The role of numeracy skills in graduate employability

Naureen Durrani

School of Health, Community and Education Studies, Northumbria University, Newcastle-upon-Tyne, UK

Vicki N. Tariq*

School of Social Work and Social Policy, University of Central Lancashire, Preston, UK

Abstract

Purpose – This article explores the role and importance of numeracy skills in graduate recruitment within a diversity of employment sectors.

Design/methodology/approach – The results of a mixed-methods study, involving three online surveys (including an employer survey), student focus group sessions and interviews with tutors, are presented.

Findings – The results reveal the importance that employers attach to graduates' numeracy skills and the extent to which employers use numeracy tests in graduate recruitment. They thus highlight the potential for poor numeracy skills to limit any graduate's acquisition of employment, irrespective of their degree subject; especially since numeracy tests are used predominantly in recruitment to the types of jobs commensurate with graduates' career aspirations and within sectors that attract graduates from across the diversity of academic disciplines, including the arts and humanities.

Research limitations/implications – Since participants were self-selecting any conclusions and inferences relate to the samples and may or may not be generalisable to wider target populations.

Practical implications – The paper highlights what actions are necessary to enhance undergraduates' numeracy skills in the context of graduate employability.

Social implications – The vulnerability of particular groups of students (e.g. females, those not provided with any opportunities to practise or further develop their numeracy skills whilst in higher education, those with no [or low] pre-university mathematics qualifications, and mature students) is highlighted.

Originality/value – The article is timely in view of national policy to extend the graduate employability performance indicators within quality assurance measures for UK higher education.

1 **1. Introduction**

2 The concept of graduate employability is constructed around a set of complex and diverse
3 skills and personal attributes believed to make an individual more likely to obtain and be
4 successful in employment (Knight and Yorke, 2004). In the UK, the possession of a degree
5 remains a ‘threshold requirement’, with employers increasingly expecting applicants to
6 possess a variety of personal attributes and generic ‘soft’ and ‘hard’ skills (Brown and
7 Hesketh, 2004). Consequently, higher education institutions (HEIs) are now expected to
8 redesign degree programmes and extra-curricular activities to foster undergraduates’
9 employability skills (Knight and York, 2004). Undergraduates too acknowledge the need to
10 enhance their degree credentials through the development of employability skills (Tomlinson,
11 2008). However, since employers’ requirements can change over time, no definitive list of
12 employability skills exists (Knight and Yorke, 2004), making it difficult for HEIs and
13 undergraduates to identify precisely what employers want (Dawson *et al.*, 2006). In addition,
14 the multifarious employability skills initiatives implemented by HEIs do not guarantee the
15 transferability of skills into the workplace (Washer, 2007).

16 Numeracy skills, recognised as being essential to employability, were amongst the
17 skills Dearing considered “*key to the future success of graduates whatever they intend to do*
18 *in later life*” (Dearing, 1997: 133). However, Dearing reported that only one in three
19 graduates felt their numeracy skills had improved whilst in higher education (HE), and he
20 called upon HEIs to do more to produce numerate graduates. Despite this call, in a recent
21 survey of 880 undergraduates from twenty UK HEIs, almost a third (29%) reported feeling
22 their numeracy skills were inadequate (Confederation of British Industry [CBI], 2009).

23 Research from the perspective of employers confirms the importance of graduates’
24 numeracy skills. For example, a study by Hoyles *et al.*, (2002) identified that demand from
25 employers for mathematically literate graduates was growing. Numeracy skills were also
26 ranked as the sixth most important (after honesty and integrity, basic literacy skills, basic oral
27 communication skills, reliability, and being hardworking and having a good work ethic), out
28 of a list of twenty-eight employability skills, by 98% of 500 respondents in an Institute of
29 Directors (IoD) survey (IoD, 2007). Despite the importance attached to numeracy skills,
30 employers of graduates continue to express concerns about the level of numerical competence
31 exhibited by their recruits. For example, 28% of recruiters expressed concerns about the
32 numeracy skills of graduates (Association of Graduate Recruiters [AGR], 2008) and 21% of

1 employers believed that numeracy skills are only ‘occasionally’ or ‘never’ demonstrated by
2 graduates (IoD, 2007).

