nicer environments Veronica suffers from some of the some problems as Tiny, she is not taken seriously. Through Tiny Terje Formoe is able to communicate certain values or dilemmas that are central in all the various cross-media stories about Captain Sabertooth: Happiness may not be achieved through finding gold, friendship and love are the real treasures of life.

When one reads the different Captain Sabertooth stories, one is often struck by the simplicity of their plots; the stories seem adjusted to fit for very young children. This is also found by Nakken in his analysis: “He [Terje Formoe] has been good in simplifying the stories as much as possible, making them easy to follow for the children – and in that way inclusion processes are facilitated” (2007: 54). The non-complicated story structures – with kernels and few storylines involving only some of the characters – seem adjusted to the expected cognitive abilities of the preschool audience. The main target group of the Captain Sabertooth stories is children 2-8 years. But there are often differences between the implied readers (those targeted) and the actual readers; those in fact consuming stories and products.

Producers are often concerned if there is a discrepancy between the target group and the actual consumers. This was also the case for the production network around Captain Sabertooth. As already indicated, the main consumption group consists of boys 2 to 8 years old. Girls are not interested in Captain Sabertooth to the same degree, something the author is aware of and trying to change:

It has been a majority of boys so far, probably because boys in general play in a rougher way. Yet, I am working quite consciously and intensively to appeal to more girls. In my next show, I will present more female characters. And actually...I have already noticed more and more girls dressing up like *Captain Sabertooth* when they come to *Kristiansand Zoo*...painting their faces white and even painting a moustache. But still...many of the female characters being presented in my stories so far, have been very traditional girls...in traditional roles. But in my next show you will meet rougher girls...who can be tough just like the boys. And that is quite important for me...to represent both boys and girls.” (Terje Formoe, 2006, see Nakken, 2007:56).

Thus, the author of Captain Sabertooth intends to have tougher female characters or tomboys that more girls can identify. Several authors (e.g. Buckingham and Sefton-Green, 2004) have pointed out that the child market is very difficult to reach, and that it is very fragmented according to age and gender. Boys are often resistant to anything “girlish”, while girls often consumes what is traditional female and also what is more “boyish”. In Captain Sabertooth, Tiny and Veronica represents this blue-pink division. Young boys may find potential heroes in both Tiny and Captain Sabertooth. Female characters include traditional, sweet Veronica, and the scary witch Miriam, who are both less prominent characters in the stories. But as we see in the citation above, girls sometimes also want to be the pirate Captain Sabertooth.

However, Captain Sabertooth is not only being aimed at children of both genders, but also their families like parents or grandparents. This is a fruitful strategy, since it most of the times are the adult family members who pay for the fun. Some of the products - especially going to Kristiansand Zoo and to take part in the nightly theatre shows - do require that children go there with grown-up. Terje Formoe is very clear about this in the interview with him:

What is very important in my shows in *Kristiansand Zoo* is to create not only entertainment for the children, but a happening for the whole family. One of my greatest interests is that the children can experience *Captain Sabertooth* together with adults. I want it to be an experience for several generations. I want parents and grandparents to join the play. When children watch their parents having fun as well, the intensity of these children’s experiences will increase. I try to reach all generations – but everything *through* the children. Because it should all be on their premises (see Nakken, 2007: 57).

For comparison, the Disney Corporation has been able to create positive and nostalgic childhood associations related to their products. The consequence is that new generations

introduce Disney products to their children, despite their feelings that Disney is more aggressive in their marketing (Hagen, 2001; Wasko, 2001). Terje Formoe has succeeded in making the summer shows in Kristiansand Zoo as summer tradition for many families with small children. During 18 years Terje Formoe has turned his pirate into a children's classic, something new generations of children will be introduced to (like with Disney) and enjoy together with their family. But how are the parents becoming involved in the Captain Sabertooth stories? Different textual strategies are used to also include parents, for example by often containing phrases or statements that will also be funny for adults, for example the short-comings of adult characters or refer to gender-relations and battles. Nakken also discusses what he identifies as inter-textual references to Norwegian folktales, which are mostly familiar to the parent generation. Moreover, Captain Sabertooth is made less a threatening to children by contrasting him with worse villains in the stories. In addition, Tiny and Veronica are blond and blue-eyed children, archetypes that are familiar to Norwegian parents.

Kosloff's terms narrators and narrates are useful when discussing the bond that is created between Captain Sabertooth and the audience (cf. Kosloff, 1992/1987). Narrators are the characters in the stories, representing different qualities and values. The narrator is the you that the narrator speaks to, directly or indirectly, for example through a song. Nakken (2007) finds that this strong bond between narrators and narrates is fundamental in the brand loyalty created to Captain Sabertooth, emphasizing subcategories like presence and closeness. Indeed, the Captain Sabertooth universe of pirates is very open to involvement from the audience. Captain Sabertooth's World in Kristiansand Zoo is probably the place where this happens the most. Here children can dress up like pirates, take part in the singing and even join up with the pirate characters (like Longfinger, Wimp and Wally, and Benjamin) walking around and participating in photo sessions (with the children) and small shows. Even Captain Sabertooth himself can occasionally be observed on the roof of his castle.

A central aspect of children's involvement with and loyalty to Captain Sabertooth is related to identification. As already mentioned, identification with and acting out Captain Sabertooth himself - the pirate with a sword in his hand - can work very well especially for small boy's entry into play and mastery of life and social like in for example a preschool (see Hjemdahl, 2003). Moreover, a number of the characters, as indicated, are crucial in these identification processes. Since the whole Captain Sabertooth universe is so available to children, they may easily feel at home and at ease in identifying themselves with several of the different characters, their personalities and also the situations that they typically are a part of. Nakken notices (2007) that humour in Captain Sabertooth is often derived from someone trying to be something he (most often male characters) trying to be braver and tougher than they are. A familiar theme to young children, one may assume.

Finally, the notion of inclusion can also account for some of the indirect marketing strategies used by Terje Formoe and his partners. The presence and closeness described above, make the whole universe of Captain Sabertooth very familiar for the children, and probably promotes their integration of this phenomenon into their everyday lives. Going to Kristiansand Zoo and being there among the Captain Sabertooth happenings and places also have a considerable indirect marketing effect, by the phenomenon being so available for the children. Also creating two-ways communication with the children can be considered an indirect marketing strategy. This happens through the website (www.captainsabertooth.com) and through the cartoon (also called activity magazine). In the latter magazine, children are encouraged to send in their pictures of themselves with their pirate heroes or draw Captain Sabertooth. One

striking example of how two-way communication and emotional bonds are created is the very clever creation of the so-called Pacifier Heaven:

Well...We in *Captain Sabertooth A/S* do not use marketing...I mean direct marketing to children...marketing in it's traditional sense. But we communicate in a different way; we get a lot of questions and letters here from children and their parents. For instance, we have a comic named "Kaptein Sabeltann" (*Captain Sabertooth*), which is a comic/magazine of activities through which we communicate with the children sending us letters and pictures that we put in. And we get a lot of letters from...different people...for instance related to *Captain Sabertooth's Pacifier Heaven*, which is an offer from us to the youngest children at about 4 years who are about to quit using their pacifier. They can send their big treasure here to *Captain Sabertooth* who promises to keep it and take care of it in his *Pacifier Heaven* – a treasury with seven chests full of pacifiers. Everybody who sends their pacifier to *Captain Sabertooth* receives a letter from him saying he will keep an eye on their treasure.... So we communicate at various levels, but we try to communicate through the stories and the universe that we represent." (Terje Formoe, 2006, see Nakken, 2007: 65).

This example illustrates some of the efforts made to create an emotional bond to small children, by offering to take care of one of their dearest belongings. This is definitely a strategy aimed at creating brand loyalty to Captain Sabertooth among the very youngest children. The cross-media properties of Captain Sabertooth also allow for children to move between passive and more active modes of consumption.

6. Brand Control

The core category in explaining the brand loyalty related to Captain Sabertooth is the notion of brand control. Brand control may be considered "the glue keeping the other components of brand building together and making them work properly" (Nakken 2007: 3). Brand control works at both the organizational and textual level.

Terje Formoe seems to have more long-term ambitions for Captain Sabertooth, making sure that this continues to be a children's classic in Norway, rather than a passing craze. Thus, according to Hjemdahl (2003), the author is the only one slowing down the economic aspect of his product, focusing on the cultural aspect. Terje Formoe expressed that improving his songs and stories in the only way to develop the brand. His business strategy is strict control over the product development related to Captain Sabertooth. This brand control seems to be a premise for the synergies of the network around Captain Sabertooth discussed earlier. In the words of Terje Formoe: "I have very strict rules which say that I shall improve everything related to Captain Sabertooth, that means the proper expression and also the way children are communicated to"(2006, see Nakken, 2007: 67). In order to secure that the different Captain Sabertooth products stay close to the origin, Formoe's company Captain Sabertooth's A/S work as a kind of quality control police. According to Formoe, only companies that he considers serious are given licence, and many producers who contact him are rejected.

The production network around Captain Sabertooth seem to share the understanding that the strict control that Terje Formoe exercises is important for the success of the brand, and especially for its long-term survival. This control is made possible by the fact that the production rights to Captain Sabertooth are licenced to different companies by Terje Formoe. Such licence agreements have proved to be an efficient way to develop the (economic) potential of a brand (Lindstrom and Seybold, 2003). Carelessness when giving licence rights to different producers may lead to economic losses, something that was the case with Nintendo and its Pokemon craze (see Tobin, 2004). Moreover, brand alliances may strengthen the brand (like Captain Sabertooth and Kristiansand Zoo), but they are also risky. As noticed by Nakken (2007), from the beginning Terje Formoe seemed very careful about whom to be

associated with; Due to his ambition to make Captain Sabertooth into a children's classic, he even changed the publisher house he cooperated with, in order to have one with more cultural weight. There are also brands one does not want to be associated with, in order not to tarnish the brand. The following quote from the interview with Terje Formoe may illustrate this:

Yes....once I cooperated with *McDonald's*. My publishing house *Cappelen* [a Norwegian publishing house] convinced me. We made two small campaigns with two small books. Actually, those books were quite all right. So....I thought....if they sell out....or give out a bunch of those books – which we already had sold out in the shops – that might be a very good promotion of the whole *Captain Sabertooth* concept. However, these campaigns became such a success for *McDonald's*...that they returned to me and asked for CDs and other stuff as well. But then I was clear on the issue: Now it was enough *McDonald's*. In fact, *McDonald's* is not what I want to be associated with first of all....Actually....it think it turns out a little bit wrong connecting *Captain Sabertooth* to *McDonald's*. But – as I said – it was *Cappelen* who convinced me, and *Cappelen* for me is a very serious company. I let me convince because I found the product quite good.” (TF, 2007, see Nakken p. 69)

The strict control also means keeping the stories and products close to their origin. For example in Captain Sabertooth the universe and characters are predictable and recognizable. Nakken (2007) argues, based on the interviews with Terje Formoe and the other network informants, that strict control is a precondition for creating a solid brand with a long life span, despite the fact that less control could have been more profitable in the short run. However, control is not only important related to production aspects of the brand. It is also important what is communicated about the brand to the public. The “Sabertooth war” in 1995 – when disagreements between Terje Formoe and Kristiansand Zoo about copyrights and royalties made big newspaper headlines, illustrated the negative effect when communication about the brand is beyond control. According to Hjemdahl (2003) this public argument about money could have undermined the credibility as cultural institutions of both Kristiansand Zoo and Captain Sabertooth.

7. Conclusion

In this paper, I have discussed some of the strategies used to create brand loyalty to Captain Sabertooth among Norwegian children. The categories of “synergies”, “inclusion” and “brand control” have been discussed as central elements in these strategies. The discussion is based on Nakken's case study of Captain Sabertooth (2007) where he claims that these concepts are highly interrelated (see figure p. 79). Brand control is regarded as the main foundation for creating brand loyalty to Captain Sabertooth, but this category presupposes and is related to the two others.

Synergies, as indicated, means that the structures and processes related to production are related. The cooperation between the production networks created synergies across organizational borders and across media borders. The result of this is also integrated marketing. Like more global crazes and cross-media products such as Pokemon and Disney (Tobin, 2004; Wasko, 2001), synergies of production may also lead to synergies between children's senses. In the case of Captain Sabertooth, the fact that the product is available in so many forms, probably has strengthened the experiences related to the brand.

Inclusion refers to the fact that the Captain Sabertooth brand is very including, in the sense that the content and products involve and activate children. The brand is also including in the way it communicates to a broad audience. Both boys and girls are given figures for

identification in the stories, and through inter-textual associations parents and also grandparents may be drawn in as well. But the main target group is of course children; the including nature of the stories and the different products enable children to enter this adventurous pirate universe. Thus, Captain Sabertooth becomes a cultural practice which does not only involve consuming, reading and watching, but also acting out and playing.

Brand control related to Captain Sabertooth is so central that it can “be considered the glue that keeps together all the other economic, organizational, social, psychological, and textual components of brand loyalty creation” (Nakken, 2007: 77). The author had a good “school” though his earlier cooperation with the Disney cooperation. Thus, Terje Formoe has been able to maintain control of the Captain Sabertooth brand while the content has been spread through numerous media channels. He has also been successful in choosing his partners in order to create positive brand alliances.

Brand loyalty among children is not easily created in a country like Norway, where globalization and an increased commercialization of childhood create fierce competition from other crazes, media products and toys. Despite the fact that the commercial aspects of Captain Sabertooth also has been heavily criticised in Norway (cf. Hjemdahl, 2003), Terje Formoe and his partners have been able to create strong brand, and even a children’s classic, where new generations of children are introduced to this phenomenon.

In fact, the brand loyalty of children for Captain Sabertooth is an important asset in further brand building. In the words of Nakken “Ever since his first success, Terje Formoe seems to have used a success as a fundament for a new success” (2007: 97). Again and again, he has improved the quality of the brand, and thus the equity, and thereby increased the loyalty among the audience. This is the secret between the long-lasting life-span of the Captain Sabertooth craze in Norway. The question is whether and how this good circle can be maintained, if Captain Sabertooth is going global like his originator is hoping to.

On the track of Norwegian childhood and the consuming child

The history of marketing to children: a study of the Norwegian company 'Proper Toys' ('A/S Riktige Leker') founded 1946¹

Abstract

The aim of this paper is to examine and discuss the products that are perhaps most strongly associated with the consuming child: toys. When describing and analysing the rise, growth and segmentation of the children's toys sector, focusing on the Norwegian company Proper Toys, we ask the following questions: What characterizes 'proper toys' in the definition of the company Proper Toys, and what forms the foundation for such a definition. By looking at how 'proper toys' are defined and singled out from other products, we also acquire an insight in how adults define childhood, how children's play is valued, and how children are considered as modern consumers, connected to an everincreasing level of marketing directed specifically towards them. The aim, therefore, is not to investigate a 'typical' toy store. Proper Toys was chosen based on its significant historical background and combined with the assertion that is implied in the very name: selling 'proper toys'. By arguing that something is 'proper' for children while something else is not, at some level one is also claiming that one knows what is 'best' for children. Such knowledge is likely to be based on certain notions of what childhood is and how adults should relate to children. Bringing these notions to the surface is the 'hidden agenda' of this paper.

¹ Tora Korsvold's *Selling childhoods and the history of marketing to children* is a subproject within the interdisciplinary project by David Buckingham and Vebjørng Tingstad, *Consuming Children: Commercialization and the Changing Construction of Childhood*. It is located at NOSEB for the period 2006-2009. Funding by the Norwegian Research Council is gratefully acknowledged. The paper is based on Linda Bomann's master thesis (forthcoming) *'Proper Toys of Norway. On the track of Norwegian childhood and the consuming child: A case study of the Norwegian company A/S Riktige Leker (1946-2007)*, which falls within the subproject.

Introduction

I well remember the first time I bought a wheelbarrow from Proper Toys² ... for my son who then was about two years old. I felt like a good mother because I had gone there to shop. So in some way I had already then, in the late 1960s, a consciousness that...or that Proper Toys meant something more than any other toy store. (From an interview with the chairman of the board of the company).

Consumption, in all its form, is a diverse and complex phenomenon. Consumption is most fully explicated and understood as a multifaceted concept (Edwards 2000: 30). The position of children here is of special interest. Empirical historical studies from other countries, like those by Daniel Cook (2004), Garry Cross (2004) and Ellen Seiter (1993) in the USA, have all shown us that children have been the focus of interest since the start of modern mass marketing. Marketing to children is not a new phenomenon, but so far we know very little about the rise of the Norwegian consuming child. Nevertheless, a modern consuming society took form in Norway in the 1930s, on the threshold of the Norwegian welfare state. Since the 1950s children have clearly been visible in the advertising of many products, like soft drinks.

Today consumption is a part of the everyday lives of most children and adults. In Norway, as one of the richest countries in the world, children's access to toys, as well as to products like mobile phones, computers and TVs, is extremely high. In 2006 85% of the population had access to a PC, 79% to the Internet and 80% to a DVD player (ssb.no/emner/07/02/30/medie/). Since Norway entered the consumer society in the post-war period, Norwegian families' patterns of consumption have changed dramatically. Families spend money both to buy and to organize their spare time, and they possess more consumer goods than ever. This development is also noticeable in the bedrooms of Norwegian children, with their large supply of all kinds of toys, leisure equipment and clothes for all kinds of activities (Brusdal 2001). The growth in consumption is enhanced by marketing directed specifically at children.

On the other hand, the Norwegian welfare state has created guidelines in order to protect children from the culture of mass consumption. Norwegian marketing regulations are intended to create suitable marketing practices. There is a particular concern here to protect children and young people from being exploited due to their 'inexperience and vulnerability' in the face of marketing pressures (NOU 2001: 6). There are also quite extensive regulations concerning marketing towards children in broadcasting. In this way, Norway stands out from other western countries and consumer societies such as England and USA. However, here we can observe interesting dilemmas and challenges in relation to the construction of childhood. The aim of this paper, however, is not to investigate the rise of the modern Norwegian consuming child, but more to describe a modern consuming culture. Children of pre-school age will be studied in greater detail by focusing on the company Proper Toys.

Data

Our text is based on a few, though important historical sources, both retrospective interviews and some written sources (see p. 12). The transcribed material from the interviews consists of 165 written pages. One interview was with the current manager of Proper Toys, who has worked for the company since 1989 and before achieving this position worked especially in marketing. He is an educated preschool teacher with work experience within his profession, but also has some training in marketing.

² Henceforward in this text, we will refer to the company as Proper Toys.

The second interview was with the Proper Toys chairman of the board, who has been with the company for an even longer period, since 1985. She is also a preschool teacher and is the president of the national committee of the World Organisation for Early Childhood Education (OMEPE). Our third informant is Norway's first ombudsman for children and a former customer of Proper Toys. As the leader of a psychological institute for children in need of therapeutic help (the Nic Waal Institute, founded after World War II), she was in contact with the company in the 1960s. Her educational background is as both a preschool teacher and a psychologist. She is also an important informant because her mother, one of the founders of Proper Toys, was also a well-known psychologist. The fourth person has been a shareholder since the founding of the company in 1946 and a central figure in it for more decades. She is a preschool teacher and a psychologist who took additional courses in pedagogy, and she worked in an institute of child welfare. She also knows the history of Proper Toys very well, from both her private and professional lives.

All our informants, however, had a great deal of knowledge of the company's history, which had been handed down from generation to generation. This, along with the fact that the running of the company has been continuous and that it has never been sold to 'outsiders' or gone in and out of business due to bankruptcy or other conditions, was helpful for us in obtaining valuable information. It is also clear to us that all the informants are speaking from a certain position of power, a rather elite position, at least as regards pedagogical and psychological knowledge. Since the beginning well-educated women have been engaged in the company. The structure of gender is itself worth considering, but we do not have the space to go into it in this paper.

The foundation of Proper Toys

Norwegian society has a generally positive attitude towards children judging from the level of political commitment that exists in establishing and supporting welfare services, but also from the laws that protect children. The positive attitude can also be regarded as an expression of the Nordic quest for equality and individual rights for children. In this respect the Norwegian authorities were in the vanguard.

At the beginning of the twentieth century, the developing Nordic preschool profession made important contributions to a specifically Nordic construction of childhood, stressing the children's point of view in early childhood education and taking care of children's need and interests. The pedagogy was based on a tradition of combining education and care. As we know, the Swedish pedagogue and novelist Ellen Key also urged the government to make the twentieth century the century of the child. In the 1930s the Swedish couple Alva and Gunnar Myrdal were strong advocates of state care. The foundation of Proper Toys must be seen within a broader context of Nordic child welfare and the role of the profession of preschool teacher.

By founding the Norwegian company Proper Toys in 1946, the active figures were a group of people consisting of preschool teachers, psychologists and others with a great interest in the welfare and upbringing of children. The idea was to open a toy store offering toys that were *riktig* in the Norwegian sense of the word, that is, 'right for children', 'proper' or 'suitable to play with'. Learning about the importance of providing children with toys, about which toys were proper for different age groups, and how to make such toys were all parts of the education of preschool teachers at the time (Korsvold 1997). The potential of the 'proper toy' for developing the child pedagogically, ergonomically and psychologically was therefore an important aspect

of this endeavour. It had to match the child's individual level of competence; neither too easy nor impossible to master. A typical indicator of this level was the child's age.

By using this knowledge to start a business of their own, the founders of Proper Toys wanted to make it easier for kindergartens to get hold of this kind of toy without having to produce it themselves. The concept of Proper Toys was based upon the idea of providing the very few Norwegians kindergartens with the ability to buy pedagogically 'correct' quality toys.

The company can therefore be regarded more as an aid to kindergartens and other institutions in their task of bringing up children rather than a company aiming at economic success by profiting from this need. From the very beginning the company had an idealistic profile, providing kindergartens but also parents with the ability to acquire affordable and 'pedagogically correct' quality toys by making such products available in their store, but also by spreading information about which toys were good, that is, suitable for the children. The preschool teacher's strong involvement in and commitment to Proper Toys also contributed to confirming their newly acquired professional significance in the area of raising children (Greve 1995, Korsvold 1998).

Vision and ideology

This profile, resembling that of an ideal organization, although in fact it was structured as a commercial company, contributed to the Norwegian Ministry of Social Affairs supporting the company financially with a subsidy from the very beginning. This was mainly because of the company's information work. In accordance with the regulations, Proper Toys had an educated preschool teacher attached to its office and appointed a 'pedagogical council' consisting of three individuals to ensure that the toys offered in the store were 'really proper'. A representative from the Ministry of Social Affairs participated on this 'council', which illustrates the political value of this endeavour for Norwegian society.

Above all, the founders must be seen as idealistic, working from a child-centred point of view in extending the provision of proper toys to children.

After World War II more kindergarten and day nurseries were built, albeit at a modest level. The new institutions needed more provision, such as new toys and other equipment. Since access to material resources was rather scarce, preschool teachers had to make toys for the kindergartens on their own (Korsvold 1997: 267-73). They also wanted to protect children from toys that might splinter and fall apart and even thus hurt children. The toys should be made of proper materials so they would last and be safe for children to play with.

From now on Proper Toys was to provide fresh support for this. The children were not addressed as customers, even though the products were made for them to use. It was the adults providing money for the products who were addressed directly by Proper Toys. In this cases, both preschool teacher and parents were being addressed.

Secondly, Proper Toys wanted to protect children from war toys, guns or the like, i.e. the new toys being produced on a more global market. The selection of toys created a 'wall' against 'the new' coming from the outside world. Therefore, the toys produced and sold by Proper Toys were based on a certain selection of toys. That is, it should be possible for the parents and preschool teachers to be able to recognize the same toys from their own childhood. Tradition and nostalgia were important elements informing the selection.

The members of the council shared the same professional or academic background as the initial founders and the stockholders. This shared background also led to a shared view of what were 'proper toys' for children. In its early years, the

company seemed to have a common basis of ideology, laying the ground for a new and better future starting with the children. A new interest in a child-friendly selection of toys, stimulating children's development and putting the children's point of view at the front, were central elements in the new ideology.

Here, the war toys were among the first toys to be considered im-proper for children to play with. There existed a clear pacifist tone in the board of Proper Toys in the late 1940s and in the 1950s, protesting not only against the cold war between east and west, but also against the marketing of certain toys to pre-school children. A trend in children's play, which was more than frowned upon by the founders of Proper Toys and other concerned adults, was playing with war toys, such as toy soldiers, tanks, bombers etc. The battle against war toys was therefore one of the most important causes the company took on, and in addition to not selling such toys, they also did important information work. Exerting ideological influence through information had increased through the new confidence in science that had grown up in the post-war period.

As the main criteria for proper toys was that they should stimulate the child's development and be of good quality (due to the product's durability), another important aspect of morality entered the scene when it came to defining im-proper toys.

In the 1940s and early 1950s, the toys were mainly produced in Norway by both private producers such as carpenters and other craftsmen, and official institutions such as prisons and rehabilitation centres for alcoholics, where the prisoners or patients produced toys on demand. In the 1960s and 1970s wood was regarded as a particularly suitable material from which to make good quality toys, as long as it was appropriately handled so that it was safe for the children to play with.

In the 1980s, new safety regulations for toys were introduced by the state requiring certain testing and documentation which could not be provided by the local toy manufacturers. This, along with the economic and cultural globalization of society in general, led to Proper Toys having to look internationally for new suppliers who could provide toys that would stand up to their new definitions of 'properness'. At this time the management alone had the necessary competence to perform the evaluation which was in accordance with the company's standards of properness. It was therefore decided that the responsibility for selecting and evaluating toys was to be handed over to the manager. Eventually the manager and the chairman of the board of Proper Toys began to buy shares as shareholders and passed them on to people who cared about the company. After struggling through the changes and economic challenges of the 1980s, on the threshold of the next decade, a new time began for Proper Toys: it started making money.

The child consumer

In this section we will go further by introducing some theoretical perspectives on childhood and the child consumer. According to David Buckingham, childhood as cultural representations are generally produced by adults, having the common feature of saying more about the idea than about children's actual lives. They can even be regarded as part of a continuous effort on the part of adults to gain control over childhood and its implications for children (Buckingham 2000: 8-9). As David Buckingham points out, childhood needs to be regarded as a historical, cultural and social variable, whose meaning is subject to a constant process of struggle and negotiation. Collective definitions of the group we call children are thus the outcomes

of social and discursive processes, where particular assumptions about what children are and should be are reinforced and naturalized (ibid.: 6-7).

Daniel Cook (2007) also looks at how the interests of capital, as represented by producers, marketers and advertisers, have formed a relationship with childhood represented by the consuming child, in which the first-mentioned group poses as the latter's allies, pledging their allegiance to 'the kids', and claiming that 'children come first'. This relationship was formed in the 1990s, and it has resulted in a considerable growth in the children's market. Cook defines this relationship as a discourse of children's empowerment through goods, and claims that it uses the term 'child empowerment' to offer 'solace' to parents, educators and any observer who may be concerned about the over-commercialization of childhood, thus selling goods along with their 'solace'. Children are often described as 'free market actors', thus making marketing to them a more morally acceptable practice.

Gary Cross's thesis is that the cute child redefined adult understanding of childhood in the rituals of family life in the early twentieth century. Later he describes a new shift, to the cool. He argues that the cool ultimately comes from the adult's romantic idea of the cute, the wondrous child, and the child's simultaneous embrace of and reaction to the cool. The key to understanding this transition is the child's need for distance from its parents, says Gary Cross. Early in the history of consumer culture, children found their own ways of becoming independent of adults.

Cross has also shown how toy companies and the new media have realized that they have to appeal to the wishes and wealth of children if they wanted to stay in business. Different companies at different times learned how to create a special world of children's own consumption. They also pulled young children much further from their parent's culture and experiences. How these processes were carried out, at different times and with different results, has not yet been clearly investigated. The late industrialized Scandinavian welfare states are drawing on other discourses of childhood, as is also the case for Proper Toys, a theme we will come back to.

Exploitation and individual autonomy

To sum up, both Cross's and Cook's studies deal with the history of modern children's culture and of how children contribute to this history, what is suitable for children or not, and how these attitudes have changed in different historical periods. Furthermore, they discuss the recent development in the 1990s, and the new relationship between capital and childhood. Both scholars strengthen the two important categories of class and gender, i.e. white urban middle-class parental values and their hegemonic role, but also how these values have been challenged by the market, and by the children themselves. They both also show a rather critical involvement with the terrain of capitalist childhood. As Daniel Cook has written in his book *The Commodification of childhood*, today children are born, live and grow in tandem with commercial culture. The twentieth century has not only been 'the century of the child', as it was christened by Ellen Key in 1909 – it must also be seen as the century of the child consumer (Cook 2004: 21). Markets shape persons in and through the consumer culture of childhood, though child consumers grow up to be something different than adult consumers and, let us add, the consumer culture and notions of childhoods are imbedded in national identities which differ.

Cook's historical research on the rise of the child consumer highlights how designers and marketers have managed to cultivate a consumer market at a deep level, beyond simple functional needs. Consumers are approached and addressed, as Cooks says, as having desires and aspirations that transcend the specific product at hand: the

need for belonging, for respect, for individuality and for being seen as someone worthy in the eyes of others. 'I felt like a good mother', the chairman of the board of the company Proper Toys insisted. As Pierre Bourdieu describes it, cultural capital consists of knowledge, tastes and preferences: it is the totality of an individual's learning, both formal and informal (Bourdieu 1995). As Bourdieu briefly explains, taste classifies, and it classifies the classifier. Taste is therefore seen precisely as the mechanism through which individual distinction operates alongside a wider question of social conformity. Cultural capital sees middle-class knowledge and expertise about proper toys – from moral values to issues of access and control across a wide range of toys, as well as including some toys and excluding others – as a key mechanism in the maintenance of social status. Proper toys paid for by adults to foster the skills of cultural capital will go through a selection process. Adults know what is 'proper' for children: they define 'outs' as well as 'ins' through the important factor of the exclusion of toys. In this way, consumption is connected to a more structural question of gate-keeping. Furthermore, children's consumption is very central in processes like individualization, inclusion and exclusion or marginalization because it is related to feelings of identity or belonging to a group of children or young people (Seiter 1993).

The changed relationships between children and parents are also extremely important. The recognition and appeasement of the child's point of view in commercial contexts began in the US in the 1930s and in Norway in the 1950s, marking a change not only in marketing and merchandising, but also in parent-child relations. From now on, the child's view was acknowledged, addressed and satisfied in many areas of social life. As Cook says, for a parent to do otherwise was to set themselves up as morally suspect.

Toys are more than tools in children's play, as Garry Cross also declares. They are also significant in the relationship between children and parents, where they serve as messages telling children what their parents expect of them, while also telling parents that their children seek recognition and freedom from them. These messages and how they have changed over the years mirror the history of childhood and child-raising (Cross 2004).

Here, as Cross implies, adults have created their own 'monsters'. By inflicting toys, signifying cuteness, suggesting what adults want children to be due to their own romanticized fantasies and idealized notions of the 'good childhood', making children accustomed to receiving such artefacts and opening the eyes of the toy industry to this immense potential, the 'nature' of available and popular toys have changed. As the toys have changed from properly sweet to improperly sexual, violent, grotesque objects threatening the 'innocent landscape of childhood', the latter was suddenly killed off by the change in its own symbols: the toys.

In the fragmented landscape of consumption today, the child consumer stands for both exploitation and individual autonomy. The marketers and advertisers have been able to position themselves and their products as children's allies. The social meaning of their goods and brands has reached a position where children 'come first'. Cook analyses this development by trying to uncover the hidden meaning of children's empowerment. Markets produce and reproduce social meaning, the meaning of things, of people, and generate particular meanings surrounding childhood and the child consumer. According to Cook, the construction of the autonomous child consumer shows the rational actor as the model of and for children's consumption. Since the 1990s the marketers have even come to believe that children are better equipped to resist the power of advertising and marketing due to changes in family structure and

to the increased choices offered to them in the market place.

What is often overlooked, is that to be empowered or to gain empowerment implies that one had already been in a state of disempowerment and that empowerment in some form is to be expected, desired and deserved. Through choice, recognition and involvement, the marketers want to liberate children from their powerless, circumscribed position in an adult-dominated world. They positively identify with children by adopting their point of view and perspective on the world. How is Proper Toys navigating today in this fragmented landscape?

The balance between proper and im-proper toys

We will now examine more closely Proper Toys' 'properness', seen within the innocent and threatened landscape of childhood. Since the notion of childhood is a social construction that indicates that every society has particular concepts about children and childhood which require and encourage the young generation to learn certain ways of behaving, thinking, speaking and interacting in terms of time and space, we also find different proper toys. The 'proper' toys that were marketed to children in 1946 or in the 1960s or today, are different, but we also find continuity.

How is the idea of 'properness' to be preserved when this idea is actually changing continuously? The toys offered by Proper Toys are selective, but how should they be profiled today? The child can choose, but with what possibility to choose 'im-proper' toys? Proper Toys means 'something else', as our informant said, but what?

Though Proper Toys was and is a commercial company, it is not a company that simply goes after the children's pocket money rather than their parents. The philosophy of the company or their idealism has changed but seems to have been compatible with economic prosperity, at least until the more recent period.

The problematic selection

Over the two last decades, there has been a steady growth in Proper Toys' economy. The company's definition of 'properness' has changed into something other than its legacy of idealism concerning what is best for the child.

The competence of the manager and chairman is, as already noted, that of educated preschool teachers. Their competence therefore seems satisfactory in relation to the company's traditional standards. The chairman is even the Norwegian president of the World Organization for Early Childhood Education or OMEP. The 'bond' between this organization and Proper Toys seems to be a tradition, given that many of the founders of Proper Toys also worked in this organization.

The company is still selective concerning the range of products that are offered in the store. Proper Toys distinguishes itself from other toy stores by not focusing on the heavily marketed, popular toys or the even more extreme and short-lived toy 'crazes', spin-offs from media texts, toys that 'every' child has to 'have' for a relatively short period of time. However, today this is a complex field.

Freedom of choice

For the first: Proper Toys markets a broad selection of toys to its customers. Individual differences between children are given as an important reason for this offering. Today the notion of diversity is important, that is, the ability to offer toys for every child, at least in the age group 0-6, whether a boy or a girl or a child with special needs. The greater variation allows children to relate to their own surroundings, since freedom of choice is closely related to modern consumerism,

where the choice between consumers and activities is emphasised, as it is by Proper Toys too.

Variety

Secondly, manifold is important. When it comes to prices too, Proper Toys makes an effort to have something to offer for 'everyone', not only those who are better off financially.

Aesthetics

Thirdly, as in the formative years in the 1940s and 1950s, design still plays an important role, emphasising the aesthetics of the toys. As taste varies individually, this is the argument for diversity in design.

Nostalgia

Fourthly, nostalgia is an underlying element that should still not be overlooked when studying the selection of proper toys. Parents want 'the best' for their own children, and their reference for this often seems to be certain positive memories of their own childhood. Symbols of a past childhood, such as toys with a nostalgic appeal (at least the wrapping), are therefore popular, and Proper Toys encourages this, as they have a broad selection of toys which have a nostalgic appeal to both parents and grandparents. From an adult point of view, cool toys can become 'cute in a cool way', as they see the 'cool' toys from their own childhood as 'cute' in retrospect.

Defining 'properness' through 'im-properness'?

In the last section we examine more closely how regarding some toys as im-proper toys has created a complexity that is hard to understand.

Proper Toys still does not sell toy weapons of any kind or 'aggression promoting toys', for example, action figures such as Teenage Mutant Ninja Turtles or Transformers. It does, however, sell superheroes like Superman or Batman, but none of their 'violent' accessories. They sell certain historical figures like Norseman figures, pirates, knights or cowboys, although these figures often tend to be holding weapons. However, they do not sell any modern figures that use 'high-tech' weapons. The argument for selling historical figures with weapons is that they represent a part of 'our' history, a play with certain narrative qualities, included characters and storylines. We find fictional portrayals of childlike figures, created in agreement with the adult image of children, and often exposed to challenges which they must handle in order for the story to take the right turn and for the characters to develop in the 'right' direction (Cross 2004: Chapter 5), thus agreeing with, and taking lessons from, the values that are regarded as proper by adults. The possibility that this hegemony increasingly seems to produce the reaction of children rebelling against it is another question.

Proper Toys has a legacy, manifested by its history, committing it to not selling war toys. The company wants to keep adult customers who expect to find carefully selected proper toys in its store, something different than what is being sold in other toy stores. They want 'the cute', not 'the cool', they want 'progress', not 'frivolity'.

For its part, the company has to modernize and select continually in order to stay in business. One of the strategies it has adopted has been to include a few of the new spin-offs from multimedia phenomena. Popular toys, even some of the 'crazes' such as Pokèmon from the Nintendo Company, have been included for a while.

Although the company still prefers toys which are ‘useful for children’s development’ above those which are generally popular and heavily marketed as entertainment, or better as ‘edu-tainment’, they have loosened their criteria for which toys can be included in their selection. Fun for the children seems to be more important than ‘the right progress of the child’, although selectivity is also a key word in this context. Spin-off products seem to constitute rather a supplement than a main attraction constituting a new commercial strategy. If the latter were the case, the company would come to appear like every other toy store and thus lose a segment of the market instead of keeping its core business going.

Like the Lego company (Hjarvard 2004: 52), Proper Toys is in some way is a rather restrictive one. Its development and power (or at least the symbolic power) seems to be based on its own ideas and values within a Nordic culture. An example of this protection and responsibility is the attitudes of both companies towards the Barbie doll. The Barbie doll is an example of an item that Proper Toys chose not to sell. The decision in the early 1960s was founded on their view of the Barbie doll as a toy that was discriminating in relation to women, an im-proper toy just as much as the ‘war toys’. A Barbie/youth soap-universe for older girls, in which exclusive leisure activities, above all fashion, make up the dominate play activity, , was considered im-proper. As with Lego’s educational and proper image, some fictional genres and narrative components were missing. Not only was violence strongly deprecated, but some sexual themes were also completely absent. The company did not want to encourage a beautiful or sexualised expression of childhood or femininity.

Proper Toys still does not sell Barbie dolls or any of the other fashion dolls either, as it does not want to promote this glamorous ‘all-about-beauty’ lifestyle to girls. As an alternative they sell dolls from the lesser known ‘Only Hearts Club’ brand. Here the dolls are more ‘normal’ looking, with various faces resembling girls in actual life. Although the manager acknowledges that Barbie is different today than she was in 1960s, since the general attitude towards her has changed, the manager still has reservations about her. In a steadily more complex and subtle market of new toys for children, the manager explained how at one point the company sold a collection of the brand new Bratz dolls. The dolls were considered acceptable for a while, until the new collection for the summer season came along: ‘This is getting more and more “porno”; get rid of it!’ There were fewer and fewer clothes on the dolls, he explained to us in the interview. The company regarded the increasing sexualisation of girls in media representations and the advertising of fashion clothing as a rather negative development.

The company still filters out the kinds of toys which are thought to send ‘wrong’ or morally incorrect messages to children, here exemplified by the ‘sexualized’ toys for girls. The reason for this is that the owners of Proper Toys relies on both their competence as educated preschool teachers and the norms of the company in the decision-making process. The more recent inclusion of some popular branded toys in which the pedagogical function is regarded as not being all that evident illustrates a greater appreciation of the entertaining function of toys than was apparent in earlier years. It shows that Proper Toys has opened its doors to toys which are popular. This popularity, however, is commercially produced. As Stig Hjarvard puts it: ‘The revolution in consumption has paved the way for a “hyper consumption”, in which a steady amount of consumer goods has to be sold and consumed within an ever-shorter time cycle’ (Hjarvard 2004: 45).

Conclusion

By looking at how proper toys are defined and singled out from other products, we also acquire an insight into the way in which adults define childhood, how children's play is valued, and how children are considered modern consumers, projected to an ever-increasing level of marketing. Markets produce and reproduce social meaning, as well as generate particular meanings surrounding childhood. Through choice, recognition and involvement, the marketers want to liberate children from their powerless, circumscribed position in an adult-dominated world above all because they want to sell goods.

However, parents and grandparents still come in to Proper Toys and decide what they want for their children and grandchildren. It would be wrong to say that children are forced to make the 'right choices', but probably they are more guided in doing so compared with other toy stores.

The toys seem to be very parent-friendly in their approach and profile. We still do not find 'war games' or 'sexualized' toys, but selecting them has become much more complicated than before. Today toy makers base new toy designs on children's fantasies based on children's own desires, which are separate from those of adults. A toy company invites children to help it in designing new products. Today advertisers are telling adults that childhood is a time for the child's exploration of play and fun, and they positively identify with children by adopting their point of view and perspective on the world.

The rhetoric of play as progress has a strong tradition within the company. This tradition builds on the hegemony of adults, which claims to know children's 'own good' better. Though individuality today is very important, Proper Toys takes a pride in offering something for every taste, but stimulating some kinds of play while excluding others, and balancing between pedagogical discourses on one hand and market forces on the other. This is a form of the progress rhetoric of play, pursued in order to maintain adult hegemony, says Sutton-Smith. He finds it paradoxical that 'children, who are supposed to be the players among us, are allowed much less freedom for irrational, wild, dark or deep play in Western culture than adults, who are thought not to play at all' (Sutton-Smith 1997: 151-2.)

Nonetheless Proper Toys still stands out as a niche store which specializes in offering a broad selection of toys and by filtering out toys that are perceived as im-proper by adults. Its selection of toys appeals both adults' nostalgia and taste, as it stresses design in a market which has changed fundamentally since 1946. The question is, however, whether proper toys today can be 'cool' enough for the 'new' kids, at a time when it has become even childish to play with toys, but attractive to play with media. By not addressing children as customers, Proper Toys' ideologically seems to agree with the notion that children should be protected from advertising due to their vulnerability as modern consumers, in line with the attitude of the Norwegian welfare state, which has created guidelines to protect children from the culture of mass consumption.

The company's changing definitions of proper and the im-proper toys are therefore part of a wider discourse produced by adults about children. Claiming to sell toys that are proper to children also entails promoting a view of adult responsibility, of what is 'best for children'. The selection of toys is made by adults and promoted towards adults, who provide them for their children. Toys given in such a way also serve as a message from the parents in telling children what their parents expect from and offer to them. By filtering out im-proper toys, such as the 'violent' toys and the 'sexualized' toys, from certain moral values which seem to pose a threat to the

hegemony of adults, Proper Toys poses a 'safe haven' for adults who want to guide children through a complex field of child consumption.

The store's name bears a legacy which seems to legitimize its right to define 'properness', although the company draws a fine line between an ideological commitment to the past and the position of a commercial company in a contemporary society defined in part by consumption. Coming closer to the present, it becomes even more necessary to consider marketing as a global phenomenon, the most important characteristic of our contemporary society (Baumann 1999). The emerging global market for children's goods is creating a new connection between children's personhood and children's consumption that we still know less about. Not at least, it is necessary to draw greater attention to the increased role of entertainment.

Finally, the history of Proper Toys is a history not only of marketing to children, but also of certain notions of what a Nordic childhood and Nordic culture are. To analyse how toys, childhood and the consuming child are viewed within certain discourses in Norway as a western consumer society, we can obtain more insights into consuming culture as its complexity.

The politics of food: Childhood, obesity and television advertising

Vebjørng Tingstad
Norwegian Centre for Child Research
Norwegian University of Science and Technology (NTNU)
Trondheim, Norway
Vebjorg.Tingstad@svt.ntnu.no

Abstract

This paper is based on a study which intends to analyse debates surrounding the regulation of 'junk-food' advertising to children, in the UK, the US and Norway, and the constructions or definitions of childhood that are at stake in these debates. These analyses will include media coverage, public debate and policy discourse; TV as well as press, if possible, corporate publicity, political documents and statements and textual analysis and interviews. The project seeks to contrast the ways in which child consumers are defined in the context of Norway with a much more consumer-oriented context like the US and a 'semi-regulated' setting like the UK.

1. Introduction: Obesity as a hot topic

Obesity has the recent years become a hot topic in policy debates, media discourse and academic literature in many countries. The phenomenon is even spoken of with concepts like *global epidemic* (Okie 2005) *globesity* (Dávidsdóttir 2005) and a *pandemic* which is suggested to be by far the fastest growing public health crisis in the industrialized world (Shell 2003). Among 8-12 years old children in Oslo (Norway), 21 % of them has an overweight/obesity problem (Andersen et al 2005) and at a national level this number is about 10-15 %. Obesity is not equally distributed in all families. Families where the parents have low education tend to have the highest level of child obesity. There are also some significant differences between Norway and other European countries and also compared to other Nordic countries. According to the National Council for Nutrition, there are significant differences for instance in food intake. In EU, 30 % of the child population is said to have a serious problem with the weight and the concern is that Europe will go in the same direction as US

and face an obesity problem out of control. A crucial question is how to tackle this problem. There has been a longstanding public concern over the potentially harmful effects of food promotion on children (Livingstone and Helsper 2006). And as a way to avoid this development, UK has banned television advertisement of unhealthy food to children under the age of 16 this year. In Norway, the situation is different. I will return to this later.

Discourses of the consuming child

This paper is part of a sub project *Discourses of the consuming child* under the umbrella “Consuming Children, Commercialisation and the Changing Construction of Childhood” which is a 3 year research project, financed by the Norwegian Research Council, running at the Norwegian centre for child research in Trondheim, Norway from 2006-2009.

<http://www.svt.ntnu.no/noseb/Consuming/> Some of the sub projects have already started, while some are about to start. I am developing my part of it this fall, so this presentation will be based both on some overall research questions, perspectives and approaches at this stage of the study.

What we intend to do is to analyse debates surrounding the regulation of ‘junk-food’ advertising to children, in the UK, the US and Norway, and the constructions or definitions of childhood that are at stake in these debates. These analyses will include media coverage, public debate and policy discourse; TV as well as press, if possible, corporate publicity, political documents and statements, etc. and textual analysis and interviews. The project seeks to contrast the ways in which child consumers are defined in the context of Norway with a much more consumer-oriented context like the US and a ‘semi-regulated’ setting like the UK. A MA-student has together with the project directors, David Buckingham and me, done interviews with key informants in UK. I am planning to do the same in Norway. This sub-project is a kind of reflexive meta-project – that is, one in which we will be interrogating the assumptions and discourses about childhood that characterise the whole range of areas we are considering here, including not just marketing discourse but also policy, academic discourse, public debate, etc.

As a ‘hot’ topic in policy debates in many countries, the obesity debates raise a series of questions. Some questions to be addressed (from the proposal, <http://www.svt.ntnu.no/noseb/Consuming/TheProject.htm>) include:

- To what extent, and by whom, are children defined as competent or incompetent, as passive consumers or as active agents, as vulnerable and ignorant or as ‘savvy’ and sophisticated?
- How do these competing discourses about child consumers relate to broader definitions and representations of childhood in the public sphere?
- To what extent are these discourses based on essentialist notions of childhood and adulthood as separate ‘spaces’?
- What evidence is adduced to support the various positions that are adopted?
- To what extent is the commercial targeting of children precipitating a public health crisis?
- To what extent might the regulation of marketing practices (e.g. advertising of ‘junk food’, food labelling) be able to prevent this?

This topic relates to children quite literally as ‘consumers’; and the debates that have been carried on (in the public media, in policy circles) raise, as already mentioned, fundamental questions about the relation between the state and the market, about the construction of children’s ‘wants’ and ‘needs’, about relations between parents and children, and so on. They also raise questions about the relationship between academic research (which is actually quite equivocal on these issues) and the making of public policy (which needs to be seen to provide ‘solutions’). The debate raises some interesting questions about the construction of childhood (‘innocence’ versus ‘experience’), and about the role of marketing (corrupting the innocent).

The project, as I describe it here as a discourse analyses based on material from so different contexts as UK, US and Norway, might look too ambitious, even impossible to carry out. We have, however, not any ambition of doing a comparative study in a strict sense, but rather use the different contexts to identify differences and similarities.

One way to approach these questions in a concrete and manageable way is to figure out:

- Who are the actors in these debates?
- What are their arguments?
- What conceptions of childhood are implicitly embedded in the debates and arguments?
- On what kind of rationale and evidence are political recommendations based?

A crucial question to ask is also whether the industry and the market are becoming easy scapegoats to be blamed for causing problems that are far more complex than being isolated to a matter of one single cause-and-effect.

Public debates

In public debates, child obesity is often presented as the most serious aspect of the obesity problem. Media coverage such as the newspaper headlines below, gathered over a couple of weeks in Norway in the spring of 2003, shows some examples of a cultural discourse where food and beverage, nutrition, health and body is intertwined with contemporary anxieties about children and childhood.

- To get slim is becoming an increased problem among children.
- Children get too much sweet drinks and sweets.
- Young people get diabetes 2.
- Day care children risk mal nutrition.
- With jam on the time table (Rogers and Tingstad 2003).

An increasing number of debates over the last years calls for immediate action to tackle child obesity. Several activist groups and experts of different kinds emerge to take care of these issues, such as different consumer groups and consumer organisations as well as nutritionists, medical experts and politicians. Food and health are not any longer a topic just for a few experts. The obesity debates escalate in a context which in terms of time and space is linked to other hot issues related to food, such as food additiveness in food, anorexia, bulimia, mal nutrition and global inequality in food distribution. With reference to food scandals, such as the outbreak of BSE (bovine spongiform encephalopathy), the debates over GMOs (genetically modified organisms) and salmonella and dioxins in chicken, Lien (2004) regards the 1990s as to represent a historical watershed with regard to the way food is thought about, talked about and handled. She argues that what could previously be left to food-safety authorities and nutrition expertise, hit the headlines of the news media and became a topic of expert controversy and public debate. Food is no longer simply a much-needed material resource. Its purchase is now linked to the need to balance monetary concerns with issues of risk and distrust. Lien argues that contemporary issues about food and nutrition require that

our notion of the politics of food is expanded to fields not traditionally thought of as 'political'.

Theoretical approach

Food and nutrition thus have emerged as discourses in contemporary societies. In this paper, I use the term 'discourse' in a wide and non-technical sense (Potter and Wetherell 2001), taking the view that since representations of the world are interpretations, they imply constructions, some of which will be obvious and natural and therefore hegemonic (Gullestad 2002). Such interpretations emerge in discursive formations that are constantly undergoing changes.

Foucault states that discourses are "practices that systematically form the objects of which they speak" (Foucault 1972: 49). By studying them, it is possible to identify connotations that are related to social categories and how they shift according to historical, political and social contexts.

Food is, whether it refers to scandals or child obesity, highly political and controversial in the sense that it is linked to a wide range of issues and complex processes in society, like global market economy and various commercial interests, conflicting ideas of national regulation, nutrition and health, environmental issues like "green and clean food" and "short travelled food" (kortreist mat), cultural traditions, personal food preferences and cultural constructions of body and appearance. As food and obesity relate to a "reality" which is closely connected to these various issues, processes and interests, the rationale beyond different arguments and the definitions of the concepts in use are also complex and often contradicting and problematic.

The concept of obesity is, for instance, problematic as it often is taken for granted as a fixed and clear concept. But as Pollock has described, this concept has traditionally been dominated by biological and medical criteria. These have been based on a dimension of body image that is formulated around a particular society's considerations of acceptable body size and with strong negative overtones through the development of philosophical tenets that support the idea that the flesh must be controlled by the spirit...or the mind over the body (Pollock 1995). For children such considerations may mean that they from birth are measured and evaluated according to 'normal' standards of height and weight.

"A number of different measures to define obesity have been proposed in the literature. These enable a numerical value to be assigned against which it is possible to assess whether a particular body is over-or-undersized. Body mass index (BMI) has

been the value most widely used in the United States and Britain; this correlates weight in kg with height in cm squared to yield a figure somewhere between 20 and 30 as a desirable weight/height ratio for western adults (Pollock 1995: xviii).

These measures have, according to Pollock, been questioned as they are derived from select groups of participants, not from a random selection of any given population. Another question is that such measures of obesity have been derived and used as indicators of the risks of certain diseases or of mortality; i.e. that a particular BMI qualifies a person for the risk of suffering coronary heart disease, hypertension and associated diseases such as diabetes. The focus has also here been mainly on western populations. An interesting dimension, as mentioned by Pollock, is that large body size was identified as a risk to survival in 1911 when the first life insurance data were being compiled. These studies established the baseline for acceptable versus non-acceptable standards of body size in both the United States and Great Britain (Bray 1979). As a result, standard average tables have become established that correlate height with weight. The question Pollock asks is whether the very existence of these kinds of overall measures may be as much the cause as it is part of the treatment, arguing that a number of authors have contested the association between obesity and western diseases. Several authors raise cautions about linking food practices too closely to obesity. These authors argue that there is a loose linkage between food intake and body weight; rather they argue for a wider genetic-environmental interaction (Huenemann et.al 1996; Sobal and Stunkard 1989). A recent article challenges the dominant idea that the driving factors behind expanding epidemics such as obesity are ascribed to a mismatch between the body's homeostatic nutrient requirements and dietary excess, coupled with insufficient exercise (Grün and Blumberg 2007). These authors present a hypothesis, proposing that exposure to a toxic chemical burden is put on top of on these conditions to initiate or make worse the development of obesity and its associated health consequences. It is obvious that it makes a difference, politically, whether the focus in the obesity discourse is placed on the individual intake of sugar and fat and the level of exercise or, on the other hand, on a more global 'politics of food', in which wider questions about food production are involved.

Regulating television advertising: the question of age and competence

It has been taken several initiatives both nationally and internationally, intending to deal with obesity as a serious health problem. The "diagnose" and the "medicine" which different actors prescribe are, however, rather contradicting. There seems to be an emerging consensus that

regulation of food advertising to children is both necessary and achievable (Ashton 2004). In May 2006, the World Health Organization organized a Forum and Technical Meeting on the marketing of food and non-alcoholic beverages to children. This meeting was held in Oslo. The objectives of the Forum were “to review the current state of knowledge regarding the influence of marketing, including advertising, of foods and non-alcoholic beverages on children’s dietary choices; to discuss the implications of this influence on children’s nutritional status; and to review national experiences and actions taken by various stakeholders to address the issue” (WHO 2006). ‘Marketing’ includes here all forms of commercial promotion; that means promotion that is deliberately targeted to children and scheduled to reach them and promotion that is targeted at other groups but to which children are widely exposed. An interesting aspect in the WHO report is linked to the definition of the concept of children. ‘Children’ is, not surprisingly, agreed to mean all persons aged under 18 years, following the United Nations Convention on the Rights of the Child. But in this context, it was recognized that “children under the age of about 13 years are more vulnerable and may therefore require more stringent protections” (WHO 2006:1). The report also highlights what is assumed as a fact; that food advertising affects food choices and influences dietary habits and specifies that food and beverage advertisements should not exploit children’s inexperience or credulity. A question to ask is on what kind of rationale this exact age indication was decided. As Livingstone and Helsper argue, it is widely assumed in academic and policy circles that younger children are more influenced by advertising than are older children (Livingstone and Helsper 2006). By reviewing empirical findings in relation to advertising and children’s food choice, they critically examine the theoretical gap in the literature regarding the relationship between advertising literacy and advertising effects. They reject the assumption that younger children are more influenced by advertising than older children. They hesitate to draw the opposite conclusion, namely that teenagers are more affected by advertising than young children. There is evidence, they argue, that children of all ages are affected by advertising.

The ongoing debates and formal encounters and reports about the relations between child obesity and television advertising, which this WHO meeting was a part of, represent a discourse, raising fundamental questions. These questions go beyond the issue of food, such as the relation between the state and the market, parents and children, children and media, the various ways in which children’s everyday lives are organised, such as the apparent declining level of physical activity and the sedentary lifestyles compared to a few

generations ago (Ashton 2004), and not least, the questions of age and images of childhood.

It is possible to analyse the discourses about childhood and obesity in terms of the concept 'moral panic' (Cohen 1972). Referring to Great Britain, Jenkins (1992) discusses the role of moral panics in the 1980s concerning what was characterised as social problems, such as drug and drink problems, violence, and interest groups approaching what is defined as social problems. "In each case", he argues,

"...we find a number of influential claims-makers, each with a set of interest or a political agenda. There is evidence for the role of all types of moral entrepreneurs and interest groups: individuals, pressure groups, and bureaucratic agencies, with a complex and often shifting pattern of alliances between them" (Philips 1992: 10).

Looking at the obesity discourse, we may also face a certain level of convergence and an "interdependence of panics", not least related to competing definitions of childhood that are apparent in many public policy debates. This interdependence means that problems and panics are closely connected to each other, and it is essential to understand them as an interlinked complex rather than as single and independent incidents. One panic is fruitful for another and vice versa, so to speak. This approach will constitute a central theoretical perspective in the study which I now am going to present.

The banning of junk food advertisements in Great Britain

A context which surrounds the debates about children and obesity is the British banning of junk food advertisement in children's television and the arguments that the food industry, the market and the media are the ones to blame for the obesity epidemic. Ofcom (Office of Communication), the British media regulator, introduced new restrictions in 2007 on the television advertising of food and drink products to children. Ofcom decided that one of its regulatory objectives is to reduce significantly the exposure of children under 16 to the advertising of food and drink products that are high in fat, salt and sugar (HFSS). This will be done, according to Ofcom, by the most targeted and proportionate means as possible, balancing this objective against its statutory duties to secure television programmes of high quality and wide appeal. Ofcom has also decided that restrictions targeting the advertising of HFSS products will use the current Nutrient Profiling scheme developed by the Food Standards Agency. On the balance of the evidence, Ofcom believes that the best way to

achieve its objectives would be a total ban on HFSS food and drink advertisements in and around all programmes of particular appeal to children under the age of 16, broadcast at any time of day or night on any channel.

The Norwegian case

In Norway, this situation is somewhat different. A crucial aspect is that television advertisement has always been strictly regulated. The public broadcaster NRK was the only television channel until early 1980s when the commercial television channels were introduced for the first time and the monopoly of NRK was challenged. Television companies which produce children's television and send from Norway are not allowed to show advertisements in their programs. With the exception of an increasing number of spin-off products, being promoted from early 1990s, children have to a large extent been protected from direct marketing through television targeted to them. The Office of the Consumer Ombudsman is an independent authority that monitors marketing activities and negotiates contracts between consumers and business. In addition, the Ombudsman can impose sanctions. The Marketing Control Act is the general regulation for all marketing activities supervised by the Consumer Ombudsman. This act states that marketing activities should not be in conflict with good marketing practice or otherwise unfair on consumers. Marketing should not be misleading or incorrect. The Office of the Consumer Ombudsman has handled several cases of misleading or incorrect marketing practices, most of which have been initiated by consumers. The ombudsman says in the WHO report that there is no overall self-regulatory framework to address food marketing aimed at children in Norway. Several companies claim to have internal guidelines, but do not promote them. No initiatives have been taken by trade associations to establish a self-regulatory framework.

As a conclusion, there is no final conclusion yet where the policies is going in Norway; the arguments so far seem mainly to have been in favour of a politics of self-regulations, trusting the food industry and marketers. Hopefully, this study will give more knowledge on this issue.

Abstract

As expected, immediately after the changeover to the euro, consumer price knowledge in Finland was clearly weaker than in the era of the Finnish mark. However, a surprising result of our study was that this weakening was not only an initial and short-term shock caused by the new currency. Consumer price knowledge has not improved significantly in five years. It looks probable that the reason for the decreased price knowledge is the change in nominal values. Earlier literature has shown the relevance of nominal values in the market. The results of our study indicate that nominal measures have a strong impact on how consumers estimate prices and, therefore, on how they learn prices.

1. Introduction

Price is one of the most important criteria in the choice of both stores and products (see e.g. Monroe & Lee, 1999; Binkley & Bejnarowicz, 2003). Its importance, however, depends on the product, situation and consumer characteristics. In grocery retailing the price of a product is an elementary attribute, both for retailers and consumers. Retailers by and large apply prices in their marketing activities. Because consumers visit grocery stores several times a week, and buy certain items frequently, we may suppose that they learn the prices of these products. Furthermore, price development is officially followed in inflation rates.

In neoclassical economics it is assumed that consumers collect all the relevant information and are therefore conscious and rational actors in the market. In practice this assumption is incorrect (see e.g. Vanhuele & Drèze, 2002). Several studies have demonstrated that consumers do not even know the prices of the products they have just selected in the store (e.g. Dickson & Sawyer, 1990; Wakefield & Inman, 1993). This has been explained by a lack of attention and motivation among consumers, difficulties in storing and retrieving prices from the memory, as well as the disturbance in a store environment (Vanhuele et al., 2006, 163).

The introduction of the euro in 2002 confused people's conceptions of prices. Consumers throughout the eurozone claimed inflation to be higher than it was officially calculated to be right after the changeover in early 2002. The gap between actual and perceived inflation grew even wider in the course of 2002. The euro is not the only explanation for this confusion. Another important reason, according to the ECB, is the concurrent rise in the prices of frequently purchased goods, such as food and petrol. (ECB, 2002.) The prices of products that belong centrally to consumers' everyday life have too much emphasis when laymen estimate inflation.

The euro changeover stimulated price knowledge research in Europe (e.g. Jonas et al., 2002; Aalto-Setälä & Raijas, 2003a, 2003b, 2005; Anttila, 2004; Guido & Peluso, 2004; Marques & Dehaene, 2004; Gamble, 2006). The issue is interesting in many forums: in science, politics, retailing and consumers' everyday life. In our earlier study (Aalto-Setälä & Raijas, 2003a) we found that the introduction of the euro was a shock for consumers and resulted in a dramatic fall in their knowledge of prices, even of frequently purchased groceries (Aalto-Setälä & Raijas, 2003b). The same result was also found in Austria and Portugal (Marques & Dehaene, 2004).

This study further examines the consumer price-learning process. Our long-term study utilizes the massive real experiment in Western Europe – the euro changeover – to witness how long it will take for consumers to learn prices expressed in a new currency. Based on the assumption that grocery prices are frequently seen everywhere, we would like to determine the speed of this learning process.

The paper is organized as follows. The next section reviews earlier research in this field, following by a description of the data and methods used in our study. After that we present our empirical analysis and results. The final section contains discussion and our conclusions.

2. Previous studies

Price awareness or *price knowledge* refers to the ability of consumers to remember the prices of commodities. In earlier studies, price knowledge has mainly been operationalised as the ability of shoppers to 1) tell the exact prices for those products they have just bought, 2) rank items according to their prices, and 3) recognise the price of a particular item (see Monroe & Lee, 1999). Consumer price knowledge has been widely studied, especially for frequently purchased groceries such as coffee, breakfast cereals, soft drinks, and milk (Conover, 1986; Dickson &

Sawyer, 1990; Krishna et al., 1991; Wakefield & Inman, 1993). These studies have concluded that consumer price knowledge is quite limited.

Since March 2000 the European Commission has regularly monitored the changes in citizens' general perceptions concerning the euro in all 12 euro countries. Here we examine the results for Finland. In 2006, over two thirds of Finns had adjusted to the euro without difficulties. The other side of the result, however, is that a sizable proportion of Finnish citizens still have at least some difficulties with the euro. In Finland the adoption of the euro has proceeded faster than in the eurozone on average, where 59% have reported no difficulty in the use of the euro. Even though the majority of euro citizens feel quite comfortable with the euro, improvements in handling euros from 2003 to 2006 have been minor. In other words, those who had no difficulties with the euro adopted it immediately after the changeover, and those who have had some problems are learning to get used it very slowly. Consumers have found the benefits of the euro to include the convenience when travelling around Europe, price comparison between the euro countries and Europe's stronger status in the world. However, consumers are still convinced that the euro has influenced inflation: as many as 91% of Finns thought that the introduction of the euro has increased prices. (European Commission, 2006, 5–34.)

The euro changeover brought consumers to a situation where they had to create a new set of monetary references and a new scale of prices (see Guido & Peluso, 2004, 200). All this can be learned easily in case of frequently purchased products, but when making more rare purchases of expensive items the former currency is more easily utilised. With small purchases, Finns are able to think in euros, but with exceptional purchases they still lean on the former currency. Consumers tend to convert prices to the euro in an uncomplicated way. In Finland the euro corresponds to 5.94573 Finnish marks, so the rounded conversion rate is six. Nonetheless, three out of four think that dual pricing is not useful for them. (European Commission, 2006, 12, 20.)

Market prices and pricing strategies have a considerable effect on how consumers learn new prices (Juliussen et al., 2005). Research has suggested that consumers live in a "euro illusion" where they evaluate prices in a nominal, not a real value (Burgoyne et al., 1999; Jonas et al., 2002). The term 'money illusion' refers to a tendency to think of prices in terms of nominal rather than real monetary values. Money illusion was already described in the first half of the 20th century (Fisher, 1928). However, the success of the rational expectations revolution caused money illusion to disappear as a topic of economics until behavioural economists started to examine the issue again. Perhaps the best-known articles about money illusion are those of Shafir et al. (1997) and Fehr and Tyran (2001). These articles showed that people often think about economic transactions not only in real terms but also in nominal terms. Fehr and Tyran further showed that money illusion has an impact on market mechanisms. The impact of money illusion is especially significant after a negative nominal shock because people are reluctant to reduce nominal prices.

The euro changeover is obviously a huge possible source of money illusion. In Finland, like in most euro countries, nominal prices are lower in euros than they were in the former national currency. With the euro illusion, consumers systematically overestimate prices with a high

nominal value and underestimate prices with a low nominal value (Gamble 2006, 532). When nominal prices expressed in euros are lower than in the former national currency, prices appear to be cheaper than earlier. This might have some influence on shopping behaviour. Almost half of Finns told that the euro has had no influence on their purchasing behaviour, but more than one in three said they buy more because they have difficulties understanding how much they are spending (European Commission, 2006, 13).

3. Data and methods

We have examined the price knowledge of Finnish consumers since the euro changeover and reported the results in several papers (Aalto-Setälä & Raijas, 2003a, 2003b, 2005). We developed a completely new approach to studying price knowledge, comparing consumer price estimations with actual market prices. Our study thus follows one of the main traditions in price knowledge research (see Dickson & Sawyer, 1990; Mazumdar & Monroe, 1992; Estelami 1998), as we compare consumers' estimated prices with actual prices. Our longitudinal data are, however, unique because we have collected the data at several points in time before and after the changeover to the euro.

This study utilizes unique data sets from the era of the national currency (2001) up until five years after the euro changeover. The aim of the study is to examine consumer price knowledge with two data sets: price data and price estimate data. The data sets were collected at six time points: at the end of 2001 (just before the euro changeover), in March 2002 (three months after the changeover), January 2003 (one year after the changeover), January 2004 (two years after the changeover), January 2005 (three years after the changeover), and January 2007 (five years after the changeover). As a consequence, we have obtained unique information about the consumer price-learning process from the end of 2001 until the beginning of 2007.

For our study we selected five everyday products sold in grocery stores. The products in the data are: a 1.5 litre bottle of *Coca Cola* soft drink, a 500 gram package of *Juhla Mokka* coffee, a 580 gram package of *HK sausage*, 1 litre of 1% fat milk, and a 1 kilogram package of sugar. *Coca Cola*, *Juhla Mokka* and *HK sausage* represent the leading brands in their product categories in Finnish grocery markets. The brands of milk and sugar were not specified. Milk and sugar are homogenous products that have no significant variation between brands in either quality or price. There are also very few companies in Finland that produce these items.

Price data

The price data set contains observations of the actual prices of the selected items mentioned above. The price inspectors from the Finnish Consumer Agency visited 82 grocery stores around Finland during two days at the six time points (from 2001 to 2007, see above), collecting the prices of the designated products. The data collection process was identical each year. The retailers were given no prior notice of the inspectors' visits in order to ensure that the prices

would be “normal.” Of course, as always, some of the items could be on special offer at a particular point in the data collection. Price data were gathered from the sample, which included all types of grocery stores, small and large. However, the sample is biased towards supermarkets and hypermarkets and, as a result, does not generally represent Finnish grocery stores. Large grocery stores typically have a lower price level than smaller ones, and so the prices in our data would have been slightly higher had we collected more price data from small stores.

Price estimate data

The data on the consumers’ price estimates were collected by telephone interviews. The sample of consumers was stratified. The price estimate data include 1000 interviews in each year and the data collection was conducted at the same time as the price data. The consumers were not the same in each data collection period but were selected randomly. In the telephone interview we assumed that the respondents had no opportunity to check any prices but had to immediately tell the price they remembered. The sample represents the adult population between 15 and 79 years old in Finland. Half of the respondents were women and half men. The data emphasized the older age groups: 27% of the respondents were 35–49 years old and 42% were 50–79 years old. Altogether, 28% of the respondents had attended elementary school and the same percentage vocational school. A quarter of the respondents were workers, a quarter were retired and a fifth were officials; 38% of the respondent lived in families with children, 25% were childless couples, and 21% lived alone. The respondents lived in different parts in Finland: 41% in Southern Finland and 35% in Western Finland.

Methods

This study examines consumer price knowledge from 2001 until 2007. In our analysis we utilize two measures of price knowledge: the *proportion of the respondents* who were able to estimate the prices of the selected products and the *mean difference* between the average market price and the single price estimate. The mean difference is calculated as the proportion of the average price.

4. Results

Table 1 presents the proportion the respondents who could estimate the prices of the selected products and the mean difference between the average market price and single price estimate. In the empirical analysis we divide the respondents into three age groups: 15–29 years, 30–49 years and 50–74 years.

In 2001, 94% of the participants were able to give price estimates. The youngest consumers were most often able to give a price estimate while the response rate of the oldest consumers was the lowest. Immediately after the changeover, the average response rate dropped from 94% to 84%. Although the response rate was already lowest among the oldest participants in 2001, it also decreased more after the changeover in this age group than among younger respondents.

Surprisingly, the response rate has improved very slowly since the changeover, and at present it is still 6 percentage units lower than in 2001.

In 2001 the average mean error was 0.197, meaning that the difference between the average market price and the single consumer price estimate was on average 19.7%. The mean error increased after the changeover to the euro and has not decreased since then. As a matter of fact, the mean error is even higher five years after the changeover in 2007 than it was immediately after the changeover in 2002. The mean error among the youngest respondents has been the highest with the exception of 2007, when the oldest respondents had the highest mean error.

Table 1. The proportion of participants in each age group able to provide price estimates for selected products (response rate) and mean error of price estimates from 2001–2007

	2001	2002	2003	2004	2005	2007
<i>Response rate:</i>						
15 – 29 years	97	90	93	94	92	95
30 – 49 years	96	87	90	92	90	92
50 – 74 years	89	74	75	78	77	77
Average	94.0	83.7	86.0	88.0	86.3	88.0
<i>Mean error:</i>						
15 – 29 years	0.22	0.26	0.24	0.29	0.28	0.27
30 – 49 years	0.18	0.20	0.20	0.23	0.24	0.25
50 – 74 years	0.19	0.21	0.21	0.26	0.25	0.28
Average	0.197	0.223	0.217	0.260	0.257	0.266

The development of consumer price knowledge over time can be distinctly seen in Figure 1. The values of the response rates and mean errors (from Table 1) have been indexed to be 1 in 2001. Thus, the years 2002 to 2007 are compared to 2001. Figure 1 illustrates that the response rate decreased immediately after the euro changeover and has recovered to only a minor extent. The mean error deteriorated immediately after the changeover. Surprisingly, the mean error has not improved during the five years since the changeover and was highest in 2007. Thus, it appears unlikely that consumer price knowledge will recover in the near future to the same level as before the euro changeover.

Figure 1. Development of the response rate (proportion of participants able to give a price estimate for selected products) and the mean error of price estimates from 2001 – 2007 relative to the values in 2001

It is relevant to note that the age groups were not fixed at the time the euro changeover. Instead, all the age groups have received younger respondents during the euro period and lost older respondents, respectively. For example, the youngest respondents of the age group 15–29 years in 2007 were only 10 years old at the time of the changeover and the oldest were 24 years old. Thus, the youngest respondents in 2007 were less familiar with the old currency, and for them it has probably been easier to learn euro prices. Some of the respondents in the middle age group have moved to the oldest one, which should have caused the price knowledge of the oldest age group to rise. This has not, however, happened. Because our results indicate that the youngest respondents had a better response rate than the older ones at all time points, the composition of the age group should at least have a significantly effect on the response rate. However, as shown above, the improvement in the response rate has been very slow.

5. Concluding remarks

As expected, immediately after the changeover to the euro, consumer price knowledge was clearly weaker than in the era of the national currency. However, a rather surprising result of our study was that this weakening was not only an initial and short-term shock caused by the new currency. Consumer price knowledge has not improved significantly in five years. We expected the price estimations to become more accurate, but this did not happen. This suggests that the

main reason for the decreased price knowledge has not been the change in prices itself but something else. If the change in prices was the main reason for decrease in price knowledge, consumers would be expected to learn the new prices in euros within five years. However, it appears that nominal euro values are more difficult to learn than earlier markka values. Another possible explanation for the decreased price knowledge is ignorance of prices: because of the rising standard of living, consumers are indifferent to the prices of products that are inexpensive. Unfortunately, we have only one cross-section of the data from the period under the national currency.

However, it appears more likely that the reason for the decrease in price knowledge has been the change in nominal values. Previous research has demonstrated that nominal values affect the behaviour of consumers and even market outcomes (Shafir et al., 2001; Fehr & Tyran, 2001). The results of our study indicate that nominal measures have a strong impact on how consumers estimate prices and, therefore, on how they learn prices. The very slow recovery of price knowledge appears to be mainly due to a lack of clear patterns in pricing compared with the era of the national currency. In other words, under the national currency retailers had an established pricing system that was familiar to consumers (Aalto-Setälä, 2005). Thus, the euro not only changed individual prices but also transformed the whole pricing process. Consumers no longer have reference prices because retailer pricing strategies are strange to them.

The nominal value of the euro is much lower than that of the former national currency. The products chosen for our study have a low nominal value and therefore, as we stated earlier, consumers tend to overestimate their prices. Therefore, it appears that the scale on which consumers estimate prices has changed. In the period of the national currency, one Finnish mark (≈ 0.16 cents) was the interval of frequently-used estimates. In the euro period, 1 euro or 50 cents has become the interval of price estimates. In other words, the scale of price estimates has become considerably cruder.

We found the respondent's age to contribute to the price learning process: the price knowledge of those respondents aged 50–74 years decreased most and the younger consumers learned the euro prices best. What is the destiny of the oldest consumers? Will they remain confused with the currency for the rest of their lives? Do consumers still think of prices in the former national currency?

To summarise, the price learning process following the changeover to the euro has been complicated because consumers have had two major issues to learn: the new currency and the new pricing system. This phenomenon should be investigated further, focusing on the background of the price learning process.

Abstract:

Although the idea of the self-governing consumer has been widely disputed (Packard 1955), shopping spaces are seen as the key arena of the sovereign and empowered consumer. Still, purchasing patterns seem predictable over time, something that is explained as the result of consumer routines and habits. Inspired by Foucault's (1975) general thesis that individual freedom presupposes techniques of discipline, this paper explains consumer routines as an outcome of governance structures in modern retailing. First, shopping in modern supermarkets is described as a sort of embodied practice that hinge on various techniques of bodily discipline. Secondly, we relate these techniques to merchandising and customer programmes in grocery retailing. We conclude by saying that power and discipline is an underscored explanation to consumer routines.

Introduction

The modern supermarket with its endless shelves of products and varieties is seen as the ultimate arena of free choice. In the supermarkets, says Milton Friedman, "you get precisely what you voted for, and so does everyone else" (Friedman and Friedman 1980:65). In spite of portrayals of the modern shopper as sovereign, unmanageable, disloyal and exploring, there is a parallel story emphasizing that consumer's choice follows relatively stable and predictable patterns. Regardless of socio-demographic shifts in society, people prefer "food that they are used to" (Lupton 1996), and food and eating patterns in many countries seem to be relatively stable (Douglas and Gross 1981, Murcott 1982, Døving and Bugge 1999). Furthermore, consumer demand for major product groups like pork, tomatoes, orange juice etc do fluctuate,

but changes very seldom appear as radical shifts and tendencies can only be observed over a number of years¹. Even though it exists a popular belief in the “battle of brands”, an astonishing continuity in their market shares are observed. The market share of major national and international brands do swing, but less dramatic than one is lead to believe. But as market researchers have been able to show, brand loyalty remains even if competing brands are sold at a lower price and switching costs are low (Hoyer and Brown 1990, Aaker 1991).

The recognition that the content of our shopping basket is predictable over time has produced different explanations. Economists argue that routines arise in contexts where consumers economize on searching costs or reduce risk (Stigler and Becker 1977). Routines are at once partly inherited and partly adaptive (Nelson and Winter 1982), and can be seen as a result both of learned behaviour and a response to changing environments. Learning is essential, once an agent accumulates sufficient knowledge about a certain action, the action is performed without repeated reflection, this then become a habit. Consumers are able to choose habits as a heuristic device (Kahneman and Tversky 1979). Linked with this notion of habitual action is the idea of learning by doing. The repetitive character of food shopping illustrates a situation that give rise to habitual behaviour because agents tend to avoid continued deliberation.

Sociology of consumption also emphasizes the significance of routines. But instead of pointing to routines as a result of rational conduct, routines are regarded as an integral part of everyday life and governed by “social pressures or contexts” (Tomlinson and McMeekin 2002) at a micro-level. Consumption has a role in the creation and reproduction of family relations, where the making of meals and making of family are regarded as closely intertwined (DeVault 1991). A related explanation is applied to practice of shopping by Daniel Miller (1998) in a study of lower class housewives in London. He demonstrates that

¹ Even after drops in consumer demand from so-called “food scares”, consumption tend to return to previous levels after a certain amount of time (Kjærnes et al 2005).

shopping is less a reflexive and self-regarding conduct because choice is driven by the notion of care, the interest of others and the integrity of household. Shopping and the provision of food are typically an inconspicuous, unremarkable and a recurrent activity that erases the distinction between everyday life and consumption (Warde 2002).

The science of marketing tends to identify consumer choice as switching between brands. A loyal customer is valuable because switching become a less viable option. Brand loyalty can be defined as “measure of the attachment that a customer has to a brand” (Aaker 1991:31), and might explain stability in food consumption patterns. Brand loyalty ensures a price premium and a competitive advantage on non-price competition. Levels of brand loyalty might vary, but strong consumer-brand bonds are characterized by affective components of commitment, love and trust (Fournier 1998). Relationships of loyalty can be promoted by communicating quality, symbolic values and increasing switching costs in order to keep customers. Several grocery items in supermarkets represent typical low involvement product where familiarity become particularly important (Aaker 1991). Brand loyalty also fits with a notion of routines – as brands serve as a symbolic or iconic reference during the evolvement of habitual action.

In this paper a fourth explanation is introduced. Not very many contributions have been occupied with the relationship between routines and power, although there are crucial exceptions. Bourdieu’s (2005) concept of *habitus* obviously captures power as a key element in the formation of consumer habits, as taste can be viewed as driven by the desire for social distinctions and class dominance. Likewise, there are contributions that conceptualize power as a determinant in the “macro social shaping of demand”, by showing how economic and non-economic institutions act at societal level – such as the modern supermarkets – structure the power relationship between producers and consumers through the range of products (Mintz 1986, Harvey 2001). On a more aggregate level, consumption practices, and shopping

in particular, has been described to develop in relation to monopolistic retailers and manufactures aspirations for market development and maintenance and public regulators need for control and legitimacy. As such social theorists have tended more to stress the restricted and manipulated nature of consumer choice rather than the free agency seen from within orthodox economics.

In this paper we also want to accentuate that institutional power also are exerted at a micro level that more concretely relate institutional power to consumer habits. We will do this by maintaining that consumer choice is directly linked to institutional order by means of bodily control. Inspired by the work of Foucault and others it is argued that the design of modern supermarkets is paralleled with what can be termed as an *embodiment of consumer choice*. Thereafter we draw on our own research on in-store marketing practices and slotting allowances among Norwegian grocery chains. We show that programmes of product placements and payments for shelf space links bodies and their daily actions to specific institutional arrangement designed by powerful suppliers and retailers within the distribution chain. By the help of monetary rewards and physical arrangements – proven to be profoundly efficient – purchasing behaviour is *normalized* and directed towards major brands and key categories of manufactured grocery items. In the last part we argue that these findings have consequences for the study of shopping behaviour and consumer habits, as they both challenge and supplement existing explanations of stability in consumption patterns.

The embodied purchase

Although retailers and marketing practitioners have been aware of the function of body as an important factor for in-store promotion for many decades, very few social scientists has paid any attention to this issue. In the Foucauldian approach to governance and discipline, bodily control is a key issue, but mostly reserved for non-market institutions, such as military,

schools and hospitals. There have been fewer attempts to transfer these insights of power into market settings, such as the stores and supermarkets. This absence is interesting, as long as there is a common acceptance among economists and social scientists that markets are institutionalized and that transactions are subjects of governance. One reason might be that Foucault himself did not extend his initial theory of power and discipline to the market sphere². Another reason might be that economists tend to regard the market as an abstract mechanism rather than a market place (Granovetter 1985). And although sociologists insist on the social impact of a market, they often overlook the meaning of its material attributes. The science of marketing acknowledges the market as a physical and geographical entity both as an analytical unit and as a technique. This particular cognition, in our view, also allows for the issue of discipline and bodily control to be inquired. Although the idea of discipline intuitively connotes to corporal control in most people's mind, Foucault elaborated on this interrelationship more profoundly and scientifically in his writings on total institutions (Foucault 1979). According to Foucault, discipline may be identified neither with specific institutions nor with apparatus "it is a type of power, a modality for its exercise, comprising a whole set of instruments, techniques, procedures that may be taken over by institutions that use it as means of reinforcing mechanisms of power" (Foucault 1979:121). In this part it is argued that the theories of body control are applicable to the field of shopping. We will show how the approach of Foucault and others are relevant to the field of shopping and consumer choice.

There are certain historical developments within retailing that have made disciplinary techniques relevant to the field of shopping. The significance of controlling bodily behaviour was preceded by fundamental changes in the retailing in the early 20th

² From the outset, he took a divergent position. Foucault maintained that we have to accept the idea of the utility-maximizing *homo economicus* in order to understand economic development of the 20th century (Foucault 2004). His approval of the market as governed by the invisible hand to a large extent conjoins with the neo-classical economics of the Chicago school (Steiner 2007). But as later will be demonstrated, his notion of *homo economicus* also depicts an individual at the disposal of governance.

century, which decomposed the direct social relationship between the salesman and the shopper. First of all, the organisation of the store was dramatically changed by the rationalization of the sales clerk. Although the American chain store Piggly Wiggly is regarded as the inventor of the self-service principle in 1916, the F. W. Woolworth Company introduced self-service at large scale in the early 1920's (Markin 1968). Woolworth's stopped building storage shelves behind counters and moved all items to counter tops where shoppers could reach them without asking a sales clerk for help, as self-service meant lower labour costs and lower costs suggested bargains. Furthermore, the transformation to self service permitted a growth in floorage and increased selling space, increasing the scope of choice without dramatically increasing costs. The combination of packaging on open shelves and limited service made it easier in many ways for women to shop. They were liberated from the social control exerted by the selling clerk, reinforcing the idea of the autonomous consumer choice. The idea of a shopper got a new meaning, as she could move freely among the shelves without social interference during the purchasing process.

This transition within retailing, widely recognized as a precondition for the emergence of mass consumption, confronted retailers with three main challenges. First of all, self-service and large selling spaces confronted shoppers with a problem of movement. "Stores grew to warehouse size, and aisles of goods became acres of products" creating "repetition and banality within unpredictable patterns of consumption". (Ada Louise Huxtable in Zukin 2004). A problem of physical orientation in space emerged in supermarkets, because "as buildings become larger and more differentiated in function, orientation tends to become a more acute problem". Arbitrary locations of product categories inside a warehouse would most likely lead to confusion and chaos. All together this created a problem of moving bodies around in a defined, but open space, from the entrance to the checkout.

Furthermore, there was the problem of efficiency and time to ensure a commitment to shopping. On the one hand shoppers were expected to spend as most time as possible inside the shop to be tempted to buy more goods. On the other hand there was a need to avoid that individuals did not squander too much in order to avoid congestion of bodies, purposeless rambling. Shopping presupposed a certain level of self-control among consumers, not to sniff at products or open lids and packages. “Banality and repetition” – in Huxtable’s terms - had to be avoided in order to keep the attention of the shopper and create a “mood for shopping”. This could be done by a prearrangement of time and a division of activities into successive segments. Parking lots, shopping carts and multiple checkout lines represented a break up of the composite parts of shopping. And although these arrangement of activities made it faster to get in and out of the stores, “it took longer to escape the supermarkets totalizing environment” (Zukin 2004:79).

Lastly, but not least important, the introduction of self-service meant that clerks no longer were able to affect buying during face-to-face interaction at the point of purchase. Sales assistants have been – and still are – immensely important instruments in marketing strategies, as “pushers” of certain products by producing recommendations, doing product promotions, arranging special deals, introducing new products, reminding shoppers of buying necessity products etc. In their absence, shoppers were left between the aisles outside the scope of direct control from managers. The predictability of shopping and choice that previously was ensured under the influence of sales clerks had to be restored. In the transition from the traditional store to the mass distribution of products in modern superstores a vacuum of influence emerged, which motivated retailers and supplier of manufactured goods to find new techniques of influence and control over shoppers. We will argue that the medium of body became a new opportunity for controlling the behaviour of the shopper. Three fields of knowledge seemed to be valuable in the design of the modern self-service store.

First, although a store represents a defined, physical enclosure, problems of moving people around emerge in large floor spaces. Methods were borrowed from both psychology and geography in order to explore spatial behaviour and increase capacity of cognitive orientation (Downs and Stea 1977). The understanding “mental mapping”, a technique used both in psychology and geography for studying cognitive orientation and spatial behaviour (Sommer and Aitkens 1982) became an aid by identifying “location cues and mnemonic aids what is essentially in and undifferentiated area”. Furthermore, location cues involved that floor space had to be coded in a manner to become understandable for the shoppers. In order to get “a hold over this whole mobile” of shoppers, retail planners responded by inventing various forms of “traffic flow patterns” (Berman and Evans 2004:460), that is architectural solutions of in-store inventory that not only facilitated self-service, but also enabled people to move around without irritating interruptions. Various solutions of spatial arrangements - such as the so called Straight Traffic Pattern or Curving patterns - were invented by retail planners in order to meet these requirements. In general, these measures can be seen as a response to what Foucault denotes as “a problem of distribution of individuals in space” (Foucault 1977:141), of moving bodies from one location to another. Functional sites of product categories were arranged attempting to link assortment categories together so that shoppers with their wheeled trolleys were moved from one place to another along routes. Aimed at “pulling” the bodies of the shoppers throughout the store, essentials like bread and milk were placed at the back of the supermarket. In large stores, closing walls of shelves were placed between the entrance and the register inhibiting individuals to take short-cuts through the store etc. “Speedhumps” – such as shock sellers, selling trays, end caps and striking visual signs and lightening – were introduced to avoid consumers rushing too rapidly through the store.

Secondly, in the absence of the salesperson, other strategies were introduced to “generate consumer enthusiasm”. Environmental aspects of retail shopping behaviour entailed lightning, noise, temperature and colours in ways that could have predictable effects on buying behaviour (Harrell et al 1980). Planners have used behavioural psychology based on stimuli-response models to increase the mood for buying (Mehrabian and Russel 1974). In-store temperature is adjusted to exterior conditions – during cold weathers shoppers are welcomed with a wall of warm air to create a “relaxed state of mind”. In supermarkets, fruit shelves are placed at the entrance to create an association of freshness and delicateness, the bakery a little further up to evoke appetite and so on. Crowding has to be avoided, as a high density of people not only was assumed to create irritation but also to produce “stimulus overload from inappropriate or unfamiliar social contact” (Harrel et al 1980:45). Textbooks in retailing strategies have endless lists of recommendations of architectural designs – stretching from flooring to wall textures – assumed to have a certain influx on the state of mind of the shoppers amplifying the willingness to buy (Berman and Evans 2004).

Lastly, knowledge on corporal behaviour within space became relevant. As Paco Underhill so strikingly remarks, shopping along aisles with a trolley in your hands represents a clash between seeing and moving. The “effort makes you vaguely uncomfortable because it requires you to train your eyes somewhere other than when you’re walking” (Underhill 1999:78). To display products so that they can be seen therefore become important. Retail planners soon became aware that some placements were more eye-catching than others, and started to refine their approach from ergonomic studies of people at work. Retail planning took account of scientific knowledge on visual work from workplaces and workshops, f ex how vertical and lateral viewing angels affect visibility of objects (Eastman Kodak 1983). Normally, it is assumed that shelves are read like books, from left to right, and that the optimal viewing angle is 15 degrees below standing height. To attain the attention of the

shopper, the best relation between a gesture and the overall position of the body were optimized. This has led to studies on the “grab factor”, which varies according to the shelf placement (Underhill 1999). The most inconvenient shelf position is at the top and floor level. Not only because it falls outside the “reliability zone” – where items are observed only if looked at intently – but also because shoppers are required to do inconvenient bodily movements, such as bending down and exposing the “butt”³. Hence, the science of ergonomic design in workplaces were transferred from factories and offices to shopping in order to adjust physical design to corporal dispositions in order to increase the correlation between the body and the gesture. All these techniques were subsumed under the heading of merchandising. Merchandising, strictly defined as providing the availability of products in demand⁴, came to include everything from store location to product differentiation in a broad sense. From the consumer’s point of view, being able to conduct shopping in supermarkets requires a considerable amount of training and exercise which involves cognitive and bodily competences. From the outset, shopping in a modern store demands skills and experiences. In order to avoid the total confusion in front of the shelves; the consumers depend on an individual learning process which enables them to move unstrained inside a retail landscape. A competence for shopping evolves from numerous trials and errors; the shoppers acquire a mental map of the structure of a store which is transferable to most other cases of stores.

In sum, the introduction of self-service and the large scale store demanded a new approach to the shopper. On the one hand, shoppers were appealed to as reasoning and rational subjects capable of conducting autonomous choices without support from sales assistants. On the other hand, marketing techniques and the lay out of the store had to address

³ Bending down can cause immediate embarrassment to female shoppers, who expose their “butts”, something that might call for a “corrective facework” in order to avoid unwanted male attention (Goffman 1967).

⁴ Textbooks of retailing define merchandising as “activities involved in acquiring particular goods and/or services and making them available at the places, times and prices and in the quantity to enable a retailer to reach its goals” (Berman and Evans 2001:546)

corporal functions in order to educate the shoppers. This is illustrated by the fact that merchandising took account of knowledge generated in other disciplines, such as ergonomics, studies of cognitive perception and environmental psychology.

The science of merchandising got a new meaning at the micro level, involving spatial arrangements and traffic flow patterns, coding of activities by categorical linking of shelves and product placement, and training. These techniques have parallels in more conventional disciplinary techniques as described by Foucault (1979:135-69), such as drawing up tracks, linking together functional sites, and prescribing movements. A trained consumer therefore must have a mental map of a supermarket that in the form a generalized representation and applicable to most other cases. The notion of being a skilled shopper – not only require the ability to process market information, but also to acquire a repertoire of gesture techniques adapted to move around in a retail landscape without resistance. Shopping in this manner represents a process of incorporating practice and routines. Embodiment of consumer choice thus can be described as an incorporation of practices and routines – visualized as track sheets on a floor space and taught movements – that interacts with what becomes apparent as a choice between alternatives. The embodiment of consumer choice can be described as incorporated practices of shopping that frames what becomes a subject of awareness and reasoning. Choice is implanted in corporal movements and gestures. In other words, by reinstating the concept of a carnal consumer new dimensions power and governance are expected to emerge.

We have argued that shopping can be viewed as an embodied activity, and how the body is affected by design (the structure of the store), merchandising (what is put in the shelves) and operations (the role of the employees). But still there lacks a connection between the embodiment of consumer choice on the one hand, and institutions of power on the other.

Our next section explores how shoppers are produced as embodied subjects and connected to specific large scale organisations.

How shopping is normalized

At the core of our approach is the recognition that shopping can be assumed as just another “technique of the body” – in Mauss’ term – shaped in order to attain certain goals (Mauss 1979 [1889]). For most social scientists it is impossible to view techniques of the body as decoupled from social institutions. Mauss argues that techniques of the body are “assembled by and for social authority”, and Foucault maintains that the body constitutes the link between daily practice on the one hand and the large scale organisation on the other (Dreyfus and Rabinow 1982). If this supposition were to be relevant for the case of shopping, we would expect to find the body as medium for exercise of power. More specifically, it would be interesting to explore whether specific techniques are applied for means of correctional purposes.

In order to explore those relations in more detail the processes and institutions that, findings from a study of slotting fees in supermarkets are presented⁵. Slotting fees are monetary support paid by the supplier in order to ensure in-store promotional support from the retailer. The study of slotting fees is interesting in at least two respects. First, it sets the framing for merchandising programmes, as it finances marketing activities at the point of purchase. Secondly, slotting fees reflects market power. The size of slotting fees reflects the retailer’s ability using buying power to extract a rebate from the supplier, while powerful suppliers use slotting allowances to ensure superior promotion inside the store.

⁵ Our presentation relies on an investigation of Norwegian slotting fees practices in grocery business (Dulsrud and Beckstrøm 2005). The study was based on a qualitative research design including the four main retailing groups and around twenty suppliers. Both an analysis of negotiation impacts and estimation of its total monetary impact were conducted.

The data, which originally were provided in order to describe the extent of vendor allowances and slotting fees in Norwegian grocery retailing, contains findings that have relevance to understanding of other market contexts. Although the Norwegian grocery retailing displays some peculiarities concerning the internal organisation of business, it resembles retailing in most other European markets as it is heavily concentrated and that power in the distribution channel has switched from manufacturers to retailers (Dobson 2003). During our empirical fieldwork, the actors were not familiar with the concept of “slotting fees” to describe promotional payments. Instead they used the collective term “joint marketing”. The negotiations over joint marketing serve to functions; on the one hand it is a technique from the retailers of using their channel power for extracting rent from their suppliers, in other word to transfer profits from manufacturers to retailers. The other function, which is the issue in this article, is to plan the physical distribution inside the store. As shown below, the concept of joint marketing contains four main practices.

Listing fee. Listing fees is paid simply for store presence, and refer to payments that suppliers provide retailers in order to be registered as a customer within a range of specific time. In some countries listing fees are formalized and made explicit. The rationale for the retailer to claim a listing fee is to cover basic promotionally tasks, such as registration of products into files, bar coding, shelf replenishment schemes etc. In our case, listing fees were not explicit, implying that the size of the fee depended upon the negotiation power of the supplier. In our terms, a listing fee reflects the most necessary and trivial part of supplier-retailer relationship. A listing fee serves as a screening mechanism for access between various store formats with in retailing group. It provides physical availability of a product and decides in which retail formats the products are to be distributed, as some formats might offer better availability,

convenience and location for consumers than others. Number one brands normally have an extensive marketing budget and will typically be represented in all formats.

Slotting fees. Negotiations over joint marketing also serve as slotting fees, as suppliers can affect the shelf positioning of products. During these negotiations so-called planogrammes are used as a tool of shelf management. Planogrammes give a virtual representation of shelves within a given retail format, whether it is a discounter, hypermarket, supermarket etc. Space management programmes, which is linked to cash register data, enables profitability of shelf space to be recorded and processed continuously. The cheapest products are normally placed very high or very low on the shelves, while the dominant brand normally has the most attractive place. Another strategy is to pay for an exclusive placement out-of-sight from bothersome competitors. In these cases, suppliers receive a defined place or “property” within the store, detached from alternative choice. This means that your product appears as a self-evident “first choice” while competitors are positioned into the margins of the viewing angle. This is the art of in-store marketing, finding strategies to position products so that they are separated from spaces where they are forced to compete on equal footing with their competitors. Equally, a physical cost is imposed upon the shoppers, as finding alternatives requires extra time searching or asking the sales assistants.

Promotional activities. A related, but separate negotiation issue are “promotional activities”. Promotional activities mean that a product receives special attention within the store during a certain period of time which implies that price offers are linked to attractive positions. A typical example is “3 for 2 deals” located at end-of-aisles displays or gondola ends. This activity is built on the assumption that as a shopper appears the end of an aisle she will naturally slow down the trolley to get round the crush at the corner. The eyes will probably

fall on whatever is on the shelf, making end-caps especially attractive. Known as “hot-spots”, these are the most profitable shelves in the store, so they are always full of offers. Suppliers can also achieve hot-spots permanently by financing in-store inventories such as coolers for milk and beverages, freezers for ice cream etc., as these inventories often represent a high capital cost for retailers. In return suppliers receive exclusive display which protects them from the comparison of competitors. Promotional activities appears as one of the strongest instruments, as they combine physical arrangements with monetary rewards

Category management implies that suppliers and retailers can negotiate over the scope of products within a given product category, such as soups, beverages, frozen vegetables etc. A special version of category management is known as category captaincy. This refers to “arrangements in which a supplier takes on a significant role in the retail management of the category, including the brands of competing suppliers” (Desroches et al 2003). A retailer said that they developed a committed relationship with “leading partners”. These suppliers were responsible for running the space management programmes and had considerable influence on the assortment. A supplier of a branded product gave a rationale for becoming a category captain. Becoming a category captain is reckoned to be very beneficial, as captains are free to choose whether competing suppliers should be listed or where their product should be positioned. It is not unusual that the captain runs the space management on the behalf of the retailer, which also include shelf replenishments and access to inhibit side-by-side comparisons. Besides, category management are in many cases linked to exclusivity arrangements and other rebates, implying that the captain can “drive out” competing brands

by extra payments⁶. We explored that a brand leader can hold a captaincy role several retail chains, thus increasing their coordinating powers.

From our point of view, joint marketing programmes is built on the assumption that marketers are able to govern the choice of shoppers. It gives leading partners an opportunity to avoid intra-brand comparison and to consolidate its market power. By legally price discrimination against smaller, less powerful channel members, the market leading manufacturer provides an incentive for the retailer to concentrate on its line. To use the words of Hoch and Deighton, in-store marketing can serve as a tool to “either reinforcing the agenda or blocking exposure when experience is ambiguous” (Hoch and Deighton 1989:1). Slotting fees were favoured both by dominating manufactures and retailers. Our findings lead us to believe that there are concurrent interests between retailers and dominant actors among suppliers, as they are beneficial to both brand leaders and retailers. Therefore it is reasonable to say that joint marketing is an agreement between the top-dogs – between the market leaders. In economical terms this could be described as techniques of profit sharing being beneficial both to manufacturers and retailers⁷.

The ultimate agenda of the in-store strategies is to regulate the state of mind, the manner in which consumers learn to experience, move around and use their eyes and how the nature of choice is perceived. Under such circumstances, seeking out alternatives to the “obvious choice” will require additional physical efforts in terms of finding another store, searching among shelves and questioning of shop assistants. Inconvenience is used as means of influencing shopping behaviour. As a case, the organization of joint marketing among

⁶ After the first presentation of our data it appeared that the near monopolist of dairies (Tine BA) had offered payments to reside as an exclusive supplier among two retail groups of which they were fined by the Norwegian Competition Authorities (Konkurransetilsynet 2005).

⁷ In return for slotting fees, retailers accept higher wholesale prices from their leading suppliers, a point that is further explored and demonstrated by Shaeffer.

Norwegian grocery retailers has its national peculiarities, but as a set of practices, it is quite similar to the system of slotting fees practiced in the rest of Europe and the US.

Slotting fees combine corporal techniques with monetary rewards. Words like “free”, “extra”, “more”, “value”, “savings” and “bargain” used in product campaigns promote the idea of value for money and reinforce the self-conception of the shopper as a “rational consumer”. Plastic cards and customer loyalty programmes add values into customer relationships through score of points, and serve as a differentiating tool, by dividing customers into categories and ranks. Exclusive customer clubs and golden cards are similar to the honorary silver epaulette among soldiers. The shoppers who qualify for the “honorary” category are entitled exclusive rights, such as access to selective rebate programmes, invitations to special events, introductions to new product innovations etc. In this manner, not choosing special offers, using plastic cards in order to increase “scores” that give rise to rebates, is made to appear as a monetary loss. The disloyal consumer is punished by loss of scores in programmes of rebate. It works against the popular idea of a price conscious consumer.

In-store cameras, installed for surveillance purposes, can be applied for systematic human experimentation. By exposing the shopper to various forms of “stimuli” – such as lightening, price offers, product positioning and exposure - the store can be turned into a scientific laboratory for the study of in-store behaviour. Underlying this approach is a notion of the “human animal” that smells feels and responds to external impulses⁸. This is a functional reductionism of man intended to adapt her to the man-machine.

In this section slotting fees and in-store marketing organized by suppliers and retailers has been analysed in terms of disciplinary power. Their techniques, procedures and measures

⁸ Paco Underhill of the consulting firm Envirosell is quite explicit on this point as he argues that successful retailing must address the shopper as a “human animal” and explore “how human machines are built and how anatomical and physiological aspects determine what we do” (Underhill 1999:43)

have strong similarities with how the exercise of discipline is performed in other institutional settings. There are nevertheless differences. Contrary to correctional institutions like the prison or schools, retailers do not rule over punishment or reprimands as means of power. Their means of correction are more subtle. Along the punishment-gratification axis of correctives rewards is by the far most important. Deviations from the “obvious choice” emerge primary as a perceived loss of rewards, but also as increased physical strains and inconveniences. These processes increase the cost of switching both at a cognitive and a corporal level. This line of strategy is evident throughout the whole distribution chain.

By aiming at getting access both to the body and the soul of consumers, modern supermarkets share – as Zukin argue - some properties with classical totalizing institutions in a Foucauldian term. Yet, the concept of “dressage” – meaning that purchases only are responses to external constraints acting onto the body is too strong. The purchase is a product of the disciplinary techniques traced in the material structure that erases the scholastic distinction between the intentional and the habitual, rational and the emotional, the corporeal and the mental. This does not imply that purchasing is a reaction or a reflex to external forces. Rather we should regard in store marketing as *normalizing* processes. Normalizing processes, as it is instituted by large scale institutions thus stabilizes and make our consumption patterns predictable by a combination of mental and physical barriers. The process of normalization penetrates the distribution channel. We should look upon consuming – in Bourdieu’s terms of an economic agency – as a “conditioned and limited spontaneity” (Bourdieu 2005).

Discussion

Modern supermarkets are – as mentioned in our introduction – often identified as a market arena that guarantee our freedom to choose and provides for the sovereignty of the consumer. Our main point is that the physical and structural changes within store planning – motivated

by cost saving programmes – coincide with the growth of mass consumption. This development has produced the need for releasing crowds of shoppers without direct surveillance inside huge spaces that created new modes of controlling techniques. Shopping in supermarkets presuppose disciplinary techniques. This case illustrates Foucault's very general argument that the reality of an autonomous individual is at the same time produced by tools of power that includes discipline. Our intention by presenting slotting fees as a case has not been to reveal that shoppers are exposed to manipulating techniques and "hidden persuaders" that mask, repress or conceal reality. In terms of a consumer policy approach we should neither be surprised nor annoyed. Rather than look upon consumers as victims that can be empowered by juridical protection or regulatory reforms, we should keep in mind that institutional solutions themselves reproduce discipline. Foucault himself does not recommend any strategy of action except that as long as power exists at the micro level, resistance also must start at the micro level (Flyvbjerg 1998).

Marketing scholars, contrary to most social scientists accept that stores and outlets are institutions with specific material and physical attributes. This perspective has allowed us to investigate shopping as an embodied activity, where the body constitutes a link between daily practices on the one hand and large scale organisation on the other. In this approach, shopping and consumer choice becomes an integral part of what could be denoted as a "body memory". The appliance of a "micro-physics of power" to shopping gives us an opportunity to discuss existing explanations to consumption routines and habits. It gives us a stronger sense of how institutional power is imported into the field of every-day life and consumption routines. To some extent, this notion supplements existing theories. In principle, there is only a tiny step between the "track sheet" of consumers moving in supermarkets and the concept of routines.

Our conclusions supplement economics and its explanation of routines by relating the embodiment of shopping to learned behaviour and the meaning of the individual history of the

shopper. The embodiment of shopping practices illustrates what items that come into consideration and become subject to consumer's experience. On the other side, our discussion plays down the rationale of routines as a heuristic enterprise or as a deliberate choice. It illustrates the limitations of routine formation practices as a cognitive enterprise and a result of an individual rational consideration – it pinpoints instead the significance of the material structure of the market and how it regulates the space of possibilities. In this perspective, bodily functions become a part of switching costs. To a stronger extent, our discussion brings in structure and distribution of power within and between manufactures and retailers as an explanatory factor to routines.

The notion of embodied consumer choice and normalisation also add to sociological studies of habits. Although there are “large scale” theories of how power structures supply and demand – Bourdieu's term of economic habitus are just one example – there is a lack of a link that shows how consumer practice is more obviously linked to market structure. In-store marketing techniques – viewed as corrective means - interact with consumer habits. It shows how market power is imprinted into daily shopping behaviour. In many ways, the concept of a physical shopper exemplifies what Shilling describes as the “micro-physics of power” by operating in modern institutional formations “through progressively finer channels, gaining access to individuals themselves, to their bodies, their gestures and all their daily actions” (Shilling 1993:151). Supermarkets are not merely institutions that “organize and articulate demand differentials” among consumer socio-economic by means of product differentiations and product range, as Mark Harvey puts it (Harvey 2001:202). Supermarkets are more active in the structuring of demand itself, as they operate as an orchestration of choice. This process explains that certain brands have come to be symbols of care – in Daniel Miller's terms – and how they support the image of integrity of households. Food items are integrated into patterns

of meals, the repertoire of recipes among housewives, the routines of child care etc. Care is managed by and through certain brands of products.

Our discussion supplement marketing theories by exploring the influx on shoppers from what marketers themselves conceive as the “hidden side of marketing” (Bloom et al 2000), that is techniques of marketing that normally is not visible to the public. On the other hand, our concept of normalizations reinterprets and challenges the rhetoric of marketing on many accounts. It emphasizes that brand-building to a larger extent is about physical availability of products and shelf layout, as Hoch and Deighton (1989) indicates, than its lifestyle image. As such, consumer loyalty can be more of a “biologico-sociological phenomenon” than a psychological attachment.

So far we have discussed the institutional, micro and supply-side framing of consumers and shopping, and could easily be accused for objectifying and even victimizing the consumer. Instead of praising a sovereign king, we may be blamed of drawing up a marionette in the hands of big business. Social scientists – and sociologists in particular - are often, rightfully or not, accused for doing this (Wrong 1961). To avoid this misconception we have to look at the micro-level realities of everyday consumption practices and the related handling of shopping. From this point of view, discipline – rather than being an outcome of a conspiracy among few – is regarded as an inherent technique in most institutions. The modern supermarket as such is no exception. This is also where consumer agency takes place, sometimes in total disregard of attempts to frame and orchestrate the outcomes.

Abstract

It is believed that household consumers in the deregulated Swedish electricity market fail to switch from their incumbent suppliers to other suppliers when they offer lower prices. If such switching inertia exists, it would counteract that the deregulation leads to increasing competition and lower prices for consumers. In a proposed conceptualization of switching intention, it is hypothesized that sales promotion triggers information search which, if successful, leads to acquisition of knowledge. Based on the acquired knowledge an informed choice to switch or not to switch is made. There are however several barriers to switching including loyalty to the incumbent supplier, high information search costs, and too small economic benefits. A survey of a random sample of 474 Swedish household consumers showed that as expected loyalty prevented switching intention to be formed and the impact of economic benefits was strongest in the stages where intention becomes stronger. Not as expected, the impact of sales promotion increased with the strength of switching intention, and information availability had some influence independently of the strength of switching intention

1. Introduction

In recent years, similar to many of the countries in the rest of Europe and states in the United States, consumers in Sweden have had the opportunity to choose supplier of electricity. Since the deregulation of the energy commodity market in 1996, a large number of suppliers are competing on a free market. These suppliers buy electric power at the Nord Pool Spot Market, an exchange market for electricity, and resell it to their customers, the retailers of electricity. The retailers are not necessarily the producers of electricity although most producers are also

retailers. About half of the retailers' customers are households who use the electricity in their homes.

The aim of the deregulation was to open the electricity market to competition among suppliers in order to reduce prices to the benefit of consumers (Swedish Consumer Agency, 2002). However, prices have gone up ever since the deregulation of the electricity market (Statistics Sweden, 2007), probably in part because household consumers do not choose the supplier who offers the lowest price (Waterson, 2003). Thus, households tend to stay with their incumbent supplier and do not switch. Furthermore, they are reluctant to choose variable price agreements because they expect and are averse to nominally increasing prices (Juliusson et al., 2007).

Research on consumer decision making has shown that consumers make trade-offs between accuracy of the decision outcome and the effort they are willing to invest in the decision strategy (e.g., Bettman et al., 1998; Payne et al., 1993). Consumer decisions vary in complexity as well as in the decision makers' degree of involvement. For instance, buying groceries would not trigger the same amount of cognitive effort, nor emotional strain, as do choosing a new home or buying an expensive car. Choices among products are complex when they vary on many attributes. In contrast, electricity is a homogenous product where price per unit constitutes the major or only difference between suppliers. Thus, the choice of the most inexpensive supplier should be relatively easy, and although involvement may be low, consumers should be motivated by the fact that they are unwilling to pay more for a commodity that does not differ in quality between suppliers.

Dissatisfaction with the incumbent supplier should be an impetus to switch. A recent report indicates that Swedish electricity consumers are dissatisfied with their incumbent supplier (Svenskt kvalitetsindex, 2006), more than they are with suppliers in the land-line telecom and home insurance markets where switching is more frequent (cf. Gamble et al., 2007). Why then does dissatisfaction not lead to more frequent switching among consumers? In the next section we present a conceptualization of switching intention that identifies barriers to switching. We then report an empirical study of a random sample of households that examines the impact of these barriers.

2. Conceptualization

In our conceptualization of switching intention (see Figure 1), it is hypothesized that some events (referred to as sales promotion) trigger information search which, if successful, leads to acquisition of knowledge. Based on this knowledge an informed choice to switch or not to switch is made. Some factors may however prevent this and will therefore constitute barriers to switching. In the following we briefly comment on each.

Figure 1. A conceptualization of the process of switching supplier in the electricity market.

First, loyalty to the incumbent supplier is one possible barrier making sales promotion ineffective. In consumer research loyalty to a brand or supplier has been conceptualized as

being closely related to satisfaction (Oliver, 1999). Whereas satisfaction has both a cognitive and emotional component, we assume that loyalty is an emotional attachment to the chosen alternative, perhaps closely related to the endowment effect (Kahneman et al., 1990; Strahilevitz & Loewenstein, 1998), status quo bias (Samuelson & Zeckhausen, 1988), or sunk cost effect (e.g., Karlsson et al., 2006). Loyalty to the incumbent supplier would possibly result in feelings of failing one's supplier when considering switching to another supplier.

A second possible barrier is that information search costs are too high. Costs for searching information may be divided into two parts (Johnson et al., 2003), the time it takes to access the necessary information, and the cognitive effort required to process the accessed information. Both lead to a low information availability.

Even if information search has led to that knowledge is acquired, a third possible barrier is that, due to small price differences among suppliers, consumers perceive that the economic benefits are too insignificant to warrant switching. Competition in a deregulated market is assumed to cut prices for consumers; however, when consumers fail to switch, this will result in that prices do not differ much between suppliers (Klemperer, 1987). This is further augmented in the case of a homogenous product such as electricity.

3. Empirical Analyses

3.1 Sample

In this paper we report re-analyses of the data presented in Gamble et al. (2007) obtained from a random sample of 488 Swedish residents between 18 and 69 years of age who volunteered to answer a questionnaire in a mail survey. The response rate was 24.8%. A description of the sample is given in Table 1. In the following section we report index measures of the hypothesized determinants of switching, followed by an analysis of how in this sample switching intention is influenced. Note that because of internally missing values the analyses reported here are confined to 474 respondents.

Table 1. Description of the sample.

