

Robots in Nursing

False rhetoric or future reality?

Winston Churchill
Travel Fellowship

Approach

Participative Qualitative
Exploratory research using
Focus Group method
informed by Social
Constructionism¹

Research Question

What do nurses think the
future role of robots could be in
assisting the delivery of
therapeutic nursing care?

Insights from Thought Leaders & Robotocists

2030-
2035

Robot Components:

- Sensors
- Motor
- Computer

Robots increase
human to
human
interaction

Robot to Human
Handover most
risky time

Robots cannot
replace nurses
in next 10-15 yrs

Deploy robots
to reduce risk

**Focus on
Autonomous
technology**

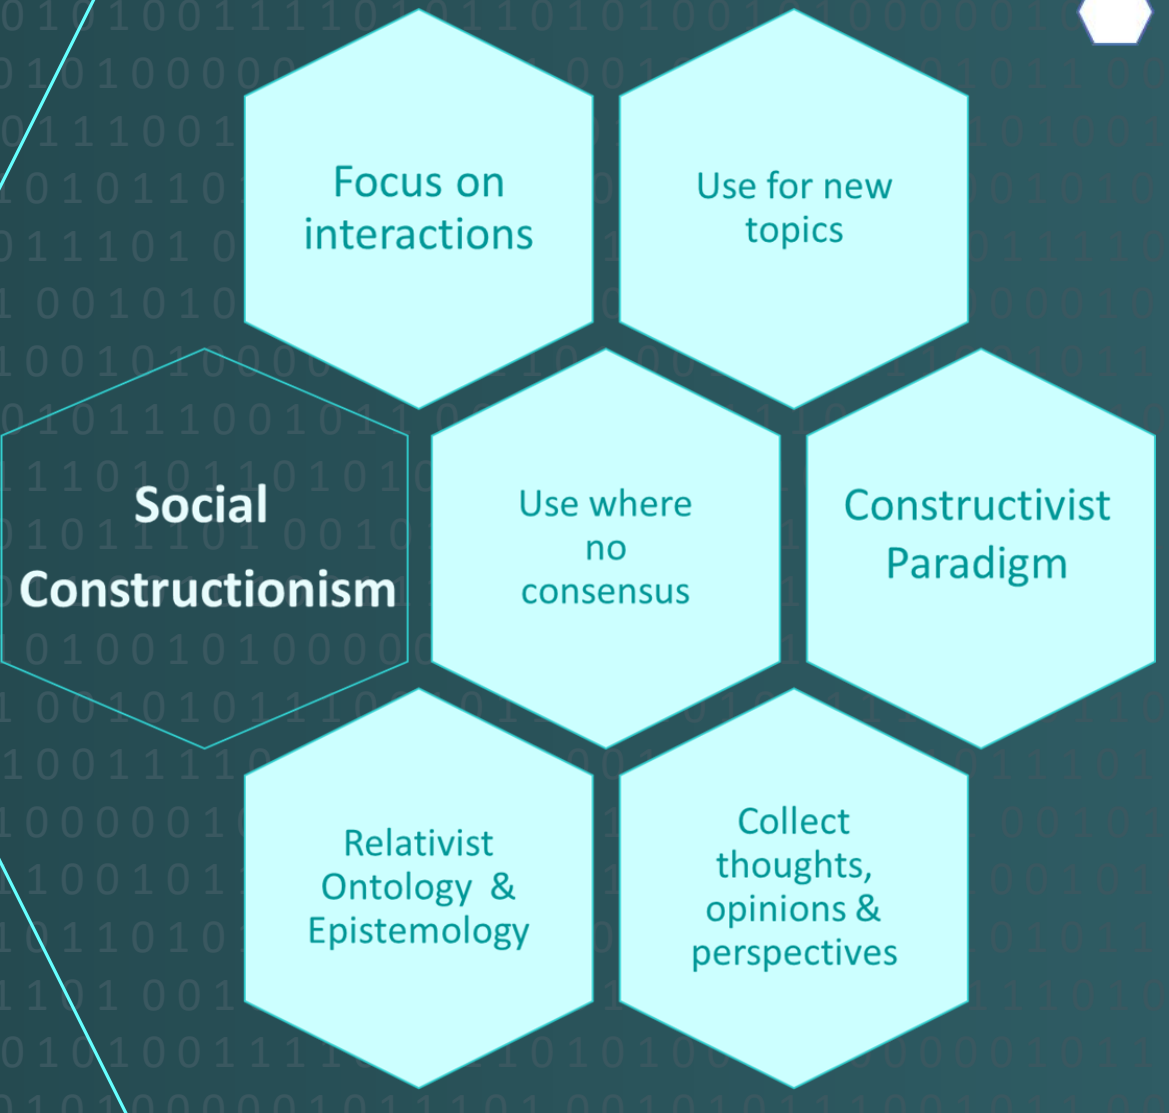

Robot
development
inhibited by
physical
demands

A higher
expectation of
accuracy?

Nursing needs
to be clear
when to deploy

Digital capability
should include
skills in
capability and
flexibility

AI capability
exceeds humans
in imaging

Robots
anticipate
human
behaviour

Nursing needs
to clearly
articulate
nursing

Graphic adapted from SAE Automation levels ²

Level 0
No automation
Zero Autonomy
Nurse performs all
tasks
Equipment is
directly controlled
by nurse or
programmed ie
Avatar

Level 1
Nurse Assistance
Equipment is
controlled by
nurse but some
nurse assist
devices included
in design ie
sensors

Level 2
Partial
Automation
Robot has
combined
automated
functions but the
nurse must
remain engaged
with the nursing
task & monitor
environment at all
times
ie robotic walker

Level 3
Conditional
Automation
Nurse is a
necessity for
decision making
but not required
to monitor the
environment
Nurse must be
able to take
over control
with notice
ie Telemedicine

Level 4
High
Automation
Robot is capable
of performing
all nursing
functions under
certain
conditions
Nurse must
have the option
to control robot
and decide the
intervention

Level 5
Full Automation
The robot is
capable of
substitution for
a nurse /carer
The nurse may
have the option
to control robot
