Key words. Coleoptera, Tenebrionidae, Pimeliinae, Praocini, *Platesthes*, South America, Patagonian steppes, distribution, biology

Abstract. The genus *Platesthes* Waterhouse, 1845 (Pimeliinae: Praocini), distributed in the Patagonian steppes in southern Argentina and Chile, is revised. A phylogeny of its 13 species is proposed, based on 48 morphological characters. The cladistic analysis provides one most parsimonious cladogram showing that three unambiguous synapomorphic characters of external morphology and male genitalia support the monophyly of *Platesthes*. This article includes a redescription of the genus, redescriptions of its species, an identification key, habitus photographs of the most representative species, illustrations of external morphology, genital features and metendosternites, a cladogram and distribution maps. A discussion of the biogeography and status of conservation of *Platesthes* in the Patagonian steppes and in Central Chile is presented. A new *Platesthes* species is described: *P. neuquensis* sp. n. and *P. hirtipes* Kulzer, 1962 stat. n. is elevated to species status. Other valid species of the genus are: *P. depressa* (Guérin-Ménéville, 1841), *P. similis* Kulzer, 1956, *P. unicosta* Kulzer, 1956, *P. nigra* Kulzer, 1956, *P. pilosa* Kulzer, 1956, *P. vidali* Peña, 1986, *P. burmeisteri* Haag-Rutenberg, 1877, *P. granulipennis* Kulzer, 1956, *P. kuscheli* Kulzer, 1958, *P. humeralis* Kulzer, 1958 and *P. silphoides* Waterhouse, 1845 (type species), for which a lectotype is designated.

INTRODUCTION

The genus *Platesthes* Waterhouse, 1845 belongs to the Praocini, an endemic Neotropical tribe of Pimeliinae with 139 species arranged in 12 genera, which inhabit arid and semiarid lands of southern South America (Kulzer, 1958; Flores, 2000a, 2001). The last revision of the tribe was made by Kulzer (1958) and a new revision is needed because one genus was not-monophyletic (Flores, 2000a), other genera were recently transferred from the Nycteliini to the Praocini (Flores, 2001) and many species still remain undescribed, some of which belong to undescribed genera. *Platesthes* comprises 13 species of which 12 are restricted to the Patagonian steppes between 39° South and 54° South in southern Argentina and Chile, and one species to Central Chile. A basic feature of the tenebrionid fauna of the Patagonian steppes is the dominance of the Neotropical tribes Nycteliini, Praocini and Scotobiini (Kuschel, 1969). Among the Praocini, endemic genera or subgenera in this area are *Platesthes*, *Praocis* (*Hemipraocis*) Kulzer, 1958, *Praocis* (*Praonoda*) Kulzer, 1958, and the monotypics *Neopraocis* Kulzer, 1958 and *Asidelia* Fairmaire, 1905.

Platesthes was established by Waterhouse (1845) for his new species *Platesthes silphoides*, who placed this genus close to the genera *Gyriosomus* Guérin-Ménéville, 1834 and *Praocis* Eschscholtz, 1829, but Lacordaire (1859) was the first to include *Platesthes* in the Praocini. Subsequent authors described new species (Haag-Rutenberg, 1877; Kulzer, 1958; Peña, 1986). The only revision of the genus, based exclusively on external morphology, was made by Kulzer (1956), who described five new species and gave a reduced distribution for the species. This study provides a revision of the genus using

also characters of male and female genitalia, which are diagnostic at the generic and specific levels within the Praocini (Flores, 2000a, b, 2001) and internal skeletal anatomy, of which drawings of the metendosternite of several species of a genus of Praocini are presented for the first time. In addition, the hundreds of specimens in studied collections, gave an accurate geographic distribution of each species.

The objectives of this study are to revise *Platesthes* by incorporating new characters from external and internal morphology, and genital features, to describe a new species, to conduct a cladistic analysis of the species and detail their geographic distribution.

MATERIAL AND METHODS

The present study is based on examination of specimens borrowed from the following collections and curators (I follow Arnett et al., 1993 where possible for collections codens): Natural History Museum, London, UK (BMNH, Maxwell V.L. Barclay), Field Museum of Natural History, Chicago, USA (FMNH, Philip P. Parrillo), Instituto Argentino de Investigaciones de las Zonas Áridas, Mendoza, Argentina (IADIZA, Sergio Roig Juñent), Fundación e Instituto Miguel Lillo, San Miguel de Tucumán, Argentina (IMLA, María Virginia Colomo), Instituto Patagónico de Ciencias Naturales, San Martín de Los Andes, Neuquén, Argentina (IPCN, Mario O. Gentili), Museo Argentino de Ciencias Naturales Bernardino Rivadavia, Buenos Aires, Argentina (MACN, Axel O. Bachmann), Museo de La Plata, La Plata, Argentina (MLPA, Norma B. Díaz), Museo Nacional de Historia Natural, Santiago, Chile (MNNC, Mario Elgueta D.), Natural History Museum, Basel, Switzerland (NHMB, Eva Sprecher), Pedro Vidal G.H., private collection, Santiago, Chile (PVGH, Pedro Vidal G.H.), and National Museum of Natural History, Smithsonian Institution, Washington, DC, USA (USNM, Warren E. Steiner).

Body length was measured dorsally, along the midline, from anterior margin of labrum to elytral apex. For paraproct/coxite length the ratio proposed by Doyen (1993) was used; for basal lamina of tegmen/lateral styles length, and median lobe/tegmen length the ratios proposed by Flores (1996) were used. Dissection methods are those used by Tschinkel & Doyen (1980) for genital structures and by Flores (1997) for internal skeletal anatomy. Drawings were made with a camera lucida adapted to a stereoscopic microscope. Exact label data are cited only for the type material, and that on separate labels indicated in brackets. The distributions of the twelve species inhabiting the Patagonian steppes follow the biogeographic districts proposed by Morrone et al. (2002) within the Central Patagonia biogeographic province (Morrone, 2001). For *Platesthes vidali* Peña, 1986, which inhabits Central Chile, the entomofaunal regions proposed by Peña (1966a) were used. The method of cladistic analysis used is explained under the heading "Cladistic analysis".

Genus *Platesthes* Waterhouse, 1845

Platesthes Waterhouse, 1845: 317; Lacordaire, 1859: 215; Gemminger & Harold, 1870: 1906 (cat.); Burmeister, 1875: 497; Haag-Rutenberg, 1877: 155; Philippi, 1887: 733 (cat.); Gebien, 1910: 262 (cat.); Bruch, 1915: 275 (cat.); Gebien, 1938: 397 (cat.); Blackwelder, 1945: 522 (cat.); Kulzer, 1956: 952, 1958: 9; Peña, 1966a: 15 (biog.), 1966b: 428 (cat.).

Type species: *Platesthes silphoides* Waterhouse, 1845 (monotypy).

Diagnosis. Recognized among other Praocini by the following combination of characters: maxillary palps with last segment axe-shaped; antennae longer in the male; length of antennomere 11 exceeding length of 10; pronotum with anterior angles rounded and anterior margin lacking edge, lateral margin simple and remote from disc; prosternum without apophysis, with edge on anterior margin; metasternum, mesepisternum and metepisternum with punctures; elytron with two straight, slightly raised carinae, surface punctate; epipleuron conspicuous in posterior 4/5; ventral femoral surface with setae arising from punctures; basal lamina of tegmen long ($B/E > 1.0$); lateral styles of tegmen with setae on ventral surface, lateral margins and dorsal surface; paraprocts very long ($P/C > 3.0$).

Redescription. Length 7.5–17.5 mm; habitus elongate to oval, flattened or convex; body glabrous or with short or long setae. Colour of body, antennae and legs black to dark brown.

Head. Prognathous; labrum with anterior margin not broadened; clypeus with round punctures, anterior margin concave, extending anterior to frontal process; frons with round or semicircular punctures; mentum subtrapezoidal, with setae; maxillary palps with last segment axe-shaped; eyes oval; antennae longer in the male; length of antennomere 11 exceeding length of 10; apical tomentose sensory patches on antennomere 9 in two areas subequal in size, on antennomere 10 in a semicircle, on antennomere 11 on distal third.

Thorax. Prothorax semi-mobile; pronotum without wrinkles, with round, semicircular or triangular punctures; anterior angles rounded, anterior margin concave, lacking edge, width of posterior margin exceeding width of anterior margin, lateral margin simple, slender, remote from disc, posterior margin not exceeding width

of base of elytra, joined in central half to elytra; posterior angles not overlapping elytral humeri; prosternum without apophysis, not extended over mesosternum, with edge on anterior margin; proepisternum and prosternum with punctures; mesosternum inclined forward, separated from prosternum; mesosternum, metasternum, mesepisternum and metepisternum with punctures.

Elytron. With two straight carinae [only one species (*P. unicosta* Kulzer, 1956) has elytron with one carina]; surface punctate; lateral margin straight, conspicuous throughout; epipleuron conspicuous in posterior 4/5, with edge, anterior margin not reaching elytral humeri or posterior angle of pronotum.