Variable	n	Descriptive value
Sex (% men)	487	48.3
Age (years) (M/SD)	487	48.8/13.1
Education	484	
High-school (% degree)		30.6
College (% degree)		33.5
University (% degree)		36.0
Married/cohabiting (%)	487	74.9
Households with children (%)	484	87.9
Annual household income (10 ³ SEK) ^a	480	
200 or less (%)		12.7
201-300 (%)		19.3
301-400 (%)		18.3
401-500 (%)		19.3
501-600 (%)		16.2
More than 600 (%)		14.1
Quarterly electricity cost (SEK)	444	
500 or less (%)		5.4
501-1000 (%)		21.7
1001-1500		13.1
1501-2000		12.8
2001-3000		15.5
More than 3000		33.7
Housing (% apartment)	486	35.4
Electrical heating (%)	469	42.2

^a1 SEK is approximately 0.20 US\$.

3.2 Determinants of Switching

Respondents were asked to check statements presented in the questionnaire selected as possible motives for their unwillingness or willingness to switch electricity supplier. For each statement respondents indicated on a 5-point Likert-type rating scale, ranging from completely disagree to completely agree, the degree to which they agreed with the statement describing their motive for switching or not switching. The ratings were averaged across three questions to obtain an index of each motive. Questions were also asked about the frequency with which the respondents had encountered events that promoted switching. Ratings were obtained on 5-point scales ranging from never to very frequently. An index was constructed by averaging across the ratings of three different events. As Table 2 shows, the reliabilities assessed by Cronbach's α s are unsatisfactorily low for sales promotion but satisfactory ($>.65$) for the other indexes.

Table 2. Means, SDs, and Cronbach's α s for indexes of determinants of switching in the Swedish electricity market. (The indexes are constructed by averaging across the ratings on five-point scales (1-5) of sets of three questions also shown.)

Scale/item	M	SD	α
Sales promotion	2.3	0.7	.55
Words-of-mouth	1.9	1.0	
Advertisements in the mass media	2.6	1.0	
News in the mass media	2.4	1.0	
Loyalty to incumbent supplier	2.1	0.9	.73
Canceling an agreement with the supplier is unpleasant	2.5	1.2	
Switching supplier feels like being disloyal.	1.7	0.9	
Remaining loyal towards the supplier is important	1.9	1.1	
Information availability	2.5	0.8	.66
Price information from different suppliers is easily obtained	2.4	1.1	
Comparisons between suppliers are straightforward	2.8	1.1	
Information provided by suppliers is easily understood	2.2	1.0	
Economic benefits	2.9	0.9	.80
Switching supplier is economically beneficial	3.0	1.1	
Switching supplier entails cutting the electricity bill	2.6	1.0	
Switching supplier will save money	3.1	1.1	

3.3 Switching Intentions

In order to obtain a measure of switching intention, respondents were requested to check one of four alternatives ranging from “no intention to switch” to “have already started to switch” electricity supplier. The distribution of the answers was positively skewed. Only 6 participants indicated that they had started to switch. These respondents were excluded since preliminary analyses suggested that the results for them deviated from the trend. In order to further reduce skewness, the remaining two strongest intention categories with 35 and 23 respondents, respectively, were collapsed into one category. Thus, the scale ranged from “no intention to switch” (no intention, $n=129$) to “will probably or certainly switch” (strong intention, $n=58$) over “will perhaps switch later” (weak intention, $n=287$).

Based on our conceptualization of switching intention (see Figure 1), we expected the indexes of loyalty and sales promotion to both decrease, the index of information availability to first increase and then decrease, and the index of economic benefits to increase with intention to switch. Figure 2 shows the index means for each degree of switching intention. As can be seen, the results are as expected for loyalty and economic benefits showing opposite changes with switching intention. However, sales promotion increases whereas information availability shows no clear change. A 3 (switching intention) by 4 (determinant) analysis of variance with repeated measures on the last factor yielded significant main effects at $p=.05$ of switching intention, $F(2, 471) = 5.02, p=.007$, determinant, $F(3, 1431) = 74.40, p<.001$, and their interaction, $F(6, 1431) = 74.40, p<.001$. Separate one-way analyses of variance showed that sales promotion, loyalty to the incumbent supplier, and economic benefits increased reliably with switching intention due to the linear trend, $F(1, 472) = 17.42, p<.001, 17.57, p<.001$, and $26.24, p<.001$, respectively. For loyalty also the quadratic trend was significant, $F(1, 472) = 12.14, p=.001$.

Paired *t*-tests showed that for no switching intention, loyalty, information availability and economic benefits did not differ and all exceeded sales promotion, whereas for weak switching intention all differed from each other, and for strong switching intention all differed from each other except the difference between sales promotion and information availability.

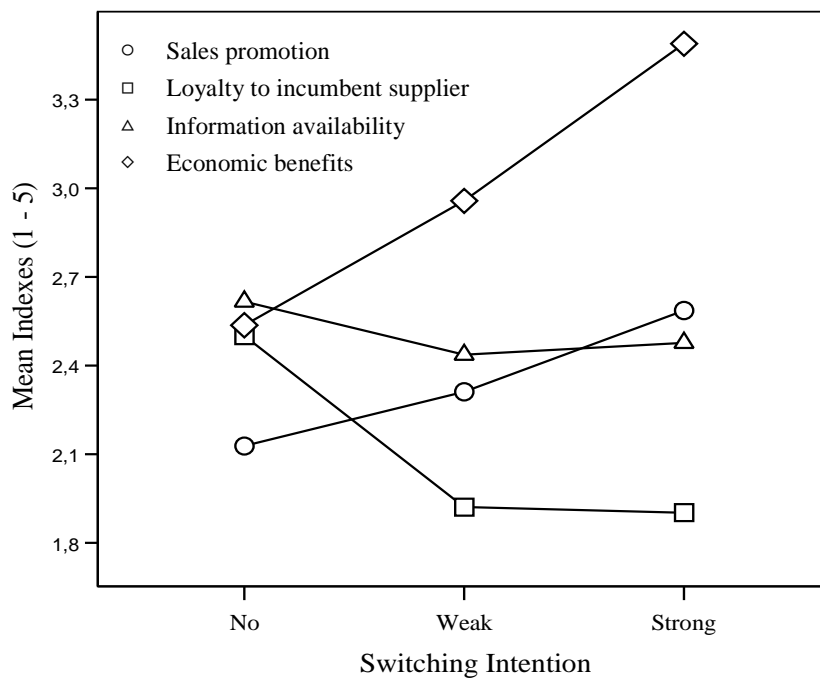

Figure 2. Mean indexes of determinants of switching for degrees of switching intention.

4. Discussion

The results showed that reliable measures were possible to construct of motives for switching or not switching from the incumbent electricity supplier to another supplier. These measures varied with strength of switching intention, partly in the way hypothesized. Loyalty to the incumbent supplier seemed to counteract that a switching intention is formed, whereas economic benefits had the effect of strengthening a switching intention already formed. However, information search appeared to be influential at all stages of switching intention. It is possible that the type of information search differs at different stages but the obtained information was too crude to determine this. The influence of sales promotion increased with strength of switching intention. A possible reason for this unexpected finding is that information is processed selectively. When the strength of the switching intention increases, consumers may become tuned to sales promotion and report more such events. It should also be noted that the measure of sales promotion had a low reliability, probably reflecting that the frequency of different events (i.e., words-of-mouth, advertisements, and news in the mass media) do not necessarily covary.

The present study has several limitations. One is that conclusions are drawn about the process of forming a switching intention from data collected on a single occasion, comparing households who presumably are in different stages of the process. A panel study would have been preferable. Another problem in the present study, as well as in a panel study, is the low frequency of switching. Another limitation is that inferences are made about causes of switching or non-switching from non-experimental data. To remedy this, an experiment was performed by Gärling et al. (2007) in connection with another mail survey. In this experiment participants in four different experimental conditions (n approximately equal to 100 in each)

first made a choice of an electricity supplier, then were faced with several choices between this already chosen supplier and other suppliers who differed on one or several of the attributes price, information provided about electricity consumption ad costs, market share, and availability of choices of green electricity. Comparisons with a control condition in which participants made no initial choice of a supplier showed that the experimental groups more frequently chose the already chosen supplier. This “lock-in” effect was observed despite that most of the alternatives were better (as judged from the choices made in the control condition). Persuading participants in one of the experimental conditions not to feel loyal to the incumbent supplier had the effect of decreasing choices of the already chosen supplier. Experimental evidence was thus obtained for the role of loyalty. In addition to this, it was shown that lower prices and availability of information about usage and costs augmented choices of the alternatives.

The emerging picture from this research is that several factors account for household non-switching in the Swedish electricity market. One way of understanding the multi-determined nature of the phenomenon is our proposed conceptualization (see Figure 1), at least as a starting point for additional research. It may be noted that economic benefits appear to be the most important motive for those (relatively few) who intend to switch. At the same time, non-switching may be assumed to partly determine that switching offers few economic benefits. Apparently, this becomes a vicious circle since increased price differences depend on switching, whereas switching to some extent depends on price differences. As demonstrated by Goett et al. (2000), large discounts on prices may break this vicious circle.

Abstract

This paper deals with consumers’ perceptions of new retail banks owned by retailers and insurance companies in Sweden. We present the first results from an exploratory consumer study within a research project on consumers’ relationships to companies that expand to other markets.

1. Introduction

The phenomenon that awakened our interest is the recent trend in Sweden where two major retailers (Ikea and Ica) and two main insurance companies’ (Länsförsäkringar and Skandia) have extended their core business to also offer retail banking services by *opening an own internet based bank*. In markets with keen competition or in markets where the Swedish Competition Authority prevent the dominant actors from growing bigger, the companies can expand to other markets and thereby form a conglomerate¹.

Behind such a move is the increased competition for consumers’ spending power. One could expect that the retail companies Ikea and Ica aim to establish stronger long term relationships with their customers who return to the same store only if they please or if they are tied to the companies’ via membership in customer clubs. Ikea offers its customers a Family Card and Ica offers Ica card with multiple benefits for the card

¹ A conglomerate is defined as a group of companies that operate in different markets. Compared to the conglomerates of the 60:ies and 70:ies the companies in our study are much less diversified.

owner. Insurance companies on the other hand have more complete customer registers but the sales are difficult to increase by selling more insurance products to same clientele. Retail banking services make sense to combine with both retailing and insurance businesses.

Due to the financial deregulation it is easier nowadays to obtain a banking license from the Financial Supervisory Authority. Although the Swedish financial regulation currently provides banking licenses to new actors, there are still extensive procedures and steps to take before the allowance is obtained and there are regulations of what a bank is allowed or required to provide². The new niche banks are small in relation to the existing main retail banks and the competition authority welcomes the newcomers to increase competition in that market. The authority has concerns if the new niche banks are treated fair by the existing main banks when entering the payment network (Swedish Competition Authority, 2006). At the same time, the competition authority is concerned about the consumers and urges the need to improve consumer mobility in the retail banking market, which is necessary if the competition is going to have an effect. These kinds of issues are in the pipeline in many European countries today.

To date, consumers' yearly bank switching rate lies around 5 percent (ECA, 2006). It is good to have several alternatives banks to choose among, but the consumers also needs to be active. In order to improve consumers' activity, Consumers' Bank and Finance Office³ in Sweden provides information for the consumers how to switch banks and other types of information of bank services or financial issues. An important issue is whether consumers really are interested in switching banks, and in particular, if they would be interested in switching to the new entrants. According to recent empirical evidence, consumers in Sweden have a high confidence towards banks compared to other business sectors. They are also satisfied with the service banks provide (Synovate Temo, 2007). Would it in this kind of situation be likely that bank switching is desirable for a consumer? Do the consumers know about the new entrants to start with and what are their perceptions of these companies and their banks?

Our concern is the consumers and how they are affected by the fact that companies grow and want obtain a larger share of their wallets. Consumers are inferior to the company concerning the knowledge and information about the products and services they buy and hence it can be unpleasant to use only one company. At the same time, it can be convenient for the consumer and save both time and money to concentrate one's affairs. Can the companies be trusted not to misuse the situation? Are the consumers able to choose freely if they establish relationships with large conglomerates? Do the consumers have influence on the relationships and how these develop in the future? These questions have economic as well as social and ethical dimensions.

² A new law on banking and financing companies state that a bank has to offer both payment services through the general payment system as well as offer savings opportunities for a customer that are available for the creditor within at most 30 days (Finansinspektionen, 2004).

³ The consumers' bank and finance office is an organ led by the Swedish Financial authority, consumer office, Swedish Bankers' Association and a couple other main financial associations.

The aim of this paper is to explore how consumers perceive conglomerates and discuss economic, social, and ethical aspects of being customers to them. We also aim to explore how knowledgeable the consumers are of the new niche banks and how much confidence they have for the newcomers. In addition we aim to get some indication about the contact preferences as the niche banks mainly offer Internet banking and personal telephone service without branch offices.

A short description of the methodological considerations is presented in section 2. The “phenomenon” of niche banks as part of a conglomerate is described in section 3, including international and Swedish examples and a presentation of reasons for retailers and insurance companies to offer retail banking services. The consumer perspective in Section 4 starts by a review of the theories on financial services consumer behaviour and it shows some empirical evidence about consumers’ bank switching and split-banking behaviour. The last part of Section 4 is about reasons for consumers to be customers to the conglomerates. Our own study about consumers’ perceptions of the conglomerates and relationships with them is presented in Section 5. The paper ends with a concluding discussion in Section 6.

2. Method

We started our research project with a literature review of conglomerates within retailing, banking, and insurance and of the financial consumer behaviour literature. Then, we collected empirical material of the Swedish retailers and insurance companies who have established their own banks. Based on this understanding, we developed a questionnaire for consumers in order to explore their perceptions of the conglomerates and especially of their new banks. We conducted 8 interviews with consumers late May 2007 in Göteborg. It was a convenience sample of consumers in our vicinity that we anticipated would give us a variation in perceptions and experiences. While the original aim of these interviews was test questions for our coming survey during the fall 2007, we found the results to be interesting enough to be presented by them selves. The consumer perspective is seldom examined and the area is topical.

3. Description of the “phenomena” in Sweden and internationally

An international comparison shows that the phenomenon of combining retailing or insurance with banking is not only a Swedish occurrence or totally new for that matter. In fact, a combination of both retailing or insurance and retail banking has a reasonably long record.

3.1 Combining banking with retailing and insurance

The U.K market offers one of the first examples to combine retailing and banking. There retailing companies have started by launching a store card/loyalty card/club card as the first step into the financial services markets (Worthington & Welch, 2006). Marks and Spencer, the leading clothing, food and household retailer, was the first and it introduced their card in 1985. Ten years later in 1995, another large retailer, Tesco,

launched its first Club card. Subsequently, in 1997 Tesco made a joint venture with Royal Bank of Scotland and opened an own Tesco bank. Sainsbury supermarket group opened Sainsbury's Bank in 1997.

In the U.S., supermarkets and banks have co-operated since the 1990's. To date Supermarket banking is a common praxis (Flur, Ledet, & McCoy, 1996). By supermarket banking is meant that a local or community bank establishes an in-store branch and in so doing gets an access to a larger customer base. In return the supermarket earns rental income but it does not offer financial services of its own. In the U.S., financial regulation imposes legal separation between banking and commerce and so closer co-operation or mergers are beyond question.

Other banking ventures combined with retail companies can be observed in Canada, New Zealand, and Australia or are currently being planned in Japan. It appears as the phenomenon offer interesting prospects for the companies.

Concerning a combination of insurance and banking, the phenomenon first appeared in early 1980's in France and it is called bancassurance. It is the provision of financial- and insurance-related products through a single corporate provider (Staikouras, 2006). It can also be called assurance bank or Allfinanz. Bank assurance is traditionally a European phenomenon but later during the 90's and in the beginning of the 20th century it has spread out to different parts of the world. It can be found in emerging markets such as Brazil, Mexico, Singapore, Malaysia, Thailand, and Korea. Financial conglomerates are also found in Japan and Australia. In the U.S., the phenomenon appeared after 1999 when the regulations were modernized and cross-ownership of banks and insurance companies became possible. Nowadays these financial conglomerates are common in The U.S.

3.2 Swedish examples - Presentation of case companies

In this study, we focus on four rather new banks that are branches of other companies. They are the four largest niche banks in Sweden. Two of them, Icabanken and Ikanobanken, belong to two major retailers (Ica, grocery stores and Ikea, furniture- and furnishing stores). The other two, Länsförsäkringar bank and Skandiabanken, belong to two main insurance companies' (Länsförsäkringar and Skandia). Ikanobanken is more loosely coupled to Ikea compared to the close relationships between the other banks and their mother companies, both in terms of ownership and in their presentation to the public. For example, when entering the homepages of Ica, Länsförsäkringar, and Skandia, their banks are presented as businesses of equal merit with the original businesses. In Ikea's homepage, you must go through several pages to see that their customer card is connected to Ikanobanken. The relationship between Ikea and Ikanobanken is also hard to find at Ikanobanken's homepage⁴.

⁴ Ingvar Kamprad owns Ikea and Ikanobanken via different foundations. Besides being an internet bank, Ikanobanken administers the IKEA customer card and offer banking services to other companies as well.

Ikea was the first in line and started Ikanobanken in 1996. Länsförsäkringar and Skandia, opened their banks in 1996 and 1998 respectively. Ica, followed in 2002 and established Icabanken. Länsförsäkringar bank and Skandiabanken are the two largest niche banks, both in terms of assets and deposits and loans to the public sector – i.e. primarily households and companies in Sweden and abroad (table 1).

Table 1 The case companies in figures

Bank	No. of branches	No. of employees	Lending to the public	Deposits from the public	Shareholders' equity	Assets	Est.
Länsförs.bank	96	651	9 264	24 035	3 248	61 471	1996
Skandiabanken	1	164	41 566	51 124	1 948	56 164	1998
Icabanken	2	174	4 489	6 393	632	7 367	2002
Ikanobanken	1	171	5 168	5 442	1 074	6 837	1995

Source: Swedish Bankers' Association, 2007: Bank- and finance statistics 2006

The four niche banks all have a wide assortment offering complete banking services, but the market shares are small on the household market. Together they have 8 % of Swedish households' deposits (table 2). Their shares of bank loans to Swedish households via banks are also 8%. Only Länsförsäkringar bank has a mortgage institute. The others offer housing loans within their banks.

Table 2 The case companies' market shares of household markets.

Share %	Deposits	Lending (Mortgage inst.)	Lending (Banks)
SkandiaBanken	4	-	5
Länsförsäkringar Bank	3	3	2
ICA-banken	1	-	0,5
IKANO-banken	1	-	0,5

Länsförsäkringar bank is very closely connected to the insurance business, the name of the company is in fact Länsförsäkringar bank and insurance. They offer a full range of banking and insurance services (table 3). The situation is almost the same in Skandia. Icabanken and Ikanobanken have narrower product lines.

Table 3 Assortment of banking and insurance services in the case companies.

3.3 Reasons for retailers' and insurance companies to offer retail banking services

Increased competition is the main explanation why retailer/insurance conglomerates have come about. Companies cannot within their original business grow further due to the law governing the restrictive practices and hence they expand to other businesses. See appendix for an overview of the dominant companies among grocery stores, insurance companies, and bank in Sweden.

According to a recent report on competition in the retail banking the explanations why niche banks have been started in Sweden are mainly four-fold: 1) companies have large customer bases, 2) they have a good knowledge of the markets, 3) they are financially strong and 4) they have strong trade marks (ECON, 2007).

Theoretically, the main reasons behind the conglomerate phenomenon lie in the synergies that can be found when companies merge, co-operate, or start an own additional business (Staikouras, 2006; Singhal & Vij, 2006). Growing bigger is motivated by economies of scale and scope that follow when synergies across the different business activities and service lines are combined. The cost of producing and selling the services jointly implies better utilisation of the resources. Especially, an important factor behind the phenomenon is the better utilisation of the customer base when the conglomerates cross-sell additional services to their existing consumers. The conglomerate position changes the competitive position in form of a stronger market power. Thereby they might be able to affect the price level. At the same time, a conglomerate is an innovation in terms of a new combination of product- and service lines that might appeal to the new larger customer base. So, the negative effects, from the society's point of view, of a stronger market power can be offset by the positive innovations to meet consumers' needs.

The “One stop benefit” is one of the most significant reasons why both retailers and insurance companies have extended their business to retail banking services in the U.K. (Worthington & Welch, 2006). By offering multiple services in one place, they hope to get a larger share of their customers’ spending power. Also, research evidence from U.S. proposes the same one stop idea as the main rationale why banking and retailing suit together (Flur, Ledet, and McCoy, 1996). It is beneficial to all. However, some concern is raised whether consumers prefer to combine grocery shopping and retail banking together (Flynn, 1997; Quinn, 2001).

However, as retail companies manage large amounts of transactions daily, the idea of starting a bank is not far away. In the U.K. it has been found that retailers’ main motivation to offer financial services originate from the retailers attempt to reduce the cost of accepting payments (Worthington & Welch, 2006). Retail companies also enjoy a strong reputation and these have tried to take advantage of the dissatisfaction towards the traditional retail banks.

Insurance products and banking products are in many ways complementary services. A mortgage needs to be insured and it makes sense from a company perspective to combine banking and insurance. From the demand side the same is true. However, the companies are commercial corporations and so they are entitled to maximise their own profits whereby the concern whether consumers are exploited remains.

4. The consumer perspective

As shown above, there are several reasons for retailers and insurance companies to offer retail banking services. In this section we introduce the consumer perspective. The section starts with a review of theories on financial services consumer behaviour, continues with empirical evidence of consumers bank switching and split-banking behaviour, and ends with reasons for consumers to become customer to the new banks.

4.1 Financial services consumer behaviour

The literature on consumer behaviour in the financial service sector has parallels to traditional consumer behaviour theory and services marketing literature, but there are also examples of concepts used in a different way. Classification of the financial service attributes and labelling various behavioural patterns are common. The managerial perspective is strong. There is an urgent need for more research that pays attention the consumers’ situation, e.g. the role of financial services in consumers’ everyday lives.

One of the studies with clear parallels to the general characteristics of services that e.g. Berry (1980) discuss is Ennew and Mc Kechnie (1998). They put forward a list of characteristics of financial services:

- Intangibility
- Lack of intrinsic value
- Inseparability of consumption and production
- Heterogeneity
- Long-term nature

- Fiduciary responsibility (the banks cannot always provide the service to the consumer even if he/she had made the decision to buy)

Financial services are comparatively necessary services for all inhabitants in modern societies. Having a normal life all people need a current account to receive an income and make payments. However, financial services are not always interesting as themselves but they are usually used in order to obtain the actual demand, for example, a house or a car. Depending on the customer's time preference the actual demand is obtained through a loan or savings/investments. Therefore, it is said that the financial services lack of intrinsic value, which is why it is not likely that when a customer has acquired a well functioning service, he/she would be interested in other similar services or to switch supplier. This kind of behaviour is additionally reinforced by the long-term nature of financial services, which does not necessitate the consumer to be very active during the product's lifetime. Both of these qualities counteract the customer's interest for financial services from the start. On the other hand, the characteristics intangibility, inseparability, heterogeneity and long-term nature of the financial services make financial services very complex to understand and evaluate. The complexity consecutively means that the information search of financial services and evaluation of alternatives is cumbersome for the consumers. These problems correspond to an important concept, namely switching costs, which express the costs for time and effort that a customer incurs when switching suppliers (e.g. Porter, 1985).

Beckett et al (2000), propose that financial consumer behaviour is determined by the strength of two main dimensions: consumer confidence and involvement. The consumer confidence dimension corresponds to uncertainty, which is due to complexity of the product and certainty of the outcome associated with that product. Involvement in turn is consistent with customer control, participation and level of contact. A matrix of consumer behaviour divides the consumers into four ideal types:

- Consumer confidence high – involvement low: Repeat-passive consumers
- Consumer confidence high – involvement high: Rational-active consumers
- Consumer confidence low – involvement high: Relational-dependent consumers
- Consumer confidence low – involvement low: No purchase

Beckett connects the matrix with a third dimension that is proposed to have a great impact on customer behaviour: the choice of preferred delivery channel.

Repeat-passive behaviour is described as once customers have made their original decision about the service provider they tend to continue the relationship although they were not satisfied or loyal. The reason is that they perceive little differentiation between financial providers, they seek convenience and are inert, and they associate high switching costs with changing banks. These customers mainly use relatively simple banking services such as current account, deposits and loans. In the increased competition and information flow, and due to the new delivery channels, switching costs will be diminished. These tendencies make it increasingly difficult for the banks to "keep" their customers in this category.

Rational-active customers experience high levels of confidence in the purchase process and consequently they focus on price as the main decision variable. This type of

consumer is likely to use modern delivery channels extensively and the types of service they seek are, for example, insurance products.

Relational-dependent category of consumers uses complex financial services, such as investment and pension products, and they prefer face-to-face contact with the bank personal adviser. To have trust is of utmost importance for this group of bank customers. They value relationships but at the same time demand a high level of service.

The consumers that belong to the quadrant '*no purchase*' represent an important source of potential new business. The main obstacle to overcome is to increase these customers' level of involvement and confidence, i.e. to make them more active/informed/interested in financial services and diminish their uncertainty.

Recent theories on financial services consumer behaviour propose a shift from relationships to experiences in retail financial services (O'Loughlin, Szmigin, & Turnbull, 2004). While personal relationships have become weaker due to the technical development and internet banking, relationships continue to be an important factor in attaching, maintaining and enhancing customer relationships. Consumers form relationships with brands and the brand relationship incorporate notions such as reciprocity, mutual exchange and fulfilment of promises in consumers' minds. At the same time the findings suggest that the consumer power has increased. Despite the fact that financial services are complex and multi faceted services, it is difficult for a bank to create unique offerings. However, if a bank succeeds to create relevant brand values and experiences for the consumer it should affect the customer satisfaction and increases the consumers' likelihood to stay with the existing bank. The relationship management paradigm is found to be highly relevant in the financial services context where the main challenge is to find an optimum balance between relationship, brand and transactional experience benefits (ibid). On the other hand it is to be acknowledged that not all consumers desire relationships but want to seek variety.

To sum up, the prevalence of high switching costs, as a result of information and evaluation problems, makes the customer's buying process risky since the customer needs to trust the service provider not to misuse the exposed situation. In the long run, concerning the relationship continuation, switching costs are weighed against customers' degree of trust and confidence in the bank. The degree of trust, confidence and reliability can be interpreted as prerequisites for customer to be satisfied and also to develop loyalty.

4.2. Bank switching and split-banking behaviour

Concerning the customers' bank attitudes and behaviour it has been found that a) customers are increasingly seeking the best value for money, b) customers are increasingly demanding service and convenience, and c) customers are increasingly comfortable with using technology (van den Bosch and van Wauwe, 1995; Kimball et al, 1997). Consequently, although customers were satisfied with the bank pricing (which they currently are not) they are more alert to find alternatives and to take the best offer. Van den Bosch and van Wauwe (1995, pp. 370) have argued: "All change is ultimately decided by the customer and banks can no longer rely on the total loyalty of the

customer as they once could.” A totally loyal customer from the bank point of view would only use one single bank for the whole of his/her lifetime. The lack of the total loyalty for the bank means a situation where customers are “shopping around” and/or “switching” banks. For example, in the UK in 1986, 15 percent of the consumers had accounts at more than one bank, which was an increase of 40 percent on the previous 12 months (Burton, 1994). According to a report concerning the development in the UK, the share of the population having more than one current account in different banks in 1999 had increased to 35 percent (Mintel, 1999).

At the same time there is also evidence that 50 percent of the UK population has never changed their current account provider and those who have done so, did so more than five years ago (Mintel, 1999). These numbers indicate that split banking and/or bank switching is not very common, but this trend of customer disloyalty is likely to continue in the future.

Another study about student retail banking customers in Gothenburg, Sweden in 2001, it was found that 68.7 percent of the students used only one bank, 63.7 percent had never changed banks and 51.5 percent had no future switching intentions (Mankila 2001). On the other hand, approximately 25% of the students had a relationship with two banks and as many had changed banks once. Concerning the future switching intentions 39.1 percent were uncertain what to do while 9 percent were sure about switching. The numbers confirm the picture that the mobility in the retail banking market is not very high but these figures also suggest that the mobility is increasing.

A report from the Nordic competition authorities (2006) concerning the Nordic retail banking market put forth that bank switching rates are approximately 5 percent per year. Unfortunately some figures concerning split banking were not present but the report clearly made a point that consumers increasingly use more than one bank for their banking needs and such split banking is another current trend. What is not known however is for what reasons consumers do it: 1) how many consumers switch banks completely and end their previous relationship, 2) when do they want to keep the existing relationship and use it actively but need add something specific from a complementary bank; or 3) how many consumers leave the exiting relationship alive but don't use anymore.

The latest results from Synovate Temo institute show a significant improvement concerning the confidence that the public experiences for banks in Sweden (Synovate Temo, 2007). It had increased from 69 percent 2006 to 76 percent in 2007. 58 percent of the public is relatively or very satisfied with the service that banks provide and that is an increase by 3 percent. 62 percent of the public perceives that the number of banks for private customers in Sweden is enough. The share that uses only one bank is unchanged: 55 percent both in 2007 and 2006. There is no statistical significant difference concerning the share of consumers that use two or three banks. However, a significant share of the public has several bank relations. Most of the (51 percent) with a bank is done via the Internet and the share has not changed since 2006. However, the share of public that has never used the internet service has diminished from 36 percent to 28 percent compared to the last year. The share of contacts via the branch office has remained on the same level.

4.3. Reasons for consumers to become customers to the new banks

In the light of literature and the cases presented above, there are three main arguments that are possible reasons for consumers to become customers to the new banks.

One-stop benefit: To be able to satisfy the basic financial (banking and insurance) –and in Ica’s case basic grocery- needs from a same source can sound appealing and convenient for a consumer. To have only one relationship to satisfy such needs saves time and simplifies life.

Price: The new niche banks are mostly internet based and hence they do not have traditional branches. However, the Ica stores offer deposit and withdrawal services for customers to Icabanken and Länsförsäkringars’ insurance offices offers personal advice to their bank customers. On the other hand, the niche banks offer noteworthy better interest rate on the current account compared to the existing banks which may turn into opening an account in some of these.

Bonus program would be another important motivator to start a relationship with the new banks. We have reported about Ica’s customer card that offers bonus checks the more groceries the customer buys with the card. At times the card offers also special prices for these customers. While we have not seen any price advantages combined with the banking products the Ica-card may be a sufficient reason to start the banking relationship. Länsförsäkringar bank has also developed a bonus program for the customers who concentrate their affairs to the bank and offer some price reductions for such bonus customers.

5. Results from the consumer interviews

We interviewed 5 women and 3 men between 28 and 56 years of age. Some of them are singles others cohabiters or married. 3 of them have children and 4 of them have a car.

In the interviews we talked about their: 1. current customer relationships with companies’ in retailing, insurance, and banking; 2. ideal number of relations within different business areas; 3. perceptions of loyalty; 4. importance of image, price, convenience, product line, quality, and loyalty programs; 5. knowledge, use and perception of the companies’ new banks; 6. trust and confidence in the mother companies and their banks.

5.1 Customer relationships and loyalty in retailing, insurance and banking

The interviewees are more loyal in terms of continuity than exclusivity in the retailing and insurance sectors. Their bank relationships tend to be both exclusive and continuous. Our consumers mostly⁵ stay for a long period of time. We find many of the

⁵ Throughout the account of the interview results we mention if none, few, some, many, most, or all of the interviewees agree – to get a feeling for the variation in our empirical material. These quantities should not be generalised to other consumers.

long customer relationships in the sectors of banking and insurance, but there are also examples of being customer to retail chains for 20 years or more. Among the interviewed consumers, comparing companies and complete switching from one to another is rather uncommon in all the investigated sectors, i.e. the mobility is low. Most of the comparisons are simple using easily accessible information. The consumers compare the grocery stores they use to purchase in, they only compare insurance companies when they need a new insurance, and they mostly look at interest rates when comparing banks. There are just two examples of frequent and detailed comparisons in our interviews – both regard banks and these consumers happen to be customer to niche banks.

Exclusive customer relationships, i.e. being customer to just one company, is most frequent in banking (5 of 8), followed by insurance (3 of 8) among the consumers we talked to. When buying groceries and furniture, all of them visit more than one retail chain. Loyalty as continuity rather than exclusivity is in line with the interviewees own definitions of loyalty to companies. Long-term relationships and being able to trust agreements is important part of their definitions. No one mentions that you shall keep to one company. Instead, some of them points out that you can be loyal to many companies at the same time; the important thing is no switching. The consumers want to be loyal if the company care for the customers own good and is sensitive to what type of relationship the customer wants.

The preferred number of relationships differs somewhat from the actual numbers mention above. More consumers want two or more banks in their portfolio compared to the number of consumers who want more than one insurance company. Most of the interviewees (6 of 8) want just one insurance company, due to convenience and because it is a better deal for them. Half of the consumers prefer one bank, some of which have more than one today. The interviewees are mostly satisfied with the number of relationships they have today in retailing. They prefer to buy groceries in two or more stores because they can't find everything in just one or because it is more fun. The interviewees all want to buy furniture and furnishings in more than one retail chain, as they already do. It would be boring to just have one alternative.

In-store self service is the obvious choice for our consumers when buying groceries, but occasionally some of them want personal service, e.g. advice in delicatessen counters or -shops. When buying furniture and furnishings the interest in personal service is much greater, but most of them want to be able to look around in the store without being disturbed. In insurance and banking most of the consumers want a combination of self service via internet and personal service via telephone. One of the consumers wants to have personal service most of the time, but the others are content with personal service when buying a new service or if they have complicated questions. Only one of the consumers prefers to meet the bank personnel face-to-face for expert advice.

5.2 Importance of attributes

We measured the importance of six different attributes for grocery stores, furniture/furnishing stores, insurance companies and banks. The attributes were: the image/reputation of the company; price; convenience; assortment; quality; discount/

loyalty program. They were measured on a 5-point scale from unimportant to very important.

Convenience, assortment and quality came out as the most important attributes of grocery stores. 6 of 8 respondents gave top priority to each of them. Price wasn't unimportant, but only one of the consumers marked "very important". Discounts/loyalty program is the least important attribute. The opinions about importance of image/reputation vary a lot among the respondents – this pattern is the same in the following sectors too.

The consumers preferred nearly the same attributes of furniture/furnishing stores, but convenience was much less important to them in this sector. Price was slightly more important compared to grocery stores and discount/loyalty programs were less important.

Price and quality were the most important attributes for the respondents when evaluating insurance companies. Interestingly, assortment of insurances is rather unimportant for most of our consumers. Convenience is fairly important and discount/loyalty programs, again, is not very important to them.

The respondents graded quality and convenience as the two most important attributes of banks. Price and assortment are important to some of them and rather unimportant to others. Again, discount/loyalty program is the least important attribute, but compared to the case of furniture/furnishing stores it is much more important.

5.3 Knowledge, experience, and perceptions of nischbanks

The consumers in our study have very different levels of knowledge about the four nischbanks; ICA-banken, Ikanobanken, Länsförsäkringar bank, and Skandiabanken. For each company, there is at least one consumer who knows nothing about it and at least one consumer who is very well informed about its business.

Three consumers have experience of being a customer to a nischbank. The first has Skandiabanken as his main bank. The second has Länsförsäkringar bank as a supplementary bank for savings and the third has had a loan at Ikanobanken.

Three interviewees are totally uninterested in nischbanks. One of them because they are not banks primarily and he does not want to be bound to the mother company. Another wants ordinary bank branches and the third wants only one bank and the nischbanks lack overall solutions for him.

Only one of the interview consumers is positive to all four nischbanks. He believes they improve the competition. Three consumers are positive to one of the nischbanks. Two of them like the company they are customers to and the third appreciates ICA-banken for the possibility to make deposits and withdrawals when visiting the ICA-store.

One of the consumers in our study is sceptical to nischbanks, but could accept a nischbank as a complement if there are economic benefits and no obligations to be customer to the mother company.

5.4 Trust and confidence in the nischbanks and their mother companies

Most of the interviewees trust the companies as a whole – they are large companies who have been on the market for a long time. However, three consumers mention that they don't trust Skandia because of the recent scandals⁶ and one consumer is uncertain about ICA's price worthiness.

The level of trust the consumers have in the nischbanks is lower than their confidence in the mother companies. They often question the companies' competence as a banks, especially the ability to offer a full assortment of bank services.

The consumers all have their own demands on the companies in order to feel confidence in them. Some of the demands are: convenience, freedom to move, easy accessible, long history, good products, high moral and ethics, keeping promises, respectful treatment of customers, personal contact, high customer integrity, good reputation, good handling of problems, and follow the consumer purchases act.

6. Concluding discussion

The aim of our paper is to ponder consumers' perceptions about having a customer relationship with conglomerates and to consider possible economic, social and ethical aspects/consequences for them if an increased relationship is established. In this first consumer study we have listened to consumers' viewpoints and reasoning around the areas of: 1. Current customer relationships with companies' in retailing, insurance, and banking; 2. Ideal number of relations within different business areas; 3. Perceptions of loyalty; 4. Importance of image, price, convenience, product line, quality, and loyalty programs; 5. Knowledge, use and perception of the companies' new banks; 6. Trust and confidence in the mother companies and their banks.

The *economic* dimension is probably the most tangible consequence for consumers and easiest to observe in consumers wallets. We witnessed that some consumers, if interested and knowledgeable of financial services, took the chance to switch to or complement with a niche bank, because it is perceived valuable. However, these consumers have to spend time on being updated and to contact the new bank. For them the switching costs were not a hinder and these consumers most likely earns from the increased relationship with the conglomerate. What can then be said of those consumers that for some reason or other have remained passive? One of the "passive" consumers said it would not be worth to switch since she had so little money. Another person could not even think of having a relationship with any of the niche banks although they were cheaper. The one-stop benefit of the niche banks was only mentioned once. At the same time, another respondent wanted the new niche banks to be separated from their mother

⁶ Unlimited bonusprograms and illegal fringe benefits among the top managers.

companies – otherwise they would not consider becoming customers. The economic dimension is just one of the valuable dimensions for the consumers but not the most important. This conclusion is also supported by the fact that when the respondents evaluated the importance of different attributes, price came on the fourth place in the banking business. Convenience, company image, and quality were evaluated higher. Additionally our results showed that only a few consumers' used discounts or loyalty cards and this attribute category got a low importance score irrespective of the branch in question.

If a consumer chooses to establish a relationship with any of the niche banks s/he can be sure that most of the contacts with that bank will be via the Internet or the Telephone. The general impression was that it was totally accepted by the consumers. The use of Internet banking increases constantly as the Synovate Temo 2007 figures showed earlier. Still, without the personal banking service via telephone the niche banks would probably not survive. Some *social* relations are always needed although these would be remote. The consumers need personal telephone service for sorting out difficulties or when they have a question about a complex service. Otherwise the consumers seemed to want to “mind their own transactions”. This result confirms the findings that we presented of the latest theory of financial consumer behaviour in Section 4.1 where it was proposed that consumers create relationships with brands and experience transactional benefits rather than long for face-to-face personal relationships. Still, the social communication and the feeling of being a valued customer should not be dismissed. Social relationships with personnel are important for consumers to feel loyal (Holmberg, 2004). In retailing, there is a positive relationship between frequent contacts and perceived loyalty (ibid). A reason why frequency is more important than exclusivity is that frequent visits encourage personal contacts and socialization with the store personnel, which in turn encourage consumers to come more often. Consumers who know the personnel well receive extra service and thereby they feel special. We believe that the social dimension is a real challenge for the niche banks. Being someone for the consumer, and not merely a technical solution with better prices, is necessary to grow from a marginal phenomenon to respected actors.

In the introduction chapter we raised some possible concerns with regard to *ethical* issues if a consumer decides to have a relationship with a conglomerate company and its niche bank. We could sense from some of the consumer reflections that the concerns were true for them to some extent. Not all of the consumers expressed their concern, but many enough. It emerged as a noteworthy issue. Consumers did not want to feel “locked in” and many of the consumers talked warmly about having several relationships instead of only one and embraced competition between the companies. Even if they do not practice switching very often, they want the possibility to switch. Consumers also indicated that mutuality and continuity in the relationships is appreciated, while exclusivity is not, when they were probed on what loyalty meant for them and what they expect company loyalty to be towards the consumers. This is in line with the current theory on financial services behaviour where brand relationships build on reciprocity, mutual exchange and fulfilment of promises in consumers' mind's (O'Loughlin et al, 2004). An important factor in this respect would be to improve consumers' perceptions of conglomerates' images in order to appear unique and caring.

This paper presented the first findings from our research project on consumers' relationships to companies that expand their business to other markets. Within this project we also participate with questions about switching behaviour and number of relationships to grocery stores, insurance companies, and banks in a national survey of 3000 Swedish citizens. We will receive the data in February 2008. The next step is to plan a structured questionnaire based on the findings from the exploratory interviews. The questionnaire will be sent to 1000-1500 consumers in Sweden and the results are expected to be ready in the Mid Spring 2008. After the survey, we plan to make a round of in-depth interviews with consumers who are or have been customers to nischbanks to gain insight of their experiences.

Appendix

Market structure and competition

The concentration within the sectors grocery retailing, insurance, and retail banking is high in Sweden. The four largest companies have market shares around 80% in their largest consumer markets in each sector. In grocery retailing, the largest company's market share is rather close to 50%.

Grocery retailing

In Sweden, there are four large retail companies for groceries, who own or cooperate with 16 larger store brands. Together they have 84% of the grocery sales in grocery stores, approximately 190 000 million Swedish crowns in 2006⁷. ICA's market share is 43%, the Cooperation 19%, the Axfood-sphere 16%, and the Bergendahl-sphere 7%. In addition, there are a number of companies operating one or two store brands, most of them local concepts.

Insurance

There are 135 national insurance companies in Sweden. 12 of them are unit linked companies and 33 are other life insurance companies. 90 are non-life insurance companies.⁸ The four largest non-life insurance companies are Länsförsäkringar, If Skadeförsäkring, Trygg-Hansa, and Folksam. Their total market share of premium income is 83%, including both the consumer and business markets (table A.1). In insurance categories where private consumers dominate; "householder & homeowner" and "accident & health", their market share is 80% and 92%.

Distributional Effects of Lower Food Prices in a Rich Country

-

Calculations Based on Household Demand for Food in Sweden

(Very preliminary version, please do not quote)

Johan Lundberg[‡] and Sofia Lundberg

Centre for Regional Science (CERUM), Umeå University, Sweden

Abstract

Even if controlling for differences in taxes and transportation costs, the Nordic Competition Authorities claims in a report from 2005 that the Swedish food prices are 11-percent higher in Sweden compared to the EU-15 countries. This paper focuses on distributional effects of a price decrease on food in Sweden. Based on a simple model of household utility the households demand for food is derived and estimated. The empirical results are based on a data set covering 1,313 Swedish households. Based on this data set, price- and income elasticities for different income groups are calculated. These calculations suggest that food is a normal good with an average income elasticity of approximately 0.17 and a price elasticity of 0.44. The results indicate the income elasticity to differ across income groups while price elasticities are constant.

1. Introduction

Based on data from Eurostat and own calculations controlling for differences in VAT, other taxes and price campaigns, the Nordic competition authorities claims in an report from 2005² that food prices in Sweden are 11-percent higher compared to the EU-15 countries. The Nordic competition authorities argue that part of this price difference can be explained by the limited degree of competition on the food retailing market. This suggests a potential for lower food prices in Sweden. From an economic perspective lower prices would be, all other things equal, beneficial for consumers. However, the effects of a price change on food are not obvious. For instance, will the households consume more food if prices are lowered or will they spend more money on other goods? From a policy and redistribution perspective, it is also of importance to analyze if and to what extend price- and income changes affect the demand for food differently across income groups.

This paper constitutes a starting point for analyzing the effects of price changes on food on households' demand for food focusing on the Swedish situation. Based on a simple model of household utility, the main issue is to estimate the household demand for food and based on these estimates calculate income and price elasticities for food for different income groups. The demand for food is estimated using a dataset covering 1,313 households in a well defined area in Sweden. The dataset includes a large set of household characteristics collected from a survey. This information is then linked to price information from the food stores in which the household have reported to make their food purchases. Price information has been collected on site from the stores and covers all food stores in the area ranging from hypermarkets to bakeries. Based on the estimated ordinary demand function, price- and income elasticities are calculated in order to analyze potential distributional effects of an 11-percent decrease in Swedish food prices.

Analysis of the demand for food is of importance from several perspectives; for the private household, firms as well as for the policy maker. First, with, at least to our knowledge and with no exceptions, human beings need food in order to survive which indicate that food is a necessary good. Second, the number of household who are self-supported when it comes to food has at least in the industrial part of the world decreased dramatically during the last 150 years which means that a majority of all households have to spend part of their income on food.³ Based on these two 'facts' it could be argued that the demand for food should not be sensitive to

² Report from the Nordic competition authorities (2005).

³ Statistics Sweden (SCB, 2001) estimated that 20-percent of the Swedish households' budget is spend on food.

income or price changes; whatever the price and income levels households have to buy food. On the other hand, as incomes increase the individual household could afford to buy more expensive or more “luxury” food items. Therefore, the effect of income and price changes on food demand is an empirical question and may also differ across income groups and regions. If the demand for food is sensitive to income changes this is of importance for the policy maker when it comes to the design of transfer programs. From a business perspective, the income elasticity is of importance as it (together with information on the regional income- and demographic development) constitutes one indicator of the local market potential. That is, in the decision to enter or not to enter a local market, local income changes is not a sufficient indicator of changes in market potential. Moreover, if the demand for food is sensitive to price changes it should be taken into account in the design of VAT on food, and maybe especially so if the sensitivity vary across income groups.

The previous empirical literature on food demand have to a large extend been based on data from undeveloped countries where under- and malnutrition are large problems. Abduali and Aubert (2004) find income and socio-economic variables to be of importance in explaining food demand among Tanzanian households. Sengul and Tuncer (2005), who use the Linearly Approximated Almost Ideal Demand System (LA/AIDS) to estimate food demand of poor and extremely poor households in Turkey, finds that food demand of extremely poor households’ tend to be more sensitive to changes in income and prices compared to poor households. This is of importance from a policy perspective as it suggests that equalization of incomes (i.e. income transfers from rich to poor and extremely poor) or decreases in VAT on food to have a positive effect on food consumption amongst the poorest.

In an interesting study Deaton and Paxson (1998) finds, given constant per capita total expenditures, the food budget share decreases as the size of the household increases. This result proved to hold for seven countries of quite different character, such as the United States and Pakistan. In contrast to expected this relationship turned out to be larger for countries with low income levels. Although Deaton and Paxson (1998) performs an analysis among countries and the present paper focuses on differences in demand pattern among income groups within a country it is relevant to mention since it highlights the importance of giving attention to differences among income groups.

This paper contributes to the existing literature on household demand for food in several ways. First, the empirical analysis is based on detailed information on both household characteristics and prices. Second, analysis of food demand based on information from households living in a rich country where starvation is not a large problem is scarce. Therefore, it is of interest to compare our results with other studies based on data from poor countries. Third, distributional effects between income groups are always of interest from a policy perspective.

The rest of this paper is organized as follows. A simple theoretical model is developed and the demand for food is derived in Section 2. The data set is described in Section 3 followed by a discussion of estimation technique and functional form in Section 4. The results are presented in Section 5 and final discussion and conclusions are given in Section 6.

2. A Simple Model

Consider a representative household, i , who receive utility (U_i) from consumption of two goods; food (g_i) and other goods (G_i). The utility function of household i could then be defined as

$$(1) \quad U_i = u_i(g_i, G_i; Z_i)$$

where other household characteristics are captured in Z_i . Denote by y_i the household total income and by p_i the price level of food faced by the household (i.e. the price level in the food store where household i makes her food purchases). Normalize the price on other goods to 1, the household then maximizes its utility (1) subject to the budget constraint, $y_i = p_i G_i + g_i$ and solves the maximization problem

$$(2) \quad \max_{g_i, G_i} L = u_i(g_i, G_i; Z_i) - \lambda (y_i - p_i G_i - g_i)$$

As the household maximum utility will be a function of its income y_i and the price on food p_i the indirect utility function, which indicate the maximum utility attainable at given prices and income, can be written as

$$(3) \quad v_i = v_i(y_i, p_i; Z_i)$$

which is increasing in y_i and decreasing in p_i and must hold for all v and y . Hence, it can also be written as $y_i = y_i(p_i, v_i; Z_i)$ where y_i indicate the minimum income at given prices to achieve a given utility. Holding utility constant at v_i^0 the compensated demand curve is given by

$$(4) \quad \frac{\partial y_i}{\partial p_i} = g_i(p_i, v_i^0; Z_i)$$

By totally differentiating (3) still holding utility constant give

$$(5) \quad \frac{\partial \bar{v}_i}{\partial p_i} dp_i + \frac{v_i}{y_i} dy_i = 0$$

As utility is held constant $dy_i = -g_i dp_i$ and by Roy's identity the ordinary demand function is

$$(6) \quad g_i^* = g_i(p_i, y_i; Z_i) \quad \frac{\partial \bar{v}_i}{\partial p_i} / \frac{v_i}{y_i}$$

From (6) it is easy to calculate the income elasticity $E = (\partial g^* / \partial y) / (y / g^*)$ as well as the price elasticity $e = -(\partial g^* / \partial p) / (p / g^*)$.

3. Data

The data set used in this study originates from two different sources. Household characteristics and information on the households food consumption have been collected by a questionnaire to a representative selection with respect to the age distribution of 3,000 households in six Swedish municipalities; Bjurholm, Nordmaling, Robertsfors, Umeå, Vindeln and Vännäs. These municipalities, who border on to each other, form the Umeå region with Umeå as the largest municipality located in the northern part of Sweden. As these municipalities differ in size (see Table 1 below), the number of questionnaires to each municipality has been weighted by the relative number of inhabitants.

Table 1. Population, number of questionnaires and respond-rate.

Municipality	Population in 2004 (%)	Questionnaires (%)	Usable answers (%)
Bjurholm	2,588 (1.8)	55 (1.8)	21 (1.6)
Nordmaling	7,511 (5.3)	164 (5.4)	68 (5.2)
Robertsfors	7,106 (5.0)	152 (5.0)	60 (4.6)
Umeå	109,390 (77.6)	2,320 (77.3)	1,029 (78.4)
Vindeln	5,773 (4.1)	126 (4.2)	47 (3.6)
Vännäs	8,525 (6.1)	183 (6.1)	88 (6.6)
Total	140,893 (100)	3,000 (100)	1,313 (100)

Note: Percentage is given in parenthesis.

The number of usable answers was 1,313 (44-percent) and the data is fairly representative in terms of preserved weights attached to each municipality. The questionnaire provide information on store preferences, how much the household spend on food per month and household

characteristics such as the households' total income before tax, the number of persons in the household, their age, the highest education of a family member, how many times per week members of the household dine out etc. The household was also asked to name its primarily choice of store for three types of shopping; large scale, supplementary, and occasional. These three types of shopping correspond to the budget shares spent on each type. All households in the data have reported large scale shopping behavior while some of them do not go for occasional shopping trips and some do neither do occasional nor supplementary shopping. The questionnaire has been developed in close collaboration with practitioners within the food market and the survey was performed in October 2004.

The second source of information concern prices which has been collected directly in the stores. In total, the respondents listed 117 food stores which is basically all stores that sells food in the area. From each store, prices of up to 171 different items have been collected and based on this information two different price indexes has been calculated based on two typical food baskets defined by the Swedish National Board for Consumer Policies (KO). One price index (p_1) is calculated for a typical single person household, the other one (p_4) for a typical 4 person household with two adults and two children. Here, (p_1) is used for families with less than three adults, otherwise (p_4) is used. The price indexes from the different stores are then weighted by the share of the households' monthly food expenditures spent at each of the stores listed by the household. As all 171 items in the KO-basket were not supplied by the stores in the lower tail of the size distribution two different price indexes has been tested. Firstly, the price for a missing item is assumed to be the mean price of that specific item within all the stores where the item was found. Alternatively the price for a missing item is assumed to be the highest price for that specific item within all the stores where the item was found. However, as it turned out, the results are not sensitive for the choice of price index. We argue that if a given store does not hold a specific item, then it is reasonable to assume that the stores cost to add this item to its assortment is high. Therefore, the latter definition is used in the empirical analysis below.⁴

⁴ This is actually a problem of missing observations. By using the highest value instead of the mean value may introduce additional bias on the estimated parameters. We are aware of this. However, as we believe the higher price to be a better estimate of the actual price if the store should hold that specific item, we argue that our definition will instead reduce the potential bias.

Descriptive statistics of household characteristics and prices used in the empirical analysis are displayed in Table 2 below. The dependent variable (g) is defined as the households' total monthly spending on food in SEK.

Table 2. Descriptive statistics

Variable	Mean	Std. Dev.	Min	Max
Spend (g)	3,933.8	1,880.2	500.0	13,750.0
Price (p)	1,344.2	694.1	704.4	3,038.2

Often (of)	2.1	1.5	0.0	7.0
Univers. edu. (ue)	0.7	0.8	0.0	9.0

Among the potential determinants of household demand, price (p) and income (y) are central in order to calculate price and income elasticities. The price variable has been defined above. In order to increase the respond rate on income, the question regarding the households' total income before tax was originally discrete where the respondent were asked to mark within what interval the households total income was. This information has then been transformed into a continuous variable.

It is reasonable to assume that the demand for food depend on other household characteristics than income. For instance, the accessibility of transportation device, storing capabilities, and characteristics of living conditions are likely to affect the demand for food. The accessibility of transportation device is measured as the number of cars ($cars$) available to the household and is assumed to reflect the possibility for the household to transport large quantities and/or 'economy packs'. Note the broad definition; access to instead of owned. Storing capabilities and capacity

are captured by a dummy variable for external freezer (*ef*). As this variable only capture the storing capabilities of frozen foods, three additional dummy variables reflecting housing conditions are used to capture the storage capability of other items. These variables are information on if the household live in a students den (*sd*), private house (*pb*), terrace house (*tb*), or apartment (*ap*). Note that apartment includes both co-operative apartments and apartments with right of tenancy. In the empirical analysis below, apartment will serve as the reference category.

A natural substitution for buying food in the store is to visit a restaurant. Ma *et al.* (2006) argue that to understand household demand for in house food consumption the households' food away from home preferences need to be accounted for. Ma *et al.* (2006) estimates the food away from home expenditures with data from urban China and finds income to be a strong predictor. To control for this, two variables are used; the number of dinners (*do*) and lunches (*lo*) that the members of the household eat at restaurants per week (this includes lunches at staff dining rooms). Note that lunches prepared at home and brought to work (lunch box, sandwiches etc.) are not included in *lo*.

Finally, it is also reasonable to assume that the age composition of the household, shopping frequency and educational level might have effects on the households demand for food. For instance, a large number of children aged 7-15 years or 16-19 years may have a different impact on the household demand compared to a household with many aged 65 years or above. These effects are controlled for by the use of information on the number of children within the household aged 0-6 years (*a06*), 7-15 years (*a715*), 16-19 years (*a1619*), 20-24 years (*a2024*), 25-64 years (*a2564*), and above 65 (*a65*). The households shopping frequency is controlled for by information on how often each week the household visits a food store (*of*) for large scale shopping for food and the educational level is measured by the number of individuals within the household who holds a university degree (*ue*). Finally, five dummy variables are used to control for potential structural differences between regions, where regions are defined as the municipality.

4. Functional form, pre-testing and estimation technique

Different functional forms and estimation techniques have been applied in the literature on food demand (references to be included here). Here, the households' demand for food is supposed to take the form

$$(10) \quad g_i = \alpha + \beta_p p_i + \beta_y y_i + \beta_{y^2} y_i^2 + Z_i' \lambda + \varepsilon_i$$

where α and the β 's along with the elements in the vector λ are parameters to be estimated and ε is the error term.

Even if there are good reasons to assume non-orthogonality between p and ε which suggests the use of an estimator based on instrumental variable (IV) techniques as OLS in such a case will be biased and inconsistent, IV estimation will be less efficient compared to OLS if p actually is orthogonal to ε . In order not to make this erroneous assumption, the Durbin-Wu-Hausman test of the endogeneity of p based on the OLS estimate of the error variance is used.⁵ With a test statistic of 4.45 and a p-value of 0.03 the null hypothesis of orthogonality between p and ε is rejected which suggest the use of IV-estimators. Given this, the next issue is to select instruments for the endogenous variable p . Besides the requirement that these instruments should be correlated with the endogenous regressor and at the same time orthogonal to the errors, the literature gives little guidance on the matter of where these instruments are to be found, and maybe especially so in applied work based on cross-section data where the use of lagged values of the endogenous regressor is not an option.⁶ Here, information on the distance between the household and the city centre of Umeå, the category of the store the household have chosen for it's large scale shopping for food (that is, if this store could be categorized as a supermarket or a middle sized store) and if this store is associated with the two largest retail chains in the region are used as instruments for p . Based on IV estimation of equation (10), the validity of the chosen instruments are then tested for by the use of the "partial R^2 "-test proposed by Shea (1997).⁷ An F -statistic of 9.93 and a p-value of 0.00 suggest that the selected instruments are valid.⁸ Further, the Sargan statistic⁹ is applied to test for overidentification of all instruments (test of the instrument's independence from the unobserved error process). With a Sargan statistic of

⁵ The DWH test, which is distributed as chi-sq, was first proposed by Durbin (1954) and then by Wu (1973) and Hausman (1978) and comes in different versions. Here we have used the one based on the OLS estimate of the error variance (the Durbin statistic) because it is more efficient compared to the version based on the IV estimate of the standard errors. This version of the test also has the advantage that it performs better when the instruments are weak (see Staiger and Stock (1997)).

⁶ Lewbel (1997) discuss and suggest a solution to the problem of constructing instruments when no additional data are available. We have tried his approach with very mixed and "unstable" results.

⁷ This test, which is an F -test, is actually similar to the one suggested by Bound *et al.* (1995) for the case with only one endogenous regressor. However, the statistic proposed by Shea (1997) has the advantage that it takes the intercorrelations among the instruments into account.

⁸ As a rule of thumb for a single endogenous regressor, an F -statistic < 10 is cause for concern (see Steiger and Stock (1997)).

⁹ This test is distributed as chi-sq. For further details of this test, see Sargan (1958).

4.39 and a p-value of 0.36 the null hypothesis could not be rejected which indicate that the instruments are not correlated with the error process.

Although the consistency of the IV coefficient estimates is not affected by the presence of heteroskedasticity, IV estimates of the standard errors become inconsistent which prevent valid inference. This could partly be overcome by the use of heteroskedasticity-constant or “robust” standard errors and statistics. The conventional IV estimator is, even if it is still consistent, inefficient in the presence of heteroskedasticity. One common solution to this is the use of a robust General Method of Moments (GMM) estimator¹⁰ which makes use of the orthogonality conditions to allow for efficient estimation in the presence of heteroskedasticity of unknown form. Here, the Pagan-Hall general test statistic, which is distributed as chi-sq, is applied to test the hypothesis of heteroskedasticity where the null is homoskedasticity.¹¹ As the Pagan-Hall test is non-significant (58.19, p-value = 0.00) the hypothesis of homoskedastic errors can be rejected which suggest the use of GMM. However, for comparable reasons we will present both the IV and GMM estimates. Finally, to ascertain the instruments independence from an unobserved error process the Hansen *J* statistic is employed.¹² That is, to test for overidentifying restrictions. This is supported by the Hansen *J* statistic (5.41, p-value = 0.25).

5. Results

Let us first comment on the IV and robust GMM parameter estimates of equation (10) displayed in Table 3 below, and then turn to the calculation of price- and income elasticities. The regional dummy variables are suppressed in order to save space.

As is evident from Table 3 the IV and robust GMM estimates are quite similar even though the significance differs for some variables. For instance, both models predict the demand for food to be negatively correlated with price which suggests that the demand function has a negative slope. This correlation is statistically significant in both models. However, the positive correlation between the demand for food and the households’ income (β_y) is only significant at the 95-percent level in the IV model (significant at the 94-percent level in the GMM model). However,

¹⁰ GMM was first proposed by Hansen (1982) and is now frequently used in empirical research.

¹¹ See Pagan and Hall (1983) for further details regarding this test. In comparison to other frequently used test for heteroskedasticity like the ones proposed by Godfrey (1978), White (1980), Koenker (1981), and Cook and Weisberg (1983), Pagan and Hall (1983) points out that these test will only be valid if heteroskedasticity is only present in the IV regression and nowhere else in the system including the first stage regressions.

¹² The Hansen *J* statistic is distributed as chi-sq.

both models predict this effect to decrease with income as β_{y^2} is estimated to be negative. The accessibility of a car for transportation is estimated to have a positive effect on the demand for food as λ_{car} is positive and significant in both models. This contradicts our previous assumption that access to a car (or cars) would facilitate transportation of large quantities and/or ‘economy packs’. One possible explanation for this is that the possession of car(s) correlate with income and hence is an indicator of purchasing power. However, as the correlation between the two variables income and car is only 0.35 this interpretation is ruled out. Another potential explanation is that car owners actually have an ‘overconsumption’ of economy packs. That is, they tend to buy too large quantities which they in the end do not use up before the ‘best before’ date comes along.¹³

Turning to storage capabilities and capacity which are captured by the dummy variables for external freezer (*ef*) and housing conditions (if the household live in a students den (*sd*), private house (*ph*), or terrace house (*th*) where those living in apartments serves as reference group). The effects of external freezer (λ_{ext}) and if the household lives in a student dean (λ_{sd}) are estimated to be positively and negatively correlated with g respectively. However, the significance of these effects differs between the two models. While the positive effect of an external freezer is non-significant in both models, the GMM estimates suggests that those living in student deans to have lower expenditures compared to those living in apartments. Positive effects are also estimated for households living in private houses (λ_{ph}) and terrace houses (λ_{th}). Again, one suspects these two variables to be correlated with income as it is reasonable to assume that households with higher incomes are more likely to afford to live in a private house or a terrace house. However, with correlation coefficients of 0.26, 0.23 and -0.23 respectively (the last correlation is between income and students dean) we disregard the interpretation that these variables are indicators of the households income. Therefore, we once more suggest the interpretation that households with large storing capacities tend to buy larger quantities which they in the end do not use up before the ‘best before’ date comes along. Another potential explanation is that these households have preferences for more expensive items. Unfortunately, we are not able to discriminate between these two potential explanations.

¹³ This interpretation was proposed to us by Carina Selander, an interpretation that we find plausible and fully support.

Table 3. IV and GMM estimates and corresponding t-values of equation (10).

	IV		GMM	
	Estimate	t-value	Estimate	t-value
Price (β_p)	-1.21	-2.14	-1.27	-2.22

ϕ	1,281.91	3.35	1,373.39	3.41

Another potentially important factor is the possession of credit cards. Again, it is likely that the number of credit cards within the household correlate with income. A correlation coefficient of 0.26 between income and the number of credit cards indicates this not to be the case. The estimates presented in Table 3 suggest a positive correlation between g and cc . If the number of credit cards within the household also reflects the use of credit cards, one potential interpretation is that households who use credit cards are less price conscious than households who pay cash. The argument by Ma *et al.* (2006) that to understand household demand for in house food consumption the households' food away from home preferences need to be accounted for is not supported by the parameter estimates presented in Table 3. As the two

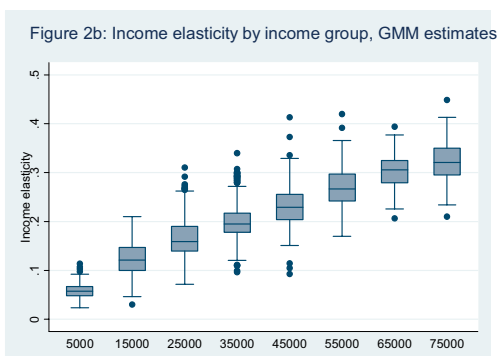

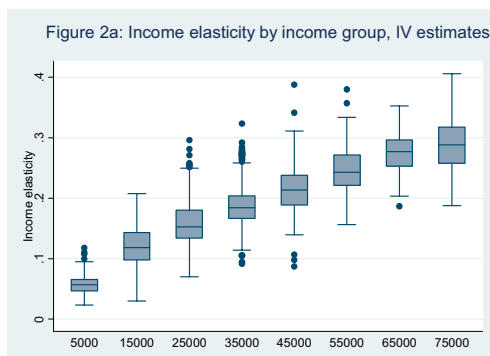

parameters (β_{lo}) and (λ_{do}) are non-significant, there is no evidence for such effect for the household included in our data.

As expected, the number of household members is estimated to have a positive effect on the households' food expenditures. However, our model predicts the magnitude of this effect to be different depending on the family members' age. For instance, an extra individual aged between 16 and 19 years (β_{a1619}) is estimated to increase the households' expenditures on food by approximately SEK 1,430 while an additional family member aged above 65 (β_{a65}) is estimated to increase the households' expenditures by approximately SEK 782. This difference is significant and so are all other differences except for $(\lambda_{a06} - \lambda_{a715})$, $(\lambda_{a06} - \lambda_{a2024})$, $(\beta_{a06} - \lambda_{a2564})$, $(\beta_{a06} - \lambda_{a65})$, $(\beta_{a715} - \lambda_{a2565})$, $(\beta_{a2024} - \lambda_{a2564})$, $(\lambda_{a2024} - \lambda_{a65})$, and $(\lambda_{a2564} - \lambda_{a65})$.

Let us continue with calculations of price- and income elasticities. Based on the estimates of equation (10) displayed in Table 3, the average price elasticity (e) is 0.43 and 0.46 for the IV and GMM estimates respectively with a standard deviation of 0.23 and 0.24. This suggests $0 < e < 1$ (at least at the 90-percent level of significance). Moreover, the average income elasticity (E) is calculated to be 0.17 (IV) and 0.18 (GMM) with a standard deviation of 0.07 in both cases which suggests $0 < E < 1$ at the conventional 95-percent level of significance. Hence, based on these calculations we conclude that food is on average a normal good. However, these elasticities differ across income groups. For instance, as shown in Table A1 and visualized in Figure 1a and 1b below, the price elasticity ranges from an average of 0.57 for the households with the lowest incomes to an average of 0.34 for the group of households with the highest incomes. However, this difference is not significant, nor is any other difference between income groups displayed in Figure 1a and 1b.

Differences in income elasticities between income groups are more evident than the differences in price elasticities, see Figure 2a and 2b below. Income elasticity range from 0.06 for household's with the lowest incomes to approximately 0.32 for households with the highest incomes. At first glance, these findings may seem strange as it would have been more likely to find high income elasticities among low income households. However, one potential explanation for these findings goes as follows. Relative many other countries, Sweden is a rich country where under nutrition is not a large problem (even though malnutrition might be), not even among households at the lower end of the income distribution. When these households receive some extra money, they have other needs than food to fulfill and therefore they use this extra money for consumption of other things. On the other hand, households at the upper end of the income distribution tend to buy more expensive food items when receiving extra income.

6. Concluding remarks

This paper deals with the households demand for food where the main issue has been to analyze distributional effects due to a potential change in food prices. The results presented in the paper are based on a data set covering 1,313 households in the mid-northern parts of Sweden. The main findings are that the effect of such a decrease in food prices will affect households with different incomes differently. For instance, our calculations suggest the income elasticity to be much higher for high income households compared to low income households.

The Substitution Patterns of Pharmaceuticals: the Case of Statins

Tanja Poutiainen
Department of Economics
University of Helsinki
Helsinki, Finland
tanja.poutiainen@helsinki.fi

Abstract

The market of statins is characterized by the large number of products, which are similar in their clinical features but which can have even large price differences. This paper examines the choice of statins with the discrete choice demand model in the differentiated product market. The results indicate that consumers prefer lower prices and the demand of statins is sensitive to price changes, when preferences are allowed to be correlated within the group of therapeutic substitutes and the endogeneity of prices is taken into account in the estimation of the nested logit model. Furthermore, the demand of statins is found to be more responsive to changes in the prices of therapeutic substitutes than other products.

Keywords: discrete choice, demand, product differentiation, nested logit, elasticity, pharmaceuticals.

1. Introduction

The industry of pharmaceuticals has been under the public debate and has been examined also from the point of view of economics not least because of dramatic increase in health care expenses in almost all Western countries during the past few decades. One market in Finland, where consumption and, in consequence, expenses for both consumers and the society are at high level is statins (HMG CoA reductase inhibitors), which are used to decrease high serum cholesterol. In 2005, the total expenses for statins was over 108 million euros, which was 30 % of the total expenses of cardiovascular system drugs and 7 % of the total expenses of all pharmaceuticals (National Agency for Medicines & the Social Insurance Institution, 2006).

The purpose of this article is to analyze the price sensitivity of the demand of statins. This market is especially interesting, because although clinical differences between statins are small in practice, there are relatively large number of products in the market and significant price differences between them. Furthermore, price developments and increase in the number of products in the market during 2003-2006 suggest that price competition between statins might have strengthened.

The demand of prescription drugs can be described as a multistage decision making process. At the first stage, the demand is restricted by a physician, who selects a prescription drug and thus a method of treatment possibly among several potential alternatives. The physician can, however, be an imperfect agent to the consumer: the physician does not necessarily select the product that maximizes the utility of the consumer, because search for price or quality

information can create costs to the physician. If the physician takes patient's welfare into account, then costs induced by the use of pharmaceuticals to the patient can affect on the choice of the physician. At the second stage, a pharmacist chooses a product, which can be a generic or a brand, with the patient and within the limits of legislation.

The demand of statins is analyzed with the discrete choice model in the differentiated product industry. In particular, a nested logit model, which takes the multistage nature of demand into account by allowing preferences to be correlated within the group of therapeutic substitutes, is used. Furthermore, prices are allowed to be correlated with unobserved product characteristics including, e.g., reputation or perceptions about quality. The endogeneity of prices should be taken into account, as was shown by Berry (1994) in Monte Carlo studies or Berry et al. (1994) in an empirical study of the automobile industry. Indeed, the results of this article support this statement.

One alternative to discrete choice models is a basic log-linear demand model, which, however, has some well-known undesirable features, especially, if the number of competing products in the market is high. In that case, the number of cross-price elasticities to be estimated is also large, if one is not willing to make some sort of aggregation or *a priori* assumptions about the magnitudes of elasticities, for example, by setting some of them to zero.

This would be a relevant problem also in the market of statins, where the number of products is relatively large, and thus, for instance, the model of multistage budgeting used by Ellison et al. (1997) is not applied here. An advantage of this article compared to Ellison et al. (1997) and also to Berndt (1996) is that the substitution patterns of pharmaceuticals are analyzed with a relatively rich monthly panel dataset for substitutable products in 2003-2006.

The main result of this article is that the demand of pharmaceuticals is sensitive to the changes of prices, which might be explained by the market environment of statins characterized by the relatively large number of products with high price differences or it can partly reflect changes in the stocks of pharmacies, when prices change¹. Furthermore, the demand is fairly unresponsive to changes in the prices of other products, which is caused by the correlation in preferences between therapeutic substitutes, the relatively large number of products in each group of therapeutic substitutes and thus low within group market shares on average. Anyhow, the demand is more sensitive to changes in the prices of therapeutic substitutes than other products.

The article is constructed in the following way. Section 2 illustrates in brief the pharmaceutical markets in Finland and, in particular, the industry of statins on the basis of the data. Theoretic and econometric models of discrete choice demand are represented in section 3 and estimation results are looked through in section 4. Finally, section 5 summarizes the results.

2. The Overview of Pharmaceutical Markets in Finland

The pharmaceutical market environment changed substantially in 1.4.2004, when a compulsory drug substitution law was implemented in order to cut drug expenses down by

¹ See Appendix 1 The Data for the construction of the dataset.

increasing competition between drug firms. According to the law, a substitutable non-patent drug has to be exchanged with the cheapest or cheap enough generic substitute by a pharmacist if neither the consumer nor the doctor denies the substitution.

Substitutable drugs belong to the same substitution group and so-called price band is composed for each group. A cheaper equivalent product offered by a pharmacist is selected from the price band. The lower limit of the band is determined on the basis of the cheapest drug of the group in every three month. The upper limit is +2 euros from the lower limit if the lower limit, or the cheapest drug, is less than 40 euros, and otherwise the upper limit is +3 euros from the lower limit. The aim of the band is to guide generic substitution, and the consumer has always a right to get the cheapest substitutable product.

Pharmaceutical companies can, in principle, set their products' prices freely, but if they want their product under the basic refund, the wholesale price of the product must not be higher than a "reasonable" wholesale price confirmed by the Pharmaceutical Pricing board. Out-of-pocket prices paid by consumers depend also on the National Health Insurance Scheme, which covers 42 % of basic refunded drugs' expenses and before 2006 it covered 50 %, exceeding consumer's excess (10 EUR in 2003-2005) per purchase. Furthermore, drugs are refunded according to the lower or higher special refund for some serious and long term diseases, when the health insurance can cover even 100 % of drug expenses, exceeding consumer's excess (3 EUR) per purchased preparation². Overall, the drug reimbursement system is quite complete and prices and pharmaceutical markets are regulated and controlled by several authorities in Finland.

Companies can change prices biweekly and the price of a certain drug is the same in all pharmacies. As a consequence, there can exist price competition between drug companies but not between pharmacies. In Finland, a firm has, basically, two optional pricing strategies for a substitutable drug: it can raise or keep the price of the drug as high as possible and count on product's brand name or lower the price to the band. In the former case the demand faced by a company can be lower but the price is higher than in the latter.

2.1. The Industry of Statins

HMG CoA reductase inhibitors i.e. statins are used to decrease high serum cholesterol, which is a significant risk factor for cardiovascular diseases. Although the mortality for cardiovascular diseases has decreased during the past few decades, they are still the most common cause of death in Finland. For example, in 2004 their share of the total death rate was 40 % for men and 43 % for women (Salomaa, 2006).

Although the total patient days³ of substitutable medicines has a clear upward trend, the average of patient days has decreased from the beginning of 2003. Furthermore, the average price and price differentials have decreased partly because of competition between products and cuts in the wholesale prices by the Pharmaceutical Pricing Board. (Figures 1 and 2.)

Even though clinical differences between statins are small in practice, there can be remarkable price differences between products (see Klaukka et al. [2], 2006). In the end of

² See National Agency for Medicines & the Social Insurance Institution (2006) for the details of the reimbursement system in Finland.

³ See Appendix: the Data for the definition of patient days.

Figure 1
Average Quantity (Patient Days/10000)

Figure 2
Boxplot for Prices in EUR

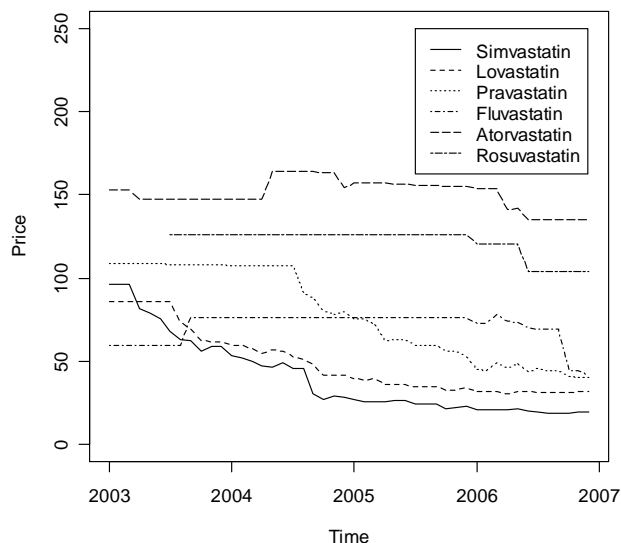

Figure 3
Average Prices in EUR by ATC –class

2006, the average price of substitutable products was the lowest, 20 euros, for the group of simvastatins, in which the number of products has increased fast from the beginning of year 2003, and the highest, 135 euros, for atorvastatins, where the number of products is moderate compared to simvastatins. (Figure 3.)

The prices of simvastatins, which have been in the market in the beginning of 2003 and also in the end of 2006, have declined the most, 76 %, on average from the beginning of 2003 and remained the same in the case of pravastatins. In the groups of lovastatins, pravastatins and especially simvastatins, where the average prices have declined significantly, the number of products have increased. Furthermore, the number of manufacturers in these groups has increased from 2, 2 and 5, respectively, in January 2003 to 5, 6 and 12 in December 2006. These observations suggest that the price competition between these products might have strengthened during the past few years.

Although the number of products within a substitution group, which is defined separately for each package size, varies only from 1 to 7, price differences within the group can still be significant. On average, the maximum price differed from the minimum price of the substitution group 10 euros, and as much as 175 euros as a maximum. (Table 1, Appendix 2.) Thus, if the physician has prescribed a medicine outside of the price band, the consumer could have saved a significant amount of money by changing the medicine to a cheaper one.

3. The Model and Estimation

3.1. The Discrete Choice Demand Model

In this subsection, a characteristics space demand model in the oligopolistic differentiated product markets is considered and it is mainly based on Berry (1994) and also on Berry,

Levinsohn and Pakes (1995). Discrete choice demand models are applied in some form by several authors for very different products from cars (Berry et al., 1995; Verboven, 1996) to cereals (Nevo, 1999) and also for pharmaceuticals (Stern, 1996) in the field of empirical Industrial Organization.

Assume a utility maximizing, rational individual facing a discrete choice problem among alternatives $j=0, \dots, J$. To simplify the presentation, I have dropped the time subscript t . Thus the consumer chooses one alternative maximizing her utility, which is specified as a function of individual characteristics, such as age and income, the price of the product and observed and unobserved (to econometrician) product characteristics, such as safety, side-effects and efficacy. There exists large unobserved heterogeneity between consumers in the valuation of drugs, because, for example, their responsiveness to drug therapy can differ and they can have different valuation for side-effects and medical conveniences (Berndt, 2002).

More formally, the conditional indirect utility for consumer i from the consumption of drug j is defined as

$$U(\zeta_i, p_j, \mathbf{x}_j, \xi_j; \boldsymbol{\theta}), \quad i = 0, \dots, N, \quad j = 0, \dots, J, \quad (1)$$

where ζ_i is an individual characteristic, p_j is the price for product j , \mathbf{x}_j is a vector of product characteristics, ξ_j is an unobserved product characteristic and $\boldsymbol{\theta}$ is a parameter vector to be estimated. Thus preferences are defined in the characteristics of the product. Here alternatives $1, \dots, J$ are different competing “inside” goods and alternative 0 denotes “outside” good for not to buy any of inside goods⁴. Furthermore, let’s assume, that the unobserved individual characteristic, ζ_i , has some known distribution (either empirical or standardized) conditional on characteristics vectors (\mathbf{x}, ξ) and the price vector \mathbf{p} .

Each consumer buys *one unit* of product j if and only if the purchase of the good maximizes her utility conditional on $(\mathbf{x}, \xi, \mathbf{p})$ i.e.

$$U(\zeta_i, p_j, \mathbf{x}_j, \xi_j; \boldsymbol{\theta}) \geq U(\zeta_i, p_l, \mathbf{x}_l, \xi_l; \boldsymbol{\theta}) \text{ for all } j \neq l, \quad l = 0, \dots, J.$$

Let’s define the set of individual characteristics for a chosen good j as

$$A_j = \{\zeta : U(\zeta_i, p_j, \mathbf{x}_j, \xi_j; \boldsymbol{\theta}) \geq U(\zeta_i, p_l, \mathbf{x}_l, \xi_l; \boldsymbol{\theta}) \text{ for } l = 0, \dots, J\}.$$

Thus, for a given probability distribution of ζ , $F(\zeta)$, which is a function of the characteristics of all goods in the market, the *predicted* market share for a product j is

$$s_j(\mathbf{p}, \mathbf{x}, \xi; \boldsymbol{\theta}) = \int_{A_j} dF(\zeta),$$

where integration is done over the alternatives $\zeta \in A_j$.

⁴ If the outside good is not included into the model, the consumer is forced to buy one of alternatives $j=1, \dots, J$ and the demand depends only on price differences (Berry, 1994). Furthermore, when the outside good is included, the aggregate demand as a function of prices and product characteristics can be modeled (Berry et al., 1995).

Because the outside good is included into the model, the choice is made among $J+1$ alternatives and thus the observed market share for a good j can be calculated as $q_j = Ms_j(\mathbf{p}, \mathbf{x}, \xi; \theta)$, where q_j is the observed quantity of the good j and M is the number of potential consumers in the market. As stated by Berry (1994), M is either known, when it can be set, for example, as a number of households in the economy, or it is a parameter to be estimated. Here I assume that each of the potential consumers consumes at most 1 patient day in a day, and the number of potential consumers is defined as 65 % of Finns aged 25-64⁵. Then the *observed* market shares are $s_j^n = q_j / M$.

3.2. The Functional Form Specification

In order to estimate the discrete choice model, the utility function is specified as

$$\begin{aligned} U(\zeta_i, p_j, \mathbf{x}_j, \xi_j; \theta) &= \mathbf{x}_j \boldsymbol{\beta} - \alpha \ln(p_j) + \xi_j + \varepsilon_{ij} \\ &\equiv \delta_j + \varepsilon_{ij}, \end{aligned} \quad (2)$$

where $\delta_j = \mathbf{x}_j \boldsymbol{\beta} - \alpha \ln(p_j) + \xi_j$ is the mean utility of a good j and is the same for all consumers. Although typically price enters to the mean utility linearly, also different type of specifications have been used. See for example Verboven (1996) for the use of nonlinear nested logit model with Box-Cox –transformation for prices. Here the logarithmic transformation was selected, because it linearized the relationship between prices and explanatory variable.

In the standard multinomial logit model, when all products are assumed to be strict substitutes, $\{\varepsilon_{ij}\}$ are assumed to be independent and identically distributed (IID) across products and consumers with type I extreme value distribution $P(\varepsilon_{ij} \leq e) = \exp\{-\exp\{e\}\}$ (McFadden, 1977). Although this model is computationally very simple, it imposes some unreasonable substitution patterns. The well-known property of the logit model is the independence from irrelevant alternatives (IIA), when the ratio of two odds is independent of the characteristics of other products.

The assumption of the IIA –property will not probably hold in the case of pharmaceuticals. Suppose, for example, that a brand name drug with a high price and another drug with a low price in a different therapeutic group have the same market shares. Then the model predicts that they have the same cross-price elasticities $\partial \ln q_k / \partial \ln p_j$ with respect to any third drug k , which can be a therapeutic substitute to another drug. Thus it might be reasonable to assume, that pharmaceuticals within the same therapeutic subgroup are closer substitutes than products between these groups.

There are several ways to relax the IIA property of the multinomial logit model. One is McFadden's (1978) nested logit specification, when IIA is assumed to hold within the same

⁵ According to the national FINRISKI 2002 study report by Laatikainen et al. (2003), for over 65 % of research subjects aged 25-64 the serum cholesterol was over recommended 5,0 mmol/l. Because there are several other cardiovascular risk factors, such as sex, smoking and weight, this measure for the number of potential consumers has to be viewed as a very rough approximation.

subset or the nest but not between the nests. In the nested logit model, products are divided to exclusive sets D_g , $g = 0, \dots, G$, and only outside good belongs to the set D_0 . Furthermore, the utility is specified as

$$U_{ij} = \delta_j + \sum_g [d_{jg} \zeta_{ig}] + (1 - \sigma)v_{ij}, \quad (3)$$

where d_{jg} is an indicator variable, that gets value 1, if product $j \in D_g$, and 0 otherwise, and v_{ij} is IID with type I extreme value distribution.

However, the nested logit requires ex ante specification of exclusive nests⁶. In the case of pharmaceuticals, the ATC –classification is used, because it is presumable that drugs within the same nest are closer substitutes than drugs between the nests. Here the subgroups of statins (ATC –class C10AA) are formed on the basis of 5th level of ATC –class within which the pharmaceuticals can be considered as therapeutical substitutes, because they have the same active ingredient.

An other option is to use more general Berry's et al. (1995) random coefficients model, which is computationally more demanding. The nested logit can, however, be viewed as a special case of the random coefficient model with random coefficients on group –specific dummy variables as stated by Berry (1994).

3.3. The Estimation and Identification

When the unobserved characteristic ξ_j is included to the model, the estimation of mean utilities becomes more difficult, because it appears in the demand equation

$$s_j^n = s_j(\mathbf{x}, \mathbf{p}, \xi; \theta) \quad (4)$$

nonlinearly and unobserved characteristics can be correlated with prices.

To solve this estimation problem, Berry (1994) introduced transformations for market shares, that depend linearly from ξ_j . In particular, he proved that for every \mathbf{s}^n there exists unique δ such that $\mathbf{s}^n = \mathbf{s}(\delta)$ ⁷, and when $\mathbf{s}^n = \mathbf{s}(\delta)$ can be inverted to $\delta = \mathbf{s}^{-1}(\mathbf{s}^n)$, observed market shares determine mean utilities, when $F(\zeta)$ is known.

In the case of the standard multinomial logit model, it can be easily shown, that the regression model to be estimated is of the form

$$\ln(s_j^n/s_0^n) \equiv \delta_j(\mathbf{s}) = \mathbf{x}_j \boldsymbol{\beta} - \alpha \ln(p_j) + \xi_j, \quad (5)$$

⁶ There are also some generalizations for this to allow e.g. overlapping nests, see e.g. chapter 4 in Train (2003).

⁷ Under some weak regularity conditions on $F(\zeta)$ and when the $\delta_0 = 0$, which are assumed to hold further.

where vector \mathbf{x}_j includes some drug –specific variables, such as price band indicator or the manufacturer of the drug, that may or may not change in time.

Here the price p_j can be correlated with unobserved product characteristics. When the conditional expectation of the error term conditional on regressors is not zero, ordinary least squares estimators can be biased and inconsistent. The solution is to estimate parameters by using the two stage least squares (2SLS). Furthermore, because I do not have data from different markets, such as from different countries, fixed effects can not be used in the estimation, because some explanatory variables do not change in time. See e.g. Brenkers et al. (2006) for the use of fixed effects in the 2SLS estimation of the two-level nested logit model.

For the nested logit model with the utility function (3), Berry (1994) showed by using unconditional and conditional choice probabilities that the model is

$$\ln(s_j^n/s_0^n) = \mathbf{x}_j\boldsymbol{\beta} - \alpha\ln(p_j) + \sigma\ln(\bar{s}_{jg}^n) + \xi_j, \quad (6)$$

where \bar{s}_{jg}^n is the observed market share of product j in the group D_g . Corresponding the logit model (4), it is assumed, that product specific variables \mathbf{x}_j are exogenous and that the price p_j and the share \bar{s}_{jg}^n are correlated with the error term.

McFadden (1978) showed, that the nested logit is consistent with stochastic utility maximization, if the coefficient σ measuring the degree of substitution is in the unit interval. If $\sigma = 0$, the model reduces to the basic logit model and if $\sigma \rightarrow 1$, preferences become perfectly correlated and cross-price elasticities between products in different groups goes to zero. For example, pharmaceuticals within the same ATC –group have similar characteristics, such as active ingredient, by construction, and are thus they assumed to have positive correlation in preferences.

Because cost shifter instruments are not available in the data, I use mark-up shifting instruments as suggested by Berry (1994) and Berry et al. (1995) and done by several authors such as Brenkers et al. (2006), Verboven (1996) and Stern (1996), to name a few. To be exact, I use the sums of other product’s characteristics, because in the oligopolistic competition framework, firm’s pricing decision depends on the characteristics of a product, other products of the firm and the products of competing firms⁸. Following Stern (1996) and also Brenkers et al. (2006), the instrumental variables measuring the intensity of competition and ownership structure used in the estimation of the nested logit model are: 1.) the number of other products, 2.) the number of other products produced by a firm, 3.) the number of other manufacturers, 4.) the number of other product within the ATC –class, 5.) the number of other products of the firm within the ATC –class and 6.) the number of other manufacturers within the ATC –class. In the logit specification, instruments 1.)-3.) are used. Furthermore, exogenous product characteristics and a time trend and its square were used as instruments in all models.

⁸ Here the supply side is not, however, specified, because the main interest is in the demand side parameters. See, for example, Berry (1994), Berry et al. (1995) and Verboven (1996) for the specifications of the supply model.

TABLE 1 Selected Estimates of Demand Models (5348 Observations)

Coefficient Estimate	OLS Logit	IV Logit, Model (8)	IV Nested Logit, Model (9)
α	-0.64 (0.03)	0.11 (1.44)	2.26 (0.14)
σ	-	-	0.35 (0.17)
R^2	0.34	-	-
Hausman test ²	-	0.27	310.3

Note 1: Standard errors are in parentheses. Other explanatory variables: a constant, manufacturer indicators, a time trend and its square. In the OLS specification, a price band indicator was also included.

Note 2: the Hausman specification test: OLS vs. 2SLS.

4. Estimation Results

Table 1 presents the selected estimation results of the demand system for different specifications: results from the OLS logit with exogenous prices are reported in the 2nd column and for the logit and nested logit models estimated with instrumental variables (see equations (5) and (6)) in the 3rd and 4th columns, respectively. In all models, explanatory variables are a constant, a trend and its square, $-\ln(p_j)$ and manufacturer indicators, which control distinction in preferences across different manufacturers. Trends are included to control exogenous changes in the demand caused by, for example, changes in the regulation of pharmaceuticals. Furthermore, an indicator variable describing, whether the price is within the price band or not, was dropped from IV logit and IV nested logit specifications, because its coefficient did not significantly differ from zero, and logarithmic within group market shares $\ln(\bar{s}_{j|g}^n)$ was included to the nested logit model. As described in the previous section, logit and nested logit models with instruments are estimated with 2SLS.

Although the basic logit model with exogenous prices leads to potentially very implausible substitution patterns between different products, it was estimated in order to study the significance of unobserved products characteristics, when prices are assumed to be exogenous. According to the results, unobserved product characteristics cause 66 % of variance of the mean utility. Although other coefficient estimates seemed quite reasonable, the coefficient estimate on $-\ln(p_j)$ is significant and has a “wrong” sign. Berry (1994) gave some examples of studies, where the ignorance of price endogeneity has led to misleading results and even to the positive effects of prices on the demand, which is the case here. (Table 1.)

When prices are assumed to be endogenous in the logit model, coefficient estimates change substantially from the logit specification estimated with OLS. Surprisingly, the coefficient on the price band indicator is no longer significant and so it is omitted from the model. Secondly, the coefficient estimate on $-\ln(p_j)$ is now positive and relatively small, which means that when prices decline the mean utility and the demand does not really change, but it is very imprecise. In this specification, the coefficient estimate of negative logarithmic price gives a relatively good approximation of price elasticities, because market shares, s_j , are typically very close to zero. (Table 1.)

TABLE 2 Average Elasticity Estimates by ATC –class, the IV Nested Logit

ATC -group	Average Price in EUR	Own-Price Elasticity	Number of Observations
Simvastatin	34.57	-3.44	2784
Lovastatin	44.45	-3.40	917
Pravastatin	63.56	-3.39	868
Fluvastatin, Atorvastatin, Rosuvastatin	124.24	-3.24	779
Whole industry	54.03	-3.39	5348

Note 1: Fluvastatin, Atorvastatin and Rosuvastatin are considered here as a one group.

In the nested logit model with instrumental variables⁹ the coefficient on negative logarithmic price is statistically significant, positive and, clearly, higher than in the logit specification. Furthermore, the coefficient on endogenous within group market shares is almost significant and the results are consistent with utility maximization because $0 \leq \hat{\sigma} \leq 1$ even within its 2.5 % confidence intervals. Thereby, on the basis of these results, there is correlation between preferences within the group of therapeutic substitutes and so the nested logit specification with endogenous prices might be more appropriate than the basic logit model to describe the choice of statins. Put differently, the degree of substitution is thereby higher among therapeutic substitutes than other products. Furthermore, consumers have high preferences for the products of certain well-known manufacturers, and the market shares of statins has a downward-sloping, diminishing time trend, other things being equal. (Table 1.)

Table 2 reports average prices, own-price elasticities¹⁰ and the number of observations by the ATC –class and in the whole industry. Fluvastatins, Atorvastatins and Rosuvastatins are grouped into the same class, because the number of products in these groups is relatively low compared to other groups. When interpreting the results of this group, one must remember that the significance of atorvastatins is the most emphasized, because the number of observations is the highest, 417, compared to 194 and 168 of fluvastatins and rosuvastatins. In addition, these markets are somewhat different, which is partly reflected by the development of average prices (see chapter 2.1.).

Because of quite low within group market shares with average of 0.05, the model specification and large number of products in the most of classes, the own-price elasticity is almost the same in all classes, but is slightly higher in absolute value in the groups, where the number of close substitutes is higher and the average price is lower. The results suggest, that when e.g. the correlation in preferences within the ATC –class is controlled, consumers prefer to pay lower prices. (Table 2.)

Average cross-price elasticities reported in Table 3 measure, how responsive is the demand of the product to changes in the price of therapeutic substitutes and other products. Cross-price elasticities are positive and, as a result, products can be considered as substitutes. The results

⁹ For a comparison, the nested logit model was also estimated with the generalized method of moments (GMM) allowing heteroscedasticity of unknown form. The results were very similar, for example $\hat{\alpha}_{GMM} = 2.34$ and $\hat{\sigma}_{GMM} = 0.35$.

¹⁰ Elasticities are derived from unconditional choice probabilities and are defined as $e_{jj} \equiv \partial \ln q_j / \partial \ln p_j$.

TABLE 3 Average Cross-Price Elasticities by ATC -class, the IV Nested Logit

ATC –groups	With Products	
	in the Same ATC – group ¹	in Other ATC – group
Simvastatin	0.02	0.004
Lovastatin	0.06	0.005
Pravastatin	0.05	0.005
Fluvastatin, Atorvastatin, Rosuvastatin	0.07	0.003
Whole industry	0.014	

Note 1: Fluvastatin, Atorvastatin and Rosuvastatin are considered here as a one group.

Note 2: The cross-price elasticity is $e_{jk} \equiv \partial \ln q_j / \partial \ln p_k$, where $k, k \neq j$, is an index for products in the same or a different ATC –class.

suggest that demand of statins is fairly unresponsive to changes in the prices of other products in the industry level and in all groups. This is primarily explained by the relatively large number of products in each groups and thus low within group market shares on average, but also the correlation in preferences between therapeutic substitutes. In addition, the average cross-price elasticity in other groups is almost zero. (Table 3.)

Furthermore, the average cross-price elasticity with products in the same group is the highest in the ATC- classes of fluvastatins, atorvastatins and rosuvastatins, where the average price is the highest and the number of products is the lowest. These elasticities are even higher if the ATC –groups of fluvastatin, atorvastatin and rosuvastatin are analyzed separately, which follows directly from the formulae of cross-price elasticities in the nested logit model. For example, in the ATC –group of expensive atorvastatins, where the number of observation is 417, the average elasticity with products in the same ATC –group is 0.14 and with products in other ATC –groups is only 0.003. In conclusion, the demand of statins is more responsive to changes in the prices of other therapeutic substitutes than other products. (Table 3.)

Logit and nested logit specifications estimated with instrumental variables were compared to constant-only –models with the same instruments as in the full models. The F –type test statistic¹¹ was as much as 51 for a logit and 35 for a nested logit model. In addition, the Hausman¹² test for the nested logit model suggests that instrumental variables might be needed. The test for over-identifying restrictions¹³ is used for studying, whether the extra instruments are uncorrelated with the error term. However, when the sample size is large enough, this H_0 -hypothesis is typically rejected. Although R^2 is in the nested logit model only 0.04 and in the logit model slightly smaller, 0.01, the H_0 -hypothesis is rejected, because

¹¹ F –type statistic is constructed by using residual sum of squares from restricted and unrestricted second-stage regressions. See Wooldridge (2002) pp. 98-99.

¹² See chapter 8.7 from Davidson et al. (2004) for a testing procedure and interpretation problems related to this test.

¹³ See chapter 8.6 from Davidson et al. (2004) for a testing procedure and interpretation problems related to this test.

the number of observations is large, 5348¹⁴. Thus there might be a possibility, that some of the instruments can be invalid. Even so, the nested logit model estimated with these instruments provided reasonable estimates for demand side parameters.

5. Concluding Remarks

Because drug expenses for the consumer can partly or fully be covered by the health insurance, the price of a drug is not necessarily an important factor for the consumer choosing a drug. As a matter of fact, the demand of several drugs can be quite inelastic up to high price levels. Even so, for example, Ellison et al. (1997) and Stern (1996) found own-price elasticities less than -1 with very different estimation methods. In the markets of statins, the number of products, which have only small clinical differences, is quite large and price competition can be quite intense. In addition, price differences between products even within the substitution group, where the products are biologically equivalent, can be significant as it was shown in chapter 2.1. These things together can cause the demand of statins to be elastic. The results indicate that consumers prefer to pay lower prices and that the demand is sensitive to price changes and more responsive to changes in the prices of other therapeutic substitutes than other products. These findings are somewhat similar with Ellison et al. (1997) and Stern (1996).

Another explanation for elastic demands could lie in the construction of the data. In particular, the consumption data is based on the amount sold by drug wholesalers to pharmacies and thus some part of the products might be stored by a supplier or a consumer (National Agency for Medicines & the Social Insurance Institution, 2006). As a consequence, the elasticity estimates might not reflect only the price sensitivity of consumers but also the sensitivity of suppliers on changes in wholesale prices, which, for one, determine retail prices, a price list for drugs and also the sales margins of pharmacies in the date of sale. Thus it would be interesting to analyze the short-run dynamics of prices and quantities with biweekly data and to study, whether pharmacies buy products to the stocks, when wholesale prices are low, and whether wholesale prices increase after that. The latter is an interesting question, if prices are not hard to change. This seems to be the case in the market of statins on the basis of monthly data.

There are several challenges for the future work. One is to define appropriate model for the supply in the market, where prices are regulated, and to analyze the market power of companies and welfare effects from policy changes, in which the empirical results from this article can be utilized. In addition, the demand model can be generalized to include more general substitution patterns with random coefficient models and to take into account income effects. These models are, however, computationally more demanding than models represented in this article. In the models used here, consumers were assumed to make decisions myopically and thus not to be forward looking. The one challenge is to include dynamic aspects of the demand to the analysis.

¹⁴ In the nested logit model estimated with the GMM, test statistic for over-identifying restrictions was smaller, 46.

Appendix

1. The Data

The panel data for period October 2002 - January 2006 is provided by the National Agency for Medicine (Lääkelaitos). It includes monthly information on all prescription drugs in Finland that are under generic substitution, such as prices, sold quantities (packages/month), active ingredients and WHO's ATC/DDD (Anatomical Therapeutic Chemical) – classifications. Datasets and especially sold retail quantities are confidential information. Prices are derived from the dataset by using information on retail sales volumes and the number of sold quantities. Because volumes are reported with the precision of several decimals, this method should provide a good enough approximation of prices. Furthermore, the consumption data is based on the amount sold by drug wholesalers to pharmacies and thus some part of the products might be stored by a supplier or a consumer (National Agency for Medicines & the Social Insurance Institution, 2006).

Drugs are grouped at 5 levels in the ATC -classification system: the 1st level corresponds main groups, which all have pharmacological/therapeutic subgroups at the 2nd level. Furthermore, chemical/pharmacological/therapeutic groups form 3rd and 4th sublevels and the chemical substance forms the 5th level. (See WHO Collaborating Centre for Drug Statistics Methodology.)

The drug consumption is transformed into patient days with the following formula:

$$\text{Patient days} = \frac{\text{Milligrams sold}}{\text{DDD in mg}}, \quad (1)$$

where Milligrams sold = Packages sold · Pieces in a package · Strength and the strength is the quantity or a concentration of the active ingredient in the product. Furthermore, the DDD (defined daily dose) is the theoretical maintenance dose per day used internationally in the compilation of medicine statistics. Patient days in (1) is actually the same as the total number of defined daily doses. Of course, one must remember that DDD is only a theoretical concept and thus actual daily doses can differ from it. (See National Agency for Medicines & the Social Insurance Institution, 2006.)

2. Tables

TABLE 1 Selected Statistics within the Substitution group¹

Statistic	Minimum	Mean	Maximum
Difference of Minimum and Maximum Prices in EUR	0.0	10.1	175.2

Abstract

This paper focuses on the consumer's perspective and own experiences of alcohol advertising. The aim of the study is to enhance the understanding of advertising as a resource to consumers. The interview and diary data from ten young adults was analysed by the hermeneutical interpretation. The marketers' intended resources embedded in selected commercials were compared with the participants' own experiences. Seven different types of resources were identified. The results indicate that the consumers deploy alcohol advertisements as a resource in various ways. One particular advertisement may offer several types of resources to the consumer. Implications to advertisers and policy makers are also discussed.

1. Introduction

In many nations, alcohol advertising constitutes a significant part of the total volume of advertising. Because alcohol potentially causes social and health problems, alcohol advertising has been studied extensively, particularly in the field of social and health sciences. In the Finnish society alcohol advertising has recently been at the centre of political discussion. Alcohol advertising has been regulated, and new legal restrictions regarding advertising of low-alcohol content drinks were enacted in spring 2007. Underlying presumptions in this discussion have been that advertising creates consumer needs and increases unnecessary consumption. In addition, consumers are conceived as passive objects of advertising.

Much of the earlier research of alcohol advertising focuses on the impact of advertising on consumers, and tries to find a correlation between advertising and consumption. The results of these studies do not form a coherent understanding of the consequences of advertising from the consumers' point of view. Especially, the idea of an active consumer using advertising to various

purposes is absent in most of the studies. The consumer's social and cultural context is often ignored as well. For this reason, there is a noticeable gap in the alcohol advertising research taking into consideration the consumer's point of view.

Recently advertising researchers have begun to pay more attention to consumers' advertising literacy and the complex relationships between advertisements and their audiences (Ritson and Elliott 1999; O'Donohue 1994). These studies regard consumers as active users of advertising. One view is that consumers use advertisements as resources when constructing their identities or social interactions and their place in the social context (Ritson and Elliott 1999).

This paper focuses on the consumer's perspective and own experiences of alcohol advertising. The aim of the study is to enhance the understanding of advertising as a resource to consumers. The research questions are 1) What types of resources does alcohol advertising convey to consumers? 2) How do consumers use alcohol advertising as a resource? This study examines the consumers' own experiences, and thus we are concerned with the subjective meanings that consumers attach to the advertisements. In order to understand the meanings and interpretations of alcohol advertising, the consumption habits and lifestyles constituting the consumption context also have to be understood.

2. Theoretical background

This section briefly reviews the previous studies on how consumers use advertising and the theoretical background of our study. There is an increasing interest in studying advertising from the consumers' perspective, in particular focusing on how consumers use advertising. This view assumes that consumers do not just react to the ads, but they actively use them for various purposes (Scott 1994). The use of the advertisement may or may not be connected with the purchase of the product portrayed in the advertisement. The process of using the advertisement is much more subtle and creative than supposed by the decision making theories (Scott 1994). What is more, the socio-cultural context where audiences receive and use advertising requires deeper research.

The previous studies concerning the consumers' uses of advertising have drawn on various theoretical backgrounds, such as uses and gratifications theory (Mitchell, Macklin and Paxman 2007; O'Donohue 1994) and a reader-response approach (Mick and Buhl 1992; Parker 1998; Ritson and Elliott 1999; Scott 1990). In addition, Buttle (1991) reviewed studies of advertising effects and discussed the integration of advertising into everyday life. He, thus, recommended the accommodation theory as an adequate approach to study what people do with advertising.

The uses and gratifications theory posits that the mass media constitute a resource on which audiences draw to satisfy various needs (O'Donohue 1994). Importantly, the theory assumes an active audience (Katz, Blumer and Gurevitch 1974). Studying media consumption with the uses and gratifications approach usually implies identifying the motivations for using a particular medium or program (Stafford and Stafford 1996). The theory has not been widely applied to advertising, but O'Donohue (1994) used the uses and gratifications perspective in a qualitative study of advertising. The reader response theory stems from literary theory and it focuses on the study of reading rather than the study of texts (Scott 1994).

In this study we draw on the consumer culture theory, CCT (Arnould and Thompson 2005), and especially the cultural resource view (Arnould, Price and Malshe 2006). The consumer culture theory (or *theoretics*, see Arnould and Thompson 2007) is a synthesizing approach consisting of four clusters of theoretical interests linked together. These clusters concentrate on the relationships between consumer actions, the marketplace and cultural meanings. It is worth underlining that CCT is not a unified system of theoretical propositions and it should be used only as an orienting device. (Arnould and Thompson 2005; 2007). We draw on the CCT cluster called *mass-mediated ideologies and consumers' interpretive strategies*. Accordingly, our emphasis lies on the micro level: consumers' active uses of media and critical readings of codes. Consumers, thus, are defined as active co-creators of meanings, connected to their socio-cultural context, conscious of advertisers' commercial purposes and advertising literate (Elliott and Wattanasuwan 1998; Lannon and Cooper 1983; Leiss et al. 2005; McCracken 1987; Ritson and Elliott 1999).

The cultural resource view originates from the resource management which, in turn, is one theme in strategic marketing research and emerging marketing thought. Resource management explores, for instance, intangible resources, co-creation of value and relationships from firm-specific perspective (Day 1994; Lusch and Vargo 2006; Srivastava, Fahey and Christensen 2001; Vargo and Lusch 2004). The cultural resource view, instead, assumes the consumers' perspective. The basic concepts of this view comprise consumer's operant and operand resources, co-production of value and conditioning elements (Arnould et al. 2006).

Consumers deploy both operand and operant resources to achieve their personal goals. Operand resources are economic and tangible (e.g. income, real property, material resources) over which a consumer has allocative capabilities. This consumer's economic and material "power", however, constitutes only a target for consumer's operant resources which, in turn, are virtual by nature. The consumers exert authoritative capabilities over their operant resources and accordingly, these resources can be applied in varied circumstances. Operant resources are divided into three categories. First, social operant resources consist of networks of relationships; on the one hand with traditional groups like families, and on the other hand with emerging groups, like brand communities and subcultures. Consequently, the consumers' decision making does not occur in social isolation. Second, cultural resources can be defined as specialised knowledge and skills of cultural schemas, life expectancies, and history and imagination. Finally, physical resources consist of the consumers' mental and physical endowments. Consumers vary in the type, quantity and quality of their resources. Importantly, the combination of the consumers' operant resources influences the use of their operand resources and their use of firms' resources, i.e., how consumers engage in the value-creation processes. (Arnould et al. 2006).

The focus of the resource perspective, thus, is on the value-creation process, i.e. resource interaction involving the consumer as a co-creator of value, not merely a target (Arnould et al 2006; Lusch and Vargo 2006,181; Vargo and Lusch 2004, 11). The interaction between the firms' and consumers' resources implies that both parties offer their resources to the value-creation process. Firstly, the firms use their operant resources to mould operand resources, which are packaged, for instance, into brands, personnel, pricing strategies, advertising (Arnould 2005, 90) and "appliances" (Vargo and Lusch 2004,11) as value propositions to the consumers. Secondly, the consumers participate in the process by deploying and activating (Arnould 2005, 93) their operant

resources, expecting to benefit through this co-production of value. In other words, this interaction should generate valued consumption experiences and enable the consumers to pursue their goals (Arnould 2005). The interaction process, however, does not occur in isolation, but is conditioned by four elements. First, control of the process can be commanded either by a firm or a consumer, or jointly. Second, temporality represents changes in meanings and value of brands, changes in cultural environment and changes in consumers' goals. Temporality may influence, for instance, the consumers' sense of continuity and connections to the past. Third, multiple firms constitute the competitive environment from which the consumers can select their preferred brands. Finally, existence of multiple customers means that a consumer may be linked to the brand only through other consumers. Thus, the relationship between a brand and a consumer may be mediated through the consumer's social operant resources. (Arnould et al. 2006).

In order to evoke this illustrated resource interaction, it is essential to communicate with the consumers (Lusch and Vargo 2006, 181). Brands are communicated through advertising which constitutes both a means to create and transfer meanings into culture and a cultural resource itself (Elliott and Wattanasuwan 1998; Leiss et al. 2005; McCracken 1987, Ritson and Elliott 1999, 274). As mentioned earlier, advertising represents one part of firms' resource package. Thus, the firms' resources seem to be embedded in advertising. Elliott and Wattanasuwan (1998, 135) consider brand advertising as a symbolic resource to consumers. They classify these symbolic resources into mediated and lived experiences and suggest brand advertising as a mediated experience of events spatially and temporally distant from the consumer. The consumers utilise mediated experiences selectively to construct themselves, and hence, the relevance of the experience to the self varies widely.

The consumers, however, do not always deploy firms' packaged resources, including advertising, in a way the firm intends. Instead, the consumers use creative ways to derive value from the package (Arnould et al. 2006, 95). Thus, the resource view, as well as the consumer culture theory as a whole, manifests the consumers' co-creative competence. Advertising may be consumed independently and not related to the product purchase or use (Leiss et al. 2005; Mitchell, Macklin and Paxman 2007; O'Donohue 1994; Ritson and Elliott 1999).

The theoretical background defines the foundation and the key assumptions of the present study. According to our interpretive approach, we do not apply a strict theoretical framework to direct an interpretation of data, but instead we apply a more inductive way of inference.

3. Methods and data

This study uses the interpretive approach in order to capture the complex nature of the phenomenon. The interpretive approach provides for describing, understanding and interpreting the meanings of the everyday lived world and experiences of the participants (Denzin and Lincoln 2000; Kvale 1996). In accordance with this approach, we collected the data through personal interviews and written diaries. Kvale argues that an interview is perhaps the most powerful means for attaining an in-depth understanding of another person's experiences (Kvale 1983, *cited in* Thompson, Locander and Pollio 1989). Also McCracken (1988, 9) suggests that the long interview gives an opportunity to step into the mind of another person, to see and experience the world as they do.

Thus, we adapted guidelines of the phenomenological interview (Thompson et al.1989) and the long interview (McCracken 1988). Both methods are in-depth by nature and they aim to take into account a holistic view of the participants' world. However, our interviews were not purely phenomenological, because we had a short questionnaire of background questions and the interview was semi-structured relative to the commercials.

Written diaries are one means to attain reliable person-level information (Bolger, Davis and Rafaeli 2003, 581). In our study the diaries aimed to supplement the interviews. Instructions to write the diary were semi-structured and we applied a variant of event-based type design (Bolger et al. 2003, 590). We asked the participants to write self-reports of their experiences of alcohol consumption and other activities, interests and opinions regarding their lifestyle (Holt 1997). They wrote the diaries within approximately two months after the interview and they were asked to send their texts according to a certain schedule.

The interviews

Before conducting the interviews we contacted three major Finnish breweries and one importer of alcohol products. The aim was to improve our pre-understanding of the industry and discuss their advertising and research practices, as well as to ask them to supply adequate TV commercials for our research purposes. We interviewed three managers and selected four TV commercials and two posters that represented brand advertising of low-alcohol content drinks. The selected brands represented various types of low-alcohol content drinks that were supposed to be relevant to the participants. The commercials were "Baileys" cream liqueur, "Koff" beer, "Kurko" long drink and "Upcider" cider (see Appendix). The breweries also provided non-alcoholic beverages and promotional materials to be given to the participants as a compensation for their time and effort.

Ten voluntary participants were selected purposively. They were recruited by electronic bulletin boards, directed email group messages and colleague networks. The academic nature of the research, the terms of taping interviews, anonymity and confidence, and a reward for participating were explained in the invitation messages. Four male and six female young Finnish adults, who used low-alcohol content drinks volunteered to participate the study. Their ages ranged between 19 and 33 years. Nine of them were students and one was a working professional. Some of the students already had a working career and they were studying their second occupation. According to the remaining selection criteria the participants were unknown to the interviewer and each other, they did not have special knowledge of advertising or contacts with the brewery industry or importers, and they committed themselves to the interviews and the diary writing. Table 1. presents the background information of the participants. Each participant was interviewed once, and with two participants a second supplemental interview was conducted. The participants were rewarded with a crate of non-alcoholic beverages.

Table 1. Summary of the participants.

The interviews were conducted at two Finnish cities during February and March 2007. They took place in the meeting rooms of the University of Jyväskylä and the Helsinki School of Economics in Mikkeli. One supplemental interview was conducted in a teamwork room at the university library. The duration of the interviews ranged from 1 hour 10 minutes to 2 hours 5 minutes.