3 Despite the importance that employers place upon graduates’ numeracy skills, the
4 literature appears unclear about the extent to which numeracy skills influence graduates’
5 procurement of employment, and in which specific numeracy skills employers require their
6 graduate workforce to be competent. This paper bridges this gap by exploring the role that
7 numeracy skills play in graduate recruitment, and the generic numeracy skills employers
8 demand of their graduate employees. It also compares undergraduates’ and their tutors’
9 attitudes towards the development of numeracy skills in the context of graduate
10 employability.

11

12 **2. Methods**

13 *2.1 Participants*

14 Employers invited to participate represented a wide variety of employment sectors (see Table
15 1) and included those listed by Birchall (2007), the *GET 2008 Directory of Graduate*
16 *Employment and Training* (Career Research and Advisory Centre, 2008) and *Prospects.ac.uk*.
17 Employers were initially contacted by email or telephone, usually via their Human Resources
18 (HR) team, with follow-up communications to encourage participation. In addition, AGCAS
19 (Association of Graduate Careers Advisory Services), AGR, UNITE[1] and the university’s
20 Business School Placement Unit helped disseminate the survey via their employer networks.

21 The target populations of students and tutors represented all undergraduates enrolled
22 at a specific post-1992 UK university in 2008/09 (i.e. 24,595 students) and all academic staff
23 (i.e. 1003) employed at the university during that year. Although all undergraduates and tutors
24 were invited (via emails) to participate and were provided with an explanation of the aims of
25 the study and their respective roles, ethics approval for the study required that participation be
26 on a voluntary basis, with submission of a completed online questionnaire accepted as
27 informed consent; all responses were anonymous. Samples of participating employers,
28 undergraduates and tutors were therefore self-selecting and any conclusions and inferences
29 relate to the samples and may or may not be generalisable to the wider targeted populations.

30 *2.2 Surveys*

31 All participants were surveyed using online questionnaires, designed and delivered using
32 Bristol Online Surveys (www.survey.bris.ac.uk). The employers’ survey, devised by the

1 authors, comprised 16 items; 11 items asked participants to select their answer(s) from the
2 options provided, while five open-ended questions sought further information and invited
3 additional comments. The undergraduate and tutor surveys, although designed to investigate a
4 wide range of issues related to supporting undergraduates' numeracy skills, included six
5 Likert items to gauge respondents' views regarding the potential usefulness of
6 undergraduates' numeracy skills. These items possessed four response options ranging from
7 'strongly disagree' (1) to 'strongly agree' (4), and were based upon items originally devised
8 by Fennema and Sherman (1976) to assess the usefulness of mathematics, and subsequently
9 modified and used by Tapia and Marsh (2004) and Kadijevich (2006). The undergraduate
10 and tutor surveys also included items aimed at gauging participants' awareness of and
11 familiarity with employers' numeracy tests, and the students' levels of confidence regarding
12 their ability to pass such tests. Demographic information was also collected from respondents.
13 All three surveys, which were piloted with samples of employers (20) undergraduates (140) or
14 tutors (6), are available at
15 www.uclan.ac.uk/information/services/ldu/every_student_counts.php.

16 *2.3 Focus groups*

17 Five follow-up focus group sessions were held with 29 volunteer undergraduates, and six
18 individual tutors were interviewed to examine the 'why' behind students' and tutors'
19 responses in the surveys. The focus group and interview schedules followed the themes
20 contained in the questionnaires, but were semi-structured, allowing participants to discuss
21 issues not raised previously. All sessions and interviews (with one exception where
22 permission was denied) were audio-taped and transcribed with the participants' consent.

23 *2.4 Analyses*

24 Quantitative data were exported into SPSS v. 17.0 for statistical analyses. Spearman's
25 correlation was used to determine relationships between ordinal variables (i.e. levels of
26 confidence to pass a numeracy test, age and pre-university mathematics qualifications).
27 Gender differences in students' levels of confidence to pass a numeracy test and whether they
28 would like a job involving the use of numeracy skills were explored using Mann-Whitney
29 tests, while differences in these two variables based upon academic disciplines (i.e. faculties)
30 were explored using Kruskal-Wallis tests, followed by post-hoc tests. Differences between
31 tutors' and students' attitudes towards the usefulness of numeracy skills were analysed using
32 Mann-Whitney tests. A chi-square test was used to determine differences, if any, between

1 national (UK) and multinational companies in relation to their use of numeracy tests for
2 different types of occupations. Finally, chi-square analyses were carried out to identify the
3 contribution of factors that might explain the variation in employers' use of numeracy tests.
4 All tests were two-tailed.