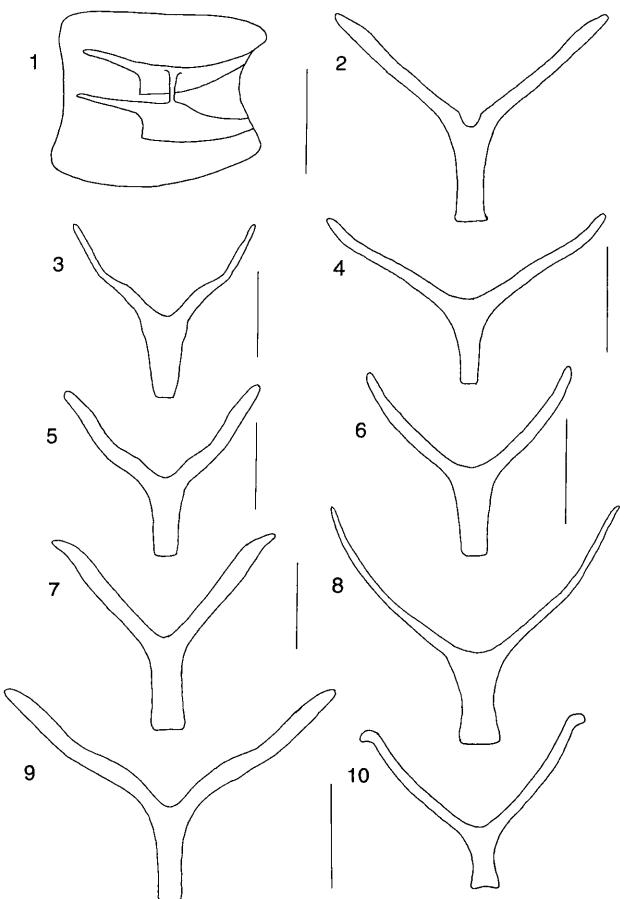

Legs. Procoxal separation equal to 1/3 procoxal width; mesocoxal and metacoxal separations not exceeding mesocoxal and metacoxal width; distance between meso- and metacoxae exceeding half mesocoxal length; metacoxal cavity closed laterally by metasternum and sternum 3. Ventral femoral surface with setae arising from punctures. External process of distal margin of protibiae equal to length of protarsomere 1; width of distal margin of protibiae equal to 1/4 or 1/5 protibial length.

Internal skeletal anatomy. Tentorium with medial straight bridge (Fig. 1). Proendosternite joined to posterior part of procoxal cavities, with posterior arms short, directed posterad and broadened in posterior margin. Mesendosternite with horizontal arms short, with long, slender dorsal arms three times as long as horizontal arms, extended about half distance to tergum. Metendosternite (Figs 2–10) with arms long, extending beyond mesocoxal inflections about one third distance to tergum, stem not exceeding half metacoxal width, length of stem exceeding width, and stem narrow in basal part (Figs 3, 4, 6), or narrow in medial part (Figs 8, 10), or stem with parallel sides (Figs 2, 5, 7, 9), always wider in upper than basal part. Elytral-abdominal fusion accomplished by a ridge in the elytral epipleuron, which joins by a simple coaptation without interlocking with the abdominal sterna (Doyen, 1993: Fig. 205).

Pro-mesothoracic joint. Prothorax connected to mesothorax by two flexible membranes: the first one is thickened, short, connecting both apertures, pro- and mesothoracic; ventrally this membrane is attached also to the two apodemes formed internally by the mesosternal-mesepisternal suture. The second membrane extends from the posterior arms of proendosternites attached to the mesocoxal inflections to the base of the horizontal arms of mesendosternite.

Male genitalia (Figs 11–14). Dorsal membrane of proctiger concave, with two sclerotized areas. Basal lamina of tegmen long ($B/E > 1.0$). Lateral styles of tegmen distally close, with apex wider, with setae on ventral surface, lateral margins and dorsal surface (Figs 12, 14). Median lobe moderate ($0.75 < L/T \leq 1.00$), sheath-shaped, with apex rounded, not narrowed proximally (Figs 11, 13).

Female genitalia (Fig. 15). Spiculum with arms "V"-shaped. Paraprocts very long ($P/C > 3.0$), glabrous or with setae; coxites with setae, basal lobe of coxite not extended over paraproct, baculi of coxite inclined 45° ;

Figs 1–10. Internal skeletal anatomy of *Platesthes* spp. 1: Tentorium of *P. kuscheli*. 2–10: Metendosternites, posterior view. 2 – *P. kuscheli*; 3 – *P. unicosta*; 4 – *P. depressa*; 5 – *P. similis*; 6 – *P. nigra*; 7 – *P. pilosa*; 8 – *P. vidali*; 9 – *P. burmeisteri*; 10 – *P. granulipennis*. Scales 1 mm.

midventral sclerite distally broadened. Proctigeral baculus exceeding length of paraproct baculus. Vagina saccate. Spermathecal accessory gland longer than vagina, with duct annulate and thick. Spermatheca with four basal tubes or less, all similar in width and branching pattern.

Geographic distribution. The species of *Platesthes* occur from 39° South to 54° South in southern Argentina (Neuquén, Río Negro, Chubut, Santa Cruz, and Tierra del Fuego) and in southern Chile (Aysen and Magallanes). One species (*P. vidali*) inhabits Central Chile between 35° 30' South and 37° 30' South.

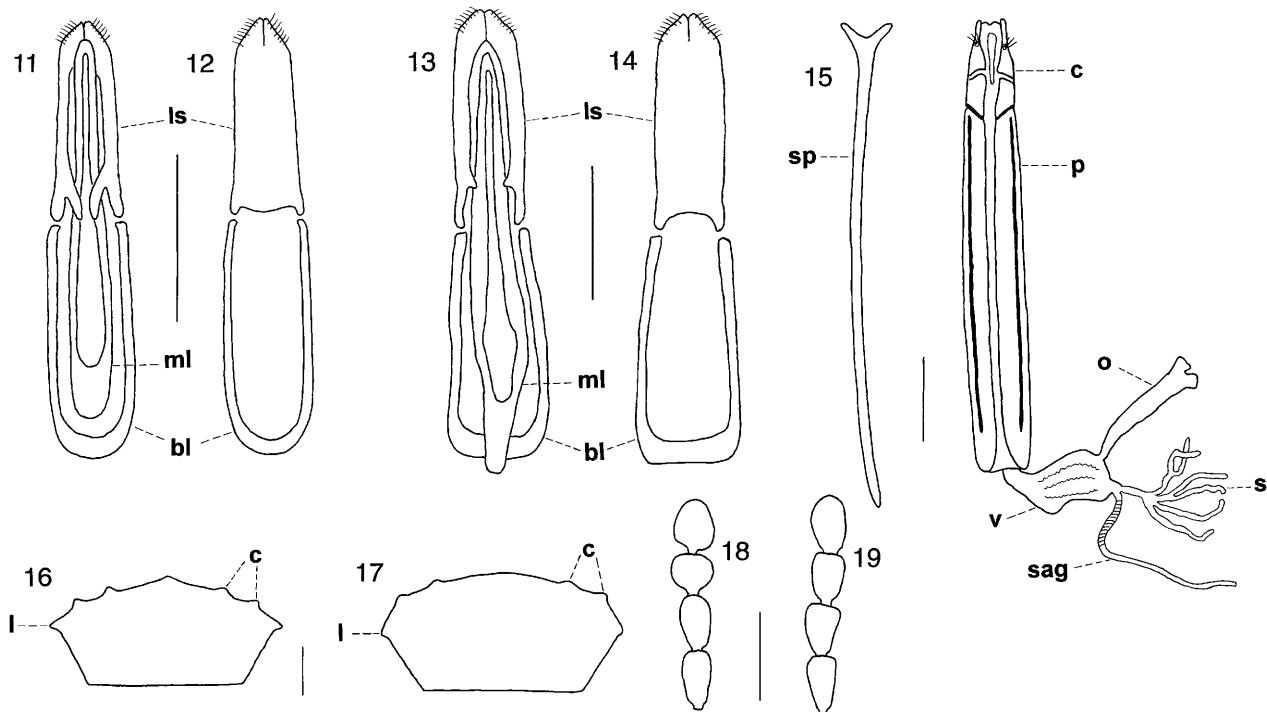

Habitat. Twelve species occur on the xerophilous cool steppes east to the Andes, in Central Patagonia biogeographic province (Morrone, 2001) from sea level to an altitude of 1300 m, where the annual rainfall ranges from 100 to 400 mm (Paruelo et al., 1998). Some of these species (*P. unicosta*, *P. pilosa* Kulzer, 1956, *P. kuscheli* Kulzer, 1958) live on the steppes and in the mesophylous forest of *Nothofagus* spp. (Fagaceae). Paula Sackmann (pers. comm.), using pitfall traps collected specimens of *Platesthes pilosa* near Bariloche, in Río Negro province (Argentina), at altitudes gradient between 813 to 1031 m, annual rainfall of from 600 to 1600 mm, on the steppes and in a mesophylous forest of *Nothofagus pumilio*. One

species (*Platesthes vidali*) inhabits deciduous woodlands of *Nothofagus obliqua*, *N. pumilio*, *N. antarctica*, and *N. alpina* (Gajardo, 1994) in Central Chile west to the Andes between 1200 to 2400 m, in the Southern Andean Mountain range entomofaunal region (Peña, 1966a).