In the beginning of the interviews the participants were explained the purpose and background of the study and the terms of participation. Every participant subscribed a written agreement regarding these terms. After that the participants filled in the short questionnaire of background questions to ensure that the basic information of every participant is consistent with others (McCracken 1988). They were enquired, for instance, to estimate their own alcohol consumption¹ and to list their favourite alcohol brands. The aim was to complete a view of the participants' alcohol consumption habits.

The interview procedure consisted of two parts. First, four TV commercials and two posters of low-alcohol content drink brands were viewed and discussed. The commercials were shown one at a time, each of them twice and in the same order for every participant. After that the participant was asked to describe how he/she experienced the given commercial. The interviews were conversational by nature and the participants were given plenty of room to talk. Relatively few questions were planned in advance and the follow-up questions emerged mainly from the discussions. The second part of the interview focused on the lifestyle and consumption habits of the participants. The conversation covered several themes, for instance hobbies, work, friends and social life, entertainment like music, movies, magazines, television, theatre and restaurants, sports, travelling, family, food, fashion, home décor and religion. All interviews were taped.

Data analysis

The hermeneutical interpretation method was applied in analysing the data. According to Kvale (1996, 46) the purpose of the hermeneutical interpretation is to "obtain a valid and common understanding of the meaning of a text". Language implicitly conveys a person's cultural meanings and shared beliefs and language has a critical role in the hermeneutic analysis (Arnold and

¹ The questions regarding alcohol consumption were consistent with the World Health Organization's (WHO) Audit test (alcohol use disorders identification test)

Fischer 1994; Thompson, Pollio and Locander 1994, 434). Thompson (1997, 442) suggests that “texts generated by phenomenological or long interviews are particularly well suited to hermeneutical analysis”. Although there are no specific guidelines to the hermeneutic method (Arnold and Fischer 1994, 61), for instance Thompson et al. (1994) and Thompson (1997) present a hermeneutic framework to the study of consumer meaning. Furthermore, the hermeneutical analysis in consumer research is discussed by Arnold and Fischer (1994) based on philosophical hermeneutics and by Thompson et al. (1989) based on existential-phenomenology. Spiggle (1994), again, distinguishes the concept of analysis from interpretation and describes useful operations to manipulate qualitative data, including iteration and metaphors. In our hermeneutical analysis we have taken into account the underlying methodological assumptions of pre-understanding, fusion of the horizons, autonomy of the text and the assessment criteria (Arnold and Fischer 1994; Kvale 1996; Thompson 1997; Thompson et al. 1989; 1994).

Our analysis consisted of four phases, which are named according to their contents as follows: 1) Preparing the data 2) First impression and a general sense of the whole, 3) Perspectives and metaphors and 4) Identification of resources. Based on the analysis process, we made conclusions regarding the resources that the advertisements represented to the participants.

All interviews were listened and transcribed literally by the first author. During the transcribing the situation, atmosphere and content of the interviews were recalled. After transcription every participant was asked to read his/her own text and he/she was given an opportunity to revise it. Two participants corrected their texts. The transcribed interviews resulted in 146 single-spaced pages of texts. In addition the data included 39 pages of diaries, 24 pages of notes, 10 questionnaires and four TV commercials and two posters with the literal description (see Appendix), and the marketers’ resource definition of each ad. It is worth mentioning that all the data was generated in Finnish. All texts are first analysed in Finnish and then the analysis is translated into English, aiming at maintaining the original idea of expression.

First impression and a general sense of the whole

Next phases of analysis were conducted by both authors. We read through all texts several times to get a general view of each participant’s data and the entire data. During the reading we took marginal notes to extract the key issues. We paid attention, for instance, to the participants’ general attitude towards the commercials and alcohol consumption, and to the features typical to his/her consumption habits and current life situation. At this phase we also paid attention to how the participants used language, their willingness and ability to express themselves, and their advertising literacy (Elliott and Wattanasuwan 1998). In order to keep an open mind (Thompson 1997) we did not try to make any classifications at this phase. The brief notes regarding each participant were written in a table format, which facilitated creating the general view. This first analysis phase mainly represents an intratext cycle (ibid.), although we also made interactive movements between different interviews.

Perspectives and metaphors

Before proceeding to the identification of resources, we tried to understand the participants’ personalised cultural frames of reference (Thompson 1997, 440). Therefore, the second phase aimed

to identify the participants' personal perspectives and a symbolic metaphor (Thompson et al. 1994). The symbolic metaphor is analogous with themes in interpretive research. Themes, however, tend to highlight similarities among participants, whereas symbolic metaphors sensitize to differences between the participants (ibid.).

At this phase we got acquainted with each text. We concentrated on the participant's experiences of the commercials and tried to look at the world from his/her viewpoint; what is typical in his/her viewpoint; through what kinds of "lenses" (McCracken 1986) he/she views the world; and how to explicate and verbalize it. During the reading we took notes and wrote key words emerging from the texts to outline mind maps. Several alternative expressions of the perspective and the symbolic metaphor emerged from each participant's text. As the symbolic metaphor we looked for a spoken, exemplary event or image that conveyed interconnections between the consumer's assumptions, concerns, values and meanings (Thompson et al. 1994). At this phase both the intratextual and intertextual cycles interacted (Thompson 1997). In other words, we implemented a series of part-to-whole and whole-to-part iterations. Finally, we wrote summaries concerning each participant's sociocultural background based on lifestyle and consumption habits, interpreted meanings related to alcohol consumption and alcohol advertising and descriptions of the selected perspective and the symbolic metaphor. We also extracted citations from the original interviews to justify our interpretation. As a result of this phase, we had developed understanding of the participants' perspectives, symbolic metaphors and sociocultural contexts.

Identification of resources

This phase aimed to identify what kinds of resources advertising seems to represent to the participants. Thus, we compared the marketers' resource definitions of the commercials with the participants' own experiences. Moreover, the participant's given perspective and symbolic metaphor underlie our interpretations. Our starting points, based on the resource view (Arnould et al. 2006) were that 1) a commercial may act as a marketer-supplied resource and as the marketer has intended, ie. the commercial and the product generate valued consumption experiences to the consumer, or 2) a commercial acts as a resource to the consumer in some other way, or 3) a commercial represents no resource to the consumer.

Our analysis had two main cycles. During the first cycle we read through all interview texts, one by one, and highlighted words and sentences expressing the participants' experiences regarding the viewed commercials. We paid attention to, for instance, how much and what kinds of subjective meanings the commercial evoked and how the participant expressed them. Consequently, we defined if the given commercial represented a resource to the participant, or not. After that we proceeded focusing on the nature and the qualities of the perceived resources. Importantly, the nature and qualities emerged from the texts and relied on the participants' own terms and categories (Kvale 1983 *cited in* Thompson et al. 1989, 140). We continued listing the types of emerging resources in to a table format. The table included 1) descriptions of the nature of the perceived resources and 2) descriptions and reasons why we linked the given resource to a certain participant and commercial.

The second cycle aimed to revise and adjust our interpretations. We read the interviews, marketers' definitions of resources and our interpretations and compared them once again. Some ad-

justments to our interpretations were made. Finally, after having analysed all the participants' interpretations of four commercials, in total 40 cases, we had identified seven different ways that the commercials seemed to represent a kind of resource to the participants. In the next chapter we present a synthesis of the findings.

4. How consumers use advertisements as resources: findings from a pilot study

In this chapter we describe the resources that emerged from the hermeneutic analysis. Seven different types of resources were identified and the descriptions below portray the essential nature of them. The citations from the interviews illustrate each resource description. However, these citations represent only a limited part of evidence. Interestingly, it seems that some of the commercials represent various resources to one consumer. What is more, in some cases the commercial acted as no resource to the consumer. The summary of perspectives, metaphors and identified resources in relation to each participant and commercial is presented in Table 2.

The commercial	Baileys	Koff	Kurko	Upcider
The participant (perspective and metaphor)				
Annie (romanticism/ control, girls)	Meaningful consumption experience	Entertaining moment	Entertaining moment Demonstration of developing consumption habits	Positioning oneself

Table 2. Summary of findings.

Meaningful consumption experience

A consumer's experience of the advertisement seems to be almost consistent with the marketer's intentions. The commercial awakes favorable subjective meanings and it is experienced positively. In this case, the participants were involved with the advertised brand and they described enjoyable and satisfying consumption experiences of the given low-alcohol content drink. For six participants Baileys commercial seemed to convey a meaningful consumption experience. "...with my girlfriends we usually drink (Baileys) just in the home evening parties, or if we are going dancing in the town, then we mix small (Baileys) drinks, so that it is related to that kind of relaxed situations in my life..."(Annie), "...mixing a couple of drinks (of Baileys)... spending time with friends, possibly before going out to a bar..." (Fred), "...in the evenings I used to have a few drinks when watching TV, and like this guy, putting ice in a glass and then pouring small amounts (of Baileys)...with one female friend, we often drink Baileys (in a bar), we both are fond of creamy drinks..." (Eric).

Positioning oneself

In this case the advertisement illustrates activities, ideologies or models, which are distinctive or opposed to the consumers' prevailing views. The consumers do not accept these views, but disprove them, and argue for their own views. The advertisement enables the consumers to define their own positions in relation to the product (low-alcohol content drinks), other drinkers, drinking habits or drinking situations presented in the commercial. Consumers may, for instance, argue against dissociate reference groups; they may criticize the product category; or they may consider the story of the commercial as immoral. Therefore, the advertisement seems to serve as a means to reinforce and justify the consumers' own prevailing views and to clarify his/her own position through a negation. Koff, Kurko and Upcider commercials appeared to act as the positioning resource. "...well, that (Kurko commercial) invoked quite disgusting feelings... when I was younger I was familiar with people like those... probably unemployed, probably living off their poor retired mothers, and their only hobby is to drink that kind of expensive drink at mothers' expense..." (Daniel), "...I at once remembered my mother's advice, that it won't be worth while to spoil an already bad day with alcohol...(I) don't value alcohol that much: ok, my telly was stolen but oh yes, two bottles of cider are still left ...it doesn't fully suit my way of thinking." (Annie/

Up cider), “*In my opinion there is no sense in trying to solve problems by drinking, they can’t be solved with it (drinking), but should be solved in other ways, I associate it (alcohol) more with having a good time with friends.*” (Janet/ Upcider).

Demonstration of developing consumption habits (cultural changes)

This type of resource implies that the advertisement manifests cultural changes in the conventional consumption habits. Advertising may either reinforce the consumers’ existing insight of the changes, or advertising may encourage the consumer to become aware of novel trends. Importantly, the consumers are the initiators and they are approvingly disposed towards the cultural changes portrayed in the advertisement. In our study two of the commercials seem to be deployed as the demonstration of cultural changes. “*...I think this (Koff commercial) has a rather fresh approach... a woman doesn’t always need to hold a glass of wine in her hand, but it is equal for a woman to drink what she prefers...I feel it is important that women also enter the masculine territory.*” (Iris, original emphasis). “*...(the situation in the Kurko commercial) was a bit of unnatural, but, however, the society is developing and things uncommon in the past may become common and ordinary, that men drink light cider...*”

Entertaining moment

In this case the value of the advertisement seems to be based on its entertaining power and capability. The advertisement is seen as a pure performance, an enjoyable story or even a joke, which is consumed independently from the advertised product. The pleasure could be based for instance on jingles, slogans or visual elements of the ad. The brand or the product may not be relevant to the consumer. Consequently, the consumers may not remember the advertised brand after viewing the commercial. In our study each of the commercials acted as an entertaining resource to some participants: “*...every time (when seeing the commercial) I burst into laughing herein...*” (Hannah/ Baileys), “*...the ad is funny, but I wouldn’t have remembered the product, if you wouldn’t have mentioned it...*” (Carrie/ Kurko), “*Funny, authentic and kind of marvelous...it is so humorous...*” (Hannah/ Kurko), “*...this ad was so amusing...(Eric/ Upcider).*”

Common language

In the case of common language an individual element, for instance music, brand name or slogan, is disconnected from the commercial and used for the consumers’ own or the community’s purposes. This resource seems to be used in order to reinforce togetherness and fellowship. The resource may not be connected to the consumption of the product. The use of these elements serves as a shared language, which is valid only during a limited time. In other words, the content of this common language is not permanent; on the contrary, the existing language gives way to a new one as new commercials appear. The present study proposes two commercials, in which the jingle or tag lines were deployed as a common language. “*...and this is catchy haba haba tsut tsut badam bam (sings the jingle)...in those days this haba haba tsut tsut was on everyone’s lips...perhaps at that time when it (Kurko commercial) was screened on TV, it could perhaps get caught on the mundane life among the lads, in some situations...*” (Fred), “*...with my friends we imitate these lines ...while sitting for instance in snow in the ski slope, and some other pal coming in, so he will be shouted (the lines)...and while I’m cleaning the toilet at home, and my mother comes to look on, I will say her (the lines)...*” (Janet/ Koff).

Nostalgia

Some advertisements seem to create positive nostalgic experiences to the consumers. The experiences can be related to the advertised product or they can emerge independently. However, the advertisements are not experienced as merely entertaining, but they convey personal meanings to the consumer. In this study two commercials, Baileys and Koff, acted as the nostalgic resource. *“...cream liqueurs were in fashion among us teenage girls and I remember even asking my own mother to bring me a duty-free bottle from a ferry cruise, we drank Baileys...even those girls who didn't like the taste of alcohol, were able to drink (Baileys), which was extremely ((laughing)) important...” (Iris), “...(when I was young) Baileys was a very attractive drink... Baileys had a certain kind of significant position...it was one of the few drinks appealing to me...” (Daniel), “... when I was a child I spent great many summers with my grandparents, and there was just that kind of hut (maitolaituri)... that landscape created a feeling of familiarity, in some positive way.” (Daniel).*

Supporting and developing professional expertise

This type of resource emerged in relation to one participant, whose hobbies, studies and perspective could be delineated as creative. The commercials seemed to be viewed as a technical performance, ie. the viewer actually considered himself more as a creative professional than a consumer. The viewer may analyze and evaluate for instance the dramatization of the story, the cast, the characters and acting. Accordingly, the viewer is familiar with the professional terms and advertising language. *“...series of events flew all the time, and basically, they didn't happen in one scene. The other (commercials) did, in the Koff commercial they are situated in that one particular scene, and in the Kurko commercial they are stayed in one certain scene...And also the Baileys (commercial) took place in one certain scene...” (Fred/ Upcider), “...a simple production...it is just shot with only a couple of cameras...and four sofas, a crate of Kurko and an old tape recorder are brought there...” (Fred/ Kurko), “...they have built a well-defined group. One is the boss, who is talking...there is a clear hierarchy between them...those two (girls) are only supporting her (the boss)” (Fred/ Koff).*

No resource

In the case of no resource the commercial seems to be insignificant to the consumer or the consumer can not make sense of it. The commercials may be regarded negatively; their messages may be rejected or their meaning may be downplayed. In our study each of the four commercials was interpreted as no resource in some cases. *“...I see nothing in these commercials, but “again some kind of product named something”...I'm not guided by advertisements at all...In my opinion there (in the Kurko commercial) exists a (Kurko) titled drink, and nothing more.” (Brad), “...the point (of the Upcider posters) can't be caught at all...I don't understand the logic.” (Hannah)*

5. Discussion and implications

This study aimed at enhancing the understanding of advertising as a resource to the consumers. Our focus was placed on the consumers' own experiences of alcohol advertising. The interview and diary data from ten young adults was analysed by the hermeneutical interpretation. The marketers' intended resources embedded in selected commercials were compared with the partici-

pants' own experiences, taking into account the participants' particular perspective and symbolic metaphor.

The results indicate that the consumers deploy alcohol advertisements as a resource in various ways. Interestingly, one particular advertisement may offer several types of resources to the consumer. First, the consumers may deploy the advertisement in a way the marketer has intended. In our study we denominate this as *meaningful consumption experience*. It seems that this type of resource may emerge when mediated and lived experiences (Elliott and Wattanasuwan 1998) are interconnected. The Baileys commercial is an illustrative example of this. Despite the participants' varied perspectives and the ad's foreign cultural origin, the Baileys ad succeeds to convey and offer acceptable resources to the Finnish consumers.

Second, the consumers may deploy the advertisement independently and for other purposes than the marketer intended. In our study we identified six ways. The case of *positioning oneself* constitutes an ambiguous resource. It differs from O'Donohue's (1994) category of self-affirmation, which emphasizes positive experiences of the given ad. Instead, *positioning oneself* seems to be based on the consumers' opposite or distinctive views of the advertisement. Furthermore, some consistencies with the findings of O'Donohue (1994), Mitchell et al. (2007) and Ritson and Elliott (1999) can be perceived regarding the resources *entertaining moment*, *demonstration of developing consumption habits*, *common language* and *nostalgia*. O'Donohue (1994), for instance, categorized enjoyment, familiarity and social interaction as non-marketing uses. Mitchell et al. (2007) and Ritson and Elliott (1999) also noted uses in a ritual manner and emphasized the social use of advertising. The participants also seemed to be advertising literate (Elliott and Wattanasuwan 1998). They discussed the nature of advertising itself and were familiar with advertising strategies and the industry's terminology. Nevertheless, the emerged theme of *supporting and developing professional expertise* was evident in relation to one participant. Finally, in some cases the advertisements represent *no resource* to the consumers. However, this can not be considered as surprising. The experiences of some participants can also reflect "the myth of personal immunity" (Pollay 1986); they may conceive themselves as immune to persuasion and regard the advertisements as trivial.

As an implication to policy makers, the consumers seem to be active interpreters of alcohol advertising. It seems that the consumers assess advertisements critically and in many cases the resource-based use of the ads is independent from the promoted product. The advertisements seem to offer the consumers material to work through their own values and principles, in a way contrary to what the advertiser intended.

This study also has a number of implications to advertisers. Advertising, as Buttle (1991) suggests, is a raw material to be processed and reprocessed within our social actions to make sense of the world. Different consumers' interpretations of the same ad may be contrary to each other. For example, the Koff commercial represents a theme of equality between women and men to the one participant, while the other regards it as a sexual exploitation of women. Advertisers should also pay attention to communicating the basic value proposition; otherwise the interpretations of an imaginary advertisement may be fragmented (Bulmer and Buchanan-Oliver 2004) and the advertisement does not convey the intended resource. It can be supposed that the consumers' varying "power" - social, cultural, economic and physical resources (Arnould et al. 2006) - underlie

their interpretations of alcohol advertising. Thus, these components of power, i.e. the consumers' resources, are suggested to constitute a basis for consumer segment profiles. This also underlines the co-creation of value in the interaction process, where advertising serves as a conveyor of the advertisers' resources. This process is not one-way; instead, our study shows that value is mutually produced.

6. Limitations and further research

The limitations and the quality of interpretive research can be approached in several ways. Koskinen, Alasuutari and Peltonen (2005, 258)² stress the importance of systematic reporting of both the research process and the paths to interpretation and conclusions, as well as reporting the verification of the generated data and reporting other motivations, such as funding. Most importantly, other scholars must be provided with possibilities to trace (Lincoln and Guba 1985) the process and assess (Mäkelä 1990, *cited in* Koskinen et al. 2005, 256) the findings. Arnold and Fischer (1994, 64) emphasize coherence of the interpretation and systematic documentation of themes and supporting evidence.

The aim of our study was to enhance understanding of advertising as a resource to a consumer. Regarding the limitations of this study it is worth discussing at least the methods, the participants and the implementation of analysis and interpretation. First, we collected the data through three different methods: using the personal interviews, the diaries and the questionnaire. The use of multiple methods aimed at obtaining a profound understanding of the phenomenon; however, in interpretive research an objective truth can not be captured (Denzin and Lincoln 2000, 5). We argued for the adequacy of these methods earlier in this paper. As a limitation, our method did not take into account the context of communication related to the natural advertising exposure (Cook 2001,4; Ritson and Elliott 1999, 273). We note the intrusiveness of the interview situation, for example, the commercials were projected on the wall and viewed at least twice. In addition, all commercials might not have been relevant or interesting for every participant. So, it is possible that these circumstances had an effect on the participants' experiences. The meanings and interpretations, however, do not originate merely from an advertisement itself, but an interpretation is also related to an individual's sociocultural context (Bulmer and Buchanan-Oliver 2004; Mick and Buhl 1992). The diary method also included some limitations. All participants did not seem to be equally committed to write according to the instructions. The semi-structured instructions, in addition, could have been confusing and a rather long reporting period might have been a burden. (Bolger et al. 2003).

Second, one weakness of this study arises from the small amount of participants. It should, however, be reminded that our study aims at understanding the phenomenon, not explaining. The issue within an interpretive study is not of generalizing and, accordingly, the participants are not chosen to represent some part of the larger world (McCracken 1988,17; Kvale 1996). The other possible limitation related to the participants resides in the critical role of language as a conveyor of meanings (Arnold and Fischer 1994). There seemed to be differences between the participants' ability and willingness to express their experiences. Most of them were able to generate rich de-

² Adapted from the original idea of Douglas (1971, 29-30) and Grönfors (1982, 178-179).

scriptions, in contrast to more narrow expressions of some participants. Furthermore, we do not know to what extent the participants described their actual experiences, or whether they coloured or distorted their statements. This study also highlighted experiences of a group of young adults - mainly higher educated students. It is likely that different meanings would have emerged from consumers having different socioeconomic backgrounds (Thompson et al. 1994).

One challenge of implementing analysis and interpretation resides in its subjectivity (Arnold and Fischer 1994; Spiggle 1994,499; Thompson 1997). As Arnold and Fischer (1994, 57) state, “[T]here is never any one, or objective, understanding of a text” and “while some interpretations will be judged superior to others, multiple interpretations are possible”. In our study both authors conducted all analysis and interpretation phases separately, but in the same manner. Working as an interpretive group (Thompson et al. 1989) enabled us to discuss each others interpretations, question and evaluate supporting evidence and view from a broader perspective and pre-understanding. We also tried to report the research process in a consistent way that is easy to follow. Finally, it is worth mentioning that we analysed consumers’ experiences of advertising from a certain hermeneutic perspective. From another perspective, however, these same experiences could result a different interpretation which is equally justified.

In the future research, more attention should be focused on the resource-based interaction between an advertiser and a consumer, especially from the consumers’ perspective. First, the consumers’ social and cultural resources as underlying factors influencing the interpretations constitute an interesting issue. Second, the process of co-creating value in relation to advertising deserves more attention. Third, based on our study, the additional research could focus on the nature of particular resources. For instance, a detailed examination of *meaningful consumption experience* could produce interesting results, as well as a dissection of *positioning oneself*. Moreover, in relation to the empirical data collection, the methods applying the natural advertising exposure and the diary method could be developed in further research.

Appendix

Descriptions of the advertisements and the embedded marketers' resources.

Baileys cream liqueur

A group of youngish Afro-American –looking adults is gathered together in the patio of a wealthy-looking villa. Sounds cheerful buzz of conversation. People are casually dressed. The weather seems to be warm and sunny. A serving table stands in the middle of the space; a bottle of Baileys, glasses and a bowl of ice are on the table. The main character, the man behind the table tries to put ice cubes in his glass with tweezers. One after another the ice cubes drop bouncing on the floor. Two men and one woman sitting on the sofa start to cheer for his attempts: "You're all right there buddy? ...Focus, focus!" The man leers at them and calmly pours Baileys in the ice bowl. "What are you doing?" "Wait a second...Ooohh". The text: contains 4 cl serving. The man drinks Baileys from the bowl with a straw. Content with his drink he joins the people on the sofa. The text: Serve chilled. The voice: Baileys now comes in a delicious new flavour. Baileys with a hint of mint chocolate.

Marketer's resources: Pleasurable lifestyle, indulgence and enjoyment. Comfortable leisure with friends. Respecting individuality. Caring for friends. A smart choice for a man's drink. International atmosphere.

Koff beer

A hot summer day in a peaceful countryside landscape, birds are singing. Three young women sit at a small, old-fashioned red wooden hut. They hold canned beer in their hands and sip at beer. They move themselves back and forth as if in rhythm with the music. The girl in the middle shouts at her friend's ear: "It's still a bit quiet feeling here, but don't worry, it'll take off!" A skinny young man drives up the village road with a moped. While passing the girls, a girl in the middle raises her hand. The man returns and the girl in the middle bends down to him and shouts loudly: "Evening! We would like to have another beer, but we'll get back to the menu later!" The man stares at them but says nothing. The girl sings out "Thank you!" and they keep on moving themselves in rhythm. The text: The Bar Feeling offered by Koff. Music starts. Sound of opening a can. The close-up: the girl holds the canned beer in front of her breasts.

Marketer's resources: Fair and uncomplicated attitude towards life. Urban lifestyle (self-ironic perspective). Nostalgia. Respecting traditions (and traditional brand). (Note: Despite of the women as the main characters, the marketer does not intend to position the brand especially for women.)

Kurko long-drink

A sunny summer day in a suburb. A few old high rises stand in the background and in the front is a rocky landscape. There sounds a distant noise of traffic from a highway and caw of crows. Old sofas and armchairs are carried outside to the cliff-top. Four men in their thirties sit there, each having his own chair. They look like ordinary working men. A robust man glances at another man, who glances at the third one. All stay stony-faced. Suddenly the robust man flips on an old recorder and rhythmic music starts. The men start to perform aerobics exercises and they use the bottles of Kurko as weights. They exclaim: "Keep your body moving!", "Keep up the good work!", "I do nicely!", "This was really Kurkobic!". The text: Two new light Kurkos. Caution: Only 30 kilocalories per a decilitre. Sound of laughing, the music continues.

Marketer's resources: The real Finnish manhood and masculine togetherness. Freedom to wander off (without women). "Retrosociality" is favourable; outward appearance and weight watching are regarded with a sense of humour. Light drinks are accepted, but also with a sense of humour.

Upcider cider/ commercial

Rhythmic music starts. Two young men drive a forklift curving inside a warehouse. They collide with a stack of boxes, and the stack collapses. An angry manager storms out shouting from an office. He throws money as a payoff and points to a door. The boys collect the money and walk out laughing. A car passes them and splatters water over them; they jump aboard and get a speedy ride. They laugh. Two angry dogs hunt them, they escape running and get an electric shock while climbing up a fence. They still laugh. While walking home they encounter a dodgy man carrying a television. The home door is open, everything is robbed and there is a mess-up. The music slows down. The boys walk to the fridge, open the door and there exists two bottles of Upcider floating in the air. The music speeds up again. The men sip at cider with relieved feelings. The text: "It's not worth moping". Image of a green bottle cap. Sound of opening a cider bottle.

Upcider/ posters

Poster 1: A wedding dressed beautiful woman and a wedding suited fat pig sit on the back seat in a car. The woman laughs and winks at the viewer. She holds a big bottle of Upcider in her hand.

Poster 2: A man lies in a luxurious bed with upper body undressed. He smiles and upraises the Upcider bottle in his hand. Beside him sleeps a bream with a lacy eye patch.

It says in the bottom of both posters: "It's not worth moping". Image of a green bottle cap.

Marketer's resources: It would be worthwhile to enjoy life, be optimistic and carefree. Friendship and sociability.

Disturbing the circuit through brand realization

Cecilia Cassinger
Department of Business Administration

Lund University, Sweden
cecilia.cassinger@fek.lu.se

Abstract

Within consumer research there has recently been an increased interest for applying the circuit of culture model to the study of brands (e.g. Goldman and Papson 1998). While this model illuminates how meanings of the brand are reworked along the different moments in the circuit, it has neglected the role played by place and space for shaping the brand. In this paper I imagine and explore the brand as modes of ordering, which are realized in spatial arrangements (Law 2000). This is carried out by means of telling stories of how distributed modes of ordering are put into practice at home. I argue that the brand emerges as different objects in these stories, which disturb both the one-dimensional logic of the circuit as well as its defined moments.

Introduction

Within consumer research there has recently been an increased interest for applying the circuit of culture model to the study of brands (e.g. Goldman and Papson 1998). This interest demonstrates a shift away from the old dichotomy of the consumer as a passive receiver of brand meanings on the one hand or as an active creator of the meanings of brands on the other. Instead the reworking of meanings of the brand is traced along the different moments of the circuit. The circuit of culture approach was developed within cultural studies as a response to the linearity of traditional commodity chain analysis. While in commodity chain analysis the progression of the commodity follows a casual sequence of such diverse moments as design, retailing, advertising and finally consumption, the circuit culture model emphasised that the tracing of the commodity can go in both directions and that moments interacts and overlaps one another (Cook et al 1998). The foundation of the circuit culture model underlying these studies can be traced to the circuit culture approach elaborated on by Richard Johnson (1986). Drawing on a particular combination of Marxist and poststructuralist theory, for Johnson the circuit is at one and the same time a circuit of capital and a circuit of the production and circulation of subjective forms. The view of consumption is partly premised on a metaphor of reading, even though Johnson acknowledge that reading include existing cultural elements within the lived culture and the social relations upon which they depend. These reservoirs of discourses and meanings serve as the raw material for cultural production and belong to the cultural conditions of production. The influence of this model, though not always explicit referred to in consumer research on brands, can be seen in the way brands are approached as a form of cultural resources which are valorised due to their association with or role in particular stories circulating in popular culture (Holt 2006; Twitchell 2004). The problem with seeing brands as cultural symbols is that it tends to turn the brand into an abstract entity, which is not accomplished by concrete relations of everyday life. Instead the brand is seen to be, at least partly, mediated by larger actors not directly connected to the lived culture where the consumer is situated Even though the meanings of the brand on the

representational level are acknowledged to vary between the sites in the circuit, its different material realizations when the brand is enacted in a particular time and place are seldom reflected upon.

In this paper I suggest that a consideration of the spatial dimensions of the circuit of culture approach could further the understanding of how the brand is realised. Place and space have largely been neglected in the study of brands. In other disciplines their significance for shaping the commodity chain has been demonstrated. The geographers Deborah Leslie and Suzanne Reimer (1999) argue that gaining understanding for how space mediates the relations in the commodity chain could assist in developing more comprehensive policies for the coordination of sites along the chain, which could balance the traditional predominant focus on production. Moreover, because commodity chains culminate in the production of space when the good is consumed, sites such as the home are likely to shape the dynamics of the chain as a whole. A focus on space could thus capture the leakiness of the chain and the ways in which the various sites are linked to each other. In order to demonstrate how a spatial approach to the cultural circuit of the brand could be undertaken, I want to imagine and explore the concept of brand image as stories, particular modes of ordering¹, coordinated by a form of a shared imaginary. This approach to brand image draws on recent developments within economic sociology, influenced by the traditions of Science and Technology Studies (STS) (Barry and Slater 2005) and the new form of spatial awareness within geography (Thrift 2006), where the assumption of pre-existing subjects and objects that can be unproblematically represented has been questioned. It diverges from the view of stories in the cultural approach to brands within Consumer Culture Theory, by suggesting that the brand is an object that is accomplished through enactment. In a recent anthology on the technological economy, Celia Lury (2005) compares the objectivity of the brand with that of a car. In an illuminating paragraph she writes:

We are easily ready to accept that a car is an object, although it typically comprises many parts or components. Moreover, while each of these parts is more or less essential to the capacity of the object to move its passengers from one place to another, none of the individual components has this capacity. It is their relation to one another that makes the components of a car into a car. We also tend to think of a car as discrete or closed object, but it is of course only a functioning car when it is in a controlled relation to elements of its environment: the atmosphere, the driver and the roads. In other words, the car is an object in a dynamic relation to its environment (Lury 2005: 183).

In a parallel manner she approaches the brand as an object that emerges in relations between products and services in a dynamic relation to consumption and everyday life (*ibid.*). Due to the dynamic nature of these relations, the brand is able to emerge as qualitatively different objects. Within the STS tradition numerous studies have demonstrated that there are no important differences between stories and material objects (e.g. Law 2000; de Laet and Mol 2001; Verran 2001). Stories take place in the material world in the form of social relations and in the form of machines, architectural and other material arrangements, bodies and so on (Law 2000). This means that stories are not just narratives in a linguistic sense but enacts (or performs) and arrange material relations that give raise to different types of spaces (*ibid.*). To put it a little differently objects are stories, which enact spaces. With this follows that stories do not merely describe or assign meanings to a single world; they craft different worlds that interfere and interact with one another (*ibid.*). Adopting a definition of the brand as a story of this kind involves talking about brands that take place in different relations and environments.

¹ I borrow the definition of stories as modes of ordering from Law (2000) who takes this term from Foucault's early writings on discourse.

In order to demonstrate what this could look like, I will tell stories of distribution and consumption practices involving the furnishing retailer IKEA². Consequently, I will limit the analysis to these two moments of the circuit. From the perspective of studying spatial practices IKEA is a particularly interesting case in point as it is organised around several concrete places like the store, the warehouse, the home and other in-door settings. It thus enables an exploration of spatial realizations of the brand. The stories were collected between 2005 and 2007 at different sites in the cities Shanghai and Malmö, by means of a series of unstructured interviews with IKEA co-workers and consumers, and participant observations at home, the IKEA store and other semi-public places³. Here, I will exemplify with stories from Shanghai and occasionally use the Swedish ones as points of contrast to reinforce the argumentation. Stories of distribution were collected through IKEA's main distribution channels, the store, the website and the IKEA catalogue. These stories are standardised to IKEA's national markets and vary in terms of language but converge in narrative content (i.e. the sequence of events). I should point out that I am adopting a definition of distribution and consumption as practices of diffusing respectively realising modes of ordering. I did, however, not directly observe these practices. I captured them as manifested in talk, written texts and home decoration.

The paper is structured in three parts. First, I describe the realization of the brand at home, then, I attend to a home where the brand cannot be realized but is accomplished by other means. The argument made is that modes of ordering bring forward different types of spaces in which the brand emerge as different objects. Finally, I single out some implications for the cultural circuit approach.

Realizing the brand

About an hours train ride from Shanghai, in Baoshan⁴, Lin picks me up in a silver coloured Lexus. We drive towards the apartment in the outskirts of town in a newly built community. When I last saw Lin he was an exchange student in Sweden. This time, he is back in his hometown Baoshan working for the local government. Even though Lin looks in the same way as I remember him, he is now an official. 'I promised my mum I would never work for them,' he says. 'Why?' I ask. He continues talking without answering the question. 'But then I got married to an old classmate from the area and well...the salary is not bad and I get to travel abroad. I am looking for other jobs with a national or preferably foreign firm.' A guard opens the gate to the area where Lin and his wife Xing live. Before entering into the apartment I mirror myself in a television monitor on which it is possible to see visitors on the outside. Xing is working as a nursery-school teacher and is not home. She will meet us at a Korean restaurant later for dinner. According to Lin it is the best restaurant in town. The hallway forms a passage through the apartment, along which the rooms are displayed.

² When I henceforward speak of IKEA, I refer to the IKEA brand.

³ The collection of material was made as part of my PhD thesis (ongoing) on retail image. The interviews were carried out in Swedish and Mandarin and were subsequently translated into English by me. To translate is to write anew and there are many local expressions, which do not have self-evident equivalences in English. In translation the aim was to grasp the meaning through the sequencing of events.

⁴ Names of people and places have been changed in order to keep the anonymity of the informants.

On the long wall is a ready-to-hang picture with four framed paintings in a row of a woman's silhouette from different angles. On the floor is a blue rectangular cotton runner with white stripes. Lin presents the rooms. 'To the left is the kitchen, to the right the living room, on the other side of the living room is my home office, straight ahead is the guestroom or nursery (laughs), at the very end is our bedroom.' In the bedroom a large wedding photo of Lin and Xing is placed above the double bed. On each side of the bed are two identical bedside tables with two identical table lamps. Another wedding photo in a white frame stands on a nest of tables beside the television. The windows are half covered with curtains in three pieces in red, white and yellow flowery patterns. They are made in a thicker material to protect from sun and light. Closer to the window there is another shorter curtain in translucent white lace. In front of it, on the windowsill is a large cactus in a blue and white porcelain pot. 'My wife made the curtains and put up the wedding photo, I think it looks...hmm...I do not know...too traditional Chinese perhaps. Otherwise, I did all the decorating. It's all from IKEA. I took the car to the store in Shanghai one Saturday and packed it with stuff. I had already selected some things from the IKEA catalogue, so I knew what I wanted. It reminds me of Sweden. I really liked your interior decoration style.' 'Did you assemble all of this by yourself?' I ask. 'Of course I did! It's fun.' We enter a small room behind the bedroom which has been turned into a walk-in closet. I tell Lin that it looks exactly as in the IKEA catalogue. He smiles and nods. He pulls out a drawer revealing several compartments in birch plywood in which rolled up ties are put. Some of the compartments are still empty. Then he pulls out another drawer displaying socks folded in rows beside one another. I sit down on the Molger bench in the middle of the room and look up at the rows of shirts, blouses and trousers that hang on rails in the wooden closet frames. Below is an empty laundry bag in white cotton and beside it is a collection of shoes organised on tilted aluminium racks. One section has been made into a place where towels and bed linen are kept. 'How did you know how to put together all this?' I ask. Lin looks at me with a query face. 'Follow the instructions...'

Even though this is an individual example tied to a particular time and place, the ordering of Lin's home is employed here as a typical example of arrangements that I have regularly observed in both Chinese and Swedish sites.

The most striking about the arrangements is the symmetrical and linear way things are arranged through being put in rows, on top of one another, side by side, in piles and so forth. This is also accomplished through putting identical things close to one another. The bed has two adjacent tables, the pictures come in a set of four, and the table is a nest of four ones. In the wardrobe there are several identical compartments, drawers and clothes rails. The space created through such mode of order is one of predictability and order. This mode of order realises the IKEA brand in the same way as it is done in the in-store showrooms and the IKEA catalogue. He wants it exactly as it is at Ikea. This mode of order enacts a geometric space in which IKEA is made to function and look in the same way as in the in-store displays and the catalogue.

According to the IKEA mode of ordering things are brought together and demarcated from one another by means of wicker and paper boxes, drawers, closets and shelves. It is about a systematisation of the things in the household to make it more predictable and easy to manoeuvre in. It is about dividing the home into units, spaces that are well defined. This also means an ordering of time where things are constantly put away to give room for new things or create more space. It is an order where things have their own place. They are not randomly

put in piles or thrown under the bed. The positions of things – from the keychain to the bed - have been carefully planned. Things are organised in boxes and separated from the rest of the environment. It is about a systematisation of the things in the household to make it more predictable and easy to manoeuvre within. To accomplish this order the home is divided into units, spaces that are well defined and demarcated by boundaries. This corresponds to what Mol and Law (1994) refer to as Euclidean space or a geometric space where objects are clustered and demarcated from other objects by means of boundaries. When objects are ordered in this way, they are also made into stable objects, i.e. we know that it is a sheet because it lies on the bed or we know these are winter clothes because they are in a box on top of a shelf in the wardrobe. The outside of the box prevents the chaos inside from entering into the order. Clothes need to be boxed and ordered, carried by hangers, and folded in rows. The clothes that are not inside the wardrobe become mess. Mess is consequently that which is not surrounded by the boundary of the solution. It is not defined. Things that are not ordered according to this mode seem awkward in comparison because they are less defined.

Arguably, the IKEA brand is not tied to a specific product but a mode of ordering, which requires the adoption of certain decoration practices and a certain enactment of space at home. It is conditioned on particular products, which are made to suit this particular order in being linear in shape. The mode of ordering is not realized by individual products, but by specific combination of products. At IKEA these combinations are called solutions. Solutions are combinations of products in which a certain pattern of action is inscribed. While a chair is not a solution, a chair with a cushion or a chair with a shelf underneath is. The marketing director for China confirmed that IKEA does not sell products; they sell solutions to problems at home (interview with US 20050319). These solutions are made up by elements that need to be related to one another in order to work (cf. Lury above). The walk-in closet is an example of a solution. Although it is referred to as an entity, it is made up by many different small components that work in unison to produce the wardrobe. These parts do not come in a box at IKEA. Setting up a wardrobe from IKEA is construction work. The ideal procedure for this construction is offered at IKEA's website in the form of a narrative consisting of a set of steps that the customer needs to go through before the solution can be put into use. Due to space limitations I provide a condensed version here.

A Day at the Store

- 1) Get inspiration through browsing through the IKEA catalogue.
- 2) Be prepared by making a list of anything you may need for your home. Take measurements of spaces you want to fill with furniture. Make sure there is room in your car.
- 3) Enter here. Everything you need to shop is available at the entrance: pencils, paper, tape, measures, store guides, catalogues, shopping carts, shopping bags and strollers.
- 4) You'll get decorating ideas from our interior room settings in the showroom. Review your options over a Swedish meal in the IKEA restaurant. Then collect your products from the warehouse in flat packages that are easy to take home.
- 7) Make yourself at home. IKEA store are huge home furnishing exhibitions. Stretch out on a bed; see how many people you can fit in a sofa, or let your children choose furniture for their rooms.
- 5) IKEA stores are self serve but there's always someone around to answer your questions. You can bring your bulkier purchases to the Home Delivery desk to arrange delivery, for a fee.
- 8) Talk to our sales staff.

9) Look at the price tag! Our tags have important information about size, colour, craftsmanship, measurements, features and care. Tags on large items tell you where to pick them up in the self-serve furniture area.

10) You pick it up. On your way to the check-out, you'll pass through the self-serve area. This is where you pick up the flat packed furnishing items. Picking up purchases is an important part of IKEA's approach to customer involvement. Specifically, if you can do simple things like pick up your purchases and assemble them at home, we'll keep prices low. Do we have a deal?

11) Flat is good. Another way we keep prices so low is by packing and shipping items in flat packages. This also makes it easy to get items from IKEA stores to your house.

12) Trolleys for everyone. There are plenty of carts available to help you bring your purchases to your car

(http://www.ikea.com/ms/en_CN/about_ikea/store_experience/showroom.html).

In order to realise IKEA's mode of ordering the consumer needs to undertake various types of labours in the store as well as at home. This labour is aided not primarily by staff in the store (e.g. "IKEA stores are self serve") but is delegated to objects like pencils, papers, tape, measures, store guides, catalogues, shopping bags and trolleys. These objects help the customer with everything from translating the home into numbers in order to be able to bring it to the store, offering prescriptions of how to decorate the home, to navigating through the store. They also act as carriers of products and means of transportation. These objects are mobile ones. They can be brought between the home and the store, thus serving as forms of mediations between the space in the store and the one at home. They make it possible to translate the home environment into IKEA's fixed measures and vice versa. The way that the IKEA experience is described through the narrative "A day at the store", above, is a rationalisation of why the mode of ordering at home needs to be realised in a certain way. On the home page the description of the IKEA experience is framed by another story of IKEA concerning its path from a small mail order firm to a global furnishing chain. It tells the story about the hard-working founder Ingvar Kamprad's hardships in his quest to offer people high quality design to an affordable price. In order to do that he invented a cost-efficient way of working together with the customer. By designing for and packaging products in flat packs, the customer was included in the production process. In this way costs were cut and prices lowered. Consequently, the mode of ordering realised in Lin's home may be seen as a story involved in economic rationality.

As pointed out by David Harvey (1990) the chronological ordering of everyday life is closely connected to profitable production where the goal was to reduce spatial barriers and "annihilate space through time". This required a predictable space with demarcated boundaries, in which objects had fixed coordinate facilitating long distance control. The space at home can, for instance, be seen as held together and protected by IKEA's objects and the practices that they presuppose. The knowledge required to carry out these practices is distributed by IKEA in the form of instructions, written on signs and information brochures in the store, but these instructions are also enclosed in the flat packages, the catalogue and the webpage.

Assembling IKEA's products is a technical work. The practices that one should undertake are translated into universal figures like numbers, cartoon figures, and drawings that guide the customer in assembly. In the standardised instruction manual it is first stated how many pieces the package contain and then how to put them together in a series of steps. For

example, in order to assemble the desk Markör, with a small-inbuilt cabinet on the side, the assembler needs to proceed through twenty-seven steps in order to bring about the desk. Without the instruction Markör is not defined as a product. It is merely a flat package consisting of: five boards in stained solid spruce with clear acrylic lacquer, one fibreboard, and two edgings. Moreover, the package contains twenty-two screws, twenty-two barrier nuts, thirty wooden plugs in different sizes, thirty screws in different sizes, a bag of small nails, eight shelf dividers, two hinges and a cabinet door knob comprised by two pieces.

Similar to Lin, many informants did not experience the assembling of IKEA's furniture as labour because they were "following instructions". I believe that it could be due to the feeling that IKEA follows the customer into the home via the instruction. The actual putting together of the furniture is not experienced as labour, as it is carried out following a set of instructions where one's own body is merely a machine for realising IKEA at home. As a result the labour is taken over by the instructions. The instructions work as an extension of the relation with IKEA, which aids in assembling and ensure that the products are pieced together as they are supposed to be. Instructions are particular distribution technologies that help assemble and install IKEA outside the store. The catalogue is another technology that are able to extend into people's lives and practices in different environments. The instructions and the catalogue are embodied forms of knowledge that inform decoration practices. It is also possible that they serve as a warrant for holding together the space enacted by the IKEA mode of ordering. Customers piecing together and installing IKEA's furniture in random ways by themselves would interrupt the standardised knowledge practices that make up the IKEA brand and turn it into something less defined. Another way in which this is order is sought to be stabilised is by means of the knowledge embodied in the products. The products inform the practices that should be undertaken in relation to them. The plywood boxes, for instance, are made to fit rolled ties but not underwear and gloves. Note that this is not about internalising the mode of ordering. It is rather about being restricted by the relations to the products. Due to the particular design of the products it is not feasible to do anything one would like with them since their materiality will not allow it. But also because the relations between them are stabilised by the mode of ordering, which hold the use of them in place.

Nevertheless, in the home this standardised mode of ordering are altered when made to relate to other modes. Relations are connections between elements. These connections are not pre-given or given once and for all but reformed and preformed in the material realizations of the brand. Marilyn Strathern (2004) has used the way in which the Mekeo people in Papua Guinea organise the world to suggest that insides and outsides have their own insides and outsides. The inside is the outside of something other and vice versa. From this perspective the effect that an order creates can be presented as a further order, one order is seen to produce a counter-order (81).

I will take the tension between what I will call the Swedish and the Chinese as an example of such connected ordering and counter-ordering. Lin seems to use IKEA as a reminder of his Swedish experience, perhaps as a way to convert an important event into the home. Lin is happy when I point out that that the closet looks like the one in the IKEA catalogue. People seek to make relations known to others in order to produce a certain response (ibid.). Hence, my comment, from the position of being Swedish, could be seen as recognition that Lin has enacted IKEA as it should be done. The enactment of the Swedish also brings forward the Chinese. The wedding photo and the curtains in the bedroom at the very end of the hallway are part of this mode and Lin regards them as being too traditional Chinese, something that

does not fit the other order that he has constructed there. The Swedish is thus constitutive of Chinese interior decoration practices and vice versa. I want to underscore that this is not a question of what is really Swedish or Chinese but how these come to be articulated and realised in relation to one another in this particular case. While the Chinese relates to Lin's marriage, the Swedish divide the space between the couples in different sections. The wardrobe is divided into fractions where Xing has her clothes and Lin has his. The bed has two beside tables. It is not that these orders are separated from one another; rather one is the extension of the other. One mode of ordering creates another one. The Chinese is not a counter-practice that is in a dialectical relation to the Swedish. It is the inside of the Swedish coming from the outside. Strathern writes:

"Growth, reversal, cutting are all Melanesian metaphors for the way in which one image displaces another. Consequently, one image elicited from another displaces it in the same way as a body may be opened to reveal the other bodies it contains: a bamboo bursts to show the persons within, a boy grows into a man. An act of severance connects what is separated: one 'cuts open' an exchange partnership to make valuable move between donor and recipient. It is relationships that cuts reveal, including the relationships that people carry on their backs" (Strathern 2004: 113).

This means that the well defined also anticipates another mode that extends it into something else. In the extension the relationships between these modes can be discerned. For example, the ordered anticipates the chaotic since the latter exists in the former and is revealed in moments when relationships shift. The relations between the brand, other objects and the environment are dynamic in nature. Therefore, because the brand is inserted into different relationships, it will also differ between sites. This is not to say that the brand is fragmented; it hangs together because the relations between the arrangements of elements are extended to one another (ibid). The one is seen to grow out of the other and one must be cut from the other. An example of a mode of ordering that does not seem to fit within Ikea's ordering is what my next story is about. Yet, even though IKEA cannot be told within that story, it is still part of the brand as a relation that does not simply negate IKEA but as "an inversion that makes as much sense as the order it inverts" (Wagner 1987: 61 in Strathern 2004: 113).

The brand that cannot be told

In Shanghai, not far from the bustling Huaihai Road, Xu waits for me outside the long tang (shikumen) house where he lives with his parents and brother. We sit down at a table facing the door in the drawing room. The house is located in the few centrally located older neighbourhoods that still haven't had to give way for new apartment buildings. According to rumours Xu's house is also about to be torn down. In the surrounding area the reconstruction has already started. But Xu does not worry. 'They said that they were going to demolish the neighbourhood but that was several years ago, then the corporation that was responsible for it ran out of money. Now, we do not know what will happen. Perhaps we will have to move outside the city'. The house lacks facilities like kitchen and bathroom. The public bathroom across the street is used and meals are prepared on a Calor gas stove. The house has a modest range of home made furniture in dark wood. Behind the drawing room is the parents' bedroom and in the room adjacent to it Xu's father shares a cabinet-maker's workshop with his brother's ironing shop. Due to the spatial limitations the workshop is partly extended into the street where the electric saw is kept. The light wooden material he uses is collected during night time from abandoned construction sites. A ladder standing on the floor leads up to the loft where Xu and his brother sleep on two mattresses. Xu is well familiar with IKEA. His father used to keep the IKEA catalogue under the counter from

which the customer could pick out styles and shapes of the furniture. Xu got the catalogue when he worked as a guard in the neighbouring high-rise to where catalogues were distributed. According to Xu IKEA would not fit their house. 'IKEA is more for white-collar workers and foreigners that live in the modern apartments', he says. 'It would not fit here. Perhaps, if the house was bigger...' I ask him if his father copies Ikea's products. Xu waves his hands in a dismissive gesture. 'No, no,' he says in English as if to ensure that the point he is about to make will get through to me. 'My father knows nothing about design, he just a hobby carpenter. IKEA is a professional company that mass produce goods,' Xu smiles. 'My father has no means to do that.'

The story of Xu's home marks the boundaries of Ikea's. It is the story IKEA cannot tell and Xu cannot tell Ikea's. In part their stories are incommensurable to one another. I mean this more in a spatial sense than in a linguistic one. Literally Ikea's furniture does not fit in Xu's house. As he says he would not get a sofa through the door. He could buy small things like sheets and blankets. But that is not what Xu uses on the loft. Since there is no central heating he uses sleeping bags. The house, Xu and his family live in, does not fit into the mode of ordering distributed by IKEA. It cannot be enacted here for the ordering was set up with another house in mind. A house protected from dust and rain, with windows and floors that are easy to keep clean. The house lacks washing facilities and clothes are washed by hand in the brother's ironing shop. The bright colours that IKEA celebrates would get dirty quickly in a house where the door is often kept open and outdoor clothes are kept on inside.

Xu's example underscores Slater's (2005) point that marketing is a process of framing based on cultural knowledges and instrumental rationality. The task of marketers is to attempt to culturally entangle goods in social relations so as to make it meaningful and desirable; culture thus becomes an object of technical rationality (62). In Xu's case Ikea's story is not tangled up with his as it is standardised to involve a certain type of home and inform certain types of practices tied to the home.

The IKEA mode of ordering is decomposed if it is not put into practice. The practices and their extensions in the form of measures, catalogues and products is what hold the relation between the IKEA story and other stories together. In Xu's house, I would argue, there is nothing to tie practices to. Therefore, IKEA becomes neither desired nor disliked. Despite that the house is located on one of the most central addresses in Shanghai and Xu was among those of informants living close IKEA, he felt that it was geographically too far away. IKEA is indifferent to Xu because the relationship between them is cut off. However, as argued above, cutting off relationships could be used as a metaphor for how one order displaces another. In relation to Xu, IKEA emerge as dependent on a way of life tied to material resources such as modern facilities, certain amounts of space and the number of people sharing it. It requires living conditions of a certain standard. It is not a coincidence that IKEA is located in Xujiahui, an area where several large new apartment complexes are being constructed at the moment. Where Xu's housing area is, new high rises will be built, which eventually will entail more apartments in need of decoration. While it seems possible that IKEA will be included in these new environments, Xu will probably not be.

On the other hand, the use of the IKEA catalogue in his father's business reaches into Ikea's story and extends it though in a reversed way. Even if identical, his furniture will not have the same exchange value as Ikea's; yet the IKEA mode of ordering will be distributed

through him. Xu's father is what could be called an externality of Ikea's distribution strategy but he is also an effect of it. With Strathern's terminology, he would be the outside of IKEA, while at the same time inside, as he is an effect of the knowledge that is available for free at IKEA. The transaction of goods is displaced for the distribution of the mode of ordering, which is potentially accessible to all who can enter into the store or get the hands on the catalogue. In this sense Xu's father becomes an inversion of the outside. By means of the replications of Ikea's design, the mode of ordering is distributed, but without the very core of the IKEA story: labour. Labour is fundamental to IKEA as it is built around the deal with the consumer (see above). If people start to hire others to do their IKEA labour for them, whether transporting, assembling or making products, then IKEA becomes more of a provider of knowledge guiding the ordering undertaken at home. I should add that Xu's father is not the only one who has replicated Ikea's products. This is an activity that has grown and been debated in the Chinese media. According the English publication of China Daily it has also reached Ikea's awareness.

IKEA came to understand that their high prices were forcing Chinese consumers to try and make copies of IKEA products; copying was simply a way to get the IKEA product they clearly wanted at a price they could afford (Moller 2006).

If IKEA offers solutions to problems, then it is offering knowledges which are potentially accessible to everyone. Ikea's knowledge was in this case accessed through its major means of distribution, the catalogue, to learn and imitate their decoration practices. What is interesting in this example, for the discussion of the circuit, is that while the IKEA mode of ordering is distributed the products are not. The order is realised by other materials. Still, it is being realised. I would argue that Xu's father marks the limits of the circuit model because his actions are not defined within it. He stretches into the story from neither a consumer nor a distributor's point of view but from the position of more silent and illegitimate kind of production

IKEA has persisted in its ambition to distribute a standardised story to its markets. According to the marketing director for China the challenge in Shanghai is to explain why self assembly is necessary. Most other home furnishing stores in Shanghai include transportation in the price. In order to adjust the boundaries of the market, IKEA have reframed themselves by undertaking a range of measures. I am providing a brief overview of some these here. They should not be seen as countermeasures to the situation just described but as an illustration of attempts to maintain and secure the mode of ordering. In 2006 IKEA stopped handing out catalogues in China and introduced a "multilogue" that can be viewed and ordered online. The multilogue is a slim version of the catalogue, released five times a year. In comparison with the catalogue it contains more pictures of home settings and educational advice on how to decorate. Furthermore, since 2003 the prices in mainland China have been considerable lowered (interview with marketing manager for IKEA China). IKEA has also started to offer free delivery service during certain months (observation 20050406).

Conclusions

In this paper I have sought to add a consideration of space to the circuit of culture approach to brands. I have suggested that the brand emerge through particular modes of ordering that are realised by putting material goods into practice. In relation to IKEA, the specific case in point employed here, these practices concern the organisation of things in the home. In the stories told I have elaborated on what realization involves through providing examples of how and where IKEA is realised. In the realizations of the mode of ordering, IKEA is connected to other stories, which frames it as a qualitatively different object (Lury 2005). This emergence has less to do with different perspectives on IKEA and more to do with spatial relations.

I have also sought to imagine what the relationships between these realizations look like by drawing on Strathern's observations of the Mekeo people in Papua Guinea who believes that insides and outsides have their insides and outsides. Following this way of viewing the world, the IKEA mode of ordering and the geometric space it produces could be seen as a stable order, which contains other spatial orders. The brand, then, moves between these different spaces extending, cutting off, and reversing relations between them (Law 2000; Strathern 2004). The IKEA brand can then not be seen as a stable set of relations that are able to transport it as one piece to different places. Because the brand is inserted into different relationships, it will also differ between sites.

The circuit is unable to capture the brand in this way due to its focus on the reworking of meanings along the chain and not on how the brand is realized by being put into use. When the brand is put into use it produces spaces, which extends the relations across the moments in the circuit. That moments in the circuit intersect with one another has been pointed out by previous research. What is different here is that the brand is seen as constituted by the movement between these spatial relations, which produces it as different objects. It is not just that the brand means or symbolises different things; it is different because it is involved in different practices producing different realities of which the brand is an outcome.

Following Strathern, another way of comprehending the circuit would be to see it as composed by disparate dimensions of outgrowths against one dimension that does not grow itself. In the context of this paper, this inert dimension would be the geometric space produced by Ikea's particular mode of ordering. It is conceivable to imagine that within this ordering there are other orderings, which come forward when relations are transformed. Approaching the brand as constituted in this way would work against the view of the brand as an abstraction, since its relationships and components are made concrete. This seems important for being able to understand the roles played by brands in everyday life. It also seems important for being able to imagine what distribution and consumption (and of course other moments in the circuit) involves. The moments in the circuit tends to draw the boundary too tightly around what is to be considered distribution and consumption. In the story of the carpenter it is not self-evident in which of the moments he belongs. From the perspective of the circuit he would probably be placed outside it, analogous to the way he is regarded to be outside the market. This, however, is only part of the story. The other part is that the carpenter is an effect of the brand. He is its unintended consequence, its monster. In order to include such unintended consequences into the circuit it would be necessary to add more dimensions to it.

Zooming in the collector's identity

Karin M. Ekström
Center for Consumer Science

karin.ekstrom@cfk.gu.se

Long abstract

The museum of Småland, also called the Swedish glass museum, arranged during the 12th of December 2004 to the 30th of January 2005, an exhibition when 24 private collectors of glass were invited to exhibit parts of their collections. The exhibition was called "Unseen", referring to unique glass in private collector's homes which neither the public nor the museum normally have access to. The intention with the exhibition was not only to focus on the unique objects, but also on the collectors, thereby symbolizing the relation between people and artifacts and the reciprocity which exists between them. Artifacts influence people and people influence artifacts. The interviews made for the museum catalogue (Ekström 2004) illustrate strong ties between the collectors and their collections. Collections can become part of the owner's extended self (Belk 1988). Possessions are not only part of the self, but can also be seen as instrumental for development of the self (Belk 1988).

The purpose with this paper is to discuss the collector's identity. Does such an identity exist? How is it formed in relation to the collector himself/herself and other people? When does a collector receive a collector's identity? More specifically, the paper focuses on how the collectors perceive their collections as well as themselves as collectors before, during and after the exhibitions had taken place. 24 in-depth interviews were conducted before the exhibition and two open-ended questionnaires distributed during and after the exhibition had ended, answered by 20 of the collectors. The study is part of a larger study on collecting of glass based on multi-sited ethnography (e.g., Marcus 1995). The persons interviewed, middle aged or older, belonged to a glass society. 23 of them were men and one was a woman who shared her interest with her husband (a few of the men shared their collecting interest with their wives). In five of the interviews, the wives were also interviewed together with the men. The interviews were semi-structured and each interview took approximately 1,5 to 2,5 hours. The interviews have been tape-recorded and transcribed. The analysis is based on reading and systematizing the transcripts and analyzing the questionnaires. Some preliminary findings are presented in this article. The collectors were anonymous during the exhibition. The results are also related to a previous study on a variety of collectors, including the author's reflections on collecting, after exhibiting their collections in another Swedish museum, Gävleborg museum, who

arranged a collector exhibition, "The collector's soul", during the 29th of May to the 17th of November 2002 when 36 collectors participated.

Collections are often highly private and it is of interest to highlight the transfer of the collector's glass objects between private and public spheres of activity. Maybe the collection is transformed after being displayed at a museum viewed and evaluated by collectors or non-collectors and related and compared to other collections? The views from the unknown public may affect the collector's perception of his/her collection as well as the image as a collector. For example, is the collection viewed as more romanticized, sterilized, profane, sacred or legitimized? Also, different rituals (e.g. McCracken 1986) related to acquiring, possession, and divestment may become affected after the collection has been exhibited. The collections in a museum are arranged in different ways than at home. For example, in a more abstract, scientific criteria, in glass cases, and with guards, all of which may mark a distance from the objects (Belk 1995). Collectors viewing their collections in a museum may or may not experience this distance to their objects. The results indicate that the glass objects were considered sacred in the people's homes before the exhibition and even more so after the exhibition. The exhibition reinforced the value of the glass collected as well as the collector's identities as collectors.

It was also found in the glass collecting study that there are collectors who do not consider themselves as collectors, even though their behavior show that they are collectors. It was also confirmed in the study of collecting at Gävleborg museum. It is possible that the word "collector" is perceived as too pretentious and results in that only serious collectors identify themselves as collectors (Ekström 2007a). The study at Gävleborg museum also showed that the exhibition made them feel proud of their collections and seemed to reinforce their identity as collectors.

The degree to which someone identifies him/herself as a collector is also likely to affect how the objects are displayed. The study of glass collectors showed that some of them gave the objects more prominent placement at home after the exhibition. The exhibition seemed to increase the value of the glass objects as well as affecting the perception of being a collector.

Belk and Wallendorf (1994) discuss that even though collecting can not be seen as inherently masculine or feminine, there are certain aspects which are regarded as such historically. They refer to aggressiveness, competitiveness, mastery and seriousness as stereotypical masculine traits and care, creativity, nurturance and preservation as feminine collector traits in western culture. Collecting aspects such as curating and maintaining have historically been considered feminine, while acquisition has been seen as a masculine trait (Belk and Wallendorf 1994). Also, the identity given collectors by other people seem to differ from the identity they give themselves. Collectors are sometimes described by others in terms of masculine traits. At the same time, collectors seem to describe their passion to collect as caring, preserving, nurturing and creative, traits which are commonly seen as feminine traits. The glass collecting study showed that both masculine and feminine images are performed in collecting.

Collectors represent a plurality of personalities, experiences and backgrounds. No single collector's identity exists. A collector's soul can not be captured, but is elusive. The wide-spread stereotypical identity as a collector appearing in fiction and mass media may diverge from how collectors perceive themselves. There is an ambiguity in identity as being developed based on both self-reference and dialogue with the societal context.

Future research needs to consider the difficulties people may have in articulating the meaning of collections. Ethnographic research is likely to contribute to our understanding of how people feel about their collections, their collecting behavior, as well as themselves as collectors.

Extended abstract

”Christmas summons images of family gathered around a decorated tree, of music and light and the comforting smell of a special dinner cooking on a snowy winter day [...] But is this the Christmas we actually experience? How many people standing in the line at the malls would say that their Christmas season is replete with warmth, affection, and neighborliness? In fact, Christmas is experienced by most adults as a time of intensified stress - - The result is often ‘holiday blues’ and even severe depression”. (Tracy, 2001)

Type the words “Christmas resistance” or “Christmas sucks” in the search engine, and you are instantly served with more than a million hits. Every year during the Christmas season, hundreds of people log onto the discussion forums to complain that Christmas has lost its meaning and degenerated into a senseless marketing frenzy. In this paper, we study these online anti-Christmas forums as sites of consumer resistance against the western materialistic consumer culture —and against the culture-ideology of consumerism (Sklair, 1998).

In most western countries, Christmas has arguably lost much of its spiritual import to materialism, hedonism, and commercialism (Belk, Wallendorf, & Sherry Jr., John F., 1989; Belk & Bryce, 1993; McKechnie & Tynan, 2006). Nevertheless, like other festive celebrations, such as Thanksgiving (Wallendorf & Arnould, 1991), Halloween (Belk, 1993) and Valentine's Day (Close, 2006), Christmas is full of meanings that derive from and lend to culture (Fischer & Arnold, 1990). All over the Western world, there are strong socially enforced rules for appropriate ways of celebrating Christmas. Such norms include the obligations of being filled with a “Christmas spirit” (Clarke, 2007), expressing love and affection with suitable gifts (Fischer & Arnold, 1990) and “doing the Christmas right” (Lowrey & Otnes, 2004) for example. These norms not only sanction appropriate behaviors for passing the holiday season but also more generally reflect what is valued in a culture (Dubois, 2002).

In this paper, we study how these cultural norms, values, and moral obligations, or cultural model (Thompson & Arsel, 2004), associated with Christmas, are reproduced, contested and negotiated in virtual ‘anti-Christmas’ communities so as to gain insights into the new forms of consumer agency and resistance that the new (global networks and) computer mediated environments have brought about. We approach cultural models as collective understandings of reality that shape individuals’ actions, conventionalizes certain social practices, and help in the internalization of certain discourses, role expectations and myths (Thompson & Arsel, 2004), some of the most profound of which concern social institutions such as marriage and family.

Based on a netnographic study, we argue that consumer participation in the Internet - based anti-Christmas communities represents a case of resistance against markets’ invasion of the private sphere and private spaces like the home (Kozinets, 2002). Our study illustrates how consumers use online discussion forums, blogs and communities to construct resistant identities, self-proclaimed “scrooges”, who resist the prevailing cultural model of Christmas—the “fake family Christmas” —and the materialistic values that it has been seen as representing.

Our study suggests that online environments provide these critical consumers with a site

not only for venting their frustration about the meaninglessness and falseness of Christmas celebration but also for anonymous and safe breaching of social standards. In the global networks of the Internet, consumers are able to congregate with like-minded people to collectively problematize and even reject the “sacred” but yet over-commercialized family Christmas without running the risk of being positioned as an outcast in their immediate social environments. In these communities, consumers are able to construct and explore new intelligible forms of identity as critics of Christmas.

The anti-Christmas sites of the Internet would thus seem to serve as alternative communities, in which consumers do their identity work to resist the undesirable forms of consumer subjectivity that the increasingly materialistic consumer culture offers them.

In general this research project seeks to gain insights into the new forms of consumer agency and resistance that the computer mediated environments have brought about. Overall we propose that online environments offer individuals a new type of flexibility in their identity projects, enabling them to occupy multiple subject positions simultaneously.

Our research also aims to contribute to the literature seeking to form a more multilayered comprehension of consumer resistance. We find that in order to form this understanding of the phenomena, the analysis of the explicit activism against the marketing techniques must be counterbalanced with an analysis of the techniques or practices of the self, or identity work, through which consumers construct alternative realities and forms of being.

Extended abstract

Drawing from cultural consumer research, we study ‘ordinary cosmopolitanism’ as a form of postmodern consumer subjectivity and cultural identity, and virtual consumer communities as sites of cultural production and mediation through which different versions of cosmopolitanism are produced and negotiated in the market. By means of an empirical study that focuses on Internet-based communities of ‘global travelers’, we elaborate on the role of Internet-based discussion forums as cultural intermediaries in the collaborative processes through which meaning is produced and value created in contemporary global and globalized consumer markets. Overall, the paper contributes to a better understanding of the new forms of consumer agency, identity and community that are brought about by the recent cultural and technological transformations in the global marketplace.

In contemporary consumer markets, territorial boundaries are becoming increasingly insignificant and it is ever more difficult to understand local or national consumption phenomena without reference to global forces. Consumers live in a “shrinking world” where transnational relations, networks, activities, and interconnections of all kinds transcend national boundaries (Giddens, 1990; Harvey, 1989). In the global marketplace

and under the conditions of globalization¹, patterns of human interaction, interconnectedness, and awareness are reconstituting the world as a single social space (McGrew, 1997: 65). The Internet and the new digitalized forms of communication, transaction and interaction, such as virtual/online communities, play an important role in these cultural transformations.

In this paper, we focus on this globalization of consumer markets and study virtual communities as sites where both consumers and marketers construct and negotiate particular forms of marketplace culture and consumer subjectivity. More specifically, we elaborate on the ways in which the members of the community draw from a discourse of ordinary cosmopolitanism in their identity work, and the forms/representations of (regimes of truth about) the global (political) society, humanity and identity of the global citizen this discourse sustains and gives rise to.

Cultural cosmopolitanism usually refers to a cultural disposition that involves an intellectual and aesthetic stance of ‘openness’ towards peoples, places, and experiences from different cultures, especially those from different nations (Tomlinson, 1999; Hannertz, 1990). Cosmopolitan consumers are “citizens of the world”. They are globally mobile and thus have broad experience of international environments and multicultural settings. Stereotypically, they feel at home wherever they go, moving comfortably within the standards of several cultures. Since cosmopolites are consumers who seek to broaden their horizons by immersing themselves in a breadth of local cultural experiences (Cannon & Yaparak, 2002) they are usually also assumed to respect and encourage cultural diversity, different lifestyles and cultural practices.

Cultural cosmopolitanism has traditionally been associated with diplomats and artists, or at least upper middle-class travelers, intellectuals and businessmen (Holt, 1998; Kofman, 2005; MacCannell, 1976; Thompson & Tambyah, 1999), i.e. professionals and experts of different sorts who spend extended periods of time living and working abroad. As a cultural category, cosmopolitanism therefore excludes migrant workers and refugees. As

¹ By globalization we refer to the intensification of worldwide social relations and interdependence, which is brought about by economic, political, technological, cultural, and social factors (Giddens, 2001).

a number of critical scholars have pointed out, the identity of the global citizen is a privilege that is reserved for modern, affluent global bourgeoisie and the privilege of those who can take a secure nation-state for granted (Kofman, 2005).

In the context of global virtual markets, however, we argue that cosmopolitanism as a cultural identity becomes accessible to much broader classes of ‘ordinary’, digitally literate consumers. In the virtual worlds and the global marketplace environments, practically anybody can assume the role of the global citizen or the citizen of the world. Based on an empirical case study (Stake, 2003) that focuses on Internet-based communities of ‘global travelers’, and by means of netnographic methods (Kozinets, 2002), we explore what characterizes this sort of “ordinary cosmopolitanism” (Lamont & Aksartova, 2002) in the global marketplace. Our data consists of naturally occurring textual data obtained from global online traveler communities and discussion forums.

Our goal is to analyze how ‘cosmopolitanism’ as a cultural identity and a form of consumer subjectivity, which takes different forms in different social and discursive contexts, is being produced and represented as a specific form of a postmodern consumer, or ‘post-consumer’, subjectivity (Firat & Dholakia, 2006). Drawing from cultural consumer research (Moisander & Valtonen, 2006) and extending Lisa Peñaloza’s theorizing on marketplace cultures (Peñaloza, 2000; 2001; Peñaloza & Gilly, 1999) to global online market environments, we analyze virtual consumer communities as sites of cultural production and mediation through which different versions of cosmopolitanism are produced and negotiated in the market.

Our study contributes to the literature on marketplace cultures (Firat & Dholakia, 2006; McCracken, 1986; Peñaloza, 2000; 2001; Peñaloza & Gilly, 1999) by exploring the intercultural market dynamics in global environments, and by elaborating on the nature of web based market environments and virtual communities as sites of cultural production and mediation in contemporary global and globalized consumer markets. Our study illustrates, in particular, how globalization as a standardizing force (Jameson, 1998) and a culture-ideology of consumption (Sklair, 1998), are being contested and negotiated in the collaborative processes of online networking and virtual communities.

Extended abstract

Drawing from cultural consumer studies (Arnould and Thompson 2005; Moisander and Valtonen 2006), this paper focuses on the mass-mediated marketplace ideologies and consumers' culture specific meaning-making processes. Specifically the purpose of this research is to explore how consumers discursively constitute and negotiate the notions and meanings of beauty, and make sense of their selves, using global advertising images as resources, and appropriating them to their own cultural, and sociohistorical contexts and identity projects. The aim of our study is thus to bring a cross-cultural perspective into the discussion previously centered on North American consumers and North American context.

We wish to position ourselves within the stream of consumer research which explores how cultural discourses are produced, maintained and contested within the markets. Some key assumptions of this line of research are that social reality and social order, or culture, are continuously being produced within the market by the marketplace actors (Moisander & Valtonen 2006); and that consumers are actively taking part in culture and markets by appropriating, negotiating and challenging the meanings given to products, everyday practices, and people, including themselves (Arnould & Thompson 2005; Firat and Dholakia 2006). So while marketers and advertisers may seek to “hand down” certain meanings to products and brands, or produce certain type of subject positions, individuals are also constructing their own, personalized meanings and identities drawing from their network of cultural resources such as social settings, mass media images and ethnic traditions (Thompson et al 1994). The individually constructed meanings however draw from, and are to some extent based on, mutual understandings shared in a culture (Kates & Shaw-Garlock 1999).

Culturally oriented consumer research has been interested in various socio-cultural processes related to consumer behavior. Within this paper we will focus¹ on the literature on construction of consumer identities (e.g. Thompson and Haytko 1997; Thompson and Hirschman 1995) and consumer’s meaning making, appropriation, and resistance processes of mass-mediated commercial messages and established cultural discourses or myths that are used as an explanatory framework for the social reality (e.g. Hirschman and Thompson 1997; Thompson 2004; Holt & Thompson 2004). The central constructs whose relationships we are exploring in this research are the cultural production systems, or the systems of representation (Hall 2003), especially through which the mass culture discourse predisposes and prompts consumers towards certain types of identity positions, and the consumers’ construction of their own meanings and identities in the midst of these predominant marketplace ideologies, and mythologies.

The overall goal of the research project is to explore how consumers discursively constitute and negotiate the notions and meanings of beauty from global advertising across cultural contexts. Our key research questions are: (1) *How Nordic consumers*

¹ For an extensive review on cultural consumer research see Arnould & Thompson (2005)

negotiate the notions and meanings of beauty by drawing from the global advertising images? (2) How are these meanings manifested as representations of beauty in the consumers' talk of beauty and consumption practices related to beautification? It is not in our objective to define or set any boundaries for the concept of beauty, but to explore how it is constructed consumer discourses.

In this paper we present a preliminary analysis of how Nordic female consumers contract and negotiate beauty through language by appropriating advertising imagery. Firstly, we would like to point out that the Nordic consumers can be conceptualized as well acculturated to the often Americanized media and popular culture, recognizing and being able to reflect on international advertising campaigns, identifying celebrities and evaluating their public images, and elaborating the advertisers' motives to influence the consumers.

Secondly, while this first round of analysis has not allowed us to fully immerse ourselves into the mythological resources that consumers draw from in their beauty readings, they were clearly informing the consumers' ways of understanding and sense-making of advertising images. The image of the Elovena-girl, for example, can be rooted all the way to the mythical female characters both in literature and in arts, such as Aino in Finnish national epic Kalevala and Akseli Gallen-Kallela's paintings. Therefore we wish to further emphasize the importance of embedding the study of consumers' meaning making processes to their own socially and historically specific contexts.

Thirdly, even this preliminary study illustrates, how a notion as commonplace as 'beauty' can disguise a concept that is very multilayered and fragmented; we are not only exposed to it, but we are 'doing' beauty in our everyday practices and talk. On the level of language beauty can be described simultaneously in multiple, even contradicting ways, which are, however, not mutually exclusive.

Ulrika.Torell@Nordiskamuseet.se

Abstract

This paper deals with the spatial dimensions involved in the consumption of sweet commodities, i.e. rooms and places for the commercial distribution of sweet articles 1850–1915. In a historical perspective places for consumption of sweet products have changed in radical ways. Before the existence of domestic beet sugar production in Sweden, sweet commodities were luxury goods, primarily available at the confectioner's shop. Today there is a widespread infrastructure for the distribution of sweets and sugar in our everyday life through convenience stores, mini-marts, cafés, vending machines, and supermarkets. How did the distribution of sweet substances spread and extend geographically? What social practices, ideas and values were generated in relation to specific places and sites that offered sweet products? A suggested study design will be discussed, and some preliminary results will be presented.

1. Introduction

Sugar on the Mass Market: Sweet Commodities and Cultures of Consumption in Sweden, from 1890 to the Present is the title of a research project recently started at the Nordic Museum/Swedish Institute for Ethnology in Stockholm, Sweden. It aims at exploring and shedding light on the consumption of sugar and sweet commodities connected to the breakthrough of the European and especially the Swedish beet sugar industry. The starting-point of the study is the mid nineteenth century when Sweden emerged as an industrial nation, self-sufficient in sugar in the 1890s, and continues into our times. The growing supplies of beet sugar generated a rising amount of new sweet articles, which in turn generated new

habits and ideas about how they were to be consumed. Gradually, as mass-produced chocolates, confectionary, lemonade, desserts, pastries and fancy cakes became affordable for growing numbers in an emerging consumer society, the use of sweet products took on different forms and functions. Today, they are highly integrated objects used for celebrations and ceremonies, for courting and rewarding, for relief and comfort, or as nourishment and sources of quick energy. Back then, however, the consumption of sugar and sweet products were novelties for the larger majority of the population. During a relatively short period of time the consumption of sugar increased dramatically. It rose from 3.5 kg per person per year in the 1850s to just about 35 kg in the 1910s – i.e. a tenfold increase and a historical increase with no counterpart in any other comestible or food item (Kuuse 1982).

These processes, the integration and assimilation of an emerging amount of mass-fabricated sweet articles into the cultures of everyday life, are of significant interest here, with an emphasis on the shaping of demand: In what forms and for what functions did the repositories of sugar hit the market? How were the sweet objects presented, re-presented? In short, how were these sweet novelties made meaningful to consume – how were they made worth demanding?

The overall purpose of the project is to identify values, meanings and functions that have come to be associated with the consumption of sweet products during the twentieth century. The focus is thus on *the production of meaning around sweet commodities*, which will be investigated from different material types such as artefacts, packaging, the representation of sugar and sweets in commercials, popular culture and more didactic and normative genres, e.g. nutrition books and health-promotion literature. Preliminary analytical themes to be further explored throughout the period under study are for instance ‘sugar as enjoyment and delight’; ‘sugar as comfort and medicine’; ‘sugar as food and nutrition’; ‘sugar as threat’.

This particular paper concerns the spatial dimensions involved in the consumption of sweet commodities, i.e. rooms and places for the commercial distribution of sweet articles. The aim is to consider the significance of ‘place’ in consumer culture and how spatial dimensions of consumption can be taken into account and studied in a fruitful way.

Questions of interest are: How did the distribution of fabricated sweet substances spread and extend geographically in the city over time? What consumption patterns and habits, ideas and

values were generated in relation to specific places and sites that offered sweet products? The relation between place and city function, place and social patterns, place and representation are key issues taken into consideration in this attempt to shed light on how a growing amount of mass-produced sweets was incorporated into the social and spatial realities of the expanding city. In the following, some preliminary results will be discussed, based on a recently started survey, mapping the places and shops offering sweet products in the city of Stockholm between 1850 and 1915.

2. Mapping the consumption of sweet articles in the city

In order to describe and map the commerce in products mainly made of sugar, the directory of trades and professions in the street directory for the city of Stockholm, every fifth year¹ between the 1850s and 1915, has been used (*Stockholms adress-kalender för år 1855*, etc.). Accordingly, the main commercial supplies of sweet articles, such as chocolates, sweets, and all sorts of confectionery, were primarily offered to the citizens by the confectioner. Furthermore, the street directory also lists other relevant professional categories such as ‘chocolate-makers’, ‘pastry-bakers’ and ‘candy-makers’. In addition and most likely, the gradually and ever-growing numbers of shops for groceries and victuals, among other things, also offered mass-produced sweets, candy and chocolates, displayed in glass jars on the counters. In this defined pilot study, however, such places for consumption of sweet substances are not included, other than with reference to numbers or to the general development of the commercial milieus in the city.

The first period, 1855–1885

In the mid nineteenth century some 50 shops producing and offering sweet articles were noted on average in the street directory, a number that would stay relatively stable in the thirty-year period to come. At the same time Stockholm underwent an extraordinary expansion. The residents redoubled and the city itself extended, with a peak in new construction in the 1880s (*Statistisk årsbok 1905*, Gejvall-Seger 1982).

1850s:	40 shops	93,000 inhabitants
1860s:	50 shops	120,000 inhabitants
1870s:	51 shops	150,000 inhabitants
1880s:	51 shops	200,000 inhabitants

Confectioners of Stockholm

The listed sites selling sweet products were mostly (80 per cent) situated in the very centre of the city. The lion's share of these (80 per cent, again) consisted of confectioner's shops, especially at the beginning of the period. Geographically, Stockholm was a relatively divided city throughout the nineteenth century, with five rather isolated districts separated by water. First, the oldest part, henceforth called the Main City (Stadsholmen) was a fully developed and densely populated district. Second, the expanding northern part, Norrmalm, which together with the Main City made up the commercial and administrative city centre with most of the residences for the wealthy bourgeoisie. Third, Södermalm in the south, also an expanding area with a less wealthy population. Finally, the eastern part Ladugårdslandet (later Östermalm) and the western part Kungsholmen, which at the time were relatively untouched, less populated districts with scattered buildings, workshops and military establishments.

Fig 1. Stockholm in the mid 1850's, with the distribution of shops in different town districts

Thus, by location, the supplies of sweet articles were associated with milieus and spaces representing wealth and a prosperous, bourgeois urban way of life. The confectioner's shops are mapped out along the most fashionable commercial streets, like Drottninggatan and

Regeringsgatan, as well as in neighbourhoods in the city centre inhabited and frequented by the well-off and well-born. In 1865, for instance, almost thirty cafés run by recognized confectioners spread over the central lower parts of Norrmalm and the Main City. There were Lutteman, Stenberg, Lindqvist, Sundell, Roffler and Berns in Drottninggatan, and Berg, Sundell, Schmidt and Hagström in Regeringsgatan. Situated in the busy bazaar at Norrbro, bridging the Main City with Norrmalm, was the well-known café ‘Pavillon du Bazaar’, run by the confectioner de la Croix. The café was referred to as a meeting place for the well-known citizens, providing delicacies and foreign newspapers in ‘salons magnificent decorated’ with chandeliers and mirror glass, shiny furniture, marble tables, murals and flower arrangements (Bolin 1944).

Fig 2. Confectioners' shops noted in the street directory situated in the central parts of the city (Norrmalm) 1857

The confectioner's shops were also situated close to parks and areas laid out for promenades, recreation and amusement in the city centre. Popular cafés were located, for example, at Strömparterren, an area for strolling by the waterside in the city centre, in Kungsträdgården and in Berzelii Park in Norrmalm. Davidson's café at Svenska trädgårdsföreningen (Swedish Garden Association) in Drottninggatan offered 'all articles belonging to a confectioner's shop' and entertainment, such as 'Concerts à la Musard'; waxworks with moving figures or the 'Alpine singer Johan Kettel with companions' (Sjögren 1923).

Providing some kind of entertainment or amusement in connection with serving sweet products seem to have been a characteristic feature of the confectioners' shops during the period studied. At Thörnblad's café there was, for instance, a self-playing piano; several others had billiard tables; yet others arranged conjurer's performances, Punch and Judy shows etc. The confectioners held enterprises in the city's theatres and the opera house, but many set up places of amusements of their own which in time became recognized and famous establishments, such as Berns Salonger, de la Croix's Salon at Brunkebergstorg, Brunkeberg's Casino, or Novilla with a popular winter garden and a variety theatre at Djurgården (Bolin 1944, Tjerneld 1996, Magnusson 1937).

Pastry-bakers, female hawkers

Another professional category offering sweet articles in city was the pastry-bakers. They were female hawkers, a traditional profession in pre-industrial Stockholm, and for a long time one of few legal opportunities for women to earn a living. The hawkers either moved around or had a permanent market stall, offering home-made pastries and sausages. According to a study by Bladh (1991), most of them lived in the poorer districts of town. In the directory of trades and professions pastry bakers are noted as a distinct category between the beginning of the 1860s and 1885, referring most likely to the ones with a permanent booth. They were noted in the city centre, although not at the most fashionable addresses, as well as in the poorer neighbourhoods. Contemporary accounts depict them offering 'sweets to the gentlemen, pastries to the ladies, and fruit syrup out of a never-ceasing carafe' from booths located in the main streets and promenades of Stockholm (Carlsson 1912). Their appearance in the 1860s as a special professional group in the street directory was probably a consequence of the new liberal commercial legislation that came into force at the time. Consequently, the numbers of female hawkers offering various goods increased enormously (Bladh 1991). Again, at the turn of the century they decreased in numbers concurrently with the transformation and reconstruction of the city, involving the demolition of old permanent booths in the centre (Carlsson 1912).

Sweetshops and representation

The next step in this study, after having mapped out the sites offering sweet articles and identified the character of the neighbourhoods, would be to carry out a closer and more systematic examination of the shops themselves, as a space and a material basis for consumption. In the 1870s a new type of shop developed in Stockholm as techniques of

construction made it possible to build and rearrange a shop in the ground floor independent of the upper parts of the building. Girders and cast-iron columns were used to erect and enlarge the sales room, in turn making it possible to enlarge the shop windows and design new entrances (Paulsson 1972, Bergman 2003). A new street aesthetic of commercial display was developed in Stockholm as in other European capitals. Elegant luxury shops served as popular meeting places for high society in the urban landscapes of Paris and London. Wolfgang Schivelbusch describes how the new social role of the shop was also reflected in their interior design. Shop owners made their sales rooms look like reception rooms in a palace, using rare woods, marble, glass and mirrors (Schivelbusch 2003). In Stockholm the interiors of the shops developed in the same way, starting in the clothing trade, with shops for fine handicrafts and luxury goods. Thereby, a new type of commercial street came into shape where the growing numbers of new articles and mass-produced commodities were displayed and illuminated on glass and mirrors. Shop interiors for essential goods, however, remained unchanged (Paulsson 1972). Very likely, sales rooms offering and serving sweet articles traditionally belonged to the well-decorated type of shops, considering the location of confectioners' sales rooms and cafés in the commercial main streets of Stockholm at the time. In comparison, when Regent Street was actively designed as a shopping street in London, cake shops, confectioners, and restaurants were allowed to set up in business, since they were 'fairly luxurious': well-decorated fashionable lounging places for the great and titled people (Rendell 1998). Another example from the eighteenth century of luxurious shop-fitting was a London confectioner who spent £300 on furnishing, while the stock was only worth £20 (Schivelbusch 2003).

Representations of these emerging semi-public places and milieus of Stockholm in the nineteenth and early twentieth century, i.e. verbal and visual depictions of social life in and about the cafés, are to be found in various sources and empirical materials such as advertisements, the contemporary press, prose and documents on cultural history. Above all, an inventory will be undertaken of the rather large collections of photographs at the Stockholm City Museum and the Nordic Museum, documenting the city and its urban life. Key issues to deal with in relation to such visual representations are the spatial arrangements and the spatial organization of consumption. What did the rooms and sites offering and serving sweet articles look like? How were they arranged and decorated? How were the goods presented, in combination with what? This involves systematically tracing the material and physical conditions for offering and consuming sweet products, and identifying the social

implications and significance. What associated ideas, functions, norms or values manifested themselves in the spatial dimensions of consumption?

Fig. 3. A Ladies café in Stockholm 1912

One concrete example of spatial organization with such implications of including and excluding is the categorization of cafés for ladies and for gentlemen. Several confectioners' shops in Stockholm were referred to as 'ladies cafés', and some had particular 'ladies rooms', for example Hellbacher's café in one of the main commercial streets in Norrmalm; Oscar Berg in Regeringsgatan; Schütz's and Sundell's cafés in Drottninggatan. In late nineteenth-century cafés and department stores there were examples of spheres where it was socially accepted for bourgeois women to stroll on their own, without chaperones. Socializing in the cafés stretched the limits of their legitimate freedom of movement in public, although it gave rise to moral judgements and conceptions about women gossiping, wasting money and threatening the stability of the family life (Sjöberg 1998).

Yet other cafés were referred to as male spheres, such as Lagerlunden in the Kungsträdgården park, and Strömparterren often frequented by officers and other male homosocial groupings (Tjerneld 1996). Some again had a special 'smoking department' – an area for male companionship, since smoking in public at the time was entirely a male habit: de la Croix's in the Bazaar at Norrebro and Grafström's in Malmskillnadsgatan among others.

According to Sjöberg the gendered milieus in cafés and department stores at the turn of the century differed regarding interior fittings and decorations. Soft, curved forms of neo-rococo style were applied in the female rooms, while the heavier Renaissance style, as well as an oriental design, characterized the male ones (Sjöberg 1998).

A systematic description of the sites for the distribution of sweet goods, including the hawkers' booths, could reveal further exclusions and inclusions related to gender, age and class, in short, reveal the social implications, norms and values associated with the consumption of sweet products in the emerging urban public spheres.

To sum up, between 1850 and 1885 sugar consumption started to rise slowly, on a national average from 3 kg to 8 kg per head per year. Sugar prices fell some 25 per cent, due to the development of the European beet sugar industry (Kuuse 1982). In Stockholm, however, the commercial sites manufacturing and serving sweet articles were relatively constant, both in numbers and in patterns of location. The doubling of inhabitants in this period did not principally affect the urban cultures of consuming sweet products in any significant way. Sweetstuffs were distributed in the fashionable commercial and recreational districts of the city, in places associated with pleasure, leisure time and a bourgeois semi-public social life. In that sense, the consumption of sweet articles was ritual, regularized, excluding large parts of the population in Stockholm living under conditions of chronic undernourishment and starvation throughout the nineteenth century (Hirdman 1983).

The second period, 1890–1915

During the following period, the 1890s to the 1910s, the population doubled again, from 200,000 inhabitants in the 1880s to 400,000 in 1915 (Ahlberg 1958; *Statistisk årsbok* 1916). And now the numbers of shops offering sweet articles doubled as well. An explanation for this development that presents itself immediately is the progress of the Swedish beet sugar industry which had its breakthrough in the 1880s. Sugar prices started to drop, reached the lowest level with a reduction by some 40 percentage points in 1895, after which prices stayed stable till the end of the period under study (Kuuse 1982). At the same time, consumption rose dramatically, from a national average of 13 to 33 kg sugar per person per year (ibid).

1890s:	72 shops	270,000 inhabitants
1900s:	81 shops	320,000 inhabitants
1910s:	98 shops	400,000 inhabitants

The city was continuously reshaped and enlarged. New buildings, blocks, squares, esplanades and districts were built. The eastern part, Ladugårdslandet, was transformed into Östermalm, a fashionable district with luxurious and expensive estates. Norrmalm extended to the north, where the Vasastan district developed. New housing areas were also erected in Södermalm and Kungsholmen (Franzén 1992, Gejvall-Seger 1982). Trade and industry grew and the economic expansion affected the urban topography. The commercial centre was expanding to the east and new main streets stretched from the busy Norrmalm to new crowded parts of lower Östermalm. Trade in food and provisions were the most expansive line of business in Stockholm with the largest number of firms and employees (Gerentz 1999). At the turn of the century new firms ceased to be set up; instead, the already established business grew bigger in terms of size, sales and numbers of employees (ibid.). This trend is also evident in the sweet business. The same confectioners set up several different cafés, especially the ones who had established firms in the city centre, or firms in the new fancy commercial streets.

The principal pattern from the previous period, with the confectioners' shops located in sites associated with the fashionable social and commercial life of the city, remained. In the 1910s almost 30 per cent of all the confectioners' shops and sweet shops in the city were to be found in the new wealthy district of Östermalm. At the end of the period they also spread in numbers in the expanding north parts of the city, the new district of Vasastan.

During the second period studied, the numbers of candy-makers increased, most likely as a consequence of the falling sugar prices. Setting up candy production for local distribution was not a very complicated or expensive enterprise and it was relatively easy to shut it down (Dahmén 1951). Most of the candy-makers' businesses were located in the two districts of Södermalm and Kungsholmen. In other words, cheaper, less elaborate, supplies of sweetness (in the form of fabricated candy) were distributed in the less well-off parts of town.

Fig 4. Stockholm in late nineteenth century, with the distribution of shops for sweet commodities in different town districts 1890-1915

3. Conclusion

The main point in this sketch of work in progress has been to discuss the spatial dimensions of an emerging mass consumption of sweet articles in the late nineteenth century. How did the supply of new sweet products spread in the urban landscapes, how was it manifested and integrated in the material and spatial cultures of the growing city? In the volume *Images of the Street: Planning, Identity and Control in Public Space*, Nicholas R. Fyfe and others explore how streets as specific, local landscapes manifest broader social and cultural processes, emphasizing the meaning and significance of urban space in relation to social identities and social practices (Fyfe 1998). Following this perspective the key issues in the study outlined are to explore how conceptions, values and functions associated with sweet articles were shaped in relation to the places where they were offered and served. That means focusing on how social practice and consumer patterns were shaped by the organization of space, by a spatial order.

A preliminary study design has been suggested, where the main professional categories fabricating and offering sweet articles are identified and mapped out in the city; the characters and contemporary qualities associated with the sites and streets are to be noted; the exterior design and interior fittings of the shops and sales rooms are to be scrutinized, as well as how

the localities were represented, visualized and talked about (mainly based on photographs and advertisements). The study will thus chart the sites offering sweet articles in relation to the social, cultural and commercial geography of the city.

Consumers as citizen – Do consumers value a landscape?

A case study of the importance of cultural landscape in big environmental construction projects

Abstract

The task of this paper is twofold, first to explore the importance and meaning given to cultural landscape in the big construction projects and second, to study how much landscape matters for the consumer/citizen. Our case study concerns a big artificial ground water system which is intended to be built in Kangasala in Southern Finland, in the village and esker of Vehoniemi by the lake Roine, a village which is famous for its beautiful sceneries and landscape. The results show a gap between the minimal role of landscape in the planning process and the high significance of landscape to the citizen. For citizen, it represents a public, cultural good with which people associate specific memories, stories, history, and cultural artefacts and which therefore becomes important for local and national identity and distinction.

1. Introduction

Consumers' perception of public goods has seldom been studied from the viewpoint of the imaginary and subjective. However, environmental issues and 'places' often include aspects that have a deep cultural meaning for consumers (e.g. Porteous 1986, Jackson 1989, Urry 1990, Lash & Urry 1994, Uusitalo & Jyrämä 2001, Scott 2002). The meaning of places to the consumer has earlier been taken up in the framework of tourist attractions. In contrast, this paper will explore the cultural meaning of a visual 'home' landscape to the citizen-consumer.

Local environmental movements have been active in trying to save natural surroundings for environmental reasons. The rationale used in the reasoning and argumentation is that one has to act for the sake of natural rights, nature preservation or plant and animal variety. It is claimed that nature has intrinsic value, and should be 'altruistically' defended regardless of what the human preferences are. However, many studies on collective and cooperative behaviour show that active participation and commitment to common goals is more likely if the consumer-citizen – in addition to the public good – also receives some private benefits from his/her activity (e.g. Uusitalo 1990).

Therefore, it is interesting to study what kind of emotional, nostalgic or cultural values are involved in the environmental disputes about the destruction of landscapes, and how important are visual and cultural aspects in motivating people to environmental activity. Pollution has been noted a factor influencing people's wellbeing and happiness, but do the proliferating industrial construction and

artificiality in natural environments have any impacts? One can see nature as equal to natural resource, as is often the case in big construction projects, but another way to view it is from the deep-ecological, aesthetic and ethic point of view. In these approaches impacts on environment are defined quite differently (Vilkkä 2007).

The objective of this research paper is twofold: first to explore the importance and meaning of the cultural landscape in the big construction projects and second, to study how much the landscape matters for the consumer-citizen. Our case study concerns a big artificial ground water system project called *Tavase*, which is intended to be built in Kangasala in Southern Finland, in the village and esker of Vehoniemi by the lake Roine, a village which is famous of its beautiful sceneries and landscape.

2. Background theory – the concept of landscape

Landscape as a word was first mentioned in the Bible in the Psalms, where the beauty of Mount Zion, a high hill, was praised as a place where God is (Kontturi 2000, Antturi 2006). As a concept landscape came on the scene actually with the Romantic Movement in the 18th century.

Descriptions of landscape became common in the literature and visual art. In the German sphere "Landschaft" did first mean a special area with borders on the map, but later, for example in the works of Alexander von Humboldt, the word adopted also aesthetic and visual meanings.

Landscape was defined in the terms of the geography by J.G. Granö *as a visual environment of a man, including both a far view and a near view*. This view preserved its position at least in Finland during the first decades of the 20th century (Granö J.G. 1929, Granö, O. 2002).

In the Finnish classification of landscape schools the tradition based on Granö's thinking was called Physiognomy perspective. Later on, in 1960s and 1970s, increasing pollution and misuse of the environment focused the discussion on environmental and ecological issues. Landscape was seen as an entity where land, water, flora, fauna and human activities were effective factors in the ecological system. This school was called Ecological school. Following this development, the ministry of environment was founded in 1983. The Landscape Architecture School was born in 1980s along with the increase of landscape planning in which the structure and form of the landscape was important. In this, ecological balance had more weight than purely aesthetic aspects. Finally, the Humanistic school perceives landscape, region, place and environment as a subjective experience. The beauty and aesthetic aspects are valued highly in this tradition (Kontturi 2000).

Consequently, landscape can be studied from various approaches. It can be studied as objective reality, subjective experience, or cultural representation. The objective approach operates with the land forms, the subjective with the contents of mind, and the representative with the symbolic meanings of language. They all exist in parallel. Therefore several researchers consider it as important to study simultaneously the physical reality of landscapes and the ideological commitments linked to them (e.g. Cosgrove 1985, Jones 1991, Duncan & Ley 1993, Karjalainen 1996, Raivo 1996).

In economic consumer theory landscape can be defined as a public or common good. It can be compared with artworks in the public places. Landscape can also be analyzed in the frame of marketing and product concepts. Landscape's 'product attributes' or benefits for the consumer-citizen are, for example, aesthetic experience, pleasure to different senses, strengthening of identity, and giving social and cultural distinction to the inhabitants. Landscape can be linked with both instrumental and terminal values (Kotler 1991, Jyrämä 1999). The landscape is experienced with many senses, both mentally and bodily. People's relationship to the landscape is continuous and embodied in different activities and narrative experiences (Arnould & Price 1993, Crouch 2000).

In Finland the whole countryside and forest landscapes have traditionally formed mentally a common good already on the basis of the so called everyman's rights. Perhaps therefore also Finnish landscapes are generally perceived as a common good in a more extensive meaning than in the EU on the average (Everyman's rights at <http://www.environment.fi> 2007). Consequently, many well-known natural landscapes in Finland are perceived as everyman's 'own' cultural heritage and property, and destroying them touches citizens and their feelings not only on the local level but also at the national level.-

Cultural approach

The rapid change of landscapes has awoken the need to consider the concept more thoroughly and from several points of view. The so called cultural turn, taken place also in the field of geography and marketing, has emphasized the importance of non-material, symbolic goods, among them landscapes and environments in general. Moreover, along the present view of seeing the consumer as an active part in the production process, the consumer-citizen's right to be heard has been emphasized (Raivo 1997, Uusitalo 2005, Moisander & Valtonen 2006).

Seen from a cultural point of view, landscape is based on a system of signs, it is an output from a process of creating meaning and significance. This process is part of the societal signifying system where cultural reality is produced and reproduced. Representations do not refer only to the physical reality of the landscape; instead landscape is a representation of the observer's interpretations, based on his or her conscious and unconscious values and choices (Jackson 1989, Karjalainen 1996, Raivo 1997).

Landscape is physically spatial and mental at the same time. The experienced landscape is often biographic and narrative in which the subjective history of the observer is present. Landscape has a role in our identity; the "self" is being formed of our memories, including memories and emotions associated with the landscapes.. These cultural elements combined with aesthetic preferences form the basis of our relationships with places or landscapes (Kyrklund 1985, Porteous 1986).

National landscape and national identity formation in Finland

Landscape has a role in forming national identity. What kind of typical features are included in the Finnish national landscape? The often used picture of a national landscape is a landscape seen from a high place over lakes and forests (Häyrynen 2005). In national romantic literature of the 19th century, we find for example Franz Mikael Franzen, Johan Ludvig Runeberg and Zacharias Topelius who described the national landscape and created the image of Finland in their poetry and writings. Through their writings, also the esker and lake landscapes of Kangasala have become elements of the Finnish identity (Topelius 1845). The well-known song *A Summerday in Kangasala*, composed by Gabriel Linsen to the poem of Zacharias Topelius, has made landscapes of Kangasala an icon of the Finnish summer. Of the first authors writing in Finnish, Aleksis Kivi and later, F.E Sillanpää have also strongly contributed to the ways how Finns see the visual landscape and construct the Finnish identity. In visual art and music the Finnish masters of the so called Golden Age had strong impact on the national landscape and Finnish identity e.g. Eero Järnefelt, Akseli Gallen-Kallela and Albert Edelfelt as visual artists, and Jean Sibelius, Fredrik Pacius, Carl Collan, Gabriel Linsén, Oskar Merikanto and P.J. Hannikainen as composers (Tiitta 1994, Nervander 2001).

Landscapes play a role for the identity and image of the nation but also of the local places. In the 1980s the utilization of natural resources and the massive tourism plans threatened some of the most important landscapes in Finland; and some of the valuable landscapes had already been destroyed as result of stone quarry and gravel taking. Therefore it was nationally necessary to develop tools for the protection of most important landscapes and sceneries.

The classification and appointing process of the national landscapes started in 1980 by the Landscape Committee. It defined as nationally valuable all representative and unique landscapes which have significance in the literary descriptions of our country and are part of our common knowledge. Further, also most known tourist sites were included, through which the Finnish landscape had become known abroad. They could be natural or cultural landscapes, and they included our most known sceneries and landscapes such as Aavasaksa, Pallastunturi, Koli, Vuokatti and *Vehoniemi in Kangasala* (Häyrynen 2005, Landscape committee report 1980). This classification and appointing work continued later and was guided by the Ministry of Environment which published lists of nationally valuable landscapes. These lists are still being used in environmental impact assessment of the projects for justifying or objecting changes.

One well-known environmental conflict concerned Koli, a famous iconic hill and lake landscape in Northern Karelia, which during the economic boom in the end of 1980s was planned to become a target for massive tourism housing and ski construction projects. The dispute ended by founding a protected National Park area in 1990. Tourism did not loose in this conflict despite of the protection decision. It only had to take another direction which is more in balance with the landscape. In 2000 a Nature Centre with an exhibition hall displaying the natural values of the area was opened in Koli (Rannikko 2007).

Traditional landscapes, referring to landscapes born as an output of traditional ways of land use, are disappearing along the changes in agriculture. To them belong both traditional biotopes and constructed traditional landscapes. Traditional biotopes can be fields, leas, meadows, beaten lands, paddocks, moors and pastures. To the cultivated and constructed traditional landscapes belong agricultural landscapes and villages as well as historical buildings and constructions with their near surroundings and relics. (Landscape protection and management at www.environment.fi 2007)

Local landscape experience and identity

Relationship to a place is different among inhabitants than among professional planners and politicians. The inhabitants live in a place concretely, and for them the place has emotional and existential dimensions. Experiences have an affect on the relationship to the place. Both individual and collective conceptions have impacts on the image of a place (Karjalainen & Paasi 1994, Karjalainen 1995, Vilkkuna 1997).

Identity of a place is often described with the concept *genius loci* or *spirit of the place*. It refers to experiences and emotions that form a character or personality of a place, which makes it distinct from all the other places. Spirit of a place is linked with the landscape, dialect, people, history, stories, songs, poems, dances, and local food. It can be felt with all senses. Therefore, also the concept *sense of place* is used when describing people's landscape perception, their involvement and commitment to it (Antikainen 1993, Brandenburg & Carrol 1995, Lukkarinen & Waenenberg 2004, Leikola 2002). Moreover, it has been claimed that local places – cities or other local places – could act as an important counterpart to economic globalization (Uusitalo & Jyrämä 2001). Local places provide social and cultural capital needed for a meaningful life, and local identities act as buffers against the worldwide standardization and unification of lifestyles.

Official information about landscapes, for example included in the Geographic Information System, is different from the local tacit knowledge of people. Concerning the cultural dimension of landscape the official information is poor. The local information which is based on traditions and practical experiences is often needed to complete the official public view on landscape planning. Therefore, many land use professionals nowadays consider traditional, local knowledge valuable and welcome in the planning processes (Raivo 1997, Salmi 2001, Puustinen 2004). In contrast to this, citizens active in local environmental construction conflicts are easily still labelled NIMBYs. With this *Not in my back yard*-syndrome is referred to attitudes of local inhabitants defending their

near environment against unwished construction projects, often assuming that it is an expression of self-interest only (Dear 1992). However, this label does not take into account the deep dimensions of inhabitants' experience. Experience of immediate surroundings is a fundamental right linked with the identity of the inhabitant. Thus, the wish to protect the *own* is a stronger issue than mere seeking for *own self-interest*. People can even be ready to offer their economic self-interest, if they can save a common good which they have become to think as their 'own' in the sense of something being a part of their identity (Uusitalo 1989, Nevanlinna 2000, Peltonen 2004).

Future consumerscape and landscape

Economic theory assumed a rational consumer who primarily tries to maximize the economic utility. However, later consumer research sees the role of consumption more broadly. Consumption is a way of self-expression and social communication, and a way to express one's social commitments and ethical values. The farther off consumption has moved from the necessary toward the discretionary spending, the more important individual, social, and cultural meanings have become in consumer theory. Moreover, consumers are more often than before also conceptualized as citizens who consume immaterial and common goods and trade off between private and public goods. In the future, non-material goods such as environment, safety, cultural togetherness and meaningful activities will be emphasized. Consumers are seen also as responsible co-producers of these common goods and general well-being (Uusitalo 2005).

New groups emerge in the field of consumption all the time; not only around the brands such as Nokia, Harley-Davidson, Nike etc. but also around shared ideas, interests, and life cycle stage (hiking, fishing, bird-watching, local pro-environmental activity). In these groups, the commodity 'consumed' consists mainly of non-material ideas rather than material products. Some of these movements can also be interpreted as a wish for a more simple way of life in which the overburden of options is voluntarily reduced (Solomon 2003).

We can conclude that the present-day consumerscape has broadened to include many non-material, imaginary goods and common goods. One of them is landscape and the emotional attachment to it, especially if the landscape is an important part of the consumer-citizen.

3. Empirical case study

Objectives of the case study

Our objective is to explore the importance of the landscape in big public construction projects and study the landscape experience of the inhabitants.

Our case project is a plan for a big artificial ground water system *Tavase* (The artificial ground water project of Tampere and Valkeakoski) which - if being realized - will have a strong impact on the cultural landscape at Vehoniemi village, a nationally valuable esker and lake landscape. According to the plan, a massive pumping plant will be placed in the bay of the lake Roine, from where the water will be pumped up to the esker which is used as a natural cleaning filter, and rained down there with the help of a large plastic pipeline systems. The infiltration areas will cover broad areas of the esker. By going through this esker filter the water will be transformed into artificial ground water, which will again be pumped up from several water reservoirs and sent further through pipelines to Tampere and other municipalities in a large area.

The idea to produce artificial ground water is very old. The system was known already in 19th century. The idea of *Tavase* project was thus born much earlier, but the project started in 1990s with explorative research. Explorations were made for example in Pinsiönkangas northwest of Tampere, and in Pälkäne and Hattula southeast. Finally the decision was made to place the project on

Vehoniemi esker in Kangasala and Isokangas esker in Pälkäne. Vehoniemi esker came latest into the agenda.

In the following, the importance of landscape is first studied by looking what is said about landscape in Finnish law and European convention. Thereafter we will explore the documents of our case, the ground water project in Vehoniemi, especially paying attention to its environmental impact assessment report. Altogether the study was limited into 6 documents: 4 documents were from the EIA procedure, one administrative planning document and the brochure of the Tavase project published after the EIA procedure. (the analyzed documents are listed in Appendix 1).

After reporting the results of the analysis of the documents we report main results of a survey, which was conducted among the local people to find out what the landscape means to ordinary people. We were more interested in studying their relationship with their home landscape in general, not only as connected with the ground water project. This helps us to understand more broadly why inhabitants can be unhappy with any kind of construction projects in their home landscape or well-known landscapes in their home country.

Legal frame of landscape issues

What kind of obligations toward landscapes are there according to the law and common rules? An umbrella covering all regulations is the Constitution of the Republic of Finland, especially its paragraph number 20. In addition, there are many other laws including statutes concerning landscapes. Consequently, the main issue is not the missing of regulations but rather the traditional ways to interpret and apply the laws in practice. The outcome for landscapes depends on the values and attitudes prevailing in society (Ekroos 1995).

The main law for nature and landscape is the Law for nature protection. The protection decisions are mostly made on the basis of this law. The aim of this law is to preserve nature's biodiversity, to take care of nature's aesthetic and landscape values, to support sustainable use of natural resources and nature environment, to disseminate information and knowledge about nature, and to promote nature research. Landscape is also mentioned in other laws; land use and building law, water law, extractable soil resources, archipelago, wilderness, and forests laws, and in the environmental impact assessment law (EIA). The last mentioned law and how it is applied in practice is especially important in large construction projects. The problem from the landscape's and nature's point of view is that the main responsibility of impact assessment is given to the management responsible for the intended projects (EIA, www.finlex.fi/fi, 2006).

According to EIA, the impact assessment procedure concerns projects that may have significant environmental impacts. All alternatives should be evaluated and compared. The procedure is controlled by the contact authority, the regional environmental centre. Everybody concerned with the project or those whose private interests the project can be injured may participate in the procedure.

The process starts with a so called assessment program done by the project responsible and handed to the contact authority, who informs about it publicly. Contact authority gives his statement to the project responsible, who studies the environmental impacts on the basis of the program and authority's advice and writes a report of the environmental impacts. In this report, the impacts of different implementation alternatives should be represented in order to compare the alternatives. Also the way to handle negative impacts should be represented. The contact authority informs about the report, allows a possibility for opinion expressions, and finally gives the statement of the report and a summary of received statements and opinions to the project responsible.

The Ministry of Environment has published rules and checking list to help the impact evaluation. (Guidelines for EIA at www.ymparisto.fi, 2007, Kansalaisen tietokortti at www.ymparisto.fi, 2006) The ministry also strives to increase citizen interest and participation in

impact assessment procedure and encourages citizens to get acquainted with the impact report and to note especially that the alternatives have been examined comprehensively and equally.

European landscape convention

There are several international conventions relevant for the landscape. The most important is the European landscape convention which was signed in 2000 and came into force in Finland 1.4.2006. The convention emphasizes the significance of landscape and the necessity to take it into account in various public projects.

The convention refers to the principles of sustainable development. It states that landscape has an important public interest role in the cultural, ecological, environmental and social fields. The landscape contributes to the formation of local cultures and it is a basic component of the European natural and cultural heritage, contributing to human well-being and consolidation of the European identity. The landscape is important part of the quality of life for people everywhere. The convention also states that developments in different fields are in many cases accelerating the transformation of landscapes, and express the wish that the public could enjoy high quality landscapes and play an active part in the development of landscapes. The signatories agree that the landscape is key element of individual and social well-being and its protection, management and planning entail rights and responsibilities for everyone. The 5th and 6th article give detailed information e.g. on how to integrate landscape in regional planning and various policy fields (European landscape convention at www.finlex.fi, 2006).

4. Landscape's role in the project documents

Tavase was founded as a company in 2002 by nine municipalities around Tampere and Valkeakoski (Kangasalan kunnanvaltuuston päätös, www.kangasala.fi, 2006.) The brochure of the company states that "in years 1994-1999 explorations were made (e.g. exploring ground water, absorption tests) for using the esker area of Vehoniemi-Isokangas to produce artificial ground water. The exploring pointed out that this esker area is suitable for this purpose" (Suunnittelukeskus 2003, Tavase, www.tampere.fi, 2007).

The landscape had no role in the *Tavase* planning process before the environmental impact assessment (Jauhia 2006). Vehoniemi esker was seen merely as a significant ground water cistern. Gravel stories would be suitable for soaking the water. The place of the esker between Tampere and Valkeakoski and on the shore of Roine was good. The bay of Hiedanperä situated well as to the pipelines to Tampere, it was open place without any buildings and on the edge of a wide field area where digging is easy. In all, despite environmental law and the European convention were encouraging to think of environmental and landscape values, the documents show that the project was treated as a technical matter, in other words, whether it was technically feasible or not to use the lake and esker for ground water creation.

The impact assessment documents tried to describe also landscape attributes as exact as the law requires, but from the consumer-citizen point of view, some essential information about Vehoniemi were missing: the fact that it was mentioned in the maps as a valuable landscape scenery area, the Vehoniemi nature protection area was mentioned but not the landscape value of it, the rank of Vehoniemi as one of the national landscapes (in the Landscape committee report in 1980), and the cultural environment program of Kangasala in 2004 were not given any attention. And the European landscape convention was not mentioned.