5 Qualitative data (focus group/interview transcripts and responses to open-ended
6 questions) were exported into NVivo 2 software for analysis. Thematic analysis, used in
7 analysing qualitative data, involved systematically coding, categorising and identifying key
8 themes within the data through an iterative process.

9 **3. Results and discussion**

10 *3.1 Participants*

11 *Employers.* The 165 responding companies and organisations were classified according to the
12 system used by Birchall (2007), expanded in light of the Higher Education Statistics Agency's
13 (HESA) Standard Occupational Classification for the Destinations of Leavers from Higher
14 Education Institutions (Davies *et al.*, 2003) (Table I). Employment sectors with the greatest
15 representation and collectively accounting for 59% of survey returns included consulting
16 firms (12%), engineering or industrial companies (12%), banks and financial
17 institutions/services (10%), local and national government (9%), IT or telecommunications
18 companies (8%), and accountancy or professional services firms (8%) (Table I). Respondents'
19 companies/organisations varied in size with respect to the number of graduates employed,
20 with 49% employing fewer than 100 graduates, 26% employing 100-1000, 15% employing
21 1001-10000, and only 10% of respondents employing more than 10000 graduates.
22 Respondents also represented companies/organisations based locally within a particular
23 region (15%), and those possessing a national (30%) or multinational (55%) presence.

24 *Undergraduates and tutors.* Table II summarises the demographic characteristics of the 567
25 undergraduate and 122 tutor respondents, representing response rates of 2.3% and 12.2%
26 respectively. The majority of respondents were females from the faculties of Science and
27 Technology or Health and Social Care. Approximately two-thirds (68%) of student
28 respondents represented second- and third-year undergraduates, in approximately equal
29 proportions, whilst an additional 26% of respondents represented year one undergraduates;
30 only a very small minority of respondents (6%) were enrolled in a foundation year (i.e. year
31 0). The distribution of students' ages reveals that over a third of respondents represented
32 mature, non-traditional undergraduates (i.e. ≥ 30 years old), reflecting the university's agenda

1 with regard to widening participation in HE by traditionally under-represented groups of
 2 individuals.

3

Electricity, gas or water supply	1
Construction firm	1
Childcare	1

5

6 Frequency distributions for respondents' highest pre-university mathematics or
 7 numeracy qualifications appear similar for undergraduates and tutors, particularly with regard
 8 to qualifications attained at GCSE, AS and A2 levels[2] (or equivalent). However, a greater

1 proportion of males (24%) than females (15%), and students based in Science and
 2 Technology (30%) possessed an AS or A2 in mathematics; such students also tended to be
 3 younger ($r = -0.38, p < 0.001, N = 562, R^2 = 0.14$).

4 **Table II. Percentage frequency distributions for responding undergraduates and tutors**

	Undergraduates (N = 567)	Tutors (N = 122)
<i>Faculty:</i>		
Science and Technology	28	31
Health and Social Care	34	39

7
 8 **3.2 Employers' use of numeracy tests in graduate recruitment**

9 Fifty-one percent of responding employers in the current study claimed to use numeracy tests
 10 in graduate recruitment, compared with only 24% in a recent AGR survey of 242 employers
 11 (AGR, 2008); the lower proportion in the AGR survey may reflect the fact that their question
 12 concerned the use of only online self-selection/de-selection exercises for candidates, while in

1 the current survey the question potentially covered the use of paper-based tests as well. Such
 2 statistics may reflect employers' continuing disillusionment with formal pre-university
 3 mathematics qualifications, particularly at GCSE level, and/or their filtering of unsuitable
 4 candidates (Jenkins, 2001). Chi-square analyses revealed that the employers' use of numeracy
 5 tests was significantly associated with only two variables, namely size of the graduate
 6 workforce and the provision of training in numeracy skills (Table III). Companies recruiting
 7 larger numbers of graduates and those providing no additional training in numeracy skills
 8 were more likely to use numeracy tests as part of their recruitment processes. Jenkins (2001)
 9 and Branine (2008) also reported the increased use of aptitude/psychometric tests (including
 10 numeracy tests) by large firms; a finding perhaps reflecting the fact that large firms have more
 11 financial resources and expertise at their disposal and a greater number and diversity of
 12 vacancies to fill.