Biology. *Platesthes* species have crepuscular habits, hiding during the night and the hottest hours under shrubs, logs or dry horse dung. In Santa Cruz province (Argentina), I have collected specimens of *Platesthes granulipennis* Kulzer, 1956 (17 km W El Calafate), specimens of *P. burmeisteri* Haag-Rutenberg, 1877 and *P. unicosta* (3 km SE El Chaltén, 400 m), walking in the evening in steppes of *Mulinum spinosum* (Apiaceae), and specimens of *P. unicosta* in El Chaltén (450 m) under dry horse dung and in Laguna Capri (700 m), near El Chaltén, under logs in open mesophylous forest of *Nothofagus pumilio*.

KEY TO SPECIES OF *PLATESTHES*

- 1 Pronotum with round punctures, separated by a distance much greater than diameter of one puncture (Figs 32, 33); frons with round punctures each with a central seta. 2
- Pronotum with semicircular or triangular punctures, separated by a distance equal or less than diameter of one puncture (Figs 34, 35); frons with round or semicircular punctures each with a seta on posterior margin. 7
- 2 Clypeus and frons at same level; epipleuron smooth and glabrous; pronotum with round punctures each with a central seta (Fig. 32). 3
- Clypeus lower than frons; epipleuron punctate and with setae; pronotum with round punctures each with a seta on anterior margin (Fig. 33). 6
- 3 Elytra flat; lateral margins of pronotum raised (Fig. 36); pronotum widest behind middle (Fig. 20). *P. depressa* (Guérin-Ménéville, 1841)
- Elytra arched; lateral margins of pronotum not raised; pronotum widest at middle (Figs 21–23). 4
- 4 Elytron with one carina; prosternum flat. *P. unicosta* Kulzer, 1956
- Elytron with two carinae; prosternum convex. 5
- 5 Elytron with two raised carinae reaching almost to the end of the elytron, lateral margin prominent and sharp (Fig. 16). *P. similis* Kulzer, 1956
- Elytron with two low carinae reaching to only half or 3/4 the length of the elytron, lateral margin rounded (Fig. 17). *P. nigra* Kulzer, 1956
- 6 Pronotum with lateral margins not raised, posterior angles obtuse (Fig. 24), and disc convex, higher than lateral margins; clypeus straight; antennomere 10 wider than long (Fig. 18). *P. pilosa* Kulzer, 1956
- Pronotum with lateral margins very raised, posterior angles straight (Fig. 25), and disc flat, at lower level than lateral margins (Fig. 37); clypeus with anterior part bent downwards; antennomere 10 longer than wide (Fig. 19). *P. vidali* Peña, 1986
- 7 Pronotum with semicircular punctures (Fig. 34); elytra with round punctures with anterior margin raised, appearing as protuberances. 8
- Pronotum with triangular punctures (Fig. 35); elytra with round punctures with anterior margin not raised. 9

Figs 11–19. Male and female genitalia and body details of *Platesthes* spp. 11–14: Male genitalia, dorsal and ventral views. 11, 12 – *P. granulipennis*; 13, 14 – *P. silphoides*. 15: Ovipositor (ventral view), spiculum and internal female reproductive tract of *P. silphoides* (c – coxite; o – oviduct; p – paraproct; s – spermatheca; sag – spermatical accessory gland; sp – spiculum; v – vagina). 16, 17: Elytra, posterior view (c – carina). 16 – *P. similis*; 17 – *P. nigra*. 18, 19: Antennomeres 8–11, dorsal view. 18 – *P. hirtipes*; 19 – *P. vidali*. Scales 1 mm.

- 8 Ventral femoral and tibial surfaces with long dense pubescence; pseudopleuron with punctures; groove between eye and frons only on posterior half of dorsal margin of eye; frons with punctures separated by a distance much greater than diameter of one puncture (Fig. 26). *P. burmeisteri* Haag-Rutenberg, 1877
- Ventral femoral and tibial surfaces with sparse pubescence; pseudopleuron with protuberances; groove between eye and frons on entire dorsal margin of eye; frons with punctures separated by a distance less than diameter of one puncture (Fig. 27). *P. granulipennis* Kulzer, 1956
- 9 Elytral humeri very raised and expanded (Fig. 38), forming a deep depression in lateral intercostal space; labrum with anterior margin "V"-shaped; punctures of clypeus with a seta on posterior margin. *P. humeralis* Kulzer, 1958
- Elytral humeri not raised or expanded (Fig. 39); labrum with anterior margin concave; punctures on clypeus with a central seta. 10
- 10 Ventral surface of trochanters with brush-like pubescence, ventral femoral and tibial surfaces with long dense pubescence; pronotum widest at middle (Figs 28, 29). 11
- Ventral surface of trochanters, femora and tibiae with short sparse pubescence; pronotum widest behind middle (Figs 30, 31). 12
- 11 Frons with semicircular punctures; pronotum with lateral margins not raised (Fig. 28); ventral femoral surfaces densely setose on proximal half, ventral tibial surfaces densely setose on distal half; width of antennomere 11 equal to width of 9 (Fig. 19). *P. kuscheli* Kulzer, 1958
- Frons with round punctures; pronotum with lateral margins raised (Fig. 29); ventral femoral and tibial surfaces densely setose throughout; width of antennomere 11 exceeding width of 9 (Fig. 18). *P. hirtipes* Kulzer, 1962

- 12 Clypeal suture not covered by frons; elytral carinae more approximate to lateral margin than suture. *P. silphoides* Waterhouse, 1845
- Clypeal suture covered by frons; elytral carinae equidistant between suture and lateral margin (Fig. 39). *P. neuquensis* sp. n.

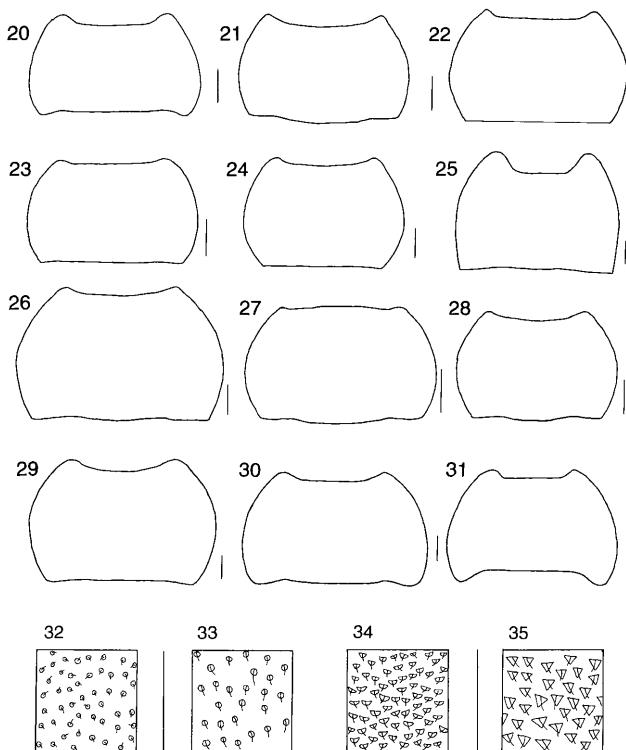

Platesthes depressa (Guérin-Ménéville, 1841)

(Figs 4, 20, 36, 41)

Praocis depressa Guérin-Ménéville, 1841: 215; Solier, 1851: 203; Blanchard, 1853: 145.

Platesthes depressa: Lacordaire, 1859: 215; Gemminger & Harold, 1870: 1906 (cat.); Burmeister, 1875: 497; Haag-Rutenberg, 1877: 155; Philippi, 1887: 733 (cat.); Berg, 1899: 60; Kolbe, 1907: 86 (cat.); Gebien, 1910: 262 (cat.); Bruch, 1915: 276 (cat.); Gebien, 1938: 397 (cat.); Blackwelder, 1945: 522 (cat.); Kulzer, 1956: 953; Peña, 1966b: 428 (cat.); Marcuzzi, 1991: 185 (biog.).