As stated earlier the EIA law is problematic when giving the main responsibility of impact

assessment to the project. Evaluators are not independent professionals, and the voice or views outside the owners' network are seldom heard. Also in this case, the documents used as references in the evaluation report did not include material concerning landscapes or their history, and among the evaluators there were no experts of landscape, culture or history. The special expertise fields reported were social issues, flora, hydrogeology, groundwater modelling, water supply, water processing and artificial groundwater systems. From outside was requested statements concerning radon contents, marsh and grove flora, subsurface drainage, agriculture etc.

The expressions mentioning landscape impacts give an impression that they are very minor. If the impacts seemed to be significant in absolute measures, a percent measure was used and the per cents were calculated of something big, e.g. of the whole esker. The following expressions were typical: landscape changes a little bit, the impact is minor, or the impact is local. If the evaluator has come to the result that there will be some negative impact, it was added how the impacts are intended to be decreased. The following examples are taken from the report's summary:

Impacts on landscape: Impacts in the esker area remain local. In lake and coastal areas the pumping plant and sign-boards will cause wider but quite small impacts.

Impacts on valuable landscape areas and cultural heritage: Impacts exist mainly during the construction.

Impacts on Vehoniemi Natura2000 area: The esker flora changes or disappears at maximum by 4 % subsequent to the project. The change cannot be considered as significant.

- *Impacts on other protected nature values:* Hiedanperä forest will be somewhat splitted. However the most valuable part of the area will remain. The project has no impact on other protected objects in the area."

Critical readers can also notice that the comparison of placing alternatives is not in balance. The criteria and objects change from one alternative to the other. Landscape does not exist as a criterion in the comparison. The comparison presents the project as the only realistic alternative. This is against the recommendations of the Nordic Guide for Cultural Environment: there should exist also alternatives which favour cultural environments. (Nordic Minister Council 2002). It can be concluded that landscape was neglected altogether in the report, or when mentioned the overall evaluation of landscape impacts was that they were non-significant.

In the other documents studied landscape was not mentioned, although the landscape as it is now was displayed in the cover picture of the project brochure. In the statement of the regional authority, the environment centre, the main attention was paid to the problem whether the system would not function in a way the project owner planned. The authority represents a new alternative for the project, in which it should be divided in two areas. The impacts of pipelines, land use plans, long term impacts on the ecosystems of the esker (e.g. the problem of organic ingredient which gradually reduces the soaking capacity of the esker), and rare plants of the lake are taken up. It is also stated that the project seems to have many impacts on the living conditions of people. The statement says that disadvantages concerning landscape are concentrated on the construction of the pumping plant in Hiedanperä bay. Also feedback from the 14 organisations includes 4 statements paying attention to Hiedanperä and the place of the pumping plant. In the citizen's feedback 7 of 13 statements paid attention to the place of the pumping plant.

The concern of the authority and the citizens about the (unsuitable) placement of the pumping plant may reflect some deep worry about the landscape values. However, in a broader sense landscape is not dealt with directly. For example there is no reference to the image of the region as one of the highly valued national landscapes, or to the loss for village inhabitants if their traditional natural landscape will change radically.

5. The meaning of landscape to local people – A citizen survey

To find out the meaning of landscape to the local people we conducted a survey covering inhabitants in Vehoniemi village, where most of the plant constructions will be placed.

Vehoniemi is an old village situated in a cape by the lake Roine. The old dense village model dates back to the 16th century. The new village housing has been placed along the road to Pälkäne on the southern side of the esker and around the road to the island villages. The bay between Vehoniemi village cape and the esker is called Hiedanperä. It has very low water with fine sand. Hiedanperä coastal forest is protected for homing a very rare bird. The open coast area holds a status of a traditional biotope and is treated by sheeps. Between the coastal area and the esker there are fields serving normal agriculture.

Information was gathered with a questionnaire sent by mail or handed personally. Totally 238 questionnaires were sent out to inhabitants, to summer residents and to the people who regularly visit the village or stay there for holidays. Response percentage was 53,8 %. In individual questions the percentage could be lower. The survey was conducted in May- June 2005. The percentage of response could have been higher if the survey had been timed for June-July; many of the summer residents do not come to their summerhouse before July. On the other hand, the survey answers now represent better the permanent population.

The questionnaire consisted questions concerning landscape in general and landscape preferences, the owning of landscape, experience of and interaction with the Vehoniemi landscapes , and about Vehoniemi as an object of the artificial ground water system. One question was devoted to the image of Kangasala.

Most of the questions were studied with a Likert type scale 1 – 4 (1=not important – 4=very important). Several questions were also open-ended questions to be answered with own words.

Background of the respondents

Both men and women were equally represented (women 58 %, men 42 %). The respondents' age distribution was the following:

Over 65	60 -65	53 -59	38 -52	20 -37
20.5%	19.7 %	18.9 %	20.5 %	20.5 %

A town was the permanent home environment by majority (60 %). One third of the respondents were permanent all-year inhabitants of Vehoniemi. The various employee groups were represented as follows: farmers/entrepreneurs 20,1 %, employees and workers 35,5 %, students and unemployed 12,1%, and retired 32,3%.

The character of interaction with the landscape of Vehoniemi was studied in relation to regularity, duration and quality. The finding was that people have a regular and steady interaction with the village. Inhabitants or former inhabitants were 41 % of the respondents, 54 % characterized themselves as regular visitors.

Results of the citizen survey –The meaning of landscape and landscape preferences

When respondents were asked to think about their own home landscape and rank its importance on a scale 1-4, the home landscape was felt very important among 81 % and quite important among 18 %. Similar results have been received from other studies as well (Scott 2002).

Perception of landscapes in general was studied with a question whether there is any landscape that has especially stayed in mind during the life. Response came from 69 %. People did not only mention one or several landscapes, but they described their landscape often with the expressions of experience. Majority of the landscapes mentioned were Finnish landscapes, but landscapes from abroad were also mentioned. An example:

”Sogndal in Norway in 1974 – seen from the esker perspective, I was embarrassed the whole winter; what impressive mountains, how could they even exist? But Sogndal had the same elements as my favourite landscape in Finland; water, trees and a high place.”

The highest rank was given to Vehoniemi. It was mentioned recognizably in one third of responses. Descriptions were many. The name Vehoniemi or Hiedanperä, lake Roine or any other place in the village or esker was described. An example:

”When coming along the village road until the edge of the forest you may see an utmost fascinating landscape opening over the fields and the lake Roine.”

Also other Finnish esker landscapes were mentioned by name: Punkaharju, Koli and Syrjänharju. Several landscapes in Lapland were represented too. In addition to Roine also other lake landscapes were noticed, Saimaa as an example. Sea, river or field landscapes were also mentioned, they numbered 14 together. Also phenomena in nature like sun rise or sun fall were described as well as the feelings felt in the landscapes.

What elements do people like in a landscape? The 12 elements or types of a landscape were given to be scaled 1 - 4. Lake, forest and esker were evaluated to be the most important elements in the favourite landscape (Table 1). Highly rated were also the untouched natural landscape and an open view. Respondents extended the list with their own elements, and among them, home and nature animals, birds, air, and river were mentioned. Also the balanced entity of a landscape was noticed.

Table 1: Most important elements in a favourite landscape (N=128)

Favourite landscape elements	Very important %	Important %	Somewhat important %	Not important %	Cannot say %	Average	St.D
Lake, shore	82,8	11,7	5,5	-	-	3,773	.53558
Forest, trees	58,6	28,1	11,7	0,8	0,8	3,430	.79053
Untouched natural landscape	50,4	29,3	17,9	1,6	0,8	3,268	.86908
Open view	43,7	32,5	18,3	5,6	-	3,143	.90963
Esker	42,2	32,8	23,4	1,6	-	3,156	.83654
Natural field	39,5	33,9	22,6	3,2	0,8	3,081	.90703
Village road	35,7	33,3	21,4	8,7	0,8	2,944	.99844
Cornfield	34,6	35,4	25,2	3,9	0,8	2,992	.91284
Forest road or path	34,4	30,5	28,1	6,3	0,8	2,914	.97227
Open view from road or autostrada	18,9	36,9	23,0	18,7	2,5	2,508	1.07754
Buildings, church	17,2	24,6	36,1	18,9	3,3	2,336	1.07266
City/town view	2,5	14,0	33,9	46,3	3,3	1,661	.85199
Some other,	28,9	36,8	2,6	2,6	28,9	2,342	1.63205

Relationship to Vehoniemi and Hiedanperä: Landscape with memories

Hiedanperä is well-known, familiar place to the respondents. The interaction has been long-lasting, 81 % say that they know the place since the childhood or for a long time. Hiedanperä bay area landscape does not just mean seeing a view. People go there for different reasons. Most important reason was interaction with nature “observing the nature, just to be in peace of nature” (35 % of the respondents), almost as popular was walking or exercising, swimming and riding. Picking flowers or mushrooms, fishing, enjoying free time, working, swimming a horse, admiring landscape, remembering childhood memories and representing the area to the visitors coming from Finland or abroad were other reasons to go there.

Landscape is culturally constructed. It is seen through one’s own history. In the landscape the old memories live together with today’s experiences. People who have lived in the same environment and have experienced important moments there, can share similar experiences. When respondents were asked whether they have an important memory or a person linked with Hiedanperä in their mind, 63 % of them told one of several memories. Important personal events linked with the landscape. Most of the memories related to excursions and visits to Hiedanperä, and often linked with one’s own childhood where grandparents, parents, aunts, uncles or other children were there. A bridge over generations was typical to the memories. The landscape had been experienced as a child with the grandfather, then with own children and later on with grandchildren. The fine sand of Hiedanperä was often mentioned. The stories and memories of different people show that this landscape includes meaningful personal histories:

“when I rode a bicycle in order to visit maternity clinic in church village there was a wire over the path, because of the horses or cows in the field - I fell down – my son was born at home without midwife” - (researcher’s note: the home of this lady was on an island of the lake Roine from where she had rowed and from the Hiedanperä path to the clinic it was still 10 kilometres left.)

Songs of the landscape

The broader culture-historical content and the identity of a place was studied with a question, whether the Vehoniemi landscape does bring any song or songs to one’s mind. At least one song was reported by the majority (64 %). Most of them mentioned the same song *Summer day in Kangasala* (Topelius, Linsen). Many respondents considered this song to be self-evident, it is about the landscape. Also many other songs were mentioned (15 altogether). They tell about the Finnish nature and express patriotic or spiritual emotions. In these songs Kangasala, Häme (the province) and Finland become living. The closeness to these songs among the Vehoniemi people is understandable because many of these songs or their poems have been created in Kangasala region or they have been inspired by its landscapes. (All the songs that respondents listed are in Appendix 2).

Overall image of Vehoniemi

To form an image profile of Vehoniemi on a semantic scale people were given 13 pairs of characteristics and they were asked to evaluate them on a scale of 1 -7. The resulted profile shows that the beauty of landscape is strongly associated with Vehoniemi. The highest profile values were given to two characterization of landscapes: *beautiful landscapes* and *belongs to the nationally valuable landscapes*. Vehoniemi is also considered to be peaceful, it respects the past and understands aesthetic values, is positively oriented, and protects nature. People consider the village being reasonably well managed, cooperative and paying attention to the future generations, too. It is considered more *traditional* than modern. Comparing the profiles by women and men, the only

statistically indicative difference was in the pair *beautiful – not so beautiful* women giving higher grades to the beauty of the place. Perhaps men pay less attention to the aesthetic aspects. The familiarity with the landscape was found to increase its value. In this case people seem to consider Vehoniemi as a national landscape, exactly in line with the Landscape committee in 1980. (The profile is displayed in Appendix 3).

Perceived changes in Vehoniemi landscapes

Do people notice the changes of the landscape and do they consider them positive or negative? To find out attitudes to landscape changes the people were asked to think about Vehoniemi landscapes from so long time as they remember. They were asked to describe if the landscapes have changed and in what way. The big majority responded that there have so far not been changes or that the changes have been positive because they had been considerate to old village buildings. The landscape damages caused by gravel taking were mentioned. Many changes mentioned were caused by the change in agriculture, its methods, tools and production directions. The plastic balls on the field instead of hay sticks were noticed. The fallen trees had been noticed as changes in village or in near forest. New technology had brought a mast in the landscape and traffic noise had increased.

Concerning specially the shore landscape it was regarded that there has been no change or the changes have been positive. Changes noted were the number of summer houses which had increased. The number of parking places on the shore had been increased, and the water surface had lowered causing changes on the shore landscapes.

We can conclude that Vehoniemi has so far been saved from major changes, and people are very perceptive of all changes in their surroundings and pay attention to them.

Perceived losses and gains from the ground water project

The artificial ground water project has faced local resistance. Therefore we wanted to find out what are the main reasons to the opposition. People were asked which things they feel are weakening if the artificial ground water plant would be realized. 84 % informed different weakening issues. The question gave a possibility to answer with several weakening issues. The 20 in top on the weakening list were 1. beautiful landscape, 2. peaceful little place, 3. beautiful nature, 4. old culture, 5. good outing and boating circumstances, 6. ecosystem of nature, 7. peace in nature, 8. spirit of the place, 9. real country life, 10. occupations, especially agriculture 11. swimming and fishing 12. groundwater, 13. roots in Vehoniemi 14. living 15. human rights 16. attractiveness of the village 17. trust on Kangasala 18. basements of houses 19 nature 20. Hiedanperä .

The question of strengthening impacts (by which the researchers referred to positive consequences) the most common answer was "Nothing would be strengthened". As 'strengthening' factors were also mentioned all kind of negative developments such as noise, disquiet, traffic, cold values, merciless destroying, feeling of beauty disappearing, insecure reactions of nature, landscape destroy, rape of nature, disturbing plants and animals, problems in water quality, weakening of the lake, drying of pits and wells, irresponsibility of the decision makers, unconcern, weakening of agriculture occupation, outsider influence on the village. Some positive consequences were also mentioned such as the possibility to clean groundwater supply and sewerage systems, temporarily the feeling of togetherness (in opposing the project), money and jobs to the village, and better care of the cleanness of the environment.

In trading off between the two public goods, getting good drinking water for inhabitants in Tampere and Valkeakoski and building the pumping station in Hiedanperä, the answer of people in Vehoniemi was clearcut: water supply is not a sufficient reason to build the pumping station in

Hiedanperä., only 6 % considered it sufficient and 7 % could not say.

In all, people in Vehoniemi see the ground water project overwhelmingly as producing merely losses, the most of them connected with the unique landscape, nature and peacefulness of the region. According to the free word given to respondents, there are also deep doubts against the functioning of the water systems. The whole system was felt to be needless and it was felt to be planned in a wrong place.

The respondents also defended their right to decide about the landscape. According to their opinion, the decision making about the landscape belongs to the inhabitants (93 % agree) and to the landowners (86 %). The attitude toward decision making of the municipality or the province was more reserved. More than half of the respondents were of the opinion that in the Tavase decision making the voice of inhabitants was not heard at all. Instead they felt that the best heard voices were Kangasala municipality and the Pirkanmaa province.

The impact of the ground water project on the ‘brand image’ of whole Kangasala municipality

The landscapes of Kangasala have been famous through the centuries of the history (Topelius 1845), and the image of Kangasala is strongly linked to its many eskers and lakes. Kangasala has benefited from this history in its marketing and in increasing its attractiveness for business firms, inhabitants, and tourists.

Respondents were asked to evaluate how well the Tavase plans are in harmony with the launched imago. The results in Table 2 show that especially the visions 1, 3, 6 and 7 are in conflict with the Tavase project. These conflicting visions are very much landscape-focused.

Table 2. The perceived conflict between the Tavase artificial ground water project and the official visions lounghed by the municipality Kangasala. N=128

Artificial water project is in harmony with the following vision	Not at all	Quite badly	Quite well	Very well	Cannot say
1 In Kangasala – on the highest branch! (song)	74,4	14,9	0,8	0,8	9,1
2 People and enterprises possess the newest knowhow	22,3	32,1	21,4	5,4	18,8
3 Clean nature, safe and ejoyable environment offer to inhabitants the best place of the city area and many refreshing possibilities starting from home door	56,4	28,2	5,1	1,7	8,5
4 Fundamental services exist that help in everyday life	32,5	30,7 5	15,8	3,5	17,5
5 Successful enterprises strengthen economical base and offer jobs and services to the inhabitants	31,9	27,6	20,7	4,3	15,5
6 Landscapes famous nationwide, fascinating history and unique cultural life create experiences, bring visitors to the Summer Day Parish	70,6	16,0	3,4	4,2	5,9
7 Summer starts in Kangasala! (The slogan of Kangasala)	57,6	20,3	5,1	6,8	10,2

6. Conclusions

In sum, we can compare the official planning documents with people's own ideas. Based on the analysis of documents we can conclude that, in municipal decision making, the concept landscape and its value to people is still a very rare phenomenon, and it is not used to guide or justify practices.

On the principal level, landscape and its cultural values are officially recognized in environmental law and European conventions and agreements. However, these principles have not yet penetrated the practice of project planning and justification. For example, the Environmental Impact Assessment law has improved the attention paid to the nature diversity and conservation. But it is seldom used to enforce studies on cultural consequences or symbolic consequences to the inhabitants, the region or the state, and their identities. The gap between technology and culture seems to be very deep indeed, and much have to be done to find out how these two worlds could be integrated (e.g. Heiskanen 2004).

The public discussion around the new projects is as technically oriented as before, and the opinions of the inhabitants are often being heard at a too late stage when there is no possibility to change the course of action. Neither have citizens resources to evaluate the alternative options and make economic comparisons. The present planning system does not take advantage of the tacit knowledge and feelings of people concerned. A drawback is also that since the project management is given the main responsibility of exploring the consequences, they tend to downplay the opposing facts and overvalue the positive aspects of the project. Also they choose which alternatives are chosen and to what extent they are analyzed for comparison.

The survey results show that landscapes in general but particularly the home country and local landscapes are important non-material goods for the well-being and identity of the consumer-citizen. The generally most preferred features of the landscape in our data were: lake, forest, esker, untouched natural sights, and open views. The peace, clean water and air, and the well preserved village and roads as well as traditional country views were also associated with the good landscape. An important finding was that one's own experiences, memories and historical stories from earlier years are very closely associated with the landscape. Earlier findings support our idea that landscapes represent a reserve of stories and life histories (Massey 2005, 2006, Rolston 2007, Carrier 2007). People engage in and make sense of their environments. As memories are bound to the landscape, people may fear that they lose something of their identity, if the landscape is radically changed.

But landscapes are important not only for the sake of personal memories and identities. Landscapes also perceived as a common good important for integrating people with a community or nation. In our case the region and the very place of the planned project has also nationwide cultural significance. This is expressed in the many cultural artefacts associated with this specific landscape.

Thus, consumer resistance against radical environmental changes should not only be interpreted as issues of aesthetic taste. Instead, the changes of the landscapes touch deep emotions and adopted cultural identities. This claim is supported by our finding that the landscape is very easily associated with literature and poetry. In our data, surprisingly many different poems and songs were spontaneously cited and associated with the home landscape. Consequently, visual aesthetics, literature, music, nature, and history are all closely intertwined in experiencing a landscape.

On the basis of the results we suggest that the impacts on landscape should be included in the environmental impact assessment of large construction projects. This seems to be essential from the

consumer-citizen point of view. It would also bring a significant local knowledge to benefit the project planning. The implications for consumer policy is that public, non-material goods are indeed becoming increasingly important for the citizen, and new ways of including cultural meanings in the public discourse and decision making are necessary. Moreover, the study shows that consumer culture theory should be broadened from emphasizing not only the importance and study of the symbolic signs of the marketplace, but also include natural and urban landscapes as an essential part of consumer identity in the future consumerscape.

The world we inhabit is full of different odours, tastes, textures, sounds and visuals. When we move from one space to another, use different product and brands, meet different people, and engage in different consumption practices, we also engage in using all the five sensory fields. The appropriation of sensory fields – that is culturally patterned and conditioned - play a crucial role in the way cultural meanings and values become produced, sustained and shaped in contemporary consumer culture. As David Howes, a leading scholar of sensual anthropology, points out: “[Sensation] is the most fundamental domain of cultural expression, the medium through which all the values and practices of society are enacted” (Howes 2006: xi). Both anthropological studies and business studies have discussed how sensory fields may be structured and invested with meanings in many different ways across cultures and market contexts. That is, the way people use their senses varies from context to context and market to market both in terms of the sensory priority and in terms of sensory sensitivity. As Edward T. Hall has pointed out “people from different cultures not only speak different languages, but, what is possibly more important, *inhabit different sensory worlds*” (1966: 2). Hence, in the advent of globalisation and mobility – and the increased number of different sensory worlds people encounter - the topic of senses and sensory environment becomes more and more important in many regards.

Despite this, in the emerging research tradition on consumer culture, little theoretical and empirical attention has been paid to the richness of sensory elements in contemporary consumer culture, except in the context of “experience economy”. Large majority of cultural consumer scholars have followed the dominant audio-visual model in their investigations, and the Western hegemony of vision, in particular, prevails in the body of research. Although audio-visual elements are obviously crucial and striking in contemporary consumer culture, to focus merely on them in is to ignore other vital sensory fields of cultural elaboration. We argue in this paper that the dominant audio-visual model comes to offer a rather limited view of the ways in which the world is inhabited, enacted, and made meaningful. Our wish is to bring all the senses into the academic discourse of cultural consumer research and in so doing to develop a better understanding of the ways in which senses play a part in the creation of particular social realities. We maintain that it is only when a form of sensory equilibrium has been recovered, that we may begin to fully understand how cultural meanings and social order becomes enacted and mediated in the marketplace.

Extended Abstract

To meet this aim, this paper works towards a cultural approach to senses. To get a better grasp of sensory elements in consumer culture we draw on, and bring together, the theoretical and empirical contributions of (sensual) anthropologists, and experience economy scholars, who have brought the topic of senses at the fore of academic investigations. Moreover, we lean on the increasing research on servicescape for theorizing the interaction between the consumer and consumption environment. At the core of our theoretical perspective is the notion of *sensescape* that offers insights to the dynamic interaction between consumers and their sensory environment comprising of visual, auditory, olfactory, tactile, and gustatory domains. The notion of *sensescape* refers, in other words, to the constellation of sensory domains with which consumers interact when they move and inhabit the scape in question.

This perspective, we suggest, can give us a distinctive understanding of how senses play a part in the production of meanings in particular consumer settings and how this is shaped and enabled by available cultural discourses and practices. We are hence not interested merely in the sensuous features of a consumption context, the sounds, and savours of a café for instance, but we wish to work towards an in-depth examination of the social and cultural significance of the sensory fields. That is, we aim to explore how each sensory domain functions also an arena for structuring social roles and interactions, expressing self, creating and enacting temporality and spatiality, and negotiating a particular social order.

To empirically investigate *sensescape*, we take up the task of developing methods, techniques and practices through which sensual aspects may be fruitfully explored, documented, and analysed. Drawing on, and advancing, recent ethnographic developments in marketing and consumer research, and the developments of new ethnographic varieties such as *nethnography*, *videography* and *visual ethnography*, we develop a methodology called *sensual ethnography*. It leans on the basic ethnographic principles and methods, but accords a particular *focus on all the senses* in the site under study. It is, in particular, interested in the *interplay* of the senses. While a major part of earlier studies on senses have considered each of the five senses in turn, as though sight, hearing, smell, taste, and touch each constituted a completely independent domain, we are interested in the entire mixture of the sensory fields, and what kinds of mixtures are available in different consumption settings.

In concrete, we conduct a systematic empirical exploration of one particular *sensescape*: an outdoor environment, or wilderness *sensescape*, and the activity we focus is sports fishing, troll fishing more specifically. We suggest that this environment and this activity are rich of examples of how the interaction with the sensual environment can be at the core of the consumption process. With the help of this empirical work, we address the general question of how *sensual ethnography* can be developed and how it can be useful in advancing investigations on consumer culture.

This article first briefly presents an overview of previous studies on senses in various disciplines. The overview brings to light the historical development – and the limits of – the audio-visual model of cultural analysis and of the psycho-physiological research tradition often applied in studies on senses. Then, the article turns to elaborate on more detail the theoretical and methodological perspective of the study at hand, that is, the *sensescape* and *sensual ethnography*. The paper also offers a sensory narrative that is based on the empirical fieldwork. In the concluding part, the article discusses how the insights gained through this perspective might enable to rework and advance current understandings of consumer culture. It focuses, in particular, on elaborating consumer policy implications that are manifold due to the wide range of ethical and political issues involved in the design, management, and

Extended Abstract

consumption of sensescapes. The nature and quality of everyday sensual environment is arguably crucial for the wellbeing of people, and therefore, if we combine the task of exploring sensescapes with an effort toward its improvement, we are engaging to a rather stimulating intellectual, aesthetic, and socio-political adventure. One particular domain that would benefit from a more thorough understanding of the role of senses is the nature-based recreation; a domain that is growing fast worldwide.

Consumer Policy and Consumer Society: The Need for a Cultural Turn

A work in progress

Paper for:
Nordic Consumer Policy Research Conference
Helsinki October 3-5, 2007
Theme 4, Consumer Culture

Introduction

Theories of consumer behaviour have changed over the past decades. A development that moved from the frivolous and defiant motivational research in the 1950's (e.g., Dichter 1960) to the rigid and formalistic behaviourism in the beginning of the 1960's (e.g., Kotler 1965) and ended with the information processing perspective in the late 1960's (e.g., Howard & Sheth 1969). In the 1970's information processing and cognitive psychology became the dominant theoretical framework in consumer research (e.g., Bettman 1979). In the beginning of the 1980's information processing and cognitive psychology was more or less synonymous with consumer research. Several consumer researchers began to see the limitations of a theoretical framework mainly based on information processing and cognitive psychology (Hirschman & Holbrook 1981). Holbrook and Hirschman (1982) were the first to publish an article questioning the information processing paradigm as dominant basis for consumer research.

“The information processing model regards the consumer as a logical thinker who solves problems to make purchasing decisions. The information processing perspective has become so ubiquitous in consumer research that, like fish in the water, many researchers may be relatively unaware of its pervasiveness (Holbrook and Hirschman 1982, 132).”

Here we see what a paradigm does to a research community: The theoretical basis is no longer seen as something which was chosen at a certain point in time, but instead it is perceived as the only way to study a phenomenon. Holbrook and Hirschman and later a handful of other researchers then questioned information processing and cognitive psychology as the only framework for the study of consumption. This movement was later labelled “the interpretive turn” by Sherry (1991), because it looked like it was the interpretations which connected this kind of research. Today, the same

movement is labelled Consumer Culture Theory (CCT) by Arnould and Thompson (2005), since it is now obvious that it is not the interpretive methodology which is the connecting theme, but instead the common interest in developing theories about consumer culture.

Consumer policy is in many ways connected to consumer research, but there has not been a similar development in consumer policy. Over the last decade there has been an opening towards the use of qualitative methods. Nevertheless, the theoretical framework is still the same, and the consumer is perceived as an information processing and utility maximizing individual who values the functional aspects of the products. For a long time it has been obvious that consumers subscribed to other attributes than function when they consume a product. Already Sidney Levy opened his classical article: “Symbols for Sale” (Levy 1959) with the vignette “The consumer is not as functionally oriented as he used to be – if he ever really was” and he stated later: “People buy things not only for what they can do, but also for what they mean ... The things people buy are seen to have personal and social meanings in addition to their function” (Levy 1959, 118-119). Since then, but especially from the mid 1980’s on, a growing number of consumer researchers have recognized the symbolic and aesthetic aspects of consumption. In sociology and the humanities this has been common knowledge for a long time (e.g., Veblen 1899/1970, Simmel 1901/1957, Boorstin 1962, Baudrillard 1970/1998). Today this classical knowledge of consumption is integrated into consumer culture theory, but it does not seem to be a part of the common knowledge in consumer policy. Hence, it is the objective of this paper to analyse the theoretical framework of CCT and show how this frame of knowledge could be integrated into consumer policy. We think consumer policy will have to add these new insights to the common curriculum if consumer policy wants to have a role to play in the future consumer society. We will not give direct advice to what consumer policy should do, but instead deconstruct the present knowledge in consumer policy and attempt to show how the field

could gain new insights from consumer culture theory. This should enable consumer policy to take on its important role in a society where consumers need more help than ever.

Theories of the Consumer Society

Outside the fields of marketing, consumer research and consumer policy there is a long tradition in understanding the rationale for consumption as much more than the functional aspects of the commodity. Marx talked about the fetish character of the commodity and the commodity as social hieroglyph (Marx 1867). These conditions were seen as a result of alienation. Marx recognized the non-economic aspects of the commodity and consumption. However, he thought that these conditions were only a temporary state connected to the capitalist system and he believed it would perish in the communist society.

Veblen (1899/1970) was also very critical towards the non-economic aspects of consumption, although not from a Marxian point of view. Whereas classical economics define humans as rational, utility-seeking people who try to maximize their pleasure, Veblen described them as completely irrational creatures that chase after social status. He saw the strive for social status as the dominant driver in society. It was Veblen's idea that people consume goods only to show their status. Veblen perceived this kind of consumption as lavish and irrational, coining the term "conspicuous consumption". Despite his critique of this wasteful consumption, Veblen recognized this kind of behaviour as a part of the society of his time. He criticized the classical economists because they could not understand this kind of consumption due to their narrow theoretical foundation. Veblen's ideas later inspired the common term "keeping up with the Joneses".

Simmel (1901/1957) wrote about fashion which is one of the main phenomena in consumer society. Simmel recognized the strive for social status as a reason for consuming fashion. Simmel did not think fashion and thereby consumer society will fade away. Fashion and the behaviour behind this phenomenon are seen as result of the fundamental changes in Western societies. In this upcoming society human beings are no longer directed by the church and life in the village, but are individuals living independently in cities. For Simmel fashion and thereby the consumer society have to be understood as something which is filling out the gap left by the diminishing importance of the church and the life in the village. By consuming fashion human beings can at the same time be individuals and member of a group who have the same aesthetic preferences. Simmel did not see any route back to a society where human beings are governed by the church or an economic rationality where man is utility maximizing. Therefore, Simmel was not critical towards fashion and the society where this kind of irrational behaviour is taking place, but he commented on this development with a heavy load of irony. Simmel was among the first to acknowledge the new cultural conditions where consumer society is taking over the vacant institutions from former cultural conditions.

Adorno and Horkheimer (1947/1982) were among the first ones to see the emerging consumer society created by a culture industry. They conducted a critical analysis of the impact of the development of consumer society and they perceived it as a very negative development of society. Years later, Boorstin (1962) made a similar, but more conservative, analysis of consumer society and the culture industry. Like Adorno and Horkheimer, Boorstin saw the culture industry as something that produces pseudo events and alienation. Baudrillard (1970/) went a step further and described the so called pseudo events as the real thing. Later on Baudrillard (1976/1993) developed

the concept of hyper-reality for this kind of phenomenon. Since then most theorists have given up the idea that phenomena created by the culture industry are only pseudo phenomena.

Today the consumer society is analysed from different perspectives. For instance from a sociological point of view by George Ritzer (1999) in *Enchanting a Disenchanted World: Revolutionizing the Means of Consumption* where it is described how consumer culture has an impact on all institutions in society. Ritzer draws some of the same conclusions as Simmel when he analyses the enchanting character of consumption. The modern world as seen by, e.g., Marx and the classical economists is from Ritzer's point of view a disenchanted rationalized society and consumption is a tool by which this culture is altered and enchanted. According to Ritzer (1999) we have left behind the rational utility maximizing consumer.

Kenneth J. Gergen (1991) analyses the same idea from the individual level in his book *The Saturated Self: Dilemmas of Identity in Contemporary Life*. He argues that people living under today's cultural conditions are in a constant process of constructing and re-constructing the self by consuming. Gergen is showing how the self no longer can be understood solely by using a cognitive psychological perspective. Instead, the individual is in a permanent process of re-constructing an identity often based on consuming different objects.

There were no reasons for the individual to put all the effort in constructing and re-constructing the self, if it was only for his or her own sake. It has to be communicated to the others and the individual consume the images constructed by the other members for the society. Stuart Ewen (1988) analyses this in his book *All Consuming Images: The Politics of Style in Contemporary Culture*. For Ewen (1988) we are living in a world of images and the main reason for consumption

is the creation of a certain image, both for the sake of one's own and of others. These images are not constructed accidentally, but are produced by companies to create an aura around their product – with branding and story telling being the most common forms. The rational utility maximizing consumer has vanished and even the functional aspects of the products have disappeared in favour of the image a commodity can create for the consumer.

In Mike Featherstone's (1991) book *Consumer Culture & Postmodernism* all these different aspects of consumption and consumers beyond the economic man are accumulated into a framework where the consumer society is transformed into a consumer culture to show that consumption has become the foundation for our culture. Featherstone (1991) tries to develop a sociology of the postmodern culture and he concludes that consumption is the most important tool when people try to create a meaningful life. Due to the importance of consumption both at the individual level and at a cultural level the meaning and the image become the dominant features when it comes to evaluating the reasons for buying and consuming a commodity. It is here essential to get beyond the consumption of the single commodity and perceive the commodity at the cultural level, since it is here that the single commodity gains its meaning in the interplay with the other commodities. At the cultural level it is even more obvious that the most important attributes connected to the commodity are the aesthetic dimensions. Featherstone defines this as the aestheticization of everyday life. It is the core idea of the consumer culture. It is the reality when most the objects we are surrounded by are branded and designed. In a Western European context we are in the middle of this. For Featherstone this leads to new ways of separating groups in society. It is no longer sufficient to focus on either class, demography or psychographics. The new parameter is taste and here we are dealing with aesthetics. In a way this new cultural condition creates the opportunities for real life *style* groups where it is the aesthetic dimensions that separate them from each other. To be able to understand

these cultural conditions in our society we have to add new theories to the traditional ones of economy and cognitive psychology.

Consumer Society Reflected in Consumer Research

It can be argued when cultural conditions of the consumer society were reflected in marketing and consumer research for the first time. One perspective on this is the work of Dichter (1947, 1949). His work can be critiqued from different angles, but clearly Dichter focused on dimensions in the consumption process neglected by the majority of marketing researchers of his time. Dichter's motivational research was mainly based on Freudian psychology and was rather narrow in its theoretical perspective. Nevertheless, Dichter tried to study and understand the non-economic dimensions of consumption. By relying primarily on Freudian psychology the single individual was the focus of this research.

It was not all the motivational researchers who were relying on Freudian psychology and the single individual when they tried to understand the non-economic dimension of consumption. Sidney Levy was among those who had another focus. Although Levy was aware of the psychological dimensions of consumption, he perceived the single individual as a part of a group and thereby introduced a more sociological understanding of consumption. In Levy's work (e.g., Levy 1959) there are also insights from structural anthropology, and consumption is seen as one way of representing the universal structures in a culture. He therefore studied consumption as a cultural manifestation of life in the 1950's. At the methodological level Levy was inspired by symbolic interactionism, where commodities are seen as symbols by which people do communicate with each other. Levy's work in the 1950's (e.g., Levy 1959) was in many way ahead of its own time and it still gives insights to understanding our present consumer culture. These insights from motivational

research in the 1950's were nevertheless forgotten in academic marketing and consumer research for many years due to the development in field during the 1960's.

In the late 1950's there was a urge in the field of academic marketing research to have a much stronger quantitative foundation or discipline, since the ability to use mainframe computers gave the opportunity to conduct big market surveys. To do this researchers need skills in mathematics and quantitative methodology. Post doc classes at Harvard gave a big group of professors these skills, but there was a side effect to this. The focus of marketing and consumer research shifted from an open mindedness towards different methodologies to a narrow focus on quantitative methods.

Kotler explains it like this:

“I spent the 1959-60 at Harvard in a special one-year long Ford Foundation-sponsored program designed to train professors in higher mathematics. (...) All of us became convinced that the future of marketing lay partly in model building and statistical analysis (in Bartel 1988, 225).”

There is no doubt about the influence coming out this event: “The program gave me a ‘quantitative view’ of the world that I’ll never lose” (Buzzell in Bartels 1988, 259).

To conduct research with the methodological foundation given in this program, researchers had to limit the research questions they could study. The theoretical foundation for marketing and consumer research in the 1960's became experimental psychology based on behaviourism and studies based on cognitive psychology and an information-processing approach. These theoretical

approaches though are not suitable for a study of consumption as it is happening in today's consumer culture.

Marketing and consumer research were not aware of the macro perspectives in consumption in the early 1960's. By the end of the decade Kotler and Levy (1969) called attention to a more macro-based approach when they argued for a broader marketing concept where non-profit institutions and organisations were included. Bagozzi (1975) argued later for marketing as exchange, where more or less everything was of importance for marketing. These new approaches can be interpreted as an emerging awareness of marketing and consumption as a phenomenon which covers much more than selling soap and soft drinks. These changes in the approach although fertilized the ground for a broader approach to consumption. It happened when marketing and consumer research due to the broadened concept of marketing began to study and research phenomena like museums, theatres and concert halls, since it is not possible to adequately understand these consumption arenas by using the traditional theoretical approaches and quantitative methods.

Hirschman and Holbrook raised this issue by arranging the conference on consumer aesthetics and symbolic consumption in New York City in May 1980. This was the first event when marketing and consumer researchers recognized that a certain amount of consumption could not be studied and understood by the traditional theoretical foundation and methodology. These aspects were also reflected in Holbrook and Hirschman's (1982) article on "the experiential aspects of consumption":

“Consumption has begun to be seen as involving a steady flow of fantasies, feelings, and fun encompassed by what we call the ‘experiential view’. This experiential perspective is phenomenological in spirit and regards consumption as a primary subjective state of

consciousness with a variety of symbolic meanings, hedonic responses, and aesthetic criteria. Recognition of these important aspects of consumption is strengthened by contrasting the information processing and the experiential view (Holbrook & Hirschman 1982, 132)”

They then conclude in a way which was impossible for the traditional approach:

“One cannot reduce the explanation of human behaviour to any narrowly circumscribed and simplistic model, whether that model be behaviouristic or psychoanalytic, ethological or anthropological, cognitive or motivational: the behaviour of people in general and consumers in particular is the fascinating and endlessly complex result of multifaceted interaction between organism and environment (Holbrook & Hirschman 1982, 139).”

This statement is comparable to the spirit in Arnould and Thompson’s (2005) seminal article on Consumer Culture Theory (CCT) many years later. Over the years the approaches advocated by Holbrook and Hirschman have gained a significant position in the field of consumer research and many groundbreaking studies have been published (e.g., McCracken 1986, Belk 1988, Belk, Wallendorf & Sherry 1989, Firat & Venkatesh 1995, Thompson & Haytko 1997), in which it was shown how the classical knowledge from sociology and anthropology is now an integrated part of consumer research.

Today, CCT research in consumer research is pursued by four research programs: Consumer identity projects; Marketplace cultures; The sociohistorical patterning of consumption; and Mass-mediated Marketplace ideologies consumers’ Interpretive strategies.

Consumer Society Reflected in Consumer Policy Research

Consumer behaviour theories and models of consumer decision-making have traditionally been developed within a positivistic paradigm, and have therefore been tested using quantitative methods. The rigorous requirements of quantitative methods though imply a certain simplification of theories and models, which then in turn have difficulties with reflecting the complexity of consumer behaviour. Moreover, markets and consumers have changed rather dramatically in the past few decades.

For years, many companies have grown their consumer business by mergers, acquisitions and price-cuttings while relying on traditional mass media to build the positioning of the brand. Whereas these tactics may be right in emerging and growing markets, continuing the use of these short-termed revenue drivers in times of highly competitive and declining markets seriously risks eroding the long-term profits of the company; thus the need for finding new ways of connecting with and ultimately bonding with consumers is a highly prioritized and urgent task of many companies operating in the age of what has been referred to as the post-mass media age. The challenges that companies in most consumer markets are facing these days cannot be ascribed to a passing trend; they are primarily brought about what can be claimed to be a core idea of the post modernistic perspective, namely the end of the notion of “mass” in the sense of “mass consumer markets”, “mass media”, and “mass culture”. Moreover, the challenges are initiated by a declining effectiveness of traditional communication, which is mainly due to both media- and marketing-savvy consumers often gathering in “tribes” (e.g., Cluetrain Manifesto; Wipperfurth, 2005) and communication clutter, paving the way for understanding marketing as a tool for cultivating lasting and deep relationships with consumers (cf. Beckmann, 2002; Fournier, 1998; Gummesson, 2002).

Cultivating consumer relationships, easy and compelling as it sounds, is anything but, and companies as well as academia are struggling with how to initiate and maintain these relationships. And consumer policy organizations are also lagging behind!

We argue that we are witnessing today a growing gap between how consumers actually consume and how consumer policy perceives consumers and consumption. Consumer policy is usually operating in three domains: education, information, and legal assistance for instance in complaint circumstances. The underlying rationale - admittedly simplified - is that of the “homo oeconomicus” who rationally decides among alternatives to maximise utility. A considerable part of consumer policy thus consists of providing information about labelling schemes (for instance: need-to-know about frozen food) and product tests that commonly present the “winner” as the product that guarantees the best quality-price ration.

But imagine the following situation: A consumer buys a new car not least because this car’s brand image fits her/his perception of her/himself and her/his life style. After a few months the carmaker decides on a new strategic marketing plan resulting in a campaign that aims at changing the brand image of the car and thereby should reach a new segment. The consumer sees this campaign and the new brand image of her/his car do not any longer fit his/her self-identity and life style. Even worse, s/he does not want to be associated with the segment the campaign tries to appeal to. The consumer is no longer satisfied with her/his new car and s/he would like to complain. But how? And to whom?

This fictitious example is meant to illustrate that tangible product attributes have increasingly been supplemented - not substituted! - by intangible attributes in consumers’ decision-making processes.

Yet, consumer policy to a very large degree still focuses on facilitating purchase decisions based on functional criteria, including price. Although “objective” quality criteria, together with the most favourable price-quality ration, are still relevant, they are no longer the core of the decision but rather the foundation. This goes especially for SMCGs that entail a number of risks - as Bauer already in 1960 pointed out: from financial to psychosocial.

But how can consumer policy cope with this situation? One possibility is of course to continue along the same lines, i.e., providing the foundation for informed decisions on tangible features of the product or service in question and “hoping for the best”. In other words, refraining from giving advice on life style and leaving it to the consumer to decide whether a product fits her/his identity, self-concept and image, or not. The only exception to this are the recommendations for environmentally responsible products that cater to those few who wish to leave a smaller ecological footprint (for instance, energy saving household appliances).

The alternative is to take a stance and develop consumer guidance according to the many life styles that a tribalized (Maffesoli 1996) consumer culture entails. We have found one example where such an approach has been chosen, namely the French dietary guidelines (Ministère, 2005). Besides presenting general recommendations on healthy eating, the guidelines present 24 different eating styles - the fast food freak, the bio consumer, the pregnant woman, the busy professional, and so forth - and then to adapt the general recommendations to ensure that healthy eating is possible no matter what other preferences a person might have (Beckmann, Reisch & Bendixen, 2007).

Finally, we would like to point out that we are aware of the difference between consumer policy and research relating to consumer policy. What we hope to have made clear here is that research relating

to consumer policy has not yet taken up the challenge of understanding and explaining the many facets of consumer culture in order to translate it into recommendations for a consumer policy that is able to meet the diversified needs of today's consumers.

Abstract

There is a mismatch between product providers' market strategies and consumers' demands and concerns related to broadband in Norway. Providers of broadband internet access focus heavily on price and technical descriptions, like bandwidth, in their market communication, while consumers have great expectations to time efficiency and content availability. One might suggest that they view the purchase differently, where the consumer consider broadband internet access to be foremost a "service" as opposed to the provider who consider it a "commodity". This discrepancy causes frustration – probably on both parties. This paper focuses on the consumer side of this issue, and argues that the mismatch can be fruitfully understood in light of two factors: *competence* and *time*. Required technological competence can be seen as an important factor related to the domestication of broadband internet access, and as time is scarce in modern households it is subordinated to the moral economy of the households (hence the focus on functionality).

1 Introduction

In Norway broadband Internet access prices are constantly dropping while bandwidth increases. Access supplies refer to this decrease in price and the increase of bandwidth as important arguments for marketing their products. By accentuating these arguments in the marketing strategy suppliers rely on an idea of "perfect customers" - that is; consumers who act and react according to the model of rational choice. In this line of thinking people are expected to make their choices in the market based on a qualified calculus of price, quality of product and level of personal competence, hence the need for support would be small as fully informed consumers would make choices that match their education about the product. The consumers in the broadband market appear not, however, to act and react as such "perfect customers". Data suggest they have product expectations concerning time efficiency and content availability with strong demands and concerns regarding support related to installation and use after the act of purchase. Suppliers and consumers thus seem to view the purchase differently; - suppliers present broadband internet access as a product mainly consisting of the access service and the necessary devices – whereas consumers need seem dependent on considerable support included in the product to enjoy functional use. This discrepancy causes frustration – probably on both parties. Focussing on the consumer side of this issue, this paper

presents data that point to this discrepancy and argue that the mismatch can be fruitfully understood in light of two factors: *competence* and *time*. Required technological competence can be seen as an important factor related to the domestication of broadband internet access, and as time is scarce in modern households it is subordinated to the moral economy of the households (hence the focus on functionality).

1.1 Background, data and definitions of terms

The discussion in this paper build on data from the SIFO survey 2007¹, reports from the Consumer Ombudsman and the Consumer Council, figures from Statistics Norway² and elements that has been highlighted in the public debate in Norway.

The term “broadband” is in this paper understood as a to-way-communication of high capacity for digital transmission of information (e.g. television, phone, radio, pictures, video and music). In Norway it is common to categorise all kinds of access with higher capacity than ISDN as broadband (ADSL, cable, wireless or fibre)³. Some suppliers use their own infrastructure and networks to access the households, while others rely on existing phone lines or TV cables. As a product, broadband is highly complex with strong interdependency between component parts that include material commodities and immaterial services, relying heavily on a complex and varied infrastructure.

When speaking of “suppliers” we think of the telecommunication companies which market and sell broadband to consumers. In the case of Norway more than 150 companies supply broadband. The biggest companies are Telenor, NextGenTel, Ventelo, Tele2 og UPC⁴.

The concept of “consumers”, is a name often used on the persons or actors that ‘consume’. In the 1990s one often spoke about the consumer as a role. In a definition of consumption restricted to acts of purchases (Campbell 1987), a person could be placed in a role as a consumer when he or she bought products and services instead of producing them. In a modern society this definition would define most of us as consumers some of the time. Yet none of us would in this definition be consumers all of the time. At present this situation-specific definition of being a consumer becomes more problematic and unclear as most consumer theories tend to construct consumption as something that also involves “use” (after purchase). Consumption is seen as a cultural phenomenon where influences (use, experience etc) on the consumer and the product before and after the purchase are considered important (Campbell 1987; McCracken 1988; Simmel 1990). The consumer then is constructed in terms of “types” or “profiles” with specific characteristics: i.e. the victim (the manipulated or need driven), the stratege (the rational/use maximizer who want to stand out) or the stagesetter (the meaning seeking communicator, the adaptive, the enjoyer or identity seeker (Lien 1994). With this in mind we use the term “consumers” to imply a person that can be or is constructed as one, in some respects by others, i.e. in the market or as a complaining customer or as a person

¹ The 2007 SIFO survey focuses on consumers orientations in the market and on what their choices are based upon. Questions have elaborated on consumer competence, consumer economy, political consumption, advertising, consumption of families with children, climate problems and telephone sales. This paper focuses on data from the consumer competence section of the survey. The data material was conducted through CATI survey methods, and this section consists of 1000 respondents, aged 18-80. The data was collected within the period of 5th to 16th of February 2007 by Norstat. The results are weighted by sex, age and region.

³ Definition by <http://www.telepriser.no/forbrukerinfo>, downloaded August 10th 2007.

⁴ http://www.bredbandsguiden.no/privat/bredband/verd_a_vite

who has purchased something that does or does not work. The point being that any person in question, as he or she struggle to make a purchase useable within the home, might not necessarily see him or herself that way,- i.e. as a consumer. This open analytical conception of the consumer allow us to acknowledge that what we refer to as “consumers” not only are constructed differently in different situations by different people, but also refer to actual people who might act and think differently from our preconceptions of them.

1.2 Broadband in Norway

Norwegian households’ access to broadband has developed rapidly since 2000, the point in time when distribution started to increase. The Norwegian government has set out a national goal of reaching 100% broadband access ability, by the end of 2007. This goal now seems within reach. According to a recent research report⁵, broadband coverage is currently up to 98.3 % and is expected to reach an acceptable 99 % by the end of the year. These figures include mobile broadband ability, while 95.3 % currently can access broadband by some kind of wire.

Results from the 2007 SIFO consumer survey shows that 72 percent of Norwegian households subscribe some kind of broadband Internet access. This is an increase from 63% in 2006 and 51% in 2005, according to figures from Statistics Norway. When combining these data materials, the rapid growth of broadband in Norwegian households is evident. The number has more than doubled over the last three years. Households with children are more likely to have broadband (ca. 75%) than are households without (ca. 50%), according to Statistics Norway.

Figure 1 Access to different electronic technologies in the Norwegian households. 1997-2006 figures by Norwegian Statistics, 2007 figure of broadband access by SIFO. Per cent.

⁵ Bredbånd – Dekningsanalyse 2007

http://www.regjeringen.no/upload/FAD/Vedlegg/IKT-politikk/Bredband_2007_Teleplan.pdf

Usage of the Internet is still increasing. The portion of daily users, aged 9-79 years, increased from 55 % in 2005 to 60 % in 2006. The rapid growth of broadband access in the households might explain the heavy use of the Internet, and vice versa the expectations to be online might explain the growth in broadband access in the homes.

The government's national goal of 100 % availability of broadband access is a clear indicator of how important it is considered that everyone is connected to the internet. It has become a national goal due to many reasons. It is an important part of the government's rural politics of course, but it has also been argued that everyone need to be connected in order to fulfil expectations related to work, school and other parts of life. Many companies expect their employees to be available at "all times" through home office solutions, most schools expect parents to log on to the schools portal in order to be up to date on all kinds off school related issues regarding their children. Indeed, the government's vision is *digital competence for everyone*, and education is intended to lift everyone to a certain level of basic competence. Digital competence is considered an important skill in line with reading and writing, regarding challenges met by adults in both the role of employment and citizenship. The governmental national goal of 100% coverage could also be seen as action taken to avoid further digital divide in the population.

The *Digital Divide* refers to; different ability to compete amongst companies and nations; to different quality of educational offers; to individual, local, national and global differences related to access and use of ICT's. In Norway digital divides most commonly are related to new forms of social, economic or regional differences⁶. In discussions of ICTs one often refer to the risk of "the creation of a two-tier society of have and have-nots, in which only a part of the population has access to the new technology" (Group of Prominent Persons 1994:8 i Mansell 1996:39). One could perhaps in this phase of implementing broadband ask whether the relevant question concerns not those who have and those who have-nots, as more and more households gain broadband internet access, but rather a society with a divide between those households who have a stable functional broadband and those who don't.

2 Broadband – product, service and support

The broadband market in Norway has been described as unclear, rapidly changing and complex in ways that make it difficult for consumers to retain full information regarding possible choices. The expanding market of Internet access in the early years of 2000 introduced concepts and products of broadband new to consumers. The suppliers themselves were also new and inexperienced actors in the market. This, and the many misleading marketing campaigns targeting consumers in the private market, made the surveillance of different broadband subscriptions available in the market a top priority for the Consumer ombudsman (Slettemeås og Helle-Valle 2003).

The considerable infrastructural differences as to which broadband products are attainable in city and rural regions restrain and complicate broadband choices and possibilities (Slettemeås and Helle-Valle 2003:10). There is a multitude of different infrastructural variants of broadband internet access: optical fiber for the few, telephone line for the many, cable TV for some and mobile broadband for the very urban or the very rural. What considerations consumers have to make when purchasing broadband, can in practice imply a variety of

⁶ Definition by Statistics Norway. Information downloaded August 29th 2007 from <http://www.ssb.no/ikt/>

elements ranging from infrastructural factors to the many different technological components – both material and immaterial.

First of all, in order to make use of broadband as Internet access, you need to have an up to date computer with network card. In addition, you have to have a modem and some kind of cable or wireless connection through which the internet can access your home. If you also would like IP telephone you might need an adapter and if you'd like to use your computer throughout your home you will also need a router to distribute the signal. Also, you need a certain level of technical competence in order to read, understand and successfully install all necessary parts, cables and codes.

From the SIFO survey it is evident that 62 % of the broadband subscribers also have IP phone included in their broadband subscription, which again implies the need for at least an adapter in order to make it work (additional equipment if you'd like to make phone calls directly over the internet).

Support is an important and natural part of any purchase or use of a product or service to most consumers; this is especially the case the more complex the product becomes. New media technologies, such as broadband, are good examples of such complex products/services. According to Slette-meås (2007), one can say that the support component of purchases is constrained, within the information- and self-service society. Self-service does not match very well with complex error tracking within technical equipment or abstract networks. Consumers have great expectations to the technical support related to both the purchase and use of complex technology, whereas the companies might consider customer support mainly an extra cost or at best a means of attaining loyal customers (ibid.). In addition, the complexity of the technology implies a bundling of sub-suppliers which opens up for confusion regarding support responsibilities – both on the supplier side and the consumer side. This confusion might, and have, indeed result in a myriad of phone calls on the consumers' part, trying to trace down the responsible part.

According to statistics from the Consumer Council, number of complaints regarding broadband suppliers increased immensely up to 2007. They received 1.600 complaints under the first half of 2006, and the newly established *Brukerklagenemnda*, User-complaint-committee,⁷ received 379 cases (63% of all cases). The latest statistics for the first time reveals a reduction in complaints regarding broadband given to the Consumer Council, by 40%⁸.

3 Some reported consumer problems

The SIFO report, *Consumers and development of broadband in Norway – from citizen to customer?* (Slette-meås and Helle-Valle 2003:31), point out different consumer relevant problem areas related to broadband. These are:

- “Too narrow bandwidth (lower speed than promised)
- Price and service bundling (complex contracts and long term bindings)

⁷ The User-complaint-committee, *Brukerklagenemnda*, only deals with cases regarding concrete complaints on electronic communication services – such as quality, lacking service and compensation.

⁸ Statistics and information downloaded from the Consumer Council

http://forbrukerportalen.no/Artikler/2007/forbrukerstatistikken_mindre_pepper_for_darlig_bredband

- Installation and use (difficult installation and unclear support-contacts)
- Problems related to switching supplier (poor cooperation and routines for handling)
- Extensive need for firewalls (continuously online mode makes the consumer more vulnerable to hacking)”

According to the SIFO survey statistics 72% of all broadband subscribers experienced problems regarding installation of their broadband. In addition 45% of the Norwegian broadband subscribers had problems related to their internet connection, during the past twelve months. The survey further shows that 20% have experienced problems related to service/support regarding their broadband subscription.

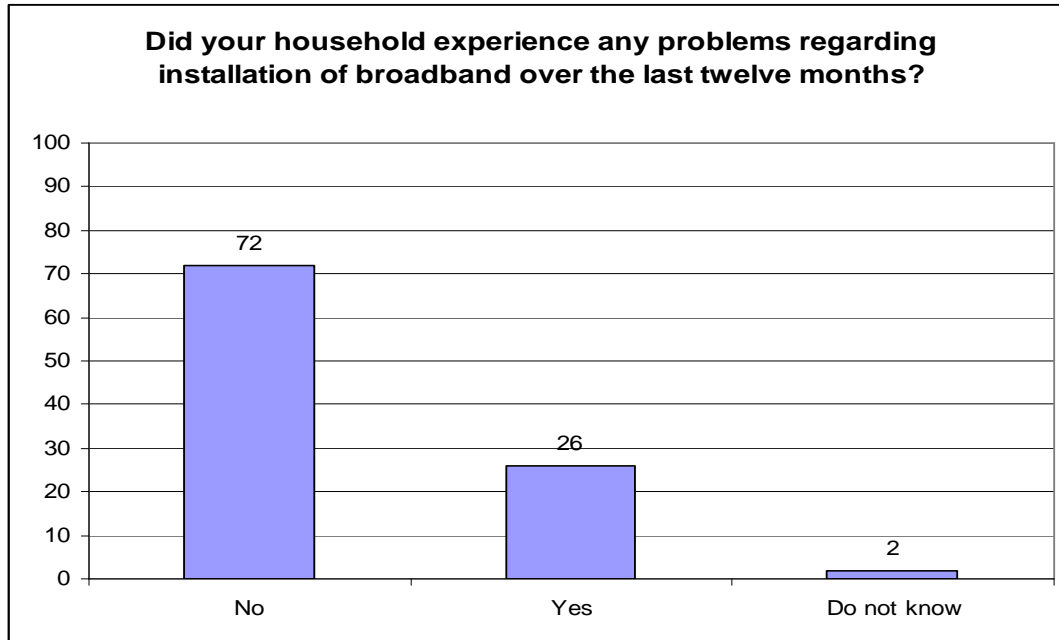

Figure 2 Did your household experience any problems regarding installation of broadband over the last twelve months? Per cent, among those who subscribe (N 724).

Figure 3 Did your household experience any problems regarding the internet connection over the last twelve months? Per cent, among those who subscribe (N 724).

3.1 What consumers do when they encounter problems

“Three times I tried to get online with the equipment from NextGenTel without any luck. I almost sent it back right away, but figured I should try some more. I didn’t know I would receive a do-it-yourself building set. They didn’t tell me that. They just said thanks for the order. After three weeks I returned the equipment to NextGenTel, along with a letter explaining that I would like to cancel the purchase due to violation of the contract”... Half a year later and after hours waiting and trying to get in contact with their customer support, the woman was still trying to get out of the contract – and online.⁹

Only ten per cent of the broadband subscribers switched Internet access supplier during the last twelve months, according to the SIFO survey. Two third of these subscribers switched in order to achieve a better price and/or higher bandwidth, while an additional reason for changing supplier were poor service and support (reported by 42 per cent of those who switched). This indicates that switching supplier might not be the obvious answer to consumers experiencing problems with their broadband access, they might consider the switching costs too high. One reason why this is a plausible explanation is the amount of effort already put into the relation with the supplier and acquisition of necessary equipment to gain access. Consumers might consider it even more troublesome switching supplier than trying to sort out the problems with their current (although not fulfilling) supplier, as switching supplier in itself could turn out to be a lot of work and trouble, due to e.g. long term complex (might include supply of phone line, cable TV, e-mail address, homepages etc.) and binding contracts, new technological equipment and so on.

⁹ Marianne Aas interviewed in Aftenposten 15.11.2005. Article retrieved 09.08.2007 at: <http://forbruker.no/pengenedine/dinerettigheter/article1157402.ece?service=print>

Figure 4 Did you switch to achieve higher speed and/or better price? Per cent, among those who did switch broadband supplier (N 81).

Great bandwidth should secure fast loading of pages, online broadcastings and films. The problem of attaining these advantages of broadband is the dependency of closeness to the suppliers signal central, which is often not accounted for in the suppliers marketing. According to Ole Asbjørn Lie, at the Norwegian Consumer Council, the suppliers are well aware of this problem – but the consumers are not. Their contract often says speed “up-to”, but many consumers don’t receive the expected maximum broadband capacity. The biggest broadband supplier in Norway, Telenor, use the term “up-to” in their marketing of broadband speed according to CMO Arild Johannessen. He underlines that many factors influence the speed of each clients Internet access; the capacity of the computer, modems, the wireless routers and general online traffic/use¹⁰

4 Supplier - consumer discrepancy; explaining the what and why of problems

One could argue that reasons for the problems consumers report are related to consumers lacking knowledge and/or it being due to the complexities in the product and the market being under communicated in the marketing of these products.

Are consumers to blame for lacking knowledge? The SIFO survey suggests that a very low percentage consider themselves to be well oriented regarding prices and qualities of broadband (9%). At the other end of the scale we find that a whole 35% considers themselves to be very poorly oriented. Although men in general rate their own orientation to prices and qualities of broadband a little higher than women, they overall state to be not that well oriented.

¹⁰ Downloaded from <http://nrk.no/nyheter/okonomi/1.1035189>, August 10th 2007.

Figur 5 How well oriented do you consider yourself to be, regarding prices and qualities of broadband? Per cent (N 1000).

It is not unusual to find that consumers report to be not well informed on various consumer areas and that men report to be a little more oriented on the economical aspects than women (Berg 2005: 10). Why then do consumers consider themselves to be poorly oriented? It was suggested above that discrepancy concerning conceptions of the product *broadband* could be due to considerable complexity concerning the product, infrastructure and the marketing of the product because they make it hard for consumers to orient themselves.

The advantages of broadband are marketed as; being online at all times, achieving high speed connections and hence “painless” surfing and non-stop video streaming, predictable costs and new services such as; video-on-demand, video telephone, virtual shopping malls etc.

According to the Norwegian Consumer Ombudsman, poor customer service is an increasing problem within the telecom business. Many consumers experience considerable problems when trying to get support either through telephone or e-mail, expensive service lines, extensive phone queues or inconvenient opening hours. These problems relates to the fact that the products and services offered get increasingly more complicated, both to install and use. Consumers are expected to be technological competent, regarding both hardware and software, and preferably able to detect and correct errors themselves.

“I had problems with my e-mail account and searched for help correcting it. A window on my screen told me to contact my supplier. But which supplier? The supplier of my account? Of my software? Of the computer? I first tried Telenor (supplier of account), who acknowledged lack on necessary competence to correct the error. I was asked to contact another part of the companies support system at a 820-number costing 25.50 NOK per minute. They told me to contact Microsoft. At Microsoft they really wasn’t interested, and asked my to contact Compaq who had produced the computer. They told me to contact Elkjøp, who had distributed the computer to me. They were kind, but suggested that I’d contact the specific

store who sold me the machine. Was really a small retailer in a rural district at the west coast supposed to fix this? Actually, a pleasant man in this store solved my problem smooth and easy within a couple of minutes. For free”¹¹.

As this case illustrates many broadband suppliers does not offer the amount of support consumers need, and expect to receive. The Consumer Council often receive complaints from frustrated consumers who have spent hours in phone queues. The Consumer Council find the situation little satisfying, although number of complaints now seem to be dropping. Ole Asbjørn Lie at the Consumer Council points to the need for consumers to consider the level of support included in the product before signing the contract, and underlines that price differences might be of less interest if the product does not work. Due to all the complaints the Council started working in this area some time ago, aiming at suppliers obligations to illuminate the level of support included in their marketing and in the contracts¹². The Consumer Council recommend all consumers to use their check list before signing contracts of broadband access, focussing on; consumers rights if delivery is delayed or not complete or disrupted; specific demands to quality of support; long term binding should give the consumers corresponding advantages; the supplier should alarm the consumer if unusual high costs occur; you should agree on a certain maximum level of costs.

In addition to these advices the Consumer Council, the Consumer Ombudsman and the suppliers (through their supplier organisation IKT Norway) agreed upon a *Good Conduct* list. Main points on this list are¹³:

- Price: The customer is not supposed to pay more than local fee to contact the suppliers support service.
- Price information regulations: Supplier should give the customer specific information on what the support service costs.
- Complaint cases: If the customer is given support/approval, the supplier should refund direct and necessary costs laid on the consumer in order to contact the support service.
- Time limits: The customer should on an average get in contact with support within maximum 5 minutes waiting on telephone. E-mails should be answered within 3 working days. Regular mail should be answered within 7 workdays.
- Competence: The supplier should secure that the one giving support is competent and able to give relevant advice to the customer.

5 Supplier and consumer conceptions of product, service and support

The “good conduct” rules, survey data and reported cases point to a striking mismatch between broadband providers’ market strategies and conceptions of consumers and consumers’ demands, concerns and conceptions of the service. Providers of broadband internet access focus heavily on price and technical descriptions, like bandwidth, in their market communication. Many private households and consumers have expectations to time efficiency and content availability when purchasing broadband to their private household, but end up experiencing problems related to installation and use of internet broadband products. One might suggest that suppliers and consumers view the purchase of broadband differently. The consumers consider broadband internet access to be a “service” as opposed to the

¹¹ VG, October 31th 2006, p.38. “An inconvenient e-mail!”

¹² Downloaded from <http://forbrukerportalen.no/Artikler/2006/1147696225.81>, August 10th 2007.

¹³ <http://www.ikt-norge.no/upload/God%20skikk%20reglene%20-%20endelig%20versjon.pdf>

provider who considers it a “product”. This discrepancy causes frustration – probably on both parties. The “good practice” rules may have helped suppliers and consumers solve some of the problems related to “support”. Through the “good practice” rules suppliers, in the present market, seem to have acknowledged the need to take some aspects of the support part of broadband product and services seriously.

The market has unquestionably changed dramatically since the introduction of broadband in the early 2000. In the first phase of introducing this new technology, the market was characterized by lack of experience both on the supplier and consumer side. There was no leading market actor, competition between suppliers in order to capture customers was harsh (e.g. through long-term binding subscriptions up to three years), and both suppliers and consumers experienced and reported severe problems. In the next phase governmental actions in terms of surveillance, regulation and control ensured some rights on behalf of consumers and how the market could compete and tie customers to their products (e.g. through restricting binding subscriptions to no longer than 12 months). At present, the market seem to have moved into yet another phase as dominant market suppliers now acknowledge that support is vital in keeping customers loyal to their broadband product and service. This does not, however, necessarily imply that suppliers support to consumers has improved much. Whether the decrease in complaints is due to suppliers’ course of action through the introduction of “good practice” rules is questionable. The decline might not be a result of better service and/or promises to provide security on the customer side. One alternative explanation is that the support has not become better but that customers competition has. An increasing percentage of the consumers, that is those who have purchased broadband products and services over the last seven years, has gained experience in this period and with that probably increased their competence. Once they have managed to reach a functional level in everyday use of broadband they do not care much to change supplier in order to gain better technical quality. That is at least what our data indicates. On the supplier side in the market, offering broadband support may present a possible challenge in terms of costs connected to keeping old and reaching new customers. In the previous market phase, seen from the suppliers point of view, reaching new customers may have been more expensive than to keep old ones. In the present market situation this might be changing. This might also explain why at present time several broadband suppliers have launched market strategies in which they offer concrete services in terms of installation to new costumers. By this they are making it easier for customers not only to buy broadband services for the first time but also for experienced customers, who have achieved functionality, to change supplier. As long as the content and quality in the support remains undefined one might expect that the decline in complaints from consumers may thus only illustrate a decline with respect to certain aspects of the problem.

The “good practice” rules illustrate that suppliers do not yet see service to be an integrated part of the product they are providing; e.g. consumers must pay to receive support. We need further more qualitative research to addresses the content of suppliers and consumers conceptions of “customer service”. The data we have discussed here point at the diversity and complexities involved both on the product side and the consumer side. With respect to the latter one must acknowledge that consumers differ, as do the products they have purchased. The problems consumers experience are therefore manifold, their actions to handle them likewise. Their conceptions and needs for “support” are consequently also diverse. In terms of future developments one needs to pay attention to some common feature in logics and processes that might be involved at the consumer side.

6 Domestication of broadband internet access in homes

In order to shed light on logics and process involved in the consumer side we must consider how broadband is domesticated by consumers in different settings. Our argument is that the mismatch between product providers' market strategies and consumers' demands and concerns can be fruitfully understood in light of *competence* and *time*. These two factors point to how the domestication of broadband in homes and families are different from the domestication of broadband in work environments, and to what might be vital in consumer conceptions of "customer service."

Basic to the domestication research perspective is the idea that technologies must be 'tamed' in order to be accepted in a given setting (Silverstone og Hirsch 1992). The perspective directs our attention to the importance of context in understanding the ways ICTs are used, and the significance of the home as one such important context. The basic argument is that in order to understand the various how and whys of ICT-use it is necessary to assume not a simple subject-object relationship but to include a significant third factor, namely the social setting in which the subject relates to the object. The home – as a phenomenological reality – affects the way people relate to and use ICTs. Social practices surrounding broadband technology thus has to be contextualised. From the consumer side, home and family is the important setting for broadband use.

'Home', 'family', 'the moral economy of the household' and 'domestication' are central terms in the domestication perspective (Silverstone, Hirsch og Morley 1992). The home is posed as a contrast to the public sphere in the sense that it constitutes a different social and cultural context – i.e. containing specific values and perspectives – than what surrounds it, i.e. the public sphere, hence the centrality of the terms 'home', 'family' and 'the moral economy of the household'. Therefore technologies that are potentially 'useful' to the household are produced in, and associated with, the public sphere the acquisition of such commodities requires a 'translation'; they need to undergo a transformation that implies that they are given a meaningful place in the home and become morally acceptable.

"This engagement involves the appropriation of these commodities into domestic culture – they are domesticated – and through that appropriation they are incorporated and redefined in different terms, in accordance with the household's own values and interests" (ibid: 16).

According to the authors, this process of domestication involves four phases, or aspects. First, the *appropriation* of an ICT refers to the actual purchase of the object. *Objectification* points to the actual usage and physical positioning of the object within the household while *incorporation* denotes the ways the ICT is given a place in the cultural framework of the home. *Conversion* points to the ways the ICT is displayed vis a vis the world (ibid: 20ff). In relation to broadband appropriation and objectification are vital. Besides from describing these phases, the Domestication perspective helps us tune attention to morality and the values inherent in homes (Silverstone 2006). Though it is important not to essentialize homes it is reasonable to start with the fact that 'home' is the central 'significant other' of the public sphere, hence it should be possible to identify a set of values that constitute the prototypical home. In short, in contrast to the public sphere, being dominated by the mentality of bureaucracy and market economy, the home is that which harbours the family, and the romantic ideology that the family is built on. This celebrates the intimate and emotional – that which is said to concern our selves and essential qualities as individuals (Shorter 1975; Luhmann 1986; Giddens 1992; Borchgrevink og Holter 1995). The family – as the prototypical framework for, and result of intimate feelings – stands forth as every action's

reason; it is what gives, at least discursively, life meaning (Sørhaug 1996). In popular conceptions the home – representing trust and security – is the haven in which the individual can find refuge from the cold hostility and mercilessness of the public arena.

In a potential contrast to the romantic ideology of familism; the demand for thinking and acting as a collective, stands individualism, the strong ideological force associated with Western modernity which emphasises not only the right to be unique and special but in fact demands that we all have to search for the uniqueness in ourselves, also has a harbour in homes.¹⁴ On the other hand we might regard familism and individualism as complementary; it is with the advent of individualism – with its focus on the right and obligation to create a meaningful life-trajectory, combined with the perennial meaninglessness of the modern public sphere – that the family stand forth ideologically as a major setting for a meaningful life. Be that as it may, we contend that familism and individualism are two strong ideological forces that affect the uses of broadband in Norwegian homes.

ICTs, as objects and media, bring public life into the domestic sphere and hence threaten to break down the moral borders that surround, and thus help to define, the family. This makes them ‘dangerous things’ (Douglas 1966). On the other hand, ICTs can promote family sociality by functioning as objects/media that gather the family. If of a ‘good’, or at least acceptable, kind, broadband use can be instrumental in generating family sociality of the right kind by giving its members time together and providing them with a focus, hence building the family as a unit. However, if the daily experience is more one of concern and worry – that the broadband does not function, or requires too much time and competence, it may constitute a threat to the ideal of spending ‘quality time’ together. Likewise, media content might be of the wrong type, mediating or promoting attitudes, mores or information of types that fit badly with what is considered appropriate within the family context. The potential both for ‘good’ family sociality, time-saving, entertainment and rest, as well as family fragmentation, time-consumption and frustration due to lack of competence and qualified help, illustrates the ambivalence that is commonly found among consumers who give voice on problems with broadband. Required technological competence can be seen as an important factor related to the domestication of broadband internet access, and as time is scarce in modern households it is subordinated to the moral economy of the households they might have high demands to support and functionality. Whereas free time for one or several members of the family to seek higher technical competence in order to install and seek for failures on the broadband will conflict with familism, the actual heightening of technical and other competences of one or more members in usage of broadband might fit well the ideology of individualism. It could nevertheless be argued that broadband as a highly complex product requires higher levels of technical competence than the ordinary private households might be expected to hold. If this is so, is it then reasonable to sell broadband products directly to single households by current standards?

7 Competence and time in households

The assumption that consumer competence, that is consumers familiarity and knowledge of products and overview and insight in the markets, has significance on how well they choose and purchase is commonplace and often grounded empirically on survey data (Berg 2005:

¹⁴ The home can with regard to individualism provide a moral room for being on one’s own, pursuing self-realisation and personal goals (Giddens 1991; Hall 1992; Williams 2000).

9).¹⁵ Two aspects of this are worth consideration. Firstly that the assumption often follows a model of the consumer as an economic man performing rational choices; that is, the more informed a consumer is the better choices they will do. Secondly, that the empirical grounding for such claims draws heavily on data from surveys. Surveys often base their measurement of consumer competence on respondents' linguistic evaluations of themselves as to how well they are oriented on prices and products and the extent to which they base their motivations and choices on economical self containment and/or the concern for others (e.g. Example above). The finding is often that this competence then has some bearing on how consumers linguistically report on their practices in the market. One problem is obviously that forces choice answers restricts answers that are more relevant to the respondent than those offered. Another more serious that one makes a comparison between a linguistic based measurement of consumer competencies to a linguistic based measurement of consumer practices and assumes this can tell us about consumers practical actions concerning the products and markets in question. Although such linguistic competence in self-evaluation obviously has some bearing on practical activities involved in solving actual problems consumers encounter with their purchased broadband product (reading product descriptions, making telephone calls, reading manuals etc) it is of another sort than the technological and communicative competence that this solving often will require (finding out what technical procedures has to be done and doing them). One thus has to be careful in concluding from such survey data to the practical knowledge and competence of consumers. Also because the act of consumption is seen as a cultural phenomenon in which the symbolic use it taken to be as important as its use-value (McCracken 1987). From this follows that we argue from a more context based line of thinking than what is commonplace on consumer competence and practices. The idea is that the context of the home, eg in comparison with the work-place, has material and social aspects that influence on individual competences understood as a practical competence, i.e the being able to carrying out the relevant action, getting things done and problems solved.¹⁶

One aspect that frames competence in this respect is obviously the material realities of the home. 'Private' domestication of broadband is partly determined by the spatiality, normativity and sociality of the local context (Sletteå 2007: 38). That is material structure, local policies, rules and norms play into the domestication process. Where you live can for instance determine what products are available and possible to purchase/install. In some instances the computer that is supposed to process the service may be too old or weak, -something the consumer might find out when trying to installing and getting the product to work after having purchased it. It is in these circumstances perfectly possible to encounter problems although one possesses competence that has made one do seemingly rational choices judged from aspects of price and width of broadband.

A rewarding way of using the domestication concept is to understand it as the various ways people make media integral parts of the language-games they engage in (Helle-Valle 2008). The "term 'language-game' brings into prominence the fact that the *speaking* of language is part of an activity, or of a form of life" (Wittgenstein 1968: §23, emphases in the original). The language-games are formed by forms of life (practice). This means that if we want to study meaning we need to study language within a form of life. As people perform their practices with broadband in different places they also move in and out of different language-games and communicative contexts. Thus, people might not only act differently, but also

¹⁵ Consumer competence is seen as a resource comparable to economic resources, that is a resource that gives possibilities and frames the extent to how good choices the consumers are able to make (Berg 2005:19)

¹⁶ Consumer competence is a term that has been used, not only on the level of the individual both also on group and institutional levels such as the household (Berg 2005: 18).

think differently, in different language-games (Helle-valle 2008). Questions of consumer competence with broadband might illustrate how. Most people work in places where broadband is a part of the infrastructure related to production, with support people around to make sure it works. They might thus have user knowledge with broadband but lack the relevant installation and support knowledge. They also lack the social network of people, -that is the knowledge of who the relevant person is that can give support. More importantly they might give meaning to the broadband product within the language-game this product has at their work; a service. When they apply this to the broadband product at home, this causes frustration because private subscriptions are given meaning within another language-game; sellers see it as a simple product that consumers are supposed to handle much on their own.

Mansell (1996) argues (with reference to Wendt 1987), that capabilities, capacities, competencies necessarily are related to a social structural context and inseparable from human sociality.

“In periods of rapid technical innovation and instability that are characteristic of changes in techno-economic paradigms, there often are severe discontinuities between the capabilities of human actors in all walks of life and those they are expected to acquire. The requisite knowledge sets are not freely given. In fact, on the contrary, capabilities arise from diverse experiences and they are the result of substantial investment of time and other resources” (ibid 1996: 28).¹⁷

Mansells discussion is directed at firms and the commercial sphere but related to this and relevant to the focus of this paper is obviously the social realities of the home, - the relations and expectations, obligations and practices people in the household are part of. This brings us to the aspect of time and to how factors of competence and time intertwine in households.

Leisure time, the time household members are off from work and school and potentially can spend time together, is increasing (Frønes 2002). Time is nevertheless a scarce resource in many modern households where the moral economy focuses on reducing time spent on housework and domestic chores through useful technology. Conceptions of time are however full of complexities. “While the public sphere is dominated by instrumental relations (zweckrational; ibid.) and hence clock-time, the home is – or rather should be – dominated by event-time; time that is ideally not measured in quantities but is tied directly to the task it is involved in because they are considered to be existentially important” (Helle-valle 2007: 53). As time is subordinated to the moral economy of the households and households differ the time scarcity might take different forms. Whereas time-squeeze is a common theme among households with children it might not be so in households without (Helle-Valle 2007).

One argument for households purchasing broadband is often related to time-saving goals connected to ideals of familism; e.g. paying invoices on the internet, a quicker way to achieving the relevant information one needs be it phone numbers, the latest news of the best buy of products etc. it is not accepted within this moral economy to spend time on installation

¹⁷ Mansell speaks of design and capabilities (competencies) as axial principles in the matrix of human action. Design is a concept used to draw attention to the importance of human action and its complexities, whereas capabilities is used to focus on the dynamics of the communication process and the formation of human capabilities through the process of technical and institutional change (Mansely 1996: 21). “Capabilities, in the sense of power to act, can be expressed as a result of action embodied in institutions (as organizations as well as by the actions of individual agents (...)). Power then can be conceived as a capability that varies as a result of the accumulation of knowledge as well as the constraints and opportunities in an actor’s environment” (Mansell 1996: 28).

and the like. The expectation to broadband is to have functionality; that the thing works when you need it. Hence the frustration and complaints from private consumers when it doesn't, that they can't make it work when it should be working. Although consumers in households might not spend too much clock-time sorting this out (waiting in line on the phone to report the problem and finding someone to help, quarrelling about who is to pay the cost of the installation they didn't manage themselves), the time spent is conceptualized as long as expectations were that broadband should save time paying bills so they could spend more time doing family relations. It is in this respect that individual consumer competence over time might play into the conceptions of households experience and practices with broadband. First and foremost because the domestication of broadband, gaining access and using it, is different in comparison to that of other ICT's in the family; such as. tv, computers, phones. Although all family members might be users of broadband technology in households (when installed and functioning, it is a service available, accessible and usable to all), the competence required to make this technology work is usually tied to one person. The competence requirements this person meets are often great and demanding with respect to using family time in early phases of broadband history in the household. However, as the person involves him (or her) self with the technology over time, the persons' individual competence with broadband technology is likely to increase. Although one effect is that individual competences with respect to the broadband technology will vary considerably between family members and enforce individualism, another effect is that households ideals of familism are ensured as the increased competence of individual family members over time stabilises the functionality of the households broadband internet access. Hence the reduction of complaints to the consumer Ombudsman.

8 Summary and suggestions

Broadband internet access is a complex product intertwined in a complicated structure of services and support systems. This is partly due to complexities in the infrastructure and technology that broadband functionality depends on. Partly to unclear lines of responsibility on the supplier side vis a vis consumers (ref. the earlier referred letter to VG by a complaining consumer). The supplier wants to sell a service, but not to be responsible for the technical products that are necessary in order for the consumer to make use of their service. The consumers wish to buy broadband as a service that will enable them to enjoy surfing on the internet, but their experience is that they are given a package of several technical devices (a bag containing wires, a manual and no one to help them make it work), - thus of having purchased a commodity product. Neither suppliers nor consumers want to have responsibility for the technical devices, the material/commodity-based side of the service. The result being frustration on both parts.

The reduction in complaints to the Consumer Ombudsmann can be interpreted in several ways. Either as a result of more relevant information given to the customer prior to purchase as well as support services having improved, partly because Consumer Ombudsmann and the Consumer Council has taken action with the suppliers in order to solve the problems. Or as a result of the time consumers have had to gain competence and to establish themselves as customers of a functional broadband. It could be that current actions taken by the Consumer Ombudsmann and the Consumer Council together with suppliers really have reduced certain problems consumers encounter with broadband. The principle that all expenditures and information of relevance to the consumer should be given in the marketing of product and services is essential and now better regulated. As these initiatives are focussed on improving

customer support at the first line contact (e.g. the “good practice” rules enhancing better support through a customer service telephone line) they do not however attend to the core aspect of problems as these prevail on the consumer side as family members and citizens. In concluding this paper we suggest three aspects in need of attention in relation to understanding how consumers in households relate and react to the various aspects of broadband internet access as a product and service.

Firstly, broadband consumers in Norway seem to be thrown between the many sub-suppliers of broadband when facing problems (ref mentioned consumer complaint in VG). The enforcement of a law that could ensure some clear principles concerning a point of consumer contact not only for advice but also for technical support in combination with clearer divisions of responsibility (as is the case in England) seems to be necessary in order to ensure that the customer/consumer gets what she or he thought they bought- so that they in fact do achieve the functionality of the product.

Our argument has been, secondly, that conceptions of support services are varied, especially those of suppliers and consumers. Further research on the issue should therefore focus consumer conceptions of support. A qualitatively based approach seems necessary in order to trace the different language-games peoples concerns and conceptions of support are a part of in relation to broadband. We have argued that the domestication perspective offers a way to understand and explain the range of adaptations of broadband that can be found as it reveals the complexity and subtlety of dynamics and mechanisms that together constitute processes of domestication. Moreover that the various consumer logics can be fruitfully understood in light of competence and time as two factors in the domestication of broadband in households. At the core one might say that consumers want broadband functionality without having to take responsibility for the technical products and devices needed.

Aside from this a third political question needs to be resolved. Seen in connection to the national goal of supplying full coverage of broadband to Norwegian citizens the question of support and consumer competence is brought to another level: to the level of citizen – consumer questions (Slettemås og Helle-Valle 2003). What competencies are reasonable to expect consumers to have? What competencies are required on behalf of the consumer for instance in order to obtain a certain price? Is it for example reasonable to expect of consumers to solve their technical problems on their own or to voice their technical competence in first line contact with customer support (phone)? If yes, who are to pay for the average consumers to achieve these competencies, not only the specialized person in the household? It is widely acknowledged that elementary ICT practices are learned by doing it with people who already know how to perform these tasks. A task the state has gone to several actions to support its citizens in achieving in other areas (e.g. Datakortet). The more complex the practice the more this is true (e.g. installation of broadband products). Should such heightening of consumer competence be included as a part of the broadband service or should it not?

The case of broadband sheds light on issues with relevance to more general problems surrounding products and services that are complex; the marketing of these products and the competence and processes involved in consumers domesticating of these products.

Abstract

Information and communication technologies continue to present challenges to consumer policy. International electronic commerce serves as a particularly telling example of such challenges. At the same time it offers opportunities to find new regulatory insights with a postmodern catch in terms of interaction, actors and goals.

We have looked at two specific cases that touch the issue of the regulation of international electronic commerce. Trust marks and consumer generated information systems which we call Consumer 2.0 both exemplify alternative and self regulative solutions to the issue. On the basis of our analysis, we recommend that policy makers consider decentralizing consumer policy, welcoming new actors and integrating policy closer to services.

1. Introduction

New potential conflicts emerge through the increasing use of information and communication technologies (ICT). Amongst other issues, consumer use of ICTs challenge the Nordic model of consumer protection. Particularly in international electronic commerce, consumers cannot rely on governmental patronage in protection as they are used to in domestic markets.

International electronic commerce exemplifies particularly well the regulatory dilemma between international consumer markets in a world of predominantly national regulation. Self regulation is often seen by regulators as one possible solution to this dilemma and there have been self regulatory initiatives to this aim. Self regulation is often attributed benefits such as expertise and efficiency over regulation (Baldwin & Cave, 1999).

We analyse two particular types of self regulatory initiatives for international electronic commerce. The first type involves trust marks that promote electronic commerce. It has now become evident that successful trust marks focus more on service mindedness, flexibility and relevance than on the rigidity of the regulatory framework (Repo & Nordquist, 2005).

The second type involves the growing use of knowledge-based support systems for consumption purposes which we call Consumer 2.0. These systems aggregate and distribute peer produced information on consumption in real time (Repo et al., 2006). Practical examples of Consumer 2.0 include consumer-generated reviews on global sites such as Amazon.com, product testing carried out by amateurs on hobbyist sites such as Videohelp.com, and consumer blogs.

We argue that the regulatory challenge concerning international electronic commerce is greater than merely a technical question. Instead, we see it as an example of a regulatory challenge between modern national ideals and customs versus postmodern international modes and practices. We believe that fragments of postmodern consumer policy will develop alongside conventional forms of consumer policy. This development takes place independently of the actions of conventional institutions for consumer policy. Governmental institutions promoting consumer policy will in other words face competition from other actors and forms of consumer policy. Self regulation will prosper in many innovative forms.

We start off from outlining features of postmodern and modern politics in the context of electronic commerce. Then we provide two self regulatory cases that challenge the regulatory framework of international electronic commerce. We proceed by sketching a typography of the self regulatory cases and concludingly aim to provide insights in future challenges of consumer policy.

2. Postmodern vs. Modern Politics and the ICTs

There are a number of theoretical definitions of postmodern society. We attempt to bring up three issues in these definitions which are relevant for self regulation of international electronic commerce: interaction, actors and goals. We do this by contrasting postmodern with the modern specifically in this context.

A large majority of the definitions found in the literature is, by contrast, used in a very general context that has to be transferred into a political setting, implying that the terms have been elaborated, transformed, and specified into the listed characteristics of modern vs. postmodern politics. As characteristics of politics are described, the impact of ICTs are considered in each area of politics in order to provide the basic queues to distinguishing the political role of ICTs. The features or areas of politics are naturally intertwined, and in a similar vein it is important to emphasize that the dichotomized characteristics of each side of the column in no way are mutually exclusive nor absolute. The idea is rather that most units of political activity float in-between the two columns of characteristics, and include various aspects and combinations of these.

In other words, we see change as the equation of the dialectic between the modern and postmodern, rather than as the specific developmental process to the postmodern society (cf. Gibbins & Reimer 1995) leaving the modern and pre-modern behind, which plagues e.g. Gibbin's and Reimer's more absolute view. We argue that the modern will remain with us

just as some aspects of pre-modern politics such as hereditary rule and leadership do; in fact, many of these pre-modern aspects are still with us even in most advanced forms of informational organizations with for instance Rupert Murdoch's media empire and his son inheriting his throne as an ironic case in point. The change, rather than development, takes place in the configurations in-between the modern and postmodern, whereas the actual pillars of the modern/postmodern temples remain intact – it is the movement between the pillars that is significant. There is not any assurance either that change moves towards the postmodern pole as in development – it might also turn the other way as in the case of Bill Gates' monopolized corporate empire. Another example of this change in the opposite direction is the re-centralization of Russia under the increasingly authoritarian and hierarchic rule of President Putin.

Our general purpose is here to be able to establish which characteristics can be considered modern or postmodern from a theoretical point of view. Then we can pinpoint the challenges that postmodern politics pose to the study of any current political, economic or social phenomena as in everything from reinventing formats of political communication to creating trust in E-commerce. Accordingly, we agree with Gibbins and Reimer “that the concept of postmodernism can operationalized and put to empirical use” (Gibbins & Reimer, 1995, 301), despite of the warnings of Kaase and Newton that “... it is difficult to encapsulate the theory of postmodern politics. Writing on the subject tends to be loose, ambivalent, fragmentary, fluid, and illusive – like postmodern society and politics, in fact.” (Kaase & Newton, 1995, 28). The reservations regarding the “kaleidoscopic array of notions” that postmodernism consists of (ibid, 28), are at least partly a reaction against the free-floating, utterly unconstrained relativism of some of the most extreme postmodern theorists (e.g. Baudrillard, 1988; Lyotard, 1984; Inglehart, 1997; cf. Thompson, Grendstad & Selle, 1999; Castells, 2000; Frissen, 1999). In fact, this reservation provides the challenge we are taking on when attempting to bring down the concept even closer to earth and provide some improved clarity in its application in the context of the political analysis of modern vs. postmodern politics.

We have summarized features of modern and postmodern politics in Table 1. Special attention has been given to interaction, actors and goals. These are all issues that are relevant and diverging in the context of ICTs and international electronic commerce.

The old clear-cut dividing lines for instance between the political left and the political right have been blurred. New patterns of political interaction have driven the old homogenous political camps into a multitude of intertwined liaisons and networks of mutual interest. The new diverse and diffusive networks increasingly consist of heterogeneous cliques temporarily united in a particular issue. At the very general level of political, economic and social interaction, the state-empowered legislation machinery and its rules based on absolute conformity, are losing their situational relevance as new realities are produced at an accelerating rate by means of the new ICTs. As previously separated realities collide, intertwine, and lose their specific normative contexts, the actors are left to situational ethics and individual reflection in coping with new combinations of medialized realities.

A more wholesome definition of politics obviously implies that the political scene has been enlarged from the national to the global scene, and from the local to the regional level with new economic and political blocks such as the EU. In a similar vein there has been much talk of so-called glocalisation, which involves the combination of the local and the global scene, as the national scene in-between them is reduced. As for the impact of new information

technology on the political scene, Internet has had a very obvious effect in bringing in the global element.

Table 1. Modern and postmodern features of politics.

Features	Modern politics	Postmodern politics
Interaction	<ul style="list-style-type: none"> · Uniform relations · Clear-cut dividing lines · Homogeneous camps · Absolute rules · Conformity by law · Formal · Authentic 	<ul style="list-style-type: none"> · Diverse contacts · Diffusive configurations · Heterogeneous cliques · Situational ethics · Reflection by values · Popularised · Virtual/medialized
Actors	<ul style="list-style-type: none"> · National governments · Political parties · Established interest organizations 	<ul style="list-style-type: none"> · Transnational organizations · New social movements · Business corporations · Temporary issue networks
Goals		
<i>Ends</i>	<ul style="list-style-type: none"> · Maximal security · Social/economic responsibility 	<ul style="list-style-type: none"> · Maximal creativity · Self-actualisation
<i>Basis</i>	<ul style="list-style-type: none"> · Stable conditions · Static equilibrium 	<ul style="list-style-type: none"> · Constant flux · Dynamic dissonance
<i>Focus</i>	<ul style="list-style-type: none"> · Internal control · Self-sufficiency · Material welfare 	<ul style="list-style-type: none"> · External integration · Interdependence · Cultural choice
<i>Means</i>	<ul style="list-style-type: none"> · Bureaucratic power · Expert supervision 	<ul style="list-style-type: none"> · Individual autonomy · Self-regulation

As already mentioned, the main actors on the political scene have shifted from national governments to transnational organisations, and of course increasing tensions between them. An increasing proportion of major political conflicts are taking place between new social movements and business corporations – for instance between Greenpeace and Shell – instead of between the political parties, which to a large degree have been reduced to general election machines rather than playing their traditional role of mobilising people around specific issues and interests. With regards to the impact of ICTs in this regard, the new actors have been much more efficient than the governments and parties at applying new information technology in gathering public support for their political cause.

The main goals of the modern state include the maintenance of security for the population and the spreading of a sense of responsibility among the population directed at keeping up the social and economic norms maintaining continuity. These ends are attained on the basis of stable conditions in an environment of political and economic equilibrium. Creativity and change being the engine of the postmodern world, the aim is to allow for a maximum of creativity and self-actualisation. This implies an in-built basis of constant flux releasing the required ‘dynamic’ energy, as in e.g. the non-stop pulse of the stock exchange, in an environment of motivating dissonance as in “creation is messy” (Steve Jobs in Freiburger & Swaine, 1999). Whereas the goal in focus of the modern state used to be the control of internal affairs, economic as well as political self-sufficiency, and the provision of material welfare for the main part of its population as in the welfare state, the postmodern focus has shifted outwards. The postmodern goals involve a higher degree of external integration as in e.g. joining economic/political unions and agreements of various kinds, and the achievement of interdependence rather than strict independence. The means to achieve these goals are in

the modern era determined by the machinery of bureaucratic power and the supervision of various experts of the authorities. In the postmodern era these means have been complemented by extended properties of individual autonomy for both citizens/consumers and organisations in combination with self-regulating practices beyond the direct control of the authorities' experts.

3. Two Postmodern Challengers in E-Commerce

The ICTs have challenged regulation based on the modern notion of politics. Next we look at two specific cases of self regulation in greater detail. The first case involves trust marks set up typically by commercial actors. The second case depicts active user involvement in market monitoring, which we call Consumer 2.0. Together, the cases indicate that electronic commerce has indeed attracted new, postmodern forms of regulatory interest.

3.1 Trust marks

In 2001, we looked at how trust mark schemes were organized and what they offered to consumers (Repo 2001a). Of the at least 60 trust mark initiatives (Rantonen, 2001) which existed we observed those considered of most relevance for Scandinavian consumers (Table 2). These initiatives were returned to in 2003 to follow up on their successes (Repo & Nordquist, 2005).

In retrospect it is hard to assess which and what kinds of initiatives have been successful as there might have been strategic reasons for setting them up. Sometimes it might not be as important to make the system effective as it is simply to have it set up. For example, self-regulation is one way of responding to political pressure from governmental regulators (Baldwin & Cave, 1999). Similarly, some initiatives were set up to explore possibilities of new markets. Commercial success was not considered as important as experimenting.

In any case, merchant and membership base can be considered indicators of success for self-regulatory initiatives in electronic commerce. To be effective, self-regulative initiatives need to become commonplace. Then they begin developing institutional trust in addition to rational trust (cf. Seligman, 1997; Misztal, 1996). Mere existence is also one, albeit small, measure of success.

The studied European trust mark initiatives had not yet been able to succeed in the trust mark business. Growth in merchant base had been remarkably small with the exceptions of the German Trusted Shops and the Danish E-handelsmarkedet. Some initiatives had receded and others been brought to an end. There seemed to be a tendency to reorganize national initiatives under European umbrella initiatives. For example, Euro-Label consisted of national initiatives from Austria, France, Germany, Norway, Italy and Spain.

Table 2. Examples of trust marks (Adapted from Repo & Nordquist 2005)

Trust mark	Origin	Scope	Services	Organization	Merchants 2001/3
E-handelsmarked	Denmark	National	-	Organizations	25/94
Nsafe	Norway	National, Scandinavian	ADR	Organizations	60/33
SafeShop	Finland	National	Insurance	Insurance company	A few/ Dismantled
Which? Web Trader	UK	European	ADR	Consumer organization	1600/ Dismantled
Trusted Shops	Germany	European	Insurance	Insurance, consulting company	150/700
L@belsite	France	European	-	Federation	15/29
TrustUK	UK	National	-	Organizations	3/2
e-com trust	Switzerland	European	-	Federation	Pilot/?
Euro-Label	Europe	European	-	Federation, Organizations	0/221
CPA Webtrust	USA	Transatlantic	-	Private	NA/36
Clicksure	UK	International	-	Private	NA/ Dismantled
Square Trade	USA	International	ADR	Private	50.000/ 1.000.000
Web Assured	USA	International	Insurance, ADR	Private	NA/8.000
BBBOnLine, FEDMA & Eurochambres	USA, Europe	Transatlantic	ADR	Federation	14.260.650/ In process

The development of two trust mark initiatives stood out in terms of merchants. SquareTrade had acquired merchants largely due to the success it has had at eBay.com, and Web Assured also had a substantial number of merchants. Two features were common for these initiatives. First, they were both of American origin. Secondly, they both offered alternative dispute resolution as a service.

3.2 Consumer 2.0

The Internet and its online communities are an increasingly significant part of consumers' everyday life. In particular we see the evolution of knowledge-based support systems to promote the new consumer, which we call Consumer 2.0.

Consumer 2.0 is a vital element of the production system instead of a black box end user. Professional consumerism has born similar manifestations as Consumer 2.0 (cf. Mayer, 1989), but never before has the input of individual consumers into information systems or their use of these systems been as widespread as today. Consumer 2.0 mediates individual consumer expertise to a collective level through the use of knowledge-based support systems.

Consumer 2.0 relies on two kinds of expertise. Firstly, there are the professional amateurs, who provide the depth of knowledge. Secondly, masses of "ordinary" consumers provide the

breadth of knowledge by having their input aggregated. The interplay between these two kinds of expertise is fundamental for the success of Consumer 2.0.

Consumer-generated information is produced, firstly, in real time and, secondly, by peers. These two features are the distinctive building blocks of Consumer 2.0. The third building block is the aggregation of information on consumption. Although there is nothing new in this, the very idea of feedbacking aggregated information to consumers to promote self-realization bears a new twist in business settings. *Real time* means here that the information is available at the time of purchase or preparations for purchase. Conventional consumer education and research typically cannot give situated information for consumers and so they have to rely on general guidelines. *Peers* are other consumers in a similar situation, i.e. in a similar position in relation to the seller. They represent the masses of consumers involved in the democratization of the production of information. Information shared by peers usually stems from their own individual experience. *Aggregation* is the abstract summation of individually produced information, and its outcome is a knowledge-based support system. All or parts of the aggregation can be automatically updated. This lifts Consumer 2.0 to a social level by enabling consumers to see themselves as a collective.

There are a number of examples of Consumer 2.0 services (Table 3). Some of these are run by businesses and others by professional amateurs. In all cases one party functions as the facilitator and obviously needs to be considered reliable by others.

Table 3. Examples of Consumer 2.0 services (Repo et al. 2006)

Type of service	Example	Real time	Peer to peer	Aggregation
Price comparison	Polttoaine.net reports on retail prices of fuel.	Supplies average price for the day before.	Users report prices.	Variation of daily price and variation of monthly average price are shown.
Product review	VideoHelp.com is a website for video enthusiasts. One section of the website reports functionalities of different DVD players and compatibility issues.	New players are presented first.	Users test their own DVD players.	Two kinds of averages representing functionality are calculated for each DVD player.
Content review	Mikseri.net distributes free music.	A top40 list is created each week.	Music is rated through listening practices and user reviews.	An algorithm calculates popularity based on downloads, online listening, comments, reviews, reviews of comments and weeks on the top40 list.
Preference review	Liveplasma (beta) is a discovery engine. It visualizes buyers' music and movie maps according to data from Amazon.com sales.	Information is updated automatically.	Consumers may make use of others' preferences.	The relations of preferences are visualized as a self organizing map.
Seller review	Huuto.net is an online auction site, where buyers rate sellers in order to build trust.	Seller ratings are dependent on time.	Buyers rate sellers.	Positive, neutral and negative ratings are calculated as a rating.
Reviewing reviews	Amazon.com allows users to rate the helpfulness of other users' reviews.	Information is updated automatically.	Users rate the helpfulness of each other's reviews.	The number of positive ratings is compared with the overall number of ratings.

All of the Consumer 2.0 services shown in Table 3 have developed ways to provide participatory elements in web services. They achieve real time, peer-generated information, and aggregation through different methods. These services are less formal and more decentralized than they would be if produced conventionally.

The reviewed Consumer 2.0 services offer information generated by individual consumers to be used by a wider consumer audience. Actually, this is the ultimate test for any Consumer 2.0 service. Although it is difficult to evaluate the relevance of such information for consumer purchases, there is definitely a connection. For example, as much as 84% of Finnish web surfers looked for information on products and services on the Internet in 2004. This figure is remarkably high, as only the use of e-mail surpassed it with a corresponding figure of 88% (Sirkiä et al., 2004). Consumer advocates can barely dream of such masses of visitors to their websites. It is also highly unlikely that consumers would look for this kind of information in a similar scale on conservative corporate web sites (cf. Yared, 2006). In this respect, Consumer 2.0 has established itself.

4. Discussing Types of Regulation

The conservative way of dealing with regulatory issues is to implement legislation. The effectiveness of such measures varies, but in the field of international electronic commerce it definitely is questionable. It seems that regulatory harmonization is a highly challenging task even in an integrated set of countries such as the European Union. Consumer authorities have recognized this and set up complementary systems such as clearing houses which support consumer protection without essentially solving the regulatory dilemma.

Non-governmental actors have addressed the regulatory dilemma in international electronic commerce. In this article, we have taken up two such cases: trust marks and Consumer 2.0. In addition to having different goals, being run by different kinds of actors and having a different approach to hierarchy (direction of interaction), these two cases show that regulation is possible to enforce without a completely comprehensive regulatory framework nor a strict focus on sanctions. In other words, there is a case for postmodern regulation at least in the context of international electronic commerce. In table 4 we sketch a typography of different ways of regulation.

Table 4. Typography of regulatory solutions

	Regulation	Trust marks	Consumer 2.0
Direction of Interaction	Top down	Top down, less strict	Between peers
Actors	Government	Business organizations	Consumers, facilitators
Goal	Legal position	Trust	Contextual information

The trust mark case bears resemblance to governmental regulation as trust marks are often operated by organizations that demand a great number of other organizations to follow rules. The overall goal of trust marks is also similar to that of governmental regulation as both aim at eliminating risks on the market. Of course, the structure of the trust mark system is weaker than that of regulation.

Consumer 2.0, on the other hand, challenges both regulation and business oriented self regulation. Facilitation is needed, but this can well be carried out by any service provider

which attracts an online community. The distinct feature of Consumer 2.0 is a knowledge support system that aggregates information provided by peers in real time.

Trust marks and Consumer 2.0 may be perceived by government as created by market actors, but this is not to say that they are provided by market mechanisms. They rather conform to a political approach to correcting market failure (cf. Hirschman, 1970).

Obviously the self regulatory solutions also have other similarities. In addition to involving peers as organizations or individuals, both are closely knit to the service they regulate. Trust marks are essentially a supporting service and Consumer 2.0 confirms the notion that consumers participate in the production of a service (cf. von Hippel, 2005). They also express some level of expertise of the parties involved.

5. Concluding insights

The regulation of international business-to-consumer electronic commerce has for long been a problematic issue for governments. Self-regulatory solutions have addressed parts of the dilemma. In this respect, international electronic commerce serves as a telling example of the regulatory challenges postmodern politics poses. Of course, not all self regulatory initiatives solutions have been successful. Nevertheless, there may be something to learn from them or at least a need to look them over.

Rather than looking at regulatory challenges as technical issues or issues of a division of labor between regulatory players, we propose to look at the tensions between modern national ideals and customs versus postmodern international modes and practices for ideas. In this context it appears that fragments of postmodern consumer policy are developing alongside conventional forms of consumer policy. This development takes place independently of the actions of conventional institutions for consumer policy. If so happens, governmental advocates will face increasing competition from other actors and forms of consumer policy.

The development of consumer policy is a highly relevant issue because modern Western societies are increasingly defined by consumption. Over the past decade, growth in the EU and North America has been driven largely by consumer demand. The consumer is at the heart of political thinking in the EU and policy makers assert that consumer participation enhances the economy. This argument is supported by marketing and business gurus, who argue that modern demanding consumers force markets to become more competitive (Inglehart, 1997; Pine & Gilmore, 1999; Porter, 1990). Moreover, consumers – i.e., amateurs and grassroots activists – have been recognized as a source of many economically and socially significant innovations (Leadbeater & Miller, 2004). Within consumer research, as well, interest has grown in the role of consumers as initiators, drivers, and shapers of innovation. Similar discussions have also been conducted in consumer research (Firat & Dholakia, 1998; Wikström, 1996).

It is in this context that consumers and consumer policy once again become important. One target in innovation policy has been to create new ways to achieve greater public involvement in decision-making (European Commission, 2002; Hagendijk & Kallerud, 2003). Consumer participation is needed at early stages of the innovation process. For example the UK Government has emphasized the need to involve consumer bodies more in policy making and to empower consumers by improving consumer education to create ‘demanding customers’.

But at the same time most academic and policy experts interviewed for this purpose (Bush, 2004) complained that, in fact, consumer bodies had not been linked in the innovation process in any meaningful way. There is a clear need to take consumer concerns into account more seriously and anticipatorily.

What could a governmental approach to postmodern consumer policy then be like? If we consider the two types of self regulation we have looked at in this article then we can at least point at challenges and propositions to solutions. Postmodern regulatory issues come well forth in them.

It would then appear that postmodern governmental consumer policy should take into consideration possibilities of being less nationally centralized and top down administered. It should welcome new actors in the development of consumer policy and its production. Especially consumers themselves may provide resources for consumer policy if they are given appropriate means and for a for this. Policy may also learn lessons from the close integration of regulation and service provision. Persuasion is not necessarily a weak tool alongside sanctions. Essentially, the postmodern challenge seems to call for an active approach towards the development of consumer policy.

Critics may claim that consumer policy is already tightly integrated with market actors and that many different kinds of measures are being used. This is of course true but does not challenge the notion that issues related to international commerce and practices related to ICTs continue to challenge consumer policy. Maybe the success of consumer policy has led to a narrowing of its vision (cf. Hilton, 2007), which is already being challenged by developments in special legislation. In this article we have sought new ideas from new forms of acting on the market including a new form of consumerism. We challenge policy makers to do likewise.

Structural Disparities of Media Consumption in the Nordic countries

Pekka Räsänen
Department of Sociology
University of Turku
Finland
pekka.rasanen@utu.fi

Abstract

The paper examines the current media use inequalities from the perspective of Nordic welfare societies. The countries selected consist of Denmark, Sweden, Norway and Finland locating near to each other in the northern part of the European continent. It is asked to what extent the Nordic countries, which have also been characterised as the world's leading information societies, show similar and different patterns of media consumption with each other. At the same time, the interest is to estimate these similarities and differences at the population level. The data consists of the Danish, Swedish, Norwegian and Finnish sections of the European Social Survey 2004 (N=7211). In general, the findings suggest that there are some recognisable national characteristics attached to contemporary media consumption patterns.

1. Introduction

An interpretation often given by social researchers is that the Nordic societies are relatively weakly structured in terms of gender, income and social class. A constant observation is that the Nordic countries show relative equality compared to other European nations, particularly in terms of poverty and other forms of economic inequality (e.g. Esping-Andersen 1990; Ferrera 1996; Norlund 2003). Also the key social institutions, such as the educational system, the labour market and income distribution systems, are considered to be by and large identical across the Nordic societies. In general, the countries are often seen as the welfare societies with universal rights of social benefits. Regarding these kinds of notions, the structural differences in the patterns of consumption and lifestyle are also expected to be small in comparison with many other countries (e.g. Katz-Gerro 2002; Räsänen 2006; Virtanen 2006).

In this paper, I examine the patterns of media consumption in the Nordic countries. I ask to what extent the Nordic countries, which have been characterised as the world's leading information societies, show similar patterns of media use with each other. My purpose is also to estimate the strength of the differences in the population level. Research interest is in television watching, radio listening, newspaper reading, and the use of the internet. The data consists of the Danish, Swedish, Norwegian and Finnish sections of the European Social Survey 2004 (ESS 2005).

The paper is structured as follows. First, research findings regarding socio-demographic and economic features of media consumption will be shortly reviewed. Research questions are

dealt next. This is followed by the presentation of data, variables, and methods of analysis. The empirical part of the paper is divided into descriptive and explanatory sections. In conclusions, it is discussed whether the consumption of the new information and communication technology (ICT) is developing a similar mark of higher social status as in consumption connected with reading and other cultural activities. The results also suggest that there are some recognisable national characteristics attached to contemporary media consumption patterns.

2. Structural characteristics of media use

Preceding research literature indicates that media use patterns connect with the differences by population groups. These differences are naturally affected by a number of factors. However, the key socio-demographic variables included in the empirical analyses of mass media and communication technology use are gender and age. In addition, there are important socio-economic factors associated with all types of media and consumer technology use. Income and education can be regarded as the most significant variables.

Gender constructs the elementary framework for many consumer practices. In most studies, men are found to spend more time and money on consumer technologies than women (e.g. Henderson et al. 2002; Rice & Katz 2003; Wilska 2003). Following this, the use of technological appliances has been regarded as a 'masculine' rather than a 'feminine' activity. Similarly, the typical course of an individual's life is built to a large extent around age. A number of studies have shown that the mass media and various other consumer technologies are used differently by people of varying ages (e.g. Hargittai 1999; Cummings & Kraut 2002; Vihalemm 2006). For example, older people spend more time watching television than younger people (e.g. Gershuny 2000; Niemi & Pääkkönen 2002). Young people, on the other hand, are often potential early adopters of new technologies (e.g. Wilska 2003; Räsänen & Kouvo 2007).

Income is a relevant explanatory factor because using different technologies costs money. One constant finding in earlier studies has been that a high income is related to more frequent ICT use and a preference for more diverse media content (e.g. Chan & Goldthorpe 2007; Hendriks Vettehen et al. 2004). Education is relevant on similar grounds; better-educated individuals are often better equipped to consume various media contents than those with less education (e.g. Attewell 2001; Parayil 2005; Räsänen 2006). A high level of education has also been associated with frequent use of various technological devices such as computers and mobile phones (e.g. Henderson et al. 2002; Robinson et al. 2002).

3. Research questions

The Nordic countries share relatively similar infrastructures in terms of print and electronic media. Particularly the recent development of the ICT infrastructures has been identical across the countries. For instance whereas before the early 1990s there were either monopolies or only a few operators in each country, ten years later there were already many players within telecommunications, several network operators and internet service providers (Nordic Information Society Statistics 2002; 2005). Together with the vigorous economic growth during the late 1990s these changes have resulted a rapid increase in the supply of mobile phone and internet services. Moreover, the Nordic countries also started the

establishment of digital television services in the late 1990s and early 2000, a way before most of the European countries.

First, it is feasible to ask to what degree the countries show similar profiles in the use of different media.

In addition to relatively similar ICT and media infrastructures, the Nordic countries are often seen as the welfare societies of social and economic equality. In comparison with the other European countries, a common feature for the Nordic countries is the strong interplay of state policies and other social institutions, such as the labour market and income distribution system. In this way the effective protective measures against poverty, universal social benefits and the prevalence of public over private welfare provisions are considered as their distinct features (e.g. Esping-Andersen 1990; Ferrera 1996). Following the principle of universalism, also economic and social inequalities within the societies are believed to be relatively small.

Second, it is motivating to evaluate whether the countries show weak structural inequalities, measured as economic and socio-demographic differences in the media use patterns.

According to many, one of the most important consequences of the diffusion of the new ICTs is that traditional forms of the mass media are at least partly being replaced by more advanced and more 'personalised' systems, designed to meet the needs of individual consumers (e.g. Fidler 1997; Cummings & Kraut 2002). In other words, newspaper and television for example can no longer be considered the primary sources of information and entertainment. Particularly the internet has become an important medium in these respects. It is not surprising that in recent time diary studies, a decline in watching television and other traditional mass media activities has been found among frequent internet users (e.g. Robinson et al. 2002; Gershuny 2003). As a main activity, also radio listening is continually losing its share compared to time spent on other media. At least in some population groups this is due to the increasing consumption of music via hand-held music players, mobile phones, and computers.

Third, it is interesting to address how differentiated the media consumption patterns are between the economic and socio-demographic groups, and between the countries.

The remaining sections of this paper deal with the effects of economic and socio-demographic factors on frequency of television watching, radio listening, newspaper reading, and the use of the internet. In order to examine how the patterns vary across the four countries, both cross-country and population-level differences have to be taken into consideration.

4. Data and methods

This study focuses on comparing the differences in media use between population groups in Denmark, Sweden, Norway and Finland. The data employed in this study are the ESS survey data, collected by face-to-face interviews in 2004 (N=7211). The data represent the residential populations of these countries aged 15 and older. The total number of cases ranges from approximately two thousand cases from each country (see ESS 2005).

