55 **Capsule summary**

- 56
- *SERPINB7* mutations in NPPK are not confined to Asian populations.
  - The presence of *SERPINB7* mutations should be tested in patients with NPPK in non-Asian
- 57
- 58 populations.

59 *To the editor:* Nagashima-type palmoplantar keratosis (NPPK) is an autosomal recessive PPK caused by  
60 mutations in the serpin family B member 7 (*SERPINB7*) gene.<sup>1</sup> It has been reported only in Japanese,  
61 Chinese and Korean populations, with a common founder mutation c.796C>T p.(Arg266\*).<sup>1,2,3</sup> NPPK is  
62 characterized by well-demarcated, mild, nonprogressive diffuse hyperkeratosis with transgradient  
63 erythema expanding onto the dorsal aspect of the hands, wrists and Achilles tendon area. Palmoplantar  
64 hyperhidrosis, aquagenic whitening and fungal infections are frequent.<sup>1,4</sup> Loss of functional *SERPINB7* in  
65 skin probably leads to overactivation of intracorneocyte proteases causing skin barrier defects with  
66 hyperkeratosis, mild inflammation, and increased water permeability.<sup>1</sup>

67 We report three non-Asian NPPK patients, with a typical NPPK phenotype and homozygous *SERPINB7*  
68 mutation. Since the age of two months, the 27-year-old Finnish male proband (P1) had a mild diffuse PPK  
69 with a well demarcated erythema extending to the wrist and Achilles tendon area (Fig 1, Table I). His whole  
70 exome sequencing (WES) (SuppText1) revealed a homozygous *SERPINB7* c.1136G>A p.(Cys379Tyr)  
71 (NM\_003784.3) variant (rs201208667) in exon 8 encoding the second-last amino acid of *SERPINB7*. His  
72 unaffected mother and sister were heterozygous carriers of the variant. Sanger sequencing among 44  
73 unrelated Finnish PPK patients revealed two other homozygous patients and four heterozygous carriers  
74 (Table I). WES of three heterozygous patients (P4-P6) revealed no other likely pathogenic variants or copy-  
75 number variations (CNVs) in *SERPINB7* or other genes. WES was unfeasible for P7 but a SNP array for  
76 haplotype analysis revealed no other *SERPINB7* variants or CNVs. The cause of their PPK thus remains  
77 unknown. Other plausible *SERPINB7* variants were not analyzed in the other patients.

78 *SERPINB7* c.1136G>A p.(Cys379Tyr) has not been reported in NPPK (SuppTable1). It was predicted  
79 damaging by SIFT, Polyphen, MutationTaster, LRT and CADD (score 19). Only heterozygous carriers were  
80 found in population allele frequency databases (ExAC, GnomAD and SISu). According to GnomAD, the  
81 heterozygous carrier frequency was significantly higher for the Finnish population (0.006397) than for  
82 non-Finns (0.00032-0.0014), indicating a 5 to 20-fold enrichment in Finns. A common haplotype spanning  
83 272 kb around the detected variant was shared by P1, P2 and six heterozygous carriers, according to

84 genome wide SNP array data (SuppTable2). The variant thus constitutes a plausible Finnish NPPK founder  
85 mutation.

86 P1's skin histology showed non-epidermolytic hyperkeratosis compatible with NPPK. SERPINB7  
87 immunostaining was strong throughout the stratum spinosum (SS) with most intense staining in stratum  
88 granulosum. Heterozygous carriers and healthy controls showed less intense staining throughout the SS  
89 and the lower SS was negative (SuppFigure 1). Thus, the c.1136G>A p.(Cys379Tyr) mutation apparently  
90 leads to aberrant SERPINB7 distribution within the SS.

91

92 The c.1136G>A p.(Cys379Tyr) *SERPINB7* variant changes the second-last amino acid cysteine, which is  
93 conserved among different species (SuppFigure2). Tertiary structure prediction suggested that the  
94 substitution is in the vicinity of the reactive site loop (RSL) where most *SERPINB7* mutations in NPPK are  
95 located. The substitution possibly affects the conformational mobility of RSL during the inhibition process.<sup>5</sup>

96 Previously NPPK has been reported exclusively in Asian patients. Our findings encourage assessment for  
97 *SERPINB7* mutations in non-Asian individuals with a NPPK-phenotype.

98 **Acknowledgements**

99 All patients and their families are thanked for participation. Alli Tallqvist, Eira Leinonen, Auli Saarinen are  
100 thanked for their expertise in the laboratory. The Department of Dermatology, Helsinki University Central  
101 Hospital is a healthcare provider of the European Reference Network ERN-SKIN.