Redescription. Length 8.5–12.0 mm. Body, antennae, and legs black to dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture not covered by frons, clypeus and frons at same level; frons with round punctures each with a central seta, separated by a distance much greater than diameter of one puncture; groove between eye and frons only on posterior half of dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ along lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to width of 9 th. Thorax. Pronotum with round punctures each

Figs 20–35. Pronotum and details of pronotal punctuation of *Platesthes* spp. 20–31: Pronotum. 20 – *P. depressa*; 21 – *P. unicosta*; 22 – *P. similis*; 23 – *P. nigra*; 24 – *P. pilosa*; 25 – *P. vidali*; 26 – *P. burmeisteri*; 27 – *P. granulipennis*; 28 – *P. kuscheli*; 29 – *P. hirtipes*; 30 – *P. silphoides*; 31 – *P. neuquensis*. 32–35: Details of pronotal punctuation. 32 – *P. unicosta*; 33 – *P. pilosa*; 34 – *P. burmeisteri*; 35 – *P. kuscheli*. Scales 1 mm.

with a central seta and separated by a distance much greater than diameter of one puncture (Fig. 32); lateral margins raised, widest behind mid point; posterior angles obtuse (Fig. 20); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron flat, with two raised carinae reaching the end of elytron, more approximate to a lateral margin, external and internal of same length or external longer than internal (Fig. 36); round punctures with anterior margin not raised; pseudopleuron with sparse punctures; epipleuron smooth and glabrous, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters, femora and tibiae with uniform pubescence; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing sparse setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally concave, widest at base, and not overlapping dorsally median lobe; base of basal lamina of tegmen concave. Female genitalia. Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

Distribution. Argentina (Santa Cruz and Tierra del Fuego provinces) and Chile (Region XII) (Fig. 41), in the Fuegian district within the Central Patagonia biogeographic province.

Platesthes unicosta Kulzer, 1956

(Figs 3, 21, 32, 40)

Platesthes unicosta Kulzer 1956: 954.

Redescription. Length 8.5–12.0 mm. Body and legs black to dark brown, antennae dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture not covered by frons, clypeus and frons at same level; frons with round punctures each with a central seta and separated by a distance much greater than diameter of one puncture; groove between eye and frons only on posterior half of dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ along lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to width of 9 th. Thorax. Pronotum with round punctures, each with a central seta and separated by a distance much greater than diameter of one puncture (Fig. 32); lateral margins not raised, widest at mid point; posterior angles obtuse (Fig. 21); disc of pronotum convex, higher than lateral margins; prosternum flat. Elytron arched, with one raised carina reaching the end of elytron, more approximate to a lateral margin; round punctures with anterior margin not raised; pseudopleuron with sparse punctures; epipleuron smooth and glabrous, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters, femora and tibiae with uniform pubescence; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing sparse setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally bisinuate, widest at base and projecting dorsally over median lobe; base of basal lamina of tegmen concave. Female genitalia.

Figs 36–39. Habitus. 36 – *P. depressa*; 37 – *P. vidali*; 38 – *P. humeralis*; 39 – *P. neuquensis*.

Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

Type material. Holotype: [Estancia Fitz Roy/ Lago Viedma (Santa Cruz)/ 26.ii.1948] [Holotypus/ *Platesthes/ unicosta* nov./ det. H. Kulzer 1956] (NHMB). Three paratypes with the same data as holotype (1 BMNH, 1 IMLA, 1 FMNH).

Other material examined. ARGENTINA: Santa Cruz: Dpto. Lago Argentino: El Chaltén, Sendero Laguna Capri, 17.i.1998, G. Flores, 1 (IADIZA), Laguna Capri, 700 m, G. Flores, 19.i.1998, 4 (IADIZA), 1 (USNM), 1 (MACN), 1 (MLPA), El Chaltén, 450 m, 20.i.1998, G. Flores, 1 (IADIZA), 3 km SE El Chaltén, 400 m, 22.i.1998, G. Flores, 3 (IADIZA).

Distribution. Argentina: Santa Cruz province (Fig. 40), in the Fuegian district within the Central Patagonia biogeographic province.

Platesthes similis Kulzer, 1956

(Figs 5, 16, 22, 40)

Platesthes similis Kulzer 1956: 953; Peña, 1966b: 428 (cat.).

Redescription. Length 8.0–13.0 mm. Body, antennae, and legs black to dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture not covered by frons, clypeus and frons at same level; frons with round punctures each with a central seta, separated by a distance much greater than diameter of one puncture; groove between eye and frons only on posterior half of dorsal margin of eye; antennae in the male reaching 3/4 along lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to width of 9 th. Thorax. Pronotum with round punctures each with a central seta and separated by a distance much greater than diameter of one puncture (Fig. 32); lateral margins not raised, widest at mid point; posterior angles obtuse (Fig. 22); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, more approximate to a lateral margin, external and internal of same length or external longer than internal; round punctures with anterior margin not raised; pseudopleuron with sparse punctures; epipleuron smooth and glabrous, texture similar to that of elytron, anterior quarter twice as

wide as posterior half. Legs. Ventral surface of trochanters, femora, and tibiae with uniform pubescence; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing sparse setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally bisinuate, widest at base, and not overlapping dorsally median lobe; base of basal lamina of tegmen concave. Female genitalia. Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

Type material. Holotype: [Punta/ Arenas/ M. Wolle] [Holotypus/ *Platesthes/ similis* nov./ det. H. Kulzer 1956] (NHMB). Three paratypes with the same data as holotype (1 BMNH, 1 IMLA, 1 FMNH).

Other material examined. ARGENTINA: Santa Cruz: Dpto. Güer Aike: Río Turbio, 17.i.1960, A. Bachmann, 1 (IADIZA), Estancia San Elías, ii.1978, F. Roig, 1 (IADIZA), Cancha Carrera, 20.xii.1960, L.E. Peña, 3 (USNM), without more precise data: iii.1899, 4 (MACN). CHILE: Region XII: Ultima Esperanza: i.1977, F. Roig, 1 (IADIZA), Dos Lagunas, 25.i.1952, T. Cekalovic, 1 (IADIZA), 1 (IMLA), Parque Nacional Torres del Paine, Laguna Amarga, 3.xii.1966, L.E. Peña, 2 (FMNH), 14.–20.xii.1960, L.E. Peña, 6 (FMNH), Laguna Azul, 16.x.1981, L.E. Peña, 1 (FMNH), Pudeto, 28.i.1974, Bordón, 3 (IPCN), 3 (USNM), Cerro Payne, iii.1958, L.E. Peña, 1 (FMNH), 1 (USNM), Cerro Castillo, 14.xii.1960, L.E. Peña, 4 (FMNH), 20 (USNM), 2 (IMLA), 2 (MACN), 2 (MLPA), 3.xii.1966, L.E. Peña, 4 (FMNH), 22.ii.1991, 1 (PVGH), Cerro Guido, 11.ii.1957, T. Cekalovic, 2 (FMNH), 1 (USNM), x.1968, C. O'Brien, 3 (IADIZA), 14.xii.1960, L.E. Peña, 1 (USNM), 1 (FMNH), Cerro Cazador, 6.i.1955, T. Cekalovic, 1 (FMNH), 9.ii.1957, T. Cekalovic, 1 (USNM), Rincón Negro, 6.i.1963, T. Cekalovic, 1 (USNM), without more precise data: xi.1982, Barrientos, 1 (PVGH). Without more precise data: 1 (IMLA).

Distribution. Argentina (Santa Cruz province) and Chile (Region XII) (Fig. 40), in the Fuegian district within the Central Patagonia biogeographic province.

Platesthes nigra Kulzer, 1956

(Figs 6, 17, 23, 41)

Platesthes nigra Kulzer 1956: 956; Kaszab, 1964: 358 (list); Peña, 1966b: 428 (cat.).

Redescription. Length 7.5–11.0 mm. Body and legs black to dark brown, antennae dark brown. Head. Labrum with anterior margin concave; clypeus with round punc-