The frequencies of media use are used as the dependent variables. These variables include measures on a total of four different media: television, radio, newspaper, and the internet. Along with the respondents' country of residence, age, gender, education, and income are used as the independent variables. A detailed description of the original measures and the coding procedure is given in Appendix.

Age and gender are measured as respondent's year of birth and sex. Age is categorised into four groups reflecting a broad classification of phases distinguished in adult lives. In this way, the variable enables us to observe a possible non-linear impact of age cohorts or generations.

Education is measured as the duration of education in years. Despite the fact that this variable does not report degree earned or level of education, it provides a congruent measure since educational systems differ slightly from one Nordic country to another. The variable was categorized into four groups.

Income is measured as the income of household and it is based on subjective estimates of all wages and salaries. A discrete variable of twelve income brackets is included in the data. However, a variable that divides the respondents into households earning less or more than a thousand Euro a month is used in the analyses.

The methods of analysis include cross-tabulations (descriptive analysis) and the logistic regression models (explanatory analysis). Throughout the analysis, the multinomial logistic regression (MLR) procedure is utilised (e.g. Tabachnick and Fidell 2001, 521-523). The effects of the independent variables in the models are presented with the odd ratios ($Exp\beta$). The odds ratio is the probability of being in one group divided by the probability of being in the other group. It indicates the increase (or decrease if the ratio is less than one) in the odds of being in the examined outcome category when the value of the independent increases by one unit. The statistical significances of the models are indicated in the tables by chi-square statistics (χ^2). Also the pseudo-coefficients of the determination, or explanation proportions, of the models are reported (Nagelkerke Pseudo R^2).

As the ESS authorities suggest, the 'design' weights that correct the sampling differences between the countries are applied in each analysis (see ESS 2007 for details).

5. Descriptive analysis

My first task in the analysis was to distinguish different types of media users from each other. Different user groups were approached with the use of three categories: 'non-users', 'infrequent users', and 'frequent users'. The first group consists of those respondents, who do not report using the given medium at all. The second consist of those who use the certain medium relatively seldom or who use it only for a short period at a time. Eventually, there are those who use the given medium often or who spend much time with it.

In general, it is known that varying amounts of time are devoted to different types of media. For example, people spend more than two hours a day watching television across Europe and US, while time spent on newspaper and magazine reading is less than one hour (e.g. Gershuny 2000; Niemi & Pääkkönen 2002; Robinson et al. 2002). In addition, the original measures in ESS data are not identical with each other. This is why infrequent and frequent

media users were classified by using slightly different criteria, depending on the medium in question (see Appendix).

Table 1 shows the proportions of media users by country. At first glance, we can observe that the overall patterns of television and radio use are similar across the countries. There is a small proportion of non-users in each country, but most respondents can be classified into the categories infrequent or frequent users. Concerning both media types, the proportion of frequent users is highest in Denmark. The Swedish respondents report the lowest proportion of frequent television watching and radio listening. On the other hand, newspaper reading and the internet use display somewhat different profiles. The share of those who do not read newspapers is highest in Denmark. The proportion of the internet non-users is highest in Finland. Norway has the highest share of frequent newspaper readers, Denmark the highest of frequent internet users.

Table 1 Proportions of media users by country

	All (N)	Country (N)			
		Denmark	Sweden	Norway	Finland
Non-users					
Television	2,1% (148)	2,0% (29)	1,6% (31)	1,4% (25)	3,1% (63)
Radio	16,8% (1208)	12,0% (178)	20,5% (389)	13,1% (230)	19,9% (402)
Newspaper	10,0% (723)	23,1% (343)	8,3% (161)	4,6% (81)	6,8% (138)
Internet	32,2% (2319)	30,2% (447)	30,2% (558)	29,4% (517)	37,9% (767)
Infrequent users					
Television	60,6% (4370)	52,4% (779)	66,9% (1303)	66,4% (1080)	59,8% (1208)
Radio	40,7% (2938)	35,1% (521)	42,4% (862)	44,5% (784)	39,9% (807)
Newspaper	74,4% (5365)	63,9% (949)	78,7% (1533)	75,8% (1334)	76,6% (1549)
Internet	16,9% (1217)	12,6% (186)	19,7% (384)	14,8% (260)	19,1% (387)
Frequent users					
Television	37,4% (2698)	45,7% (679)	31,5% (614)	37,2% (655)	37,1% (750)
Radio	42,5% (3065)	52,9% (784)	37,1% (722)	42,4% (746)	40,2% (813)
Newspaper	15,6% (1126)	13,0% (193)	13,0% (253)	19,6% (345)	16,6% (335)
Internet	51,0% (3675)	57,3% (849)	50,1% (976)	55,8% (982)	42,9% (868)

Source: European Social Survey (ESS 2005).

The findings indicate that there are certain cross-country differences in media use, which should be taken into account in the further analyses. The proportion of the frequent internet users is over 50 percent in each country, except for Finland. It thus seems that Finland represents a slightly less developed environment compared to other Nordic countries when it comes to internet use. In principle, this observation is consistent with the official statistics (e.g. Nordic Information Society Statistics 2005; Eurostat 2005). It is also interesting to address in more detail the structure of newspaper reading particularly in Denmark and Norway.

The differences in media use patterns among population groups were examined next. Table 2 shows variations by gender, age, education and income in all countries. The first observation

is that the differences by gender are small in general. However, the use of the internet provides an exception. Male respondents appear to be considerably more often frequent internet users compared to females, and less often non-users. This finding is consistent with numerous studies examining the interplay between gender and ICT-use (Dutta-Bergman 2005, 104-105; Räsänen 2006; Wilska 2003). The fact that there is more internet material targeted at male users, such as pornography or sports, may partly explain the observed gender disparities.

Table 2 Proportions of media users by different population groups

	Gender (N)		Age (N)				Education (N)				Income (N)	
	Men	Women	<30	30-44	45-60	>60	>15	13-15	9-12	<9	<1000	>1000
Non-users												
Television	2,1 (76)	2,0 (72)	2,9 (44)	1,8 (35)	1,7 (33)	2,0 (36)	2,8 (45)	1,6 (31)	1,7 (46)	2,5 (25)	4,6 (33)	1,6 (97)
Radio	15,3 (544)	18,2 (664)	23,2 (351)	16,3 (312)	13,6 (264)	15,2 (281)	15,8 (255)	14,9 (283)	18,3 (486)	17,3 (173)	23,2 (167)	15,5 (920)

Source: European Social Survey (ESS 2005).

Differences by age indicate that particularly the proportions of frequent media use vary considerably between age groups. Newspaper reading and the internet use reveal the strongest differences. Older people are more likely to be frequent newspaper readers and, at the same time, much less likely to be frequent internet users, compared to younger people. The difference in television watching is considerable particularly between over 60-years-olds and other respondents. Radio listening does not show strong variation between age categories. Otherwise, the findings show that the patterns of media use are built to a large extent around age. A number of preceding studies have found that young and old people use the mass media and ICTs differently (Hendriks Vettehen et. al 2004, 421; Vihalemm 2006). As expected, older people are watching television more frequently than younger people. Young people, on the other hand, are often the most likely to be regular internet users.

Also educational attainment has considerable impact on media use. The strongest impact can be observed in the use of the internet. Those with many years of full-time education completed are less likely to be non-users than others, and more likely to be frequent users. Regarding other media use variables, differences appear to be more ambiguous. Those with less educational attainment are watching television and listening to radio more frequently

than others. Newspaper reading is not influenced strongly by education. Still, those who spend much time on newspaper reading are more likely to have completed less than nine years of education. At the same time, however, those who do not read newspapers at all are the least likely to be found among the most educated respondents.

Finally, income differences show that both non-use and frequent use patterns vary between income groups. Income has the strongest effect on the internet use, and the weakest on radio listening. Internet is less often used among those who live in households that earn less than one thousand euro a month. Television and newspaper shows the opposite; respondents from households that earn less spend time more time on these media. However, the effects of most of the other dependent variables are clearly stronger in this respect. Despite this, the findings point out that media use displays differences between the poor and well-off individuals.

Overall, the observed differences in the internet use and newspaper reading pattern provide interesting information, but otherwise findings can be held fairly predictable. This means that the results are consistent with the existing research literature.

The selected socio-demographic and economic factors are connected with the media use patterns in most instances. Given the results, media use is a relevant social issue especially when it connects to the varying use frequencies. With the exception of the internet use, there are few respondents in the non-user categories. It is also likely that the variation indicated by Table 2 can be explained more sufficiently by utilising several independent variables at a time. Next, the distribution of frequent use patterns among the Nordic consumers will be examined in more detail.

6. Explanatory analysis

In the further analysis, I employed logistic regression models on the combined data that included all cases from each country. Models were used to predict an outcome of being a 'frequent user' from a set of independent variables. In order to do so, categories 'non-users' and 'infrequent users' were combined. This resulted in dichotomous dependent variables.

Table 3 shows the adjusted models for frequent television, radio, newspaper, and the internet consumption. Regarding television watching, all independents appear to be significant, except for gender. It is clear that education and age provide strong predictors, while income has somewhat weaker effect. The odds ratios by age indicate that over 60-years-old respondents are twice as likely to watch television frequently compared with other age groups. Differences between educational categories point out that those who have completed less than nine years of full-time education are the most likely to watch television frequently. The most educated respondents are nearly three times less likely of being among that user group. Respondents with low household income are also more likely to watch television more frequently than others (with the odds of 1.4). The model explains only nine percent of total variance though.

Table 3 Frequent media use in Nordic countries, logistic regression models

Main effects	Television, Exp β	Radio, Exp β	Newspaper, Exp β	Internet, Exp β
Gender, χ^2	0,0 (ns)	1,1 (ns)	27,2***	78,6***
Male	(ns)	(ns)	1,45	1,68
Female (a)	1	1	1	1

Source: European Social Survey (ESS 2005).

Radio listening, on the other hand, is not strongly affected by any of the independents. Only age and education remain statistically significant. Respondents in the youngest and the second youngest age group are less likely to listen radio frequently when compared with the older respondents. The effect of education is significant only between the most and the least educated respondents. The respondents in the former category are about 1.7 times as likely to listen to the radio frequently compared to the latter. Despite the differences by age and educational categories, this model has practically non-existent explanatory power (three percent).

Newspaper reading shows more interesting differences. In fact, all independent variables remain significant in the model. Effect of income, however, is relatively weak indicating that respondents with low income are likely to spend more time on newspaper reading than others. The effect of gender shows that males are almost 1.5 times more likely to read newspapers frequently than females. Educational differences appear to be systematic since the likelihood of frequent newspaper reading ascends gradually from the lowest income category to the second lowest, and so on. In this sense, newspaper reading shows an opposite ‘cultural pattern’ of consumption compared with television watching. In spite of that, it is evident that age has clearly the strongest impact here. Under 30-years-old respondents are 14 times less likely to read newspapers frequently when compared with over 60-years-olds. The second youngest age group has approximately eight times smaller odds of belonging to frequent category compared to the oldest. The model results with a satisfactory explanatory share of total variance (17 percent).

The last model shows the effects of independent variables on frequent internet use. Obviously, the strongest differences can be attributed to age and income. Under 30-years-olds are about twelve times more likely than over 60-years-olds to be frequent users. The most educated respondents, on the other hand, are 14 times more likely to belong to that category

compared with the least educated. Results by gender indicate that men are 1.7 times more likely to be frequent internet users than women. Income difference is also interesting; respondents in the lowest income category are twice as less likely to be frequent users. The model explains as much as 38 percent of total variance.

The main-effect models were applied in order to compare the effects of economic and socio-demographic variables. On the basis of these results, we can conclude that the frequency of media use can be explained by the variables selected. In addition, the effects of independent variables appear to be different when different types of media are compared with each other. In general, age and education can be held as strong sources of variance.

However, the cross-country differences observed in Table 1 were not taken into account. In Table 4, two-way interactions between independent variables and country are displayed. The models are adjusted for the main-effects of economic and socio-demographic variables. The table reports the significances based on chi square statistics only.

Table 4 Interactions between frequent media use and country, logistic regression models

Main effects + interactions	Television × country	Radio × country	Newspaper × country	Internet × country
Gender, χ^2	4,8 (ns)	1,4 (ns)	0,62 (ns)	12,4**
Age, χ^2	8,6 (ns)	12,7 (ns)	21,9**	7,6 (ns)
Education, χ^2	11,6 (ns)	5,7 (ns)	10,8 (ns)	16,0*
Income, χ^2	9,9*	3,9 (ns)	1,2 (ns)	1,7 (ns)
χ^2 (a)	608,6***	264,5***	792,2***	2279,6***
df	35	35	35	35
Pseudo R ²	.12	.05	.19	.39

Note: ** = $p < 0.01$; * = $p < 0.05$; (ns) = $p > 0.05$; (a) = indicates the difference between the final model and a reduced model.

Source: European Social Survey (ESS 2005).

As the statistics show, the country interacts with income when explaining television watching. Age has an interaction with newspaper reading, and gender and education with the internet use. Investigation of radio shows that there are not any significant interactions. This means that regarding radio listening, there are no differences in the effects of economic and socio-economic variables between the countries.

A closer investigation of the parameters (not shown in Table 4) revealed that respondents earning less than a thousand Euro a month were in fact slightly more to watch television frequently in Finland when compared with other countries. However, the effect is barely significant (at $p < 0.05$ level). Regarding newspaper reading, it was found that 30-44-years-old Finnish respondents are less likely than other 30-44-years-olds to be frequent newspaper readers. Despite the fact that the effect is not very strong, the finding is rather interesting in the context of Nordic societies. The analysis of internet use revealed two significant interactions. The interaction between gender and country revealed that in Finland male users are less likely to be frequent users compared to other countries. This finding shows that while the proportion of users is lowest in Finland, the gender difference is not as strong as it is elsewhere.

The interaction between education and country, on the other hand, revealed that the Danish respondents with less than 9 years of education are more likely to be frequent internet users compared to same group in other countries. This indicates that education is weaker determinant of internet use in Denmark. It is thus reasonable to notice that there are certain

cross-country differences in the strengths of some of the socio-demographic variables. Some of these interactions require special attention in conclusions.

7. Conclusions

When trying to define and understand consumption patterns, sociologists refer to such factors as individuals' age, education, income level, and so on. It is believed that these kinds of variables can predict consumption behaviour more effectively than various situational, psychological or need-based factors. Naturally, at the most abstract level, there are certain collective social norms and fashions that may lead consumers to consume in particular ways. But in order to understand the explanatory mechanisms behind consumption patterns, we typically draw to the more basic views on classes, social stratification, and structural effects.

The differences of cultural 'appreciation' or 'knowledge' adopted by certain educational or occupational classes are normally held as effect-mechanisms explaining the findings. Similar interpretations stressing some sort of boundary conditions may also be given in relation to age and gender. The consumption patterns of men and women and of people of different ages can reflect certain role expectations, for instance. In comparison, the effect-mechanisms related to income are somewhat more straightforward; the available economic resources simply control one's expenditure and the planning of future expenditure.

This paper focused on the differences in the media use patterns in the Nordic countries. My aim was to examine to what degree the basic social structures and the inequalities based on media use were interrelated. One of the key finding was that income strongly affects internet use frequencies in all countries. It is also clear that the patterns of internet use are strongly connected with youth. Older age groups are less likely to access the internet frequently. Television watching and newspaper reading, on the other hand, show the opposite trend: older people spend clearly more time on these media types compared to younger people. Radio listening appeared to be the only variable that was not explained effectively by any of the background variables.

In general, the disparities by population groups are important in the light of prevailing socio-demographic structures in the Nordic societies. The results suggest that certain media use patterns are introducing new types of structural inequalities. Particularly the role of the internet can be emphasised here. The analyses showed that the educational disparities in the internet use are similar with the disparities attached with newspaper reading. However, the effect of education on the internet use is clearly stronger. Newspaper reading is explained sufficiently by age. In this sense the new ICTs can be thought to reflect the identical structural conditions that are reflected by the more traditional forms of cultural consumption. Broadly speaking, it appears that assumptions, according to which the structural inequalities between population groups can be smoothed when more extensive media infrastructures will be provided for consumers, are too simplistic.

The results also indicated that the Nordic countries show differences in the examined media use patterns. In addition, variation was found in some of the socio-demographic effects between the countries. From the comparative perspective, the results thus suggest that the Nordic countries are not necessarily as homogenous with each other as many social researchers believe.

APPENDIX

Measures, original questions presented in the questionnaires, and the coding of variables

	Original question	Coding	
DEPENDENT MEASURES	Television watching	On an average weekday, how much time, in total, do you spend watching television?	1=No time at all, 2=Less than ½ hour; ½ hour to 1 hour; Up to 1½ hour; Up to 2 hours; 3=Up to 2½ hours; Up to 3 hours; More than 3 hours.
	Radio listening	On an average weekday, how much time, in total, do you spend listening to the radio?	1=No time at all, 2=Less than ½ hour; ½ hour to 1 hour; 3=Up to 1½ hour; Up to 2 hours; Up to 2½ hours; Up to 3 hours; More than 3 hours.
	Newspaper reading	On an average weekday, how much time, in total, do you spend reading the newspapers?	1=No time at all, 2=Less than ½ hour; ½ hour to 1 hour; 3=Up to 1½ hour; Up to 2 hours; Up to 2½ hours; Up to 3 hours; More than 3 hours.
	Internet use	How often do you use the Internet, the World Wide Web or e-mail – whether at home or at work – for your personal use?	1=Never; No access at home or at work, 2=Once a week; Several times a month; Once a month; Less than once a month, 3=Every day; Several times a week.
INDEPENDENT MEASURES	Country	Are you citizen of [country]?	Yes: 1=Denmark, 2 =Sweden, 3=Norway, 4=Finland.
	Education	How many years of full-time education have you completed (including compulsory/mandatory years of schooling)?	1=0-8 years, 2=9-12 years, 3=13-15 years, 4=Over 15 years.
	Age	Respondent's year of birth	Calculated from the year of birth: 1=15-29 years, 2=30-44 years, 3=45-60 years, 4=Over 60 years.
	Gender	Sex of respondent	1=Male, 2=Female.
	Income	If you add up the income from all sources, which of the following describes your household's total net income (if you don't know the exact figure, please give an estimate)?	Dichotomized from a twelve-point ordinal scale: 1=Less than 1000 Euro a month, 2=Over 1000 Euro a month.

Abstract

The starting point for this paper is the lack of linkage between two of the prominent social agendas of the time – the development of the information society and the question of how to prevent man-made climate change. The paper is intended as a contribution to integrate the two agendas by considering ICT in an energy perspective. In particular, the paper focuses on the integration of ICT in households and the energy impacts related to changing everyday practices. As this has not received much attention in previous research, the paper has an explorative character. Firstly, the paper reviews some of the previous studies on ICT and energy and the consumption perspective is introduced. Secondly, the integration of ICT in everyday practices and the dynamics behind the changes are outlined, inspired by a historical perspective. Thirdly, a figure of the relationships between changing everyday practices and the related energy impacts is presented, followed by descriptions of direct energy consumption related to household ICT, indirect energy consumption outside households, and derived impacts both within and outside households. The paper concludes with some remarks on political implications and questions for further research.

Introduction

The development of the information society has been and still is accompanied by enthusiasm and a strong sense of necessity where the challenge for political and administrative institutions at all levels is to increase the pace of the development and remove all hindrances – take care of security problems, increase the competencies of the population, supply new services, support the provision of infrastructure. The necessity springs from the drive for competitiveness and the emergence of new business opportunities in the so-called “experience economy”. At the same time, other parts of the political and administrative system are concerned with environmental issues, not the least with the prospects of global warming. Information and communication technologies (ICTs) offer both potentials for energy savings and increasing demand for energy use so there are good reasons to bring together these two agendas. In the early 1990s the first studies on the positive environmental prospects of ICT emerged (Freeman 1992), and the first steps were taken towards regulating ICT energy use. As we will return to below, the importance of ICT in relation to energy consumption has carried some interest since then, but still the two agendas tend to develop in relative isolation. As Alakeson and Wilsdon wrote in 2001: “Most European policies for the information society and for the environment have developed in separate silos, but it is fair to say that the potential environmental impact of digital technologies is increasingly acknowledged by EU policy makers” (Alakeson and Wilsdon 2003, p. 10). In spite of this increasing acknowledgement, there is still a long way to go before the two agendas of the

information society and global warming are really brought together. As a small illustrative example, it is still possible to write a nearly 200-page status on the Danish information society (Statistics Denmark and National IT and Telecom Agency 2006) without mentioning energy (or any other environmental concerns) at all.

This paper is intended as a contribution to considering ICT in an energy perspective. ICTs have many other environmental impacts than those related to energy – for instance, the use of toxic materials, brominated flame retardants, heavy metals – but these are only included in so far as they influence the energy impacts. The point of departure is taken in the integration of ICTs in households, and the energy impacts of changing household practices are discussed. Most studies of ICT and energy have concentrated on macro scenarios or the prospects seen from the production side, so households have not received much attention (there are exceptions, such as (Aebischer and Huser 2000)). On this background the paper has an explorative character, and it is based on a combination of literature studies, discussions with experts, and a visit to the “digital home” in Taastrup, Denmark. The data used in this paper mainly refer to Denmark. The main interest is to provide a basis for further in-depth studies of households and for more proactive political approaches dealing with the energy impacts of ICT, whereas there is no intention to quantify the complex relations between household ICT use and the related energy impacts, to outline scenarios for future developments or to assess whether ICT development in households is good or bad in an energy perspective. The integration of ICT in household practices is a fact, so it is less important whether the net energy impact is positive or negative than it is to find ways to avoid the negative impacts and encourage the positive.

In the following, some of the previous studies on ICT and energy are briefly mentioned and the consumption approach is related to these. Secondly, the integration of ICT in everyday practices and the dynamics behind the changes are outlined, inspired by a historical perspective. Thirdly, a figure of the relationships between everyday practices and the related energy impacts is presented, followed by descriptions of energy impacts directly related to ICT in households, indirect impacts outside households, and derived impacts both within and outside households. The paper concludes with some remarks on political implications and questions for further research.

Previous studies and the consumption perspective

Early studies on the emergence of the information society tended to emphasize the positive potentials related to ICTs. The most immediate positive impacts relate to the possibilities for increased production efficiency in most sectors: more accurate monitoring and control of processes, quality, and inventory, miniaturizing resulting in substantial reduction in the number and weight of components, and increased transportation efficiency (Freeman 1992) – and these issues are still central for more recent studies (Berkhout and Hertin 2001; Jørgensen et al. 2006). Furthermore, it is emphasized that the Internet opens up opportunities for information sharing in business and academia regarding environmental issues (Richards et al. 2001) (see also a European series of conferences under the heading Informatics for Environmental Protection), and corresponding positive effects are identified in relation to consumers and environmental NGOs (Reisch 2001).

Gradually, the enthusiasm was supplemented with more discussion on the problematic environmental impacts of ICT. Before the entry of ICTs, offices were usually considered less important when energy requirements were calculated, but from the late 1980s offices appeared as energy consuming places. Both for economic reasons and in consideration of the

environment, more attention turned towards energy savings (e.g. the U.S. EPA introduced the Energy Star labelling in 1992 for office equipment). In the late 1990s and early 2000s, a heated discussion took place in the U.S. in the wake of some provocative statements concerning the high electricity consumption of ICT equipment, titled *Dig more coal – the PCs are coming* (Huber and Mills 1999), based on (Mills 1999). The statements were repudiated by many other researchers, as can be seen from the summary of the debate at <http://enduse.lbl.gov/projects/infotech.html> where links can be found to the many contributions; short summaries can be found in (Laitner 2003) and (Cole 2003). In one of the contributions (Baer, Hassell, and Vollaard 2002), it is concluded that even large growth in deployment and use of digital technologies will only modestly increase U.S. electricity use over the next two decades, however, Huber and Mills stuck to their ideas (Huber and Mills 2003).

Other studies go beyond electricity and include both direct and indirect environmental effects of ICT use, including various categories of rebound effects, for instance (Plepys 2002; Erdmann et al. 2004). In Berkhout and Hertin's study for the OECD on the environmental impacts of ICT (Berkhout and Hertin 2001), summarized in (Berkhout and Hertin 2004), they distinguish between direct effects, indirect effects, and structural and behavioural effects of ICT. Direct effects stem from the production, use and disposal of hardware, indirect effects concern efficiency improvements in production processes and in design and operation of products and services, whereas structural and behavioural effects are a mixture of rebound effects and effects related to increased consumer information. Berkhout and Hertin argue that the direct effects are mostly negative, whereas the indirect efficiency effects are largely positive, and the structural effects (including rebound effects) are highly contested. Related categorizations are used in other studies, e.g. in the foresight study by Jørgensen et al. (2006) who, inspired by Berkhout and Hertin as well as others, consider first, second and third order relationships. First order relationships refer to the direct environmental impact from the ICT equipment and ICT infrastructure, second order relationships arise from the use of ICT in different applications and the influence on processes and products, and third order relationships concern the changing structural composition of business and product areas as well as broader social and structural changes.

In most macro studies on ICT and environment, consumers play a very minor role. This role is mostly related to the indirect, structural level where the positive potential related to behavioural change is emphasized. In particular, teleshopping and teleworking are pointed out as having a potential for energy savings related to transport (just as business travel is expected to decrease because of videoconferencing). However, in studies focusing on electricity consumers are becoming more visible. Concluding a study on energy consumption of PCs Cole writes: "While this chapter places greater emphasis on PCs in the commercial sector, the impact of PCs in the residential sector must not be overlooked. The proliferation of PCs in the home, due to expanded use of the Internet, means that the residential sector may be responsible for a much greater proportion of energy consumed by office equipment than previous estimates" (Cole 2003, p. 156-7). A direct focus on consumers appear in some Swiss and German works (Aebischer and Huser 2000; Cremer and et al. 2003; Aebischer and Varone 2001), and small sections on ICT emerge in reports on consumption and environment (European Environment Agency 2005).

Consumers have been most visible in relation to the discussion of standby electricity use. The first mentioning of standby consumption of home equipment was in the beginning of the 1990s (Sandberg 1993). Since then, the American energy efficiency conference ACEEE

(www.aceee.org) and the European conference organized by the sister organisation, ECEEE, (www.eceee.org) have had workshop sessions on standby consumption, as has the International Conference on Energy Efficiency in Domestic Appliances and Lighting, EEDAL (see <http://re.jrc.ec.europa.eu/energyefficiency/events/eedal2006.htm>). Papers have, on the one hand, focused on measurements of the size of ICT-related energy consumption in households (Roth 2006; Harrington, Jones, and Harrison 2006), and on the other hand, discussed how to agree on standards which can be useful for energy labelling and other types of product regulation (Jones 2006; Murakoshi et al. 2005). However, standby consumption has increased steadily, and one of the leading experts on standby consumption, Alan Meier, concludes that internationally the standby consumption in households represents 4-11% of the total electricity consumption (Meier 2005). There are two ways to reduce standby consumption, either to encourage producers to develop appliances using less energy or to make users turn off the appliances instead of leaving them on standby. Internationally, the former has received far most attention, and this would also be the most efficient if it was successful. In 2005, however, only Japan had compulsory programmes concerning standby, whereas both Europe and USA worked with voluntary agreements (Meier 2005). Much of the research and development presented at the ACEEE, ECEEE and EEDAL conferences is closely related to these political efforts to reduce standby consumption, and even though progress is seen, one of the problems with the regulation and standardization is that fast technology development resulting in new types of appliances and new types and levels of standby are appearing continuously (IEA 2001).

Nationally, however, there have also been campaigns targeting consumer behaviour. A Danish study focused on households' interest in and possibilities to reduce their standby consumption (Gram-Hanssen and Gudbjerg 2006). Results here indicate that some households quite easily change routines and are able to eliminate the majority of their standby consumption. Other families, however, having expectations of being online all the time, and having many of their appliances connected to each other found it much more difficult and inconvenient. Thus both the producer and the consumer approaches relating to standby consumption indicate that standby consumption is a problem continuously to be dealt with.

In this paper the intention is to go beyond the relatively narrow roles assigned to consumers in studies on ICT and energy. There is a need for paying more attention to consumers when dealing with the energy impacts of ICT, first of all because ICT is increasingly integrated in everyday life. Furthermore, a consumption perspective can highlight aspects that complement the aspects brought forth when focusing mainly on production, thus also opening up new opportunities for managing the energy impacts. In general, when a production perspective is the point of departure in environmental studies, technological changes tend to be perceived in terms of solutions, because technology can contribute to efficiency improvements. In spite of the increasing awareness of rebound effects, the perspective tends to be mostly optimistic. This differs from the consumption perspective where new technologies are only in exceptional cases introduced to improve, for instance, the energy efficiency of household activities. New technologies serve as drivers behind consumption growth and will as such contribute to increasing environmental impacts (Røpke 2001; Røpke 2003). From this perspective efficiency improvements become a modification to the main effect. The consumption perspective thus tends to bring the more problematic aspects of technological change more directly into focus – not being relegated to the position of rebound effects.

The organization of the paper is inspired by the studies mentioned above considering different levels of effects (Berkhout and Hertin 2004; Jørgensen et al. 2006). As the

perspective of this paper is more narrow than in these studies, the same categories are not directly applicable, but a related way of thinking is reflected in a three level categorization of the energy impacts related to ICT use in households. The impacts are thus grouped in

- *Direct energy consumption* (mostly electricity) related to the use of ICT equipment in household practices, both in the dwelling and on the move.
- *Indirect energy consumption* related to the provision of households' electricity consumption, the production and disposal of ICT equipment for household use, and the running of the infrastructure such as sending masts and servers. The term "indirect" is thus used here in the same way as usual in the energy literature rather than in the way used in ICT studies.
- *Derived energy impacts* relate to changes in the composition of consumption and in behavioural patterns influencing households' energy consumption as well as systemic energy consumption.

The two first categories of energy consumption tend to increase when the amount of equipment is increased, although this can be counteracted by increased efficiency of new equipment. In the third category more positive impacts can be expected to dominate, such as, for instance, those related to equipment installed to manage heating and lighting in the dwelling in an energy-saving way – however, the outcomes in this category will be highly contested. This category also covers the effects of teleshopping and teleworking for energy consumption of both households and the wider system. The term rebound effects is not used in this categorization, because the term is attached to the indirect effects of a change which is motivated by environmental concerns (rebound effects in consumption is discussed by (Hertwich 2005)). In a few cases it could be relevant here to talk about rebound effects – for instance, in the case of energy-saving heat regulation which might save money that can be used for more energy-consuming purposes – but few of the ICT acquisitions are motivated by environmental concerns so this will be left out.

The integration of ICT in everyday life

As a basis for dealing with the energy impacts of household ICT use, this section focuses on the ongoing process in which ICTs gain access to everyday life. The process will be seen in the perspective of the history of technology as this indicates the sweeping character of the changes.

In some respects, the integration of the computer in everyday life can be compared to the integration of the small electromotor. When the electromotor was introduced, it became integrated in a wide range of domestic appliances and tools – vacuum cleaner, mixer, refrigerator, washing machine, dishwasher, airconditioning, drilling machine, toothbrush. The electromotor could replace muscular strength and transmit energy for heating and cooling, and innovators searched for all conceivable possibilities for developing devices applying this new technology (including some of the more absurd applications, e.g. the electric tie holder). The motor became part of the thorough transformation of household work, the near disappearance of domestic servants, and the increasing participation of women in the labour force (Cowan 1983; Olesen and Thorndahl 2004). The point is not that the electromotor was driving all these changes, but it became integrated in the ongoing social processes and put to uses formed by the social dynamics. Thus Cowan emphasizes how the technology could have been used in other ways with different social outcomes, such as collective solutions to household chores, if the social and cultural dynamics had been different. The computer has a general applicability comparable to the electromotor and can be integrated in practically all everyday activities. The computer replaces or enhances brain capacity – the ability to calculate, manage, communicate, and regulate – a quality that can be used everywhere.

Presently, innovators are searching all conceivable possibilities for applying this new technology in appliances, tools, and devices that can be tempting for consumers and fit into their topical concerns and desires.

The computer is not only connected to the electricity net (directly or indirectly through batteries) as the electromotor, but can also be connected to networks of communication, including the Internet, the so-called motorway of information. The Internet introduces a new infrastructure that calls for comparisons with the introduction of electricity, telecommunication, broadcasting, and even the water supply system and the sewerage system. When these large technological systems are developed, many actors and interests are involved and contribute to the coevolution of technologies and use patterns. When such a system is stabilized, it becomes an unacknowledged basis of everyday life – one more system that we are served by and serve in our everyday life (Otnes 1988). The Internet has not yet acquired this status of unacknowledged basis of everyday life, but the new possibilities for acquiring information and entertainment and for communication are increasingly integrated in all conceivable activities, driven by both commercial and political-administrative interests and by users themselves.

The present coevolution of technologies and everyday life is, furthermore, characterized by the increasing mobility. This trend can be seen as a continuation of previous efforts to make all sorts of equipment available for activities on the move, such as the portable gramophone, the portable typewriter, the transistor radio and all sorts of equipment for the car and the camping trip. The mobile phone is probably the much successful innovation ever in this line of mobile appliances, and Levinson (Levinson 2004) argues that this follows from basic human desires: “It is a need as old as the human species – the need to talk and walk, to communicate and move, at the same time. It is a need that even defines the human species, as an organism that makes symbolically meaningful sounds with voice boxes and tongues, and goes from place to place upright, on hind legs” (p. 13). When the mobile phone is combined with wireless access to the Internet in large geographical areas, the mobile encyclopedia, the mobile library, and the mobile entertainment center are available as well. The development of wireless connections and better batteries permit that ever more activities can be carried out on the move, gradually reducing the difference between what can be done at home and on the move, respectively.

These general observations are reflected in the ongoing integration of computer, Internet, and mobile phones in numerous everyday practices. The pervasiveness of these technologies can be illustrated with examples from the different spheres of everyday life. The use of computer and Internet is increasingly integrated in:

Work and education: Telework, e-learning, ordinary school work, well equipped home offices, video conferences.

Reproductive work: Shopping, banking, public services, health monitoring, the intelligent home (regulation of heating, lighting, security systems), security, child care (entertainment, monitoring), cooking (find the recipe), do-it-yourself (exchange experiences, find information). Computer and Internet also add a new task to the list of reproductive activities, namely ICT maintenance, just as the car once added the task of car wash.

Leisure: Social communication, entertainment, games, creativity, documentation, hobbies, gambling, sex.

Civil society: Organizations, political activities.

Theories concerning the formation of practices in everyday life point out three constituent aspects of a social practice: The competences needed to carry out the practice, the material devices used for the activity, and the meaning attached to it (Shove and Pantzar 2005; Warde 2005). This theoretical framework has been used to discuss the formation and change of specific practices, but it can also be used to illustrate more general dynamics cutting across many practices. ICT is an example of generic technological change – a change of basic technologies influencing all sorts of applied technologies – which provides a supply of renewed material devices for many different practices. Simultaneously, these practices are influenced by changes in the other two constituent aspects, as technological change codevelops with changing discourses offering new meanings to various practices and with the development of training in the use of the new technologies. In Fig. 1 (next page) the three constituent aspects are illustrated in the top part of the figure, surrounding everyday practices. For all three aspects, government regulation, subsidies, campaigns, and other activities play a decisive role alongside the governance enacted by the firms and organizations involved – for instance, in the provision of safety, standards, business models, and training, as well as in influencing the discourses through reports on the need for keeping up in the competitive race, the prospects of the experience economy, and the potential for using ICT in various sectors.

In the formation of everyday practices, the ICT-related dynamics meet with other social dynamics related to dominant social concerns and trends of the time. Examples are the long-term trend towards individualization and personal independence, the discourse on busyness, stress and the balance between work and family life, and the preoccupation with body and health. In Fig. 1 these cross-cutting trends are mentioned within the box of everyday practices. In relation to each specific practice, many other, more detailed concerns will be important.

Direct energy consumption

The most immediate energy impacts of the integration of ICT in everyday practices are visible in household electricity consumption. Still this impact is not large compared to other categories of energy consumption in households, but it is increasing. Denmark has been particularly successful with regard to decoupling household energy consumption from economic growth. From 1990 to 2005 household energy consumption increased only 4.4%, but electricity consumption for light and appliances increased 18% (Energistyrelsen 2006). Most electricity is used for white goods, but the importance of media technologies, including TV, video, computers and related equipment, increases. Presently, approximately 20% of electricity consumption is used for media equipment, and about half of this is used for standby (Gram-Hanssen 2005).

As illustrated in Figure 1, energy consumption related to the use of ICT depends on the quantity of ICT equipment, the energy efficiency of this equipment, and the patterns of use, that is, the number use hours, the time on standby, and the intensity of use (the energy consumption of some appliances depends on the kind of use). In the following, some of the present trends influencing electricity consumption will be highlighted.

Presently, television and video weigh more heavily than computers, and in the near future, a particular burst of energy consumption can be expected in relation to the digitization of television and to the diffusion of HDTV, High Definition TeleVision. The increasing energy consumption is related to the need for set-top boxes that can be combined with existing TV sets or are integrated in new sets. In spite of increasing interest in keeping down energy consumption of TV sets, little interest has been directed towards set-top boxes, and many

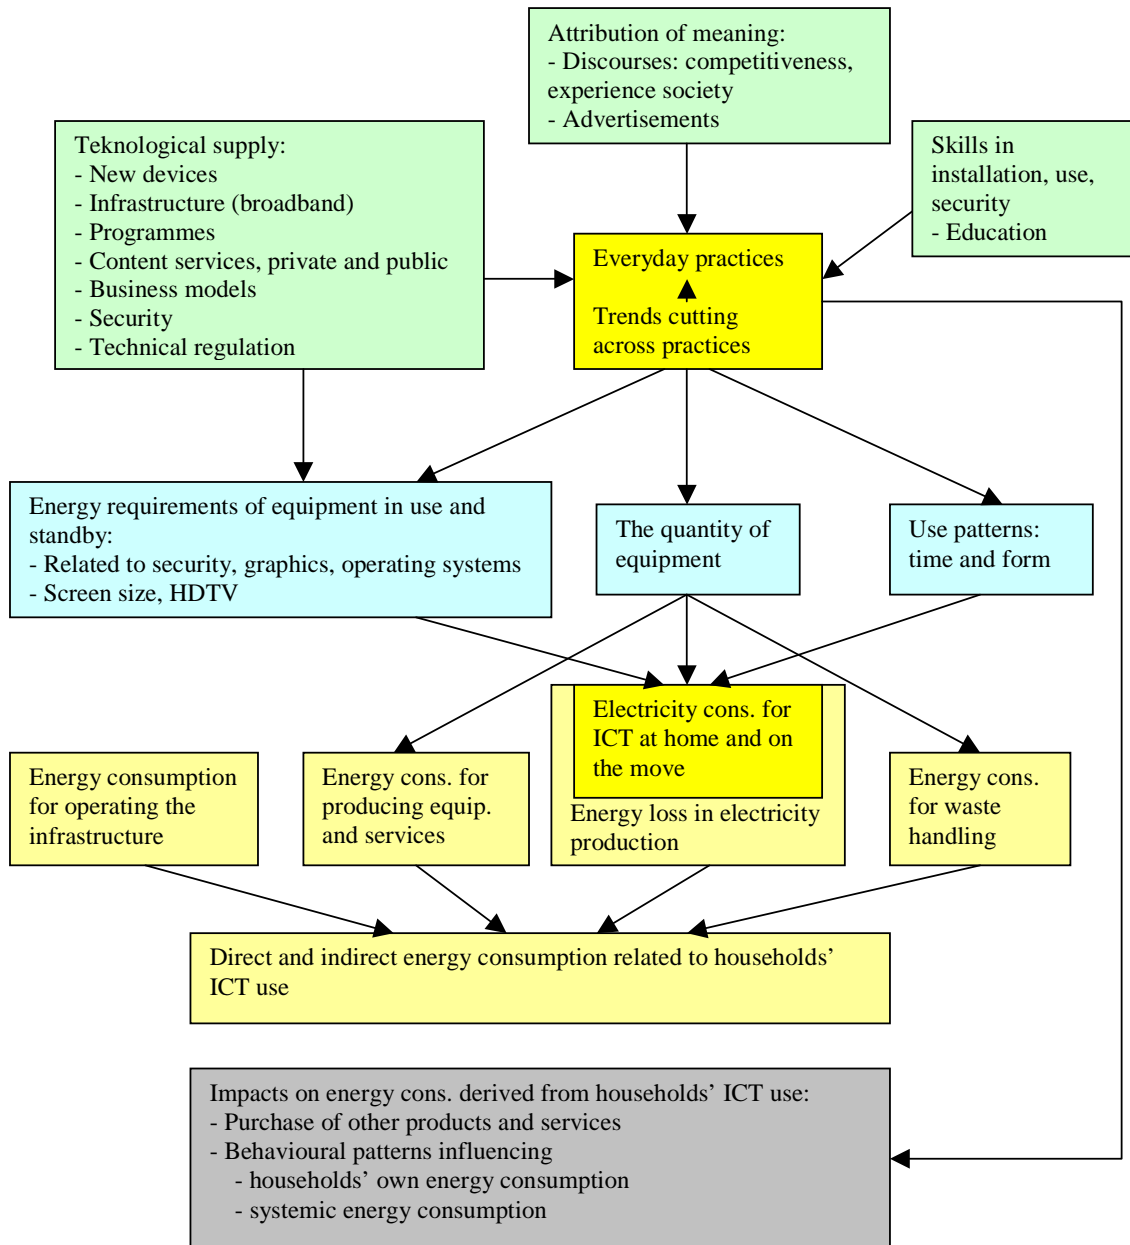

Fig. 1. Relations between ICT-related changes of everyday practices and the ensuing impacts on energy consumption.

models are rather ineffective. As the stock of TV sets is large, nearly one set per person (Energistyrelsen 2006), and as many people have to follow suit if they want to watch television (excepted are a large group connected to cable TV who can carry on as usual), the impact can be expected to be considerable. Of course, digitization can be an opportunity to replace older energy-consuming models with newer and more energy-effective models (LCD (Liquid Crystal Display) flat screens are more efficient than the old CRT (Cathode Ray Tube) screens), however, replacements are often combined with increasing screen size, counterbalancing the efficiency improvements. The interest in so-called home cinema equipment has increased, including acquirement of plasma screens which are particularly energy-consuming. TV sets prepared for receiving HDTV are also more energy-consuming because of the higher resolution. Instead of following the trend towards increasing average efficiency exhibited by white goods, the average efficiency of TV sets has been relatively stable and even decreased a little (Energistyrelsen 2006). As mentioned, the number of TV sets is already very high, but the diffusion of flat screens might increase the number further, as these screens are easy to place everywhere, bringing TV into kitchen and bathroom and adding to the use of TV as a kind of “back cloth” for other activities.

Digitization of television does not directly seem to be part of any profound changes in the practice of watching television. The quality of the picture improves, and it is possible to turn on subtitles in various languages. When digitization is combined with the use of media centres / harddisk recorders, the opportunities for flexibility are increased as programmes can be shifted in time more easily than with the use of video and DVD. Visions regarding interactive television are discussed (Jensen & Toscan 1999), but it still remains to be seen whether practices change more profoundly.

While television is bound to a particular practice (which is very time-consuming), computers and Internet are integrated in a wide variety of practices. The increasing energy consumption related to computer and Internet springs from the integration in an increasing number of practices and the ensuing increase in time use and amounts of equipment. When time use at the computer increases, household members increasingly demand their own computer so they do not have to wait for their turn. The demand for individual independence that is well-known from the acquisition of TV sets now makes itself felt for computers – each person his or her computer seems obvious for the younger generations. A less developed trend – which might become more important in the future – is the emergence of activity or room specific computers, for instance, specially equipped computers for use in the kitchen, the bathroom or in the garage where conditions may be tough.

Due to rapid technological change and ever more advanced applications, there is not only a demand for more computers, but also for ever more powerful computers and other ICT equipment. Demand thus increases for

- higher quality, such as larger screens with better resolution
- more processing power needed for, for instance, running the latest versions of operating and security systems and for the advanced graphics of games
- more data storage capacity, needed for the increasing amount of photos, videos, sound files, mails
- larger bandwidth, needed for video-streaming and for upstream P2P (peer to peer) file-sharing of videos and music.

These changes constitute a strong force counterbalancing improvements of energy efficiency.

Seen over a long period, various factors have influenced the energy efficiency of computers (based on (Cole 2003)). To increase the processing power of computers without increasing the size, heat reduction was necessary and this stimulated efficiency improvements. With the introduction of laptop computers energy-saving was encouraged because of the desire to increase battery life, and the advances for laptops were later brought into desktop computers. For instance, this was the case for built-in power management which was brought from laptops to desktop computers in the early 1990s. The U.S. conservation programme, Energy Star, strongly encouraged further improvements so from the mid-1990s standby consumption decreased drastically, and impressive savings were achieved in business offices in the U.S. However, the power levels in operation did not change much, because the efficiency improvements codeveloped with more powerful microprocessors, more memory, and more disk storage. The monitor part of the computer became more energy-intensive in the 1990s because of the almost universal shift to colour screens and larger screens with higher resolution. However, over a more extended period of time the shift from CRTs to LCDs saves energy.

As modern computers are very diverse due to consumer-specified features, the power requirements vary so much that it can be difficult to assess the general trend (Cole 2003, p. 138). Danish data indicates that the average new desktop computer is not requiring less energy in operation than computers a few generations older (T. Fjordbak Larsen, pers. comm.). However, an increasing number of new computers are laptops, and they are more energy-effective than desktop computers. In 2006, for the first time the number of laptops sold in Denmark exceeded the number of desktop computers. This can be an energy-saving trend if the laptops replace the desktop computers, but it is difficult to assess to which extent the laptops are additions rather than replacements. Desktop computers are still cheaper in terms of processing power per dollar, so a person interested in playing games or carrying out other demanding graphical activities will often prefer a desktop. Furthermore, it is easier to extend a desktop computer with supplementary graphics cards or other peripherals.

The power management functions offer good opportunities for energy-savings, but they have to be activated. This is not always done, either because of lack of knowledge or because of technical difficulties, for instance, related to network connections and the coupling to other equipment.

The question of complementarity versus substitution in the case of laptops and desktops can be raised as a more general question. In many cases, ICT equipment incorporate a variety of functions and can, in principle, replace other, more specialized appliances. An example is the camera phone which can render the camera superfluous. However, the camera in the mobile cannot provide the same quality and capacity as the dedicated camera so the camera phone may become part of a diversification process rather than part of a rationalization of the number of appliances. Another example is the combined printer-scanner-copy machine which can reduce the number of appliances attached to the computer. However, it is expensive to run a scanner because of the need for colour cartridges, so it can be cheaper to invest in a supplementary laserprinter for printing texts.

The trend towards diversification of equipment seems to be strong, as it is reflected in the wide variety of available devices advertised in magazines. Not the least for mobile devices is the supply widening as more functions become available on the move. Rapid technological change implies that multiple generations of equipment co-exist, for instance, taperecorders – CD players – MP3 players, and video – DVD – harddisk recorders. Consumers thus tend to

have an increasing number of small and/or supplementary devices, often in various ways related to the core products – the computer and the TV set. The direct energy consumption of each of these devices in the use phase is usually not large (except for standby consumption that can be high for some products), but the sum of the small contributions may be significant. Adding to this is the phenomenon that less attention is focused on the energy consumption of the peripheral devices than on the energy-efficiency of the computer and the TV set. One reason may be the quick renewal rate which does not allow producers to pay much attention to optimizing energy-efficiency, and another reason may be the lack of regulatory attention, partly due to the difficulties related to regulating products that are changing so quickly.

A particular trend adding to the ICT-related energy consumption emerges from the phenomenon of multi-tasking. Especially, young people are able to manage computer, television, music centre, mobile phone, and the electric guitar – all at the same time. A Danish study thus demonstrates the high electricity consumption of teenagers (Gram-Hanssen, Kofod, and Nærvig Petersen 2004). Older generations may be less able to multi-task, but they are able to install systems that use electricity without anybody being present, such as surveillance cameras and other security systems. One of the visions related to the “intelligent home” is the possibility of communicating with the security systems at a distance, for instance, opening the door for the postman bringing a parcel or the plumber coming to repair an installation in the house.

Finally, it is worth mentioning that the search for new ways of using ICT has resulted in more functions using energy in the use phase – functions which were previously carried out without energy consumption in the use phase. Examples are the electronic diary and shopping list, maps for navigation, photo frames showing digital pictures, and surveillance.

Summing up, the increasing direct energy consumption related to ICT equipment has many sources. The effect of increasing quantities of equipment and of more time spent on activities using ICT is difficult to counterbalance with efficiency improvements, in particular, because the equipment in itself becomes more powerful, and because in some cases, the attention to energy-efficiency is limited.

Indirect energy consumption

Presently, we have few available data for elucidating the indirect energy consumption related to household use of ICT, so this section will only include some preliminary reflections. The indirect energy consumption arise from the production of electricity and from the other phases in the life cycle of the ICT equipment, apart from the use phase. Furthermore, the importance of the supporting infrastructure is considered.

The first component of the indirect energy consumption relates to the provision of the electricity used for operating the household equipment. This component differs between countries in accordance with the efficiency achieved in electricity production. Due to a high degree of combined power and heat supply, this efficiency is relatively high in Denmark. This component of the indirect energy consumption is thus only about the same size as the direct electricity consumption.

The second component relates to the energy used for the production of the ICT equipment. Kuehr, Velasquez, and Williams provide data for the environmental impacts related to the production of computers, and they emphasize that a significant share of these impacts are

incurred in the production phase: “For a desktop computer used at home, for example, the energy needed to produce the machine is four times more than that needed to power it during the use phase. The energy consumed to produce a refrigerator is only about one-eighth the electricity used to run it” (Kuehr, Velasquez, and Williams 2003, p. 4). For mobile phones the economic life is very short and this makes the relative importance of the energy consumption in the production phase even larger (Legarth, Willum, and Gregersen 2002). In other words, the rapid rate of renewal for ICT equipment implies that energy use for production is a very important category.

The third component relates to waste handling. The high-tech parts of computers and other electronic equipment are difficult to recycle, while the bulk materials like steel and aluminium are easier to handle. Klatt (Klatt 2003) outlines the many technical difficulties that recycling of computers meet with and explains why it is quite costly, however, he gives no information on the energy costs of the process.

Finally, the fourth component relates to the operation of the ICT-infrastructure (a brief discussion on this can be found in (Hille, Aall, and Klepp 2007)). A recent report from IDC illustrates the enormous growth of digital information and the need for storage capacity not only at user level, but also for service providers such as Google (Gantz et al. 2007). Some service providers run large parks of servers, so services that appear to be virtual – immaterial – from a user perspective can be based on quite extensive material investments. The virtual world of “Second life” thus has a material basis in the servers of Linden Lab.

Derived energy impacts

While both direct and indirect energy consumption tend to increase when the number of appliances and the time spent using them are increased, the derived energy impacts are more likely to be positive. Most obviously, ICT can be used directly for energy savings. Thus ICT can be used for managing heating and lighting in the dwelling (lowering of the temperature at night, sensors turning off the light when nobody is in the room), and ICT can also make it easier for households to monitor their energy consumption and thus encourage savings. The Danish Electricity Saving Trust estimates a potential for electricity savings from 10 to 30% in households by using intelligent building systems to control the electric equipment. For instance, in summer cottages, heated by electricity and only used occasionally, there is a large potential for reducing the consumption by using such systems. However, the existing systems are too expensive today, due to a lack of competition, and also the standards are closed, meaning that they cannot communicate with the electronic equipment of existing systems (Ingeniøren newsletter, 21.04.2006).

Also, the Internet can be used for making available relevant information on energy savings, as can be seen, for instance, at the homepage of The Danish Electricity Saving Trust <http://www.elsparefonden.org/> and the recently initiated public campaign encouraging people to save 1 ton of CO₂. While these impacts are positive in an energy perspective, it should not be overlooked that the Internet, in an analogous way, can encourage energy-intensive consumption – for instance, by making available new options for booking cheap flights and finding exotic travel destinations (Reisch 2001).

While it is relatively simple to see that ICT can be used for energy-saving purposes, it is far more complex to consider what happens to the various practices in which the use of ICT becomes integrated. In some cases the use of ICT is just an “add on” where more equipment is added to well-known activities that are not much changed. An example can be the use of a

“running computer” for monitoring one’s training efforts; such an addition does not change the practice of running in ways which have derived impacts on energy consumption. The same goes for quality improvements, such as larger screens, HDTV, and better graphics in game consoles.

In other cases the practices are changed more profoundly by the integration of ICT. Environmental improvements, including energy-savings, have been expected from such changes, in particular, in relation to teleshopping, teleworking, and the replacement of material products such as newspapers and CDs by Internet-based services. Jørgensen et al. (2006) summarize a number of studies on telework and transport. Whereas some of the early studies were very optimistic with regard to the potential for energy savings, more recent studies emphasize that a substantial part of the transport savings are counterbalanced by increased transport for other purposes and increased transport by other family members. In general, the results regarding structural impacts are highly sensitive to system boundaries and dependent on behavioural assumptions. Studies are often inconclusive because it is difficult to know, for instance, whether people will continue to go shopping although they buy some things via the Internet, and whether they will move further away from their workplace to take advantage of lower property prices when they work at home part of the week.

Supplementary to the discussion on derived impacts in relation to individual practices, it is possible to raise the issue from a more general perspective: If consumers tie their money and their time to the acquirement and use of ICT, then less money and time are free for other purposes – and the question is whether these other purposes are more or less energy-intensive per monetary unit and/or per unit of time. It may seem surprising that the question is raised in terms of both money and time, as one of the two perspectives could appear to be sufficient, in particular, if an economic maximization model is applied (Linder 1970). However, in practice both time and money constitute limitations on consumption, and institutional constraints imply that the two factors cannot be reduced to one another. To start with the monetary perspective, the acquirement of ICT equipment and services takes up an increasing part of consumers’ income. In general, competition on hardware keeps prices down and energy-intensities high. In some cases, service providers have succeeded in keeping high prices due to monopolistic or oligopolistic market conditions which implies a relatively low energy-intensity per monetary unit (examples are charges for phoning, Internet access, and packages of television programmes). However, public regulation is quite active with regard to breaking the monopolistic tendencies, not only because of the general wish to promote competition, but also because of the particular interest in developing the information society. A recent project thus demonstrates that the energy intensity of ICT-based leisure activities is relatively high (Hille, Aall, and Klepp 2007, p. 166-67).

From the perspective of time, it is worth considering whether the integration of ICT tends to take up time that could have been used for other purposes or whether, on the contrary, time is freed for other purposes. If, for instance, reproductive activities such as paying the bills, shopping, and contacting the taxing authorities, can be carried out in a shorter time by using the Internet, then time is freed for either working more (and earning more money) or having more leisure time (where money can be spent). Also activities usually considered to be leisure, such as planning holiday travelling, can be done more effectively, thus freeing time. Multi-tasking and accomplishing tasks on the move can add to the productivity increase. On the other hand, the Internet is known to be time-consuming as one can become absorbed in surfing and sidetracks, reducing the time for other activities and related consumption.

It is difficult to conclude anything regarding the consequences of the changing composition of time use and consumption in the wake of ICT integration in various practices. But it can be argued with more certainty that the supply of ever changing ICT and the integration of ICT in a wide variety of products and practices serve as part of the motor driving consumption growth. It is difficult to imagine the achievement of any kind of satiety in this dynamic setting.

Concluding remarks

As emphasized in the introduction, the intention of this paper is not to assess whether the integration of ICT in household practices is good or bad in an energy perspective. Anyway, the issue is so complex that even very elaborate studies could hardly lead to any decisive conclusions. It is more important to find ways to avoid the negative energy impacts of ICT development and to encourage the positive impacts. The issues dealt with in this paper suggest various ways in which the net result can be improved:

- The indirect energy consumption, in particular, related to the production of ICT equipment carries great weight. Therefore, “The simplest and most effective way to reduce environmental burden may be to ensure that users need fewer new PCs in the first place”, as Kuehr, Velasquez and Williams argue (p. 14). In chapters 8, 10 and 13 in their anthology it is discussed how the lifespan of computers can be extended through more effective used-computer markets, smooth transfer of software licenses to secondary users, and easier ways to upgrade computers. The issue of lifespan extension is highly relevant also for other ICT equipment, not the least for mobile phones.
- Power management functions are important for electricity consumption in the use phase, and it is still highly relevant to focus on the reduction of standby consumption, both by technical means and through changed patterns of behaviour.
- Digitization of television should be complemented with intense campaigns for the choice of energy-efficient replacements.
- The focus on the energy use of the core products, the computer and the television, should be broadened to include also the wider variety of ICT equipment.
- Economic considerations have not been the focus of this paper, but it should be mentioned that the net energy impact of ICT use is influenced by the price of energy. For instance, there is a potential for using ICT for energy savings, and the realization of this potential depend, at least partly, on energy prices. The price of energy for transport is also decisive with regard to the derived impacts, for instance, whether people decide to move further away from their workplace when they get the chance to telework part of the week. In short, price incentives, as well as other incentives not directly related to the technology, influence the net energy impact of ICT use.

The above suggestions relate to direct and indirect energy consumption, whereas it is much more difficult to consider how positive energy impacts can be encouraged and negative impacts prevented when focus is turned to the derived impacts. To improve the basis for elaborating suggestions for a proactive approach to ICT-related energy consumption, further in-depth studies of household ICT use could be useful. Such studies could deal with questions such as:

- In which practices are ICT becoming integrated? For which household members?
- In which cases does the ICT integration serve as an add-on to previous ways of carrying out the activities, and in which cases do the activities change more profoundly?

- Does the use of ICT save time, for instance, in relation to shopping, banking transactions, and enquiries to public authorities?
- Does the use of ICT save transport in relation to the same activities?
- What does social communication via ICT imply for the wish to meet?
- Is ICT applied with the purpose of saving energy?
- How often are various appliances replaced?
- Do several generations of appliances co-exist?
- Which functions are served by diversified equipment?
- Which functions are merged in rationalized equipment?
- What do households do with equipment they want to discard?

Hopefully, such studies on households' ICT use in an energy perspective can encourage that the agendas related to the information society and to climate change, respectively, can increasingly be brought together.

Abstract

Do new media make young people empowered or more vulnerable as consumers? The paper approaches this question by exploring the ways commercial interests influence the self presentations of a group of classmates aged 11-12 on a social networking site called Piczo. On social networking sites the users link their pages to the pages of their friends. In this way a social network is established online. The users must consume space, text and tools to produce their self presentations on Piczo pages. Observations and interviews reveal the preferences and choices to the pupils in this study. None of them can separate participation in the global, commercial Piczo network from participation in their local, non-commercial network. Nor can they separate consumption of commercial and non-commercial resources in the production of their self presentations. Still, their modes of consumption show great variation. Broadly they can be classified as either "collectors" or "elaborators". The similarities and differences between them inform the subsequent discussion. It is argued that through presenting themselves on Piczo pages the pupils in this study are empowered as consumers but at the same time made more vulnerable as producers.

Introduction

During the past few years, use of so-called social network sites has been a rapidly growing trend in young people's communication on the Internet. This paper presents a study of how the self presentations of a group of 11-12 year olds on one of these network sites are related to commercial consumption.

The Internet can be viewed as a place where communicational technologies are "remediated" (Bolter,2001) into "convergence" (Jenkins,2006). In light of this, social network sites can be described as a homepage with enforced interactive possibilities. In recent years remediation, meaning that a newer medium takes the place of an older one, has brought different types of interactive media online. On social network sites chat boxes, polls and comment boards complement the traditional guestbook. The convergence of a rich variety of channels for communication on social network sites makes the communication closer to the one we use face to face. The recently invented notion "social software" reflects this development, which distinguishes social network sites from the personal homepages of the 90's.

As the term indicates, a social network site allows social life to take place in a network established on a website. Websites like Friendster, Myspace, Facebook and a number of others all have a structure that allows people to search and be searched in a network based on shared social or professional interests. Some of these network sites, like Tagworld, Bebo, Mixi, Faceparty and Piczo, are directed towards children and young people.

The one explored in this paper, Piczo, started out in 2004, as a place where young people could share pictures and photographs. Today Piczo offers young people the chance to create "fully customizable personal websites that do not require any understanding of html code. Users share their life stories with friends by designing their sites with multiple pages featuring photos, graphics, guest books, comment boards, music, and more." Social connections are made explicit and social networking emerges, when the users subsequently link their pages to their friends' Piczo pages. Piczo has taken a commercial interest in making this kind of social life dependent upon consumption.

When compared to young people's consumption of commodities and other kinds of media, consumption on Piczo pages can be specified by its relation to the users' own production. In the Piczo network the users not only consume, they consume to produce. To analyse the specific features of this kind of consumption among the pupils in this study a specific part of their production will be analysed, namely their self presentations. To socialize in the network the users produce presentations of themselves. To explore how consumption relates to the production of these self presentations both identity and mediation must be theorised. In this study this is done by combining Erving Goffman's perspectives on identity formation (Goffman,1959) with perspectives on mediation developed in the tradition of social semiotic (Kress, 2003; Kress & van Leeuwen, 2001;Lemke,2002).

Within this theoretical framework the pupils' consumption on the Piczo website will be related to a central debate in the research literature on children as consumers. David Buckingham describes this debate as a polarization between "on the one hand, the critical view of children as passive victims of consumer culture; and on the other, the views of marketers themselves, who define children as much more active, competent and powerful." (Buckingham, 2007). Claiming that this polarization is a simplification, Buckingham suggests that researchers for one thing look more closely at "newer commercial strategies" such as "product placement, peer-to-peer marketing, cross-promotion and viral and online marketing".

The Piczo website is based on these kinds of marketing strategies, which influence the users' consumption in the way they socialize with their friends. The commercial pervasion of young people's social interaction gives them a more productive role than they are given as consumers of more traditional media. The question raised in this paper is how this productive role is to be understood. Some researchers have worded this question aptly and concisely by asking whether young peoples' consumption of new media makes them "Frontrunners or copycats" (Tuft et al., 2005). This study approaches the question by examining how commercial interests influence a small group of users' production of self presentations on a specific social networking site. As Piczo users, how freely do the pupils in the study perform their self presentations? Are their agencies empowered or made more vulnerable in this commercial setting?

Young people's consumption and identity

The link between young people's consumption and their identity building has been acknowledged in the research literature ever since "teenagers" as a specific consumer group was established (Abrams, 1959). In recent years the age group 8-12, now often referred to as "tweens" (Tuft & Rasmussen, 2005), has been included in this market. The extension down the age range has contributed substantially to the increased estimate of the market's worth every year. Young people have become an evermore important market group and today "few consumer industries don't target kids" (McNeal, 1992, p.13).

Young people need to find out who they are, and the market of clothes and other commodities can be understood as one arena for this identity work. A marketer is successful whenever able to produce a brand that e.g. satisfies young people's urge to be "cool" (Lindstrom & Seybold, 2003). Such needs cannot be satisfied permanently because consumption is tied to the young people's identity work precisely through the act of choice:

"Choice becomes the ultimate, inescapable fate: who are you if you can't choose? Brands can be said to have appeal because what they signal is the *exercise* of choice." (Lee & Munro, 2001, p.5).

The research literature reflects the fact that marketers regard young people as active consumers who use much energy in making their own choices, and also as an invaluable

marketing resource in their ability to influence the choices of their peers and their parents (McNeal, 1999, Gunter & Furnham, 1998; Hansen & Hansen, 2005). Critics within marketing research emphasise the manipulative strategies children are exposed to when their urge to choose is brought to an ever-expanding market (Linn,2004;Schor,2005; Seiter,2005).

Young people's consumption and identity on social networking sites

Media consumption is both an important part of, and commercially intertwined with, young people's consumption in general. Surveys confirm that young people spend more and more of their time as media consumers (Livingstone,2002, Drotner ,2000). As mass media audiences they are involved in a double exchange that gives them value both as consumers of commodities and as media audiences:

“As Sut Jhally (1990) points out, commercial media play a twofold role in consumer culture. The media is used by producers to sell products to consumers and, equally, media audiences have become commodities sold by media organizations to producers – hence we have a process of double exchange; that is, the media acts as a two-way delivery system.”(Kenway and Bullen,2001 p.31)

New media, together with new technologies, can also be said to structure young people's identity building in new ways (Langager,2004). Young people's use of the Internet, and more specifically of social network sites, is part of this picture:

“Utilizing the unique features of the Internet, companies can integrate advertising and Web site content to promote “brand awareness” and “brand loyalty” among children beginning at a very early age, in ways never previously imagined”.(Montgomery, 2000, p.156)

The interactive features of the Internet not only blur the boundaries between Piczo users' consumption and production, but also the boundaries between their public and private spheres. Piczo users are at the same time audiences in their local networks of friends, and mass audiences in the Piczo network of marketing. In “Consumer citizens online: Structure, agency and gender in online participation” Kate Willett approaches this kind of consumption from a sociological viewpoint. Referring to Gidden's distinction between structure and agency, she claims that “young people's online identities must be viewed not only in terms of active engagement, but also in relation to the structures which frame those activities.” She also refers to an understanding of these structures as “cultural resources”:

“For example, social-networking sites which combine blogs, profiles, and photo and video-sharing can be viewed as cultural resources which are used by young people as a way of performing and perhaps playing with their identity”.(Willett, forthcoming)

A combination of a sociological and social semiotic framework allows a further theorization of both “performing and playing with identities” and “cultural resources”. Erving Goffman’s notion of self presentation has already been found appropriate in the analysis of peoples’ consumption on personal web space (Schau & Gilly, 2003). While this notion specifies the meaning of “performing and playing with identities”, a social semiotic approach to “cultural resources” opens up for a more specific description of how the pupils in this study actually consume on the Piczo website. This allows the question raised in the introduction of the paper to be answered by relating the pupils’ self presentations to the semiotic resources they consume in order to produce them.

Theory

Presentation of the self

By analogical use of theatrical terms Erving Goffman describes “the presentation of self in everyday life” (1959) as a perpetual process of social performances. With adoption of his framework the Piczo website can be understood as one of the stages where young people are invited in to perform, and thereby also to explore who they are. Goffman emphasizes that he uses the theatrical analogy as a scaffold to illuminate the social basis for our structuring of the self. In his thinking the self is not grasped as an autonomous entity, but as a function of roles performed in everyday interaction. Normally it is in our interest to avoid choosing the wrong role, or to experience that our performance of the role is turned down. To be able to interact we must (at least seemingly) reach a mutual understanding of how the situation is to be defined, or else we will not know how to relate to the other participants, and they will not know how to relate to us:

“...when an individual appears before others his actions will influence the definition of the situation which they come to have. (...) The others (...) may be suitably impressed by the individual’s efforts to convey something, or may misunderstand the situation and come to conclusions that are warranted neither by the individual’s intent nor by the facts. In any case, in so far the others act *as if* the individual had conveyed a particular impression, we may take a functional or pragmatic view and say that the individual has “effectively” projected a given definition of the situation and “effectively” fostered the understanding that a given state of affairs obtains.” (Goffman, 1959, p.6)

Consuming to present the self

The presentation of the self online is not performed under the same conditions as in the face to face encounters used by Goffman to explain the dynamic aspects of social interaction. Our face and body are not literally present on the Internet, which deprives us of a rich array of possibilities for presenting ourselves. On the other hand the digital mediation of the self online also opens new possibilities for what Goffman calls impression management. For example, net based mediation can influence our moral judgement of self presentations. Sherry Turkle was among the first to proclaim the liberating effect of using Internet to play out parts not available to us in real life, e.g. a man pretending to be a woman (Turkle, 1995). In opposition to this, the philosopher Hubert Dreyfus has stated that the reduction of social risk on the Internet equally reduces

the value of the performed roles (Dreyfus,2001). The focus of this paper is how net based mediation also opens new possibilities for commercialization of the users' performances of roles.

Goffman describes the performance of roles as dependent on a front, which he further distinguishes as setting, appearance and manners (Goffman, 1959, p.22). For example, the office, the stethoscope around the neck and the attentive look while we describe our symptoms all confirm that the person in front of us is playing out the role of a doctor. In her dramatic realization the doctor also tells us how she relates to the part, e.g. whether she is absorbed in the role as doctor or performs the part with an ironical distance (Goffman, 1959, p.30) On the Piczo website performance of any role requires resources that allow not only not the front, but also the dramatic realization to be commercialized.

In a social semiotic perspective our self presentations are dependent on "what is to hand" (Kress,1997, p.13). On the Piczo website commercially manufactured resources are to hand. Some are intrinsic to the users' production of self presentations, other are optional. In "literacy in the new media age" Günther Kress refers to the "stuff of writing" and "the stuff of speech" while explaining that his interest as a social semiotician lies in "the materiality of the resources, and in how humans work with them in the demands of their lives." (Kress,2003, p.13). Adopting this material approach the resources offered to Piczo users can be categorised as space, texts and tools. The Piczo website is a structure where space, text and tools are offered for free, because in the consumption of these resources the users make brands, promotion and advertises part of their own self presentations.

Commercial influence through consumption of space

Piczo pages can be read in sequences that are not linear. They are hypertexts which make multiple choices of reading paths available. One can argue that all texts have a multi-sequential potential, regardless of whether they are displayed in the hypertext transfer protocol of the Internet or not (Karlsson & Ledin,2000). For example, we also consume in a hypertextual manner while reading papers and magazines. Still, when consumption is considered in a commercial perspective the specific features of net based mediation become essential. It is the unlimited potential of hypertextual dispersion on the Internet that allows Piczo to take a commercial interest in providing their users with the resources required to produce their presentations of themselves.

Piczo users' consumption of space defines the "frames" for their self presentations. Kress & van Leuween explain frames as semiotic means for demarcation of textual meaning on page or screen. In their conception "frames" confine the different textual elements on a page, and are thereby also means for relating these elements to each other. Ervind Goffman gives the same notion a sociological significance, suggesting that frames relate the situations we define in social interactions to the surrounding social world. Self presentations on Piczo pages are brought under commercial influence in both senses. Firstly, the demarcation of textual meaning relates consumption and production of self presentations to the surrounding banner ads in a concrete, material sense. Secondly, these

concrete and material frames include commercially produced self presentations, e.g. the models exposed in advertisements, which inevitably become points of references, frames, when the users' own self presentations are related to the surrounding world.

Commercial influence through consumption of texts

Piczo offers multimodal texts for the production of self presentations which supplement or replace the presence of faces and bodies in real life encounters. A multimodal text is expressed through the simultaneous use of various modes of expression (e.g. writing, pictures, music, animations and video clips). (Kress & van Leeuwen, 2001). The multimodal texts offered for consumption and use on Piczo pages are, or include elements from, brands, promotion and adverts. Brands, promotion and adverts are made for the consumers to identify with, and subsequently purchase, products. Piczo users become consumers of mediated advertisements not in the role of passive audience, but in the role of active producers of self presentations. Consequently, in the production of self presentations they also become advertisers for commercial products.

Commercial influence through consumption of tools

Piczo offers tools for its users to integrate the collected texts on their own pages. The basic offer is "prescripts", programs which make html-code superfluous (Fagerjord, 2005). Piczo has already pre-scripted the coding process through the offer of a rich array of ready-made texts or textual elements (see Skaar, 2007). According to Roman Jakobson (1952), language use at the same time requires choices from the paradigmatic (the choice of words) and syntactic axis (the combination of words). In contrast to this, the use of textual (and ready-made) elements in the design Piczo pages only requires paradigmatic choices (because, unlike words in a sentence, the syntactic combination of ready-made elements on Piczo pages is not restricted by code). Manovich calls this the "logic of selection" claiming that "although software does not directly prevent its users from creating from scratch, its design on every level makes it 'natural' to follow a different logic – that of selection" (Manovich, 2001). For example, users do not have to spell out "Welcome" on their pages, instead they can choose a "Welcome-sign" from the "textual elements" menu. The coding of the word is done, and at the same time thirty different choices of colours, backgrounds etc. are added. In other words, Piczo offers tools that allow its users "shortcuts" in the coding process, while simultaneously expanding the possible choices of ready-made signs. By the choice of these shortcuts the users attach their self presentations to brands, promotion and adverts.

Method

According to their own figures, Piczo have "roughly 12 million monthly unique visitors" (<http://pic6.piczo.com/public/corporate/index.jsp> [retrieved May 2007]). In "Literacy on a social networking" (Skaar, forthcoming), I present an ethnographic study of 11 of them. The study is based on observations and interviews with pupils and teachers in a 6th grade primary school class in Oslo. The class had 23 (later 22) pupils, 9 girls and 14

boys, most typically from middleclass and lower middleclass homes. Around one half of the pupils are ethnic Norwegians, the other half have mixed or immigrant backgrounds. The first period of observation took place at the end of the 5th grade, the second half a year later. I observed the pupils' activities, once a week, during a three-month period.

All but one of the 22 pupils in the class had Internet access at home, although with a variable degree of personal access. Through the research project in which I myself am a participant, the class were connected online by the use of a school-based blog called eLogg (see Østerud et.al.,2006). During observations of their use of eLogg, I soon became aware of some of the pupils' visits to the Piczo website. I charted 11 Piczo users in the class and interviewed them about their Piczo use. Their use of Piczo pages was also documented consecutively on the net. This made their peer interaction out of school, which is often hidden from parents and teachers, accessible for close observation over time. After the first round of interviews I downloaded the pupils' Piczo pages weekly for a period of 6 months in order to track the changes they made. The observations showed that the correctness of the answers already given in the interviews often was questionable. This generated additional interviews. To fill in the picture I also interviewed one of the class teachers about the pupils' Piczo use. The interviews varied in length from 2-3 to 25 minutes.

In "Literacy on a networking site" I used the data collected to compare the pupils' literacy on Piczo pages with their school based literacy. The study also made me aware of the need for further investigation of the commercial aspects of the pupils' use of websites like Piczo. For this reason I kept on observing the pupils' Piczo pages for a year after my initial data collection and analysis. New social constellations naturally emerged during this period. The typology established in my initial study still serves as a distinguishing categorization of the pupils' literacy on their Piczo pages, but two of the pupils have moved from one category to another. Three of the pupils left the class, but kept on as Piczo users. Two newcomers raised the total number of users to 13.

In the period of prolonged data collection I have focused on the research question raised in this paper. The presentation of the findings is not exhaustive, but structured in accordance to this question.

Findings

Similarities:

Consumption and production of fun and coolness

In interviews the pupils give two reasons for their production of Piczo pages, either because it is "fun" or because it is "cool". In comparison the pupils describe their production of school-based eLogg pages in more moderate terms, most typically as "ok".

The pupils list their interests in a similar profile on eLogg and Piczo pages. Nearly all of the pupils list "friends" as an interest on both websites. On their Piczo pages most of the pupils also add pictures of their friends. Apart from "friends", "girls" or "boys" the most

commonly listed interests are football, film, TV, music, foods and clothing. On eLogg the pupils present these interests in writing, only complemented with a single picture and a selection of one out of nine backgrounds (e.g. hearts or footballs). On Piczo pages the pupils express these interests not only through writing, but also by the use of commercially provided space, texts and tools. Although some of the pupils present pictures and additional written texts about special interests like reptiles or puppies, most of them tend to elaborate on interests consistent with the fun and coolness produced by Piczo and other marketers. Football, music, fashion and film/TV-productions are the interests most heavily supported by commercially provided textual resources within the Piczo network.

In the pupils' rating of each other as persons and as creators of Piczo pages, "cool" is one of the most frequently used epithets. Similarly, in the promotion of its own site Piczo Inc. also uses the terms "fun" and "cool" to describe the activities conducted by its users. Advertisers using Piczo space to advertise and promote their products follow up with use of the same terms:

“His homepage is a bit cheap because he is more interested in checking out your cool Piczo page”

Figure 1-2

The merge of local and global consumption and production

The pupils' production of self presentations requires a minimum consumption of Piczo-provided resources. The consumption of these resources simultaneously makes the pupils participants in a local and a global network. Within these two networks the pupils in the study combine the consumption of resources manufactured by Piczo with the consumption of commercial and non-commercial resources provided by themselves or other Piczo users.

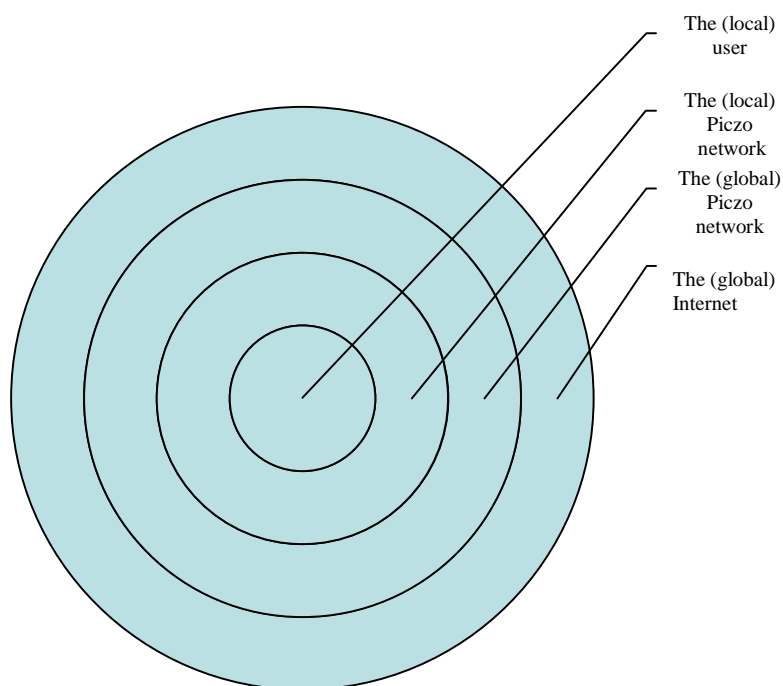

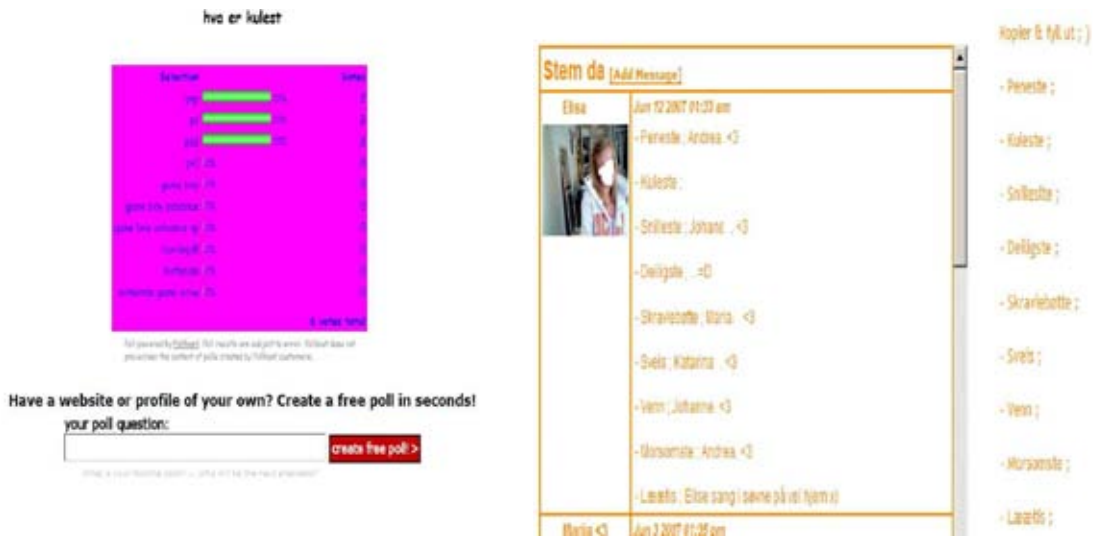

Figure 3

The pupils consume resources from their own files, from their local Piczo network, from the global Piczo network and from other Internet pages. Consequently the texts and tools consumed can either be self-made or ready-made. The self-made textual resources used by the pupils in the study are restricted to written texts and pictures, while the ready-made resources, containing written text, pictures, graphics, animations and videos, show a much greater variation and complexity.

The tools offered by Piczo, or other commercial providers, are also much more sophisticated than the tools produced by the pupils themselves. None of the pupils have programming skills sufficient to make their own tools. All the same, some of them combine the tools offered by Piczo, or other commercial tool providers, with texts that give the ready-made tools new functions defined by the pupils themselves. For example, Pollhost is a ready-made tool used by the pupils to rate both commodities and friends (see Skaar, forthcoming). Piczo offers its users so-called shout boxes as tools for comments and chats. By combining the shout box with a self-made text in which the visitors are invited to fill in the gaps, a “self-made” tool to rate the site holder’s popularity is produced:

Ready-made poll

“Self-made” poll

Figure 4-5

The pupils’ consumption within and outside the Piczo network blurs the distinction between commercial and non-commercial providers of texts and tools. For example, by copying the commercially manufactured and ready-made background from her friend Eva’s page, Ann is expressing her friendship with Eva. This privileged relation becomes apparent not only to Eva but to all the members of her local Piczo network:

Eva’s opening page

Ann’s opening page

Figure 6-7

By the subsequent use of the background on her own pages, Ann herself is likewise becoming a local provider of commercially manufactured resources to others in her local network.

Differences

The volume of consumption

Some of the pupils set up their websites on their own; some with classmates or friends, and some, among them the most active producers of web pages in the class, do both. Nevertheless, the sharing of pages with classmates does not correlate systematically with productivity. The number of pages produced by the 13 pupils in the study varies from five to more than 100. Five of the pupils have produced fewer than 10 Piczo pages, while eight of them have produced more than 10 Piczo pages. Those with the highest number of sites set up were also those producing most pages. Nine of the pupils have set up one site alone, while three have set up more than one site alone. All but one of the pupils sharing pages with friends have also set up sites by themselves.

Piczo pages produced:			Piczo sites set up:		
Fewer than 10 pages:	More than 10 pages:		Alone :	With friend(s):

Figure 8

The modes of consumption: collectors and elaborators

When the pupils' modes of consumption are compared they can be divided in two groups. One group of pupils can be labelled as "collectors", the other as "elaborators". Both groups consume space, tools and texts to produce their self presentations on Piczo. The collectors do not relate these commercially manufactured resources to their self

presentations in ways that allow them to define the situation (see Goffman,1959) in their local Piczo network. Conversely, the elaborators do. In their production the commercial resources consumed are merged with their own texts and tools in a way that breaks down the difference between the two, and makes the agency involved in the elaboration of the commercially provided resources visible and significant.

Generally, the consumption of commercially provided resources is proportional to the volume of pages produced. The most eager consumers are also the most eager producers. Elaboration of consumed resources requires skills that can only be acquired through production, and most of the pupils in the group producing more than ten Piczo pages (six out of eight) are elaborators. Conversely, in the group producing fewer than ten Piczo pages all of the pupils are collectors.

Collectors with low productivity

Kent and Ann are examples of collectors with low productivity. They are the latest adopters of Piczo in the group, and in the period of observation Kent gives up his site without creating a new one.

Kent's opening page

A kitten branded "Obaketsu" as background for Ann's collection of friends.

Figure 9-10

On his opening page Kent uses the brand "Surf Naked" to present himself. On his three additional pages Kent presents a profile and some pictures of his friends. From a classmate he has copied a fill-in text combined with a shout box, which he uses to rate his own popularity.

Ann uses the lipstick copied from her friend's opening page as background. She has produced nine Piczo pages, some of which she has not yet filled with content. Among the ones produced are a profile page, a page with brief written descriptions of her friends, and a page showing a collection of pictures of cats and kittens. On some of these commercially provided resources, brands (e.g. "Obakesu") are exposed.

Neither Kent nor Ann makes any explicit reference to the brands appearing on their pages, and neither of them uses the commercially provided resources to establish an interactive relation to the visitors of their pages.

Collectors with high productivity

Freddy and Tobias have both produced more than 10 pages, and they have also been relatively persistent in their Piczo use. The texts and tools collected are partly categorized, partly randomly displayed on their pages. When Tobias abandoned his site to make a new one, he tells the visitors this is because "my previous site sucked". His new site focuses on his own cool appearance in a technically more sophisticated way, but he still primarily uses his self presentation on Piczo as a reference when he is chatting on MSN. Freddy keeps on exposing his various interests through collections of pictures throughout the period of observation, and some of his collections are slightly more cleverly arranged by the end of the period.

Over time, both Freddy and Tobias show a gradually improved capability to produce Piczo pages, but their mode of consumption does not change. They are still collectors.

Tobias's collection of brands and funny pictures.

Freddy' collection of Eminem pictures

Figure 11-12

Elaborators

All the elaborators in the group have a high production of Piczo pages. Henry and Jenny are typical elaborators.

Henry was among the early adopters of Piczo in the group. From the start he shows a very self-conceited attitude towards his own consumption of commercially provided resources. On all of the sites he set up, Henry collects and elaborates resources in a way that allow him to play out a role as fashion model and trendsetter in the local network. Brands are rated and given specific social significance, along with all kinds of merchandise that can influence social appearance, e.g. make up and sun glasses:

Example of elaborator's pages: taking the role as trendsetter
Figure 13-14

On a shared site, Henry and one of his friends proclaim their aspirations for a future as fashion designers and models. In the local network they consume commercial tools and resources to produce these roles for themselves:

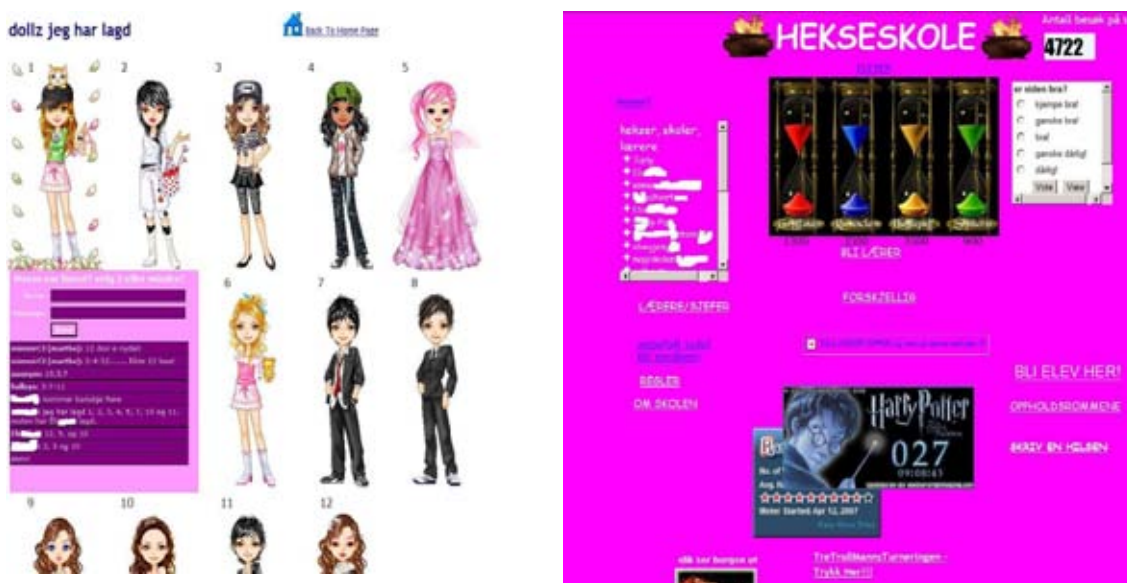

Example of elaborator's pages: taking the role as fashion model

Figure 15-16

Jenny was not one of the early adopters, but once started she soon had produced more pages than any other in the group. Initially she primarily presented personal texts she had written before she became a Piczo user, e.g. an fictional interview with herself, a diary and various fictional stories, but gradually she went on producing pages based on commercial resources. Adding pages and making new sites at a very rapid pace, she soon asked for help and assistance from others in the local network: a network partly underpinned by other children's interests in the production on her various sites. Some of her pages are copied "as is" from the local Piczo network or elsewhere on the web, but generally her consumption of commercially provided resources results in a production that gives her a role as creator of fun in the local network. Basically, these roles are based on her ability to show the others how to be inventive in their engagement with commercially provided resources on the net. She is also generous in her role as playmaker. For example, after having produced a fan site for a young female actor, she finally gives it away to another girl in the network.

Jenny engages the others by taking on the role as editor of her own magazine, or as headmaster of her own Harry Potter inspired "Witch school". But she also gets negative comments for these initiatives. For example, one anonymous commenter tells her to stop her silly games and "get yourself a life". Another tells her that her pages are full of girlish silliness.

Example of elaborator's page: taking the role as creator and facilitator
Figure 17-18

Discussion

Do the self presentations produced by the pupils in this study indicate that they are passive victims of consumer culture or active, powerful and competent consumers? Does their commercial consumption on Piczo pages turn them into frontrunners or copycats? To answer these questions, one must account for the power and influence of the commercial resources available to Piczo users while at the same time recognising how the pupils actively engage with these resources.

The pupils in this study cannot present themselves to a handful of friends in their local network without being counted among the millions of users in the global Piczo network. Through consumption of commercial space, texts and tools they allow the public to penetrate their private sphere. At the same time their own production of pages is replicated by marketers in their production of brands, promotion and adverts (see figure 1-2). This not only implies that the private is made public (see Chandler, 2005; Boyd, 2007), but also that the public is made private.

On Piczo pages the users generally try to match the marketers' production while the marketers try to match the users' production. In their production of self presentations all the pupils in the study mix their self-made texts and tools with commercially manufactured texts and tools offered by Piczo, by other commercial providers or elsewhere on the Internet. In the pupils' simultaneous consumption of space, texts and tools the commercial influence on their self presentations is strengthened by asserting itself on these three levels at the same time. The consumption's range covers the entire self presentation, not only the front but also the dramatization (see Goffman, 1959, p.30)

of the performance. Consumption becomes integrated in the pupils' production of self presentations in ways that makes it difficult and sometimes practically impossible to distinguish between global and local, commercial and non-commercial providers of resources.

When pupils provide others in their local network with commercially manufactured resources, the closer and more personal relationship between the provider and consumer also makes the identification with the taste and judgement involved in the resource stronger (see figure 6-7). Being participants in global and local networks at the same time can also mislead the users' perception of their actual audience on Piczo pages. The pupils' self presentations appear in a spatial surrounding that make them compete for attention with the professional eye-catching strategies of professional marketers. For example, marketers' use of sex, seduction, shock tactics and teasing to engage mass audiences can appear relevant in the development of personal presentations aimed at, and certainly actually reaching, a much more familiar and restricted audience.

The pupils express a number of interests on their Piczo pages, but commercial resources are mainly used to support two interests that they all share: having fun and being cool. In accepting Piczo's offer of hypertextual space, multimodal texts and pre-scripted tools in order to produce fun and coolness, the pupils tie the presentations of themselves to brands, promotion and adverts. The pupils are free to choose their own self-made texts and tools instead of the ready-made texts and tools offered on the website. But if this was their preference they would hardly find Piczo an interesting place to be. As confirmed on their pages and in the interviews, the pupils are Piczo users precisely because they appreciate the freedom to make their self presentations fun and cool in an easy way by consumption of the space, texts and tools they are offered. Consequently, through their presentations of themselves they are also presenting commercial products, and thus taking the role as advertisers in the Piczo network.

Investigating the so-called exposure effect Fang et al. (2007) present findings that consumers are more positive to commercials when a fluent exposure of banner ads on the Internet makes them unaware of the commercial intentions. At the Piczo website brands, promotion and adverts are exposed fluently to the users and at the same time made part of their own production. The pupils are free to collect resources both within and outside of the Piczo network, and some of them rely more on self-made resources than others. Still, their status as Piczo users sustains any individual choice. As participants in the global Piczo network the pupils in the study, like all Piczo users, inevitably support Piczo's own "brand management" which "exploits the productivity of consumers." (Arvidsson, 2006,p.70):

"(Brand managers') work consists in managing the autonomous production process that consumers engage in: to make sure that the common social world that they produce by means of the brand (a new street style, an experience of family bonding at McDonald's, an experience of empowerment with Nike) adds to the brand by either innovating or reproducing its desired set of qualities.(...) It is about ensuring that the means of

consumption effectively become means of production; that the ethical surplus that consumers produce also becomes a source of surplus value” (Arvidsson, 2006, p. 82)

Based on their different modes of consumption the pupils in the study can be categorized as elaborators and collectors. Both categories consume resources to have fun and be cool, but the freedom, attraction, and easiness available on Piczo pages influence their self presentations in different ways. The collectors are copycats in the sense that their consumption is not related to their production of self presentations in ways that allow them to define the social situation in their local network. The elaborators, on the other hand, are frontrunners in the sense that they consume to produce self presentations that allow them to try out their aspirations as playmakers, models, designers and trendsetters. These roles give them power to define the social situation in their local network. Does this give us reason for concluding that the pupils are partly empowered, partly made more vulnerable by their exposure to and dispersion of brands, promotions and adverts on the Piczo pages? The findings show a more complex picture. To give an answer, not only the pupils’ agencies but also the double structure of the Piczo network must be considered.

As described above the social situation on the Piczo website is structured with a local and global level of interaction. Although collectors and elaborators position themselves differently according to this double structure, none of them can escape it. But Piczo’s “brand management” is intertwined with the pupils’ “impression management” in different ways. According to Goffman “impression management” brings participants’ performances in accordance with a given social situation:

“Each participant is expected to suppress his immediate heartfelt feelings, conveying a view of the situation which he feels the others will be able to find at least temporarily acceptable” (Goffman, 1959, p.9)

By their simple dispersion of ready-made commercial resources, the collectors make their own creativity less visible than the elaborators do. They also make themselves less vulnerable to criticism from other participants in the Piczo network, not revealing their own voice but instead letting the commercial resources talk on their behalf. It is the pupils’ own, self-made texts that are degraded and made fun of by other Piczo users, not the commercial, ready-made texts they use to present themselves. One might say that being an elaborator raises the risk of being insulted online and that elaborators must be self confident enough to sustain this pressure. The study reveals that Jenny, highly aware of her own creativity and starting off with a large volume of self-made texts, gradually consumes more and more ready-made texts and tools to make her pages. Generally, the merge of global and local structure makes it both safer and easier to be a copycat than a frontrunner, and this gives the marketers an opportunity to present the Piczo users in the study with “an offer they can’t refuse”.

Both collectors and elaborators show a tendency to adopt global strategies in local interaction. For example, the collectors simply copy a ready-made poll, while some of the elaborators use their creativity to design a self-made poll by assemblage and reuse of resources initially intended for other purposes. Still, in the use of the polls both

elaborators and collectors replicate the commercial culture of rating persons the same way as they rate commercial products, similar to what is done in reality shows designed to entertain mass audiences (see figure 4-5).

The merge of the local and global gives Piczo Inc. the opportunity to offer its users resources that makes their “impression management” work for Piczo’s “brand management”. The study reveals that both collectors and elaborators are held up to ridicule for their self-made texts, but not for their choice of ready-made texts. In other words, it is easier to obtain fun and coolness in a socially impregnable way through the use of ready-made texts and tools. This makes it reasonable to assume that the merge of the global and local structure generally makes it more tempting to be a copycat than a frontrunner. Being fun and cool in a universe defined by adolescents and professional marketers seems like a difficult task for the 11- and 12- year-olds in this study. In their production the paradoxical nature of coolness becomes apparent:

“As in the case of the appropriation of style, capturing cool is a matter of incorporating and profiting from the resistance that consumers spontaneously produce. (Indeed, the antithesis of cool is understood to be commodification: one ceases to be cool at the moment in which one’s style becomes appropriated as part of mainstream. Conversely, continued coolness builds on a continuous capacity for stylistic resistance.” (Arvidsson, 2006, p.73)

In other words; the “cool” self is a sovereign self, which turns into a paradox when it is embraced and appropriated by the masses. Once everybody wears the most popular jeans or looks like the most popular artist, the coolness vanishes. Still, in the global network the self with the highest value is the self that calls for attention and identification among the highest number of consumers. This self typically belongs to the athletes, models and artists from sports, music and TV series. Just as the most popular jeans and jackets are the bestselling jeans and jackets, the most popular selves (often wearing those jeans and jackets) are the best selling selves. Consequently these self presentations are allowed to define the situation in the global Piczo network. The pupils in the study relate to these self presentations as collectors or elaborators, but none of them are powerful enough to abandon the globally defined fun and coolness and at the same time define the social situation in their local networks.

By getting their presence in a commercialized setting paid off by easy access to fun and coolness the pupils are cooperating closely with the market while at the same time relating to their peers. Does this make them vulnerable? Being in need of advice and guidance from parents, teachers and other adults, young people are always vulnerable. Not yet mature enough to protect themselves, they are “victims” for their preferences and desires in the sense that they cannot as easily as an adult see through and evaluate the costs attached to their fulfillment. The question is how the surroundings should be allowed to influence these preferences and desires. Presumably their inability to define the social situation on Piczo pages makes the collectors more vulnerable than elaborators to a feeling of powerlessness in their production of self presentations. On the other hand, the collectors do not generally involve themselves as much with the commercial

resources as the elaborators do. Spending less time on the Piczo website, they are less exposed to brands, promotion and adverts. This, on the other hand, also means that they do not become sufficiently experienced consumers to use commercial resources in the production of powerful self presentations on the Internet.

Arguing for a positive correlation between “good video games” and learning, Gee (2003) emphasizes that gamers not only consume but also produce. On Piczo pages the users consume to produce. If the production of playing “good videogames” is a positive thing, can the production of Piczo pages be understood in a similar way? Regardless of the learning effect it must matter whether gamers learn to shoot or beat people to death or to make clever dispositions in order to build up a city or an empire. Most of us presume that only the latter have a positive value capable of being transferred to real life. Similarly, the valuation of learning on Piczo pages depends on our valuation of the space, texts and tools the users consume in order produce their self presentations. Are the resources offered on Piczo pages “good”? What is good for young people, and what is harmful for them? If a commercial offer can be good or harmful, then Piczo can be good or harmful. To what extent do we want marketers to produce the premises for the socialization of young people? To what extent do we want young people and marketers to collaborate? Presumably most people do not see a problem if the marketers are working to combat famine in the third world or save the global system, but what if their products are unwanted, harmful or damaging? On the Piczo website the young users are left with the responsibility of understanding and discerning the difference themselves.

Conclusion and implications for future research

Piczo pages give the marketers access to a part of young people’s life realm previously out of their reach. Making young people mediate their self presentations through the use of e.g. a Cola Cola slogan is a deeper dive into their identity work than making them wear the same slogan on their T-shirt. Through their production the young consumers are made marketers themselves. On the other hand, when they consume the Cola Cola slogan in the production of their self presentations they also acquire skills that don’t follow mere consumption (see Skaar, forthcoming). As participants in a network that is global and local at the same time all the pupils in the study merge commercial and non-commercial, readymade and self made resources to produce their self presentations. They can be divided in elaborators, who use the commercially provided space, texts and tools to empower their position in their local network, and collectors, who do not. But regardless of their mode of consumption none of them are powerful enough to abandon the globally defined fun and coolness and at the same time define the social situation in their local network. This makes the question of whether the commercial influence empowers or makes the pupils in this study more vulnerable an ambiguous one.

In the final end the answer depends on our own value based assessment of young people’s exposure to the market on Piczo pages. One might emphasize their empowerment as consumers in the sense that their preferences for fun and coolness can be commercialized and provided ready-made for them at a more rapid pace. In other words celebrate the fact that they are made more powerful in the *global* network, as a

mass audience of *consumers*. Conversely one might contend that in the *local* network, the pupils in this study, although more or less self-assertive, are made more vulnerable as a local audience of *producers* precisely because they are forced to relate directly to the competition from the marketers in their efforts to produce fun and coolness by themselves.

In this study theories of identity and mediation are used to define a relatively small group of pupils' communication on a specific social networking site. Consumption of space, texts and tools is tied to their production of self presentations. The commercial influence on this production is explained by the pupils' simultaneous participation in a global and a local network. Based on the differences between their consumption the pupils are furthermore categorized as collectors and elaborators. The value of the study depends on whether "What I have found true of people in this study is likely to be true of any people placed in this situation" (Judd et al. 1991, s.317). Thus, future research should examine whether my constructs and categorizations catch the essential features of young peoples' consumption on social networking sites in particular, and also to what extent they might help us define and understand young people's consumption on the Internet in general. The validity of the study can be tried out on other groups or samples of young people, and on other social networking or commercial websites.

RFID - the ‘next step’ in consumer-product relations or Orwellian nightmare?

Dag Slettemeås
National Institute for Consumer Research (SIFO)
Oslo, Norway
dag.slettemeas@sifo.no

Abstract

RFID has over the last few years been successfully implemented in supply chain management, for inventory control, and in automated toll-collection. The next implementation is expected to come in retail, with RFID being embedded in products, shelves and check-out points for value-added sales and post-purchase services. This vision of a pervasive and omnipresent technology has spurred a lot of controversy due to privacy concerns and fear of an Orwellian-like surveillance society. At the moment, consumer-oriented RFID research is scarce and there is little empirical material to base sound policies and guidelines for RFID development on. This paper seeks to chart the RFID territory, address the research that is already available, and conclude with a call for more encompassing research done on RFID in context to support policy and industry in RFID-related initiatives.

1. Introduction

Radio Frequency Identification (RFID) is a generic term for technologies that use radio waves to identify commercial products. An RFID system normally consists of an RFID tag (transponder), a reader (transceiver) and a database. The RFID tag consists of a tiny silicon chip (microchip) for data storage and an antenna that transmits information about the tagged product to an RFID reader. Information can further be transmitted to central databases linking the RFID code to consumer information. The transmission of data goes through electromagnetic waves in the radio frequency spectrum – *the far field*, or through inductive (magnet) coupling, in which case the tag must be within the reader’s magnetic field – the *near field region* (Gragg, 2003; Langheinrich, 2006). The tags normally allow for functionality such as writable storage, environmental sensors, access, control and encryption (Sarma, Weis & Engels, 2003).

RFID can uniquely identify specific objects and help “classifying, counting, and organizing anything” (Boriello, 2005). This is also perceived to be the main idea behind RFID – to provide items or products with a unique identity, so they can be counted and traced. The core of this identification is the Electronic Product Code (EPC) that follows the RFID-tag. In a way it is the successor to the barcode, but RFID has a much wider application potential due to the unique code that make products individually identifiable.

In today’s knowledge or information society, technology optimism permeates policy and technology circles and the use of technology such as RFID seems both promising and future-

oriented. This makes it easy to justify extensive RFID usage, beyond tracking items in the supply chain. The manufacturing industry and retail businesses have voiced interest in implementing RFID “closer to the consumer” in order to extract the benefits of a closer relationship between products and consumers. At the same time consumer and privacy groups have voiced concern for a developing Orwellian society, in terms of private sector consumer surveillance. It is expected that low-cost RFID chips will behave like “smart-labels” on every commercial product, and hence RFID may become one of “the most pervasive computing technologies in human history” (Sarma, Weis & Engels, 2003). The ability of the technology to collect data about a person from various sources, to track a person in public places, to create enhanced profiles by monitoring consumer behaviour in stores, to remotely read data from a persons clothes, accessories or the person herself – are all scenarios that should raise privacy concerns according to the EU-initiated *Article 29 Data Protection Working Party* (2005).

So far the technology has been implemented to achieve cost savings and to improve efficiency and visibility into the supply chain of goods and processes. But the technology seems to have unlimited potential in terms of acquiring, storing, tracing and transmitting data. It has been proposed by the scientific community that RFID technology could be the “embodiment of the paradigm shift towards low-cost ubiquitous computing” (Rieback et al, 2006) and that the technology will blur the physical and online worlds by allowing individuals to manage a plethora of wirelessly interconnected commercial products – and even animals and people. Tracking dogs through RFID has become common practice to many pet owners, while patients in hospitals have already had RFID chips implanted to monitor health and medication needs. A bar in Barcelona offers its VIP members subdermal RFID chips for identification, access and transaction, while a bar in Glasgow offers subdermal RFID tags containing credit card information.

Consumer awareness of the technology primarily stems from mass media’s focus on questionable RFID pilots conducted by large supermarket chains, primarily in the US, Germany and the UK. Retailers and the tech industry advocate counter-strategies to these mass mediated scares in order to “educate the consumer” about the potential benefits of the technology. These advocates also feel a need to debunk the myths that swirl around RFID. Consumer advocacy groups on the other hand address the issues of privacy, covert tracking and behavioural profiling as key concerns, and are stern opponents of the RFID technology.

This paper will discuss current RFID deployment and pilots, address the potential benefits and risks for consumers, as well as the expected omnipresence and “invisibility” of RFID and related systems, making RFID intrusive and potentially evading consumer consciousness in the future. We also look at regulations and initiatives from private actors and consumer organisations as first attempts to provide guidelines for a “healthy” RFID development. Concerning consumers’ present perception of RFID there are very few consumer studies available. In this paper we refer to two studies conducted by Capgemini, a consultancy, as well as to a few other consumer-related studies. We conclude the paper by reviewing the relevant research, media coverage, tests and applications, and the potential pros and cons of the technology. On the basis of this we suggest more research as well as collaboration between industry and the consumer sector to pave way for a sound RFID deployment in the Nordic countries.

2. Background

RFID as a technological concept is not new. RFID was already used in World War II to identify friendly aircrafts in air battles. In the 1980s it was mostly used to tag livestock in order to track and monitor the wellbeing of animals (Gragg, 2003). The first commercial implementation of RFID came in 1984 as General Motors attached RFID tags to car frames to make sure that the right equipment was put on each frame (Juban & Wyld, 2004). In the 1990s RFID entered the supply chain for managing production and distribution systems.

Hence, RFID has moved from the labs and niche uses into a broader range of applications such as supply chain management, asset management, access control, wireless transactions, etc. (Evans, 2004). The brief “public” history of the technology has been myth-spun and polarised between advocates and antagonists of the technology. The public debates have focussed on the future potential of the technology and not so much on existing applications. Roussos (2006) claims that we over the past two years have “witnessed an explosion of interest in radio-frequency identification and supporting technologies”. The main driver of this development, according to Roussos, is the expanding supply-chain tracking of groceries. Tracing food has also become forced on the European food industry by EU legislation due to recent food scandals. The current use in retail is in essence to monitor store-keeping units (SKUs) and not individual goods – although this is the controversial topic that has created privacy fears. Item-level tagging is however in many ways impractical according to Roussos due to the high costs of RFID deployment and the low profit margin of most supermarket products. However, for high-values products RFID could yield benefits and added-value.

In terms of a *consumer perspective* on RFID the most interesting aspect is tied to the retail business’ use of such applications – both in-store and out-of-store as consumers bring home RFID-tagged items that are “live”. There is still a long way to go concerning item-level tagging but large retailers worldwide, such as *Wal-Mart*, *Tesco*, *Marks & Spencer* and *Metro*, have already conducted pilot-tests to see how RFID systems work in practice.

It is claimed that even though the RFID technology occupy a range of great capabilities for both consumers and businesses, the technology and its perceived uses are considered sensitive from ethical and legal standpoints, including many controversies and issues that need to be resolved – mostly because consumers are not aware of the technology, how it might be used, and they do not grasp how the technology itself works (Lee, 2005). As Taghaboni-Dutta & Velthouse (2006) states, many consumers have already had hands-on experience with RFID technology without being aware of it. Juban & Wyld (2004) follows up on this claiming that most consumers are unaware of RFID *as a term*, how RFID will *affect how products are sold*, and what *benefits and risks* are involved at the consumer level.

3. RFID and its potential

EPC Global is the joint venture organisation that has set out to develop industry-driven standards¹ for the Electronic Product Code (EPC) that is used in RFID. The predecessor to the EPC is the Universal Product Code (UPC), also known as the barcode system. The UPC only identifies a *product type* and not *individual products*. It is expected that RFID will succeed the well-established barcode as an identifier of products. Today it is reckoned that more than 5

¹ In close cooperation with the International Standards Organization (ISO).

billion barcodes are scanned on a daily basis worldwide (Garfinkel, 2002). Garfinkel compares the optically scanned barcodes with the new RFID tags and claims that the latter represent a lot of advantages:

- 1) Optical barcodes need line-of-sight to be read, while RFID tags can be read through most materials, although there are drawbacks when it comes to liquids and metals.
- 2) Barcodes have 13 digits of information while RFID tags can store hundreds or thousands of bytes of information.
- 3) Only one barcode can be read at a time, while dozens of RFID tags can be read simultaneously by a single reader.
- 4) Barcodes are read-only, while RFID tags can both store and process a limited amount of information.
- 5) Barcodes are promiscuous, since any compatible reader within range can read the tagged object's data. RFID tags on the other hand can be encrypted for enhanced security.
- 6) Barcodes must be physically destroyed or discarded while RFID tags can be electronically deactivated; meaning either "killed" or "put asleep".

Over the past few years, businesses and industry have invested large sums in researching RFID and seek for quick implementation of these systems to get ROI² (Boslau & Ritke, 2006). Manufacturers and retailers desire transparency throughout the supply chain, and the individual tagging and identification of each item through RFID supports that vision. But an added value is the real-time market research that retailers can perform through surveillance of in-store shopping habits (Perakslis & Wolk, 2006), as well as finding new ways to gather, analyse and communicate information in order to achieve more targeted marketing, less excess production inventory and address consumer demands for better and more correct service. Even though the anticipated benefits seem high, it must be realised that replacing the barcode system will come at immense costs.

RFID-tags or transponders can be attached to, or implanted into, objects, animals or people. There are in essence two kinds of RFID-tags in operation, referred to as *passive* and *active*:

- *Active tags*: The active RFID chip continually radiates information for any receiver to pick up (unless its message is coded). These chips have a local power source and are consequently larger and more costly to produce than the passive tags. They are also prone to be disabled if the power source fails. Still the signal that is sent out is a lot stronger than for the passive tag and can reach up to, and even beyond, 100 meters. The size and cost of the active tag renders it less useful as a potentially all-encompassing tool for pervasive and ubiquitous computing and commerce.

- *Passive tags*: The passive tag on the other hand is small, now down to the size of a grain of sand (the Hitachi Mu-chip is 0.3 mm²). The passive tag is powered by incoming electromagnetic or inductive signals from the RFID reading device. It uses this energy to activate and to send information (the EPC and/or other information) back to the reader. The reading distance is however very short, from a few centimetres up to a meter. The advantage is long life-span due to the lacking power source, less maintenance, and the chip only sends information when activated by a reader (Gragg, 2003). The production costs keep falling for the passive tag, and the hope is that each chip will fall below 5 dollar cents to reach mass-

² Return on investment

implementation into consumer goods. It is only the passive tag that could potentially replace the barcode.

RFID-applications can be differentiated into two product groups; 1) products with RFID being a *central feature* of the object itself, and 2) objects that are *tagged with RFID*. The first category can be exemplified by access control systems, vehicle immobilization systems and automated toll collection system. The second group can be exemplified by any product group having RFID-tags attached to them, but where RFID is not a central feature of the product itself (Boslau & Ritke, 2006). The authors claim that a fundamental difference of the two groups is that in group 1) RFID provides a core value to the consumer, while this is not the case in product group 2) where the added value is basically for producers and businesses. In the future there will potentially be more hybrid versions of these two groups as RFID is being implemented into traditional consumer products and not only attached onto them or onto their packaging.

The assumed advantages that RFID brings to the marketplace are increased automation, unique identification, improved visibility, real-time information, enhanced information about products such as ingredients/ potential uses/ ethics, improved efficiency, reduced costs for asset tracking and management (Evans 2004), lower prices, greater product selection, higher product availability, faster check-out at the counter, location of products involved in recall, as well as mail-tracking and luggage-tracing. Furthermore, enhanced working standards, reduced medical risks, protection of personal assets (e.g. easy and quick recovery of high-cost stolen items) and overall ease-of-living are seen as benefits (Perakslis & Wolk, 2006). According to Juels (2006) *unique identification* and *automation* stand out as main advantages over the optical barcode.

Some proponents of barcodes purport that these are sufficient for keeping track of specific items and for data maintenance, while for certain products, in particular high-value or sensitive assets, RFID can add value through asset tracking, precision location, anti-theft, and updating tags with critical product information or maintenance information (Evans, 2004). Further, RFID can protect against the counterfeit industry, which has increased drastically over the past years (Taghaboni-Dutta & Velthouse, 2006). It is assumed that consumers have an interest in verifying products. Hence, RFID becomes a mechanism *for increasing trust in a product*, while this is also in the interest of producers and retailers. For the pharmaceutical industry in particular this feature is critical. The focus in this case is not on improved efficiency in the supply chain, but on protecting consumers against potentially harmful counterfeit products.