13

14 **Table III. Chi-square analyses of factors potentially influencing employers' use of**
 15 **numeracy tests**

Potential influencing factor	Pearson Chi-Square value	df	<i>P</i>	Cramer's V value	Strength of association (effect size)
Size of graduate workforce	14.609	3	0.002*	0.298	Medium
Type of company (local v. national v. multinational)	1.492	2	0.505	0.095	NS
Minimum mathematics qualification requirement (GCSE v. higher qualification)	0.403	1	0.597	0.055	NS
Importance attached to applicants' degree subject	2.245	1	0.161	0.117	NS
Importance attached to applicants' degree classification	4.367	1	0.050	0.163	NS
Satisfaction with technical numerical competence	3.735	1	0.061	0.150	NS
Provision of training in numeracy skills	6.261	1	0.017*	0.195	Modest

16 * Significant association between the influencing factor and employers' use of numeracy tests

17 NS = no significant association

18 Although a greater proportion of national (UK) companies and organisations (58%) within the
 19 sample appeared to use numeracy tests, compared to those possessing a multinational (48%)

1 or only local presence (46%), the variation was not statistically significant (Table III).
2 However, the lower percentage for multinational companies may reflect the fact that within
3 the current sample these companies possessed higher requirements in terms of applicants'
4 formal mathematics (or -related) qualifications and, therefore, they may have been less reliant
5 on additional tests of their applicants' numeracy skills. For example, 23% of multinational
6 companies, compared with only 8% of locally-based and 6% of national companies, required
7 applicants to possess a mathematics-related first degree. However, 11 out of the 24 companies
8 with only a local presence, representing different employment sectors and requiring different
9 levels of mathematics (or -related) qualifications, reported using numeracy tests, and of these,
10 five employed fewer than 100 graduates, negating any assumption that local companies
11 employing relatively few graduates may be less inclined to use numeracy tests. These
12 statistics reveal the high probability that graduates seeking employment will have their
13 numeracy skills assessed, particularly if the post does not explicitly require applicants to
14 possess a mathematics (or -related) qualification at a level higher than GCSE.

15 Although numeracy tests play a role in recruitment to all the Standard Occupational
16 Classification (SOC) categories used by HESA (HESA, 2000), they appear to be used
17 predominantly when recruiting to the types of occupations often associated with graduates'
18 aspirations. For example, 29-75% of employers used numeracy tests when recruiting to
19 professional (75%), managerial (48%), administrative (39%), associate professional and
20 technical (31%), or secretarial and clerical (29%) posts, compared with sales and customer
21 service (19%), skilled trade (14%) and process, plant and machine operative (10%) posts.
22 This confirms Jenkins' and Wolf's (2002) observation that, while in the 1990s
23 literacy/numeracy tests were primarily used for clerical posts, by 2001 such tests had been
24 extended to the recruitment of professional (30%), managerial (25%) and skilled manual posts
25 (23%). In the current study, Chi-square analyses revealed no statistically significant
26 differences between national (UK) and multinational companies in relation to the use of
27 numeracy tests in different types of occupations. The current survey also revealed that almost
28 two thirds (64%) of organisations use commercially available tests, as opposed to bespoke
29 tests, with Saville and Holdsworth Ltd (SHL) proving to be the most popular commercial
30 provider.

31 Examples of sectors in which $\geq 60\%$ of respondents indicated that they use numeracy
32 tests included bank or financial institution/services (N = 17), national and local government
33 (N = 14), and accountancy or professional services (N = 13). This finding has particular

1 relevance for arts, humanities and social sciences graduates, since many of them will have
2 had little, if any, opportunity to develop and practise their numeracy skills since leaving
3 school, but they will, nevertheless, attempt to enter these employment sectors, believing their
4 first degree provides adequate proof of their skills. In fact, only a third (32%) of jobs demand
5 a first degree in a specific academic discipline, with this requirement being less prevalent in
6 the banking/finance/insurance, and professional services sectors, where only 16% and 29% of
7 jobs respectively have this stipulation (CBI, 2008). The current study revealed that
8 opportunities for undergraduates to develop and/or practise their numeracy skills were far less
9 prevalent in the Arts, Humanities and Social Sciences faculty, where only 16% of participants
10 (representing 8 out of 15 disciplines) reported their occurrence, compared to the other three
11 faculties (87% from Science and Technology, representing 14 out of 15 disciplines; 67% from
12 Management, representing all 5 disciplines; and 63% from Health and Social Care,
13 representing 4 out of 7 disciplines). Although this finding is not surprising, given that the
14 content of different undergraduate programmes is preparing students for different types of
15 jobs or careers, it nevertheless highlights the importance of providing central support facilities
16 for those students not provided with intra-curricular opportunities to develop and practise
17 their numeracy skills.