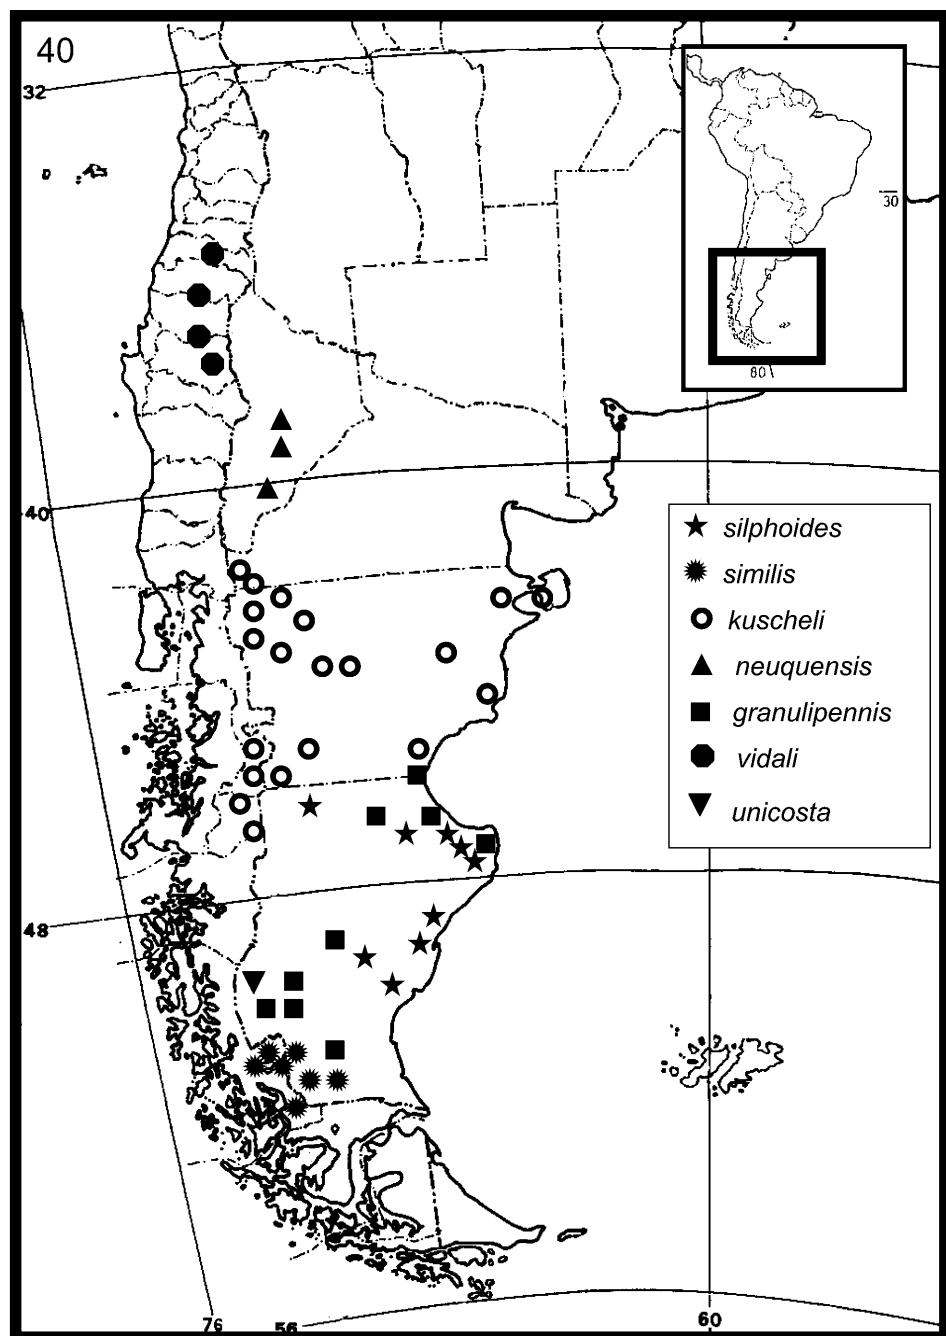

Fig. 40. Geographical distribution of seven species of *Platesthes*.

tures each with a central seta; clypeal suture not covered by frons, clypeus and frons at same level; frons with round punctures each with a central seta and separated by a distance much greater than diameter of one puncture; groove between eye and frons only on posterior half of dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ f lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to width of 9 th. Thorax. Pronotum with round punctures each with a central seta and separated by a distance much greater than diameter of one puncture (Fig. 32); lateral margins not raised, widest at mid point; posterior angles

obtuse (Fig. 23); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two inconspicuous carinae reaching to only half or $\frac{3}{4}$ the length of the elytron, more approximate to a lateral margin, external and internal of same length; round punctures with anterior margin not raised; pseudopleuron with sparse punctures; epipleuron smooth and glabrous, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters, femora and tibiae with uniform pubescence; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing sparse setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally

bisinuate, widest at base, and not overlapping dorsally median lobe; base of basal lamina of tegmen concave. Female genitalia. Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

Type material. Holotype: [Lago Argentino/ Santa Cruz 15–20.ii.1949/ Argentina. Wittmer] [Holotypus/ *Platesthes nigra* nov./ det. H. Kulzer 1956] (NHMB). Three paratypes with the same data as holotype (IMLA). 18 Paratypes: [Estancia La Cristina/ (Lago Argentino)/ Santa Cruz/ 11.iii.1953/ A. Willink] (7 IMLA, 1 BMNH, 1 FMNH, 1 USNM), [Estancia La Cristina/ (Lago Argentino)/ Santa Cruz/ 14.iii.1953/ A. Willink] (2 IMLA), [Estancia La Cristina/ (Lago Argentino)/ Santa Cruz/ 18.iii.1953/ A. Willink] (4 IMLA, 1 BMNH, 1 USNM).

Other material examined. ARGENTINA: Santa Cruz: Dpto. Lago Argentino: Estancia La Cristina, 22.i.1953, A. Willink, 78 (IMLA), 2 (IADIZA), 2 (MACN), 2 (MLPA), 1.iii.1953, 26 (FMNH), Punta Bandera, 10.xii.1958, P. Miles, 4 (IADIZA), 1 (FMNH), Lago Argentino, 2.iv.1953, A. Martínez, 1 (IADIZA), Lago Argentino, Glaciar Onelli, 1.i.1959, P.W. James, 1 (BMNH). CHILE: Region XII: Ultima Esperanza: Parque Nacional Torres del Paine, 20.i.1955, T. Cekalovic, 3 (FMNH), 3 (USNM), 11.xii.1955, L. Peña, 2 (USNM), Laguna Azul, 2.ii.1974, Bordon, 1 (IPCN). Magallanes: Tres Brazos, 5.xi.1960, T. Cekalovic, 1 (FMNH).

Distribution. Argentina (Santa Cruz province) and Chile (Region XII) (Fig. 41), in the Fuegian district within the Central Patagonia biogeographic province.

Platesthes pilosa Kulzer, 1956

(Figs 7, 24, 33, 41)

Platesthes pilosa Kulzer 1956: 958; Kaszab, 1964: 358 (list).

Platesthes pubescens Bruch (nomen nudum; description not published).

Redescription. Length 10.3–15.5 mm. Body and legs black to dark brown, antennae dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture covered by frons, clypeus lower than frons; frons with round punctures each with a central seta and separated by a distance much greater than diameter of one puncture; groove between eye and frons on entire dorsal margin of eye; antennae in the male reaching 3/4 along lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to width of 9 th. Thorax. Pronotum with round punctures each with a setae on anterior margin and separated by a distance much greater than diameter of one puncture (Fig. 33); lateral margins not raised, widest at mid point; posterior angles obtuse (Fig. 24); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, equidistant between suture and lateral margin, internal longer than external; round punctures with anterior margin not raised; pseudopleuron with abundant punctures; epipleuron punctate and with setae, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters with brush-like pubescence, ventral femoral and tibial surfaces densely setose throughout; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing abundant decumbent setae. Male genitalia. Lat-

eral styles of tegmen with proximal margin ventrally bisinuate, widest at base, and not overlapping dorsally median lobe; base of basal lamina of tegmen concave. Female genitalia. Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

Type material. Holotype of *Platesthes pilosa*: [Dr. Lendl Adolf/ Neuquén 1907] [Holotypus/ *Platesthes/ pilosa* nov./ det. H. Kulzer 1956] (NHMB). Syntype of *Platesthes pubescens*: [Rca. Argentina/ Gob. Río Negro/ C. Bruch] [Type] [*Platesthes/ pubescens/* Bruch] (MACN) intended to be (designated as) the type.

Other material examined. ARGENTINA: Chubut: Dpto. Cushamen: Epuyén, 16.ix.1961, A. Kovács, 1 (BMNH), 26.vii.1962, A. Kovács, 6 (BMNH), 20 km N Leleque, 19.x.1960, L.E. Peña, 3 (FMNH), 1 (USNM), S El Maitén, 5.xi.1985, L.E. Peña, 1 (FMNH). Neuquén: Dpto. Los Lagos: Paso Córdoba, 20.iii.1962, J. Ripalta, 4 (IADIZA), Confluencia Traful, 690 m, 25.i.1975, M. Gentili, 2 (IPCN), 50 km N Bariloche, 2.x.1985, L.E. Peña, 1 (FMNH), Lago Nahuel Huapi, Brazo Huemul, 2.xi.1958, 4 (IADIZA), 3 (IPCN), Isla Victoria, 1.iii.1943, F. Monrós, 5 (IMLA); Dpto. Lácar, Río Caleufú, 850 m, 4.xi.1974, M. Gentili, 1 (IPCN), Lago Meliquina, 4.xii.1974, H.J. Molinari, 1 (IPCN), 21.ii.1963, 1 (IPCN). Río Negro: Dpto. Bariloche: San Carlos de Bariloche, 14.x.1960, A. Kovács, 8 (BMNH), 3.ii.1962, T. Cekalovic, 2 (FMNH), i.1988, M. Kun, 1 (IADIZA), Refugio Chalihuaco, 813 m, 41°11'27.5"S, 71°19'30.6"W, 15.i.–10.ii.2001, P. Sackmann, 2 (IADIZA), Ruta 237, 813 m, 41°3'21"S, 71°8'49.4"W, 15.i.–10.ii.2001, P. Sackmann, 1 (IADIZA), Lago Nahuel Huapi, i.1960, Lutes, 1 (USNM); Dpto. Pilcaniyeu: Ñirihuau, 7.i.1963, 2 (IADIZA), 1 (IPCN), Alto Río Limay, ix.1957, 1 (IPCN); without more precise data: 3 (IADIZA), 21 (MACN), 5.ii.1898, C. Bruch, 3 (MACN) (these three specimens were in Bruch's collection next to the type of *Platesthes pubescens*).