For the retailers and manufacturers in general “user profiling” appears as one of the most tempting and valuable benefits of item-level RFID deployments. Such profiling enables price discrimination. Price discrimination can thus be an incentive for many market actors to violate the privacy of customers, while consumers might be outraged at the price discrimination practice itself (Stajano, 2005). The loyalty of customers is invaluable to retailers and new ways to attract and retain customers are always sought. Thus the trend towards more individual marketing/service and targeting/mass customization is increasing, although fully individualized marketing is still not a reality (Roussos, 2006). But the cost to the businesses of being “too easy” with consumer data could prove to be fatal.

RFID on an item-level can yield new information and insights into shopping habits and RFID also leaves an “information trail” (Roussos, 2006) involving recordings about location, how

and when consumers and products have engaged, and how the products travel through the value chain. It is expected that retailers, in their hunger for information about consumers, will want to follow this trail to gain knowledge of how the product is used in everyday life – combined with a deep profile of the specific user. Thus, more individualized offers and promotions can be displayed to the consumers as they return to the store, by connecting the consumer's profile, interests and lifestyle choices to available products. Stajano (2005) claims that the assumed benefits are mostly for manufacturers and retailers and not so much for the consumers, even though these are the ones that need to be convinced. Eckfelt (2005) follows Stajano's logic and claims that consumers calculate perceived values against their risk exposure, referring to RFID in security systems as the best value for consumers. Automated toll collection also provides great convenience for the consumer, while RFID in stores is more difficult to legitimate. Consumers must be convinced of the benefit from real-time and extended information, as well as the reward of after-sales services, in order for the RFID to be welcomed. The impending danger is that consumers start feeling they're being "spied on" and tracked for the purpose of marketing or clandestine profiling. The privacy-related issues will be addressed in chapter 4.

3.1 RFID applications

There are already a range of services where RFID has been implemented, also in the Nordic countries, where automated toll collection and RFID in libraries are the most prominent, in addition to supply-chain management. On a general level there are various sectors that could enjoy RFID. In the *transportation industry* RFID can be used for tracking physical goods. Today this can only be done by manually scanning individual barcodes, requiring manpower and line-of-sight. RFID-enhanced *museum exhibits* can be realised through reader packages being mounted on museum exhibits, while RFID tags can be carried by visitors on cards or necklaces. User profiles can be registered in museum kiosks, and web-pages for post-exhibit involvement can be included in the service. A key concern has been the conceptual part; making customers understand how the technology works. Hsi & Fait (2005) claim that visitors have an underdeveloped mental model of what RFID technologies are and how they work.

In *libraries* RFID has been implemented for easy checkout of books and inventory control. The monitoring of peoples book selections have spurred some concerns, in particular in the US where the government may be interested in peoples reading habits for national security reasons. In *manufacturing* the German manufacturer *Gardeur AG* has deployed an RFID system for better visibility in the supply chain, to reduce shrinkage (theft or loss) and to generally increase efficiency and reduce costs³. Further, in *clothing* small passive chips/tags can be put into clothes to protect the integrity and prevent counterfeit products as well as reduce theft. Accenture, a consultancy, has developed a prototype where a person can access information about another person's clothes, via embedded RFID technology in the clothes. The relevant item can then be ordered immediately over the internet using a PDA. Also, RFID tags in clothes could potentially "talk" to a washing machine that automatically chooses the appropriate wash cycle to avoid damaging the fabric (Juels, 2006).

In *retail*, automatic purchasing has been tested⁴ but not implemented on a large scale. This implementation means no more check-out lines. Consumers in retail stores will in this case be

³ RFID Journal, Aug. 2006: "Clothing Manufacturer Invests Its ROI in RFID".

⁴ See the reference to the *Metro Future Store Initiative* in the next chapter.

equipped with RFID in key chains, credit cards or mobile devices. Sensors detect the products as the consumer leaves the store and bills the users account. However, pilot studies have shown that one can end up paying for other customers products that accidentally have been read by RFID readers at the counter (Taghaboni-Dutta & Velthouse, 2006). In *homes*, we have already mentioned intelligent washing machines, while sensors in refrigerators can detect expiry dates, keep up stock, reorder food over the Internet, and could potentially provide relevant recipes for certain foods. These are services that are still on the test bed.

A more established application is RFID used in *security keys*. RFID-enabled keys are used for access control, such as car-keys, automatic opening of car gates and doors at home. This application provides hands-free authentication and can also record the specific time a person enters a certain room/area. RFID keys are also difficult to reproduce and reverse engineer (Gragg, 2003). *Automated toll-payment* for automatic cost deduction has already been mentioned as a huge success, where RFID-tagged devices are attached to car wind shields. In *hospitals* and for *medication*, Accenture, the consultancy, has tested an “intelligent” online medical cabinet, in the sense that it can monitor a persons health and give reminders on medication and pending refills, and even order refills. *Tracking* of pets, children and patients by using active RFID tags are also applications that are in operation. Parents can for example track where their children move in a confined area. This service has been implemented in several amusement parks, such as *Legoland* in Denmark and *Dolly’s Splash Country* in the US. Tracking patients (autists and dementia patients) and preventing abduction of babies from hospitals have also become practical applications.

3.2 RFID tests and implementations by businesses

Large retailers and supermarket chains are in the forefront when it comes to experimenting with new technology for improved efficiency and cost reductions. German-based *Metro Group*, one of the world’s largest retailers, has initiated *The Future Store Initiative* (www.future-store.org) that gathers more than forty companies from retailing, consumer goods and information technology to explore solutions for future retailing. RFID is a central technology in this initiative. The initiative has tried out RFID applications for households, supermarkets, department stores, warehouse management and order picking.

US-based *Wal-Mart*, the worlds largest retailer, actually forced the implementation of barcodes in 1984 by pushing its suppliers to implement the technology, just as the retailer now demands its top suppliers to implement RFID for inventory tracking. That is RFID on pallets, not on individual items (Gragg, 2003). *Wal-Mart* and *Gillette* also tested a “smart shelf” in 2003 where the smart shelf system detected information from RFID-enabled Gillette products (low stock, stolen items). Privacy advocates criticised the two for violating consumer privacy. There are even websites dedicated to boycotting Gillette for their privacy-invading use of RFID (www.boycottgillette.com). *Wal-Mart* also equipped shelves in a store in Oklahoma with RFID in 2003, tracking a brand of lipstick, while *Proctor & Gamble* researchers detected when consumers removed the lipstick from the shelves – in Cincinnati. The removal of lipsticks triggered a video monitor where researchers could watch consumers (Hildner, 2006). *Wal-Mart* has also tested the use of robots with RFID technology embedded that can help handicapped consumers navigate through the aisles to find relevant products (Taghaboni-Dutta & Velthouse, 2006).

Other RFID tests have been conducted by the large retailer *Tesco*, that attempted a similar system to that of *Wal-Mart* in 2003 – on Gillette products and DVDs. But this system took photos of the consumer taking the product from the shelf, then comparing it to pictures of people actually purchasing the product (Gragg, 2003). This was considered highly privacy-invasive by consumer groups. *Marks & Spencer* use wireless transponders to ensure that their perishable foods reach the consumers faster.

In the clothing industry *Prada*, the upscale clothier, has implemented RFID in its New York store. In this case the sales representatives can provide enhanced information about the products to the customers by scanning the RFID-tagged clothes with a portable reader. The dressing rooms are also RFID-enabled giving customers video displays of runway shows, or matching clothes and accessories to the items tagged.

ExxonMobil, one of the worlds larges oil companies, has used RFID its “SpeedPass”⁵, a service for automatic gas fuelling. This system links the customers RFID key to a database containing consumer credit card information. No signature or pin-code is needed. In the near future *Exxon* envisions fixing RFID-tags to cars so gas pumps can load customer data instantaneously as the customer arrives at the gas station. Customers can further purchase other products than gasoline and *Exxon* has partnered up with *McDonalds* so consumers can purchase burgers with their “SpeedPass”.

There are plans for using RFID in bank notes and credit cards. *The European Central Bank* wish to embed RFID-chips into Euro notes as an anti-counterfeiting measure, to reveal money laundering attempts, and for counting and sorting money. As one article mentions, the tags in bank notes allows the money to “carry its own history by recording information about where it has been”. This provides government and law enforcement with means to “follow the money”. The anonymity of cash will consequently disappear (Albrecht, 2002). *Visa*, *MasterCard* and *American Express* plan to simplify payment processes through a “contact-less” credit card system for consumers, by utilizing RFID. The new card need to be in close proximity of the reader to complete a purchase, and no signature or pin is required for smaller purchases (Perakslis & Wolk, 2006).

4. Privacy and consumer concerns

The “Big Brother” scenario surrounding RFID has spurred some public concern; the vision of a future comprehensive surveillance society, with a seamless network of millions of RFID readers and billions of RFID tags placed everywhere that constantly read, process and evaluate consumer behaviour and purchases (Langheinrich, 2006). Stajano (2005) follows up on this common fear, that objects will radiate unique IDs and that each tagged consumer item can be tracked by others. This provides for an “inescapable, Orwellian surveillance” (Stajano, 2005).

It is argued that the US, and other western countries, are becoming surveillance societies nevertheless, with new high-tech ways of invading people’s privacy. New technologies pave way for this development with microchips, computers, cameras, sensors, wireless communication, GPS and biometrics that constantly reduce the technical barriers to establishing a private sector Orwellian regime. With RFID introduced in this scenario people

⁵ 10 000 users in 1997 – 7 million worldwide in 2003.

can become identifiable through their possessions, and the stealth nature of RFID is what distinguishes it from other technologies that can intrude upon consumer privacy⁶ (Hildner, 2006). The disintegration of consumer privacy, as well as the reduction in consumer awareness, consent and consciousness is what is at stake.

However, historically heated debates have always occurred when new ground-breaking technologies have been introduced. In the 1970s there were fiery discussions when the first printed barcodes were introduced on the American market, as the comprehensive numbering of items “fuelled fears of a dawning apocalypse” (Langheinrich, 2006). Traditionally businesses have been portrayed as the potential abusers of commercially initiated technology. RFID on the contrary, even though implemented by businesses, enables misuse and encroachments by manufacturers and retailers, as well as by governments and law enforcement, and finally by crooks and scoundrels.

It is the idea of ubiquitous tracking of people, which RFID as a component enables, that has spurred most controversy regarding privacy and which has fuelled demands for policies and ethical guidelines. *The U.S. Privacy Protection Commission* noted already in 1997 that “the real danger is the gradual erosion of individual liberties, through the automation, integration, and interconnection of many small, separate record keeping systems, each of which alone may seem innocuous, even benevolent, and wholly justifiable (Perakslis & Wolk, 2006). These functions, that can prove to be privacy invading, are also the alleged advantages of RFID and related technologies, and the key to a pervasive, ubiquitous computing society.

The main concerns that surface in the debate over RFID are *clandestine tracking and inventorying* (Juels, 2006). If there is no encryption, RFID tags attached to items or people will respond to relevant readers *without notifying* the owners or bearers of the tags. This lack of control is probably what scares people and privacy organisations; that others can point a reader at them and engage in clandestine scanning of items that the person possesses. If this information is connected with the person's profile or a larger database of information, a potential “surveillance” aspect is introduced. The other concern is that items one is carrying or wearing will give away position data about a person's whereabouts. This is the tracking concern. Boriello (2005) states that: “No consumers would want anyone else to be able to follow their every move by tracking the objects they carry or wear.”

The fear generated by the tracking and predictive capabilities of RFID systems will potentially scare consumers more than provide them a feeling of efficiency and closer information and bonds to the product. This awareness can make some consumers demand that all links are cut between themselves and the product, preventing new services, upgrades and recalls to work efficiently. In addition, access and visibility into how one's data are handled will be a related demand, including controlling the RFID tags in terms of deciding whether they should be “alive” or if they should be “killed”.

The problem is that consumers have no practical way to *actually verify* that tag functionality has been shut off, killed, or disabled in other ways. In trials at the before-mentioned *Metro* stores in Germany, tags were not disabled while consumers were given notification that this had been done (Roussos, 2006). Roussos states that most consumers do not trust retailers to comply with the *EU Data Protection Directive*, and he believes that even though low-level mechanisms and technical tools (such as tag-killers or blockers-tags) can ensure some

⁶ E.g. supermarket loyalty programs and cards.

compliance with relevant EU directives, “they are unlikely to conclusively address consumer concerns because the users interact with RFID systems at a much higher conceptual level”. Another *Metro* initiative that led to public outcry took place in Germany in 2004 when the *Metro Future Store* was opened. As people learned that the company had distributed 10 000 loyalty cards with implanted RFID to customers without notifying them, activists teamed up outside the store and protested. The *Metro* response was that it had done this to prevent children from watching adult movie clips at store kiosks (Lee, 2005).

The advantages of RFID are the technology’s biggest drawbacks, as it was postulated earlier. According to Langheinrich (2006) the key attributes of RFID (automation, identification, integration and authentication) can threaten two classes of individual privacy; *data privacy* and *location privacy*. Location privacy is threatened if a tag ID is associated with a given person spotted at a particular reader location. If a tag contains more data than the unique ID, or can be connected to a database with a person’s profile information, violations of data privacy might occur. A problem that arises from consumer responses to business invitations is that the individual does not see the reach of single actions, and is as such *willing to give away personal data* or *accepting “tagging”* for various purposes, without realising the consequences. A related problem stems from the unwilling compromising of personal data through insufficiently secured tags, access controls, payments systems or passports. The true danger of RFID lies at this latter point; that automated data collection of personal information and an increasing amount of data traces available on all levels of our lives, *accidentally will be disclosed*.

*CASPIAN*⁷ (*Consumers Against Supermarket Privacy Invasion an Numbering*) has been highly visible in the RFID debate in the US, constantly pointing at actual and potential abuses by the retail sector – and the government – and consistently referring to RFID-chips as “spy chips”⁸ (Taghaboni-Dutta & Velthouse, 2006). The organisation uses the press as a channel to voice its concern over privacy breaches (potential and real) and to call for boycott actions. Due to the one-sided portrayal of RFID as a negative privacy-breaching system, industry consultants and advocates have felt the need to dispel certain myths that have been created about RFID. This verbal fight has to some extent led to a polarisation of the RFID debate, in particular in the US.

The RFID Position Statement of *The Consumer Privacy and Civil Liberties Organizations*, issued by a range of organisations concerned with individual privacy, lists several threats to privacy and civil liberties when, or if, RFID is implemented on a large scale. The assumed threats are: 1) Hidden placement of tags, as these can be embedded onto/into objects and humans/animals and radio waves travels silently, 2) Unique identifiers for all objects worldwide, through the EPC, could lead to a global item registration system, 3) Massive data aggregation in large databases can be linked to personal identifying data, 4) Hidden readers make tags readable from a distance. Thus a person can neither detect the reader nor the act of being read covertly, 5) Individual tracking and profiling, which is basically a sum of the concerns/threats listed above.

Langheinrich (2006) claim that popular and media articles tend to quote capabilities of *active tags* when discussing the possible implications for RFID deployment, leading to surveillance

⁷ CASPIAN, a US-based consumer group, was formed in the US in 1999 to address issues related to supermarket and retailers’ collection and potential abuse of consumer information. RFID is by the groups seen as a “Big Brother” technology that will monitor consumer purchases and habits.

⁸ See: www.spsychips.org. The psychips webpage is a CASPIAN project.

scenarios that to some extent are out of touch with reality. The active tags have higher read ranges and can store more data, but cannot be implemented on an item-level as they require large batteries to function and are expensive. But these tags form the basis for the most common myth of the intrusiveness of the technology. In addition orientation problems and radio interferences will render the RFID systems impractical as a general surveillances system.

4.1 Potential barriers to RFID deployment

Critical to the success of RFID is the ability to develop proper *standards*, to provide an environment for *interoperability* among tags and scanners, and also to secure that RFID is embedded seamlessly in larger systems. As of now, most of these aspects are inadequate and existing systems rely primarily on smaller proprietary solutions. Mokoff (2004) writes that integration issues are key concerns in RFID development and must involve tag creators, reader manufacturers, software middleware developers and system integrators. EPC Global, the organisation guiding the development of RFID standards is a step in the direction of proper cooperation and standards in the RFID field, and Microsoft has initiated the Microsoft RFID Council, which is set out to join EPC Global on standardisation issues (Sullivan, 2004).

The *costs* of implementing RFID systems are also high, and provide a potential barrier. There are investments in tags, readers, networks/interfaces, middleware/software, integration costs, installation costs and training costs involved (Juban & Wyld, 2004). Even though the cost of for example passive tags should fall below the “demand” of 5 dollar cents per tag, there are still steep costs associated with implementing the RFID system in industry and retail. To reap the full benefits of i.e. lower inventory, theft reduction, product tracking, etc., tags have to be introduced in a very early stage of the process – *throughout the whole supply chain*. The problem so far has to a certain extent been that some market actors believe that you only need a few readers and tags that are attached to pallets, cases or items, and that this will give you real-time supply-chain visibility⁹.

Other barriers are *effective read ranges*, operations in environments where *water or metal* are present, *good software* for analysis, the fact that inexpensive tags are *read-only* so additional information cannot be applied to the tag as it goes through the supply chain, and finally that there is a “*Big Brother*” label connected with RFID, which is die hard and not easy to get rid of.

Another barrier is the potential for *information overload*. RFID can generate enormous amounts of data that need to be collected, stored, handled and interpreted to produce knowledge and value to its users. Thus new tools for intelligent analysis must be developed. In addition to effective tools, actors in the value-chain must show a willingness to *share information* and decide on relevant access levels. Nguyen & Kobsa (2006) argue that tagged products will change ownership as they travel through the value chain, from manufacturer to distributor to retailer to consumer. At each stage, or in overlapping stages, the “owners” will want to control the tags for various needs.

Security is also a relevant issue, and a potential inhibitor for RFID deployment. The lack of cryptography in RFID applications (in particular passive ones, due to the cost issue) is an

⁹ IEEE distributed systems online, 2007: “RFID: Not Your Father’s Bar Code”.

impediment to proper security design. It is hard to guarantee confidentiality and integrity of consumer data in a wireless, non-encrypted network environment (Lee, Park & Yoon, 2007). In such environments data transfers are more vulnerable to interceptions and eavesdropping than in wired environments.

Another aspect, slightly different from the control and privacy concern, is the concern for a *digital divide between* those who can access RFID communicated information and those who can't. The former are expected to make well-founded choices, and are hence also more accountable for their actions as they have access to "deep information" about a product and its life-cycle.

Those concerned with privacy issues have proposed *blocking technology* as a measure for consumers to avoid being tracked through their products. These blocker tags prevent unauthorised readers, either retailers or "spies", to access information about a consumer's possessions. However, such technology increases the burden on the consumer who must manually disable the tag or assure that deactivation is done in the check-out process. Consumer groups and privacy proponents advocate a permanent deactivation of RFID tags already at the check-out counter to avoid surveillance. This means no added benefits or post-sales services, such as easier return of products, notices of default and hence activating warranties for repair or replacement of products. As such, blocking technology can be a barrier to effective post-sale functions.

4.2 Regulations and statements relevant for RFID

On a European level there are a few directives that address or impact new technology uses such as RFID. These are (Roussos, 2006): *The Data Protection Directive* (1995), *The Electronic Commerce Directive* (2000), and *The Privacy and Electronic Communications Directive* (2002). The DPD directly addresses the fair use of personal data and how privacy should be maintained, the ECD points out contractual terms and conditions and call for explicit consumer consent at all stages in a commercial relation, while the PECD takes care of the recording and use of location data. Apart from these directives the EU at this stage has no immediate plans for either forcing industry implementation of RFID, nor issuing specific rules and regulations for privacy protection in RFID applications. This position will be re-evaluated in 2008. The Nordic countries are to a large extent bound by these directives, either through their EU membership or through the EEA agreement.

The US does not have protection of personal privacy in its Constitution, although certain aspects such as "breach of confidence" etc. are put into the law. The State of California has gone further than federal law by addressing RFID specifically in its state laws, due to the complexity of RFID and privacy-related issues. A 2004 bill prohibits "a private entity from using an electronic product code system that uses radio frequency identification (RFID) tags attached to consumer products or an RFID reader to gather, store, use or share information that could be used to identify an individual unless the entity complies with certain conditions". These conditions are that the data are collected only to the extent of the law, that the information has been provided by the customer for purchase or rental purposes, and that information must not be collected prior to the customer initiating the purchase or rental, or after a completed transaction (Taghaboni-Dutta & Velthouse, 2006).

In addition to government regulations, there are several initiatives by industry and consumer groups that aim to provide guidelines for RFID development and deployment. One such initiative is headed by EPC Global, the organisation leading the development of industry-driven standards for the Electronic Product Code (EPC) to support the use of Radio Frequency Identification (RFID). EPC Global has issued the following guidelines for RFID deployment: 1) Consumer notice – clear notice to consumers of the presence of RFID tags on products and packaging, through a logo or identifier, 2) Consumer choice – consumers must be informed of their choice in discarding, removing or disabling the RFID tags from acquired products, 3) Consumer education – consumers must easily obtain accurate information about RFID and its applications and about advances in the technology, 4) Record use, retention and security – companies must publish information on their policies regarding retention, use and protection of consumer-specific data generated through their operations.

Regarding Nordic initiatives, the Danish Technology Council has established a group that provide principles and recommendations regarding the coming RFID developments. The group has presented 5 principles that they claim should be consulted as new RFID initiatives develop (Teknologirådet, 2006): 1) The principle that the user should control the technology, 2) The principle of personal integrity, 3) The principle of interoperability, 4) The principle of user-friendliness, and 5) The principle of sustainability.

In addition the RFID-group suggests several means to promote security and privacy related to RFID development (Teknologirådet, 2006): 1) Support and incentives for developing privacy solutions, 2) Privacy must be incorporated in the early design process, 3) Consumer control, through an opt-in model for registration of data, in marketing, and for controlling the tag to be activated or not, 4) Privacy can become a parameter for competition, and 5) Study existing regulations to see if these can be applied to address the challenges posed by RFID.

These principles correspond to the EU work initiated on privacy protection related to RFID, through the *Article 29 Data Protection Working Party* (2005).

5. Media coverage of RFID-related issues

It has been claimed that 2004 was the year that RFID became a hot topic as new applications and tests were commented in the press. The technology itself, as we have already learnt, has existed since World War II but has somehow not caught the public interest until recently. RFID was mainly tested out and introduced into supply chain management, but the various pilots and tests performed by the above-mentioned retailers (chapter 3.2) have resulted in RFID reaching the public audience through the mass media's critical assessments of the tests and RFID's potential in the future.

BBC News has covered RFID on several occasions and one article claims that the roll-out of RFID faces the danger of being derailed before it takes off, due to the public's perception of it. Most media articles focus on the potential privacy breaches that can materialise in the future if the technology is allowed to develop freely, with no privacy fetters to hold it back. A book published in the US by a Christian author even claims that RFID will evolve into the "mark of the beast"¹⁰, while another 2006 book is titled "*Spychips: How major corporations and government plan to track your every purchase and watch your every move*". A popular

¹⁰ BBC News, February 2005: "Alarm over shopping radio tags".

scare factor is that the products we buy will somehow be linked to us forever, that we cannot escape the products we buy.

Some media articles have referred to the Hollywood movie “Minority Report” in addition to George Orwell’s book “1984”¹¹. Others have referred to Aldous Huxley’s “Brave New World”, claiming that developers seek to create order and balance in a chaotic world by introducing RFID and related technological systems (Albrecht, 2002). The analogue to these movies and books is that RFID-tags in clothes can be linked to a person’s profile, which is detected the next time the consumer enters a store. Furthermore, ads can flash up in front of you in stores and on the streets, based on your spending patterns or profiled interests. In addition the police can access the core databases to do deep surveillance, or spies can covertly read information from you or your items from a distance. These media portrayals of the technology impact and form public opinion on the issue. Even though some of these scenarios seem far fetched and more suited for Sci-Fi writers, the technological potential for realising these visions is probably not a barrier.

The Capgemini surveys from the United States and Europe (Capgemini, 2004, 2005) indicate that consumer awareness of the technology is fairly low, and that for Europe people who were aware attained information about the technology through printed media (37%), internet (29%), television (16%) and word of mouth (16%). Some of those who had heard of RFID from television actually referred to “Sci-Fi” series or movies where RFID had been mentioned. The RFID-survey conducted in Europe (Capgemini 2005) also states that the internet has become a main vehicle for consumer groups to post their anti-RFID messages and run their boycott campaigns¹².

6. Consumer-related research on RFID

There is a scarcity of RFID-related research with a consumer focus available. Most articles refer to the 2004 and 2005 study performed by Capgemini, in the US and Europe respectively.

The US study reveals that 23% of respondents have heard of RFID technology. 42% of these have a favourable perception of RFID, while 10% have an unfavourable opinion. 31% have no opinion at all, while 17% don’t know. Consumer awareness of existing RFID applications proved to be low and most respondents did not make a connection between listed applications and the RFID technology itself.

When it came to potential benefits of RFID the top five responses where:¹³ Faster recovery of stolen items (71%), improved car anti-theft capabilities (70%), consumer savings due to decreased costs (66%), improved security of prescription drugs (65%), and faster and more reliable product recalls/ and improved food safety and quality (62%). At the bottom of the benefits list came, what retailers have visioned as a future scenario, the in-aisle companion product suggestions (28%), instant recognition of preferences (41%), and increased access to products (44%).

In a pre-programmed list of potential RFID-related concerns 69% of Americans rated consumer data used by a third party as something they were “extremely concerned” about.

¹¹ ZDNet, January 2003: “Are spy chips set to go commercial?”

¹² E.g. www.nocards.org, www.spychips.com, www.boycottgillette.com, etc.

¹³ Respondents finding the benefits of RFID to be “extremely important”

67% were concerned about more targeted and direct marketing, while 65% did not enjoy the idea of tracking consumers through product purchases.

The European study reveals that 18% of consumers have heard of RFID, with 24% in the UK and only 12% in the Netherlands. The perception of RFID in Europe proved to be “more positive” than in the US, with 52% regarding it as favourable. When it came to the potential benefits of RFID the list is nearly identical to the US-based list:¹⁴ Improved car anti-theft capabilities (70%), faster recovery of stolen items (69%), improved security of prescription drugs (63%), improved food safety and quality (58%), and providing potential savings to consumers (55%). Also here, the lowest scores came for in-aisle companion product suggestions (19%), instant recognition of preferences (28%) and increased access to products (36%).

The concerns of the Europeans respondents were, as in the US, related to consumer data being used by a third party (59%), tracking of consumers via products purchases (55%), targeted and direct marketing/ and that tags could be read from a distance (52%).

Several scholars (i.e. Boslau & Ritke, 2006) agree with our perception of a lacking consumer emphasis in RFID-related research. This could be the result of RFID being a dawning technology that still needs to develop, and that studying it “to death” before it has even been implemented to a certain extent might seem futile. Still, as the technology is young and developing fast into a full scale “consumer-relevant technology”, it seems pertinent to study the “human” and societal aspects of the development from its early stages. The chapter on media coverage related to RFID indicate how polarised and myth-spun public discourse on such a technology can become – even with very few applications in active operation – and this calls for more well-grounded research on RFID-technology in various contexts – including the consumer context.

One attempt at “investigating the mindset of consumers when it comes to RFID” comes from Boslau & Ritke (2006). The authors refer to the investigative and descriptive research conducted by Capgemini (2004, 2005), and that these studies chart out consumer awareness and perception of RFID technology. The authors further introduce a behavioural science perspective in the study of RFID. The research done by Boslau and Ritke seeks to investigate how consumers’ attitudes towards the RFID technology relate to their actual behaviour. The authors state that: “By knowing what consumers’ attitudes are, we should be able to understand whether RFID technology is beneficial or not and improve the marketing mix to improve consumer attitudes” (Boslau & Ritke, 2006). We find this assumption to some degree naïve, based on the assumption that it is difficult to infer such a relationship when the technology is so new and diffuse, yet extremely complex, and with few practical applications as reference points.

The model of consumer behaviour that the authors apply, investigate the relationship between stimuli, organism and response (SOR). On *consumer attitude* a subdivision is made of the attitude construct into *attitude towards new technologies* (ICT) in general, *attitude towards RFID-technology* in particular and *attitude towards products with RFID-tags*, with an expected positive correlation between the attitude constructs. Then, using the *attitude-behaviour relation* it was assumed that attitude towards the technology directly influences behavioural *intentions* and indirectly influences *behaviour*, with assumed positive

¹⁴ Respondents finding the benefits of RFID to be “important” or “extremely important”

correlations. The positive correlations were confirmed in the analysis. The authors acknowledge that the context of the study is fairly general and that an emphasis on specific products potentially would have revealed differences in attitude depending on product or product group. Still, the new insight the authors claim to have brought to the table is that attitude towards RFID is driven by emotions and not cognitions, possibly explained by the novelty of the technology.

The authors conclude that consumers are interested in learning more about RFID, and that educating consumers about the *advantages of the technology* is critical as well as *evoking positive attitudes* in advertising and information campaigns, as their study has revealed that consumers form attitudes towards RFID based on emotions. Again, we would claim that a more balanced information strategy, to supplement the media hypes, myths and polarised accounts, and bringing to the fore the disadvantages as well would somehow seem more credible and trustworthy to the consumer. In addition we find “evoking positive attitudes”, due to the finding that RFID attitudes are based on “emotions”, a bit far fetched. The RFID-consumer relationship and related contextual aspects are more complex than that and consequently require a more encompassing research strategy and methodology.

Taghaboni-Dutta & Velthouse (2006) refer to a 2005 US-based study that show that consumers are not only concerned about unauthorized people or businesses accessing private information, but there is also a mistrust in government intentions related to exploiting the RFID potential. This conclusion could prove different if applied to the Nordic countries, as trust in government is comparatively higher. In the survey the respondents revealed their awareness of RFID and they were presented with a “neutral” overview of the technology so all respondents had a basic knowledge for later questions. This differs from the Capgemini study where only those who had previously heard about RFID were asked RFID-relevant questions. In this survey as many as 47% (N=155) claimed to have heard of RFID while 53% (N=176) had not heard of the technology. In the Capgemini-study only 18% of European and 23% of American respondents had heard of RFID.

The authors acknowledge that consumers learn more about RFID as time passes, especially after 2004, when news coverage accelerated. However they claim that mass-mediated information is diffuse and not clear on content and context, and not based “on today’s facts”, but mixed with the authors/journalists “visions of the future”. As a consequence Taghaboni-Dutta and Velthouse emphasise that “objective coverage” is necessary to educate consumers. However, they also call for a balanced media education by focusing both on functions and limitations of RFID. Common views and critiques related to privacy and data protection must be discussed rather than be ignored, according to the authors.

Roussos (2006) and colleagues have carried out both qualitative and quantitative research on a prototype item-level RFID retail system. Any type of recording or personalized communication via RFID should not be activated in consumer homes as a post-sale service, was the unanimous conclusion of the test persons. Such acts were regarded as privacy infringing, and consumer control proved to be more important than potential commercial benefits. The consumers were fully informed of the trade-off between privacy protection and advanced post-sale functionality. The majority did not want to give away personal data without guarantees that the data would only be used in relation to a *particular service*. Such permission should not result in a *carte blanche* for general product-related communication, which would rather violate their trust relation with the retailer. In general the prediction of

user habits, interests and “needs” were found to more intrusive than helpful to the participants of the study.

Günther & Spiekermann (2005) did research on Metro’s *The Future Store* in Düsseldorf, Germany¹⁵, focussing in particular on consumers’ privacy fears. A 2005 study of 129 consumers’ perceptions of privacy-enhancing technologies (PETs) revealed that the dominant consumer perception is a *deep-seated distrust in RFID-based environments*. 73% wanted the RFID functionality deactivated at check-out time, even though the advantages of potential after-sales benefits were well understood. The participants were shown a film on future shopping in RFID-embedded environments, while the technology itself was explained in an unbiased way. Two services were focussed; *an intelligent refrigerator* and *product return without receipt including relevant after-sales benefits*. The analysis revealed a higher degree of helplessness when facing an intelligent environment, even with various PETs available to the consumer, while the feeling of control and being informed was not dominant at all.

These research contributions give some insights into consumer-product relations in information-intensive, interactive and intelligent environments, as well as an idea of the level of consumer awareness of RFID. Still, more consumer related research is demanded to provide developers and policy-makers with well-founded insights into a complex, ground-breaking technology such as RFID and related systems.

7. Conclusion and suggestions

It must be acknowledged that even though RFID is discussed and referred to in the media and in academic literature, RFID in itself is only a small communication element in a larger system for location awareness and enhanced product knowledge. It is the scale and configuration of such RFID-enabled systems that opens for the opportunity for monitoring and following the object and its interactions with other objects, processes and human beings. Juels (2006) comments that it is astonishing how a apparently modest device such as the RFID tag, which he refers to as a “licence plate”, gives rise to such a complex security and privacy melange, and consequently such a heated consumer-related debate as we have seen in the wake of the dawning RFID development. With this realisation it seems pertinent that RFID as a technology is not regulated *per se*, but that a technology neutral legislation is implemented that encompasses the whole range of issues and problems related to the pervasiveness of intelligent and invisible technologies and systems.

On another account, it might be just as relevant to discuss RFID in connection with developments such as *u-commerce*. The growth of Internet, mobile access, broadband-connections, as well as related advances in e-commerce and m-commerce, has resulted in a focus on the potentials for ubiquitous commerce, or *u-commerce*. U-commerce is said to overcome the time-space limitations seen in other commerce. Watson et al (2002) in (Lee, Park & Yoon, 2007) define u-commerce as “the use of ubiquitous networks to support personalised and uninterrupted communications and transactions between an organization and its various stakeholders to provide a level of value over, above, and beyond traditional commerce”.

¹⁵ The first large-scale rollout of RFID in a retail context worldwide

It is predicted that in future u-commerce environments RFID tags will be attached to products, services, animals and humans in various ways and for various purposes, but all with the same aim of more efficient commercial operations. Such a seamless commercial environment has also been referred to as “silent commerce”, a term that in itself can spark fears of covertness, spying and surveillance.

The Danish Technology Council (Teknologirådet, 2006) believes that RFID potentially can empower the consumers, if they are given control and are educated about the opportunities, so that consumer preferences can be addressed more directly, in depth and in time. The key benefit is that RFID can assist consumers in providing wider and deeper insights about the products they consume (origin, content, ethical and environmental matters, etc). In theory this is the optimal situation – a fully informed and updated consumer acting in a market environment with no information asymmetry. The reality is harder to foresee. As Lee (2005) states; “the possibilities of RFID technology are limitless, as are the opportunities for the technology to be misused”.

To conclude; from the academic literature, empirical research, and the media discourse presented in this paper, there is now doubt that RFID represents a huge potential for change in consumer-product relations. It will change how we interact with, purchase, store, access, and utilize products and relevant information. The greatest potential still seems to be in supply chain management and inventory control, but RFID implemented in consumer products on a large scale can not be written off.

Most concerns that are addressed in this paper are related to an American context, and are hence not as relevant in a European or Nordic context, as the legislation protecting individual privacy and freedom is strong in these countries. However, the pervasiveness, omnipresence, invisibility and interconnectedness that RFID and ubiquitous computing systems represent, make it harder to disclose security breaches and privacy infringements.

This acknowledgement calls for a triangulation of perspectives in addressing the coming development of RFID. The polarised media debates in the US and in some European countries firstly indicate a need to address consumer awareness when testing RFID in a Nordic setting. RFID pilots in “real life” environments, where consumers interact with RFID-enabled items, should seek to involve the consumer in the functionality and consequences of RFID usage. Furthermore, the lacking empirical research in the field calls for in-depth studies of RFID in context, to secure deeper insights into the motivations and perceptions of consumers related to RFID-enabled systems. This is particularly relevant in light of the experiences from the US where a polarised debate proves to be more destructive than healthy for sound RFID development. Finally, even though the Nordic countries have implemented relevant privacy and data directives into national law, there is a need for alliances between the industry, consumer, data protection and research organisations, in order to provide balanced and consumer-sensitive guidelines as a support mechanism for RFID developers.

A conscious, coordinated and well-founded approach relative to RFID, ubiquitous and pervasive computing, is the key to preventing anything even resembling an Orwellian-like nightmare from materialising.

Abstract

In the discourse on nanotechnology a rather controversial parallel is often drawn to the GM discourse. In this paper we explore some major governance issues related to GM food and compare them with those emerging for nanotechnology. Nanotechnology has received comparatively little attention in the public sphere. We relate this to different awareness on the regulation of science and the regulation of markets and to different types of conflicts. Nanotechnologies are still viewed as taking place within the realm of science, whereas GM foods have been viewed as products in the market, where the relevance for consumer politics is clearer. At the same time, GM food is about living organisms, more easily raising ethical and environment questions. New, deliberative types of governance seem well suited to handle some of these conflicts, while others are much more problematic.

1. Introduction

Everything is good as it leaves the hands of the author of things, everything degenerates in the hands of man. He forces one soil to nourish the products of another, one tree to bear the fruits of another. He mixes and confuses the climates, the elements, and the seasons. He mutilates his dog, his horse, his slave. He turns everything upside down, he disfigures everything, he loves deformities, monsters. He wants nothing as nature made it, not even man himself. (Rousseau, 1762).

The main theme in this paper is the governance of emerging technologies relevant for the consumer market. More specifically, we compare the GM food-discourse with the corresponding discourse on nanotechnology. Thus, our main research question can be formulated in the following way:

What are the similarities and differences between GM food and nanotechnology in terms of regulatory issues brought up in public discourse, types of actors involved, conflict alignments, and modes of governance?

The paper is based on a review of research within in these two areas, and on a Norwegian project on the precautionary principle in nanotechnology. Quite early in this project we noticed that parallels were drawn between developments in nanotechnologies and the developments that took and take place in the case of genetically modified organisms used for food (GM foods). In qualitative interviews with representatives from the scientific community, NGOs, businesses and political authorities, a large number expressed the opinion that it is an important goal to avoid the confrontation that destroyed the GM food-discourse. These parallels, which are contested, form a point of departure for this paper and we will frame them in a governance perspective along six dimensions. These dimensions are developed after a discussion of relevant topics within concepts of new governance and deliberative processes, presented below.

The main dimensions are:

- What are the main topics in the discourse?
- Who were the main actors involved?
- What was the role of science in the discourse?
- What kind of deliberative processes were conducted?
- Is it possible to identify consensus or contradiction in this discourse
- What have been the proposed regulations of these technologies? (Private/Public)

That the development of nanotechnologies takes place in a similar sociopolitical context as GM foods did, is seen as one of the reasons why analogy between the two is often made. The difference is of course that one started after the other: first GM foods, then nano discourse. By “started” we mean the emergence of a public debate and societal focus on the issue that is when they became framed as issues of governance. Both technologies have a history that goes some decades back, but it was the GM food issue that first made to the headlines and spurred a considerable societal debate.

Both genetically modified food (GM foods) and nanotechnologies are emerging technologies. Their proponents consider them to have enormous potential to alleviate environmental problems and human suffering, while their sceptics have equally radical visions about their potential to accelerate these challenges.

2. New governance, the regulatory state and deliberative processes

The classical democracy builds upon the ideal of one man/one vote, and that political decisions within this numerical democracy are based upon the power of the majority. New forms of governance within the frames of the regulatory state and deliberative processes offer an alternative to the constitutional processes by introducing lobbying, negotiations and consensus driven ideals and processes. At the same time, the modes of regulation have shifted.

Regulatory reforms have been observed around the globe, accompanied by new institutions and instruments of regulation. These reforms have had huge impact on the social and economic fabric of modern capitalism. The era of neo-liberalism is also the golden era of regulation. Levi-Faur talks about ‘regulatory capitalism’ or even ‘regulocracy’ (Levi-Faur and Jordana 2005). An enormous literature has been produced on this subject, using a variety of theoretical approaches and illustrated by a large number of empirical cases. At the heart are processes of Europeanization and globalisation of regulation as well as changing relationships between state and market and new foundations for legitimacy (see e.g. Ansell and Vogel

2005; Majone 1999; Scott 2004; Jordana and Levi-Faur 2004; Kooiman 2003). Increasingly, regulation and governance are studied as decentred processes, attempting to capture variations in the locus of control (central state bodies, more autonomous agencies, independent or commercial bodies, etc.) as well as the multiplicity of administrative levels, ranging from the international to the local.

The shift from *Government to Governance* and the new regulatory state, presents a substantial development in legislation, regulation and public policy in Europe (Lindblom 1977; Majone 1996; 1999). To some degree it represents a deregulation of public policy; in other areas we have witnessed a re-regulation. This may, however, vary from one country to another because of traditions and the fact that the welfare state was developed along different paradigms in the 1960s and 70s. In the White Paper on European Governance for the EU (COM (2001) 428 final) the document defines the main principles of governance as: *openness, participation, accountability, effectiveness and coherence*. In a report from the Commission (2003), the discussion on European governance has also included *democratic legitimacy and subsidiary* as other important principles.

Public-private partnerships are important with the new “stakeholderism”, where the state, market actors, civil society actors, and consumers meet as more or less equal “concerned parties”, as stakeholders, where influence is negotiated relatively openly and quite different from traditional forms of corporative governance.

In recent literature we have seen that *governance and the new regulatory state* are concepts that are used in very similar ways. The literature on the regulatory state/new governance often presents a more realistic description of what regulation is and how it works, a realization of the regulatory limits of state authority, and the corresponding potential of private actors to block and restrain public policies. It also includes an awareness of the possible positive contributions of private firms, organisations and associations to enhance public goals and policies, and, more controversially, a new normative model of how regulation is supposed to work, emphasizing the interactive and interdependent nature of regulation. However, Olsen argues (2002) that formal processes of reform of governance may not always produce a precise and stable policy outcome. One of the reasons for this instability is the fact that not all types of actors involved as ‘stakeholders’ have resources to play the expected part in the political process. For nanotechnology this might be the case for almost all types of actors.

New forms of governance include, as already indicated, new ways to develop regulation, with considerable emphasis on deliberative processes. The roots of deliberative democracy, or discursive democracy, are not old as a specific concept. It was originally coined by Bessete in his book *Deliberative Democracy* (1980); however, it is easy to link the concept to the work of Habermas (1989). According to Cohen (1989) there are four criteria for an ideal deliberation:

- It is a free discourse; participants regard themselves as bound solely by the results and preconditions of the deliberation process.
- It is reasoned; parties are required to state reasons for proposals
- Participants in the deliberative process are equal
- Deliberation aims at rational motivated consensus.

For a decision to be called deliberative Renn (1999) emphasises that it is essential that it relies on mutual exchange of arguments and reflections rather than on decision-making based upon

the status of the participants, power or political pressure. In addition, deliberative processes should be governed by established rules of rational discourse (Elster, 1998).

It is easy to understand that it is difficult to reach these goals and ideals in praxis; the political discourse uses many arguments that don't meet these ideals. One major issue is the question of imbalances power (Flyvbjerg 1998). However, this is not a strong argument against deliberative processes. Collective decisions reached by arguing may be considered as reasonable solutions to given problems, because they are based upon convincing reasons.

Thus, Renn argues that deliberative processes are better suited to deal with environmental challenges than the representative democracy, based upon majority votes, because deliberation can produce common understanding of the problem and of the positions of various groups of stakeholders (1999). Furthermore, deliberation can produce new options and new solutions, and has the potential to document the full scope ambiguity associated with the problem.

The concept of deliberative processes is complicated along two dimensions. The first is related to the degree of consensus, the second to the degree of institutionalisation. It is a misunderstanding that deliberative processes are synonymous with consensus. Consensus is a possible solution, but more common is tolerated consensus solution, - an agreement of the position of the stakeholders involved in the process. A compromise is a product of bargaining, and belongs more to the concept of new governance. The degree of formal institutionalisation is another important dimension. The concept is used to describe citizens' panels, public forums, deliberative opinion polls and consensus conferences with relatively low levels of institutionalisation. However, it is also possible to include more institutionalised praxis such as formal hearings and advisory committees within the concept of deliberative processes.

There is a lot of attention towards market driven reforms. But this does hardly represent responses to specific consumer demands. At the same time, people, as consumers, have less and less control over and insight into the consumer items that they buy, but they are at the same time being attributed more responsibility and agency in the form of "consumer choice". The question of social distribution of responsibility is much more complex (and open) than agencies' relationships to politics and markets or market self-regulation (Halkier and Holm 2006). This type of question can be addressed using classical as well as more recent contributions on regulation, supplemented by theories of individual self-governance (governmentality) that can help us to understand the growing emphasis on individual responsibility.

Legitimacy and trust have received a lot of attention in relation to the deliberative processes. Regarding popular trust, it has been argued that one-way information to deal with a knowledge deficit will not work, mainly because knowledge is not the main problem (Hansen et al. 2003). Some believe that these processes can and will produce consensus, provided that all arguments are well presented and all 'stakeholders', that is all concerned parties, are represented. Others have suggested that considering the diverging interests and positions, consensus cannot be expected. The aim should rather be to create for a where all voices can be heard. This will by itself produce legitimacy for the decisions that are made. As already indicated, however, deliberative institutions reproduce well-known problems of corporative systems (see e.g. March and Olsen 1989), namely that arguments from various representatives will be strongly influenced by their resources in terms of knowledge, organisational resources, economic and political power. Cooptation is also a major risk. Consumers represent a typically very weak party, representing what may be characterised as common interests, but

with few resources to back their arguments and vulnerable to co-optation. Closed forums are therefore not necessarily legitimate, even though many voices have been heard.

In relation to the establishment of new regulatory structures, however, much less attention has been paid to trust and legitimacy problems of changing forms of governance. Some, like Ulrich Beck, have announced expectations of major problems of declining trust linked to individual uncertainty (Beck and Beck-Gernsheim 2002), while others believe that new organisational structures will make trust redundant (Cook et al. 2005). Our studies indicate that new types of relationships and new foundations for legitimacy are interesting and important. Trust is crucial, but new structures and processes are perhaps associated with less controversy and distrust than is often anticipated in discourses on new technologies (Kjærnes et al. 2007).

Both genetically modified organism (GMO) and nanotechnologies are emerging technologies. The debate on GM FOODS is often used as a reference point when discussing the ethical, legal and social aspects (ELSA) of the nanotechnologies (Sandler & Kay, 2006; Rip, 2006; Einsiedel & Goldenberg, 2004). What is the relevance of this? What could be the implications for governance and the new regulatory state? In this paper we are particularly interested in the relevance for consumer politics. In what ways are consumers brought into the process, what is their influence, and what kind of role do they play in the establishment of regulatory frameworks? We will therefore concentrate on the deliberative processes that dominate decision-making, on the one hand, and the types of public-private partnerships that develop to regulate the areas, on the other, where labelling schemes and consumer choice play a significant role.

3. The GM foods debate

In trying to give an overview of this debate, it is easy to think of it in rather simplistic terms, how this story is widely recognized as a contrast between the promise of the GM foods in the 1970s, with the backlash of the 1980s and 90s. This is what (Rip, 2006) calls the folk theory about GM foods, insisting that the story is more complex and that it ought to be checked. It is seems hard to avoid, as this version is rather ubiquitous. That the debate on GM foods was rather heated at times is at least something that all actors agree upon – “The debate is an unholy mess” (The Economist, 2003)

What are the main topics in the discourse on GM foods?

In trying to define what genetically modifications really is, you soon realise that terms used in the debate on food biotechnology not always have a clear, unequivocal meaning. This fact has sometimes been used intentionally by one side or the other in the debate. For our purpose here genetic engineering, genetic modification and biotechnology will be used as fully synonymous terms. We understand the these terms as “ (...) referring exclusively to the direct transfer or modification of genetic material using recombinant DNA techniques” (RSC, 2001). As all living organisms have genetically material, the genes can in principle be moved between all organisms: genes from soil bacteria transferred to corn, genes from flatfish to potatoes.

Further, will we in this paper only address GMOs that are used for food – “GM foods”, and not Non-food GMOs, which is more widespread than you might think (GM cotton is widespread, GM oilseed rape, GM pharma). These non-food GMs have gone largely unnoticed, unlike the GM foods.

GM foods were first commercially cultivated in the early 1990s. One was a practically “everlasting” tomato developed in the United States; it aroused a dislike among Norwegian and European consumers. The first GM food in the UK actually sold quite well. It was a tomato puree sold at Sainsbury’s made from GM tomatoes that ripen slowly, compared to the conventional ones. The result was lower prices due to reduced waste, and in addition better flavour. However, as the adverse publicity around other GM crops grew in the late 90s, it too was pulled off the shelves. At that time (1999) the EU imposed a moratorium on any new GMO approvals (The Economist, 2005) over growing public concern of supposed environmental and health risks.

Rather than breeding modified plants that were resistant to diseases, variants that were resistant to herbicides and/or insects were the focus of attention. The idea was that these approaches significantly would reduce the need of herbicides and insecticides. As the plants were resistant to the herbicide it could be applied later in the growing season where the weeds would be more venerable. Monsanto was the company that came to represent this line of research. Crosspollination with wild weeds, creating herbicide resistant weeds and problems for insect-eating birds. The so-called Terminator-seeds were another case where Monsanto was involved which produced much furor. These were plants that produced sterile seeds, creating what some saw as imposing an unacceptable dependency between the farmers and the seed producer. Monsanto announced later that this technology would not be realised into products in the market (RSC, 2001).

Issues like these came to produce an image among European consumers especially of the GM foods as products that were “all risk, no benefit” (Murray, 2003; Einsiedel & Goldenberg, 2004). The only likely beneficiaries seemed to be multinationals. The public’s issues of concern have been grouped into 3 (RSC, 2001:3): Health and Environmental Risks, Socio-Economic Risks, Philosophical/Metaphysical Risks.

Who were the main stakeholders involved?

Where Burke (2004) sees the public as a victim of a hype created by the media and NGOs, Mayer and Stirling (2004) note that there is a full range of public values, priorities and concerns, and that studies have shown that the public attitude in Europe appreciated NGOs’ role but saw them as biased, like any other actors, and the public also held nuanced views to the media’s role. On the other hand it is becoming increasingly clear that the obtained results from “science-based” risk-assessment are sensitive to what questions are asked, how they are posed and the underlying assumptions (Mayer and Stirling, 2004).

What was the role of science in the discourse?

One of the main reasons for the disagreement among scientists and for the heated public debate is scientific uncertainty. This is often quite narrowly defined as a lack of knowledge that can be reduced by further research. A rather more complete definition would include acknowledgement of uncertainty may be irreducible, the existence of ignorance and that underlying assumptions and framing of hypotheses in themselves might create uncertainty (Myhr, 2002).

The question of safety:” ..there is no robust evidence to prove that GM foods are unsafe” (BMA, 2004 cited by Burke, 2004). Inherent in this is the definition of safety, in (RSC,2001) the authors equate safety with “acceptability of risks”. If this is used as a starting point, it is quite clear that judging something to be safe (or unsafe), can involve a value judgment and not necessarily (just) a “pure” scientific evaluation. This is especially the case when cost-

benefit approach is the method applied. In principle that approach will permit any level of risk, as long as the benefits are considered to offset them (RSC, 2001).

What kind of deliberative processes were conducted?

Although concerns over environmental and health consequences are questions that call for scientific answers, they cannot be treated in full without reference to broader ethical, social and political aspects and assumptions (RSC, 2001).

According to (Sandler & Kay, 2006) the “standard reconstruction” of what happened to GM foods was of communicational nature: there was a lack of information from the scientific, business and regulatory agencies to the public from the start on. When worries started to emerge in the public, it was ignored or dismissed. This lack of disclosure and acknowledgement gave an atmosphere of suspicion and misunderstandings that the opponents of the technology took advantage of. This gave a severe blow to the development and dissemination of GM foods, which could and would have given helped those in most need.

This is the so-called “deficit model”, referring to a top-down view of the public being ignorant of the scientific “truth” on risk and probability. Research on ELSA and public engagement apparently stems out of a concern to avoid public resistance, rather than exploring potential problems and ways of solving them that could inform the development of nanotechnology (Sandler & Kay, 2006).

Is it possible to identify consensus or contradiction in this discourse?

Provision of information and education would increase consumer acceptance (Scholderer & Frewer, 2003). Testing this idea in a large-scale experimental study on GM foods resulted in “The biotechnology communication paradox” (ibid.): Neither a balanced information strategy or a hard sell approach resulted in attitude change, but interestingly consumer product choices appeared sensitive to the provision of information: all information material significantly decreased the probability of consumers choosing the GM food products!

What have been the proposed regulations of these technologies? (Private/Public)

Some called the EU moratorium in 1999 a “quasi-moratorium on GMO foods” (Scholderer & Frewer, 2003). The moratorium put the EU under intense pressure from biotech firms and the countries growing GM foods, America first and foremost but also Brazil, Canada and Argentina. The EU agreed to lift its moratorium and replace it with a label-and-trace scheme in which all products containing GM foods ingredients had to be labelled as such, and that the ingredients should be traceable (The Economist, 2004).

Assessing the safety of novel foods in Canada was based on “ the product and not the process used to develop it” (Health Canada, 1994, p4 cited in Metha, 2006). The new Canadian regulations have different wording, but the same message: “This flexibility is needed to allow novel foods and food products to be assessed on a case-by-case basis and to take into consideration future scientific advances.” (Health Canada, 2006, p5). This consideration runs parallel to the one we see in the nanotechnologies: it is the applications that should be regulated or restricted, and not the technologies themselves.

“In general, those who are responsible for the regulation of new technologies should not presume its safety unless there is a reliable scientific basis for considering it safe” (RSC, 2001: 206).

New governance of food is strongly influenced by changes in the food market. The introduction of new technologies and logistics has influenced and is part of a general process of integration and concentration. This has, in turn, led to new power relations, especially regarding retailer led integration along the food chain. We also see that new relations and forms of governance in the food chain is associated with processes of differentiation and segmentation, what may be characterised as “quality modernisation”. Self-regulation constitutes a significant element. More market based regulation is reflected in standardisation processes and contractual formalisation as part of organising and regulating global trade, but significantly also as part of the ongoing “supermarketisation” of the European food distribution system. But we also find such processes of codification and standardisation contribute to an opening up the issue, with reconsideration of established norms and expectations related to the handling of farm animals in modern food production (re Busch). This is in line with regulation developing in less hierarchical forms, with new forms of sanctioning. Animal welfare may also develop as a case of “trading up” (re Vogel).

4. Nanotechnology

What are the main topics in the discourse?

As with GM foods we start with explaining what we understand by nanotechnology. It is to utilize the novel properties that materials get in the nano-scale: “It is the ability to do things – measure, see, predict and make – on the scale of atoms and molecules and exploit the novel properties found at that scale. The nano-scale is not just another step towards miniaturization, but a qualitative new scale. Many current theories of matter at the micro-scale have critical lengths of nanometer dimensions. These theories will be inadequate to describe the new phenomena at the nano-scale. The new behaviour is dominated by quantum mechanics, material confinement in small structures, large interfacial volume fractions and other unique properties, phenomena and processes.” (Throne-Holst & Stø, 2008).

The Nanosciences and nanotechnologies were first visioned by Richard Feynman in 1959, in his famous lecture “There’s Plenty of Room at the Bottom” (Feynman, 1959). He starts here by asking why we cannot write the entire Encyclopaedia Britannica on the head of a pin? And he goes on to examine what would be needed to achieve that.

Another rather early publication in this field was Eric Drexler’s book *Engines of Creation* in 1986. He envisions applications of nanotechnology in wide variety of fields from power generation to medicine. But he also have some dystopian visions of what could go wrong that would haunt the debate on nanotechnologies: How self-replicating molecular assemblers could evolve into thinking machine that would pose basic threats to people and life on Earth, what later would be called “grey goo”. (He later downplayed the possibility for such accidents in a paper in 2004 (Phoenix & Drexler, 2004)).

The Prince of Wales made a media furore following comments he made on nanotechnology in April 2003 where he warned of the potentially “enormous environmental and social risks” from the nanotechnologies (The Guardian, 2003), (probably partly inspired by such dystopian visions, which had been voiced again by the etc-group). This prompted the British government to commission a report from the Royal Society and Royal Academy of Engineering. It became an important and authoritative report on the issue and was published in July 2004: “Nanoscience and nanotechnologies: opportunities and uncertainties” Their main conclusion was that the nanotechnologies offer many opportunities, but public consultation and debate is needed on their development.

Over the years since Drexler's book, that debate has turned from applications to the material technology needed and specific materials. What is much in focus regarding this, is to assess the toxicological potential of nanoparticles, and how to regulate them. A landmark decision on this was reached by the US EPA in November 2006 published plans to regulate products marketed as anti-microbial because they contain nano-sized particles of silver (Campbell, 2006).

Who were the main stakeholders involved?

And this time, regarding the nanotechnologies, interest and research on the ELSA is happening relatively early in the development phase, resulting at least in the possibility of influencing the trajectories of technology development. For the GM foods these aspects were addressed at a later stage, when the stage was set and the "trenches" were manned. The etc-group which was highly successful in getting the public's attention to the problematic issues and aspects of GM foods, have not had the same repercussions with the nanotechnologies, despite rather drastic suggestions like moratorium on all research (etc-group, 2003). Up to now there has been little or no public concern (Rip, 2006: 358) As researchers and society we have the possibility to make it right, this time. As (Rip, 2006: 362) concludes, as social scientists now are taken onboard contribute to a more reflexive co-evolution of nanosciences/technologies and society.

What was the role of science in the discourse?

One of the conclusions of the project this paper is based upon, is that key stakeholders in Norway with regard to who should be precautionary, place this on the individual researcher and the scientific community. The stakeholders do not know much on the subject, and are under the impression that both the knowledge of the nanotechnologies as such, but in addition the ability to politicise the problematic aspects, both are in the scientific community (Throne-Holst & Stø, 2008)

What kind of deliberative processes were conducted?

Interest and actual research on the societal and ethical aspects are happening more in parallel with the technology development than what was the case for GM foods, even though there were some critical voices there too from the start on (Rip, 2006: 362)

Deliberative processes get rather a lot attention in the case of the nanotechnologies, there is even a specific point addressing this in a recent call of the 7FP of the EU.

The Research Council of Norway were quite early in addressing the ELSA of the nanotechnologies and early in 2005 they published a report on the national needs for research and competence on these aspects (RCN, 2005). Here they stress the need to involve lay people in the assessment and deliberation of the nanotechnologies. Not only to enlighten them, make them reflect on the issues and start a democratic debate on technological choices in the interest of technologists as such, but also because the lay people will contribute with other perspectives than the experts themselves. An EU-funded project, Nanologue, concluded on the same note: "The future of nanotechnology: We need to talk".

The Danish Board of Technology (Teknologirådet) has developed the "consensus conference" concept which takes the form of a hearing where a lay panel composed of individuals from different fields of society assess expert evidence on the issue under consideration. This model has been adjusted and developed further both in the US (Madison area Citizen consensus group in 2005), in Germany ("Consumer Conference on the perception of nanotechnology in the areas of foodstuffs, cosmetics and textiles") and the UK(Nano-jury in 2005). Stimulating

upstream dialogue between scientists and citizens was at the core of the DEMOS study (DEMOS 2006). Based on a number of group discussions and a workshop the project revealed that besides possible health risks consumers feared increasing opportunities for industry to control everyday life and doubt government capabilities to steer technology development.

Other deliberative studies have been more focused on key stakeholders, like project we report from in this paper. In a collaborative project in Norway between SIFO and DNV research stakeholders from 4 different sectors were individually interviewed on their views on technological development in general and nanotechnology in particular and on the suitability and possibility to use the precautionary principle on this emerging field. The 4 stakeholder groups were politicians, businesses, NGOs and researchers.

Standardisation is a tool within the concept of governance, addressing stakeholders. Standards are being developed at three levels; global, European and national level. At the global level ISO plays an important part as the international independent organisation for standardisation. The European standardisation organisations are CEN, CENELEC and ETSI. Standards are voluntary documents developed under open and transparent procedures and are consensus based. The development of standards is organised in technical committees and working groups with representatives from business, government, universities, NGOs and consumers. European consumer organisations have established their own organisation – ANEC – to influence the standardisation processes. The CEN have recently established a separate Technical Committee (TC 352) on nanotechnologies.

One could mention here the numerous activities launched by civil society organisations (CSOs) such as the Woodrow Wilson Centre, which is funded by a private foundation, or the International Risk Governance Council, Geneva, which is financed by national governments and international organisations. Both organisations can be regarded pro-active in the sense that they initiate dialogue and deliberate processes much earlier than national governments (can) do.

Is it possible to identify consensus or contradiction in this discourse?

One analysis of why consumers rejected the following waves of GM foods is that they were seen as “all risk, no benefit”. Can the same thing happen to the nanotechnologies? We see a similar “all benefit, no risk” as in the start of the GM foods introduction. Can there be a backlash for the nanotechnologies as well? Reducing the comparison between the two technologies to concern only how to avoid a consumer backlash, would be to miss the point (Einsiedel & Goldenberg, 2004; Sandler & Kay, 2006).

What have been the proposed regulations of these technologies? (Private/Public)

There has been a debate on this issue. One position would say that silver is silver – whether in batch-size or as nanoparticles, and subsequently there is no need for new regulations on exposure and toxicology. Opposed to this would be to point out that the reason why so much money is invested in nanotechnologies is the novel properties found there, it appears rather naïve to believe that just nice, useful properties emerge in the nanorange – some nasty side effects might come up as well.

A landmark decision on this was reached by the US EPA in November 2006 published plans to regulate products marketed as anti-microbial because they contain nano-sized particles of silver (Campbell, 2006). A popular view is to say that it is not the nanotechnologies themselves that should be regulated or restricted, but rather the specific applications that should be addressed.

5. Conclusions: comparing GM foods and Nanotechnology

The main objective of this paper is to describe and analyse similarities and differences between the GM food and nanotechnology discourse within the concept on new governance. This is done for six dimensions, and an overview of the result is presented in figure 1 below.

Table 1. The main dimensions in the GM food and nano-discourse

	GM foods	NANO
Main topics?	Safety of health and environment What are the benefits for consumers? Strong ethical and religious dimensions	Grey goo Toxicity of nanoparticles and regulatory issues What are the risks for consumers? Mainly “technical” topics
Main stakeholders involved?	NGOs Multinational companies (Monsanto) Religious groups Governments	“Public” organisations like Danish Board of Technology, Research Councils. Ethicists
Role of science	Scientists on both sides of the debate	Positive driven discourse by scientists. Calls for a moratorium on research has received little support.
Deliberative processes	Gained momentum over this process	Much focussed, but more in the function of legitimating rather than real influence?
Consensus/contradiction	After initial consensus, a heated debate on GM foods (but not on non-GM-foods or GM pharma)	Consensus that there a great positive potential application and research are needed on these. NGOs has hesitated to call for moratorium
Regulation: private/public	Quasi moratorium Labels	A debate on the need for new regulations

The technologies we have discussed in this paper are not just emerging but transformative as well, solving and interacting with problems on a broad front touching virtually all technology frontiers (manufacturing, agriculture, medicine, biology, chemistry, physics) as well as a range of ethical, social and socio-economic issues. Some have called them strategic

technologies as well, on their ability to transform entire industrial sectors as well as creating new ones (Einsiedel & Goldenberg, 2004).

This point in it self, calls for parallels to be drawn between the two. On the other hand, there are some differences as well. GM foods entered the public domain prior to nanotechnologies, so some lessons have probably been learned. First among these seems to be the need to involve the public at different levels, as one of the more dominant views on what went wrong with GM foods was a “deficit model”: the authorities thought the public to be ignorant of the scientific “truth” on risk and probability. Public involvement would solve this. If you agree on this view or not: deliberative processes can hardly be regarded as something negative. The challenge is that it may appear as a top-down initiative, which really does not have the purpose to include the public’s views and worries. It should have a specific place in the political process on these issues.

Apart from this, there is an interesting argument that has appeared in both of the debates, and that is the degree of naturalness: throughout the history of life on Earth organisms have evolved. This has happened through changes or mutation of the genes, and accordingly changes in the genome of organisms are a natural process. It can even be said to be necessary for organisms to survive as environmental conditions do change. Along the same lines the proponents of GM foods argued that they did nothing else than what nature does herself. The proponents of nanotechnologies would also argue that we have been surrounded by nanoparticles since humankind learned to control fire: soot consist of very fine particles, some in the nanorange. Possibly even earlier than that: volcanic ashes (Clift, 2006.) And, later, during the last century, we have been exposed to particles from traffic. So nothing is new, some would claim. GM foods concerns only living, organic matter, whereas nanotechnology concerns non-food and inorganic matter as well. And the issues and products that have been marketed so far concerns development within the material sciences (eg. Carbon nano-tubes; silicon-oxide, titanium oxide).

It is interesting to witness the role the 3rd World play in debates on both GM foods and nanotechnologies. The proponents highlight how they can solve paramount problems in these countries of food security and clean water, while those who are sceptical to these technologies point to the possible dependency peasants in the 3rd World would have of multi-international companies (like the case with Terminator-seeds) and that the high expenses of nanoproducts will pull the development of such products to solve issues in the West (“The nano-divide”). Others would claim that there is enough food in the world today, but that it is unevenly distributed due to economic and political causes. In that case there is no need for GM crops/foods - these new technologies should be used to solve “real” problems. On the other hand this may be just like saying that there need not be any poverty in the world, because there is enough money already.

Abstract

Objective: The aim of this study was to describe, analyze and evaluate the presence of negative emotions among overindebted individuals, and this as a first step to deepen our understanding of the importance of negative emotions and its links to health during different kinds of economic pressure. **Methods:** A specially designed questionnaire (i.e., the IMPdebt scale) was designed to assess negative emotions among a sample (n=220) of overindebted Swedes. **Results:** Factor analysis (maximum likelihood with oblique rotation) of the questionnaire ratings resulted in a six-factor solution. The first dominant factor was interpreted as Mental trauma, the other factors were labelled; Desire of vengeance, Flight, Shame-guilt, Infringement, and External attribution. **Conclusions:** The particular pattern of negative emotions here found, suggest extreme mental hardship during overindebtedness.

1. Introduction

Most people would probably agree, that a good personal economy, or at least a private economy in balance, is one prerequisite for quality of life, even happiness. According to many health researchers and practitioners an individual, who is having a life, where there is an abundance of positive emotions like happiness and joy, tend to make the life both longer and healthier for that particular individual. The reverse also seems to hold truth. Negative emotions like anger, sadness, worries and fears, especially if they are frequent and long lasting, easily bring about stress reactions that in turn might lead to illness (Lewis and Haviland, 1993).

The most common response to a stressor is anxiety. People who live through events that are beyond the normal range of human suffering (e.g., natural disasters, rape, kidnapping) often develop a severe set of anxiety-related symptoms known as post-traumatic stress disorder – PTSD (Barlow & Durand, 2002; Holmes & Rahe, 1967). Post-traumatic stress disorder may develop immediately after the trauma, or it may be brought on by a minor stress experienced weeks, months, or even years later. Traumas caused by humans, such as sexual or physical assault, terrorist attacks, and war, may even be more likely to cause PTSD than natural disasters, for at least two reasons. First, such traumas challenge our basic beliefs about the goodness of life and other people, and when these beliefs are shattered, PTSD is more likely to occur (Janoff-Bulman, 1992). Second, human-caused disasters often strike individuals

rather than whole communities, and suffering through a trauma alone, seems to increase a person's risk of experiencing PTSD.

Previous research has also shown that *economical difficulties*, such as overindebtedness might be a serious threat to health (Ahlström, 1998, Aldwin & Revenson, 1986; Hintikka, et al, 1998; Nykänen, Kuntula & Palonen, 2000) However, there is a paucity of research when it comes to the understanding of how the mechanisms of negative emotions affect health during economic pressure, especially when it comes to the specificity and combinations of negative emotions. Also, the intensity of emotions and temporal aspects such as the onset, continuation, and chronic presence of negative emotions is of considerable interest. This issue is important to pursue, since the number of overindebted individuals and households is growing in the whole western world at an alarming rate. For example, according to Betti et al, (2001) the amount of overindebted households in the European union is at present 16 percent.

In order to investigate these considerations, the present study was carried out. The aim of this study was to describe, analyze and evaluate the presence of negative emotions among overindebted individuals, and this as a first step to deepen our understanding of the importance of negative emotions and its links to health during different kind of economic pressure.

2. Methods

This study is a substudy of a cross-sectional study (Ahlström, 1998), which examined the health and quality of life of overindebted individuals in Sweden. The focus of this substudy was to analyze the emotional impact of severe debts on the individual. The emotional impact was assessed using a self-report questionnaire, which was mailed to the subjects and filled in at their home location, and hence returned to the investigator in a reply paid envelope.

2.1. Measures

In addition to items covering relevant socio-demographic data (e.g., gender and marital status), a questionnaire was included that focused on the assessment of the emotional impact of severe debts on the individual. This questionnaire, comprising 26 statements, was constructed on the basis on a content analysis of the results of 20 in-depth interviews previously held with overindebted individuals in the Swedish cities of Gothenburg and Sundsvall. The statements in the questionnaire mirrors frequently expressed emotions when reflecting the experience of being in debts among the participants in the interview study. The purpose of the questionnaire is to measure and evaluate the impact and structure of emotions when being in a life situation characterized by severe debts. For each statement a five degree Likert scale was attached, comprising a range from 1: "Disagree completely", to 5 "Agree completely". For reasons of convenience, the questionnaire will hence be referred to as the IMPdebt-scale.

2.2. Participants

A total of 300 subjects agreed to participate in this substudy. They were all recruited in a two-step procedure by officials from the Money advisory service in 20 communities in Sweden. The two-step procedure was used to secure the participating subjects' anonymity. The inclusion criterion for participation in the study was that the subject should fulfil the legal court requirements for debt settlement according to the Swedish debt settlement law (SFS, 1994). This imply that the subject has been severely overindebted during a substantial time period, with no, or very limited capacity to pay back his or her debts. The twenty communities were selected as to represent the most typical average living conditions in Sweden with respect to average income levels, education, geographic region etc.

Out of the total 300 subjects, 236 subjects (i.e.78,6 %) subjects returned the questionnaire. Due to missing data 16 questionnaires were excluded from the final analysis. The final sample of subjects (n=220) comprised 136 women and 84 men. Mean age for men and women was 46,2 years. On average, the subjects in this study had been overindebted for 7 years and 4 months.

2.3. Statistical analyses

A first-order factor analysis was used to explore the content and pattern of the 26 statements in the questionnaire (i.e. the IMPdebt-scale). In order to compare the relative emotional impact of scale items a mean values analysis was carried out. Analysis of variance was used to test sociodemographic differences. These three statistical analyses were performed with the SPSS 12.0 software package. In addition, a second-order factor analysis was performed based on the factor structure of the first-order factor analysis employing the LISREL 8.50 software (Jöreskog & Sörbom, 2001)

3. Results

3.1. Factor analysis

In order to explore the main aim of the study in an adequate way, a factor analytic approach was chosen. Factor analysis is a suitable method here, since its employment makes it possible to map the not directly observed (i.e. latent) dimensions underlying subjects' ratings of the questionnaire statements, as well as the relative importance of these latent dimensions.

In a preliminary step, the internal consistency of the 26 IMPdebt scale items was calculated. In the present sample the Cronbach's alpha coefficient was 0.90, which imply good psychometric properties. Second, taken together, the results of Bartlett's test of sphericity ($p < 0.0001$), and Kaiser-Meyer-Olkin's measure of sampling adequacy (0.90) indicates that the IMPdebt scale indeed fulfils the necessary requirements of factor analysis (Hair Jr, Anderson, Tatham & Black, 1995).

In order to identify as many theoretically meaningful latent dimensions as possible, the maximum likelihood method for factor extraction was chosen, in combination with a direct oblimin rotation method.

The results of the factor analysis yield a very meaningful factor structure consisting of six dimensions (see Table 1). Initially, the factor extraction indicated an eight-factor solution, based on Kaiser's criterion (i.e. Eigenvalues > 1), but the six-factor solution was superior when it comes to interpretability and meaningfulness. Solutions based on less than six factors resulted in an impairment of interpretability and meaningfulness. The six-factors taken together explain 45,8 percent of the total variance.

The result of the factor analysis is interesting. The first factor is dominating, whereas the explanatory power of the other five factors is clearly less important. In **the first factor** there are mainly three groups of items, and each one of them express a distinct emotion. The three items in the first group 2, 4 and 10 ("I feel totally powerless", "I feel outlawed" and "I have almost no control of what is happening to me") all address a basic feeling of having no or very limited control over one's own life. In the second group of items 3, 5 and 8 ("I feel frightened when thinking about my debts", "My life in debt very often terrifies me" and "I worry all the time that the sheriff is planning to distrain the few, last assets that makes my life endurable") the emotional content express fear and worries. In the third group of items in factor 1, items 6 and 9 ("I feel constantly on the run", and "It feels like I am living under a constant threat") there is a definite emphasis on being hunted and threatened. The remaining two items in factor 1, 1 and 7 ("The uncertainty of my own future is painful", and "Managing my debts is like a full-time work in itself") accentuate and links to the significations of emotions contained in the groups of emotions in factor 1. Taken together, the significance of items in factor 1 clearly indicates the existence of a **mental trauma** among subjects.

In **factor two**, only two items (11 and 12) give rise to strong factor loadings. These two items ("Sometimes at night, not being able to find sleep, I have nurtured desires of vengeance towards those people who put me in this life situation", and "One day I will hit back hard on those people who forced me in the debt trap") no doubt signify emotions that are centered on a basic desire for vengeance and revenge. Therefore factor two was labelled **desire of vengeance**.

Factor three comprising three items 13, 14 and 15 ("More and more, I feel that I have to go underground, without address and identity", "I wished I could escape to a foreign country where they cannot find me", and "I am loosing the grip of reality") signifies emotions that focus on a wish to escape the debt problems, either factually by "going underground" or to emigrate (items 13 and 14, or by an inner escape route that implies loosing the sense of reality (item 15). Factor three was labelled **flight**.

The three items; 16, 17 and 18 ("My debt problems are shameful", "Having debts makes me feel like a criminal", and "I am personally guilty for the collapse of my economy") captured in **Factor four**, very clearly address feelings of shame and guilt. Therefore, this factor was labelled **shame and guilt**.

Table 1. Factor loadings from the factor analysis of the IMPdebt scale items. Only factor loadings higher than .40 are shown.

Scale items	Mental trauma	Desire for vengeance	Flight	Shame & guilt	Infringement	External attribution
1. The uncertainty of my own future is painful.	.796					
2. I feel totally powerless.	.611					
3. I feel frightened when thinking about my debts.	.607					
4. I feel outlawed.	.591					
5. My life in debt very often terrifies me.	.581					
6. I feel constantly on the run.	.496					
7. Managing my debts is like a full-time work in itself.	.491					
8. I worry all the time that the sheriff is planning to distrain the few, last assets that makes my life endurable.	.487					
9. It feels like I am living under a constant threat.	.482					
10. I have almost no control of what is happening to me.	.417					
Percentage explained variance=29.8						
11. Sometimes at night, not being able to find sleep, I have nurtured desires of vengeance towards those people who put me in this life situation.		.875				
12. One day I will hit back hard on those people who forced me in the debt trap.		.640				
Percentage explained variance =4.6						
13. More and more, I feel that I have to go underground, without address and identity.				.871		
14. I wished I could escape to a foreign country where they cannot find me.				.631		
15. I am loosing the grip of reality.		.481				
Percentage explained variance =3.6						
16. My debt problems are shameful.			.676			
17. Having debts makes me feel like a criminal.					.546	
18. I am personally guilty for the collapse of my economy.					.452	
Percentage explained variance =3.3						
19. I have been humiliated.					.751	
20. I have been treated nicely when it comes to my debts.					.539	
21. I have suffered physical violence from creditors.					.511	
22. At times I am furious when considering the treatment I have been given.				.423		
Percentage explained variance =2.4						

/ Table 1 continued

Items	Mental trauma	Desire for vengeance	Flight	Shame & guilt	Infringement	External attribution
23. I can simply not grasp that people and institutions that create financial breakdowns are given awards and promotions, while people like myself are punished.						.631
24. I feel like a victim on the financial market.						.612
25. I feel sheer disgust that there is people and companies who makes a profit out of my debts.						.550
26. The reason that my economy collapsed is solely due to external factors beyond my own reach.						.431
Percentage explained variance=2.1						

Extraction method: Maximum Likelihood
 Rotation method: Direct oblimin with Kaisers normalization

The **fifth factor**, contain four items; 19-22 (“I have been humiliated”, “ I have been treated nicely when it comes to my debts”, “ I have suffered physical violence from creditors”, and “At times I am furious when considering the treatment I have been given”). Item 20 is here reversed. The emotional impact mirrored by these items, taken together, is focussed on aspects of negative treatment executed by creditors and officials. Three out of four items in this factor (i.e., 19, 21 and 22) signify feelings of **infringement**.

Finally, the **sixth factor** entails four items; 23-26 (“I can simply not grasp that people and institutions that create financial breakdowns are given awards and promotions, while people like myself are punished.”, “. I feel like a victim on the financial market”, “. I feel sheer disgust that there is people and companies who makes a profit out of my debts”, and “The reason that my economy collapsed is solely due to external factors beyond my own reach.”) that express an attribution of one owns economical failure to external forces (e.g., creditors, debt collection companies, law enforcement etc). Also, the items express a resentment of being somehow victimized on the financial market. This factor was labelled **external attribution**.

With the exception of factor one, all remaining five factors (i.e. two to six) contribution to the overall amount of explained variance, is roughly the same ranging from 2.1% – 4.6 %. This indicates, that the reciprocal relationship in the hierarchical order between these five factors is probably arbitrary in the sense of what factor is more important than any other factor. Also, in contrast with component analysis, a factor analysis with an oblique rotation method (i.e., the choice in this study) assumes that factors are intercorrelated.

Another aspect of the results of the factor analysis in this study, is the dominance of the first factor. This in turn might indicate the presence of one or more additional higher-order latent factors, which are inter-correlated in a subtle, however systematic way with the factors

obtained in a first-order factor analysis. In order to investigate this aspect, a complimentary second-order factor analysis (Jöreskog & Sörbom, 2001) was carried out. This analysis indicated that the introduction of one additional second-order latent factor to some extent brought about a minor improvement in the overall explanatory power of the initial factor analysis. However, by closer inspection in terms of the interpretability of factors and factor structure the result provided no improvement whatsoever, and was therefore dismissed.

3.2. Analysis of item mean values

An additional, but far less complicated evaluation of the way questionnaire scale items measure the emotional impact of debts, is the calculation and comparison of item mean values in a rank order fashion. By focusing on the ten most prominent scale items and their corresponding arithmetic mean values, the following result was obtained (See Table 2).

The result exhibits a great deal of overlap with the results obtained in the factor analysis, and therefore support the main findings previously obtained.

Table 2. The ten most prominent scale items, based on the rank order of arithmetic mean values (n = 220) Max: 5.0; Min: 1.0.

Scale item	Mean value
1. The uncertainty of my own future is painful	4.02
2. I feel sheer disgust that there is people and companies who makes a profit out of my debts	3.87
3. The reason that my economy collapsed is solely due to external factors beyond my own reach.	3.83
4. I feel frightened when thinking about my debts.	3.80
5. I feel totally powerless.	3.72
6. I feel outlawed.	3.71
7. My debt problems are shameful.	3.60
8. I feel constantly on the run	3.56
9. I feel like a victim on the financial market.	3.53
10. It feels like I am living under a constant threat.	3.40

3.3. Analysis of variance of sociodemographic differences

In order to evaluate the influence of the main socio-demographic background variables (i.e. gender, age marital status, education, occupational status, the number and amount of debts) on the emotional impact, separate one-way analyses of variance were performed. In these analyses the dependent variable (i.e., emotional impact) was operationally defined as the summed score of the IMPdebt-scale across subjects. The result was negative; i.e. no significant differences were found for any one of the socio-demographic background variables. This means, that regardless of gender, age marital status, education, occupational

Proceedings of the Nordic Policy Research Conference 2007

status, the number and amount of debts, the subjects probably share the same magnitude of a basic, complex of emotions as expressed in the dependent variable.

4. Discussion

The aim of this study was to describe, analyze and evaluate the predominant emotions among a group of severely overindebted individuals in Sweden. Taken together, the results indicate that the life situation of the subjects recruited for this study is characterized by mental hardship. Especially the results obtained in the factor analysis provide evidence that the dominating emotional experience is overwhelmingly negative. For example, the essence of the scale items loading high on the first factor address fears, worries, threats, and uncertainty of ones future. These emotions are also linked (in the same factor) with emotions of powerlessness and feelings of being without legal rights. Descriptions of this particular complex, or rather, combination of emotions is frequently found in the modern psychiatric literature under the heading PTSD -post-traumatic stress syndrome (Barlow & Durand, 2002). An important facet in the life of the participating subjects in this study is, that the average time spent in overindebtedness is almost seven and half years. A life situation characterized by fears and worries in combination with severe economical hardship (i.e., poverty) during an extended period of time is no doubt deleterious to mental and physical health. Also, the economical situation in overindebtedness is worsened by debt collecting procedures ranging from distress of assets and salary to losing ones home by eviction.

The results that were obtained in the factor analysis (e.g., factor three) also provides evidence that subjects expressed a need to escape their debt problems. In the areas of emotion psychology and psychiatry there is an abundance of research findings linking fears and flight fantasies and flight behaviours. Flight is a normal, adaptive and beneficial reaction to threats that bring about fears. However, flight behaviour as a response to enduring fear provoking threats is not beneficial from a health perspective.

In contrast to previous research (Phil and Starrin, 1998; Starrin and Kalander-Blomqvist, 2001), the results obtained in the present study do not support the claim that the predominant emotion in the life of overindebted individuals is shame. Rather, the results that are evident in the first factor in the factor analysis in the present study, as well as the result of the analysis of item mean values of the IMPdebt scale, indicates that fear and worries and related emotions are more salient in the life of the overindebted individual. However, as suggested by Tangney & Fisher, 1995) emotions like shame and guilt can interact with fear and anxiety thus creating an attenuated stress response.

4.1. Study limitations

Despite the reasonably large sample size in this study, one has to notice that the sample was not a representative population sample of overindebted individuals. Furthermore, there is a imbalance in the number of men and women recruited for the study.

Another obvious limitation is that all assessments were self-reports and no objective health outcome data could be incorporated in this study.

Proceedings of the Nordic Policy Research Conference 2007

Furthermore, the results are based on cross-sectional data only, which limit the understanding of how negative emotionality develop over time in this group of exposed individuals. Also, the study was carried out in Sweden. The legal system in different countries is different, also when considering debt-handling, debt-collecting and the debt settlement procedure. This imply that the pressure executed by the authorities towards the overindebted individual and his/her family) might be quite different in different countries.

4.2. Conclusions

It is concluded that the results support the idea that the life situation of overindebted individuals is characterized by hardship and mental trauma. The content and specific structure of negative and long lasting emotionality, as a precursor to extreme stress, implies that overindebted individuals are at high risk for mental and physical breakdown.

Abstract.

Levels of debt have reached an unprecedented extreme in Iceland. This rise has occurred in the context of a consumer culture highlighting supposed psychological benefits of buying consumer goods. Over-indebtedness can have serious financial, social and psychological consequences, thus studying its antecedents is vital. This paper reports findings from two studies examining materialistic and motivational precursors to various financial outcomes. The first study ($n = 271$) showed that people who endorse materialistic values have more financial worries, have more tendency towards compulsive buying and spending and have higher credit-card debt, but this is particularly true for lower earners. The second study ($n = 304$) showed that people in lower income brackets who buy goods for mood related purposes are more likely to have higher consumer debt.

1. Introduction.

In Iceland, household debt (including mortgages) has reached new and worrying heights (Bank of Iceland, 2007). Households owe nearly 240% of their aggregate disposable income, which is considerably higher than the year before, when this proportion was 215%. Obviously, such a trend cannot continue without serious consequences. It must be noted, however, that some, but not all, of the surge of household indebtedness in Iceland can be attributed to the fact that housing prices have risen immensely in the past decade due to increased competition in the mortgage market. No official numbers exist as to how much of the increase can be reliably attributed to the house prices alone, and how much is due to individual consumption. This is because housing loans are not required to be deployed entirely on residential purchases. Thus, although one can trace loans to different lending institutions, one cannot assume that loans are for consumption

purposes only and not for housing or that second mortgages are for housing and not for consumption (Kristjón Kolbeins, Bank of Iceland, personal communication, 27. 9. 2006).

Although information on personal debt is not as easily accessible as aggregate data on household debt, it is likely that the enormous recent increase in household debt is disproportionately due to individuals spending more on consumption, such as material goods or holidays, given that the rise in household debt outstrips the rise in house prices. This rise in household debt has occurred in the context of a consumer culture highlighting supposed psychological benefits of buying consumer goods, such as greater happiness and a better self, encapsulated in the slogans of “retail therapy” and “I shop therefore I am” (Dittmar, 2007; Kasser & Kanner, 2004). Thus, it is highly likely that over-indebtedness can have significant psychological causes.

To date not many studies have focused on the underlying psychological functions of buying and spending that may *lead to* overspending and, consequently, indebtedness. It is important to address this gap in research, because debt not only has serious financial consequences, with bankruptcy at the extreme, but can also have social and psychological effects (e.g. Elliot, 2005; Ryan, 1992). Over-indebtedness can contribute to physical and mental health problems, such as anxiety and distress, as well as psychosomatic symptoms. The most extreme consequence of serious indebtedness is suicide. Social consequences include serious relationship problems which can lead to the break-up of families. Given that over-indebtedness can cause such prolonged misery to individuals and families, more investigation into its antecedents is both fully justified and timely.

To address this research gap and to try to decipher how much of total household debt can be attributed to individual spending on consumption; the authors have launched an ongoing research programme¹, both in the UK and in Iceland. The research programme aims to test a theoretical model of indebtedness, which integrates various psychological factors that have already been shown to be linked with individuals’ buying and spending behaviour: materialistic values, identity deficits, and psychological buying motives. Money-management skills are also included, because they have been shown to play a role in whether or not people are likely to plan and monitor their consumer spending, rather than giving into desires for immediate consumption. This model will be described in more detail later. The primary focus of this present research paper, however, is to report the findings from two prior studies upon which, among others, we base our theoretical model.

2. Study 1.

2.1. Current knowledge.

Elliot (2005), in his overview on what determines debt levels, claims that the cause of debt is a combination of three factors. One factor, temptation from lenders, such as the ease of making personal loans, increasing overdrafts, and getting new credit-cards, is not addressed in the present research. The focus is on the other two factors. The first is naïve personal financial management. This means that the borrower has some fundamental

¹ Funded by RANNIS, the Icelandic Centre for Research.

flaws in his/her management of finance, such as disregarding budgeting and financial advice, and has an unrealistic optimism that things will get better. The second factor consists of external and internal pressures that cannot be resisted, and this factor is of special relevance to the present research. The external pressures constitute equipping a home, size of family, business ventures, meeting spending demands of family. The internal pressures (arguably originating from outside sources) are, for example, the maintenance of a lifestyle equal to peers, relatives or society, or maintaining an *identity* or *image* that is deemed socially acceptable. The lifestyle pressures of maintaining or seeking a better identity and positive emotions are likely to be linked to an underlying belief structure that places a strong emphasis on money and material goods as a means to achieving important life goals, such as life satisfaction, happiness, and success. This belief structure is characteristic of a *materialistic value orientation*, which has increasingly become an integral component of consumer culture.

Materialism

A materialistic value orientation can be defined as the “the importance ascribed to the ownership and acquisition of material goods in achieving major life goals” (Richins, 2004, p. 210). A person with highly materialistic values believes that the acquisition of material goods is a central life goal, prime indicator of success, and key to happiness and self-definition. People who are materialistic strive for things that do not improve their well-being in the long-run, they are misguided in their thinking that financial success, wealth and possessions *are* or *bring* ‘the good life’ (e.g. Garðarsdóttir, 2006).

There is a growing research literature that demonstrates a negative link between a materialistic outlook and individual’s Subjective Well-Being (SWB, for an overview see Kasser and Kanner, 2004). However, financial downsides of materialism have been largely overlooked in the research literature. It is, quite possible that the negative impact of materialism extends beyond SWB and also affects people’s finances, their consumption patterns, their tendencies to spend or save, and consequently, their levels of debt.

Watson (2003) has examined people’s attitudes and behaviours towards debt, saving and spending, depending on their level of materialism. His study showed that people who were high in materialism were more likely to see themselves as spenders, compared to people low in materialism. It also showed that there is a tendency for people who are low in materialism to exhibit more careful saving behaviour, such as investing safely. People who scored highly on materialism also had different attitudes towards long-term borrowing of money than people with lower scores. Further, Watson found that higher materialists had more favourable views of taking loans for home improvement, beautifying/correcting treatments, vacations or holidays, buying recreational vehicles or expensive sporting equipment as well as purchasing art, furs and jewellery. From these findings, Watson concluded that materialists were more favourable towards overspending and borrowing for luxury purchases. These findings all suggest that materialists are more likely to be more indebted than non-materialists, but the study did not address actual amounts of debt as is done in the research presented here.

Compulsive buying

Dittmar (e.g., 2000; 2004; 2005) has found in numerous studies that people who endorse materialistic values *and* have large ‘self-discrepancies’ (are different from what they would ideally like to be), are more likely to be compulsive shoppers. This is because

people who are materialistic are more likely to pursue their happiness through acquisition or possession rather than through other means (Richins & Rudmin, 1994). There is no agreed upon specific definition of compulsive buying (Dittmar, 2004), and in the current diagnostic manual DSM-IV-TR (American Psychiatric Association, 2000), compulsive buying is included in the non-specific, residual category “Disorders of Impulse Control Not Otherwise Specified”. Nevertheless, there is consensus that compulsive buying consists of three core features: a) the impulse to buy is experienced as irresistible, b) individuals lose control over their buying behaviour, and c) they continue with excessive buying despite adverse consequences in their personal, social, or occupational lives, and financial debt (Dittmar, 2004). This last feature of compulsive buying - the inability to stop buying despite the accumulation of debt - is especially relevant to the present research programme. Compulsive buying can lead to substantial and serious indebtedness (Faber, 2004). When assessing the effects materialism has on people’s finances, studying the causes and consequences of such dysfunctional shopping and spending is therefore imperative.

Money management

A common finding in previous research on personal indebtedness is that higher debt can be attributed in part to poor money-management skills (Kim, Garmand, & Sorhaindo, 2003; Elliot, 2005; Watson, 2003; Lea, Webley & Walker, 1995). Lea et al. (1995) found that people who were in serious debt were less likely to have bank or building society accounts, and they rated themselves as poorer money managers than non-debtors. Money-management skills are therefore taken into account in the two studies presented here in order to establish whether debt can be attributed to particular psychological determinants directly, or whether money-management skills affect the relationship.

Income

Iceland’s economy is flourishing with Gross Domestic Product (GDP) per capita (\$40,277²) among the highest in the world (IMF, 2006). At the same time income disparity appears to be growing in Iceland³ and this once impoverished country now has multi-billionaires raising the lifestyle standards for the rest of the country, who are (perhaps consequently) drowning in household debt. Income has before been shown to play a moderating role in the association between materialism and well-being (Garðarsdóttir, 2006; Garðarsdóttir, Jankovic & Dittmar, 2007). Income moderated the relationship between materialism and SWB in such a way that higher income earners were in certain respects protected from the adverse psychological effects of materialism. There may therefore be reason to believe that income could interact with materialism with regards to financial and consumer behaviours and attitudes. Also, if certain values and behaviours have bad effects for the lower income groups of society, but not the higher earners, this can have important political implications.

2.2. Aim and hypotheses.

The aim of the first study is to examine the effect of materialism on debt, attitudes to spending and saving, compulsive buying tendency and financial worry. Based on research by Watson, it is proposed that higher levels of materialism will predict more favourable attitudes to spending, (Hypothesis 1), more financial concern (Hypothesis 2)

² Adjusted for Purchasing Power Parity.

³ This is debated. Politicians have trouble agreeing what statistics to include in calculating income disparity (GINI index), thus this remains officially unsolved.

and higher credit-card debt (Hypothesis 3). Further, based on research by Lea et al. (1995), it is proposed that materialism will affect these relationships even though skills for managing money have been controlled for. Based on research by Dittmar (e.g. 2004), materialism will be expected to be associated with compulsive buying (Hypothesis 4), also having controlled for money management skills. Finally, based on research by Garðarsdóttir (2006), income is predicted to interact with materialism with regards to its effect on financial and consumer behaviours and attitudes. Materialism is predicted to have a stronger effect for the lower income group than for the higher income group (Hypothesis 5).

2.3. Method.

Participants and procedure.

A questionnaire was set up as a web page which also contained an introduction and instructions. After submitting their answers, participants were debriefed on the purpose of the study. Participants were recruited via a snowballing method. An E-mail with a link to the online questionnaire was sent to contacts of the first author and they were asked to complete the questionnaire and forward the link to their contacts. Directions were given to participants to pass the questionnaire on to Icelandic adults (over 18 years of age, non-students) in full-time employment. This resulted in 271 participants, 56 (20.7%) of the respondents were men and 215 (79.3%) were women. The average age of respondents was 38.41 years, *SD* 10.27, median = 35, ranging from 22 to 68. The average income was 300,805 ISK per month, *SD* = 206,158; median = 275,000, ranging from 20,000 to 2,500,000 ISK per month (equivalent to $M = \$ 4,866$; $SD = \$ 3,335$; median = \$ 4,448, range = \$ 324 - \$ 40,438⁴).

Measures.

All participants completed a questionnaire consisting of seven main sections. One section asked for demographic information, including age, gender, income and education, whereas the other six sections consisted of the core measures central to the model.

Materialism was assessed using the Richins and Dawson's (1992) Materialistic Values Scale (MVS) which consists of 18 items measured on a 6-point Likert-type scale. The MVS measures 3 aspects or dimensions of materialism; 'Success' (The things I own say a lot about how well I'm doing in life), 'Happiness' (I wouldn't be any happier if I owned nicer things (rev.)) and 'Centrality' (I try to keep my life simple as far as possessions are concerned (rev.)). Internal consistency of the scale was excellent, $\alpha = .80$.

Compulsive buying. The extent to which people engage in compulsive shopping behaviour was measured by the 11-item Compulsive Buying Scale (CBS; d'Astous, Maltais, & Roberge, 1990). This scale focuses on both financial and psychological aspects of compulsive buying and addresses each of the three core features of compulsive buying; irresistible impulses, loss of control and continuing despite adverse consequences. The items (e.g. 'I sometimes feel that something inside pushes me to go shopping', 'At times I felt somewhat guilty after buying something because it seemed unreasonable') were measured using a 6 point format ranging from strongly disagree (1) to strongly agree (6). Internal consistency was excellent, $\alpha = .90$.

⁴ Based on average exchange rate in January 2005, 1 USD = 61.82 ISK.

Financial concern. The extent to which finances are causing worry or concern was measured with nine items, thereof six were taken from Jessop, Herberts, and Solomon (2005, e.g. 'I worry about my financial situation'). Three further items measuring particular concern with debt and overspending were developed for the purposes of Study 1 ('I never seem to make ends meet', 'I owe too much money', 'My spending habits worry me'). Items were rated on a six point Likert-type scale ranging from strongly disagree (1) to strongly agree (6). The nine item scale had excellent reliability, $\alpha = .92$.

Spending tendencies. Six items were used to measure people's spending tendencies. Four of the items (e.g. 'I spend everything I earn') were taken from Watson (2003). Two additional items were developed specifically to measure people's attitudes towards their own spending and saving behaviour (e.g. 'I should save more of my money'). The scale had acceptable reliability, $\alpha = .64$. Higher scores indicate greater tendency to spend.

Money-Management Skills (MMS). Five items were used to measure skills in money-management, thereof three items were developed for the purposes of this study ('Do you monitor your financial statements?' 'Do you put away money for bills?' 'Do you keep an eye on your cash flow?') These were measured on a 5 point scale measuring frequency, ranging from (1) never to (5) always, where higher scores represent better money-management. Also, two items asked people to rate on a scale of 1 (very good) to 6 (very bad) how good or bad they believed they were at managing their own money. The items were taken from Watson (2003). Internal consistency of the items was good, $\alpha = .79$.

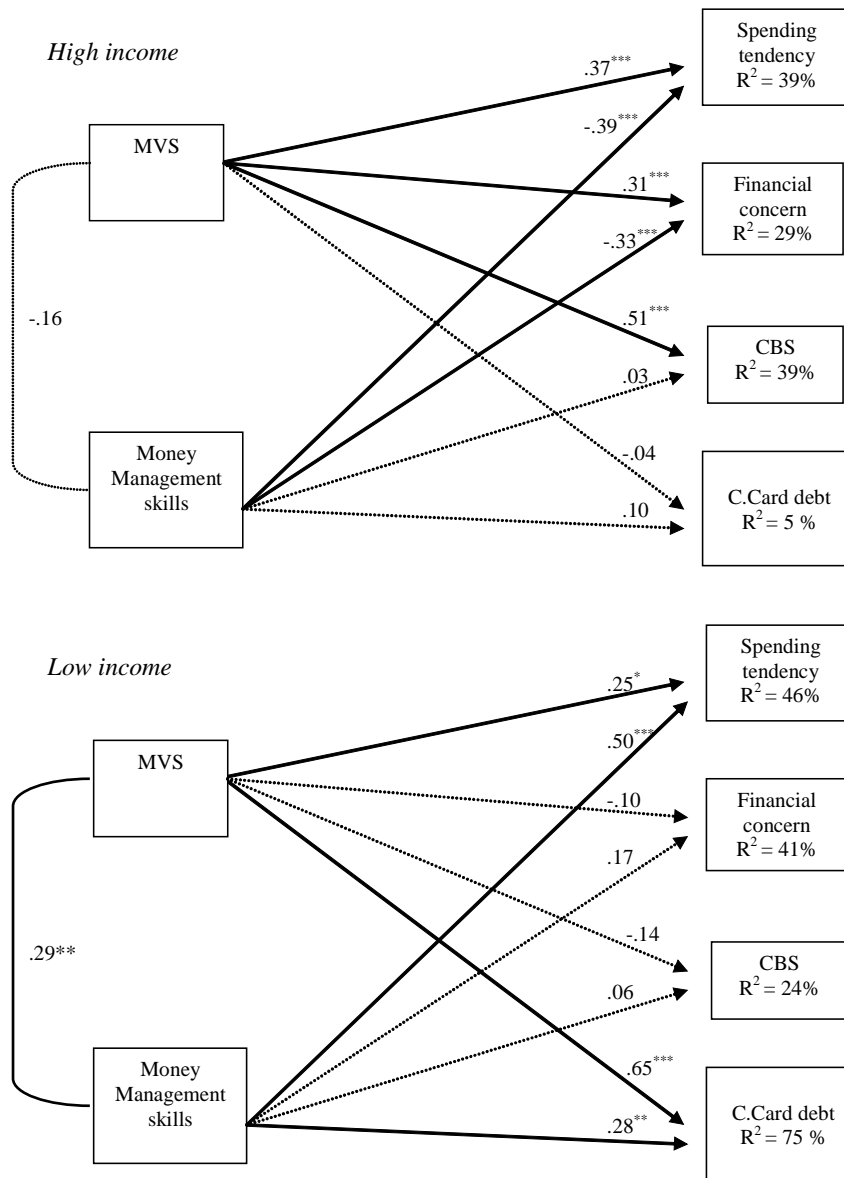

Credit-card debt was assessed by asking people first if they owned a credit or store card. If they answered yes, they were asked to estimate in an open-ended question how much they owe. Credit-card debt is probably more likely to reflect short-term spending due to consumption than any other form of common debt. This, however, is an assumption and as it is difficult for a researcher to access participant's bills, it is impossible to assess what people are using their credit-card for with total accuracy (some people could conceivably shop for food and other necessities using their credit-card). It is therefore not assumed that amounts owed on credit-card are an entirely accurate measurement of consumer spending or by-product of materialism, but a close proxy measurement.

2.4. Results, Study 1.

Hypotheses were tested using structural equation modelling (SEM, EQS version 6.1, Bentler, 1995). A two-sample SEM was used, modelling associations simultaneously for both higher and lower income groups (split by median income), and assessing model fit with respect to both groups. The model provided an adequate fit, $X^2(72) = 741.423$, $p < .001$; CFI = .94; GFI = .94; ST.RMR = .058; RMSEA = .099. The chi square fit index is significant, which indicates that there is some discrepancy between the model and the data, which is to be expected for an analysis that measures a reasonable numbers of items in various samples. Figure 1 depicts the paths from the analysis and Table 1 shows inter correlations between outcome variables in Study 1. Not depicted are paths for control variables. Age, gender and education were controlled for.

Materialism (MVS) is related positively to spending tendencies in both income groups, supporting Hypothesis 1. Materialism is related to more financial concern for the high income group only, partly supporting hypothesis 2, and at odds with hypothesis 5.

Interestingly, materialism is associated positively with compulsive buying tendencies for the high income group only, partly supporting hypothesis 4. However, in support of hypotheses 5 and 3, materialism is a very strong predictor of credit-card debt for the low income group but is not related significantly to debt in the high income group. This is true despite the fact that both high income, $M = 2.78$, and low income groups, $M = 2.76$, endorse materialistic values equally, $t(252) = -.22$; *ns*. Also, the average amount of credit-card debt for the two income groups does not differ significantly $t(136) = -1.51$; *ns*.

Note. Error terms and control variables are not shown for the sake of visual clarity. Table 1 shows correlations between outcome variables.

Figure 1.
Two- sample SEM Model showing the effect of materialism on financial outcomes, controlling for money-management skills. High income and low income groups.

Table 1.

Zero order correlations between outcome variables in the study.

	Tendency to spend	Financial concern	Compulsive buying
<i>Lower income</i>			
Financial concern	.46 ^{***}		
Compulsive buying	.46 ^{***}	.39 ^{**}	
Credit-card debt	.09	.18	.01
<i>Higher income</i>			
Financial concern	.42 ^{***}		
Compulsive buying	.55 ^{***}	.38 ^{***}	
Credit-card debt	-.16	-.14	-.19 ⁺

Note: + $p < .10$; * $p < .05$; ** $p < .01$; *** $p < .001$

The effect of money-management skills also differs with regards to income group. In the lower income group, people with self-reported good MMS tend to be more inclined toward spending their money, while the opposite is true for people in the higher income group. A negative association was to be expected. Logically, people in the higher income group who have better self-reported MMS have less financial concern. For the lower income group, there was not a significant association between MMS and financial concern. MMS does not affect tendencies toward compulsive buying for either income group. Oddly, for the lower income group, good MMS predict higher credit-card debt.

2.5. Discussion, Study 1.

The findings of Study 1 show that materialism does affect debt, but for the lower income group only. Interestingly, materialism, combined with MMS explained a very large amount of the variation in credit-card debt for the low income group, while, for the high income group, they did not relate to debt at all. In Study 1 debt was only measured using credit-card status as a proxy indicator of consumer debt, and therefore not a thorough measurement. Also, some odd findings emerged with regards to money management skills suggesting that the measurement of MMS needed improving.

3. Study 2.

3.1. Current knowledge.

There is evidence that the very nature of buying and shopping has become more psychological, focusing on hoped for emotional and identity-related benefits (e.g. Dittmar, 2005). In popular culture, these developments are captured by such slogans as 'retail therapy' and 'I shop therefore I am'. This is characteristic of a materialistic value orientation, which has increasingly become an integral component of consumer culture. This value orientation sends unrealistic messages that emphasize psychological benefits from consumer goods (Dittmar, 2005). Study 1 has already established that materialism is a likely predictor of credit-card debt. There has, however, been a lack of research on the underlying *psychological functions of buying* as factors that may increase the likelihood of consumer over-spending. In Study 2 both debt and money-management skills are measured in better detail than in Study 1. Also, importantly, Study 2 examines a new set of psychological predictors, namely *buying-motives*.

Buying motives

Buying motives refer to the motives or reasons people have for buying consumer goods. According to Dittmar (e.g. 2000; 2004; 2007) these motives can be both practical and psychological for most people. The practical motives focus on economic and functional aspects of buying, including usefulness, value for money, and efficiency. The psychological motives, however, describe behaviour whereby individuals engage in buying and shopping in order to obtain emotional and identity-related benefits (for a review see Dittmar, 2007). Buying motives have been found to predict compulsive buying, and this study aims to test whether they can also be predictive of debt when measured directly. There is some evidence that emotional and identity-related buying motives could predict overspending. Dittmar (2007) showed that the reported ease of spending money inadvertently could be predicted from identity-seeking buying motives. Mood and identity related motives made it more likely that individuals spent more money than they intended or, possibly, could afford.

3.2. Aims and hypotheses.

The aim of the second study is to assess whether buying motives contribute to the understanding of indebtedness. For the second study, improved measures of money management skills were used, furthermore, participants were asked to assess their debt in more detail than in Study 1. Following Dittmar (2007) it was hypothesised that seeking a better identity and positive emotions through shopping is linked to debt (Hypothesis 1). This association is hypothesised to exist with money management skills controlled for. In line with previous findings, it is hypothesised that income moderates the relationship between buying motives and debt. Mood and identity related buying motives are predicted to have a stronger impact on debt for the low income group than the high income group (Hypothesis 2).

3.3. Method.

Participants and procedure.

As before a questionnaire was set up as a web page, also containing an introduction and instructions. An E-mail with a link to the online questionnaire was sent to participants who were volunteers recruited by the third author in various large workplaces in different locations in Iceland. A total of 304 participants completed the questionnaire, thereof 104 (34%) were men, 162 (53%) were women and 38 (13%) did not specify their gender. The average age of respondents was 38 years, *SD* 9.54, median = 37, ranging from 21 to 65. The average income was 404,864 ISK per month, *SD* = 456,416; median = 350,000, ranging from 10,000 to 6,000,000 ISK per month (equivalent to $M = \$ 6,333$; $SD = \$ 7,139$; median = \$ 5,475, range = \$156 - \$ 93,854⁵).

Measures.

The questionnaire consisted of four sections, one containing questions on background (age, gender, income, education, occupation, number of people in the household), and the remaining three on the core measurements of the study.

Money-Management Skills. A 12 item scale was used to assess people's self-reported skills in managing money. Six items came from Lea, Webley and Walker (1995, e.g. I always know exactly how much money I owe) and six questions were developed by the authors (e.g. I keep an eye on my cash flow). Half of the questions were answered on a

⁵ Based on average exchange rate in April 2007, 1 USD = 63.93 ISK.

five point frequency scale ranging from always (5) to never (1), and the other half using a five point scale measuring agreement ranging from disagree strongly (1) to agree strongly (5). Internal consistency of the scale was good, $\alpha = .77$.

Buying motives were assessed using a 25 item scale, whereof 13 items came from Dittmar, Long, & Meek, (2004) and the remaining 12 were developed for the purposes of the study. Participants were asked to agree or disagree with statements describing various reasons people may have for buying personal consumer goods such as clothes, CD's, accessories, cosmetics or decorative house items. They were instructed not to answer with everyday grocery shopping in mind. The scale assessed four types of buying motives, mood or emotional motives (When I buy these goods, I do so in order... to get a real buzz), practical motives (...to get a good buy), identity motives (...to feel more like the kind of person I would like to be) and for the current study an additional scale measuring social comparison motives (...to feel I am better than other people around me).

Debt. Participants were asked whether they had any credit-card, overdraft and other short term debts, and were then asked to estimate the amount they owed on each type of loan. The total amount of debt from these three sources is used as an outcome measure in the analyses to follow.

3.4. Results, Study 2.

The hypotheses were tested using a two sample SEM like before. The model had good fit indices, $X^2(36) = 50.41, p < .05$; CFI = .95; GFI = .97; ST.RMR = .055; RMSEA = .043. Figure 2 shows that none of the buying motives predict total short term debt for the higher income group (not supporting hypothesis 1). However, for the lower income group, mood related buying motives predict debt, despite MMS being controlled for, partly supporting hypotheses 1 and 2. Table 2 shows the covariances among the independent variables. As was expected, the three psychological motives (identity, social comparison and mood) are interrelated but do not relate to the practical buying motives. Not shown are paths for the control variables which were; age, gender, occupation, education and number of people in the household.

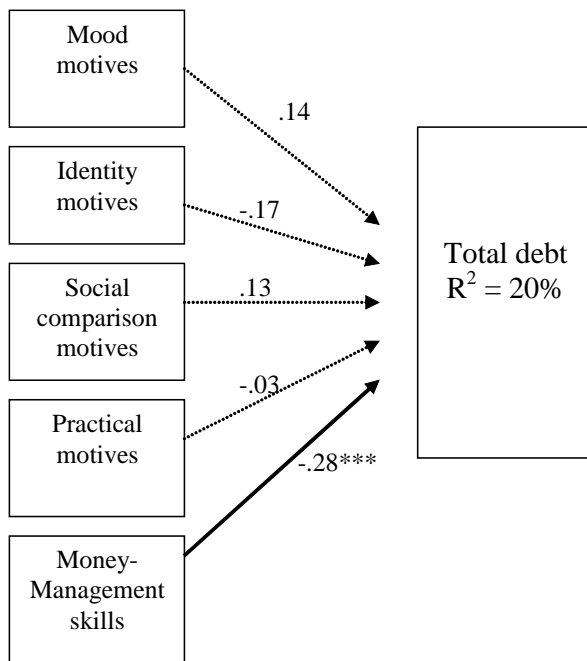

Table 2.

Covariances among independent variables in the model

	Mood motives	Identity motives	Social comparison motives
<i>Lower income</i>			
Identity motives	.51 ^{***}		
Social comparison motives	.31 ^{**}	.57 ^{**}	
Practical motives	.03	.04	-.04
<i>Higher income</i>			
Identity motives	.66 ^{***}		
Social comparison motives	.42 ^{***}	.62 ^{***}	
Practical motives	.01	.09	-.04

Note: + $p < .10$; * $p < .05$; ** $p < .01$; *** $p < .001$

High income

Low income

Note. Error terms and control variables are not shown for the sake of visual clarity. Table 2 shows covariances between independent variables.

Figure 2.

Two- sample SEM Model showing the effect of buying motives on financial outcomes, controlling for money-management skills. High income and low income groups.

A supplementary analysis was done in order to compare participants who did and did not have particular types of debt. Participants did not differ on any of the buying motives depending on whether they had or did not have credit-card debt and overdraft debt. However, MMS did differ depending on whether or not participants had overdraft or credit-card debt. Consumers who are indebted with personal short term loans are more likely to shop for mood and identity related reasons than those who do not have personal short term debt (See table 3). They also have worse money-management skills.

Table 3.

Means and standard deviations of buying motives and MMS for people who do and do not have short term debts, other than overdraft and credit-cards.

	Short term debt		No short term debt	
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>
Money-management skills	3.83	0.70	4.00	0.65 *
Identity buying motives	2.38	1.10	2.07	1.03 **
Social comparison motives	1.79	0.87	1.63	0.67
Practical motives	4.46	1.00	4.31	1.03
Mood buying motives	3.08	1.16	2.63	1.12 **

Note: + $p < .10$; * $p < .05$; ** $p < .01$; *** $p < .001$.

3.4. Discussion of Study 2.

Study two shows that mood related buying motives are a significant factor in predicting debt for lower earners, but not for higher earners. Identity buying motives, which have been shown to relate to compulsive buying, were not related to debt. People who have short term debt other than credit-card or overdraft are more likely to buy for identity or mood related reasons than those who have not got such loans.

4. Conclusion.

The findings from the two studies reported here show that there is ample cause to believe that debt has psychological antecedents, and is not only founded on bad money-management, attitudes toward debt and socio-economic status as much previous literature has assumed (e.g. Lea, Webley & Levine, 1993; Lunt & Livingstone, 1992). Obviously, indebtedness is multi-determined, consisting of financial, social, situational and cultural causes. Nevertheless, psychological factors such as materialistic value orientation and mood related buying motives can contribute to understanding personal debt.