18 With regard to employers' minimum requirements concerning mathematics (or -
19 related) qualifications, 48% of respondents stipulated that graduate applicants should possess
20 at least a GCSE in mathematics or a mathematics-related subject (such as statistics, physics,
21 economics or accounting); these respondents included $\geq 60\%$ of healthcare organisations, law
22 firms, recruitment and HR organisations, and accountancy and professional services firms.
23 Whilst some organisations were prepared to accept the attainment of a first degree in any
24 discipline as sufficient proof of numerical proficiency,

25 [Formal mathematics (or -related) qualification] Not always applicable for graduate
26 recruitment - often attainment of the degree is proof of qualification enough. (A
27 respondent representing national government)

28 17% of respondents, including consulting firms, engineering or industrial companies and
29 banks or financial institutions, demanded a higher secondary level qualification (e.g. at AS or
30 A2 level), and an additional 16% of respondents, including IT or telecommunications
31 companies (69%), engineering or industrial companies (32%) and banks or financial
32 institutions (18%) required applicants to possess a first degree in a mathematics (or -related)

1 subject. These findings support those of Hoyles *et al.* (2002), who reported that the type and
2 level of mathematics qualification demanded varied across sectors and the types of post.

3 The potential for graduates' poor numeracy skills to limit their employment
4 prospects is reinforced by the fact that 70% of employers considered it 'essential' for
5 applicants to 'pass' their numeracy tests, while the remaining 30% indicated that it was
6 'desirable' (N = 81). Although the minimum 'pass' threshold varied and was dependent
7 upon the position and scheme to which candidates applied (e.g. 40% for 'mainstream'
8 candidates, but over 70% for applicants on 'fast track' schemes), almost a third (32%)
9 of all respondents required applicants to achieve a mark of $\geq 60\%$; sectors represented
10 within this group included bank or financial institutions/services, IT or
11 telecommunications companies, and those involved in research and development:

12 Many graduates are rejected without interview because of poor maths skills. (A
13 respondent representing the banking/financial services sector)

14 *3.3 Requirements for numerical competency*

15 When asked to select those numeracy skills in which they would expect their graduate recruits
16 to be competent, only four of the 14 items listed were selected by fewer than 50% of
17 employers, namely the use of statistical software (25%), representative sampling (32%), use
18 of database software (48%) and understanding the language of maths (48%), while over 70%
19 of employers expressed an expectation of competency for eight of the remaining items (Table
20 IV). Consulting firms, IT or telecommunications companies, banks or financial institutions,
21 and engineering and industrial companies expressed the highest demands, with $\geq 60\%$ of
22 respondents requiring recruits to possess at least ten of the fourteen skills listed (Table IV).
23 Recruitment and HR, and charity or voluntary sector or special interest organisations
24 appeared to be the least stringent in terms of the numeracy skills they expected and were less
25 likely to use a numeracy test; for example, only 38% and 25% of respondents from these
26 sectors respectively used numeracy tests. Perhaps not surprisingly, relatively few respondents
27 across the range of sectors required recruits to be proficient in the use of statistical software or
28 representative sampling techniques, since these are specialist skills.

29

1 **Table IV. Percentage frequency distribution for expectation of graduate competency by**
 2 **responding employers**

Numerical topics/tasks	Employment sectors (total number of employers within sector)*								
	Overall expectation of graduate competency (N = 165)	Accountancy or professional services firm (13)	Bank or financial institution (17)	Charity or voluntary sector or special interest organisation (8)	Consulting firm (20)	Engineering or industrial company (19)	IT or telecoms company (13)	Local government (10)	Recruitment and HR (8)
Understanding the language of mathematics	48	31	59	13	70	47	62	50	25

Using statistical software	25	23	35	0	40	32	46	20	13

3 * Only those sectors represented by ≥ 8 respondents are included

4 *3.4 Undergraduates' and tutors' attitudes*

1 Overall, undergraduates and their tutors recognised the importance of numeracy skills in the
2 context of graduate employability and in individuals' everyday lives, although for four of the
3 six Likert items (nos. 1, 3-5), tutors' recognition of the importance of numeracy skills
4 appeared significantly higher than that of the undergraduates (Table V). However, within
5 individual programmes of study, the importance accorded to numeracy skills has to be
6 balanced with regard to the other skills demanded:

7 As an associate lecturer in English Literature, literacy is my main concern and I have
8 little reason to test the numeracy skills of my students. (English tutor)

9 As mentioned, drug calculations, and basic numeracy, are huge issues within healthcare.
10 Given that patients may die if these are wrong, it is clearly extremely important that ODP
11 and nursing students can demonstrate numerical competency. (Operating Department
12 Practice tutor)

13 In an additional survey item, only 46% of students indicated that they would actually
14 like to have a job that involved them applying their numeracy skills, with a significantly
15 higher proportion of males (61%) than females (41%) expressing this desire ($p < 0.001$,
16 *Mann-Whitney* $U = 22949.00$, $Z = -4.012$, $r = -0.17$). Similarly, a greater number of students
17 from Science and Technology (54%) expressed this desire, compared to students from
18 Management (49%), Health and Social Care (47%) and Arts, Humanities and Social Sciences
19 (33%) (*Kruskal-Wallis* $H(3) = 19.774$, $p < 0.001$, $N = 553$). However, post-hoc tests revealed
20 that the number of Science and Technology undergraduates expressing this desire was
21 significantly greater only in comparison to undergraduates based in Arts, Humanities and
22 Social Sciences ($p < 0.001$, *Mann-Whitney* $U = 7292.00$, $Z = -4.365$, $r = -0.26$). What was
23 more surprising was that 54% of the students surveyed appeared unaware that employers are
24 increasingly using numeracy tests in graduate recruitment; a statistic which could translate
25 into a significant proportion of students being totally unprepared for the types of tests they
26 might encounter when seeking employment. However, it was also apparent that students
27 provided with placement opportunities as part of their undergraduate degrees (e.g. nursing and
28 business programmes) possess a greater awareness of employers' recruitment procedures:

29 Well I'm applying for placements at the minute and I know people who have applied for
30 HR jobs and they've had to do a maths and statistics test online and they've failed it.
31 They've never been asked any question relating to HR yet, but they've been knocked
32 back based on a numerical test. (20-29 year-old female business student)

1 Many of the students who participated in focus group discussions were concerned
 2 about the increasingly competitive nature of the job market, acknowledging that their
 3 numeracy skills would become increasingly important when it came to obtaining a graduate
 4 job, even if subsequently they were not required to apply their numeracy skills in the
 5 workplace, and believed that adequate preparation for the types of test they might encounter
 6 could provide them with an advantage.

7 **Table V. Summary of student (S; N = 567) and tutor (T; N = 122) responses to items**
 8 **measuring respondents' perceptions of the usefulness of numerical skills**

Respondents	Item	% respondents (strongly) agreeing	% respondents (strongly) disagreeing	Mean rank	<i>P</i>
S	I'll need to be numerically competent if I'm to gain future employment	84	16	338.0	0.040*
T	Students will need to be numerically competent if they are going to gain graduate employment	90	10	374.6	
S	It's important that I ensure I have excellent numerical skills	79	21	340.2	0.126
T	It's important that we ensure our students have excellent numerical skills	82	18	367.3	
S	Numerical skills are important in everyday life	95	5	332.2	< 0.001*
T	Numerical skills are important in everyday life	98	2	402.1	
S	I feel that improving my numerical skills is a waste of time	9	91	357.9	< 0.001*
T	I feel that trying to improve students' numerical skills is a waste of time	5	95	285.1	
S	Numerical skills will not be that important to me in my future employment	14	86	354.2	0.004*
T	Numerical skills will not be that important to students in their future employment	5	95	302.3	
S	I see my numerical skills as something I won't use very often once I leave education	15	85	342.8	0.586
T	I think that many students won't use their numerical skills very often once they leave education	13	87	352.6	

9 *Significant difference between mean rank of tutor and undergraduate responses (Mann Whitney test).