Distribution. Argentina: Chubut, Neuquén, and Río Negro provinces (Fig. 41), in the Central district within the Central Patagonia biogeographic province.

Platesthes vidali Peña, 1986

(Figs 8, 19, 25, 37, 40)

Platesthes vidali Peña 1986: 62.

Redescription. Length 11.0–15.0 mm. Body and legs black to dark brown, antennae dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture covered by frons, clypeus lower than frons, with anterior part bent downward; frons with round punctures each with a central seta and separated by a distance much greater than diameter of one puncture; groove between eye and frons on entire dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ along lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 longer than wide (Fig. 19); width of antennomere 11 equal to that of 9 th. Thorax. Pronotum with round punctures each with a setae on anterior margin, separated by a distance much greater than diameter of one puncture (Fig. 33); lateral margins very raised, widest behind mid point; posterior angles straight (Fig. 25); disc of pronotum flat, at lower level than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, equidistant between suture and lateral margin, internal longer than external (Fig. 37);

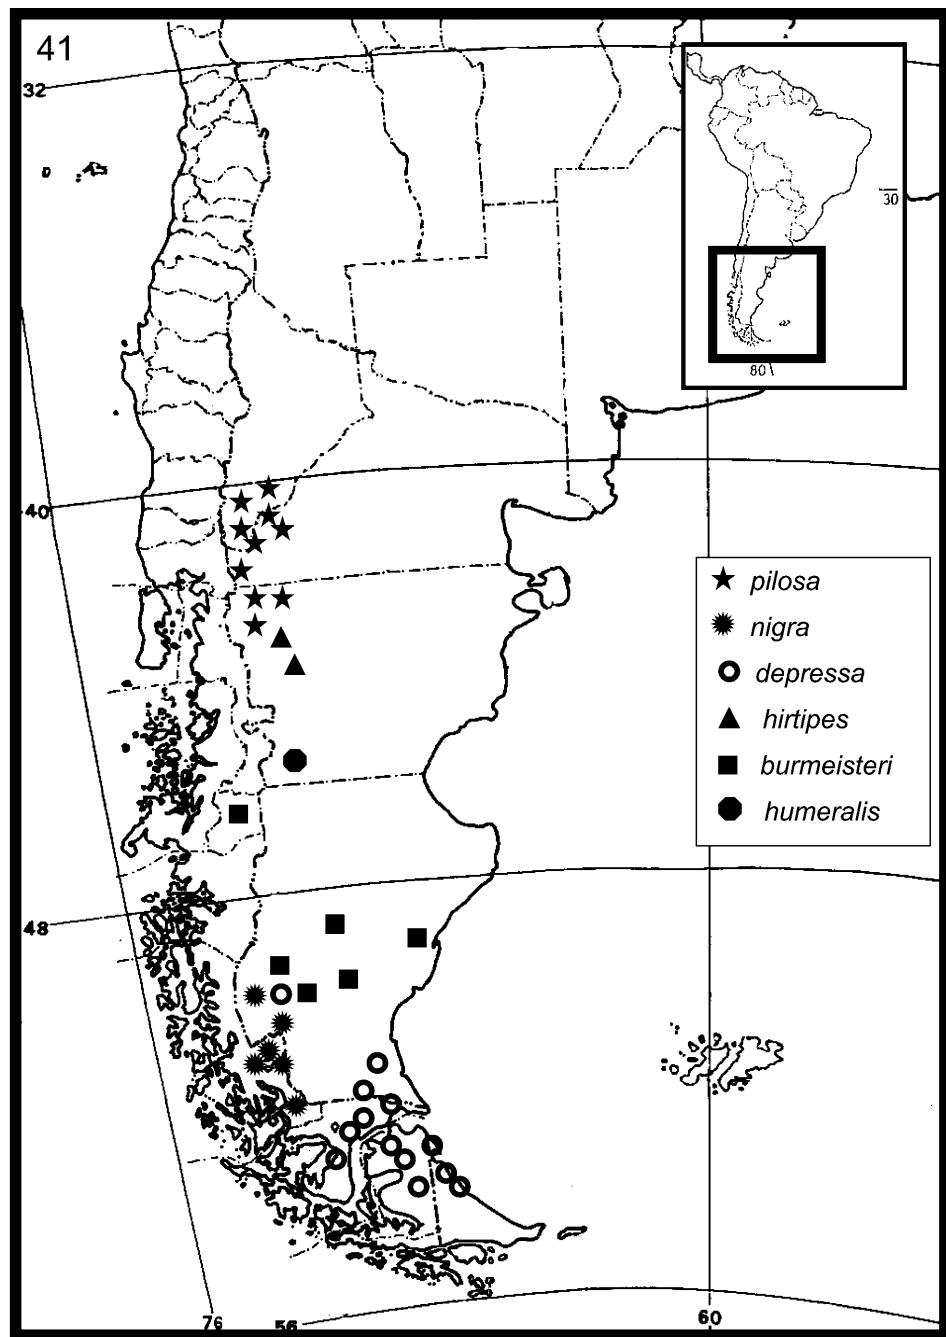

Fig. 41. Geographical distribution of six species of *Platesthes*.

round punctures with anterior margin not raised; pseudo-pleuron with abundant punctures; epipleuron punctate and with setae, texture similar to that of elytron, anterior quarter 1.5 times as wide as posterior half. Legs. Ventral surface of trochanters with brush-like pubescence, ventral femoral and tibial surfaces densely setose throughout; width of distal margin of protibiae equal to 1/5 protibial length; ventral surface of tarsi bearing sparse setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally bisinuate, widest at base, and not overlapping dorsally median lobe; base of basal lamina of tegmen concave. Female genitalia. Paraprocts glabrous; apico-

dorsal lobe of proctiger extending about 1/4 length of coxite.

Type material. Holotype: [Alto de Vilches/ Talca 2200 m/ 2–15.iii.1974/ leg: P. Vidal] [*Platesthes/ vidali* n. sp./ Holotypus/ det. L.E. Peña 1986] (FMNH). Allotype: [Alto Vilches/ Talca Chile/ 19.i.1985] [*Platesthes/ vidali* n. sp./ Alo tipo/ det. L.E. Peña 1986] (FMNH). Two paratypes with the same data as allotype (FMNH).

Other material examined. CHILE: Region VII: Talca: Alto de Vilches, 2400 m, 10.ii.1974, P. Vidal, 1 (PVGH), 2000 m, 14.xi.1997, P. Vidal, 2 (PVGH), 10.i.1985, Pérez de Arce, 1 (MNNC), 12.i.1999, M. Gálvez, 1 (MNNC), 18.i.1999, M. Guerrero, 3 (PVGH), 1 (USNM), 1200 m, 20.xi.1999, M. Guerrero, 7 (PVGH), 2 (IADIZA), 1 (IMLA), xii.1999, M. Guerrero,

8 (PVGH), 1 (BMNH), 1 (NHMB), 1 (USNM), 1 (MACN), 1 (MLPA), 2 (IADIZA), 10.i.2000, M. Guerrero, 2 (PVGH), iii.2000, M. Guerrero, 2 (PVGH), Alto de Vilches, Piedras Blancas, 13.xi.1999, L. Abello, 1 (MNNC); Reserva Nacional Altos de Lircay, 18.xi.2000, J. Mondaca, 3 (MNNC), 1900 m, 6.i.2001, M. Diéguez, 2 (IADIZA). Region VIII: Parque Nacional Laguna del Laja, 22.i.1991, G. Carrasco, 1 (PVGH), Los Angeles, Cerro Abanico, 25.ii.1986, P. Vidal, 1 (PVGH).

Distribution. Chile: Regions VII and VIII (Fig. 40), in the Southern Andean Mountain range entomofaunal region.

Platesthes burmeisteri Haag-Rutenberg, 1877

(Figs 9, 26, 34, 41)

Platesthes burmeisteri Haag-Rutenberg, 1877: 156; Fairmaire, 1889: 121; Champion, 1895: 93; Kolbe, 1907: 86 (cat.); Gebien, 1910: 262 (cat.); Bruch, 1915: 275 (cat.); Gebien, 1938: 397 (cat.); Blackwelder, 1945: 522 (cat.); Kulzer, 1956: 953.

Redescription. Length 9.0–13.5 mm. Body, antennae and legs black to dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture not covered by frons, clypeus lower than frons; frons with semicircular punctures each with a seta on posterior margin and separated by a distance much greater than diameter of one puncture; groove between eye and frons only on posterior half of dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ along lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to width of 9. Thorax. Pronotum with semicircular punctures each with a seta on anterior margin and separated by a distance equal or less than diameter of one puncture (Fig. 34); lateral margins not raised, widest at mid point; posterior angles obtuse (Fig. 26); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, equidistant between suture and lateral margin, internal longer than external; round punctures with anterior margin raised, appearing as protuberances; pseudopleuron with abundant punctures; epipleuron punctate and with setae, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters, femora and tibiae with uniform pubescence; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing abundant decumbent setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally concave, widest at base, and not overlapping dorsally median lobe; base of basal lamina of tegmen concave. Female genitalia. Paraprocts with setae; apicodorsal lobe of proctiger extending about $\frac{1}{2}$ length of coxite.