The two studies confirm different psychological factors as important, which are included in the psychological model to be tested in the ongoing household debt research project. There are two further factors deemed worthy of inclusion of the basis of previous literature. These are Subjective-Well Being and Self-Discrepancies. Dittmar (e.g. 2000 & 2004) has shown that people with high *self-discrepancies*, i.e. people whose actual self differs markedly from their ideal, and are highly materialistic are more likely to be compulsive shoppers or suffer from shopping addiction. Dittmar (2005) also demonstrated that identity deficits in materialistic individuals are linked with a buying motive, whereby people buy goods in order to try and move closer to the person they would ideally like to be, which in turn predicts excessive buying.

The new proposed model of psychological predictors of debt is outlined in Figure 3. This model treats individual personal debt as the main outcome variable, predicted from buying motives as proximal predictors, the impact of which are likely to be moderated by money-management skills. The buying motives, in turn, are predicted from materialistic values and self-discrepancies. An interaction effect of self-discrepancies and materialism is predicted because self-discrepancies should manifest themselves in emotional and identity-related buying motives only for individuals who endorse a materialistic value orientation. Compulsive buying tendency and SWB are examined as correlates of debt. Furthermore various socio-economic variables will be controlled for. This model would appear to fit the recently affluent Icelandic nation which is often perceived as being preoccupied with appearances, keeping up with the Jones's and the chase after the "good life".

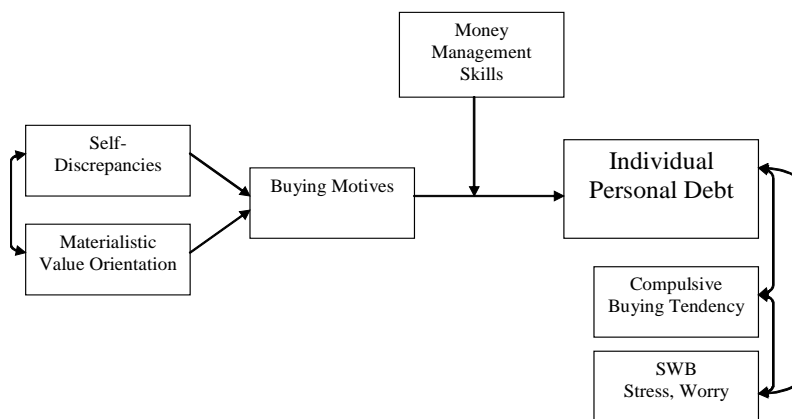

Figure 3.
Model of Psychological Predictors of Individual Personal Debt

This research programme has important theoretical and applied implications. Theoretical implications include the added understanding of the nature of the link between various psychological factors and debt. In particular, offers a first insight into these factors as psychological *causes* of debt. Applied implications are various such as identifying specific buying motives and values that may lead to debt, help with consumer advice both in schools and in the public domain, and interventions for indebted households. Also, this information can be of considerable use to lending institutions and policy makers in assessing risk levels for debt handling and loan limits per person.

The findings from these studies provide important information for the designing of interventions programmes, e.g. whether it is more effective to focus education on good money-management or on the underlying psychological triggers of over-spending such as high self-discrepancies, materialism and buying motives. To date, interventions have only focused on the former type of education. Future research should compare the effectiveness of the two types of intervention programmes.

Innovative Consumer e-Services in the Financial Sector

Abstract

In this paper we discuss innovative e-services in financial markets. On the basis of the theoretical considerations we propose a new definition for innovative financial e-services and tackle issues that are essential in new e-service innovations. Thereafter, we empirically examine the content of three innovative e-services in the financial sector that have recently been developed and/or launched. We limit our study to cover only e-services provided on the screen and leave other processes connected to them outside the scope of the study. Finally, we discuss the importance of interaction and trust in the electronic environment and suggest several viewpoints for future research.

1. Background

During the last ten years a large number of e-services have been launched in electronic markets. Especially in banking services, consumers have rapidly moved to the electronic environment. In Finland, for example, about 70% of bills are paid through e-banking (The Finnish Bankers' Ass. 2006). However, lending, wealth management and insurance are still subject to face-to-face interaction, even though most financial companies also provide these facilities via the Internet. As far as insurance issues are concerned, consumers have only recently come to accept e-services and started to use them more actively. The development has been slower than predicted, but the trend towards e-services is clear. As Lovelock et al. already pointed out in 2002, the Internet Revolution is still in its early stages.

Rust (2004) indicated that technological development presents service providers new tools and opportunities, but in many cases traditional financial services have simply been moved to the electronic environment and human work has partly been substituted by computers and software. Therefore, it is important to analyse various types of currently-marketed innovative financial e-services that are targeted at consumers and determine how these services respond to the present state of services marketing literature.

The purpose of our paper is to analyse new innovative e-services and propose definitions for both e-services and innovative financial e-services. Especially we pay our attention to the role of interaction in electronic environment. The paper includes conceptual and theoretical considerations of the definitions, but also empirical examples and analysis of recently launched e-services. At the end of the paper we discuss future challenges for innovative financial e-services by combining both theoretical and empirical knowledge. The reason behind this is our strong belief that proper e-service innovation calls for conceptual roots connected to empirical reality.

The basis for the theoretical part is formed by the fact that there is no unique way to define e-services, even though the term is commonly used in current literature concerning electronic commerce. In this paper we limit our examination to e-services provided on the screen, and thus leave outside the scope of the study those service processes that occur behind the screen.

Innovative e-services are similar to other innovations in that they usually increase efficiency, reduce costs, create new activities and open new avenues to global markets. Innovation research in the financial sector is a relatively new area, since it started as late as the 1980s (Lievens and Moenaert 2001; Akamavi 2005). Even the basic terminology is still developing. This may partly be the result of the limited number of studies in the area. So far, innovation research, especially in the financial sector, has been carried out from perspective of the organisations involved and has focused on themes such as how innovation processes are managed and how innovations have been born within organisations (Akamavi 2005). In addition, a recent research report by Tekes (2007) has shown with case examples that innovations in the financial sector seem to concentrate on information processes, and core services gain only limited attention in these processes. The above arguments indicate that it is worth paying more attention to innovative financial services themselves in both theoretical and empirical senses.

2. Defining e-services in the financial context

There is no unique way to define e-services, even though the term is commonly used in the current literature concerning electronic commerce. According Rust and Lemon (2001),

"e-Service is providing consumers with a superior experience with respect to the interactive flow of information."

Rust and Kannan (2002) stated that

"e-Service can be defined as the provision of service over electronic networks such as the Internet."

Zeithaml (2002) included both pre- and post-Web site service aspects into the concept of e-service quality. However, none of the authors have paid attention to describing e-service content or characteristics in their definitions. This indicates that discussion of the definition and content of e-services is really needed.

The definitions of e-service presented above refer to services that are delivered in a special way, namely through electronic channels or networks. These channels most often refer to the Internet, even though other electronic channels exist (see Järvinen & Lehtinen 1996; Vuorinen et al. 1998). However, e-services used by consumers are mostly provided through the Internet

and therefore, in this paper, we concentrate on this channel only. Still, the above definitions lack consideration of the content; what is an e-service like?

Technology-based services have been categorized by various authors, e.g., Bitner et al. (2000) and Dabholkar (1994). Heinonen (2004) has even defined a technology-based service "as a service with both tangible and intangible elements that is performed totally or partly by the customer via a technology interface." From our perspective, e-service is a different concept compared to technology-based services. The deviation between the two concepts can be illustrated with the aid of two examples from the financial sector. Namely, there are services that benefit from IT, such as ATM banking services and unit-linked insurance, but they are not e-services (Järvinen and Lehtinen 2005). Even though banking and insurance services are considered as among the most abstracts of services (see Järvinen et al. 2001; Järvinen 1998; Järvinen and Heino 2004; Nordman 2004), they are often made more tangible with the aid of various documents such as insurance policies and loan agreements.

For this reason, we here define e-services according to Järvinen and Lehtinen (2005):

e-Service is a benefit-providing object of transaction that can be characterized as an intangible process that is at least partially produced, marketed and consumed in a simultaneous interaction through electronic networks.

It should be emphasised that the above definition is meant to be general and exceptions exist, especially in ways of interacting with customers. Some service providers choose automated interaction, some try to provide a human touch, some try to combine automation and a human touch, and some offer non-interaction.

In many contexts (e.g. Heinonen 2004) it is stated that information-based services are particularly suited to the electronic environment. As information exchange is about to begin to dominate economic activities (see Vargo and Lusch 2004a), this will bring new challenges to e-service activities. Services differ in their frequency of use (Nordman 2004). Some services, e.g. insurance, are quite rarely used, while others, e.g. bank transactions, are used weekly or even daily. We agree that these two issues affect the way traditional service can be transferred to e-service and whether this transfer is successful.

Many financial e-services are simultaneously marketed and produced, but only partially consumed because, for instance, insurance provides security that lasts the whole insurance policy period and investments in stock may provide profit during the whole owning period. Many other financial services follow the same mode: customers can enter their bills into an online bank before the due date and the bill can be paid automatically when it is due. On the other hand, many banking transactions can be executed in real time, although e-loan applications, for example, have to be submitted beforehand and an e-loan decision may take a couple of days.

Like traditional services, e-services consist of a core service and supplementary services. A core service is the reason to be on the market, but supplementary services are those additional services that facilitate the use of the core service, increase the value of the service or differentiate it from other services (cf. Lovelock and Yip 1996; see also Grönroos 1990).

3. Interaction in connection with financial e-services

The definition of e-services by Järvinen and Lehtinen pays attention to simultaneous interaction through electronic devices and is formulated on the basis of an early article by Lehtinen (1984).

More recently, some other service scholars have also adopted the interactive element in their definitions. For example, Lovelock (2001) defined services "as an act or performance offered by one party to another (...)." Grönroos (2000) also stressed the process nature and interaction between customers and service providers. Moreover, Liljander and Strandvik (1995) divided services into episodic and relational ones, where the latter comprise the interactive nature of services. However, e-service definitions have overlooked the role of interaction and Bitner et al. (2000) even argued that alongside technological development, interpersonal service encounters will disappear altogether. This is because interaction in e-services materializes in the interaction through computers?] between customers and service providers.

In reality, personal interaction has been eliminated from many e-services and customers only interact with their computers. We call this automated interaction. In this sense, all kinds of reservation systems (hotel, flight/railroad tickets, packaged tour and food take-away) represent automated interaction, whereas banks, insurance companies and financial advisers offer some e-services that are linked to human interaction, even though not always on a real-time basis. Our term 'mostly automated' refers to linking partial human interaction with automated interaction.

Lovelock et al. (2002) emphasized that the human factor plays a lesser role in e-services than in face-to-face or even telephone-based services. However, as soon as anything goes wrong, personal interaction is vital in performing service recovery and human work is obligatory in solving technical problems. The empirical study by Järvinen and Lehtinen (2005) revealed interaction as the most interesting of the studied e-service characteristics, as it varies more among e-services than other studied characteristics. Even Vargo and Lusch (2004a) emphasized social processes, i.e. interaction, in connection with services. We, on our part, raise two questions: 1) what actually is interaction in the e-context? 2) Does interaction always require a personal or personalized response, or can an automated standard reply be considered as an essential element of interaction? The key issue in interaction is a prompt response, but empirical studies show that there are still companies that do not confirm e-orders or reply to e-mails. Järvinen and Lehtinen (2005) referred to such situations as non-interaction. In these cases, even automated response systems are better than non-response.

A great challenge lies in the continuum between personal interaction and automated interaction. Each e-service provider has to decide on its strategy towards the element of interaction and find a balance between technology and a human touch (see Järvinen et al. 2003). Concerning this, Vargo and Lusch (2004a; 2004b; see also Lovelock & Gummesson 2004) suggested that the goal should be in developing ongoing communication processes or dialogues. However, Lovelock et al. (2002) warned of the dangers in rushing to adopt new e-strategies without thinking through the implications for customers, employees and overall operating system, because it may end up in pain. This requires careful scripted plans of the content of each e-service.

4. e-Service innovation

Innovation is not a new term in the academic literature, being utilized as early as the 1930s (Schumpeter 1934). Sundbo (2001), referring to Schumpeter, defined innovation as "the introduction

of new elements or a new combination of elements in the production or delivery of manufactured and service products.” Newness seems to be the central characteristic of innovation in this definition. Service innovation is naturally a sub-type of innovation. Innovation can be defined either narrowly as confined to the “idea generation” phase (Edvardsson et al. 2000), or widely, incorporating the whole process of service development (e.g., Sundbo 1998; 2001).

Hill and Jones (1998) defined innovation as "the process by which organizations use their skills to develop new goods and services or to develop new production and operating systems so that they can better respond to the needs of their customers." By this definition, the main characteristics of service innovation are skills that organizations use in developing new services and/or developing new production and operating systems as well as better responses to the needs of customers. This replaces the construct of newness in the former definition.

Lehtinen and Järvinen (2007) propose following definition for service innovation:

Service innovation is a largely intangible benefit-providing object of transaction that includes to some extent inseparable production, marketing, consumption and other service processes, and is better targeted to respond to the needs of customers and providing organizations, and evolved by using the skills and knowledge of service providers and customers in simultaneous interaction.

Thus, service innovation is a service with the basic service and innovation characteristics included in the definition. Naturally, innovation is a benefit-providing object of transaction or exchange if we speak about service-like marketed entities. The processual nature is important in service innovation, and every service process should be studied carefully as a part of innovation, because it may be influenced by different service characteristics in unique ways compared to other processes. These processes may be partly invisible to customers. This draws attention to production and operating systems, which as such are not included in the definition. It is true that the influence of better production and operating systems can usually be seen as better innovation, but the customer cannot entirely see them because they are, to a large extent, invisible functions. Like Atuahene-Gima (2005), the above definition considers the skills and knowledge of personnel of utmost importance in developing service innovations. Atuahene-Gima (2005) went even further in his analysis and proposed that both competence exploitation, i.e. using existing knowledge and skills, and competence exploration, i.e. building of entirely new knowledge and skills, are required.

Many new services fail because they simply have no market (Ogawa and Piller 2006). Repo et al. (2006) argue that totally new services are unlikely to achieve commercial success until users perceive needs or values for them. Respectively, Ogawa and Piller (2006) suggest the integration of customers into the innovation process. Nevertheless, innovations are increasingly expected to respond to the needs of customers in order to be saleable. In this, continuous interaction with consumers is inevitable in one form or another.

Various scholars have paid attention to the levels of innovation. Johnson et al. (2000) depicted the development from radical to incremental innovations. Radical innovation means that a totally new service or system replaces an old one and incremental (or improvement) innovation refers to the increase in value of an existing service resulting from some kind of development effort (see Johnson et al. 2000).

Lovelock et al. (2002) identified seven categories for new service development. Only the two first categories include clear innovation, but in some other categories also have innovative elements. The

first category deals with major service innovation, i.e. a new core service for markets that have not previously been defined, and the second category comprises major process innovation, in which existing services are produced and delivered through new processes with additional benefits. The other categories concern product line extensions by offering new services to existing customers, process line extensions delivering existing services in distinctive new ways, supplementary service innovations that can be either new services or improvements in former supplementary services, service improvements and style changes. The two last categories are the most common types in practice.

We consider that our conceptualisation is in line with Lovelock's vision. We respect all service improvements as valuable, but believe that service providers earn the best profits from proper innovations, i.e., core services clearly offering new benefits or values that may also be targeted at new customer segments. We agree with Vargo and Lusch (2004a) when they argue that success does not come from finding ways to provide efficient, standardized solutions but from making it easier for customers to acquire customized service solutions. These solutions can be offered in the form of e-service packages, including core service plus all necessary supplementary services (see e.g. Grönroos 2000; Järvinen 1998; Normann 1991). Achrol and Kotler (1999) even extended this issue to the 'customer-consulting function.'

Following the lines of the above discussion and referring to the service innovation definition by Lehtinen and Järvinen (2007), we define innovative financial e-services as follows:

Innovative financial e-services are mostly intangible, benefit-providing and novel core or supplementary services that are better targeted to respond to the needs of customers and evolved by using the skills and knowledge of service providers and customers.

5. Three empirical examples of innovative e-services in the financial context

It is common that financial companies launch new or re-designed e-services every year. These e-services are quite seldom truly innovative services in reality, but merely small improvements or copies of financial services marketed by domestic or international competitors. Below we describe the content of three recently-developed and/or launched innovative financial e-services. Thereafter, we assess their innovativeness and comment how they fit into our e-service definition and how interaction with customers is organized. Our method is close to conceptual analysis, which in this case means that empirical examples are compared to the proposed theoretical constructs.

Example 1: Safety and insurance advisor for consumers¹

The eInsurance service concept termed the "safety and insurance advisor" was developed in two separate phases during 2003 and 2007 by a research consortium consisting in the first phase of one university, one research organisation, two insurance companies and two software companies, and in the second phase of two universities, two research organisations, one insurance company and two software companies. The first part of the service, called the "insurance cover evaluator," was developed in the first eInsurance project during 2003 and 2004, and the second part called the "safety advisor" was the result of the second project executed during 2005 and 2007. The overall service concept is an Adobe Shockwave application that can be accessed through the project Web site. The selected application type enabled the development of a suitable graphical user interface

¹ see more Ahonen et al. 2007.

and the use of an external database that provided easy-to-update storage of information. The whole concept comprises three functions that are described below.

The first phase of the service concept is a “*selector*” function that collects information about the consumers’ living environment in order to suggest a suitable type of insurance cover along with tailored safety information. The consumer is asked to provide information on the following topics: 1) accommodation (apartment, terraced house, detached house), 2) family members (male, female, teen, child, pets), 3) assets (vehicles, valuables, summer cottage, forest, etc.) and 4) activities (travel, hobbies).

The second phase of the service consists of the “*insurance cover evaluator*” function that lists the selections made earlier by the consumer and combines them with suitable insurance types (e.g. family member, asset). The insurance types were divided into two categories: primary insurance types, which are the most common and therefore highly recommended types (e.g. car, home and travel insurance), and secondary insurance types, which are optional but useful types, especially for customers who want full insurance coverage against risk (e.g. all-risk car insurance, health and sports insurance). By selecting an object from the list, the consumer is provided with information about each specific insurance type covering the risks of that object. The combination of consumer selections and insurance types clarifies the relationship between them and suggests an insurance cover as a whole. The information can also be printed out and used as foreknowledge when contacting an insurance company or an independent broker.

The third phase of the service consists of the “*safety advisor*” function. This function combines the earlier customer selections with examples of accidents and hazards that might occur within the customers’ living environment. The customer can acquire safety information about four different topics within their living environment: home, vehicles, travel and hobbies. The graphical user interface provides several scenarios within each topic, for example a fire in the kitchen or losing one’s luggage during a trip abroad. The individual scenarios include the following information:

- *What might happen?* (a scenario of an accident or hazard that might happen)
- *How to avoid damage?* (how to prevent the accident and/or minimize the damage)
- *In case of damage* (how does insurance apply in this situation and what kind of issues must be considered in making an insurance claim)
- *Did you know...* (statistical, instructional and/or other information related to the scenario)

At the moment only a pilot version of the insurance and safety advisor is available via the Internet (www.einsurance.fi).

Example 2: e-Invoice

Various e-Invoice systems have been developed in many countries, but in all countries the system has to be adapted to the national e-banking infrastructure. In Finland, e-Invoice for consumers was launched at the beginning of 2007. Before that, corporate customers already had their own e-Invoice system.

Consumers who are willing to join the e-Invoice system must have Internet banking codes and passwords and have to sign an agreement with the bank. After that the consumers receive invoices directly via their online bank and it is their duty to accept the bill to be paid, which can be done by clicking on a button. However, they have an opportunity to change the due date and the total amount of the invoice before accepting it.

The advantages of e-Invoice are that the consumers do not have to enter any details of the invoice into the online bank and the mailing of paper invoices can be stopped. The consumers have to monitor when invoices arrive at the online bank, but if not willing to do that, they can order a message notifying of arriving invoices by e-mail or mobile phone. This service is not free of charge, but may save overdue payments.

Example 3: Housing loan calculator in connection with the estate broking portal

Housing loans have been a target of tough competition between banks during recent years while the housing-estate industry has been booming as a result of more and more families seeking and moving to new homes. For a long period of time banks have advertised housing loans on their Internet pages, where they also have loan calculators that consumers can use in order to test their financial standing by changing loan amounts and pay-back periods.

Recently, a loan calculator was also introduced as a supplementary service in the estate broking portal called “www.Etuovi.com” [Frontdoor.com]. This portal is designed for consumers searching for a new home. It contains information, photographs and location maps of properties for sale. The costs of the portal are carried by estate agents and for customers it is free of charge. The portal is a few years old but has been recently been redesigned in order to help customers find an appropriate home more easily and match their wishes better against various alternatives offered.

The loan calculator at Etuovi.com functions as follows. First, it automatically enters the asking price of the property that the consumer has selected to obtain more information. The calculator approximates the current loan interest rate and the length of the pay-back period. The task of consumers is to enter the amount of self-financing, but they are able to change the other details as well. After that the consumer can accept the figures provided by the calculator and the computer offers them an application form on which details of the housing loan and the property are already printed. When the consumers have added their personal data, they can forward the application to three Finnish banks or only one or two of them and receive a loan offer by return in due course.

The loan calculator with the estate portal is convenient for consumers: it bundles the housing loan with the property for sale and there is no need to organise any separate contact with the bank. It also makes it easy to compare the loan terms between the banks.

Evaluating the innovativeness and level of interaction of the three financial e-services

When evaluating the innovativeness of each studied financial e-service, it can be presented on a continuum between radical innovation and incremental innovation. Equally, the level of interaction can be presented on a continuum where at one end is non-interaction and at the other end personal interaction. Between the two is, among others, the automated interaction that was discussed earlier in this paper.

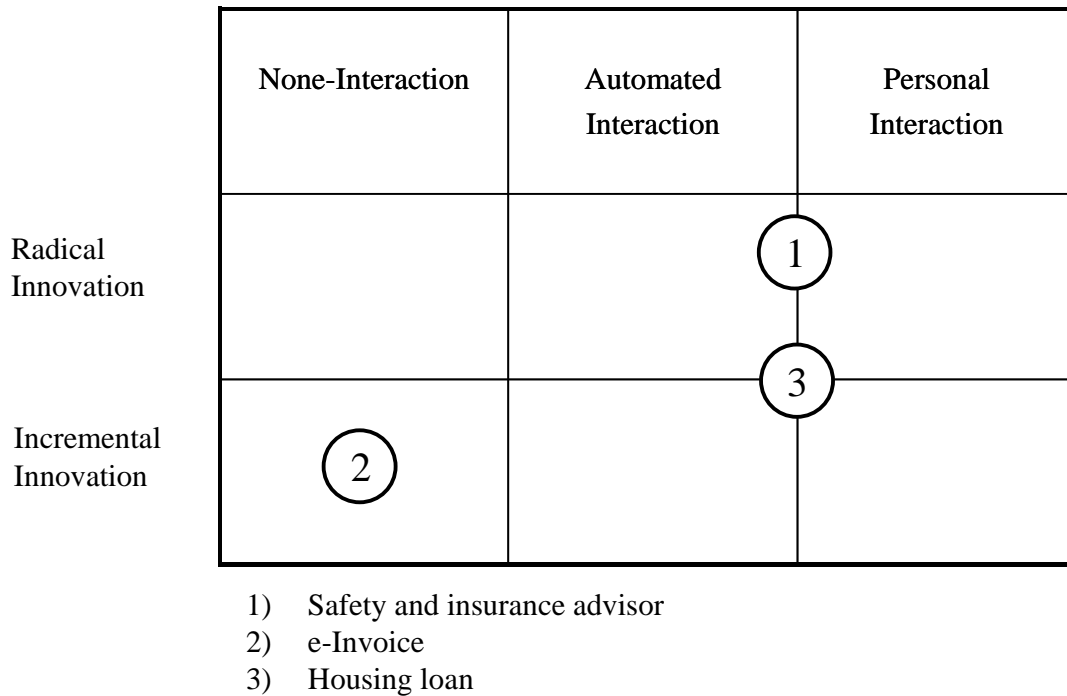

Figure 1: Evaluating innovative financial e-services

Starting from the level of innovation, the safety and insurance advisor represents a radical innovation, because no other such concepts exist, neither as e-service nor manual service. e-Invoice is an incremental innovation, because it has been adapted from the e-invoice system that was earlier developed for corporate customers. The housing loan is between the two, because such a service existed earlier via online banks. The part of the loan calculator that can be considered as a radical innovation is its location in the estate portal and the automatic entering of various data.

There are also variations in interaction between the studied e-services. e-Invoice works with non-interaction with the bank personnel, whereas the other two e-services initially function as self-services, with the consumer later being able to change to personal interaction and negotiate completely tailor-made solutions.

6. Discussion

In this article we discuss innovative e-services in the financial sector. The paper includes theoretical considerations of e-service definitions and innovations, as well as our proposition to define innovative financial e-services. In addition, three empirical examples of such innovations are presented.

Reasons for starting the service innovation process vary. Some service providers are merely seeking price competition, while others wish to add value through innovative service concepts. In our opinion, cost-saving purposes may even ruin successful service innovations, since during the innovation phase costs are usually even higher than during the production phase. Nevertheless, many companies target faster, better and cheaper ways to organize their activities through innovation projects (Thomke 2006). However, we believe that many customers may lose trust if they find out that the only purpose for service providers is to save money. Within the context of

service innovations, the importance of trust and loyalty will increase, because innovative service business conducted through technological devices multiplies risks as well as uncertainty. In this respect, customers have to rely on image and promises (cf. Reichheld & Schefter 2000). Trust helps to keep customers. Without trust, service providers cannot manage referrals. All other attributes, such as low costs and a broad selection, remain far behind.

Reichheld and Schefter (2000) pointed out that word of mouse spreads even faster than word of mouth, and referrals on the Internet are therefore even more lucrative than in traditional services. However, the Internet is fast in spreading both good and bad publicity: trust can change to mistrust and referrals become a curse. Trust and loyalty are intertwined. Reichheld and Schefter (2000) argued that e-business makes customer loyalty more important than ever and loyalty is an economic necessity: acquiring customers on the Internet is enormously expensive and only if these customers make repeated purchases over the years will profits remain. The only way to avoid negative publicity is to earn trust each day and keep it tomorrow. This, for its part, calls for better understanding of e-service content and context.

Customers choose how they use services and whether to engage in self-services (i.e. do it yourself). However, to be successful at self-service, customers have to have sufficient physical and mental skills and/or appliances to make self-service possible (Vargo and Lusch 2004a). Therefore, customers are dependent on adequate system infrastructure. On the other hand, when comparing e-services with traditional services, it is clear that methods to provide concrete services deviate and there are various ways to visualize e-services on the screen that are not available in traditional service encounters (Järvinen and Lehtinen 2005). This issue calls for new ways to look at e-service innovations. One such way is to design e-services to educate customers, as in the case reported by Reichheld and Schefter (2000).

To be honest, we must ask if some of these innovations have already gone too far in the standardization and industrialization of the services in question. This is an especially relevant issue if we remember that there are different market segments in all markets. In addition, attitudes and competencies of customers can never be equal in any market; rather, they tend to move in a more fragmented direction.

Along with new technology, service automation has been a popular theme in recent years, and it has been pinpointed in the sense of productivity and efficiency of organizations. When services are automated, part of the staff working in the service sector can be moved to other fields, and human contact in services will often become a luxury. However, the most demanding and information-intensive services may not always be suitable for the automated environment.

Another important issue in the context of financial services is the human need for social contact. There are indicators (e.g., Tuorila 2001; Järvinen and Heino 2004; Tuorila and Kytö 2005) that all age segments of customers include individuals who prefer to rely on human services instead of electronic services. This represents a challenge both to service innovation research and business and management in general.

Consequently, we anticipate the following future trends in the case of financial e-services that should be targeted in research:

- Most of the financial services will be commonly available on the Internet.
- Visibility through electronic devices will allow more personal interaction and real-time problem solving.

- Some services will remain a face-to-face mode or they will need another perspective to be successfully automated.
- Consumer segments will be polarised: some will prefer personal interaction, some will rely on self-service through the Internet and some will choose combination of the two alternatives.

The first two trends mean that services should be seen as a continuum, where automated (i.e., non-touch) services and those involving human touch are at opposite ends of the continuum, although all services lie between the ultimate points, i.e., include an opportunity for face-to-face interaction at least in certain situations (see Järvinen et al. 2003). As soon as real-time voice and image opportunities through electronic devices become commonly available, this may start a new e-service innovation boom. The technology already exists to organize this system, but the hindrance lies in consumers' attitudes together with the costs incurred. It is also good to remember that many technological innovations have been finally buried because they have been too complex for customers, who have not accepted them, or they have been ahead of their time and customers have not yet been prepared for them.

Abstract

Investment behaviour of private investors has been little researched in Nordic countries. In our study we provide answers to the following questions: How do consumers make their investment decision and what motivates consumers to invest? The theoretical roots of the paper lie in both consumer behaviour and behavioural finance theories. The study is qualitative and the data was gathered in the six focus group interviews. We found two types of private investors, active and passive. Active investors were interested in investments, searched for information on them and were confident in their investment decisions. Passive investors trusted in the expertise of financial companies and did not want to waste their time in learning more about investments. As a result of the study we try to reveal knowledge gaps in consumer wealth management and investment decisions, in order to suggest how to improve the position of consumers in financial markets.

1. Motivation and purpose of the study

The amount of privately-owned financial capital has rapidly increased during the past ten years throughout Europe. In Finland the total amount of privately-owned financial capital was 120 billion euros in 2006 (FK 2007). This means that more and more consumers are acting as private investors in financial markets and becoming acquainted with various financial services. Active financial markets are important for the whole of society. It is even more important that money is directed to the most productive investments that can thereby promote economies of scale.

As a consequence of blooming financial markets, more financial companies have appeared. They have responded to consumers' interests and started to actively offer a wider assortment of financial services. These services are often packaged in order to spread consumers' risks and minimise volatility in their investment portfolios. According to previous studies, consumers consider financial services complex and it therefore takes time to become acquainted with them. Moreover, the contents and risks of various financial services vary greatly and consumers require a specific ability termed financial literacy to identify the best investment solutions for their purposes.

Despite increased interest and activities in the area, private investments have been little researched in Nordic countries, at least from the consumers' point of view. The reason for this lack of research lies in additional challenges linked to all financial services in general. According to Campbell (2006), it is important to ask how consumers actually invest, but it is difficult to answer this

question because the data are difficult to obtain. This is because it is unusual for consumers to reveal details of their intimate affairs. In addition, many consumers have complicated finances with multiple accounts at different financial companies that have a different tax status and include both mutual funds and individual stocks and bonds. Even households that wish to provide data may have some difficulty in answering the questions accurately.

Acknowledging the challenges mentioned by Campbell above, it is important to contribute to this research area in order to learn more about consumers' motivation and decision making. Thus, the purpose of our paper is to explore consumers' wealth management in financial markets. This includes the following research questions:

- How do consumers make their investment decisions?
- How do consumers manage their investments?
- What motivates consumers to invest?

The theoretical roots of the paper lie in both consumer behaviour and behavioural finance theories. In addition, the service literature, especially adapted in the financial services context, is utilized. Within consumer behaviour literature this paper is focused on consumer decision-making processes, whereas behavioural finance seeks the consumer motivations behind the decisions.

2. Theoretical background

The theoretical background of the study is formed by three angles (Figure 1). The classical theory of consumer decision making is complemented by the rather new approach of behavioural finance. As private financial investments form the focus of the study, the nature of these services has implications for consumer behaviour. All three angles are shortly discussed below.

Private financial investments

Consumers' private financial investments consist of bank deposits, stocks, bonds, equity funds, life and pension insurance. The share of each item in Finland is presented in Table 1.

<i>Financial Investments</i>	<i>billion euros</i>
Bank deposits	55.7
Stocks	26.5
Life and pension insurance	20.7
Equity funds	17.3
Bonds	1.4
Total	121.6

Table 1: Private financial investments of consumers in Finland in 2006 (FK 2007)

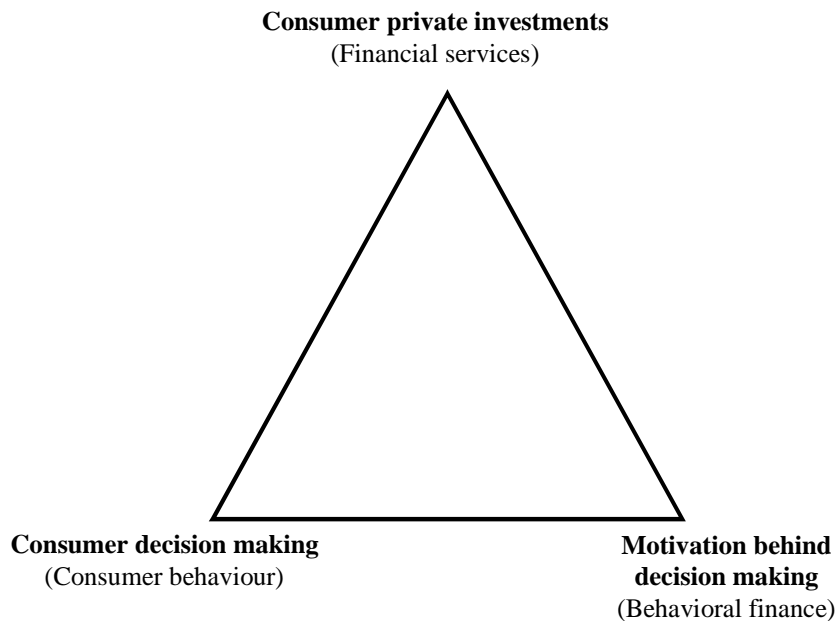

Figure 1: The theoretical roots of the study

Campbell (2006) emphasises that a major question is how consumers construct their portfolios within each asset class. According to Swedish data, real estates account over 70% of household assets, bank deposit and money market funds 11%, stock and mutual funds 6% each and bonds, derivatives and insurance account for the remainder. Altogether, 62% of households participated in financial markets by holding financial assets other than bank deposits and money market funds. (Ibid.) In Finland, real estates form 66% of household assets, but financial assets only 2%, of which bank deposits alone account for 46%, stocks and insurance around 20% and funds 14% (Statistics Finland 2007). The statistics show that Finnish consumers do not yet operate in financial markets on a large scale, but the figures are increasing rapidly.

Financial investments are a part of financial services. Financial services differ in nature from many other services. The common service characteristics, such as intangibility, heterogeneity, perishability, simultaneous production and consumption, are only partly fulfilled in connection with financial services (see e.g. Ylikoski et al. 2006). Financial services encompass a vast variety services, some of which are quite simple, whereas others are even too complicated from the consumer perspective. Investment services are among the most complicated, and many consumers find it difficult to understand the structure of these services. Therefore, it is difficult for many consumers to make investment decisions.

Some financial services are used often, even weekly, but some only once a year. On the basis of their use, financial services are divided to low frequency and high frequency services. Those services that are needed often tend to be more familiar to consumers than those that do not require attention on a regular basis.

Financial services can also be divided to low and high involvement services. Involvement is defined as “a person’s perceived relevance of the object based on their inherent needs, values and interests” (Zaichkowsky 1985). Even though involvement may also be caused by advertisements and purchase decisions (see e.g. Solomon 2004), in this paper we refer with involvement to the feeling that is directed towards the private financial investment products. Low involvement in connection with financial services means that consumers are not interested in the services, and the whole service sounds more like a ‘must’. This is the case with many insurance types. By comparison, high involvement refers to those financial services that consumers are committed to and that arouse positive feelings. For example, the possibility to gain in stock markets usually leads to high involvement.

Consumer decision making

During the past two decades, research in the area of consumer behaviour has been divided into information processing (utilitarian) and experimental perspectives. The information-processing view concentrates on decision-making processes and portrays consumers as rational problem solvers, whereas the experimental perspective focuses on the symbolic, hedonic and aesthetic nature of consumption. Traditional consumer behaviour assumes that consumers differ from each other in their socio-economic and demographic background, but the experimental perspective also takes into account emotions and personalities (e.g. Holbrook and Hirschman 1982; Mäenpää et al. 2006).

Burton and Easingwood (2006) combine the above-mentioned perspectives in their utility model, which they have developed based on the model of Kim and Mauborgne (2000). The suggested levers are: 1) consumer productivity, 2) simplicity, 3) convenience, 4) risk, 5) environmental friendliness and 6) hedonic benefit.

Mäenpää et al. (2006) found in their study that hedonic consumers expect more from on-line banking services than less hedonic consumers. However, they also recognised that more profitable consumer groups for banks, i.e. older, richer and more educated, seemed to be less hedonic. As a consequence of this the experimental perspective is less interesting for the purpose of this study, and therefore we concentrate in this paper on the utilitarian view, especially the consumer decision-making process.

The stages in consumer decision making start from problem recognition and continue to information search, evaluation of alternatives, product or service choice, and finally the evaluation of outcomes (e.g. Engel et al. 1990; Solomon 2004). Traditionally, researchers have approached this process from a rational perspective, where consumers calmly and carefully integrate as much information as possible with what they already know about a product or service. They even weight the pluses and minuses of each alternative until they arrive at a satisfactory decision. However, it is now realized that decision-making involves a repertoire of strategies. First, consumers evaluate the effort required to make a particular choice and then they choose the most suitable strategy to fit the level of their effort. Thus, there are at least three alternatives in the decision-making process (Solomon 2004):

- Extended problem solving, which corresponds most closely to the traditional decision-making process presented above.
- Limited problem solving, which is usually more straightforward and simple than extended problem solving.
- Habitual decision making, which refers to choices that are made with little to no conscious effort.

When considering private financial investments and the discussion of their nature above, it is clear that extended problem solving is the usual mode, but in case of renewal of investments limited problem solving is most probably also used. In addition, the amount of money invested is an important determinant of the length of the decision process. A small amount of money saved in a deposit account may require only little effort, whereas an investment in stocks can produce various analyses of the past and future of the particular stock.

However, some consumers may proceed with their decision-making process by using cost-benefit evaluation, where each decision associates with benefits and their probabilities, but also has certain costs (Bettman et al. 1991). In addition, Wertebroch et al. (2007) claim that consumers evaluate financial transactions against their budget constraints and other reference standards. They also mention the mechanism of money illusion, which is the result of consumers' thinking in nominal rather than real terms. We find these concepts relevant, especially in context of financial investments.

Järvinen and Heino (2004) have proposed a framework explaining consumers' experiences in the financial sector adapted from Engel et al. (1990). The framework consists of the stages of the traditional decision-making process and four factors affecting the process. They are financial services themselves, psychological processes, environmental factors and personal individual factors.

As a rule, consumer decision making entails some kind of perceived risk. Solomon (2004) divided risks into monetary risk, functional risk, physical risk, social risk and psychosocial risk (see also Stone and Gronhaug 1993; Goldsmith 1996). March and Shapira (1987) noticed that consumers often claim that they 'take calculated risks' but they 'do not gamble'. This statement indicates that risks are seen as controllable and bad outcomes refer to bad decision making.

De Bondt (1998) wondered why it matters if small individual investors do not behave as they should. He finds two reasons: First, financial management affects consumers' well being, and second, investors' behaviour affects what happens in markets. This means that too risky behaviour causes harm not only for those consumers acting against their own good, but also for other consumers and actors in the markets to some degree.

Many consumers take too much risk without knowing it. They either do not care or do not understand the potential harm and losses that follow if the risks are realized. Campbell (2006) argues that some consumers make serious investments mistakes, although many consumers find adequate solutions to the complex investment problems they face. According to him, the problems arise from participation in risky asset markets, underdiversification of portfolios and failure to refinance mortgages.

An important lesson of modern portfolio theory is that diversification pays, i.e. properly diversified investors can earn higher returns without having to face the danger of higher risk. Yet many consumers are underdiversified. The very idea that risk is defined at the level of the portfolio rather than at the level of individual assets, and that risk depends on covariation between returns remains foreign to many private investors. (De Bondt 1998)

Motives behind decisions - behavioural finance

Motivation refers to the processes that lead people to behave as they do. It occurs when a need is aroused that the consumer wishes to satisfy (Salomon 2004). The need may be either rational or irrational.

Behavioural finance theory describes the choices consumers actually make (Campbell 2006). It relaxes the most important assumption of traditional finance theory: investor rationality (Linnainmaa 2003). Therefore, for behavioural finance the human being is susceptible to making mistakes and often acts under “irrational” and passionate impulses (Kleinubing Godoi et al. 2005).

Studies related to behavioural finance have been embodied in the finance context in recent decades, but started to flourish in the 1990s. The pioneers in the field have been Kahneman and Tversky (1979), who criticized the utility theory as a descriptive model of decision making under risk and developed an alternative model, showing that individual’s feel the pain of loss much more than the pleasure of gain. A phenomenon correlated with loss fear is regret fear, according to which many investors try to follow most market behaviour in order not to make mistakes themselves. Kahneman and Tversky (1979) and Statman (1999) have especially approached the retrospective feeling of pain, when the consumer finds out that other choices would have resulted in a better outcome.

The main issues studied in behavioural finance are loss aversion, overconfidence, exaggeration of optimism and pessimism, and overreaction or under reaction to market news (e.g. Kleinubing Godoi et al. 2005). In addition, constructs like mental accounting, decision framing, regret avoidance and familiarity bias are found to underlie irrational consumer behaviour.

In this study the concepts of overconfidence and mental accounting seem to be most relevant according to a priori understanding. Dittrich et al. (2005) defined overconfidence as the persistent overevaluation of one’s own investment decision. They demonstrated that overconfidence increases with task complexity. It has been shown that overconfident investors overreact to private and under-react to public signals (Daniel et al. 1998). Mental accounting refers to situations where consumers have not only one but multiple attitudes towards risks. Risk tolerance is low and for some investments and the opposite of others. It is also explained that consumers keep their money in separate jars depending on the purpose: there are Christmas Club accounts, accounts for credit cards, accounts for food, accounts for mortgages etc. (see e.g. Nevins 2004)

There have been several empirical studies in the area of behavioural finance concerning consumers’ decision making. For example, Benartzi and Thaler (2002) investigated the subjective attractiveness of portfolio decisions by comparing three alternatives: the individual portfolio, the median portfolio and a portfolio picked by a professional investment manager. The majority of survey participants preferred the median portfolio and the professional portfolio to the self-selected one. The authors explained the results by a desire for investor autonomy which appears as initial over- and underconfidence. However, Dittrich et al. (2005) provided evidence that investors highly value their own investment choice, and feel reluctant to switch to alternative investing opportunities.

There are numerous indications of consumers’ investment choices being short-sighted or turning out to be far from rational. Therefore, it is justified to ask, like Campbell (2006), whether consumers should plan their financial affairs over a lifetime rather than over a single short period.

All in all, the concepts of behavioural finance concerning human nature find support in psychoanalytical theory, and the observation that consumer behaviour is susceptible to cognitive and emotional mistakes is quite familiar to psychoanalysts who are used to listening to their patients narratives about difficulties in dealing with money (Kleinubing Godoi et al. 2005).

3. Empirical findings

Methodology of the study

The study is explorative in its nature, because only a few pieces of research have been published in the area. Therefore, it was decided to start data gathering from an “empty table” and allow consumers to explain in their own terms their understanding of private investments, their risks and how they perceive their own wealth management. For these purposes, qualitative data are most suitable.

The empirical data were gathered in six focus group interviews in May and June 2007. Altogether, 33 consumers were attending these groups. They were selected from among the members of a consumer panel maintained by the National Consumer Research Centre. Each discussion took at least two hours. The discussions were transcribed and the preliminary qualitative analysis performed during the summer of 2007.

The advantage of the focus group method is that participants are able to freely discuss various phenomena in depth and from various points of view (e.g. Heiskanen et al. 2005; Kitzinger and Barbour 2001; Woolley and Spencer 1999).

Preliminary results of the focus group interviews

When consumers in the focus group interviews discussed their wealth management, they referred to the following items:

- dwelling
- summer cottage
- forest
- bank accounts
- equity funds
- stocks
- insurance
- car
- boat
- work of art
- jewellery
- inheritance
- human capital.

The dwelling is an exception among the others in the above list, because many consumers cannot imagine their home as an investment. In this, Finnish consumers differ from Americans, who mostly consider their dwelling as an investment that will be changed to a better one every 4 to 5 years (Laitamäki 2007).

Like Campbell (2006), we asked from interviewees how consumers allocate their assets across broad categories of opportunities. Even though they did not mention the share of each financial item in their portfolio, most discussion focused on stocks, funds and pension insurance. They revealed that their decision making is mostly based on their own interests and own knowledge about each investment item, but the trustworthiness of the financial company was also very important. In addition, experience, emotions and social networks affected their financial investment decisions.

The interviewees were of two types:

- Active investors who are interested in investments, search for information on them, and are confident in their own investment decisions. This group also felt a lack of confidence with the expertise in financial companies.
- Passive investors who value easy care most of all, and do not waste their time in learning more about investments. Unlike the first group, they trust in the expertise of financial companies and in many cases bank tellers have persuaded them to start financial investments. Some of them favour various deposit accounts.

Mental accounting was easily recognised among interviewees when they explained their motives behind investment decisions. The investments were made in order to save for retirement, for children, for inheritance and to show status and success. In addition, worries about bad times in the future inspired investments. Some consumers also paid attention to the gain and taxes. Moreover, there seemed to be a division in their minds between their dwelling and their other investments.

It is interesting that among interviewees safety came before many other motives. In that sense, wealth releases the burden of a future shortage of money, makes it possible to fulfil dreams and satisfy all kinds of needs, and provides enrichment to life. However, the importance of profits varied, and a conflict was seen between wasting and investing money. Some consumers honoured the traditions of their family by their investments.

Concerning the discussion of short-sighted consumers, many consumers in this study were goal oriented and acted in the long term, but those who acted spontaneously and in short term considered themselves as only small savers, not real investors.

Risks are connected to financial investments, but the relationship between risk management and wealth management was unfamiliar to most of the interviewees, except in the case of insurance. A common factor was that the recognition of various risks varied. Some consumers linked them to their own life, some to financial markets, some to financial companies, and some considered them global. Some consumers were constantly worried about financial risks, but the rest felt that their investments are so modest that there is no need to worry, because in any case the money goes somewhere.

Only some suggestions for financial risk management were brought into the discussion. They included the allocation of investments, long-term orientation, assessment of one's own financial statement, and reactions to changes in financial markets. Finally, it was commonly acknowledged that "risks are a part of life."

4. Discussion

In this paper we have combined the theories of consumer decision making and behavioural finance with considerations of the nature of private financial investments in order to form the framework for our empirical study. The empirical study consisted of the six focus group interviews with altogether 33 participants. Although we presented the traditional consumer decision making process at the beginning of the paper, we did not discuss the process itself with interviews, but concentrated on the decision making stage and the motives behind it.

The empirical results show that confidence is an important construct in consumer decision making concerning financial investments. The active investors have self-confidence with their decisions,

but the passive investors can be considered even over-confident with their financial company, yet they do not even question the expertise of these companies. In our study part of the consumers were actively learning more about financial investments, but it was not common to seek advice from financial planners and other experts as was confirmed in Campbell's (2006) study.

According to a priori-knowledge, mental accounting was easily recognised from the focus group interviews. However, there may well be variation in weightings between mental accounts that depend on cultural characteristics. For example, Christmas shopping accounts are important in the USA, but travelling accounts in Finland.

Our empirical study confirms that the consumers do not make their financial decisions purely on a rational basis, but irrational behaviour is surprisingly strong when they explain their motives. Before conducting the empirical study, it seemed only natural that consumers would emphasise the importance of gains and profits and avoidance of losses in their wealth management, but these issues were not considered the most important ones. In addition, there was lively discussion of human capital, although before the interviews it was decided that the interviewer would not take this topic actively into discussion.

Financial risks and how to manage them are not well known constructs for consumers, even though financial risks are more familiar to them than most of the other risks they face in their every day life (see Peura-Kapanen et al. 2007). If consumers knew more about financial investments they could probably evaluate the risks better than our study indicates. It can be concluded that there is plenty of room to educate consumers in how to better handle their financial affairs.

As a result of the study we will present triggers for consumer investment motives. In addition, we try to reveal knowledge gaps (or knowledge deficiency) in consumer wealth management and investment decisions, in order to suggest how to improve the position of consumers in financial markets. For financial organisations we will suggest new ways to provide information on wealth management and means to attract consumers in these markets.

Choice, freedom and responsibility: young consumers in credit markets

Anna-Riitta Lehtinen
National Consumer Research Centre
Helsinki, FINLAND
Email: anna-riitta.lehtinen@ncrc.fi

Indebtedness is a serious and increasing problem among young consumers worldwide. The use of credit cards has expanded at a record-breaking rate from the 1980s to the present. The use of credit cards to finance consumer purchases has also become an unarguable way of life among young consumers. Young people's lifestyles are based to an increasing degree on credit products and services. At the same time, this ongoing development has brought new risks to consumers' consumption habits, finances and credit use. Payment defaults and payment difficulties have become common alongside the increase in credit card use.

Young people between the age of 18-29 years form a challenging group. They are moving from the transition phase to the establishing phase in their life. It has been found that adolescence has been prolonged and delayed. Emerging adulthood is a developmental concept for the period from the late teens to the twenties in industrial societies. This is a period when change and exploration are common. The young are beginning to establish, for instance, their economic life and make more and more decisions about how to handle their private finances. In addition to age, gender, household structure, living conditions and the occupation or work situation are the most important factors affecting young consumers' consumption-based lifestyles. Young people are also usually in very different circumstances and stages on their way to independence. Young consumers are not a homogenous group. Traditional courses of life have de-standardized and become less dependent on age. Today's young people represent a generation that has been living in a materially affluent society. Young consumers have been socialized into a world that is directed by information and communication technology and are essential partners in the network society, and they also shape consumption and communication culture through their choices and activities.

Internal migration and expanding ICT together with continuously changing fashions and trends challenge lifestyles and also involve lots of demands. One has to make appropriate choices and develop the skills to survive in the information society. The same concerns consumption. Consumption and consumer goods, and also competition, qualify as ingredients in the construction of identity and self reflection, but also as sources of togetherness. One has to be able to make choices among an array of alternatives. More than before, young people have to rely on themselves in their choices. Today's model favours independent, ambitious and motivated characteristics. A fundamental or existential question is whether one is good enough according to prevailing criteria. Identity-seeking and self-creation through consumption can be considered as characteristics of a certain life-course stage and lifestyle, mainly because consumption is currently an essential element in the rites of passage from youth to adulthood.

Young consumers' credit use and indebtedness has been researched, among other countries, in Canada, the United States of America, South Korea and Great Britain. The biggest causes of indebtedness are simply small incomes and large expenses. However, consumption, credit use and potential payment defaults have a multifaceted nature and are not the result of any single factor, but

of the whole lifestyle of consumers. Additionally, different situations caused by individual and societal factors affect their development.

This study examined the credit-based lifestyles of young consumers and related payment problems in Nordic countries. Further, it focused on the concept of responsibility, its role and implications in credit use from the viewpoint of young consumers and other societal actors. Qualitative, explorative and comparative data were collected by interviewing young consumers (aged 18-29) in four Nordic countries (Denmark, Iceland, Finland and Norway). Additional Finnish data, including interviews of the representatives of market sector (credit grantors, collection companies and the execution office), were analysed from the viewpoint of responsibility issues.

Lifestyles help us to define our attitudes and values as well as show our wealth and social position. Discussion of lifestyles is a feature of the modern world or modernity. Lifestyles can be considered as patterns of action that differentiate people. They help to make sense of what people do, why they do it and what doing it means to them and other people. People also use lifestyles in everyday life to identify and explain wider complexes of identity and affiliation. Research indicates that certain objects, attitudes and styles become particularly significant icons, and lifestyles are a particularly significant representation of the quest for individual identity.

In this study, lifestyle was broadly taken to be the totality of people's conditions and resources, practices or activities, as well as values, attitudes and subjective experiences. Various situations in life may bring about a considerable decrease in income, including illness and unemployment. They are more occasional by nature, but have strong implications concerning the financial management of consumers. Previous studies suggest that people are, in general, willing to pay back their debts, but unexpected events may disturb, or totally prevent repayment. Furthermore, some lifestyles, per se, may without any problematic situations lead to overextended credit use.

Based on this study, three lifestyles were identified among young consumers based on the way they talked about consumption and credit use: an easy-living, pleasure-seeking lifestyle, a risk-investing lifestyle and a disorganized lifestyle. Young consumers in the first category used credit to maintain their desired lifestyle. Those with a risk-investing lifestyle used credit to make financial investments or invest in their own education. Finally, in a disorganized lifestyle, credit was used to purchase necessities. The interviewees' lifestyles and consumption had largely been based on different kinds of consumer credit. Even though their credit use had been conscious, the young consumers did not ultimately understand the impact of credit on their own finances. Our findings clearly indicate that the young had difficulties understanding what they had agreed to in signing a credit agreement. The key factors behind indebtedness were usually the young person's own consumption, spending habits and the phase of life (emerging adulthood). External circumstances and incidents as well as debts incurred by other people were other reasons.

The sharing of responsibility between pertinent parties was examined on the grounds of how they regarded the credit agreement. The credit agreement is an essential element in a credit relationship. Although there has been much discussion lately about corporate social responsibility, the concept was quite unfamiliar among those companies we interviewed. Among credit grantors and collection companies, responsibility is a new concept. The concept is technical and appears as rules and guidelines in their business actions. For companies, responsibility means proper estimation of a customer's paying capacity and making the right decisions. They emphasize that credit granting and money collection are business activities. Both pertinent parties feel more responsibility collectively than towards each other.

All interviewees (the young and companies) found it very easy to obtain credit. Since no-one had questioned their capacity to manage finances, neither had the young begun to ponder their resources. Nevertheless, these young consumers had made their decisions themselves, and so it was difficult for them to place the blame on anyone else. We found responsibility among young consumers to be subjective, which extends to all sectors of life. The young did not understand that they were liable for the credit agreement, which they also confessed. They did not reflect on the credit agreement until they had defaulted on payment and were forced to do something. They acted reactively rather than proactively. In the light of this study, it appears that inexperienced young consumers have negotiated with experts in credit granting or debt collection.

When applying for credit the young did not act in a liable way, but when clearing their debts they tried to act responsibly. They cleared their debts on their own, but mostly they wanted to dispel the feeling of shame, guilt and deviance. They had failed to manage their finances, and payment default had cut consumption and freedom. They felt payment default to be a punishment and did not obtain more credit. They felt more or less deviant in society because consumption was the way through which they could become a member of it. Membership of society means adulthood, but they had not yet reached it, even though they were consenting adults.

We found that young consumers were socialized to the consumption society and credit society, where credit use is a routine practice. Young consumers seemed to be very consumption-oriented and their life was consumption- and credit-centred. Their consumption was based on pleasure seeking and experiences, but consumption was also a necessity. The young had easy access to credit, which was surprising, because according to previous studies young consumers have an unsteady income, short-term jobs and quite many are set against credit use. Consequently, it should be quite difficult for young consumers to obtain credit. They knew they could use credit but they did not understand what they had agreed with the creditors or what might be the consequences of credit use. They lacked the information and skills to manage money matters and economic issues.

The results show that there is need for pre-emptive measures to prevent indebtedness. The existing information should be targeted so that it reaches those who need it. There should be access to consumer education and advice throughout the educational system. It is important to pay attention to the identification of potential risk-groups. It has been said that a positive debt register does not reduce indebtedness, but could a positive register prevent the debts of risk-groups such as the young? Could it be possible for young debtors to get a 'fresh start'? Debt causes serious and long-term troubles and limits their opportunities to participate in studies, careers and housing. These difficulties prolong and delay their growing up. A permanent negotiation board for the key representatives of the credit system could be useful in which, for instance, legislators, bankers, merchandisers, consumer authorities, educators, counsellors and politicians can meet and discuss. Above all, there is also a need for public discussion on the 'acceptable' level of debt problems in society and how to support reasonable consumption and credit use. A crucial issue is how to share responsibility or promote responsible behaviour in the free market.

The relationship between parenting style and adolescents' future orientation and spending preferences¹.

Abstract

In this study, we explore the role of parenting in the intergenerational transfer of future orientation and economic behaviour using data collected from 600 14-15 year olds in Norway. We focus on conscientiousness, future orientation and present orientation and find these dispositions associated with spending preferences and ability to resist spending. Furthermore, we study the link between these dispositions and 4 parenting dimensions: responsiveness, behavioural control, psychological control, and autonomy granting, as well as the link between the dispositions and 4 parenting typologies. We find adolescents who perceive their parents as psychological controlling to be less future oriented and conscientious and more present oriented than others, while adolescents who perceive their parents as responsive, autonomy granting and controlling of behaviour are more future orientated and conscientious than others. Direct effects of the parenting styles on spending preferences and ability to control spending are weak, so the effect of parenting on economic behaviour is likely to be indirect through the shaping of general dispositions. The parenting typologies were found important for the plans for the adolescents' educational plans.

1. Introduction

Economists have long been interested in the transmission of human capital from parent to child and in understanding what determines the economic success of children. Research within several fields show that parents have an impact on their children through a variety of channels: they invest in their children's education, transmit cultural values and social skills,

¹ This data was collected as part of a collaborative project with Annette Otto (University of Exeter) and Dr Michelle Mahdon (The Work Foundation). We would like to thank the teachers, and students. Financial support was provided by the Norwegian Research Council (project number 135090/510) and the University of Exeter.

and pass on their genes. But exactly which values and skills are important for the transmission of economic behaviour is far from clear and we know little about what is transferred and how. Research on individual differences in saving and borrowing behaviour indicates that the shaping of time horizon and future orientation may be an important candidate for the transition of economic behaviour. For example, Webley and Nyhus (2006) found that parental behaviour (such as discussing financial matters with children) and parental orientations (conscientiousness, future orientation) have a weak, but clear impact on children's economic behaviour as well as on economic behaviour in adulthood. These results provide some evidence of an overall economic orientation being passed down through the generations although the mechanisms through which economic orientations are passed down remain obscure.

In this paper, we explore the role of parenting style in transferring future orientation. The research is inspired by Seginer et. al.(2004) who have demonstrated links between parenting styles and future orientation in children in a recent study. They studied the link between perceived parenting style and adolescents' motivation to engage in future thinking, the cognitive representation of the future, and future-related behaviours. The domains used in their study were work and career and marriage and family. Their model included self-evaluation as a mediating factor. They found that autonomous-accepting parenting is linked to future orientation indirectly via self-evaluation, self-evaluation is linked directly only to the motivational component, and the motivational component is directly linked to the cognitive representation of the future and behavioural components. Trommsdorff (1986) report that adolescents who perceive their parents as loving and supporting had a more positive future orientation and believed more in personal control over their future. Similarly, Pulkkinen (1990) reported that positive memories of child-rearing and parents having time for children encouraged future orientation in Finnish adolescents. All these studies provide an indication of parental support being one important determinant of children's and adolescents orientation towards the future.

As pointed out by Trommsdorff (1983), future orientation contains cognitive, motivational and affectionate components and the same label seems to be used for very different aspects of this cognitive-motivational system across studies. Future orientation is used to denote structuring of future events, coherence of future orientation, anticipation of need satisfaction, the experience of the future as optimistic or pessimistic, etc. In the following, we focus on the

motivational aspects of future orientation and use the concepts of future time perspective and present orientation as described in Zimbardo and Boyd (1999). Future oriented people are concerned with future goals and rewards. Present enjoyment is contemplated in terms of future consequences. Present hedonistic people, on the other hand, are living for the moment and show little concern for future consequences. Both concepts include the trade-off between pleasure or pain now or in the future as well as preferences for planning, fun and spontaneity.

2. Parenting style

According to Baumrind (1991), the concept of parenting style captures normal variations in parents' attempts to control and socialize their children. The underlying idea is that the broad patterns of parenting are more important than specific behaviour such as, for example, teaching the children about budgeting or making them save using a bank account. In her seminal studies, Baumrind (1967; 1971), argued that the two dimensions "demandingness" and "responsiveness" are particularly important. Based on the degree of responsiveness and demandingness employed by parents, she defined three parental styles: authoritarian, authoritative and permissive. Maccoby and Martin (1983) later revised Baumrind's classification and suggested distinguishing between permissive and indulgent and permissive and neglectful. They labelled the two dimensions of parenting "parental warmth or supportiveness" (corresponds to Baumrind's responsiveness) and "parental behavioral control" (corresponds to Baumrind's demandingness). Behavioural control can be defined as parental monitoring and limit setting (Steinberg, 1990). Moreover, they advocated, in line with Baumrind, that it is the combination of these dimensions that is important, rather than each individual dimension and devised the following typology of parenting styles:

Authoritative parents are characterised by high demands for maturity and self-control from their children, while they also display high levels of sensitivity, emotional warmth, and involvement. The authoritative parenting style is associated with positive child outcomes across several domains, such as higher education, more social responsibility, increased self-regulatory ability, frequent use of adaptive strategies, fewer depressive symptoms, etc (Baumrind, 1991).

Authoritarian parents also have high demands for self-control but they are less sensitive to the child's developmental needs, providing minimal emotional support and demand high discipline. Children and adolescents from authoritarian families tend to perform moderately well in school and be uninvolved in problem behaviour, but they have poorer social skills,

lower self-esteem, and higher levels of depression. The authoritarian parenting style has been found associated with poorer child outcomes, such as lower academic grades compared to the authoritative parenting style. It increases the risk for various psychological and behavioural problems compared to the authoritative parenting style.

Indulgent/permissive parents are characterized by low expectations for self-control and discipline while they are sensitive and warm. Children raised by permissive parents are found to have higher self-confidence, but lower level of self-control than children raised by authoritative or authoritarian homes. Children and adolescents from indulgent homes are more likely to be involved in problem behaviour and perform less well in school, but they have higher self-esteem, better social skills, and lower levels of depression.

Neglectful parents show low demands for self-control and are insensitive to the child's needs. Children raised by neglectful parents are found to have a higher likelihood of depression, smoking, and poorer educational achievement. Children and adolescents whose parents are *uninvolved* perform most poorly in all domains.

According to Silk et al (2003) the dimensions "psychological control" and "autonomy granting" are particularly salient during adolescence when teens are becoming more independent from their families. Psychological control is characterised by hostility, guilt induction, shaming, and an environment in which acceptance is contingent on the adolescent's behaviour (Barber, 1996). Psychological control is related to Baumrind's "responsiveness" and may be used to distinguish between authoritarian and authoritative parents. Both types of parents place high demands on their children, but authoritarian parents usually are low in psychological control compared to the authoritative parents. Autonomy granting is manifested in parental encouragement of individual expression, decisions and independence. It is related to Baumrind's "demandingness" and may be used to distinguish between permissive neglecting and permissive indulgent parents. Autonomy granting has, according to Silk et al, been found to promote academic achievements, lower levels of substance use, self-esteem and ego development. Silk et al (2003) find that psychological control and autonomy granting are two separate constructs, rather than opposite ends of a continuum. Parents may, for example, use the guilt induction to increase the likelihood of the preferred behaviour while they simultaneously encourage independent thinking and behaviour.

Parenting style may have an impact on the development of preferences for spending and saving beyond the effects of the parents' efforts to teach their children about economic

behaviour. It may be important for the development of a general ability to delay gratification. For example, Mauro and Harris (2000), using younger children (4-year olds) found that mothers of children who fail to delay gratification typically have a permissive approach to child-rearing. Mothers who rate themselves as more restrictive and nurturant (that is displayed what Baumrind would call an “authoritative” parenting style), tend to have six- to eight-year old children who delayed gratification more than those who are restrictive but not nurturant, that is “authoritarian”. A more recent study has found the authoritarian parenting style to be associated with overweight status (Rhee, et al, 2006). Rhee et al found that children with authoritarian mothers had an increased risk of being overweight than children with authoritative mothers. Children of permissive and neglectful mothers were twice as likely to be overweight compared with children of authoritative mothers.

In this study we explore the links between parenting dimensions, parenting style, future orientation, preference for spending, and ability to control spending. We expect adolescents describing their parents as authoritative to be more future oriented and have the lowest preference for spending than the adolescents describing their parents as practicing the other parenting styles. In the following, we describe the methods used in the study in section 3, report the main findings in section 4, while section 5 concludes.

3. Methods

The data for this study were collected from students in schools in Kristiansand, Norway, a medium sized city (population of 78 thousand) and predominantly middle-class. Schools were contacted to gain access to year 9 students (aged approximately 14) and data were collected between March and June 2005. All relevant schools in the municipality were contacted, and seven of nine schools agreed to take part in the study. The principals of the remaining two schools declined participation due to an overload of other projects. Researchers were allowed access to classes of students for one period. In this session, the children were introduced to the researchers and asked to fill out a questionnaire about pocket money and money management, without mentioning the concept of saving. Parents were sent a letter in advance giving details of the study and an opportunity to prevent their child from taking part. This type of passive parental consent results in a smaller sampling bias than active consent which may result in overrepresentation of well-functioning adolescents and parents (Lamborn et al, 1991). Only three of the sampled students declined to participate due to unwillingness. A few others were

absent from school on the day of data collection due to dentist appointments, illness or other reasons not associated with the investigation.

Questionnaires

The questionnaire was divided into five sections. The first (general information) contained three straightforward demographic questions (age, gender, number of siblings) and seven questions on pocket money and earnings. The second section covered general money management and dealt with what students usually did with money they were given or earned. Their *general approach to spending* was measured by asking “what do you usually do with your pocket money/allowance/income?”, which the students answered by using a 5-point scale (save all of it, save most of it, save some and spend some, spend most if it, spend all of it). Three *social comparison* questions were included in this section. These had the form: “With regard to /the money my parents give me/the money I earn/the money we as a family have/ I think, in comparison with my best friends, I get/earn” with a 5-point response format (a lot less, a little less, about the same, a little bit more, a lot more, and I don’t get pocket money). One question asked how often the student argues about money matters with their parents, using a 5-point scale (never, rarely, sometimes, often, always).

The third section dealt with getting large sums of money (larger than the usual income per month). These fifteen questions, which asked about various strategies for obtaining large sums of money, were taken from Otto and Webley (2004) and slightly adopted. They deal with five different ways of obtaining large sums of money: saving, asking parents, working, selling things, or adjusting expenditure. The fourth section consisted of a 10-item conscientiousness scale from the IPIP (Goldberg, 1999; International Personality Item Pool, 2001), and twenty items drawn from Zimbardo’s Time perspective inventory (Zimbardo & Boyd, 1999). These cover two of the five factors identified by Zimbardo (present-hedonistic and future time perspective). Some of the questions were slightly modified to make them suitable for adolescents. For example “I meet my obligations to friends and authorities on time” was rewritten as “I do what I should for teachers on time” and “It upsets me to be late for appointments” became “I generally don’t like being late”. In addition, the fourth section consisted of ten items intended to tap into how well a respondent is able to take specific steps to control their spending (e.g. not break into large notes, not take money out of your bank account) and a 30-item adolescents’ attitude towards saving scale, as reported in Otto (2004).

Section 5 consisted of a series of questions which measure the adolescents' perception of the parenting style they are subject to. The first block of fifteen items included statements such as "My family does something fun together" and "When I get a poor grade in school, my parents (step-parents/ guardians) propose to help me". These questions, based on the Parenting Scales reported in Lamborn et al. (1991) were used to measure "responsiveness". Two questions were added to the original scale. The response format was changed as to allow for more variation, so rather than using Lamborn et al.'s response alternatives with two (usually true or usually false) or three (never, sometimes, or usually) options we rephrased the questions to fit a 5-point scale (labelled never, sometimes, usually, often, always). Some questions were asked twice, asking about mother and father respectively. In two-parent families, the average scores of these paired questions were used as measures. The next block of twelve questions, also based on Lamborn et al.'s scale, concerned how much parents try to know and really know about what the adolescent is doing outside home (where the student goes at night, uses his/her free time etc) and two 'curfew' questions. The students could answer by using the response alternatives "Don't try", "try a little", "try somewhat", "try a lot", and "try a very great amount". These questions were used to derive a measure of *behavioural control*. The third block of sixteen questions was adopted from the study by Silk et al (2003). The *psychological control* subscale describes covert, psychological methods of controlling the adolescent's activities and behaviours, like guilt induction, love withdrawal, and excessive pressure for change. Sample items from the Silk et al scale are "When I get a poor grade at school, my parents make me feel guilty" and "My mother acts cold and unfriendly if I do something she doesn't like". These were included here, though instead of mother, the referent for the second question is 'my parents'. The *autonomy granting* subscale, also adopted from Silk et al, describes the extent to which the adolescent is encouraged to think and behave independently. Sample items are "My parents emphasise that every member of the family should have some say in family decisions" and "My parents keep pushing me to think independently". The last questions in the questionnaire was about plans for further education, asking if the student planned to work, attend secondary education or attend secondary education followed by higher education.

Sample characteristics

Among the 600 students interviewed, 52 were excluded from the analyses, since their responses were considered untrustworthy based on their behaviour during the data collection

or the way they had filled in the questionnaire (made patterns rather than answering the questions). The remaining respondents had the following characteristics:

The age range was 14 – 16, and the mean age being 14.4. There were 271 boys (49.5% of the sample) and 274 girls (50% of sample), with 3 respondents not filling in gender. 515 (94%) of the sample were Norwegian, while 33 (6%) reported 1 of 29 other nationalities. 499 (91.1%) respondents reported that Norwegian was their mother tongue, while 44 (8%) reported having another language. The number of siblings ranged from 0-11, with the average number of siblings being 1.9.

4. Results²

A principal component analysis with oblimin rotation was carried out to estimate the factor score coefficients for the parenting dimensions. Missing data was handled by pairwise deletion of cases and the program was instructed to extract 4 factors. Items that did not discriminate sufficiently between the factors were removed. Factor score coefficients were estimated by the regression method. The responsiveness factor ($\alpha=.86$) was based on 11 items, the behavioural control factor ($\alpha=.88$) on 10 items, the psychological control factor ($\alpha=.76$) 7 items, and the autonomy granting factor ($\alpha=.63$) on 6 items. These factors explained 45,8% of the variation in the data. The KMO=.87 and Bartlett’s test of Sphericity was significant at the 1% level. Table 1 shows the relationship between the 4 parenting dimensions. Responsiveness is positively associated with behavioural control and autonomy granting, while it is negatively associated with psychological control. There is also a positive relationship between behavioural control and autonomy granting.

Table 1: Relationships between parenting dimensions

	Responsiveness	Behavioural control	Psychological control	Autonomy granting
Behavioural control	.33**			
Psychological control	-.24**			
Autonomy granting	.28**	.18**		

Note: Only significant correlation coefficients shown.

n = 442

**significant at the $p<.01$ level

² We are reporting preliminary analyses here. For an up-to-date version of the paper, please contact the authors.

The sample of adolescents was divided into four groups depending on how they had rated their parents on the responsiveness and behavioural control dimensions. We used an approach similar to the tertile-split procedure as described by Lamborn et al (1991) in order to ensure that the four groups were different from each other. Due to a smaller sample size, we used the a quintile-split to categorise the families, rather than tertiles. Authoritative families (n=109) are those who scored above the 3th quintile on both dimensions, while neglectful families (n=106) are those who scored below the 2nd on both. Authoritarian families (n=41) are those who scored above the 3rd quintile on behavioural control and below the 2nd quintile on responsiveness, while the indulgent families (n=38) are those who scored below the 2nd quintile on behavioural control and above the 3rd quintile on responsiveness. It is important to note that this makes the definition of the parenting styles sample specific. A family that is defined as neglectful in this sample may not be regarded so compared to a different population. Figure 1 shows the scores for the two parenting dimension from each adolescent and the combination of them. Observations between the middle lines are not included in the analyses of effects of the parental styles. There is a clear tendency to rate their parents either as both responsive and strict (authoritative) or as little responsive and permissive (neglectful), so that these groups are larger than the adolescents perceiving their parents as either authoritarian or indulgent.

Fig 1: Scatterplot for Scores on Responsiveness and Behavioural Control

The score for conscientiousness ($\alpha=.73$) was computed by calculating the mean of the scores for respondents who had answered 8 of the 10 items comprising the index (4 items reversed). The scores for future orientation ($\alpha= .68$, 12 items) and present orientation ($\alpha=.62$, 8 items) were assessed by calculating the mean of the answers from respondents with two or less missing items for each factor (2 items reversed). The score for spending preference ($\alpha= .81$, 11 items) was calculated by using the average answer the questions about what the respondent usually do with money received or earned and other questions concerning saving and spending. Means were calculated for respondents who had answered 9 or more of the 11 items. The measure of self-control ($\alpha=.84$, 10 items) were calculated by estimating the mean of the responses to 10 questions regarding strategies for preventing oneself from spending money. The score was calculated for all who had answered 8 or more of the 10 questions.

The results from the different analyses are reported below. First, we report on analyses that replicate Webley and Nyhus (2006), such as the relationships between future orientation, conscientious and saving in adolescents. Table 2 shows results which confirm that general orientations and dispositions are related to children’s approach to money: the pattern here is very clear with conscientiousness and future orientation being positively associated with a preference for saving and a ability to use strategies to control spending while hedonism (and income from pocket money) being associated with a preference for spending and less ability to use self controlling strategies.

Table 2: Correlations between the child’s dispositions, behaviour and income

	Log Income from pocket money	Log Income from earnings	Conscientiousness	Future orientation	Present hedonistic orientation	Preference for spending rather than saving ¹
Log Income from earnings	.25**					
Conscientiousness	- .06	.04				
Future orientation	-.04	.03	.61**			
Present hedonism	.12*	-.06	-.16**	-.08		
Preference for spending rather than saving ¹	.27**	.07	-.38**	-.24**	.36**	
Ability to use Self controlling strategies	-.21**	.01	.45**	.36**	-.21**	-.60**

Notes: Ns are lowest for the Log earnings correlations (between 301 and 484), for the other cells they vary between 539 and 547.

Income here is adolescent reported pocket money and earned money and does not include money given irregularly by adults

* significant at the $p<.05$ level **significant at the $p<.01$ level

Variation and differences in outcome variables across parenting styles were first studied for each of the four parenting dimensions. Table 3 shows that each of the dimensions of parenting behaviour is associated with conscientiousness and future orientation. As expected, parental involvement (warmth), behavioural control, and autonomy granting are positively associated with future orientation and conscientiousness, whilst psychological control are negatively associated with both. Psychological control is related to present orientation, a preference for spending rather than saving and reported difficulty with controlling expenditure.

Table 3: Relationships between parenting dimensions, dispositions and behaviour

	Conscientiousness	Present orientation	Future orientation	Preference for spending	How easy to control expenditure
Responsiveness	.29**		.22**		.11*
Behavioural control	.17**		.28**		.11*
Psychological control	-.16**	.21**	-.16**	.215**	-.17**
Autonomy granting	.13**		.12*		

Notes: Only significant correlations shown.

Ns vary between 435 and 442

* significant at the $p < .05$ level **significant at the $p < .01$ level

Following the method of Lamborn et al (1991), variation in the outcome variables were also studied for the authoritative, authoritarian, neglectful and permissive parenting styles respectively. These preliminary analyses reported in Table 4 show direct effects of parenting styles on spending preferences, ability to control spending and plans for education as well as indirect effects of parenting styles on economic behaviour through impact on general dispositions such as future orientation and conscientiousness. The results are in line with other research that shows that an authoritative parenting style is one of the most consistent family predictors of competence from early childhood through adolescence and can also be used to explain differences in adolescences' approach to economic life. In our sample, we find that adolescents describing their parents as authoritative has the highest mean for future orientation and ability to control spending. More adolescents in this group have a plan for further education, and the high number of respondents in this group having plans for university education is noticeable. Adolescents with neglectful parents had the lowest average scores for conscientiousness, future orientation and ability to control spending, while they had

the highest average score for preference for spending. Only 36,8% of the respondents in this group had plans for a university education, compared to 69,7% in the authoritarian group. There is a gender effect in the sample that should be investigated further in future research. Girls, more than boys, tend to describe their parents as authoritative, while more boys than girls tend to describe their parents as neglectful.

Table 4: Relationships between parenting typologies, dispositions and behaviour

	<u>Authoritative</u>	<u>Authoritarian</u>	<u>Neglectful</u>	<u>Indulgent</u>
Responsiveness	High	Low	Low	High
Behavioural control	High	High	Low	Low
N	109	41	106	38
Sex Boys/Girls (%)	34 / 74 (31,5/68,5)	22 / 29 (53,7/46,3)	66 / 40 (62,3/37,7)	51 / 49 (51,4/48,6)
Number of siblings	1,8	2,0	1,9	1,8
Nationality (% Norwegians)	96.3 %	92.7%	93.4%	100%
Gets pocket money? (% yes)	92.4%	89.2%	85.3%	91.7
General Dispositions:				
Conscientious (mean)	3,3	3,2	3,0	3,4
Future orientation (mean)	3,2	3,0	2,8	3,1
Present orien. (mean)	3,4	3,3	3,4	3,3
Economic preferences/behaviour				
Preference for Spending	3,0	3,0	3,1	2,8
Easy to control spend.	3,8	3,7	3,4	3,7
Plans to continue study?				
No (%)	1%	7,5%	2,8%	5,3%
Yes – (%)	27.5%	36.6%	60.4%	44.7%
Yes – university (%)	69.7%	56.1%	36.8%	47.4%

5. Discussion

Though the analyses reported in this paper are very much exploratory ones, it is clear that these results do provide evidence of a link between parental approaches to economic matters and that of their children. It is tempting to interpret these results as demonstrating a causal link from parental behaviour to child behaviour but of course the results are correlational, and the direction of causality may be the other way around. Nevertheless, the consistent findings with other longitudinal studies give some strength to a causal interpretation.

Results of the preliminary analyses show that both parental responsiveness and parental behavioural are associated with higher scores for conscientiousness, future orientation and ability to control spending. Psychological control, on the other hand, is associated with present orientation, preferences for spending and difficulties with controlling expenditures. We observe strong relationships between future orientation and conscientiousness and preferences for spending and problems with controlling expenditures, which suggests that any effects of parenting are likely to be both direct and indirect. In line with previous research, we find that adolescents with authoritative parents have higher scores for conscientiousness and future orientation, while children of neglectful parents have the lowest scores for these variables. Finally, we find a strong relationship between parenting style and plans to continue studying and enrol in higher education. The results suggest that economic training and fostering of future orientation in primary schools may be important in order to decrease intergenerational transfers of economic inequality.

Abstract

In this paper we examine the demand for insurance connected to typical social service activity. How do people in a typical social-democratic welfare state system behave according to private social security insurance? The analysis focus on four different types of insurance: health insurance, pension insurance, life insurance and child insurance. There is of course an ideological aspect tied to this debate. Use of private insurance is one central aspect of the liberalisation of the economy. This ideological dimension applies not only to ideological differences between regimes but also to different ideological views at the individual level. Our analysis reveals that the more positive people are towards holding private insurance as an alternative to the welfare state the more likely they are to hold kinds of private insurance that compete with or supplement public social security.

1. Introduction

The modern welfare state can be regarded as an insurance institution aimed at protection of the citizens against risks related to disease, disability, unemployment, old age etc (Svallfors 1996). The last twenty years there has been an ongoing debate whether private insurance can supplement or even substitute public social security. It has been suggested that private insurance in many respects may be better suited to insure people against risks (Norges forsikringsforbund 1996).

In this paper we examine the demand for forms of insurance that compete with or supplement public social security. How do different social groups in a typical social-democratic welfare state system adapt in the market of private social security insurance? The analysis focus on four different types of insurance: health insurance, pension insurance, life insurance and child insurance.

2. The Norwegian welfare state system

Norway has a comprehensive welfare state system. This means that the public sector is large with universal welfare service financed by taxes and that income inequalities are low. The universalism in the Norwegian welfare state has distinguished it from that of most countries. The Norwegian welfare state is further distinguished by a high labour force participation for women and an institutionalized commitment to full employment through active labour market measures. Central trade unions have contributed to equality in wages and the base level of income is relatively high and unemployment relatively low. Norway is then regarded as a prototype of the social-democratic welfare regime (Esping-Andersen 1990:73-76).

Major public social service policy programs, such as sickness benefits, national medical insurance covering the entire population, day care and family allowances lag behind that of many nations. State institutions have a major responsibility for the administration and delivery of service. Public social expenditures are then higher than most nations. In 2003 total public social expenditures were 25,1 % of GDP in Norway and the average for EU was 20,7 %, public expenditures on health were 6,5 % and the average for EU was 5,9 % and public expenditures on pensions were 7,0 % and the average for EU was 6,9.

In social provision the market then has a weaker role than in most other countries which means that provision through private insurance and employer sponsored schemes are less widespread.

High level of public social expenditures also means that the need for private insurance to secure social security would be less than in a typical liberal welfare state system like the US. However, no welfare state system can secure all kind of social service demanded. Public social expenditures have increased in Norway later years. At the same time private insurance to secure welfare service have also increased in Norway.

3. Market based versus public insurance

For the individual the main purpose of insurance is to secure oneself against financial losses caused by unforeseen and unwanted events. Insurance is characterised by four features (Socialförsäkringsutredningen 2005). Firstly, insurance handles risk by taking over each individual's risk and compensating for financial losses caused by particular events. Secondly, insurance spreads the risk of damages on all insurance-holders. In the longer term total premiums must cover the compensation costs. Thirdly, the benefit of insurance is not primarily the compensation of losses but rather the security by being insured. Fourthly, the insurance must be clearly defined and stable regarding what events it covers and the conditions for compensations.

Usually, one thinks of market based forms of insurance in relation to the concept of insurance. One can distinguish between on the one hand *personal insurance* like life insurance, accident insurance, health insurance and pension insurance that covers financial losses related to illness, disability, old age and death and on the other hand *general insurance* or non-life insurance that covers damages on property due to fire, housebreaking, car accidents etc. But it is also makes sense to regard public social security and social assistance as insurance because these welfare arrangements share with market based insurance the four characteristics mentioned above.

There are, however, several characteristics that distinguish market based insurance from insurance offered by the welfare state (Norges forsikringsforbund 1996). Public insurance is offered by one large supplier while market based insurance is offered by several competing suppliers. The pricing of market based insurance is based on actuarial principles in which there is a correspondence between premiums and the payments that can be expected (so-called 'fair pricing' or 'actuarial justice'). As a contrast public insurance is financed through taxes with a more loose relation between contributions and expected benefits. In other words, while market insurance-holders can expect higher compensations the higher premiums they pay, citizens can to a larger extent expect to be benefited regardless of how much taxes they pay.¹

Another difference between market based and public insurance is that insurance companies must be profitable while the welfare state merely must see to that expenses do not exceed income (taxes) in the long run. While there is a market risk connected to private insurance public insurance is vulnerable to political risks, i.e. that changing political regimes may substantially alter the terms offered by welfare arrangements.

4. Two perspectives: embracing risk and the precautionary principle

Ewald (in Baker and Simon 2002) claims that there has been two paradigm shifts within insurance since the 19th century. The prevailing paradigm in the 19th century was the paradigm of *responsibility* implying that every person must bear the consequences of the events that one is exposed to, except that one is entitled to compensation from other persons that have caused losses. Foresight, prudence and charity for others are the main virtues within this paradigm.

The second paradigm is the paradigm of *solidarity* that replaced the paradigm of responsibility during the 20th century. The point of departure for this paradigm is not guild and responsibility but risk. The main question is not who is responsible for the events but instead how to distribute the financial losses related to unforeseen events. Individual financial losses is covered partly or wholly from a common pot financed either via taxes or insurance premiums.

According to Ewald the paradigm of *precaution* is presently replacing the paradigm of solidarity. The fundamental idea of this paradigm is that there are limits towards what risks that can be insured, both because too much insurance is not social efficient and because the modern risk society implies new risks (like environmental disasters) that cannot be calculated. These facts threaten the fundamental idea of insurance as fixed premiums in advance that guarantee certain compensations afterwards. Instead of relying on insurance individuals must to a larger extent be cautious and avoid risks.

Baker (in Baker and Simon 2002) suggest another development than the one indicated by the precaution paradigm which he names 'embracement of risk'. The core idea is that too much protection and insurance paradoxically can lead to more losses. Thus it is in the interest of both individuals and society as a whole that each individual bears more risk. One main argument bears on the concept of 'moral hazard', i.e. the phenomenon that individuals adapt their behaviour (act less prudent) because they are insured.

¹ There are, however forms of public insurance, like public pension insurance, in which payments are related to contributions.

The precaution principle and the embracing of risk are apparently two contradictory perspectives in that the former emphasises prevention of risks while the latter emphasises taking and individualizing risks. According to Baker they still have in common that they both question the basic tenets of the solidarity paradigm, namely that it is possible or even desirable to redistribute risks.

In our context these principles actualise the questions of how private insurance and increased individualisation of risks function compared to public welfare arrangements, especially what distributional consequences such a transition will have. There is of course an ideological aspect tied to this debate. The last 20-25 years a neo-liberalistic approach has gained ground. Public arrangements and regulations have to a certain extent been replaced or supplemented by market based solutions (Stamsø 2005). Use of private insurance is one central aspect of the liberalisation of the economy. This ideological dimension applies not only to ideological differences between regimes but also to different ideological views at the individual level.

5. Hypotheses

In accordance with the discussion above we want to test out whether the demand for private insurance is influenced by ideological views. The main research hypotheses behind this study are:

- H1: Insurance forms that directly compete with public social security will be influenced by attitudes towards private insurance versus public insurance while other forms of insurance will not be influenced by such attitudes.
- H2: The more positive people are towards private insurance the more likely they are to have types of private insurance that compete or supplement public social security.

In addition the demand for private insurance may be influenced by the family situation (single versus couples and parents versus non-parents), the educational level, the financial situation (household income and savings) and life stage or generation (old versus young people). We are in particular interested in whether the demand for private insurance increases with financial resources or not.

6. Methods

The analyses in this paper are based on data from the yearly SIFO survey. 1000 respondents between the age of 18 and 80 have been asked questions concerning different aspects of consumption, among them insurance. The data were collected through computer assisted telephone interviewing (CATI).

The questions concerning insurance are related to the household as a whole. Accordingly, we only want respondents that are capable to answer on behalf of the household. Thus, respondents that are not one of the main persons in the household are excluded. Then it remains 930 observations.

In order to be representative for the Norwegian population the data material is post-stratified (weighted) by using information on sex, age and geography. Still, there remains an overweight of high-income households in our data material compared to national statistics. This bias is handled by controlling for income in the multivariate analyses.

The multivariate analyses are carried out by using binominal logistic regression analysis (Agresti 1990; Long 1997). Odds ratios are reported instead of logits. An odds ratio less than 1 means that the relationship between the independent and the dependent variable is negative, while an odds ratio above 1 means that the relationship is positive. An odds ratio similar to 1 indicates that there is no relationship between the variables in the data material.

7. Dependent variables

Insurance companies offer a great diversity of insurance products. In this study we focus on four insurance products that are relatively well known and that in some ways represent a parallel to traditional social security arrangements within the Norwegian welfare state. These are health insurance, life insurance, pension insurance and child insurance.

Health insurance

Health insurance covers for care and expenditures that are not included in the public health care system. In Norway the insurance companies offers four different health insurances: "Top-up insurance" covers for a fixed share of expenditures within a certain level (relatively low), for treatment domestically not offered by the public health care system. The insurance is affordable for all and widespread in countries with comprehensive public health care and social security system. "Principal health insurance" is more comprehensive than Top-up insurance in all respects, among others in the insurance sum, the treatments offered and that it covers treatment wide world. This insurance is most widespread in countries with a poor public health care system. "Principal hospital insurance" is world widespread and covers mostly hospital treatment. "Critical disease" insurance offers payment that is not connected to treatment after diagnosed critical disease.

In these analyses we do not separate between different kinds of health insurance.

Life insurance

Life insurance compensates for economic loss resulted from death, disability or old age. Life insurance then operates as both a saving agreement and as an insurance against risk. The security of risk against income loss resulted from disability means that it is also a kind of health insurance. Three main categories exist: life insurance with death risk, life insurance with disability risk and life insurance with life risk. Different kind of life insurance covers for either one or more of these elements and some are combined with saving elements for the insured.

In these analyses we do not separate between different kinds of life insurance.

Pension insurance

Pension insurance is a savings agreement that secure payments during old age. In Norway both individual and occupational pension insurance exists as a supplement to the public retirement pension. Individual pension insurance also works as a supplement to collective pension insurance. The insurance can incorporate marriage partner/cohabitants and children

and also cover for disability. Individual pension insurance give the insured right to tax allowance.

Our analysis only include individual pension.

Child insurance

Child insurance is a pay out resulted from death and for economic loss resulted from disability or loss of provider. Different types of child insurance covers for different kinds of losses.

This analysis includes all kind of child insurance.

The four mentioned forms of insurance will be contrasted with more traditional forms of insurance, namely house contents insurance and travel insurance.

8. Measuring attitudes towards private insurance

The main independent variable is the attitude towards private insurance as an alternative to public social security. In our survey we ask three questions about people's attitudes towards private insurance. The questions are formulated as follows:

“Are you positive or negative towards that it is more common to take out private insurance related to...

- the treatment of illnesses?
- old-age pension?
- disability due to accidents?”

The question is slightly unbalanced and will probably tend to over-report the number that is positive towards private insurance.

The questions are meant to measure people's attitudes towards the use of private insurance instead of public welfare arrangements. However, the questions may also measure people's attitudes towards precaution in general. Thus, a positive answer can mean at least two things: firstly, that one means that private insurance is a good alternative to public welfare arrangements and (the private-public dimension), secondly, that one is positive towards the fact that people are aware of and insure themselves against different forms of risks (the precautionary dimension).

This second component will probably vary a great deal for each of the indicators. One way to reveal whether there is a common component in these three indicators or not is to conduct factor analysis. The factor analysis reveals that there is one common component that has an eigenvalue above 1. This common component “explains” 66 per cent of the total variance. All three variables have factor scores (that indicate the correlation between the common component and each of the indicators) above 0.55. Cronbachs alpha, that measure the consistency of an index containing these three indicators, is 0.74. This is above the recommended threshold of 0.7 (Tabachnick and Fidell 2001), indicating that the reliability of the index is satisfying.

There remains however still the question of what component that has been retained through the index construction. Is the private-public dimension or the precautionary dimension? One

way of controlling the construct validity of the index is to check out the *nomological validity* of the concept, i.e. whether the index behaves in an expected manner or not (Cronbach and Meehl 1955). It is reasonable to believe that the precautionary dimension will be relatively little related to political attitudes while the private-public dimension, since it is related to liberalisation that is attributed to conservative and neo-liberal parties.

Table 1: Attitudes towards increasing use of private insurance (index) dependent on political attitude. 2007. Norway.

	Left	Centre	Right	Total
0	35	28	16	26
1	24	17	16	19
2	26	28	22	25
3	16	27	46	30
Total	100 (N=261)	100 (N=124)	100 (N=262)	100 (N=647)

$p < 0.001$ (chi-square test)

The relation between attitudes towards use of private insurance and political attitude is shown in table 1. The table reveals a monotonous relationship between the variables with a Gamma of 0.35. The mode shifts from 0 (negative) to 3 (positive) when moving from adherents of left wing parties to adherents of right wing parties. The relationship is statistically and the cross-tabulation supports the hypothesis that our index is related to the political dimension and thus measures the private-public dimension and not the precautionary dimension.²

9. Analysis

We have chosen four different types of insurances, namely health insurance, pension insurance, life insurance and child insurance. All these insurances represent supplements to traditional public welfares arrangements in Norway. Life insurance is of course an old insurance form. Private pension insurance has also existed for a relatively long time. Its popularity rose particularly in the 1980's. Health insurance and child insurance represent relatively new insurance products on the Norwegian insurance market.

We want to see whether there is an ideological component behind the purchase of such insurance products or not. The ideological component is measured by two indicators, the private-public index discussed above and political sympathies.

In addition purchase of insurance can be related to, firstly, age and civil status that are indicators of life stage and generation differences. Secondly, we include different indicators of capital, namely educational level, household income and whether the household has been able to save money or not the last year. A third set of control variables was also tried out, namely whether one has been exposed to different dramatic life events such as long-lasting illness or disability and unemployment. None of these indicators were statistically significant, so they were dropped in the final analysis.

² This relationship holds even when we control for civil status, education and household income.

Table 2: Logistic regressions on health, pension, life and child insurance. Odds ratios. 2007. Norway.

	Health	Pension	Life	Child
Age	0.953***	1.192***	0.984*	0.971°
Age squared		0.999**		
Single	1.071	0.641	0.690	
Single parent	1.757	0.696	1.190	0.944
Couple parents	1.530*	1.090	2.094***	
University education	0.626**	1.220	1.006	0.626
Household income	1.001*	1.000	1.001**	1.000
Household income squared	0.999*		0.999**	1.000°
Political centre	1.238	0.986	0.697	0.799
Political right	1.396	1.237	0.808	1.014
Political none	1.167	1.080	1.158	1.551
Saved money last year	1.123	2.005***	1.122	0.956
Private-public index	1.242**	1.450***	1.261**	1.457**
N	805	826	829	355
Pseudo-R ²	0.12	0.08	0.10	0.07

°: $p < 0.10$ *: $p < 0.05$ **: $p < 0.01$ *** $p < 0.001$

Table 2 shows the results from logistic regression analyses. All analyses indicate that the propensity to have health, pension, life or child insurance respectively is higher the more positive attitudes towards private insurance contra public welfare arrangements. We will shortly sum the other results.

The likelihood of having private *health* insurance is lower the older people are. There can be several reasons for this. Young people may be more eager and dependent on avoiding the Health Service queue. It may also be more expensive and more difficult for older people to get private health insurance. In addition health insurance is a relatively new product in Norway that may not be well known among old people.

Secondly, parents with children are more likely to have health insurance than couples without children. Again, this may be due to a wish or need to avoid the Health Service queue. These families rely on income from the main supporter(s) and cannot afford a long-lasting period of reduced income because of disability. In addition, we see that household income increases the likelihood of having health insurance while education reduces this likelihood.

Concerning private *pension* insurance, the likelihood increases with increasing age until the age of 63, then it start to drop. This pattern may on the one hand be the result of a life stage effect that make people more eager to insure their old age when they get older and on the other hand a generation effect in which older people have more trust in the provisions of the welfare state while younger people. In addition people who have saved money the last year are more likely to also have invested in pension insurance.

The Norwegian social security system is universal and based on principles of both high base level and on a certain connection to income (Øverby in Stamsø 2005). These principles could give important contributions to explain the need and demand for such insurances. As seen from the analysis the demand increases with income. This is an expression of affordability to

buy insurance. However on pension it is also connected to the principle of equalisation in the Norwegian public pension system. Only income up to a certain level gives pay up in the public pension system. This level is equal with middle income, which means that income above this level give no pay up. For people with income above middle level it would then be favourable to buy private pension insurance.

The probability of having *life* insurance is lower the older people are. This indicates that younger people are more inclined to use this sort of insurance and investment than older people. Life insurance is also very expensive and less accessible to older people. Like health insurance life insurance is more common among couples with children than couples without children. Since death or disability of (one of) the main provider(s), may have serious impact on the financial situation, couples with children may have felt to need to insure risks more heavily than couples that do not have the responsibility of raising children.

Finally, when it comes to *child* insurance there are none of the control variables that are statistically significant on the 5 per cent level. If we relax the significance level, two variables may have some impact, namely age and income. Older parents seem to be somewhat less likely to have child insurance. Older parents are more likely to have older children, thus taking child insurance may be somewhat less relevant. Further, household with high incomes seem to be less likely to have this kind of insurance. This may indicate that high income parents can afford and are more willing to take the risk instead of insurance but we must be careful when interpreting these results.

It is interesting to compare the analyses above to similar analyses conducted for two other kinds of insurance, namely house contents insurance and travel insurance. These results are shown in table 3.

Table 3: Logistic regressions on house contents and travel insurance. Odds ratios. 2007. Norway.

	House content	Travel
Age	1.097***	1.157**
Age squared		0.999**
Single		1.161
Single parent	0.116**	0.853
Couple parents		0.845
University education	0.881	0.994
Household income	1.008*	1.003***
Household income squared	0.999*	0.999***
Political centre	0.857	1.651
Political right	2.725	1.507
Political none	1.593	1.806*
Saved money last year	8.283***	1.934**
Private-public index	1.231	0.983
N	840	828
Pseudo-R ²	0.48	0.15

°: p < 0.10 *: p < 0.05 **: p < 0.01 *** p < 0.001

The main difference between the latter analyses (table 3) and the former analyses (table 2) is that the private-public index is not statistically significant and that economic capital (income and saving behaviour) is positively related to the likelihood of having insurance that does not represent alternative to social security.

10. Conclusions

Our main hypotheses were that the demand for forms of private insurance that directly compete with public social assistance are related to ideological views in such a way that the more positive people are towards private insurance as an alternative to the welfare state the more likely they are to hold these kinds of private insurance. Our analyses support these hypotheses. In particular the analyses show that only insurance forms that compete with public social security are related to ideological views while other forms of insurance (in this case house contents insurance and travel insurance) are not.

Since the data are based on a correlational research design we cannot in principle conclude on the causal direction of the relationship between the variables (Shadish, Cook, and Campbell 2002). It seems, however, more reasonable to conclude that ideological views in general influence demand for insurance than the opposite.

The analyses also reveal that financial resources influence the demand for insurance. The likelihood of holding life insurance and health insurance increases with household income while people that have saved money last year are more likely to hold private pension insurance. Child insurance is, however, an interesting exception with the slight tendency that people are less likely to hold such insurance when household income increases. Our analyses of insurance that do not compete with public social security reveals that holding these insurances is positively related to income but not to ideological view.

Introduction

Within the fashion system there are many different agents (like designers, manufacturers, buyers, editors, models and photographers). Though the interest for fashion seems insatiable, many parts of the system are yet virtually unknown or poorly understood. Practical realities of the fashion business seem to be little known to very few other than those who work within it. A small group of agents is specialized in what is called *fashion forecasting*: they produce and sell information on what is believed to become the *must haves* of next season. They claim to reveal the future of fashion.

Having been active within the fashion forecasting business myself (directing for many years the Swedish Fashion Council) I have seen this phenomenon from within. In this paper I will discuss the following questions: what is fashion forecasting, who are the actors, how do they produce their information, and who is using it? What relationships do they have to one another and how is status and recognition created in the continuous struggle between the actors? And how is the ordinary consumer influenced by these trend predictions – or are they? Is forecasting actually helping the consumer to make better choices or does it manipulate us into consuming goods that we actually did not know existed and even less wanted? The paper is based on a study of some sixty trend books with predictions for 2005 – 2008 from major international trend agencies active on the Scandinavian market as well as on interviews with key people producing and buying this type of information. The study is to a large extent built on ethnographical material as I also used participant observation of trend seminars, trade fairs and exhibitions.

Using the theoretical framework of Pierre Bourdieu, I see fashion forecasting as an autonomous field of cultural production where symbolic capital is used and produced to obtain and maintain positions and prestige, and various social practices exist to create trustworthiness and status.

Why listen to Forecasters?

Historically the most important forecasting agencies are based in Paris. Here a few women founded the first businesses some forty years ago in order to meet the emerging needs of guidance in a society where, up till then, the seasonal French Couture showings had been the credo for the fashion world. To promote their predictions, traditional trend agencies today produce documents (“trend books”) regarding style, fabrics and colour cards and arrange seminars and exhibitions. A typical trend book can be anything from a 100-page document with photos, sketches, fabric swatches, colour cards and small gadgets for inspiration, to plain

”magazines” with nothing but hundreds of pages with photos from the international runway. Other documents communicate a more conceptual information with associative texts and images for an individual interpretation. Among the users of this kind of information you find companies from a variety of categories: luxury brands down to low-end manufacturers and from fashion as well as life-style related areas: cars, mobile phones, sports, media, food, cosmetics and entertainment.

The price level for forecasting information is very high and there is a lot of secrecy around this phenomenon within the fashion world. The predictions are made one to two years in advance, following market needs of production and consumption. Today however, the market moves much faster: a new style or trend can be developed and produced in a couple of weeks – the market is invaded by what is called *fast fashion*. This creates a problem for the traditional and “orthodox” forecasting agencies: several on-line actors as well as various media today challenge them. Information from the runway, trade fairs and market trends bubbling up from “street fashion” is communicated daily to professionals as well as consumers. Thus, predicting reliable truths regarding a phenomenon as fickle as fashion and the development of market and consumer trends more than a year in advance is losing ground: it is the Achilles heel of the field.

Old and New Strategies

Why are so many companies prepared to pay so much for predictions that rarely prove to be true? What creates trustworthiness within this autonomous field – the producer of an inspiring creative message or the one who comes up with truly commercial predictions? Is it at all possible to combine the two? And do the forecasters try to manipulate the consumer with fantasy trends or are they actually interpreting contemporary movements in society into concepts that later will become “fashion”?

The paper discusses if and how it is possible to predict trends. What tools does a forecaster use to “look into the future”? The study argues that there is something called *trend pitch* found in some forecasters, a gift to spot trends and new “winds” in society and the ability to interpret them. This means an important symbolic capital for the forecaster – some have it and others do not. It is a vital ability in order to gain recognition and prestige in the field. Others seem to justify their predictions through *trend spotting*, just screening the market for the latest news. But the interviews show that there is little reason to believe that fashion forecasting actually *creates* fashion: forecasting helps push certain trends, and those actors who are seen as successful make their predictions in a creative way, often presented through associative and abstract images. While many independent designers want to draw on their own creativity and not be influenced by others (“forecasting is useless – old fashioned and too late anyway”), other users have a different opinion: the information is seen as an affirmation and assurance, a kind of “safety-net” and guarantee that one is “on the right track”. To be “with it”, and to know what everyone else looks at is also an important motivation. The constant commercial pressure and the demand for continual economic growth and improving financial results haunt everyone. This means that looking at trends from someone who has a good track record of credibility might be helpful and worth paying for.

The Creative Consumer

Today the main challenge to traditional trend forecasters is the ubiquity of information about fashion and the sheer amount and variety that now exists, all instantly accessible. If you are a fashion-interested designer or consumer, the Internet offers the opportunity to seek out any type of information that you want – be it photos from last night's show at a New York night club, showing what the seventeen year old hipsters are wearing right now, to Japanese online fashion magazines, to fashion communities in Germany, to Scandinavian fashion bloggers. It helps that much of this takes place in English. On sites like Myspace you can make 'friends' with other people with the same interests and trade ideas across continents. The *creative consumer* will be more and more active in the future and create their own fashion forecasts through blogs and on-line videos.

Conclusion

Fashion forecasting can be seen as a representative of modernity with its demands for individuality, diversification and growing consumption: The different strategies of today's actors indicate a change and an adaptation to new ways of marketing and communication: while traditional forecasters still base their information on documents, with predictions for what is going to happen at least a year ahead, newcomers have chosen to go on-line in order to deliver constantly updated and *à la minute* information. Timesaving tools and fast information means prestige in a business that constantly is looking for new and fresh ideas.

The study shows that forecasters do not create new fashion trends but can help push ideas that already exist on the runway, on celebrities, in the street and in society. Creative and visual information gets higher recognition than verbal texts that are often disregarded and not read at all. Information is seen as a guarantee and help to find the right balance between novelty and continuity, reducing the uncertainty that is constantly found in the challenge of commercial pressure.

However, traditional forecasting is losing ground. A young generation of designers and consumers find their inspiration in a more and more globalized world, where the explosive development of "trend spotting" on the web, in fashion blogs and social networks lead the way to a more individualized fashion. The huge amount of free information on the web will – at least to a degree – erode the importance of the traditional forecasters. This is an arena where the creative consumer can create his or her personal fashion trends and communicate them to millions of friends and experts all over the globe. But the professional forecasters could still offer some value in organising all existing information into easily understandable categories. They effectively 'curate' the information into messages that help save time and position what is happening into real, understandable movements for those who are willing to pay for it.

Universal Design to Make a Difference

Lena Hansson

lena.hansson@cfk.gu.se

Abstract

This paper aims to describe Universal design from a Swedish design perspective. Universal design includes an ambition to create a more 'inclusive' society by working against design exclusion. It opens up for a more extended view of consumers as it implies that all designed products, services, environments etc. should be usable and accessible for as many people as possible. In Sweden, the interest of Universal design, also commonly known as Design for All, can be derived from design traditions in the field of 'social responsible design', ethical statements reflected in governmental policies, and the potential market of elderly (considering the aging populations of Europe and Sweden). Still, Universal design is easier to elaborate as a "way of thinking" rather than visualise in the design practice. Nevertheless, it implies what can be achieved by design.

Universal design in a Swedish context

Design constitutes a significant dimension in contemporary Western consumption societies and the design practice implicitly determines consumers' ability to create a meaningful life. Depending on for whom the designed objects are made, some consumers are included and others are excluded from consumption. If design as an important aspect in consumers' everyday life is discriminatory it becomes a social and cultural issue. Universal design is a design concept that has the ambition to create a more 'inclusive' society. In theory it is defined as "an approach to design that incorporates products as well as building features which, to the greatest extent possible, can be used by everyone" (Ostroff, 2001).

The purpose with this paper is to describe Universal design from a Swedish design perspective. The paper is based on material collected for the author's thesis about Universal design from a consumer research perspective (Hansson, 2006). The material in this paper includes twelve qualitative interviews lasting 1,5 hours in average with designers and other design experts within different design fields and consist of rich accounts of their experience and their practice of Universal Design. The informants will

be presented as design experts in the paper, and their expertise in Universal design should be implied.

Three aspects illustrating the interest of Universal design, also commonly known as Design for All¹, will be discussed in the paper as a result of the study made among Swedish design experts promoting the concept. In Sweden, the interest of Universal design can be derived from design traditions in the field of ‘social responsible design’, ethical statements reflected in governmental policies and similar, and the potential market of elderly (considering the aging populations of Sweden as well as Europe). The interviewed design experts use both ethical and market arguments to justify the necessity of Universal design. However, their interest is also influenced by design traditions that are related to specific design fields. What is needed to make Universal design a successful practice will be discussed as well and the paper is ended with a discussion of the implications of Universal design for consumers.

The emergence of Universal design and influential design traditions

Universal design emerged during the 1980’s and through the work of advocates such as designers and producers, as well as among representatives from disability rights organizations and politicians, the concept is nowadays globally recognized (Ostroff, 2001). With an ambition to embrace everyone, the concept includes an ideological view of design and an urge to serve humans and society as a whole. This is far from a new thought in the design world since design is assumed to both reflect and influence societal and cultural values as well as commercial and political interests of its time (Sparke, 1987; Thackara, 1988; Woodham, 1997).

Universal design can be compared to other known design movements with the pursuit of making changes in society with the help of design. The modernists in the latter 19th century believed in creating a democratic ideal society “whereby the majority would be able to enjoy an improved quality of life in a hygienic, healthy, and modern environment” (Woodham, 1997: p34). The famous German design school Bauhaus stands as a role model for the modern style and still has an impact on designers in these days even if it is challenged by many other views of design. Although it can be argued whether this design movement always works in favor of the people or nourish an elitist view of design. A democratic idealism has been a basic premise of Scandinavian design since the beginning of the last century (Sparke, 1987).

Furthermore, the Universal design ‘movement’ partly resembles the ‘social responsible design’ movement which started out in the 1960’s when the purpose of design as a differentiator or market-led design (e.g., Whiteley, 1993) was criticized. It was during this time the views of designers like Papanek (1984) became very influential, emphasizing a true user focus and the need to consider minorities including people with

¹ There are a number of names given design approaches like Universal design. Universal design is originally an American term, also popular in Japan. In Europe Design for All is commonly used, with a Swedish correspondent. In United Kingdom the preferred term is Inclusive design.

disabilities. He also demanded high social and moral responsibility from the designer. In Sweden, Papanek's work inspired design students at Konstfack in Stockholm during the end of 1960th and 1970th (Svengren, 1995). Sweden has further a 50-year history of design for accessibility in the built environment and in ergonomics approaching disabled users (Paulsson, 2002) as the design fields of assistive aid emerged in close connection to the field of ergonomics during the late 1960's (Rosell, 1994). These design fields have been influential in the Swedish design community ever since and as they are closely related to the ideology of Universal design, with its background in barrier-free design² and accessible design, it is not surprising to find that several of the interviewed design experts have their professional background within these design fields or sympathize with these views of design.

The field of 'social responsible design' includes ethical and green design as well and is known for its tradition of design criticism. The core of the critical tradition implies that there is a direct and inevitable link between a society's design and its social health: design is a manifestation of the social, political and economic situation (Whiteley, 1993). Thoughts close to Universal design has thus been around for some time and Sweden is no exception. The design concept embraces consumers that are commonly neglected in the design process, for instance elderly, children, disabled, consumers that are deviating from the norm. But it is not design for specific consumer groups, i.e. design for disabled and elderly (e.g., Welsh, 1995; Leibrock & Terry, 1999). What characterizes Universal design is the awareness of design exclusion.

Countering design exclusion means to be aware of who are excluded, why they are excluded along with how they are excluded in order to create more inclusive or 'universal' solutions. And by identifying why and how end-users cannot access or readily use a product or service, it allows for the possibility to counter such exclusion (Clarkson, Coleman, Keates, & Lebbon, 2003). One way of doing this as Clarkson et al. (2003) explains is to identify the capability demands that are placed upon the user, any user, by the features of the designed object. Prescriptions, i.e. what an object allows or forbids the user to do are materialized inscriptions made by designers when they decide how an object should work and look like (Akrich, 1992; Latour, 1992). These prescriptions can also make it harder for consumers to use them if it requires certain capabilities, certain strength in the fingers, arms, legs, or ability to move or read. It is in this way that design empowers people or makes them disempowered.

An ethical perspective reflected in governmental policies

The design experts depict Universal design as a means to create opportunities for more people to take part in everyday life and participate in society on equal terms. Designers in favour of this thinking object to the traditional segregation and stereotyping of people who do not fit 'the norm', such as children, elderly, and disabled. But the ethical perspective is ultimately about human rights and the view of people. The design experts

² Barrier-free design and Accessible design are concepts closely linked to legislation requirements for built environments and emphasize accessibility for disabled people specifically.

think that design should support people's possibilities to live a normal and independent life despite of age, ability etc. and believe it is possible to make a difference with the help of design. They are convinced that Universal design is a way to create a more inclusive society.

The view of disabled people changes over time and the importance of social and cultural aspects have come to be realized as important to consider along with the environment (Ridell & Watson, 2003; Minkler & Fadem, 2002). How the environment is designed has implications for those using it and can facilitate or set up barriers, making people feel handicapped.

"The environment puts certain demands on you and if you can't control all of them, you become handicapped." (Karin)

An important notion reflected in the study is that even if you do not have a disability, to become or feel handicapped is something most of us experience at times for different reasons. For example, if the lighting is bad it makes you see worse, if your arms and hands are occupied with something it hinders your flexibility, if you break a leg and use crutches accessibility becomes more important, and using a complex device or a badly designed device makes it harder to work with if it is possible at all. This is very interesting and highlights the consequences of the shortcomings in design, something that people commonly blame themselves for (e.g., Norman, 1998). This means we can all be handicapped at times and in certain situations.

"We are individuals, we are of different lengths, we have different abilities to hear well, and we also hear in various ways in different situations, we see differently well in different situations. In the mornings when it's dark in the bedroom it can then be hard to see the time if it isn't well-lit, or if the contrasts are not good etc. and in other situations we can easily see the time, and it's the same for those who are visually impaired, in certain situations they see great and in other cases they get really dazzled, which is more disturbing than anything else for one person but not for another." (Håkan)

Behind the philosophy of Universal design you find the assumption that we will all eventually be discriminated by design for various reasons, not the least as we grow older and abilities diminish over time. This is a natural cause of life and should be recognized in the design. The general opinion among the design experts is 'equal possibilities' for everyone and it is in relation to an environment that someone becomes handicapped.