1 However, 80% of students responding to the survey reported that they were unfamiliar with
2 the types of numeracy tests employers use. The need to raise student and staff awareness of
3 the use and nature of employers' numeracy tests was reinforced by the finding that although
4 53% of tutors claimed to be aware of employers' increasing use of numeracy tests, 81% were
5 unfamiliar with the types of tests used. There were also some interesting discrepancies
6 between the tutors' and their students' awareness of recruitment procedures, highlighting once
7 again the importance of raising awareness:

8 Application for employment as a police officer requires the candidate to submit to
9 numeracy tests. Often this one test alone prevents some applicants progressing through
10 the process. (Policing and criminal investigation tutor)

11 They [employers] are not going to think 'oh they've got into university with no numeracy
12 skills'; they're not even going to ask you. It's just irrelevant because you've got a degree.
13 (20-29 year-old, male policing and criminal investigation student)

14 Given that 80% of students were unfamiliar with the types of numeracy tests employers use, it
15 is somewhat surprising that 48% of respondents were 'moderately confident' or 'very
16 confident' that they could pass such tests. Further analyses revealed variations amongst
17 specific groups of students in terms of their levels of confidence. Male students were
18 significantly more confident than female students ($p < 0.001$, *Mann-Whitney U* = 21690.00, *Z*
19 = -4.681, $r = -0.20$), although the effect of gender was small, while a higher proportion of
20 students from Science and Technology (57%) were moderately or very confident, compared
21 to students from the other faculties (37-54%) (*Kruskal-Wallis H* (3) = 19.367, $p < 0.001$, $N =$
22 553). However, post-hoc tests revealed that Science and Technology undergraduates were
23 more confident only in comparison to undergraduates based in Health and Social Care ($U =$
24 11514, $p < 0.001$, $N = 347$, $r = -0.20$). Perhaps not surprisingly, students possessing higher
25 pre-university mathematics (or -related) qualifications tended to be more confident ($r = 0.40$,
26 $p < 0.001$, $N = 561$, $R^2 = 0.16$), as were younger students ($r = -0.15$, $p = 0.001$, $N = 565$, R^2
27 = 0.02), possibly because the latter tended to possess higher pre-university mathematics
28 qualifications and/or because, in comparison to many mature students, they had more recently
29 successfully completed a formal mathematics qualification. However, qualification accounted
30 for only 16% and age for 2% of the variability in students' expressions of confidence in being
31 able to pass an employer's numeracy test. Discussions with the students confirmed that it may
32 be the lack of any recent opportunity to practise numeracy skills, rather than age *per se*, that
33 contributes to lower levels of self-confidence:

1 My course involves a lot of statistics which is pitched at people who have recently
2 completed A-levels. As a mature student I haven't studied statistics for 14 years so am at
3 a disadvantage. (30-39 year old female forensic and investigative sciences undergraduate)

4 In contrast, mature students with some recent experience of studying for a formal
5 mathematics qualification appeared more confident:

6 I'm in a better position because I'd just literally sat the GCSE before I came on the course
7 (20-29 year old nursing student).

8 Although beyond the scope of this paper, a discussion of the strategies students are
9 using to help them develop their numeracy skills, the ways in which tutors are adjusting their
10 practices and the institutional strategies being implemented to help students practise and
11 develop their numeracy skills is provided by Tariq *et al.* (2010).

12

13 **4. Conclusions and implications**

14 Since all participants in this study were self-selecting volunteers, and were free to withdraw
15 from the project at any time, any conclusions and inferences drawn relate to the samples and
16 may or may not be generalisable to wider target populations. It is also important to note that
17 numeracy skills constitute only one factor that can influence a graduate's procurement of
18 employment, with graduate recruiters also placing substantial emphasis on 'soft', behavioural
19 and interpersonal skills (e.g. team working, initiative, reliability), as well as other 'hard' skills
20 (e.g. literacy, IT) (Brown and Hesketh, 2004). Nevertheless, the data presented highlight the
21 extent to which employers are using numeracy tests as part of graduate recruitment
22 procedures, and draw attention to the potential for poor numeracy skills to limit any
23 graduate's acquisition of employment, irrespective of their academic discipline; especially
24 since the use of such tests appears to be particularly prevalent in recruitment to the types of
25 jobs commensurate with graduates' career aspirations and within sectors that often attract
26 graduates from across the diversity of academic disciplines, including those from the arts and
27 humanities. In addition, the data highlight that four out of five students were unfamiliar with
28 the types of numeracy tests used by employers and that fewer than half the students were
29 confident that they could pass employers' numeracy tests.

30 Although employers' minimum requirements in terms of a mathematics (or -related)
31 qualification vary, even those setting their minimum requirements at GCSE level may expect
32 their employees to demonstrate a higher level of numerical competency, particularly in certain
33 sectors, once in the workplace. Undergraduates not prepared in advance to successfully meet

1 these challenges are being placed at a disadvantage, particularly in the UK's current economic
2 climate, where 46% of graduate recruiters anticipate recruiting fewer graduates (AGR, 2009).
3 Greater access to information on the widespread use of numeracy tests in graduate recruitment
4 and to the range of sample tests available is a first step towards enhancing students'
5 performance in such tests; greater familiarity and practice could also help boost students'
6 confidence.