Material examined. ARGENTINA: Santa Cruz: Dpto. Lago Argentino: 3 km SE El Chaltén, 22.i.1998, G. Flores, 2 (IADIZA), Río Santa Cruz medio, margen izquierda, 18.x.1975, M. Gentili, 3 (IPCN), 7 (IMLA), 4 (FMNH), Lago Argentino, 22.xii.1960, L.E. Peña, 1 (USNM). Dpto. Magallanes: San Julián, 29.iv.1951, L.E. Peña, 2 (FMNH). Dpto. Río Chico: Gobernador Gregores, 24.xi.1966, L.E. Peña, 12 (FMNH); without more precise data: 1 (MLPA), 2 (MACN), ii.1899, C. Bruch, 1 (MACN). Without more precise data: 4 (MACN), 8

(MLPA), 1 (IADIZA), 1 (FMNH), 1 (NHMB). CHILE: Region XI: General Carrera: Chile Chico, 1–11.ii.1983, G. Arriagada, 3 (MNNC).

Distribution. Argentina (Santa Cruz province) and Chile (Region XI) (Fig. 41), in the Central district within the Central Patagonia biogeographic province.

Platesthes granulipennis Kulzer, 1956

(Figs 10–12, 27, 40)

Platesthes granulipennis Kulzer 1956: 957.

Redescription. Length 7.5–10.0 mm. Body and legs black to dark brown, antennae dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture not covered by frons, clypeus lower than frons; frons with semicircular punctures each with a seta on posterior margin and separated by a distance smaller than diameter of one puncture; groove between eye and frons on entire dorsal margin of eye; antennae in the male reaching posterior margin of pronotum, in the female reaching $\frac{3}{4}$ along lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to that of 9. Thorax. Pronotum with semicircular punctures each with a setae on anterior margin and separated by a distance equal or less than diameter of one puncture (Fig. 34); lateral margins not raised, widest at mid point; posterior angles obtuse (Fig. 27); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, equidistant between suture and lateral margin, internal longer than external; round punctures with anterior margin raised, appearing as protuberances; pseudopleuron with protuberances; epipleuron punctate and with setae, texture different from that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters, femora and tibiae with uniform pubescence; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing abundant decumbent setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally bisinuate, widest at base (Fig. 12), and projecting dorsally over median lobe (Fig. 11); base of basal lamina of tegmen concave (Fig. 12). Female genitalia. Paraprocts with setae; apicodorsal lobe of proctiger extending about $\frac{1}{2}$ length of coxite.

Type material. Holotype: [El Calafate/ Santa Cruz/ 5.iii.1948] [Holotypus/ *Platesthes/ granulipennis* nov./ det. H. Kulzer 1956] (NHMB).

Other material examined. ARGENTINA: Chubut: Dpto. Escalante: Comodoro Rivadavia, 2 (MACN), iv.1921, G.L. Harrington, 1 (USNM), 20.i.1967, A. & E. Willink-A. García, 3 (IMLA), 27.x.1968, T. Cekalovic, 1 (FMNH). Santa Cruz: Dpto. Lago Argentino: 17 km W El Calafate, 13.i.1998, G. Flores, 1 (IADIZA), Lago Argentino, 22.xii.1960, L.E. Peña, 1 (FMNH), Cañadón León, 23.xii.1960, L.E. Peña, 1 (FMNH), Lago Viedma, 1.iii.1974, Bordon, 2 (IPCN); Dpto. Güer Aike: Río Coig, 25.xi.1966, L.E. Peña, 1 (FMNH); Dpto. Río Chico: S Gobernador Gregores, 24.xi.1966, L.E. Peña, 4 (FMNH); Dpto. Deseado: Puerto Deseado, 15.i.1967, A. Willink, 3 (IMLA), Las Heras, 4.iii.1974, Bordón, 1 (IPCN), 20 km S Caleta Olivia, 12.xii.1966, L.E. Peña, 1 (FMNH).

Distribution. Argentina: Chubut and Santa Cruz provinces (Fig. 40), in the Central district within the Central Patagonia biogeographic province.

***Platesthes humeralis* Kulzer, 1958**

(Figs 38, 41)

Platesthes humeralis Kulzer 1958: 9.

Redescription. Length 13.0–14.0 mm. Body and legs black, antennae dark brown. Head. Labrum with anterior margin “V”-shaped; clypeus with round punctures, each with a seta on posterior margin; clypeal suture covered by frons, clypeus lower than frons; frons with semicircular punctures each with a seta on posterior margin and separated by a distance much greater than diameter of one puncture; groove between eye and frons on entire dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ of lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to width of 9. Thorax. Pronotum with triangular punctures each with a seta on anterior margin and separated by a distance equal or less than diameter of one puncture (Fig. 35); lateral margins raised, widest behind mid point; posterior angles obtuse (Fig. 38); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, equidistant between suture and lateral margin, internal longer than external (Fig. 38); round punctures with anterior margin not raised; elytral humeri very expanded and raised (Fig. 38), forming a deep depression in lateral intercostal space; pseudopleuron with abundant punctures; epipleuron punctate and with setae, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters, femora and tibiae with uniform pubescence; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing abundant decumbent setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally bisinuate, widest at base and not overlapping dorsally median lobe; base of basal lamina of tegmen concave. Female genitalia. Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to that of 9. Thorax. Pronotum with triangular punctures each with a seta on anterior margin, separated by a distance equal or less than diameter of one puncture (Fig. 35); lateral margins not raised, widest at mid point; posterior angles obtuse (Fig. 28); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, equidistant between suture and lateral margin or more approximate to lateral margin than suture, internal longer than external; round punctures with anterior margin not raised; pseudopleuron with abundant punctures; epipleuron punctate and with setae, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters with brush-like pubescence, ventral femoral surfaces densely setose on proximal half, ventral tibial surfaces densely setose on distal half; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing abundant decumbent setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally bisinuate, widest at base and not overlapping dorsally median lobe; base of basal lamina of tegmen concave. Female genitalia. Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

Type material. Holotype: [Balmaceda/ Aysén 45°54' / 20-II-1957 Kuschel] [Holotypus/ *Platesthes/ kuscheli* nov./ det. H. Kulzer 1957] (NHMB). Two paratypes: [Valle del/ Lago Blanco (Chubut)/ Patagonia] (BMNH).

Distribution. Argentina: Chubut province (Fig. 41), in the Central district within the Central Patagonia biogeographic province.

***Platesthes kuscheli* Kulzer, 1958**

(Figs 1, 2, 28, 35, 40)

Platesthes kuscheli Kulzer 1958: 10; Peña, 1966b: 428 (cat.).

Redescription. Length 9.0–17.0 mm. Body and legs black to dark brown, antennae dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture covered by frons, clypeus lower than frons; frons with semicircular punctures each with a seta on posterior margin and separated by a distance much greater than diameter of one puncture; groove between eye and frons on entire dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ along lateral margin of pronotum, in the female reaching the

15.–17.i.1961, L.E. Peña, 217 (USNM), 2 (IMLA), 2 (MACN), 2 (MLPA), 6 (IADIZA).

Distribution. Argentina (Chubut, Río Negro, and Santa Cruz provinces) and Chile (Region XI) (Fig. 40), in the Central district within the Central Patagonia biogeographic province.

***Platesthes hirtipes* Kulzer, 1962 stat. n.**

(Figs 18, 29, 41)

Platesthes silphoides hirtipes Kulzer 1962: 86.

Redescription. Length 14.0–17.5 mm. Body black, elytral carinae and legs black to dark brown, antennae dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture covered by frons, clypeus lower than frons; frons with round punctures each with a seta on posterior margin and separated by a distance much greater than diameter of one puncture; groove between eye and frons on entire dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ along lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 exceeding width of 9 (Fig. 18). Thorax. Pronotum with triangular punctures each with a seta on anterior margin, separated by a distance equal or less than diameter of one puncture (Fig. 35); lateral margins raised, widest behind mid point; posterior angles obtuse (Fig. 29); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, equidistant between suture and lateral margin, internal longer than external; round punctures with anterior margin not raised; pseudopleuron with abundant punctures; epipleuron punctate and with setae, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters with brush-like pubescence, ventral femoral and tibial surfaces densely setose throughout; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing abundant decumbent setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally concave, widest at base and not overlapping dorsally median lobe; base of basal lamina of tegmen straight. Female genitalia. Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

Type material. Holotype: [Sierra Tepuel (Tecka)/ Chubut/ Argentina/ 11.iii.1961/ Coll: L.E. Peña] [Holotypus/ *Platesthes/ silphoides* ssp./ *hirtipes* n./ det. H. Kulzer 1961] (FMNH). Allotype (FMNH) and two paratypes (1 NHMB, 1 IADIZA) with the same data as holotype. Three paratypes: [Tecka/ Chubut/ Argentina/ 11.iii.1961/ Coll: L.E. Peña] (3 USNM).