The ethical arguments used by the design experts to justify Universal design are reinforced by their reference to human rights and other non-discrimination policies. Universal design is no charity and the EU Treaty of Amsterdam is mentioned. With the aim of achieving equality of opportunity and social inclusion for everyone, the anti-discrimination clause states that actions should be taken against discrimination based on sex, racial or ethnic origin, religion or belief, disability, age or sexual orientation and towards physical accessibility (Ostroff, 2001; EU Treaty of Amsterdam³). In response to

³ www.itcilo.it/english/actrav/telearn/global/ilo/blokit/eutrety.htm, 2006-01-27.

this, governmental policies that reflect human rights and equality declarations have been formed and constitute important reference points for the design experts. The Swedish proposition ‘From patient to citizen – a national action plan for the handicap politic’ (Government Bill 1999/2000:79) seems to be significant as it is mentioned by most of the design experts. Especially the ambition to create accessibility for ‘all’ by 2010. One of the design experts summarizes the core meaning of the message in the proposition concerning design as follows:

“Everything that a person meets, you can be cognitive or physical disabled or immigrant, he should be able to understand the society, take part of society, not feeling excluded.”
(Kristina)

Universal design or Design for All is recommended as a means to create a society for all and reach the goal “accessibility for all by 2010” in public spaces. The same goes for the Government Bill ‘An information society for all’ which states that “...everyone must be able to take part in the information society...for people with disabilities it requires that the IT-systems are accessible and usable” (Government Bill 1999/2000:86). Furthermore, in an SOU⁴ report from 2003 concerning governmental politics of elderly, Design for All is recommended as a possible way to reach higher independence for elderly people in the future (SOU 2003:91). On a European level there is an amendment⁵ in the European Union directive nowadays that require public authorities to take into account accessibility for people with disabilities and design for all requirements whenever possible (EIDD, www.design-for-all.org, 2004-02-02).

A market perspective of Universal design

Another commonly used argument for explaining the interest in Universal design among the design experts is the potential market of elderly due to undisputable changing demographics. The market potential embraces the needs and requirements of aging populations of Sweden as well as Europe, USA and Japan among others. By 2010, for instance, one in five Europeans will be aged 62 and over (Eurostat: 101) and every second European will be over 50 years old in 2020 (Coleman, 1999). From being a marginal group of consumers, the elderly will become a powerful consumer force which in research is referred to as the grey market, 55+ consumers etc. (Shoemaker, 2000). Although they are commonly grouped due to their age, it is far from a homogenous group (Moschis et al., 1997).

Older consumers have within the field of marketing historically been viewed as uninteresting as a consumer group based on old stereotypes of aging people. The overwhelming majority of people with disabilities are older people with minor impairments, problems with hearing or with walking far without aid or assistance et cetera, which hinder everyday activities (Green & Jordan, 1999). But being elderly today means something different than being elderly in the past and since people grow older

⁴ SOU – Statens Offentliga Utredningar

⁵ The European Union directive, amendment 33, article 23, paragraph 6a

very differently the cognitive age might divert significantly from the biological age (Moschis et al., 1997). The cognitive age is as important to consider in the design process although inevitable changes in abilities come with aging.

Elderly consumers may not feel old or want to change their lives just because they are experiencing age-related impairments. Nobody wants to be stigmatized. Consumers wants products that are usable, i.e. the design to make sure that a user can grasp what to do and knows what is going on products (Norman, 1998), but aesthetics and emotions are as important in consumers' interaction with any designed object (Norman, 2004). Consumer products etc. should thus not only be accessible but also social and cultural acceptable. To integrate Universal design into mainstream design makes sense since people in many ways are expressing themselves through their consumption and if you then are excluded – cannot take part in the consumption due to shortcomings in the design of products et cetera – consumers can easily become socially and culturally excluded. Design is acknowledged in contemporary consumer cultures both as a practice of creating desirable objects but also for consumers as a means to create a meaningful life (e.g., Lury 1997).

Using a Universal design approach in practice requires high user involvement and to include 'everyone' ought to be expensive. However, no socially acceptable design can be made without the help of the end-users (Papanek, 1984). The cost might be impossible to refuse in the future going towards an 'accessible' Swedish society, at least in the public environments. At the same time money can be saved with the social benefits reached with the help of Universal design, enabling consumers to live a more independent life longer.

The market potential is the most pronounced argument for justifying Universal design economically. At the Center for Universal design they claim that Universal design has become a very marketable approach, since it addresses the diverse needs of a majority of consumers thus leading to reasonable cost (CUD⁶, 2007-01-16). On a global scale this might be accurate but to what extent this is true in Sweden cannot be concluded from this study. The economical perspective of Universal design was not pronounced by the Swedish design experts in any depth although a market potential implies that something can be marketed and sold with profit. What is argued though is common sense; to think carefully beforehand is better than realizing your mistakes afterwards. Design expert Birgitta believes that future needs ought to be assessed in new buildings instead of having to do costly changes later on because you have not been thinking enough about the users and their requirements from the beginning. However, long-termed calculations are seldom made within the construction industry only immediate investigation cost.

"...It's often said that if we should adjust and make it very Universally good in every way then it costs more, the counterargument is then if we use a general standard, that you do everything from the beginning so to speak then it won't become more expensive, because it's the changes, to rethink, that costs more." (Jan)

⁶ CUD – The Center for Universal design, www.design.ncsu.edu/cud/about_ud/about_ud.htm

To design for access is more cost effective than afterwards changes or adjustments of products and it also lead to better designed products that can give companies competitive advantages. But it is always a question about money and the companies must see the result and that it is a profitable investment. As one of the design experts explains, if you are creating an IT-system with the right technology to make it accessible this is argued to give only advantages as it also becomes faster and cheaper.

How to make Universal design a successful practice

The definition of Universal design is open for interpretation which is the strength as it opens up for different solutions and creates possibilities. At the same time it is a weakness since it might easily be ignored or dismissed because of the challenging ambition to include all and for its focus on usability and accessibility. Furthermore, it is not easily practiced because what is to be defined as ‘universal’? What does it mean that something is ‘universal’ or universally designed? Nevertheless, the design experts do not see any contradictions between Universal design and special or unique design. Even if the ambition with Universal design is to reach a design usable for many, it is not possible to achieve or even desirable to embrace everyone, but to use a broad consumer base and include others than the ‘average’ consumer. Universal design should therefore not be interpreted as an impossible standard or a ‘one size fits all’ approach but a quest for more alternatives so that ability impairments will not stand in the way for individual consumers to choose in accordance to their preferences of taste and style.

Design expert Maria believes it is possible to design products for many users as possible functionally, without implying that it becomes a product without character. It can be diversified when it comes to the communicative expression so that it addresses and attract maybe younger users but that it still works functionally for a rather wide target group. This is reflected in parts of IKEAS assortment according to her. IKEA is very aware of the ageing population and that the needs of these consumers have to be satisfied. They work in a quite invisible way and might be bold as it can also work repellent. If a product becomes viewed as an assistive product, then it can be rejected also by those who really need it because it becomes unwanted.

Designers can use the seven design principles of Universal design for guidance in their work but these are only recommendations and are in their descriptions open for interpretations just like the definition (Story et al., 1998). The principles can also be used to evaluate existing design to see how accessible they are. The rather free use of the principles and way of applying Universal design is deliberate and works as an alternative to standards. Standards are in theory believed to be inadequate and tend to make things uniform and provide barriers for designers to work creatively (Welsh, 1995). Novitski (2001) argues that Universal design is not a euphemism for accessibility but differs from the prescriptive ADA standards, which give many individuals access to spaces, but may not support their active and full participation. Sweden has no equivalent to ADA (Americans with Disabilities Acts) standards, which are constituted by law in USA (Ostroff, 2001).

The design experts express contradicting opinions when it comes to standards. They are not against standards per se but believe they can become obstacles if taken for maximum requirements instead of minimum recommendation. Standards could be used as a benchmark but the disadvantages seem to be greater as the standards get outdated when things change. Design expert Birgitta believes that existing knowledge should be utilized but Swedish building norms, the so-called 'Swedish standard', should only be used as general outlines and furthermore need to be updated. However, they are no longer mandatory, and Jan, another design expert, believes there was a greater need of standardization in the beginning of the 1950's with the negative consequence that buildings became rather uniform. Today the picture is different.

"...Now we have limited laws [building legislation of framework character] that give pretty generous instructions, soft instructions and they can be interpreted in different ways and the risk is naturally that questions like these [accessibility] aren't solved well."
(Jan)

Within the UN they are talking about initiating standards for Universal design or Design for All when it comes to products and services⁷. Industrial design standards are possible to obtain but should not according to design expert Lena be expressed in numbers and figures in any way. The design should not be restricted to something that gets old. Instead these standards should be challenging and illustrate the best possible way to improve and still avoid limiting the development possibilities. In this way standardization could be used to achieve refined knowledge. One of the design experts uses the international guidelines W3c of Web Accessibility Initiative⁸ in her work, but expresses a concern if used without doing real user tests. Because every 'book of rules' needs to be interpreted and gets out-of-date as the development within this area proceeds at an incredibly fast rate.

If standards are used as a minimum and no users participate in the design process the risk is that standards become a tool of uniformity and the flexibility possible to accomplish with design and Universal design is lost. This is in line with Novitski's (2001) view who believes that knowledge about users and their diverse capabilities is needed in addition to standards as both design and human bodies change over time. One needs to go beyond standards to achieve Universal design and therefore such ought to be used with caution.

Instead, three other factors are mentioned by Ostroff (2001) as important to make Universal design develop into a successful practice: education for design professionals; evaluation of universally designed products and environments; and communication with the general public. All three factors are mentioned by the design experts in different contexts but the most emphasized is the requirement of knowledge. Working with Universal design puts new requirements on designers. They must be able to handle a diversity of human capabilities of which many may be unknown to designers. The design experts talk about the value of competence and discuss the lack of it among designers.

⁷ Article about Design for All and standardization on a European level in the magazine Consumer Power (KonsumentMakt), No. 3, June 2003.

⁸ Web Accessibility initiative, www.w3.org/WAI/, 2004-03-13.

One of them claims that to have knowledge of Design for All is a valuable competence as these questions today have an international touch because of the ageing population and legislation within the area in Europe, USA and Japan. It is a competitive advantage to have this competence.

In Sweden, an education project in Universal design finished 2004. The Universal Design Education Project-Sweden (UDEP-S) was launched in spring 2001⁹. The purpose of the project was to promote and develop the Universal design perspective in design education programs and all major universities have been participating (Paulsson, 2002). Activities like this helps to increase the awareness of design and the possibilities to create a more inclusive society, to make a difference. Although the project has come to an end the knowledge of Universal design stays with those involved in the project, teachers and students as well as other involved actors. The future will tell if it has had any permanent influences on the participating design educations.

However, it is not only designers that need to be educated in these questions but also those purchasing design competences.

“...I see it like you can accomplish more by so to speak educate better buyers, when they eventually buy design that they [the designers] get a good specification, if they get a good spec the designers can make a good job, if they don't well, it is of course an interaction [between designer and the buyer about the spec].” (Andreas)

“Environments are in general rather bad, because in order to save money they reduce professional knowledge but if then the purchaser is educated in Design for All, then he knows he needs to get help from someone who really knows which functions that are needed.” (Kristina)

In fact, everyone that influences the design process needs knowledge, as they work as ‘silent designers’ (Gorb & Dumas, 1987), which includes engineers, marketers, constructors etc. Not to forget policy makers. Several of the design experts therefore provide education for other designers and constructors along with people feeling a need to know and use a Universal design approach in their work. In the governmental and the municipal area this is probably more common because of their mission to serve all citizens. Design expert Elena, not only share her knowledge about how to make accessible spaces but believe it to be important to provide education in ‘awareness’ [insikt], that is, why you should do things in a certain way; how you treat people; about dignity because people want to be independent. People need to know why they are doing things in a certain way otherwise they tend to go for the ‘old’ way, “this is how we always have done it”. Some of the design experts even view the issue of education as something additional to their work.

“The problem with Universal design is that people is not always aware of the significance and the need for it but also requires knowledge and a conscious attitude and

⁹ UDEP-S (The Universal design Education Project – Sweden), www.universaldesign-sweden.com/, 2002-10-14.

design methodology. If the client is not aware of this the educational work is also important.” (Maria)

There are also influential institutions that promote Universal design and work for creating a more inclusive society with the help of design by trying to change the view of design among decision makers, companies and the public. The Swedish branch of the network the European Institute for Design and Disability (EIDD) is one of those and works for enhancing the quality of life through Design for All (www.design-for-all.org, 2003-05-13). Several of the design experts are members and one of them gives a background to the start of EIDD Sweden and its relevance.

”EIDD Sweden was established in 1996 because the involved people thought that the design of architecture and products and environments was very bad as regards to people. It was flashy and nice in many ways but the people had disappeared totally, whether we are talking about disabled or ordinary people. And that was what Paul Hogan [initiator of EIDD Europe] also thought and the reason why he tried to get it all going.” (Jan)

An interesting project born from the initiative of EIDD is the project designforalla.se¹⁰. The project provide good examples of Design for All and are trying to reach out broader both to the business community and the public sector. They also provide information to the public. An advertising campaign was launched last year directed towards the public, emphasising human diversity and criticizing the ‘average’ person used in many marketing and developing processes, especially since such a person does not exist in reality. The message of the campaign is: ‘Liberation of diversity’ and ads where shown for instance in the subways of Stockholm for the public to see. Increased knowledge among consumers can make them aware of what demands they should have on consumer objects and put pressure on producers and similar.

The project “Considerate design” (Design med omtanke) in the West Swedish Region is using ‘Design for All’ to design public spaces in a sustainable way (www.design.medomtanke.com/, 2004-02-25). It has grown into a business and they give education in Design for All among other issues for every participating designer. The educated designers are to be found on the website for anyone interesting in using this approach to their own design.

Implications of Universal design for consumers – a conclusive discussion

The Universal design movement wants to change the fact that design has become a means of exclusivity, of segmentation which puts many desirable goods and services out of reach of many consumers. The problem is that most objects, services and environments

¹⁰ The non-profit institute EIDD Sweden, a non-profit institute stand behind the project. The Swedish Industrial Design Foundation (SVID), The Swedish Agency for Disability Policy Coordination (Handisam) and the Swedish Disability Federation (HSO) are collaborators. The project is being funded by the Swedish Inheritance Fund and has a planned lifespan of three years (2005-2007). www.designforalla.se

are designed for a target group of consumers, addressing their needs and wants and thus excludes others. However, a large group of peoples is excluded just because they are diverting from the norm of 'the average consumer', conceptualized in marketing and by designers in the design process. The unequally aspect should not be neglected and there are many means of barriers for exclusion e.g. social, economic, attitudinal and spatial (Dischinger, 2000).

From a consumer perspective it is of great importance to try and create awareness of design exclusion and the possibilities of using design to counteract it. Especially for those today excluded by design because they cannot live up to the requirements set up by the design. Consumers with impairments are not necessarily viewing themselves as disabled but become handicapped in the interaction with products, services and environments. This affects their possibilities to be consumers and express themselves in preferred ways with the help of their consumption choices. As discussed in the paper, anyone can at times and in different situations experience design exclusion and feel handicapped, although people with special requirements due to impairments may have less access to designed objects than others. They do not want to be discriminated or feel stigmatised when consuming which makes it a good reason to broaden mainstream design with the help of Universal design. Because it is not until all consumers are considered in the design and development of products, services and environments that they can become equal participants in society and today's consumption society.

This 'right' can partly be legalised but the study shows that there is a strong focus on the public area when it comes to policies and design. Governmental policies only address public places and concerns while the private area remains practically unregulated. Standards are no solution according to the study so standardization is not the best way to go either. That is probably why a market argument is used as well to make Universal design economical justified. Universal design can then both provide business opportunities and at the same time make society more equal. From such a perspective it is possible to see Universal design as a way to think differently and consider true human diversity and instigating change, a design dimension that Buchanan & Margolin (1995) acknowledge.

The study implies that Universal design is still more elaborated as a 'way of thinking' rather than visualised in the design practice. One of the reasons for this is probably the difficulty of defining what is universally designed and not. There are no restrictions of how to use Universal design and recommendations that are made are free for interpretation which decrease the risk of conformity but leave designers with a challenging design practice. When can a product be considered 'universal'? Is it from a user perspective, i.e. that many users agree when trying it that it works for them in respect of usability and accessibility or is it a professional view point that counts. And who should determine the evaluation criteria for what can be defined as 'universal'? The existing principles of Universal design can be used but they are only recommendations and do not fit all design and are rather open for interpretations. Even if designers use the principles the practice may result in very different end-results. Another thing that complicates it is that Universal design should actually work invisibly (Welsh, 1995), as design should not stigmatise. A 'universal' object cannot be too distinct from other

similar products etc. in appearance, even if it can and should be accessible for many more or most consumers.

To conclude, the Universal design movement wants to move the attention away from disabilities and niche markets like ‘assistive aids’ and ‘barrier-free design’ towards mainstream design where diverse abilities is considered something normal. Design would then become more ‘inclusive’ and hence ‘ethical’ but above this it could also become economical. How well it will develop is hard to judge today and in the context of the entire design society the impact is still marginal. So far the Universal design movement in Sweden can only be described as a rather disparate network of enthusiastic people working with various activities like the Swedish education project UDEP-S, organizations like EIDD Sweden, those who work with public spaces and services and who has knowledge of these issues.

Although Universal design might be morally and ethically justified it is not a prerequisite of creating an inclusive society. However, it is a way to think about design as a means to make a difference. Just by using such ‘way of thinking’ I believe one has come further towards a more inclusive society. If everyone who works with issues of inclusion or exclusion and accessibility are aware of the possibility of Universal design and what can be achieved with design, much have been accomplished. For this to happen knowledge need to be achieved not only among professional designers but for anyone involved in making decisions about the design and development of products, services, and environment, whether it be for private or public use. Not the least among policy makers who are important ‘silent’ designers who influence the supply and selection of consumer objects that are accessible and do not exclude consumers. As Universal design is one way of creating a more inclusive society, its possibilities are important to make policy makers aware of. However, policies are not enough to encourage designers and other ‘silent designers’ to use the philosophy of Universal design. The market aspect works better in some respect, especially within the business community and if Universal design can generate businesses then it can be integrated into mainstream design. Besides talking about Universal design, showing good examples will help visualising the possibilities and can play down images that people have of ‘universal’ objects if interpreted literary as a “one size fits all” approach.

By studying design issues like Universal design, it becomes apparent what can be achieved by design, both for individual consumers and on a societal level. The possibility to make a difference by design is challenging but also rewarding. As people are deeply affected by their ability to function in the physical surroundings with a sense of comfort, independence and control (Kanes Weisman, 4/1999), creating an inclusive society by design means that increased social sustainability is achieved at the same time.

Care and maintenance, a contribution to the planned Western Europe

volume of Berg's Encyclopaedia of World Dress and Fashion

Conference theme 8: Design and fashion in consumption

Abstract

Our clothing is not just a result of the clothes themselves and the way they are produced, but also of how they are maintained. Today laundry is an important part of this maintenance, but a few decades back laundry was far more infrequent, and techniques such as stain removal, airing and particularly repairs were crucial in securing a presentable appearance. I will show some of the principal features of this development and discuss how changes in perceptions of cleanliness, the value of textiles, the increase of affluence, technology and access to water, electricity and detergents can help explain them. The article is written as a contribution to the planned Western Europe volume of Berg's Encyclopaedia of World Dress and Fashion. In addition to discussing the content I would like to discuss this to discuss

the Encyclopaedia as a literary genre as a literary genre.

Care and maintenance, a contribution to the planned Western Europe volume of Berg's Encyclopaedia of World Dress and Fashion.

The two enclosed texts about *care and maintenance* and *Why do women throw out clothes?* are both written for this planned Encyclopaedia. The publisher has provided the authors with a detailed agreement which contains the content, style and “tone” of the planned publication. A short version of this and a description of the project was formulated as follows by Kathryn Earle, Managing Director, Berg Fashion Library Limited:

The Berg Encyclopaedia of World Dress and Fashion will be published in 2010 by Berg Fashion Library Ltd, a subsidiary of Berg Publishers/Oxford International Publishers Ltd, a leader in book and journal publishing in fashion and cultural studies. A ten-volume scholarly reference, The Encyclopaedia will explore all aspects of dress and adornment across cultures. The overall encyclopaedia project is edited by Joanne B. Eicher, Regents Professor Emeritus of the Department of Design, Housing, and Apparel, University of Minnesota, USA. It will contain 655 articles, all written by scholars and organized by theme within geographical sections, as well as 500 images per volume. An international collaborative outreach effort, this thorough, cross-disciplinary reference will convey the full breadth of scholarship on

dress and fashion, making it accessible to students, researchers, scholars, and non-specialists in school, academic, and public libraries around the world for many years to come.

In order to serve a wide range of readers, we ask that all articles be written in a clear, intelligible manner. Articles should include all relevant factual information and be even-handed in presenting any controversial issues.

At the conference Dressing Rooms in Oslo in spring 2007 Lise Skov, Editor of the Western Europe volume, presented the paper Encyclopaedic knowledge of dress and fashion. In her paper she discussed why we just now get not only one, but in fact two such comprehensive publications, with reference to how knowledge about dress and fashion is constituted today. In her paper she wrote:

... in the last decade or so, there has been a veritable explosion of publications which for the first time make it possible to talk about something like fashion studies. Yet the demands of the new discipline are contradictory. On the one hand, the need to legitimise research seems best met through imitation of humanities paradigms that emphasise aesthetic or cultural autonomy. On the other hand, the need to prove the value of fashion research calls for a closer association with practices in design, production or marketing. In this respect, the emerging field of fashion studies stands at the epistemological crossroads on a foggy day when neither of the beaten tracks seems to lead to a reliable destination. (Skov 2007:1)

Skov concludes that the encyclopaedic form suits this situation because it allows “more dissonance” than for instance a textbook does. In contrast to a number of other academic texts this type of text is characterised by not contrasting and arguing against the findings and views of other researchers. On the contrary, the texts should appear to be authoritative in their field and not as an argument for or against different views. At the same time it is clear that both the content, i.e. the selection of authors, subjects and perspectives, and the texts themselves will represent different ways of understanding dress and fashion. I will for instance be interested in the relationship between understanding clothes as a result of the thoughts and ideas of producers and vendors versus understanding clothes as something that is constituted through everyday use.

The choice of subjects and authors is partly based on a wish to cover the great variety that exist, and partly on the basis of current research in the various fields. That means that some of the texts – like the two that are enclosed here – are based on extensive previous research. Other texts, on the other hand, will have to cover more or less white spots on the map and be based on much weaker empirical evidence. One by-product of the work with the publication will thus be to identify precisely such white spots. Out of the texts that I will contribute, “Clothes for Sports and Outdoor Life” (maps the development of dress for outdoor life and sports in Western Europe from 1800 to the present) is an example of such a white spot. One problem with the first type of texts is that the research is usually situated in one country, in my case

Norway, whereas the text of the Encyclopaedia is supposed to cover a greater geographical area, in this case “Western Europe”.

I want to discuss this literary genre based on these two texts.

- Are they “clear, intelligible”, and do they include “all relevant factual information and be even-handed in presenting any controversial issues”?
- Does the relationship between the predominantly Norwegian empirical evidence work in comparison to the wider geographical area they are supposed to cover?

In addition I want a wider discussion about whether this is a type of publication that will advance “fashion studies”, in contrast to textbooks and journals about clothes, or articles about clothes in publications where the dominant theme is not clothes, but consumption, material culture etc. Of course I do not think that it is a matter of either-or, but that it may be important for an academic field in rapid development to reflect on how the field should be constituted in the years to come.

Care and maintenance

Care and maintenance are important for durability and the way clothes look, they have been both an advanced craft and a time consuming part of women's unpaid work in the home.

Throughout much of Western European history clothes and textiles have been

among the most precious possessions of a household. The many labour intensive processes, from the cultivation of flax and shearing of sheep to the finished clothes, made extensive use of repairs and maintenance profitable. Hard physical labour and few items of clothing per person resulted in a lot of wear. In poor families the mother stayed up past bedtime because repairs had to be made when the clothes had been taken off for the night. Many people did not own more than what they wore. Even for better off women mending and patching were significant everyday tasks.

Techniques for repairing textiles were important parts of home economics training for girls, which became common with the introduction of primary schools at the end of the 19th century. The girls were not trusted with repairing real clothes, but practised on mending and patching samplers that were later used as models for their own work. In the domestic science schools that emerged during the same period repairs were an important part of the curriculum. Repairs should be as invisible as possible. The girls also learned different techniques to prevent wear and ensure that future repairs would be as simple as possible. Closely associated with this knowledge were ways to use and store clothes to prevent wear, wrinkling and soiling as much as possible. Protective clothing worn over regular clothes in the form of aprons, overcoats and galoshes was part of this.

Proverbs show that wearing clothes with holes was associated with shame, as opposed to properly mended clothes, which did not dishonour a man (examples from Denmark? England?). Inability to use textile remnants, rags and patches to the last fibre was also associated with shame. Patches were either used in repair work or

made into new textiles by sowing small pieces of cloth together. If the remnants were of poorer quality they were used as padding, woven into rag rugs or carded and mixed with new fibres. Several of these techniques had a revival during and immediately after World War II, when the access to new textiles again became more limited.

In the post-war era the standard of living in Western Europe has increased rapidly, and most rapidly in Norway, which was among the poorest countries and today is among the richest. Along with growing affluence access to clothes and textiles increased. The rag heaps grew rapidly both in quantity and quality. The techniques that had been used as a virtue of necessity were associated with frugality and diligence, good feminine virtues. With the hippie movement, women's liberation, anti-fashion and not least the increasing focus on creativity these economising techniques enjoyed an upswing in the 1970s as fun ways of “making something yourself”. The patches should no longer be invisible, but were used as decorative elements. Torn and tattered clothes were no longer unambiguous signs of poverty and deprivation. The transition between repairing and decorating clothes was blurred. Patches were increasingly produced by new materials, and patching techniques were no longer a way of making use of resources, but had an independent aesthetic value.

Laundry; changes in techniques and increase in quantity

Whereas repair work has decreased drastically, the time spent on keeping the clothes clean and the home clear of clothes on their way back to wardrobes, drawers or the

laundry basket has increased significantly. This increase has occurred in spite of new and effective laundry aids.

In the middle of the 19th century the quantity of laundry was still very limited. Among the general population in Norway the practice of using various interior textiles such as table cloths, napkins and curtains had not yet arrived, and clothes were to a limited extent washed. We have good information about this through Eilert Sundt's comprehensive description of "cleanliness in Norway" (1969). He reports that it was not common to own a towel in rural areas of Norway. The most frequently washed clothes were the underwear, which was usually washed between once every fortnight and once every 2-3 months. However, many people did not wear underwear and wore clothes of leather and homespun. Leather was not washed and homespun was only washed in exceptional cases. The body was washed a couple of times a year, or possibly only during the annual Christmas bath. Sundt writes that many a pair of pants were worn out without tasting any other water than the occasional rain shower. Socks were not washed in rural areas, and Sundt comments that this is no stranger for rural people than it is for city dwellers not to wash their shoes.

The transition from beds with fur rugs and ticking – which were not washed – to feather-beds with sheets and quilt covers as well as the increased use of interior textiles contributed to the growth of laundry. So did the spread of underwear and other linen and cotton clothes. Laundry was organised as seasonal work, ideally once a year. The work took several weeks and was performed by professional washerwomen. The techniques that were used for washing linen were common to

large parts of Europe. The clothes were boiled with lye made from ashes, or simply boiled with ashes. After that, the clothes were beaten clean of dirt and ashes, usually in brooks or lakes. The use of soap in addition to lye was on the increase during the 19th century and contributed to whiter laundry. After being boiled with lye the laundry was laid or hung out to bleach in the sun. The shining white textiles were the measure of the washerwoman's art, and also a strong symbol of feminine purity and chastity – a point that producers of detergents later would put into words and images.

Soap has been industrially produced in Norway since the early 19th century, however, home-made soap from fat and ashes was not uncommon up until after World War II. Soap was one of the earliest consumer goods, and a product that has made strong use of advertising and other forms of marketing all along . Sunlight is regarded as one of the first branded goods. Soap has also been an important export article from the West to the colonies, both as a regular commodity, but also ideologically closely linked with civilising black people.

Laundry was hard work, and as the amount of laundry increased, there were experiments with new and improved methods. The first major improvements were zinc buckets, which lightened the transportation of water, and the washboard, an American invention from the 1860s. At the end of the 19th century different manually operated washing machines and laundromats appeared, in 1925 came the first electric laundromat from the USA, and the first fully automated laundromat appeared in 1949. The organisation of the work also went through major changes. The amount of laundry increased, also for regular people, and access to cheap female labour and

house maids was more limited. Thus more and more women washed their own family's textiles. The laundry moved into washhouses and cellars. Laundry experts were eager to turn laundry into a professional service, but nevertheless most of the laundry was done in the home, particularly in Scandinavia, where commercial laundries are little used. The housewife, a female role that transcends economy and class, thus became the performer of this ancient female profession.

The increase in the amount of laundry was one of several aspects of the increase in cleanliness and hygiene in Europe in the 19th century up until the 1960s. This development was a grand alliance between medical reformers and educational and political reformers who aimed to improve public health and fight the great epidemic diseases, but also to cleanse society of disorder and undesirable elements. The housewife became an important ally in this fight, with a particular task in keeping the home clean and teaching the rising generation the importance of a pleasant and hygienically clean home. Domestic science schools were important both in the training of housewives and in the establishment of institutions that developed and administered domestic science knowledge.

Attention had primarily been directed at infrastructure, water and sewage, but after this had become more organised during the 19th century, the attention moved inside the homes and to the individual's body and clothes. Doctors, domestic science experts and not least advertising for hygiene products argued in favour of increasingly frequent body and clothes wash, and of doing the laundry more often instead of letting it accumulate into big laundry days. At the start of the 20th century

the underwear – which had become a matter of course by that time – was washed once a week together with the weekly body wash in the city and once every fortnight in the Norwegian countryside. The weekly change of underwear survived as a norm until the 1950s and -60s. Today it is common to change underwear every day. In Norway 88 % change this often, whereas 98 % of the Dutch population put on clean underwear every day. The corresponding figure for washing t-shirts in Norway shows that 52 % put on clean shirts every day, whereas 71 % of the Dutch did so in 2002.

There is good information about laundry in 1955 through a Swedish public survey “tvätt” (“laundry”). If we leave underwear aside, the average annual laundry for a man included 78 shirts, 24 collars, 12 shirt cuffs, eight sport shirts, three overalls, two pullovers, a track suits, four shorts or other casual pants, three slipovers and a windcheater. For women the annual laundry included 64 aprons, 12 overcoats, 42 blouses of different kinds, 12 jumpers, 14 dresses, four sweaters, a windcheater and four shorts. On average she washed a protective item of clothing for housework between once and twice a week, more often than she washes sweaters, blouses, jumpers or dresses combined. Long pants and skirts were not part of the laundry. Compared with the great amounts of training and leisure wear we wash today, an annual laundry consisting of one training overall, a windcheater and four shorts is of course surprising. In the Netherlands in 2002 jeans were usually washed after being used twice (38 %) and after five times or more in Norway (35 %). The survey from 1955 also shows the importance of protective clothing. Dirt was still perceived as something that came from without in the form of dust and filth. Today the focus is

rather on dirt that comes from the body through sweat and bodily grease. It is the smell and not the stains that decide whether something needs to be washed.

Hygiene was an important argument for the shift towards washing laundry once a week, but for the shift to even more frequent washing other arguments were used. These were partly tied to the danger of smelling and thus for social stigmatisation, and partly to the new synthetic materials that “required” more frequent washing to preserve their good characteristics. At first nylon stockings and shirts were not part of “the laundry”, but had to be rinsed by hand after use, which according to both advertising and domestic science books in the 1940s and 1950s would save work.

In 2000 an average washing machine in UK washed 274 washing cycles with an average 2 kg load. The Americans washed approximately twice as much, 1332 kg per year, three times as much per household as in 1950. The growth in laundry was particularly due to more clothes, more washable clothes, increased changing frequency for clothes and towels, and the fact that the washing machine has replaced other methods of keeping the clothes in order. During this period there was little or no change in the washing of bed linen, and possible a decline in the washing of interior textiles. The latter is due to less use of such textiles and a shift to other materials, such as paper napkins and oilcloths. Sanitary towels and diapers disappeared from the laundry and were replaced with disposable products. In the period from 1950 until today many new fibres and the shift towards coloured textiles has resulted in more complex laundry. The main laundry is no longer white. Even

though underwear is washed more frequently, this has not lead to more laundry because the individual items of clothing have become smaller and lighter, and because fewer types of underwear are in use.

Laundry today is completely dominated by washing with water and soap, mostly in privately owned fully automated washing machines. Only a couple of decades ago other techniques were equally important. Stains were removed as soon as they appeared, and clothes were aired, brushed and pressed. If we go even further back, a plethora of different techniques were in use to keep textiles reasonably clean and free from vermin.

The finishing work has changed considerably. Smoothing was an important part of the work with the white woven linen and cotton fabrics. The tools for this purpose have changed, from smoothing stones, via rollers and mangles to irons first warmed with coal or on the stove, and later with electricity, like the ones we use today.

The shift to other fibres, more use of knitted fabrics and changing ideals for the use of women's time and for the look of textiles have reduced the use of smoothing. Today not everybody iron the most obvious “ironing fabrics”, such as canvas woven cotton. Others have extended the tradition of smoothing all textiles to the new “non-ironing” fabrics such as terry cloth and jersey.

Even though many people have cut down drastically on the smoothing, this does not mean that laundry no longer requires finishing. With the large amounts of clothes that are used – and washed – today, a lot of work goes into sorting, folding

and putting the clean clothes back in place. This work is closely associated with keeping track of the family's clothes, what they have, where it is, where it should be and whether it is clean and presentable when it is supposed to be used. This also involves defining when something needs washing and putting it in the laundry basket. The latter is an issue that often leads to conflicts because of diverging standards and different perceptions of the boundary between keeping one's own things in order versus joint housework chores. The laundry basket is often used as a way of tidying up, a place to dump the heap of more or less used clothes that pile up on available surfaces, such as chairs, beds and floors.

Pure female honour

One aspect of care and maintenance has not changed; the work and the responsibility for the work did and does lie with the women despite persistent attempts to achieve a more equal distribution of the unpaid work in the home. Today, laundry is the most female dominated part of housework. Therefore laundry can be used as a point of departure for understanding the interplay between men and women in relationships (Kaufmann), or to discuss why not more has changed in practice after several decades of gender equality as a publically accepted discourse (Klepp).

An obvious way of explaining why laundry is so dominated by women is quite simply that after all most things to do with clothes and textiles are. But there are also other explanations.

Eilert Sundt writes that women competed to have the whitest laundry and that

an unkempt person in a household would dishonour a woman. In the world of the fairytales the ability to wash white is associated with pure, proper femininity and distinguishes a real bride from trolls and other non-Christians. Hard work in wash houses was regarded as a cure for loose women. Generally there is a close connection between external purity and feminine purity, interpreted as sexual innocence. Even though it is not expected that women today are virgins when they marry, the idea of a more delicate female purity is still alive. Women wash their own clothes more frequently than those of their men. Dirty children and unkempt men will still hurt a married woman's reputation.

Women are supposed to be pure, but at the same time the feminine is closely associated with dirt and the intimate. Whereas no-one reacts when mother sniffs her family's clothes that lie around to find out if they are dirty, a man with his nose down his wife's or daughter's panties will arouse quite different associations. Men are assumed to be uncomfortable with bodily secretions and intimate care for children, sick or elderly people. When women want to keep laundry to themselves part of the explanation may be that they do not want to let men get so close to their dirty clothes.

The most important reason why women do the laundry “themselves” is men's alleged lack of skills and inability to learn to sort laundry properly. Kaufmann shows how formerly good washers among French men slowly, but inexorably became bad washers after they established themselves with a female partner. It is more difficult to wash other people's clothes than one's own, and women's clothes are more complex and therefore more difficult to wash than men's. Nevertheless, it is striking that men –

who do not generally have learning difficulties – so consistently are thought incapable of learning this.

One practical explanation of female dominance over laundry is that clothes are so intimately associated with social life. This, too, is a female-dominated field in Western Europe. Women dominate arrangements about social events, and not least know (or determine) what is suitable to wear on different occasions. The laundry work is closely interwoven with organising the family's clothes, and thus also knowing what is clean and in order at any time. If women hand over control of laundry, they may also have to renounce on the possibility to control what the family wears on different occasions.

Clean clothes

After going without clothes, wearing dirty clothes is the most obvious violation of clothes norms, possibly next to breaking the gender specific dress norm for men. As long as the clothes are clean and proper, they may be both old-fashioned and “wrong” with regard to occasion and age.

For centuries being well-groomed has been regarded as one of the most important criteria for being well-dressed. But what is regarded as well-groomed has changed. Today the focus is on the absence of odour, and on newly washed clothes. Today putting on fresh clothes every day is regarded as a way of showing that you are a responsible and reliable person. But this norm – like most clothes norms – does not apply equally to all, and certainly not equally on all occasions.

The norm about clean clothes is stronger for women than for men. Whereas women cannot be too clean, overly meticulous men are not masculine. Thus there is an ideal of a (slightly) unshaven, unkempt man, while a corresponding ideal does not exist for women. Similarly chalk white has different significance depending on gender. On women it is associated with innocence, as in the virgin's shining white bridal dress. On the contrary, men dressed all in white are immediately sexually suspect. For a man in a suit, the norm says that the shirt should be immaculate, and as long as it is, no-one questions the cleanness of the suit. For women varying between different outfits is an important way of visually showing that the clothes are frequently changed and thus also washed.

The norm about cleanness also changes with age. Small children should be allowed to get dirty. Particularly in the Nordic country, where a good childhood is strongly associated with active play in nature, children full of mud and dirt are a sign of happy and healthy children. For school children the focus on cleanness increases. Among adults the rule is that ill-groomed elderly people are even more unsavoury than ill-groomed adults.

The relationship between occasion and cleanness is complicated. But the requirement for cleanness increases when you leave your own home, when you are in the company of others indoors, and in situations where your professionalism or other forms of reliability are at stake. Due to the great focus on body odour, training – especially indoors – has gradually become a place where the clothes should be newly washed.

Washing and maintenance of clothes are important for how they look and thus for how a person appears. As in most other areas to do with clothes there are numerous nuances and distinctions in this field. Some of them are durable, tough structures, such as the perception that this is primarily women's responsibility. Others may be short lived and break with traditions, such as the production of new clothes with apparent dirt and wear. With regard to the social significance of the cleanness of clothes this is a field within clothes research that is little developed.

Sustainable Consumption – Sustainable Ways of Consuming Fashion

Annu Markkula
Department of Marketing and Management
Helsinki School of Economics
Helsinki, Finland
annu.markkula@gmail.com

Sustainable consumption related to fashion and clothing has not yet received systematic research attention. This study aims to cover parts of this gap by analyzing literature on sustainable consumption with specific focus on fashion and clothing consumption in order to find out what kind fashion and clothing consumption could be considered to be sustainable. The paradox between the definitions of fashion and sustainable consumption is also addressed. The study addresses further the need and importance of doing cultural research on sustainable consumption in order better understand the possibilities and limitations sustainable consumption practices. Current fashion consumption practices need to be reformed, but also governments and companies need to contribute to advancing more sustainable life styles.

Extended abstract

Recently the political role of consumers has been emphasized when discussing possible solutions to overcome environmental problems of consumption (Ministry of Trade and Industry 2004; European Commission 2005). This is clearly manifested for example on European Union's consumer policy guidelines. However, there are signs that a more holistic perspective will be needed to advance more sustainable ways of living (UNEP 2007). This implies that also governments and industries need to contribute towards this common goal.

Little attention has been paid so far on sustainable consumption as regards fashion and clothing sector. Studies on retail sector have mainly been focused on grocery shopping although clothing is one the biggest sectors of industry. Having also important effects on retail and advertising sectors, fashion and clothing sector does have a remarkable role in striving for more sustainable development and society (UNEP 2004).

The sustainability of fashion and clothing sector has remained quite untouched perhaps as the short-living character of fashion has been taken for a granted for which there is very little to do. Both sustainable production and consumption related to this sector need to be critically re-discussed in order to reach environmental, economical, and social sustainability. This said, also the current fashion consumption practices would need to be reformed.

In order to advance more sustainable consumption practices, the term "sustainable" itself should be reviewed and discussed more profoundly. This is particularly true as regards

the field of fashion and clothing. There is no clear understanding among the consumers what could be defined or considered as sustainable fashion and clothing consumption. Moreover, there is also a remarkable lack of academic papers dealing with sustainable fashion and clothing consumption. Ethical issues and green fashion have been more broadly investigated (e.g. Joergens 2004, Iwanow et al. 2005; Iwanow 2007, 35) but also these studies are very few. No researches address specifically what kind of consumption is considered to be sustainable as regards fashion and clothing.

In this situation the question what is sustainable consumption has become most relevant. This study aims to provide insights into this subject by analyzing literature on sustainable consumption with specific focus on fashion and clothing in order to find out what kind of fashion and clothing consumption could be considered to be sustainable. By doing this, this study aims also to discuss the ways in which fashion and clothing consumers are presented in sustainable consumption related literature (Moisander 2001).

Based on the definition of World Commission (1987), sustainable consumption has been agreed to mean meeting the needs of present generations without compromising the needs of the future ones (Heiskanen & Pantzar 1997, 410; Fuchs & Lorek 2005; Birtwistle & Moore 2007). Although during the past 30 years sustainability issues have gained remarkable attention, the definition of sustainable consumption did remain somewhat unclear for years (Heiskanen & Pantzar 1997, 410). In fact, in the common discourse the terms sustainable, green, ethical, responsible, and conscious consumption are still often used interchangeably or as synonyms.

Sustainable development does not focus only on environmental issues as it encompasses three general policy areas: economic development, environmental protection and social development (UN 2005). Consequently, sustainable consumption should also consider the totality of social, economic, and environmental concerns related to consumption (UNEP 2007). The review on the concepts of sustainable, green, ethical, responsible, and conscious consumption would seem to suggest that although the concepts of ethical consumption and socially conscious consumption (Cooper-Martin & Holbrook 1993, 113) take into account the social and environmental aspects of consumption, the role of economic sustainability seems to play a minor role also in these concepts. Economic sustainability addressed partly when addressing concerns for the public consequences of private consumption. In fact, attention on economic aspects of consumption has mainly been concerned with the negative consequences of increasing consumption and this has resulted in a limited understanding of sustainable consumption as a whole. Furthermore, ethical issues are not simple questions to discuss as for example Moisander (2007) has recently re-addressed.

For consumers around the world purchasing and consuming clothing and fashion do not barely serve as a means to satisfy basic needs, but rather as a means to create identity, distinction, and status (e.g. McCracken 1986) and shopping itself has become a leisure activity. Covering one's body is, however, a necessity no matter what stance one takes towards fashion - spending in clothing is thus a necessity. With the advent of fast fashion and globalization also consumers who claim to be all but fashion oriented can end up as

owners of items labeled as fashionable or items that have been produced with the same procedures. Thus the question is not so much about the conceptual differences between clothing and fashion – it is more a question of consuming to cover the body.

The study elaborates on fashion, clothing, and sustainability further. When talking about fashion, clothing, and sustainability, the synonymous use of terms responsible, sustainable, ethical, green, and conscious consumption is faced again. The paradox between the definitions of fashion and sustainable consumption is addressed. This study takes the position that when talking about fashion and clothing, we are ultimately dealing with actions of consumption aiming to cover the body, and that the short-living character of fashion should not be taken for a granted for which there is very little to do in terms of sustainable consumption practices.

Based on the literature reviewed understanding sustainable consumption and specifically understanding the sustainable consumption of fashion and clothing seems to be a complex task as the phenomena seems not have been studied broadly. Guidelines for environmentally friendly consumption of clothing are widely available on various web sites. These guidelines also include some prosocial aspects. In order to make green choices time, effort, and knowledge are also required from consumers as assessing the environmental impacts of a product is not a simple task: consumption guidelines are lists of long and detailed advices that may also be contradicting. In general, consumers are recommended to buy second hand clothing and recycle; choose more durable quality and timeless styles, favor repair, choose products with environmental labels, and to wash clothes less often, at lower temperatures and using eco-detergents (e.g. Allwood et al. 2006).

Commodities are produced via complex networks of relations: consumption decisions are influenced, shaped, and constrained by linked choices being made, and power being exercised, as products are created, distributed, used, and disposed (Princen et al. 2002, 15). Regarding the problem of consumption's sustainability as a problem of personal choice has failed to appreciate the socially situated and socially constructed character of consumption (Antonides & van Raaij 1998, Moisander 2001; Princen et al. 2002; Southerton et al. 2004; Peñaloza & Venkatesh 2006). The use of quantitative methods has largely ignored the social construction and culturally shared moral ideas, meanings, and signifying practices embedded in consumption processes. Thus the interest of research should not merely be in trying to identify gaps between attitudes and behavior but instead in trying to understand in more depth the cultural processes of markets including the relations of power in which the subjectivity and nature of the consumers are being shaped. (Moisander & Eriksson 2006, 272)

As long as continuous economic growth and growth in material wealth are desired goals in the society (Killbourne 2004, 202), what can be done to promote more sustainable consumption practices? Consumer's choices are influenced by contextual social forces, notably in advertising and media images of the good life, which also seems to imply that the attention should be placed on social relations and locations of power that structures consumer choices (Princen et al. 2002, 15). Businesses could, however, take to encourage

better practices while still remaining profitable and government could support these efforts. According to Allwood et al. (2006) this kind of practices enabling more sustainable consumption practices could include the following: more fact-based information offered for consumers; more emphasis on durability in new fashions; new business models (re-)introduced for clothing retailers; overall rise in consumer retail prices; new technological material developments.

Overall, the study addresses the need and importance of doing cultural research (Moisander & Valtonen 2006) in addressing the socially situated and socially constructed character of consumption (Antonides & van Raaij 1998; Moisander 2001; Princen et al. 2002; Southerton et al. 2004) to better understand the possibilities and limitations sustainable consumption practices related to fashion and clothing consumption. This calls for the need to shift policy attention to studying, addressing, and targeting people as members of different groups to understand better the moral, political, and practical problems related to sustainable consumption (Moisander 2007, 409). This study suggests that in order to advance more sustainable consumption practices of fashion and clothing, more research will be needed to understand more profoundly the cultural practices of the contemporary market place.

Design, Media and Consumer Culture? – The representations of design in Finnish economical press

toni.ryynanen@helsinki.fi

Abstract

This paper presents empirical examples of how design representations could be seen from the aspect of Consumer Culture Theory (CCT). As suggested by Arnould and Thompson (2005), CCT examines consumer ideology - systems of meaning that tend to channel and reproduce consumers' thoughts and actions in such a way as to defend dominate interests in society. These very same issues seem to be under a considerable debate, both in contemporary academic and practical fields of design. Are the representations of design in any relation to CCT and how is industrial design represented from the consumer culture aspect? The focus is on the analysis of economic press articles concerning industrial design representations in the context of mass-mediated marketplace ideologies. The analysed data is collected from economic newspapers in Finland, and it consists of altogether 400 articles from 1990 to 2005. The discussion suggests that Finnish economical press presents the industrial design as beneficial for the nation, companies and consumers. Representations of industrial design are relevant part of culturally orientated consumer research.

1. Introduction to design and consumer culture

The artefactual, material culture inevitably guides our daily life at work and leisure. It gives us the most immediate and very tangible cultural frame. The effects of material culture are in general not clear to people and evade explication because of the anonymity and self-evident presence of the artefact world around us. The important role design has in enhancing the aesthetic and functional level of our environment is not generally understood. (Järvinen and Koskinen 2001, 10-11)

As described in the quotation above both design and material culture are important parts of our everyday life (also Miller 1987; 1995). It is easy to see the importance of designed objects in everyday life, but defining design is quite problematic. Generally speaking design is the human power to conceive, plan, and realise products that serve human beings in the accomplishment of any individual or collective purpose. Or simply "*[Design is...] the conception and planning of all the products made by human beings [...]*" (Buchanan and Margolin 1995, X). As a term design describes a wide array of activities from popular usage to professional activity in product development. Histories and theories of design are also exceptionally diverse, representing a wide range of beliefs about what design is, how it should be practiced, and for what purpose (Buchanan 1995, 23).

The representations of design in economic press can be divided into three classes. The classification is based both on end-products and the type of the design activity itself. In the economic press there are articles concerning Arts and Crafts design, applied arts design and industrial design (also Karihalme 1996). *Arts and Crafts design* is handicraft work usually done by a single designer. The end-product is typically unique and artistic, for example a glass vase. *Applied arts design* refers to low-tech and mass-manufactured products, for example furniture or glassware. There is usually one designer involved, but the manufacturing of the product is done by other people. *Industrial design* is cooperative work typically conducted in an industry or in a design consultancy. The scale of manufacturing is large and in many cases the designs are high-technology consumer products or business-to-business capital goods. The economic paper articles consider mostly industrial design, but there are articles addressing also other areas of design. In this paper an emphasis is on industrial design.

Design is an interesting topic since it seems to unite both production and consumption in a cultural context. Design is activity in productive side - planning and realising products. On the other hand, design is something that has an effect on consumption and to consumers' actions as well. For example, in consumer products aesthetic design gains more and more foothold (Charters 2006). There are various goods where the aim of design is to enhance functionality in addition to the advantages gained from visually attractive design. Many consumer goods have become articles of fashion and indicators of a certain lifestyle (Chaney 1996). Consequently in the consumer's mind, designed equipment is quite automatically linked to fashion issues. The sales of most consumer goods and products are largely dependent on the trends in fashion and the fluctuation in the markets. (Järvinen and Koskinen 2001, 122).

In this paper the term "culture" is used in the meaning of ideas and activities with which people construct the world. In the same vein, consumption is defined to include the processes by which consumer goods and services are created, acquired, used, communicated, and finally disposed. Basically, consumption is shaped, driven, and constrained at every point by cultural considerations. The system of design and production that creates consumer goods is an entirely cultural enterprise (McCracken 1988, XI; also Featherstone 1991). The "research enterprise" of consumer culture was born in the 1980s. Consumer culture - as a culture of consumption is unique and specific form of activity. It is the dominant mode of cultural reproduction in Western countries in the modern era. "*Consumer culture denotes a social arrangement in which the relation between lived culture and social resources, between meaningful ways of life and the symbolic and material resources on which they depend, is mediated through markets*" (Slater 1997, 7).

What, then, links the above defined design to consumer culture? Celia Lury has stated that a process of stylization is what best defines consumer culture (1996, 4; also Featherstone 1991). The stylization of contemporary consumer culture is in relation to the importance of the circulation of commodities, changes in the interrelationship of different systems of production and consumption or regimes of value, the relative independence of practices of consumption from those of production and lastly, the special importance given to the consumption or use of cultural objects (Lury 1996, 4). Consumer culture provides interesting context because consumption is the social activity which, above all others, unites economy and culture (Lee 1993, XIII; also Douglas and Isherwood 1979).

The discussion of consumer culture is the common ground linking design to economic, societal and cultural context. Consumer culture research is basically an extension of

anthropological studies concentrated on material culture (see Miller 1987; 1995). Latest findings on the field of consumer culture crystallises into a proposition of consumer culture theory (CCT) suggested by Arnould and Thompson (2005). CCT is divided into four research programs each having a somewhat different angle to the study of consumption. The programs are *consumer identity projects*, *marketplace cultures*, *the sociohistoric patterning of consumption*, and *mass-mediated marketplace ideologies*. It could be stated that the keywords are consumer identities, marketplace, historical development and media.

Consumer culture theory examines consumer ideology - systems of meaning that tend to channel and reproduce consumers' thoughts and actions in such a way as to defend dominate interests in society. In these theories consumers are conceived of as interpretive agents their meaning-creating activities range from those that tacitly embrace the dominant representations of consumer identity and life-style ideals to those that consciously deviate from these ideological instructions. In this paper it is suggested that readers of economic press are also consumers acquiring information about design.

At the macro level CCT research investigates the influences that economic and cultural globalisation exert upon consumer identity projects and identity-defining patterns of social interaction in distinctive social contexts. However, at the meso level of analysis consumer culture researchers also explore how a particular cultural production system systemically predisposes consumers toward certain kinds of identity projects (Arnould and Thompson 2005). In this case the cultural production system is media and the articles of economic press in Finland.

It seems that a division of consumption and production is not relevant in a larger cultural context. Many of the contemporary consumer and social science researchers have also suggested that this division is out-dated and basically slowing down the development of consumer research (Fine & Leopold 1993; Firat and Dholakia 2003; Ritzer 2004; Trentmann 2006). This notion makes design an even more interesting topic when consumer culture is considered - "design phenomenon" unites both the production and issues in consumption in a cultural context.

2. Research data and methodical procedure

The focus of the paper will be on the analysis of economic press articles concerning mainly industrial design representations in the context of mass-mediated marketplace ideologies. The empirical part of the analysis is based on a tradition of representation studies while the theoretical part is based on the idea of CCT. The analysed data is collected from economic newspapers in Finland, and it consists of altogether 400 articles from 1990 to 2005¹. The data consists of all published articles concerning design in the mentioned time period.

The main questions of this study are: *what have the representations of design been like when the cultural aspect of economy is considered? How can these media representations of design in economic context be classified in a relevant way?*

¹ The Finnish economic papers the data was collected are Kauppalehti (KL, Business News), Taloussanommat (TalSa, Economic News), Tekniikka&Talous (T&T, Technology&Economy), Talouselämä (TalE, Business Life) and Markkinointi&Mainonta (M&M, Marketing&Advertising). All the quotations taken from economic press are originally published in Finnish. The English translation is done by the researcher.

Besides the above stated questions this study pays attention to the appearance of the relationship of design and economical issues. For example, the effects of the economic recession of the 1990s are discussed in detail. Consequently, this paper deals with design discussions on the level of three cultural conventions analysed from the data. These classified themes are considered in detail in the following chapters.

The research method applied in this paper is a rather well-known and quite simple approach to study qualitative texts and their content: classification of themes. The nature of classifying is rather heuristic than strictly methodological. On the other hand, flexible research method is applicable in qualitative research setting in which the purpose is to describe the "design phenomenon" in press and find new categories. In many cases strict data analysing method guides also the results of the research (Gadamer 1975). When the method of analysis is fixed from the very beginning the results can be distorted. After all, discourse analysis will provide discourses and frame analysis some frames despite the differences of the data.

The analysis and classification is focused on the usage of language and on what kind of meanings press articles are mediating: to conceptual classifications and to different meanings language can transmit. Basically, social reality is produced in various socially determined conventions. This socially constructive approach means that social meanings, communicative aspects and culturally orientated issues behind the texts have control over other relevant factors. The usage of language is not seen as a bridge to the reality, but rather as a part of reality. In the event, radical interpretation could state that the results of this research are shaping the perceived reality. The researcher's central challenge is not a perception of different systems of meaning but a detailed analysis of ways of using these systems. In the case of design in the economic press context it seems that various benefits that could be gained applying design are in focal interest.

This paper is based on qualitative examination of economic newspaper articles. The applied method of interpretation, classification of themes, can be divided into three general procedural phases. Firstly, the repeated representations of design were recognised and isolated from the irrelevant part of the economic press data. Secondly, these representations were classified based on topicalisation, functions and goals these representations were emerging for. Thirdly, classified themes were compared in a cultural context: three different classes or themes of how design is represented were formulated.

3. The frame of economy - the meaning of design in market

The actual substance of economic press is to communicate various international and national economy-related events and news to citizens. Economic press is also describing widely the actors as well as phenomena taking place in the market. Design and particularly industrial design is attached to this context quite easily. Industrial design is discussed in relation to international competitiveness as well as activities of individual companies. In economic press articles different interest groups are bringing forth relevant issues from their own point of view. For example representatives of companies, designers, design managers, policy and political actors and institutions promoting design are interviewed in various occasions. Also journalists are expressing themselves through apt columns.

Basically the articles of economic press are considering industrial design. Traditional applied arts are also present, but lesser extent. Cases of unique design or heavily art-based "Arts and Crafts-design" are quite exceptional. It is quite obvious that economically modest handicraft design is not the most interesting area of inquiry in economic press. Discussions are concentrating on the role of industrial design in the context of international competitiveness. Focus is on design as an exploitable resource in increasing nation's competitiveness. Economic press data include wide scale of articles in terms of text type or text genre. For example, economic press described in detail in 1998 published national report that pinned down the present state of Finnish Design and possible future scenarios (Korvenmaa 1998; 2001; Rynänen 2006b). Another example is the launch of national design policy program and the preliminary preparations that took place in the late 1990s and in the beginning of 21st century (Saarela 1999; Valtioneuvosto 2000). Articles that are closer to consumers' or customers' everyday life deal with role of design in general betterment of the Finnish society.

Describing design is heavily related to continuous change and ever tightening competition. In many cases these scenarios of tightening up economic situations are built on various discursive constructions (Hall 1999). Interestingly, issues and aspects the media communicate can develop in quite rapid phase as general information or "well-known fact" that is repeated over and over again. Privatisation, incorporation, outsourcing, networking, innovation and creativity-generation are examples of hype-words that are usually linked to industrial design in the economic press. These are representations that "efficient" industrial design should turn out in industry. On the other hand, representatives of design are characterising the management of industry as backward-looking. It is emphasised that attitudes towards design are negatively loaded in industry. It is argued that this is a great part of explanation why industrial design is not exploited in its full potential.

"At the same time, when art penetrates even deeper to industry, the advancement of bio-, material- and information and communication technologies will provide new challenges to design. In a broad meaning design carries product's, process's or experiences total message. Highly aesthetic expertise has to be elevated beside the technical and commercial knowledge. Also industrial corporations have to employ people that understand how combination of virtual, visual and experiential influence increasingly to the choices of people. The result of manufacturing has to appeal the user and buyer and it has to fit in the environment of use. [...] Linking shape and content to smooth part of Finnish industrial and commercial success story will be the great challenge of the next decade." (KL 4.11.1999)

In any event, every interest group sees industrial design and creative product development significant regardless of the level of discussion (international competitiveness, company level, consumer's wants/needs). The basic thought is that design has to be raised on the strategical level in companies' activities. It is underlined that design should be the basic principle putting together company's strategical planning, business operations and the value increasing process. Mentioned goals are valuable, but from the aspect of another discipline argued visions might appear quite megalomaniac. In the cultural development of design this is not peculiar in any way. In the "golden age" of Finnish Design media was made good use of telling unrealistic stories (see Kalha 1997).

In economic press articles financial and economical benefits are emphasised across the board. Designers' arguments consider the usefulness of design, and they use frequently economical and marketing related terms. In this sense interests are unified and industrial design as well as economic-related development is highlighting the same goals. Contacts to industry are important because industrial design consultancies and in-house design organisations have to be able to provide products that function on several levels for their customers, and ultimately for consumers.

It is emphasised in many occasions that industrial design can provide high-technology products which are understandable, more enjoyable and more desirable for consumer. Some of the companies compete not so much with functionality, but with "pure design". In particular, customers may be design-conscious, and judge new products not just in terms of the qualities of products, but also in terms of design. This seems to be the case in some consumer products such as mobile phones and - perhaps - cars (Järvinen and Koskinen 2001, 172). In economic press industry is represented as being interested predominantly to utilise professional industrial design in product development processes and when strategical advantage can be reached applying design to existing processes.

Articles are mostly positively-orientated. Especially gained advantages and benefits are emphasised. Negative commentators are highlighting missing or shorthanded state subsidies allocated to design promotion. Other negative comments are explicitly in relation to industrial design. These are lack of common sense in applying industrial design or underutilisation of industrial design in companies' product development processes. As a consequence of underutilisation the press articles state that useful resources are being wasted and competitive advantage is critically weakened. All of the above mentioned consequences are built on the main argument concerning economic success or loss of it in the near future. Industrial design is represented as culturally relevant activity in the context of economic press whether the focus is on international competitiveness of the nation or successful product development of a firm.

The connections of design and the economy seem to be important. The research reports that address the relations of design and the economic gain are not so outspoken. Measuring the financial benefit of design has proven to be quite difficult (Calonius 2002; Calonius 2004; Gorb 1990a, 2; Lindström 2005; Lindström and Pajarinen 2006; Lindström, Nyberg and Ylä-Anttila 2006; Nyberg and Lindström 2005; Sulonen 1968, 115). The results of research are on a general level and findings are based on then measurement of opinions of the corporate representatives (Nyberg and Lindström 2005, 21). In next chapters the classified themes of design and economy are discussed in detail.

4. The themes of design in economic press

4.1 External competitiveness - Design as an agenda on a national and industrial level

Finnish Design is internationally known and well appreciated. This view is repeated in the media, also in the economic press, and it is based mainly on achievements of traditional history of Finnish Design (Kalha 1997; Takala-Schreib 2000). This discourse of the "golden age" of Finnish applied arts, spanning roughly from 1930s to 1960s, is still visible in

economic press articles. In more contemporary settings and especially in the context of an economic activity this historical fame cannot carry far. In the context of economy there are representations that highlight the role of design as a leverage pulling up the Finnish manufacturing industry. It was noticed that when the design discussions began to move to the field of industrial design in the 1970s, the commercial aspect was also emphasised. The surrounding culture was pushing forth economical issues in Finnish society. The message in the economical press articles is quite clear: it is worth to invest industrial design in order to gain competitive advantage.

Research data starts from the late 1980s when Finnish society faced the major economical upswing usually referred as "the casino years". Despite that, in those days design representations were low in numbers in economic press. In the beginning of the 1990s Finland was descend into exceptionally deep economic recession covering years 1990-1994 (Kalela et al. 2001; Kiander 2004). In the first years of recession design writings are related to international competitiveness and to "the ethos of surviving", that is how to outcome the recession and what would be the means to achieve this goal. The recession fell also on the design companies, but still unsuccessful design solutions were never accused as a reason for the recession. Several articles were emphasising Finnish design know-how's uniqueness and ability of design to ease the economic situation of the firms'. In addition, various design quarter's encouraged industry to exploit the benefits that design could provide in reviving market. The recession made it clear that economic issues, communal aspects and cooperation are fundamental parts of industrial design. Basically, the smoothness of design collaboration is constructed on outlining consumer's general usage-situation, efficient product development process and business activity as profitable as possible.

"Finnish design is going through tough times. General recession kills design firms around the country and whole industries are in danger to vanish for good. [...] – The problem is how to bring both designers and industry to the same table. There are plenty of examples in Finland how well-managed company combined to adept design will provide viable industrial manufacturing. – Design provides the needed surplus value for a product. Since the world is already full of things, design remains almost the only mean to shape product's identity." (KL 10.5.1991)

"So far Finnish industry does not exploit design properly. Industrial design as a term is, unfortunately, hazy to the corporate management. [...] Industrial design is a natural part of product development, Arts and Crafts -based design is totally another topic. – When SME entrepreneur overhears the word designer, he or she thinks that people are talking about some artist, who draws beautiful pictures. However industrial designer is a professional operating in the middle ground of engineer and artist. But the fault seems to be with both parties [...] industrial design having also been underdeveloped as a business activity." (KL 25.10.1991)

When economic recession tightened up the national economy, the international competitiveness was emphasised even to a greater extent. The rhetoric of competitiveness was applied in other contexts as well (see Heinonen 1992; Heinonen et al. 1996). In economic press articles there is also reappearance of "Finnish Design discourse", aspiration to find the guilty ones and reasons why design was withering (Kalha 1997; Takala-Schreib 1995; Takala-

Schreib 2000). There are also discussions concerning the new economical upswing that will strengthen the Finnish competitiveness.

“The state of Finnish design has been under the debate a lot and long. Term 'Finnish Design' is nowadays only a nice memory, and so will be the case soon in many design based industries. Domestic textile companies goes down one per week, exports of the furniture industry is almost stagnant, glass industry is in danger to disappear for good. The international success story of industrial design for the last years, too, takes the only form of a mobile phone. The core of this problem is in concept of applied arts. When designers' and industry are not collaborating, there exist on grounds for businesses to survive. Designers shift the blame onto industry, the companies for not understanding the additional value design brings to manufactured products. Whereas in industry the designers are seen as hard nuts and very troublesome people to cooperate with. [...] Still some of the companies have succeeded. Almost in all of these companies design plays a major part in a finished product. [...] - Whole societal atmosphere was different after the Wars, full of hopeful entrepreneurship. Of course that reflected to design. – Now people are living in a totally different industrial environment, but designing have held the standard.” (KL 10.5.1991)

During the 1990s economic recession missing design activity was linked to companies' backward product development process and incompetency to exploit competitive advantage design could provide. Virtually, the background themes were the same in the 1970s when oil crisis swept around the globe. In those days environmentalism, ethicality and general responsibility were issues that surfaced in a rapid phase in the field of design (e.g. Papanek 1973). In other words, communal issues and increasingly also the globalisation contribute to design representations in economic press (Ryynänen 2006a). In the beginning of 1990s ethically acceptable, aesthetically developed and sustainable product development was, at least on discursive level, highly appreciated. These issues were seen as means to increase products' value and quality perceived by consumers. It was suggested that the above mentioned goals and also increasingly appreciated symbolic meanings could be achieved by applying design to the product development process.

”- Finland is in economic crises and companies are suffering. The international competitiveness of our companies ought to be supported. The best option is to increase our products' value; to better the value consumers' perceive. [...] In post-industrial society markets are matured. In many cases technical product development is advanced to the optimum. When every stereo set are technologically in top class and shoes are ergonomically good, differences are created only by branding and through symbolic meaning creation. – Products are turning out to communication devices. [...] When the technical quality is self-evident there will be a need for another kind of quality. Products must turn out ethically acceptable, good looking and environmentally sustainable.” (KL 20.8.1992)

Highlighting the symbolic meanings is common in consumer societies since the 1960s (Baudrillard 1970; Featherstone 1991; Ilmonen 1993; 2007). It is suggested in economic press that it is the role and task of a designer to create symbolic meanings to manufactured

products. Production of cultural meanings is usually linked to rise of consumer culture, symbolic meanings of products, lifestyles, consumer differentiation and distinction. (Hall 1999; Lury 1996; Slater 1997; McCracken 1988; Julier 2000)

The role of design as a provider of international competitiveness surfaces again in the late 1990s in economic press. Using design as means to leverage international competitiveness of a nation is not solely a Finnish phenomenon. In the economic press there are writings that refer to Nordic discussions concerning industries ability to exploit design in global markets in its full potential. This all-embracing promise is also heavily questioned. Designers claim more investments to industrial design activities and at the same time the role of marketing is argued as too strong in product development especially when design related issues are under consideration (KL 28.11.1990).

”In the competitive situation design is a focal element to distinguish one self from others that master similar technological innovations. A central part of good quality is the finished off design. – Design classics have achieved an enduring reputation. [...] Design is at best when people do not notice it. Part of the everyday life quality is also that the shape of the door handles makes opening easy and smooth.” (KL 12.11.1998)

In the beginning of the 21st century the relation of design and international competitiveness is constructed on activity taking place mainly in companies. It is emphasised that design is an essential part of the product development process, not an extension or a last phase of it. Design matters not only in the case of product's appearance but also in terms of ergonomics, work safety and usability. In terms of competitiveness obsolescent appearance gives a retarded image to the product, which in turn is crucial for the success. Economic press articles address that internationally known product or brand image will be important in the future. It is argued that successful design will provide additional value from which also a consumer is willing to pay more.

The theme of competitiveness is regularly emphasised in media. Still, the striving for internationalisation of Finnish companies' has been modest and usually manufacturing-led (Salimäki 2003; Tikkanen 1994). Salimäki found that internal efficiency, price competitiveness, research and design-led differentiation were highlighted as subjects of further development in companies. From this point of view the connection of design and international competitiveness seems to be a discursive construction. The existence of this construction is validated by listing every positive thing in the context of economical activity that design can provide when applied professionally. On the other hand, international competitiveness is a quite abstract phenomenon and concrete examples are few in numbers. In many cases article texts are embellished with rhetorical devices. The case is about various individuals, groups and organisations and the interests of these actors. The rhetorical devices are employed whenever it is necessary to fight for the design cause.

4.2 Companies internal efficiency - design as a practical competitive advantage

Economic press articles addressing the recession in Finland in 1990s, exporting design and the role of design in international competitiveness are all in relation to economic activity on a macro level. When the scope is moved onto a more pragmatic level the activities of companies are emphasised. This means that discussions shift away from general competitiveness of the nation to more tangible competitive advantages companies employ. In the case of design the discussions concentrate on cost savings and on benefits design can provide to companies.

In theory, an investment to product design should benefit the manufacturing company, affect positively to sales, market share, profit, and increase the growth of the company in the long run (Roy 1990, 49; Ughanwa 1989, 297). New demands are set for designers in the business context - in international competitiveness discussions stated design being beneficial in general. When design is being considered as a competitive advantage the requirements are set differently. Besides technical know-how designers have to be aware of industry's prospects on market, be familiar with materials and company's productive machinery. All of this information is applied to design process in order to increase the company's competitive advantage, to create cost savings and products' manufacturability. In addition, this activity has to be controlled in which case "Design Management" structures are vital in an organisation. Furthermore, it is argued that designers are lacking proper commercial skills and they do not master properly useful economic parameters (for example return on investment, ROI) in managing design function in a business organisation (Blaich 1993, 91-166; Heskett 1989; Lorenz 1986, 104-113).

Design consultancies approach this theme from slightly different angle. Consultancies are providing knowledge-intensive business services to industry when economic and market capabilities are connected both mastering consultant's own business and value production to client company (den Hertog 2000; Kemppilä and Mettänen 2004; Lith 2003; Luukkainen and Niininen 2000; Hakatie and Ryyänen 2007).

Pictures 1 and 2. Cobra-diving computer has made Suunto industry's trend-setter. Wrist computers help both extreme and novice athletes. (Picture 1: Outi Järvinen, TalSa 27.1.2004). Mobile phone companies have the courage to trust design. Benefon mobile phone in exhibition of Design Forum Finland. (2. Picture: Outi Järvinen, TalSa 14.3.2001)

Both industrial manufacturers and design consultancies are developing good quality products in the representations of the economic press articles. This development is done in a balanced way - in the end, product's price and the manufacturing costs have to be tuned in for profit-making. Efficiency-based design discussions have also surfaced in economic press articles. Design has a role in the articles considering economic efficiency generation (Hakatie and Ryyänen 2007; Ryyänen 2006a; Ryyänen 2006b).

”– Small and medium sized companies have not entirely understood the meaning of design. Design has to be in fit if company wants to succeed in the market [...] Two basic structures of design are beauty and practicality, aesthetic and functionality. Sheer beauty is not enough but design has to support the usage of a product. Successful design is user-friendly. [...] If there is success, where are the new stars? Where are new sarpanevas? - Nowadays, design tackles so complex problems that one person cannot handle it alone anymore. Product design is done in teams. In these teams, there are individuals that each has his/her own and unique capabilities [...]” (TalSa 2.7.2002)

Term "design management" was already used in the 1960s to describe various tasks in managing designers and to describe design managers' different organisational roles (Farr 1966; also Borja de Mozota 2002, 82). From companies' aspect managing design is something more than merely managing designers' daily work routines. In large design organisations design manager's tasks can vary from sketching design scenarios to organising meetings. Design management tasks vary in detail also when in-house organisations are compared to design consultants (Valtonen 2007, 175-177).

Michael Farr approaches design management as an activity: design management is a function which defines design problems, takes part to search for suitable designer and enables a designer to do his/her job in terms of schedule and resources (see. Farr 1966, 3). Farr's point of view emphasises strongly smooth cooperation in an organisation. Peter Gorb defines design management broadly as distribution of design resources in an organisation in order to achieve planned goals (Gorb 1990a, 2-3; Gorb 1990b, 10-11). Successful allocation of design resources makes it possible to attain product innovations, quality product development, and development of product group. Design management is also applicable in coordinating inter-organisational design processes, in product simplification and in promoting certain product groups (Gorb 1990a, 4; Ughanwa and Baker 1989, 31).

Robert Blaich divides the tasks of a design manager to four distinct areas (1993, 14-15). Design manager takes part to creation of company's strategic goals and commits to follow this strategy through in design organisation. Secondly, there are design resource-related management tasks, and thirdly there is concrete design process management which is connected to company's overall product development process. Lastly, design manager's task is to create and maintain knowledge and idea networks. Prevailing practice of design presuppose active cooperation and communication outside one's own organisation (Hasu et al. 2004). Mike Press and Rachel Cooper noticed that design is in interaction between the industry and the society generating a possibility to accumulate profits and express company's social responsibility (1995, 3). Thereby it is possible to link design to the wider contexts - design management is connected to social, cultural, technological and commercial aspects.

In economic press articles design is represented as a led process. It is said that the identity of a company is in its products and product design. The same style must go through product categories if the goal is a coherent corporate image. Thereby design management is the basic tool for corporate communication, a strategic factor and an issue for top level management. At the same time the frames of economy and marketing are becoming more important - design activity is budgeted and more accurate accounting takes place (KL 6.5.1988).

”Design management is about controlling the corporate image. This presumes centralised management of design and planning activities. Also communications and external image of corporation has to be connected to design management. [...] – There is a remarkable monetary value of design and losing money is never desirable. It also means that a company should have a separate budget for design.” (KL 2.5.1988)

When the design management is under debate, the role of top managers' attitudes are set in high priority. The behaviour of the management is seen as one of the most crucial issues concerning successful design. Design consultants can provide guidelines and ideas, but realisation of the ideas has to take place inside the organisation. The encouraged commitment to design is needed. It is noticed that the commitment of various parties, clarity of assignment and focused distribution of work tasks are critical in terms of successful design project (Hakatie and Ryyänen 2007).

The expanding role of design in companies and in industry is emphasised in economic press articles. At the same time industry is encouraged to exploit Finnish design capabilities that are verified with research findings. Arguments state that proper exploitation of design will provide badly needed competitive advantage.

Design as a competitive advantage of a company is linked to other issues in research data. It is claimed that designers are approaching the products and issues under development from different angle. When routine procedures are questioned there is room for new and simpler solutions. It is argued that result is cost savings, sustainable corporate identity, and company's products or services will be personified and differentiated from rival products and services.

”Design is greatest differentiating competitive factor today [...] It has been surprising how fast the meaning of design has increased. [...] Products are quite similar in terms of technological standardisation, which has increased the meaning of product appearance substantially.” (T&T 26.4.2001)

Good design does not ensure the success in all the cases. As mentioned, it is probably that when the standard of living rises people want to consume and own different products. The control of product variation and stream-lining the product groups are on the domain of design function. From this aspect design is one part of brand building. Several articles addressed that a successful product is based on the functionality or how does the product fulfil the purpose of use. In addition, the role of creativity, manufacturability and fitness to desired price segment are highlighted in the articles.

In the last years of the data there are still discussions going on concerning design, industry and possible competitive advantage created by design. The highlighted benefits of design are furthermore almost the same as in the late 1980s, but there are also some new themes as well. There is, following the spirit of times, brand rhetoric, design connected to innovation activity, and the strategic dimension of design. Before emphasis was on controlled corporate image, design management, market know-how, and discussions concerning general betterment of design.

"Design could be used in differing products, services and operation processes. It makes products understandable and easy to use. Design makes product attributes and corporate know-how visible. When applied products will be more attractive, desirable and product's brand image will become stronger. Strong brand is something that people are willing to pay more. This equation is familiar to everybody especially from luxury markets. Successful design decrease manufacturing and implementation costs. Design is not something cosmetic glued on the top of a product, decoration or some brand-tape. When applied professionally creative designing rises from the needs of people. Or as professional designer say: user centred innovation activity. The full advantage is gained when design is brought to strategical level and when it is integrated to company's every function. The deeper design is integrated to company's innovation activity the greater will be the gains attained [...] International research results show that design intensive companies are succeeding better than their competitors. The same goes with nations and geographical areas." (KL Presso 5.8.2006)

Increasingly faster changes in international economy, the advanced competitiveness of developing countries and differentiation of geographical areas fuelled by the globalisation are also mentioned in economic press (also Ritzer 2000; 2004; Urry 2003). Life cycle of the products' has shortened, which demands the time span of product development also to be shortening. Companies have to create and produce novelties and new innovations increasingly faster pace (Lorenz 1986, 43). In addition, the role of the consumers' and customers' in product development is stronger than before. In 1999 Design Forum Finland's managing director Anne Stenroos includes also the societal and cultural aspects to the list:

"Contemplating the state of design is topical nowadays. The countries that do not have a long design tradition like Finland does, have noticed that design is a considerable factor [...] It is crucial to understand that design has both economical and societal influence. There is also a strong cultural effect [...]" (T&T 28.10.1999).

4.3 Design and the benefits on a marketplace - The role of consumers', customers' and users'

”- When companies compete with similar products, when manufacturing costs and product attributes are the same, design will be the differentiating factor and the reason for choosing the product. – People have always been interested in well-designed, aesthetic products. Nobody will wake up in the morning and say: today I'll go out and buy some truly bad and faulty products.” (KL 28.4.2000)

Previous quotation positioned industrial design towards the experiences of consumers' and end-users'. In the end, the success of products' and services' are defined ultimately in markets where consumers are making their undisputed judgement by purchasing products. Yrjö Sotamaa, the rector of University of Art and Design Helsinki starts his column in *Kauppa-lehti* Presso by considering his own consumption choices in relation to design.

"The product has a second or a couple of seconds to win my interest, otherwise it will remain in shelf as a loser. How to beat competing products, which product (brand) promises most, which functions best, which matches my life style and feelings? Same questions arise everywhere whether the topic is about clothing, cars, mobile phones, make-ups or flights. The markets of plenty and increasing competition make differentiation created by design a vital condition. Brand image created by design is crucial. Brand crystallises consumers' rational, functional, emotional, and symbolic values. The relationship between people and products is deeper and more multidimensional as usually is thought. The stronger the emotional and social relationship is towards a brand the harder it is to choose differently." (KL Presso 5.8.2006)

In this theme the central factors are distinguishing the products from others. At the same time, styles and fashions are strongly indicative to culture from the aspect of consumers'. In consumption process routines and traditions are playing roles besides different styles and fashions (Corrigan 1997; Gronow 1997; Ilmonen 1993; 2007, 247).

Design was connected to style in examined economical press articles. Especially in the case of information technology design will be emphasised in the future. Frequently stated argument is that technological standardisation launched the era of low prices - now design is perceived as an element which differentiates the products and which has a remarkable effect on consumer's purchase decisions. At the same time, creating a personal product image will become important especially in consumer products. Articles stress that style is something in a product where a consumer can identify him/her self (TalSa 4.10.1999). Successful products embody attributes that address consumer personally and individually. Style must be enduring, because by definition stylish product cannot become obsolete. Questions of emotions, style and fashion are related especially to mobile phones.

"Designers of mobile communicators are taking into account ergonomics as well as emotion. 'Using a mobile phone should be like looking to friends face' [...]"

Style is more and more important, products must lead the trends". (TalE 10.12.1999)

"Fashion is a remarkable market factor in mobile phones [...] – The charm of novelty is influential, same products and gadgets will not please for long. [...] New design stands out and it will sell. – Producers have to consider how various needs of different users are fulfilled. Mobile phone manufacturers are studying methodically consumers' attitudes and lifestyles, and the knowledge is applied in the process of new product development, design and marketing." (TalSa 10.9.2003)

The relationship between branded product and design is under debate in economic press in the beginning of the 2000s. Before that brand and design discussions are quite few in numbers. The connection between brand and design is manifested to a question of how designing the product could change and develop a brand perception. While brand and product portfolios are expanding the product range and assortment have to be fixed and accurately tailored. Single product must carry the same features that a product category in order to be recognised as a product family. It is noticed in the articles that daring or futuristic design may as well fail or succeed. There is no general formula for success stories in the field of design (KL 27.5.2003). Companies are striving for balanced differentiation through brand image: excessive consumer adulation could end up to a dull and mediocre product that nobody is willing to buy.

In addition, it is mentioned that the meaning of design in communicating company's brand is understood better from the late 1990s. Design is seen as a factor that could be used in communicating companies' strategic identity. Thereby product design cannot be in conflict with brand image, and product design should be supported by the means of strategic communication (KL 29.11.2004).

"– Do you know what is common with mobile phone business and Iittala's business? The three most important things are brand, design and logistics, answers Lundmark² himself. Out of these three brand and well-working logistics are vital for the crane company, design is also a useful activity. Lundmark sees traditional machine shop industry in a same path the electronic industry went already in the 1990s. [...] Images and ideas are important in crane business. – Brands are not significant only in consumer product business. People make the decisions; people are also buying the cranes. [...] – The meaning of brand is increasing in traditional industry, but it is only possible to build on a real product substance." (TalSa 12.3.2005)

Bringing brands and branded products to the discussions of design is connected closely to companies' aspect to consider consumers and the market. There is also pondering and willingness to understand the meaning of consumer and customer in products' manufacturing processes. This connection of consumers' to the success of designed product is quite new

² Pekka Lundmark was at the time of interview the CEO of Konecranes Oyj (global company designing and manufacturing large industrial cranes)

phenomenon described in economic press articles. In the 1980s companies' design management, general competitiveness and competitive advantages were focal points of the discussions. In the beginning of the 2000s consumers and their needs and wants are appeared to the industrial design writings. Companies are also interested in consumers' reactions towards design and their possible participation to product development.

The product development and design are characterised as customer orientated or user centred. From this point of view product's usefulness, ease of use and desirability are defining the success in the market. All of these three factors are important to consumers or customers both in making buying decisions and when using the product. Above-mentioned reasoning leads to argue that product's success follow automatically if consumers are willing to choose the product. Higher price and "good" design are also connected together (KL 13.3.2003). Desirable product must also create new content to consumer's imagination.

”What a consumer wants to buy in the future? Smart house, where all of the operations of home will be taken care of by pushing a button? Quality time with family? Third generation mobile phone and connection provided to everywhere and all of the time? Or perhaps products whose eventual purpose of use consumer can affect him/herself? [...] Over emphasising of technology will lead to a situation where the ultimate solutions are provided to the consumers - then these perfect solutions are rejected. Most fit and interesting solution will turn up through a dialogue. [...] - Companies have to learn to tolerate their own mistakes, and to take into account that estimations concerning the purpose of use of their products or services might be wrong. This is the reason why product development and design should be as explicit as possible so that users could participate to defining the final use situations. [...]” (TalSa 10.5.2000)

In the economic press designers are emphasising the functionality and usability of products in contrast to "styling" or re-designing the external surface. In a larger context journalists writing in economic press consider consumption and design as a phenomenon taking place in a society and which are interlinked to societal development. While the standards of living achieved a higher level also the aesthetic values of different products are gaining greater importance and meaning in consumers' lives. Design and luxury, maybe even some sort of consumer "flirtation" through using and owning designed products is noticed in economic press articles. Showing off is not any longer connected to vanity or considered as negative trait of a human being. Aesthetic values are attached to Finnish tradition of industrial design.

”At best designer is a link between consumer and producer. Design can connect company's know-how to their products in a useful and even artistically enjoyable way.” (KL 11.4.1990)

What consumers then want? Stories, experiences, stylishness, creative solutions and new innovations are central issues that consumers are looking for, at least in the representations of economic press. Consumers themselves have not given the above answer. It is more common that the statements are articulated by design consultancies, representatives of consumer product manufacturers and actors that promote design (KL 25.10.2002; TalSa 16.2.2002; TalSa 14.8.2004). Is customer the king or is consumer always right? In economic press articles this arrangement is not questioned, but still consumers' or customers' rights are under

the debate and they have to choose products from those offered on the market. It seems that productions' push -model is increasingly changing to consumer-led or demand-led direction.

More and more attention is paid to consumers actions. From the aspect of design it is noticed that consumers acquire from two products the one which is more elegant and easier to use. Bringing consumers' thoughts and ideas to the design process is not only the issue in companies' strategies. More traditional applied arts and companies that base their business on applied arts are also taking consumers more seriously than before. The reactions of consumers' and the link between artistic work and business are under considerable debate. In addition, design is redefined in relation to consumers' dominating role in companies product development processes (KL 13.11.1997; KL 15.4.2004).

5. Discussion

On the level of products and consumer commodities not only the functionality but increasingly also the cultural signs and messages transmitted via design help to characterize the habits and socio-cultural profile of groups and individuals. In this way the immaterial, cultural-based values have become vital in design practice and the new product development it serves. (Järvinen and Koskinen 2001, 11). New innovations utilize cultural understanding often in a highly conscious manner. Culture can be an important source of new ideas and business. At best, it can articulate scientific, artistic and popular cultural values in the marketplace in those products that people use in their lives (Järvinen and Koskinen 2001, 12).

The cultural reflections of Finnish design and representation in economic press seems to divide in three dimensions. Firstly, the general themes of the recession and international competitiveness were emphasising the role of design on a national and international level. Secondly, recognised theme was linked to a more concrete level and particularly to companies striving to achieve competitive advantage when compared to rivals. Also issues concerning design management and creative product development process were connected together. Thirdly, economic press emphasised consumers' and brands' meaning and their relation to design. All of these three themes were in context with economic issues. Usually culturally orientated and understood design was now connected to management systems, quality production, consumers and fragmented markets.

"Made in Finland" is again a guarantee of quality in international markets, as CEO Pekka Paasikivi of Oras Oy said in Kauppalehti interview in 7.11.2002. Especially Nokia's pioneering work in electronic industry, Finland's membership of the European Union and the particularly good statistics of international competitiveness have contributed to this development. In consumer cultural context industrial design can be seen as a part of both national economy and more concrete business environment (Lindström et al. 2006). The economy is naturally an ensemble of its own, but promoting and developing design takes place also in other fields as well. Particularly, design policy and governmental decision making, design education, actors and organisations promoting design are in interconnection with each other. All of these actors are marking the culturally understood themes of Finnish design.

In the research data examined, there were three means to represent design in cultural context. For example, culturally distinct way to represent design as a means to develop international

competitiveness in a situation where technological advancement did not produce needed edge anymore. Companies' internal efficiency and competitive advantage that could be gained through properly applied design was second mode of representation in economic press. Lastly there were the attainable benefits of design in marketplace. This meant highlighting the role of consumer and consumption in general. In international discussions that concerned competitiveness, national economy and the great recession in the 1990s were essential. Another theme concentrated, as mentioned, on companies possible benefits when applying design, efficiency, cost savings and competitive advantage provided by design. In the third theme customers' and consumers' convenience and benefits were discussed. In addition, product differentiation, marketing and brand value were connected to design activity in manufacturing companies.

In consumer products, consumers' emotions, experiences, as well as fads and fashions play a crucial role in decisions concerning what is deemed desirable and what is not. In contrast, in business-to-business sectors, professional buyers stress features such as reliability, performance, cost-effectiveness, and maintainability. (Järvinen and Koskinen 2001, 117). Consumers or customers, depending on what industry is producing, gain quite much importance in economic press. End-users or in many cases consumers appreciate products' or services' technical functionality, usability and convenience. These attributes are seen as self-evident. Consumers are appreciating rather enjoyable products, pleasure, feelings and new experiences. Technical functionality as a base attribute seems to be moved to "experiential" use value. In these cases products and services are built on individualistic "internal spirit" (see Pine and Gilmore 1999). In the light of critical articles the main thing is not linked to production per se. Successful companies have to understand different consumers and they have to build individual experiences through goods and services. Product's visual age and ageing will most probably be a crucial competitive advantage besides the technological ageing. Experiential part of a product will also affect to the status of a company - this is the reason products experiential dimension is described in economic press to influence on companies assets, advantages and value production processes in the future.

Design does not evolve in isolation from the rest of society. Occasionally, designers are also involved in shaping society and culture at large. Basically, designers create an understanding of what design has to offer. The ideas and arguments formulated by the design world influences economy indirectly. (Järvinen and Koskinen 2001, 131). Consumption and consuming manufactured products has become a key for building differentiation and distinctions between people (Bourdieu 2002; Featherstone 1991, 86; Forty 1986; Hall 1999). Design, consumption and cultural relations are all interrelated to each other constructing a part of contemporary consumer culture. As mentioned before, economic press articles are presenting empirical examples concerning this cultural assimilation in textual representations. Although a major part of economic press articles tackled with productive side of product development design brings consumers and users into discussions. After all consumer culture research is not possible if the "both sides" are not considered. Mass mediated marketplace ideologies are born in cooperation and in a cultural context both production and consumption cannot evade.

"[...] The increasing demand for quality design could be explained by societal structural change. New middle class wants to express their lifestyles and to communicate the social group they belong to. – Designers should consider also

these societal connections. When the way of living change, changes design.”
(KL 30.8.1991)

ALLOCATION OF EXPENDITURES WITHIN THE HOUSEHOLD: A NEW DANISH SURVEY*

BY JENS BONKE** AND MARTIN BROWNING§

***Rockwool Foundation Research Unit, Copenhagen*

§Department of Economics, Oxford University, and Department of Economics, University of Copenhagen, CAM

We report on a new data initiative that is designed to address the question of “who gets what” within the household. The data consists of supplements to the Danish Expenditure Survey (DES) which is a traditional nationally representative, diary based survey of expenditures. We collect supplementary data of two kinds for all couples (with or without children) in the survey. The first addition is that respondents report on the intra-household allocation of each item of expenditure (‘joint’, ‘her’, ‘him’, ‘children’ and ‘outside’). The second addition is an extra set of ‘sociological’ questions concerning household management, autonomy and family background. These types of information for the same respondents may facilitate research bridging the divergent views of economist and sociologists concerning the allocation of resources within the household.

The paper focuses on the survey design and gives some descriptive statistics from the survey. We also show how the distribution of expenditure on clothing, which is investigated in most expenditures surveys, is related to the distribution of expenditure on other goods.

JEL: D13 C81 C42

Keywords: Household Production, Intra-Household Allocation, Household Survey methodology.

Note. The survey was funded by the Danish Social Science Research Council, and by the Danish National Research Council through its grant to CAM. We are grateful for the funding, and we also thank Hans Uldall-Poulsen, Mc. of Economics, for data cleaning and processing.

** Correspondence to: Jens Bonke, Rockwool Foundation Research Unit, Sejroegade 11, DK-2100 Copenhagen (jb@rff.dk).

1. INTRODUCTION

The paper describes a new data source that is designed to throw light on intra-household allocation. That is, for the first time respondents in a conventional family expenditure survey are asked to state for whom the goods purchased are bought. Moreover, information on decision processes for the same households are collected. We hope that having both types of information for the same households may facilitate more economic research on the allocation of resources within the family, see for example Lundberg and Pollak (2003) and Browning et al (2006), as well as sociological research, see for example Pahl (1995) and Heimdahl and Houseknecht (2003), and a synthesis of economic and sociological research in this area.

First we report on a pilot-study validating the formulation of questions used in the survey. Then we describe the data collection procedure in detail and make comparisons with other investigations. We also present some descriptive statistics from the data gathered up until 2002. Finally, we present an analysis of how expenditures on men and women's clothing are correlated with the distribution of spending on other goods. The former is often taken as a proxy for within household allocation so that it is important to investigate how reliable it is as a proxy. The problem of infrequency of purchase of some goods (such as clothing) is addressed in Browning and Bonke (2006), and the analyses of the distributional regime phenomenon in Bonke and Uldall-Poulsen (2006).

The formal empirical tests of the various allocation models will be addressed in other papers. However, we hope that this paper will be of interest to other researchers who are contemplating doing similar data exercises for research in intra-household issues.

2. THE DATA

2.1. *The sample*

Our data are collected in conjunction with the Danish Household Expenditure Survey (DES). This is a continuous survey of approximately 1,000 households per year. It is administered by Danmarks Statistik (DS). The DES includes a questionnaire and an accounting book ('diary'), the latter being self-administered and registering the purchases of each adult household member during a two weeks period (Danmarks Statistik, 1999). We began by establishing a pilot study with DS to find the most appropriate formulation

of extra questions and methods to be used in the project. We only sample households 'headed' by a married or co-habiting couple. Furthermore, to diminish heterogeneity only couples with both spouses between 18 and 59 years old are included in our sample.

The supplementary data collection has two aspects (described in more detail in the two sub-sections below). In the DES, all members keep a diary of their purchases. In the diary we append five columns in which respondents record for each good bought (except food stuffs), for whom it was bought. Specifically they can respond one of: 'mainly for her', 'mainly for him', 'mainly for the household', 'mainly for any children' or 'mainly for someone outside the household'. To our knowledge such information has never been collected before for a wide range of expenditure categories.

To supplement this extra information and the information routinely gathered in the DES we also ask a set of extra questions at the end of the final DES interview. Basically there are three types of questions. First, there are questions on the background of the respondents. These include how long they have been living together and their mothers' labour market status when they were 14. The latter have been successfully used in, for example, analyses of French budget surveys (see Browning and Lechene (2003)). Second, we have a small suite of questions concerning the management of household finances and how much autonomy husband and wife feel they have. These are modelled on questions asked in other surveys that have been conducted by sociologists. Finally we have some new questions about the effect of a hypothetical transfer of income from one person to the other in the household. This is to address directly the income 'pooling' question and to test whether we can obtain direct evidence on intra-household allocations.

The pilot study was conducted in September to November 1998, and the results collected were used in preparing the final questions for the DES. Surveying began in early 2000 and, given our sample selection, we had information on 1372 couples by the end of 2002. One notable feature of survey data in Denmark is that we can use personal numbers to link the survey information to a very wide range of administrative data for each respondent over the period 1980 to 2002. The latter includes labour force status, marital status, earnings and asset income (from tax returns) and housing information. This greatly expands the possible analyses that can be conducted with our data.

In the rest of this section we report on the specific questions asked. An analysis of responses is given in the later sections.

2.2. *The accounting book information*

At the start of the survey period each adult member of the household is given an accounting book (diary) in which she/he is asked to record all expenditures during the survey period of two weeks. At this time some demographic information is collected and also retrospective information on expenditures on large, infrequently purchased items such as cars and electrical goods. At the end of the survey period the interviewer returns to the household and the respondents go through the diary and for each item record who the good was bought for. A code-description is displayed on a card to the household indicating the possible for whom-categories, and for the interviewer the concurrent values are given, see question 1.

QUESTION 1: EXPENDITURE DISTRIBUTION

For whom is the good bought?

- 1 Mostly for the husband
 - 2 For the whole family
 - 3 Mostly for the wife
 - 4 To the child(ren) in the household
 - 5 To persons outside the household (ex. gifts)
 - 6 Do not know
-

If only one spouse participates in this interview an indication should be given by the interviewer in a specific question about this matter. However, this does not prevent the respondent answering on behalf of the spouse, although it might cause some problems for specific items in which case an indication is given to us by the interviewer. Below we report in detail on the outcome of this procedure, but for now we merely report that this step did not present any problems for most goods and most respondents.

2.3. *The interview information*

After having filled out the booklets the respondents are given a questionnaire. This includes questions on how they perceive their own distributional system and the expected consequences of changes in the income-distribution within the family. The regime question - question 2, given below - includes 9 categories inclusive of an unspecified and a do not know category. Most of them follows the categories used in other investigations (see, Vogler & Pahl, 1994) although some minor changes are to be

found. Thus, the regimes saying that the husband/wife has the disposal of some of the housekeeping money and that the wife/husband manages the rest of these money are presumed to be similar to the female/male whole wage systems (Pahl, 1989). The regime stating that some money are conceived as ones own and other as joint money is placed between the pooling and the independent management regimes, a regime not present in the Pahl-system.

It has to be emphasized that the regime question as well as some of the other additional questions are asked to both the husband and wife for which reason the interviewer has to be attentive to who responds to every specific question.

The third question is about autonomy in the spending of money and asks in general terms if the wife and the husband have to discuss their individual buying with their partner beforehand, and if this happens if there is a lower limit of autonomy indicated by a certain amount of money that can be spent without discussion.

QUESTION 2: DISTRIBUTIONAL REGIME

I want to ask you some questions about the way your household organize the economy. Which one of the following ways, as indicated on the card, do you think fits best to the way, your household perform?

- 1 All money are shared, we do not distinguish between “my” or “your” money
 - 2 Some money are conceived as ones own and other as joint money
 - 3 What we earn individually belongs to ourselves
 - 4 The husband manages the money and the wife receives an allowance, when she is in need of
 - 5 The wife manages the money and the husband receives an allowance, when he is in need of
 - 6 The husband has the disposal of some of the housekeeping money, the wife manages the rest of these money
 - 7 The wife has the disposal of some of the housekeeping money, the husband manages the rest of these money
 - 8 Some other arrangement
 - 9 Do not know
-

QUESTION 3: AUTONOMY IN BUYING - ASKED TO THE WIFE AND THE HUSBAND INDIVIDUALLY

How much can you buy for yourself without discussing it with your partner beforehand? Indicate an amount or the way, which fits best.

- 1 No matter what I buy, I usually discuss it with my partner, if it costs more than DKK
 - 2 It depends on what I am going to buy. However, if I find it to a reasonable price, I usually do not discuss it with my partner
 - 3 It does not matter what it costs, I always discuss all my buying with my partner - except small things as newspapers or tobacco
 - 4 Do not know
-

**QUESTION 4: INCOME-DISTRIBUTION AND SPENDING - TRADE-OFF I
- ASKED TO THE WIFE AND THE HUSBAND INDIVIDUALLY**

If you were earning 1.000 DKK more per month (net of tax) and your spouse 1.000 DKK less, would you then spend more money on yourself? It is assumed that you and your partner work the same number of hours as now. It is only the distribution of income, which has changed.

- 1 Yes
 - 2 No
-

**QUESTION 5: INCOME-DISTRIBUTION AND SPENDING - TRADE-OFF
II - ASKED TO THE WIFE AND THE HUSBAND INDIVIDUALLY**

If you were earning 1.000 DKK less per month (net of tax) and your spouse 1.000 DKK more, would you then spend less money on yourself? It is assumed that you and your partner work the same number of hours as now. It is only the distribution of income, which has changed.

- 1 Yes
 - 2 No
-

Questions 4 and 5 deal with the hypothetical distributional effect of a change in the income distribution. Specifically we ask about the consequences of a redistribution of income between the two partners, the first favouring the respondent and the second the spouse. These two questions are asked to each spouse individually.

In the interview we also ask some socio-economic questions. The first of these is on the length of the current marriage/cohabiting relationship (question 6). Another dimension asked for in the DES interview is the family background of the respondent when she/he was a child, see questions 7 and 8.

QUESTION 6: MARRIAGE/CO-HABITING CAREER

For how long time have you been living together with your present partner?
years

**QUESTION 7: ADOLESCENCE CONDITIONS I - ASKED TO THE WIFE
AND THE HUSBAND INDIVIDUALLY**

When you were about 14 years old did you then live together with your mother and father?

- 1 Both my mother and father
 - 2 Only my mother
 - 3 Only my father
 - 4 Do not know
-

QUESTION 8: ADOLESCENCE CONDITIONS II - ASKED TO THE WIFE AND THE HUSBAND INDIVIDUALLY

When you were about 14 years did your mother then work at the labour market?

- 1 Yes, full-time
 - 2 Yes, part-time
 - 3 No
 - 4 Do not know
-

QUESTION 9: THE INTERVIEW SITUATION (INTERVIEWER INFORMATION)

Who replied to the question?

- 1 Both
 - 2 Only the wife
 - 3 Only the husband
-

Finally, we ask the interviewer to record who was present at the interview, question 9, because the information level about consumption is not necessarily the same among spouses.

2.4. The pilot study.

The DES follows a well-documented data-collecting procedure and the validity and reliability of the expenditure information have been subject to different investigations. However, the additional questions asked here, including the ‘for whom’ diary questions, are novel so that a pilot study was performed. In the pilot-study 14 households were interviewed by 4 interviewers (see Table 1 for details). The purpose was to investigate if the questions asked were suitable as well as to examine if the ‘for whom’ questions made sense to the respondents in respect to all the different items bought during the two week diary period.

TABLE 1 ABOUT HERE

The interviewers reported that the ‘for whom’ question did not appear to raise any significant problems for most of the respondents. In general no discrepancy was found between the two spouses in how and what to respond to the questions nor in how to fill out the booklet. It was emphasized that the interviewers had to try to persuade both partners to participate in the interview, and if they did not succeed a note should be

given in the booklet. If only one spouse was present and he/she was not the one doing everyday shopping, which happened in two out of the 14 families, severe problems were encountered. Nonetheless, some families gave examples of purchases, which were not easy to categorize. For example, a bottle of wine which was mostly consumed by one partner but the other had one glass. A curious example of non-response was the buying of Christmas gifts, which the respondent did not want to tell for whom they were bought when sitting in front of a potential receiver! Also the buying of pet-food was found dubious, because pets do not necessarily belong to the “the whole family”-category.

The general instruction was that all goods except foodstuff should be classified in the ‘for whom’ question. However, some foodstuffs, such as ice cream and hotdogs, are consumed immediately where it is bought. In this case the ‘for whom’ classification is appropriate. Foodstuffs not to be classified are thus those brought home to be consumed as they are or after further preparations. All other foodstuffs and other items have to be classified by whom it is bought for, see question 1. Some respondents, however, found it easier to classify all foodstuffs as well, which they were allowed to do. The general attitude among the respondents to the questions was that they were interesting and a nice supplement to the other questions in the Household Expenditure Survey. They were found to fit naturally into the context and nobody were puzzled over the formulations for which reason it was not necessary to stress that it was voluntary to reply to these questions, because they “are outside the aim of this investigation”, as the interviewer-instruction said. Of course, participation in the DES is voluntary as are responses to every individual question.

Even though the list of recorded expenditure items is long, the ‘for whom’ categorisation went quickly. The interview-time in the pilot-study was calculated as 5-10 minutes for the survey-questions and another 10-15 minutes for the supplement to the diary, which gives an overall average of 15.3 minutes. The variation was modest, and even the over 60 years old respondents did not spend more time in replying to the questions and in filling out the booklet than did other respondents. Nonetheless, it was decided to introduce an upper age limit on 59 years for the main investigation - and a lower limit on 18 years.

Concerning the interview questions the interviewers reported that they were easily understood and even understood in the same way by different respondents. Nonetheless,

it was decided to employ more cards to be shown to the respondents, namely one for each of the questions Q1, Q2 and Q3.

Furthermore, some interviewers reported that the autonomy question (Q3) caused some interpretational troubles. The first version of the question, thus, said that for how much one usually can buy for personal purposes without asking the partner, and four intervals were given - 0; 1-199; 200-1.000; >1.000 DKK. Some respondents thought that the question referred to the household budget constraint and not to the perception of autonomy, while other respondents found that the upper level was too low and that responding to given intervals *per se* was inappropriate. For that reason the wordings were changed and an open interval introduced, see the final outcome in Q3.

Question 4 and 5 about the relationships between income-distribution and spending pattern - trade-off - were easily understood, and this holds even though the amount of money referred to was net of tax (a natural income concept for Danes). Finally, it was proposed to change the order of regimes in question 2, so the individual regime (value 3) was mentioned before the partly pooling (value 2) and pooling (value 1) regimes. As the majority of families was expected to belong to the pooling regime the order was kept intact.

3. THE RESULTS

We now report on some results from the survey from 1999 to 2002. Table 2 presents the details of the numbers of people interviewed. As can be seen, in 77% of cases both husband and wife responded but in about a quarter of households we could only obtain responses to survey questions from one partner. Even when only one partner was present at the final interview, all household members kept diaries. In the following all the information on spending behaviour refers to the account book ('diary'). This means that low-frequency purchases are included for a small number of households whereas no registrations are done for other households even though such items might have been bought within the year referred to in the interviews. In Browning and Bonke (2006) a statistical model is developed to account for this infrequency problem.

TABLE 2 ABOUT HERE

3.1. *Distribution of consumption*

In Table A.1 in the Appendix we present results for detailed categories using the DS categorisation of goods. We found it best to focus on potentially assignable (non-public) goods, to exclude durables and to re-categorise specific items to broad categories that more closely approximate those found in other expenditure surveys. Thus we concentrate on the seven commodities: food at home, ‘vices’ (alcohol, tobacco and eating out), clothing, services (household operations), transportation, recreation and personal services. In table 3 we present the proportion of goods distributed among the household members; the proportion of expenditures for which respondents report an allocation; the number of non zero-respondents and, finally, the budget share for each good (as a share of total expenditure on potentially assignable goods).

TABLE 3 ABOUT HERE

As can be seen from column 6, respondents were willing to report allocations for most of their expenditures the exception being foodstuffs. This latter is undoubtedly because we did not require interviewers to ask for the allocation of this good in the first few months of the survey. To be frank, that respondents were willing to allocate expenditures was a major relief for us: even after the pilot it was not altogether certain that respondents would be willing to assign goods. As we might expect, most foodstuffs are reported being bought for the household (87%), and for the remaining part the spouses get the same proportion as the child(ren).

The results on the ‘vices’ category hide many interesting details which are worth reporting, see Tables 4 to 6. From Table 4 we give the distribution of smokers. Half of households have no-one smoking. Of those with at least one smoker, the numbers of ‘both smokers’ are the biggest followed by ‘only husband smoking’, whereas the number of ‘wife only smoking’ are considerably lower. For drinking the pattern is somewhat different (see table 5). About one third of households report no alcoholic beverage expenditures in the two weeks reporting period. Of those reporting some expenditure, the great majority is for the household as a whole, with a significant minority reporting for the husband only. Households in which only the wife consumes alcoholic beverages are rare. Table 6 presents statistics on the allocation of expenditures on alcoholic

beverages, tobacco and eating out. As can be seen, more than half of expenditures are for both partners but the ‘husband only’ is considerable and twice as great as the ‘wife only’ share.

TABLE 4-6 ABOUT HERE

Turning to clothing, we first note that in the DES respondents have always been asked for whom clothing is bought, and therefore used in empirical analyses of for example the sharing rule, see Lundberg et al (1997). We have made comparisons between the responses to these questions and the responses to our new questions on allocation. Not surprisingly, the two sets of information give very similar results, see Table 7. Thus the additional information we collect on clothing is not likely to significantly improve on the previous information we had available. Referring to Table 3, we see that, as in most surveys, expenditures on women’s clothing are higher than for men’s. Furthermore, the child(ren)’s share is also considerable being bigger than that of men but smaller than that of women. We find the proportion of expenditures that are reported ‘for others’ (11%) surprisingly high.

TABLE 7 ABOUT HERE

Household services are mostly reported as being for the household as is transport. Recreation expenditures is a high budget share category, being passed only by food at home. The major recipients of assigned goods are children; this is not surprising since this category includes toys and cd’s. Finally, personal services are mostly assigned to one member, with the wife receiving far and away the largest share.

When we aggregate all potentially assignable goods, we find that the shares of husband and wife are very similar (13.5% and 14.1% respectively). This is extremely interesting given that the allocations of individual goods are often quite skewed. In Browning and Bonke (2006) a more detailed analysis of the distribution of relative shares across households is given.

3.2. *Distributional regimes*

In the sociological literature different distributional regimes are used to analyse the

decision making processes concerning the allocation of economic resources within the family. Among other Pahl (1983, 1989) employs the following distributional regimes;

- *the whole wage regime*, where one of the spouses, usually the wife, is responsible for the management of the total income of the household and the paying of nearly all expenditures, i.e. the husband hands over his income except a minor part dedicated to personal expenditures, or he takes some money back after having handed over the full income to the wife. If the wife earns money herself these will be put on top and used for the best of the household.
- *the household allowance regime*, where the husband hands over a fixed amount of money every week or month for the buying of specific everyday goods. The rest of the income remains in the household for the paying of goods of which he is responsible.
- *the pooling regime*, where both spouses ‘pool’ earning.
- *the independent regime*, where the spouses keep his/her money for own consumption and management. None of the spouses has access to the full income and they are each responsible for the paying of specific joint goods, the decision of which has been taking beforehand.

The interpretation of these regimes is problematic. For example, the term ‘pooling’ referring to the management regime is not necessarily synonymous with ‘income pooling’ as economists understand it. In the sociological literature the regimes are often identified with particular ‘power’ regimes. It could be, however, that they refer only to ‘technological’ features of the household with particular regimes being chosen because they are the most efficient for the household. In such a case one person could be an effective dictator but delegate all of the implementation of the desired outcomes to the other person. One goal of our data initiative is to assess the relationship between the responses to questions regarding management regime and actual distribution within the household. In this paper we shall simply report on the responses and leave the difficult issue of interpretation and inference for future work.

In this investigation we apply similar categories by asking the interviewed persons, which regime they believe they belong to if any, the different possibilities are given in Question 2 above and include a) All money are shared, we do not distinguish between “my” or “your” money, i.e. the pooling regime, b) Some money are conceived as ones own and other as joint money, i.e. The partly pooling regime, c) What we earn

individually belong to ourselves, i.e. The independent regime, d) The husband manages the money and the wife receives an allowance, when she is in need of, i.e. The allowance regime, the husband manages, e) The wife manages the money and the husband receives an allowance, when he is in need of, i.e. The allowance regime, the wife manages, f) The husband has the disposal of some of the housekeeping money, the wife manages the rest of these money, i.e. The whole wage system, the wife manages, and g) The wife has the disposal of some of the housekeeping money, the husband manages the rest of these money, i.e. the whole wage system, the husband manages.

TABLE 8 ABOUT HERE

Table 8 gives the findings from some earlier surveys and from our survey. Most investigations find that the pooling system is the most widely distributed with among 50 per cent of all households belonging to that regime. In this investigation the proportion is even bigger, with two thirds (67%) of all households pooling their resources. Furthermore, in Denmark 6 per cent belong to the individual regime and in Sweden 14 per cent, as opposed to only 2-4 per cent in the other investigations, the exception being the Pahl study (102 cases) in which 9 per cent represent the independent regime. Between the pooling and the independent regime the Swedish and the present investigation operate a hybrid - the partly pooling regime - to which 19 and 21 per cent, respectively, state they belong to. The remaining regimes - the allowance and the whole wage regimes - appear very infrequently opposite to what is found in most other investigations, where between one third and two-thirds of all households report they belong to either the whole wage regime or the allowance regime.

One possible explanation for the differences is that the Danish and Swedish surveys are for later periods and simply reflect changes over time. Whilst this is certainly possible we do not believe that it can be a full explanation for such large differences. There are other plausible explanations as to why Denmark and Sweden are so different to UK, the Netherlands and US. One is that the proportion of dual-earner families is higher in the two Scandinavian Countries than in the other countries implying that the spouses' contributions to family resources are more equal and the pooling regime thus more appropriate. Another is that the family institution is more unstable with more marriages ending up with divorce in the former countries than in the latter countries for which

reason the independent regime is also more likely than other regimes (Pahl, 1989). Tables 9 to 11 presents more results on the management/distributional regime.

In Table 9 we see that households who pool are older and have longer partnerships. There are several possible explanations for the latter correlation. One is that good matches at the beginning of a partnership, or the expectation of such a partnership, are likely to lead to both pooling and to longer marriages, see Stratton et al (2005). It could also be, however, that as marriages evolve the pooling regime becomes more attractive. Without panel data (so that we could observe if long lasting marriages adopt pooling earlier) it is difficult to see how we might distinguish between these alternative explanations. Another notable feature of Table 9 is that the regime does not seem to be correlated with the wife's share of income. Finally, the pooling regime and the individual regime families are the richest the total household income being 19 to 24 per cent higher than among partly pooling regime families. This is probably due to the differences in age between the different households.

TABLE 9-10 ABOUT HERE

To investigate if belonging to a specific distributional regime is partly an inheritance from the parents' behaviour we asked about the labour market participation of the mother of the respondent when they were 14 (see question 8 above). Table 10 indicates that every third husband and wife pooling their incomes had a full time working mother, whereas nearly half of the husbands and more than half of the wives partly or not pooling their incomes are descendants from full time working mothers. Being brought up by part-time mothers, on the other side, means that sons choose partly pooling regimes more than pooling and individual regimes, whereas daughters choose individual regimes more often than pooling and partly pooling regimes. Furthermore, if the mother was not working at the labour market when the respondent was 14 years old, the pooling regime is by far the most often chosen for men as well as for women.

3.3. Income-distribution trade offs.

Table 11 depicts the prevalence of income distribution trade-offs within different distributional regimes. The question is, thus, to what extent personal spending is assumed to be influenced by redistribution of incomes between the spouses. First of all,