7 Recent research suggests that particular groups of students, e.g. female students,
8 students not currently provided with any opportunities to practise and/or further develop their
9 numeracy skills (e.g. as part of their undergraduate programme), students with no (or low)
10 pre-university mathematics (or -related) qualifications, and mature students, may require
11 additional support to help them improve their employment prospects through enhancing their
12 numeracy skills (Tariq *et al.*, 2010; Tariq and Durrani, in press). Some universities will need
13 to do more to provide support (e.g. in the form of centrally-available workshops and/or drop-
14 in sessions) to those students requiring additional help to raise the level of their numeracy
15 skills competency. If universities are to enhance their graduates' employment prospects then
16 the numeracy skills required in the workplace must be included amongst the diversity of
17 'employability skills' universities are expected to nurture. This may require changes in
18 curriculum design and/or the provision of central support facilities and resources (Tariq, *et al.*,
19 2010). The latter may be particularly important for those undergraduates studying academic
20 disciplines which find it difficult to accommodate numeracy skills within their programmes,
21 e.g. drama or English; such students may have had little or no opportunity to practise and/or
22 further develop their numeracy skills since their compulsory secondary education and, as
23 such, may find employers' numeracy tests particularly challenging.

24 The results presented are significant in the context of national policy which is
25 determined to link graduate employability to HE quality assurance measures and to require
26 universities to publish data on their graduate employment rates (Department for Business,
27 Innovation & Skills [BIS], 2011). The current list of performance indicators, which includes
28 the Destination of Leavers from Higher Education (DLHE), will be extended in light of the
29 outcomes of recent government-commissioned research into the information needs of a range
30 of prospective users of information about HE (HEFCE, 2010). Attempting to measure
31 graduate employability by simply measuring institutions' graduate employment rates within a
32 specific time period is problematic, since it views employability as an institutional
33 achievement rather than the ability of the individual graduate to obtain employment (Harvey,

1 2001). The latter is, of course, dependent upon a number of factors, in addition to the
2 employability-development opportunities provided by HEIs, including the subject of study,
3 graduates' demographic characteristics (e.g. age, ethnicity, gender, and social class) and work
4 experience, and external economic factors (Harvey, 2001). Nevertheless, changes to national
5 policy should provide additional external drivers for universities to review and improve their
6 strategies with regard to enhancing the employability skills (including numeracy skills) of
7 their students.

8 While the results of this study suggest that many employers seek graduates with
9 particular kinds and levels of numeracy skills and that many test the possession of the latter
10 via their recruitment procedures, to what extent employers and their graduate employees make
11 use of these numeracy skills subsequently in the workplace and whether and how employees'
12 numeracy skills influence organisational performance warrants further investigation. In
13 addition, future research should evaluate the relative importance of numeracy skills in relation
14 to other employability skills, since graduates' mathematical competencies represent a marker
15 of only one element of their employability, and the question remains as to how mathematical
16 competencies impact upon individuals' longer-term employability.

19 Higher Education Funding Council for England and managed by the Higher Education
20 Academy.

22 **Notes**

- 23 1. 'UNITE' is a North West based initiative providing support to small to medium enterprises
24 (SMEs) through four-week undergraduate and graduate placements.
- 25 2. CSEs (Certificates of Secondary Education) and O-levels (ordinary levels) were
26 qualifications introduced in the 1950s and 1960s and achieved by 16-year-olds at the end
27 of their compulsory secondary level education between these dates and 1987. In 1988,
28 CSEs and O-levels were replaced by GCSEs (General Certificates of Secondary
29 Education). Traditional A-level (advanced level) qualifications were normally awarded to
30 pupils aged 18 years after 2 years' further study of an 'advanced' syllabus. In 2000,
31 Advanced Subsidiary (AS) level and A2-level qualifications were introduced. Pupils may
32 'cash-in' an AS qualification (after one year of post-16 study) or continue studying the

1 subject for a further year to achieve the higher A2 qualification (equivalent to the
2 traditional A-level). Adult Numeracy and Key Skills in 'Application of Number' represent
3 national qualifications that may be attained at a variety of levels; level 2 is regarded as
4 equivalent to a grade C in GCSE Mathematics.