Other material examined. ARGENTINA: Chubut: Dpto. Languiñeo: Sierra Tepuel (Tecka), 11.iii.1961, L.E. Peña, 1 (FMNH).

Distribution. Argentina: Chubut province (Fig. 41), in the Central district within the Central Patagonia biogeographic province.

***Platesthes silphoides* Waterhouse, 1845**

(Figs 13–15, 30, 40)

Platesthes silphoides Waterhouse, 1845: 319; Lacordaire, 1859: 215 [as synonym of *Platesthes depressa* (Guérin-Ménéville, 1841)]; Gemminger & Harold, 1870: 1906 (cat.) [as synonym

of *Platesthes depressa*]; Burmeister, 1875: 497 [as synonym of *Platesthes depressa*]; Haag-Rutenberg, 1877: 155 [as synonym of *Platesthes depressa*]; Fairmaire, 1883: 496; 1889: 120; Philippi, 1887: 733 (cat.) [as synonym of *Platesthes depressa*]; Kolbe, 1907: 86 (cat.); Gebien, 1910: 262 (cat.); Bruch, 1915: 276 (cat.); Gebien, 1938: 397 (cat.); Blackwelder, 1945: 522 (cat.); Kulzer, 1956: 952.

Redescription. Length 10.0–15.0 mm. Body, antennae and legs black to dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture not covered by frons, clypeus lower than frons; frons with round punctures each with a seta on posterior margin and separated by a distance much greater than diameter of one puncture; groove between eye and frons on entire dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ along lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to width of 9. Thorax. Pronotum with triangular punctures each with a seta on anterior margin and separated by a distance equal or less than diameter of one puncture (Fig. 35); lateral margins raised, widest behind mid point; posterior angles obtuse (Fig. 30); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, more approximate to lateral margin than suture, internal longer than external; round punctures with anterior margin not raised; pseudopleuron with abundant punctures; epipleuron punctate and with setae, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters, femora, and tibiae with uniform pubescence; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing abundant decumbent setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally concave, widest at distal third (Fig. 14) and not overlapping dorsally median lobe (Fig. 13); base of basal lamina of tegmen straight (Fig. 14). Female genitalia. Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

Type material. Lectotype: [Type] [Port Desire] [*Platesthes/ silphoides*/ Waterh. Ann. 16. 319] (BMNH). To fix the current interpretation of this name and to ensure stability, I am hereby designating this lectotype: [Lectotypus/ *Platesthes silphoides*/ Waterhouse, 1845/ Des. G. Flores 2002].

Other material examined. ARGENTINA: Chubut: without more precise data: 1 (MLPA), 3.vi.1961, A. Kovacs, 1 (BMNH), 22.iv.1975, A. Kovacs, 1 (FMNH). Santa Cruz: Dpto. Distribution. Argentina: Chubut and Santa Cruz provinces (Fig. 40), in the Central district within the Central Patagonia biogeographic province.

***Platesthes neuquensis* sp. n.**

(Figs 31, 39, 40)

Diagnosis. Pronotum with triangular punctures each with a setae on anterior margin, separated by a distance equal or less than diameter of one puncture; clypeal suture covered by frons, clypeus lower than frons; frons with round punctures each with a seta on posterior margin; lateral margins of pronotum raised, widest behind mid point; elytra with two raised carinae equidistant between suture and lateral margin.

Description. Length 12.0–15.0 mm. Body and legs black to dark brown, antennae dark brown. Head. Labrum with anterior margin concave; clypeus with round punctures each with a central seta; clypeal suture covered by frons, clypeus lower than frons; frons with round punctures each with a seta on posterior margin and separated by a distance much greater than diameter of one puncture; groove between eye and frons on entire dorsal margin of eye; antennae in the male reaching $\frac{3}{4}$ along lateral margin of pronotum, in the female reaching the middle of lateral margin of pronotum; antennomere 10 wider than long; width of antennomere 11 equal to width of 9. Thorax. Pronotum with triangular punctures each with a setae on anterior margin and separated by a distance equal or less than diameter of one puncture (Fig. 35); lateral margins raised, widest behind mid point; posterior angles obtuse (Fig. 31); disc of pronotum convex, higher than lateral margins; prosternum convex. Elytron arched, with two raised carinae reaching the end of elytron, equidistant between suture and lateral margin, internal longer than external (Fig. 39); round punctures with anterior margin not raised; pseudopleuron with abundant punctures; epipleuron punctate and with setae, texture similar to that of elytron, anterior quarter twice as wide as posterior half. Legs. Ventral surface of trochanters, femora and tibiae with uniform pubescence; width of distal margin of protibiae equal to $\frac{1}{4}$ protibial length; ventral surface of tarsi bearing abundant decumbent setae. Male genitalia. Lateral styles of tegmen with proximal margin ventrally bisinuate, widest at base and not overlapping dorsally median lobe; base of basal lamina of tegmen straight. Female genitalia. Paraprocts glabrous; apicodorsal lobe of proctiger extending about $\frac{1}{4}$ length of coxite.

Etymology. Named “neuquensis” for the Argentinian province Neuquén in which all the type specimens were collected.

Type material. Holotype, male: [Leg. M. Gentili] [Collón Curá, Neuquén, Arg./ 29.xii.1958/ Col. H.J. Molinari] [HOLO-TYPUS male/ *Platesthes/ neuquensis* n. sp./ Det. G. Flores 2003] (IADIZA). Allotype, female, with the same data as holotype (IADIZA). Two paratype females: [Zapala, Neuquén/ 1-47 Z.1948/ Hayward y Willink] [PARATYPUS female/ *Platesthes/ neuquensis* n. sp./ Det. G. Flores 2003] (IMLA). Two paratype females: [Leg. M. Gentili] [Marucho, Nq., Arg./ 8.xii.1966/ Col. H.J. Molinari] [PARATYPUS female/ *Platesthes/ neuquensis* n. sp./ Det. G. Flores 2003] 1 (IADIZA), 1 (MACN).

Distribution. Argentina: Neuquén province (Fig. 40), in the Payunia district within the Central Patagonia biogeographic province.

CLADISTIC ANALYSIS

Methods. Outgroups. Character polarity was determined by the outgroup comparison method (Nixon & Carpenter, 1993). Outgroups were used to provide a root for the cladogram and to test the monophyly of *Platesthes*, not to explore the sister group relationships of *Platesthes*. Since there is no phylogeny for the genera of Praocini, the outgroups chosen within Praocini were the genera *Praocis*, *Antofagapraocis* Flores, 2000, *Falsopraocis* Kulzer, 1958 and *Platyholmus* Solier, 1840. The present analysis was based on 17 terminal units: 13 species of *Platesthes* plus the following outgroup species: *Praocis rufipes* Eschscholtz, 1829 (type species), *Antofagapraocis subnudus* Flores, 2000, *Falsopraocis ricardae* (Solier, 1851) (type species) and *Platyholmus uspallatensis* Fairmaire, 1883.

Characters. Of the 48 characters used 41 were features of external morphology, five of male genitalia and two of female genitalia (Appendix 1). The distribution of states among the terminal taxa is indicated in the data matrix (Appendix 2). Multistate characters 7, 9, 16, 19, 22, 27, 29, 30, 34, 37, 39, 42 and 44 were treated as non-additive because it was not possible to make a correlation between apomorphic states. Multistate characters 6, 11, 12, 14, 15, 33 and 40 were treated as additive and coded according to Strong & Lipscomb (1999). The rule for ordering, in which conditions are arranged in a graded linear sequence from one to another through intermediates, is called the method of intermediates (Wilkinson, 1992); it assumes that small changes in a character are more likely to occur than large changes. In characters 6 (punctures on the frons) and 15 (punctures on the pronotum) the states absent (0) and round with a central seta (Fig. 32) (6.1, 15.1) are present in other genera of Praocini (the last also in four species of *Platesthes*), while the states round with a seta on anterior (pronotum)/posterior (frons) margin (Fig. 33) (6.2, 15.2), semicircular with a seta on anterior (pronotum)/posterior (frons) margin (Fig. 34) (6.3, 15.3) and triangular with a seta on anterior margin (Fig. 35) (15.4) are unique to species of *Platesthes* within Praocini. I considered the absence of punctures plesiomorphic for Praocini and that the states 2, 3 and 4 evolved in sequence from the state 1. For the different states exhibited by the elytral carinae (characters 22–24), the absence of carinae was coded only once in the character 22 to avoid repeating this state three times and the consequent heavy weighting of this character state. In characters 23 and 24 the absence of carinae was coded as inapplicable (–) for the species *Praocis rufipes*, *Antofagapraocis subnudus* and *Platyholmus uspallatensis*. The same for the character state “absence of punctures” on frons and pronotum, which was coded only once in the character 6 (punctures on frons) and character 15 (punctures on pronotum) and coded as inapplicable (–) in characters 7 and 16 for the species *Platyholmus uspallatensis*.

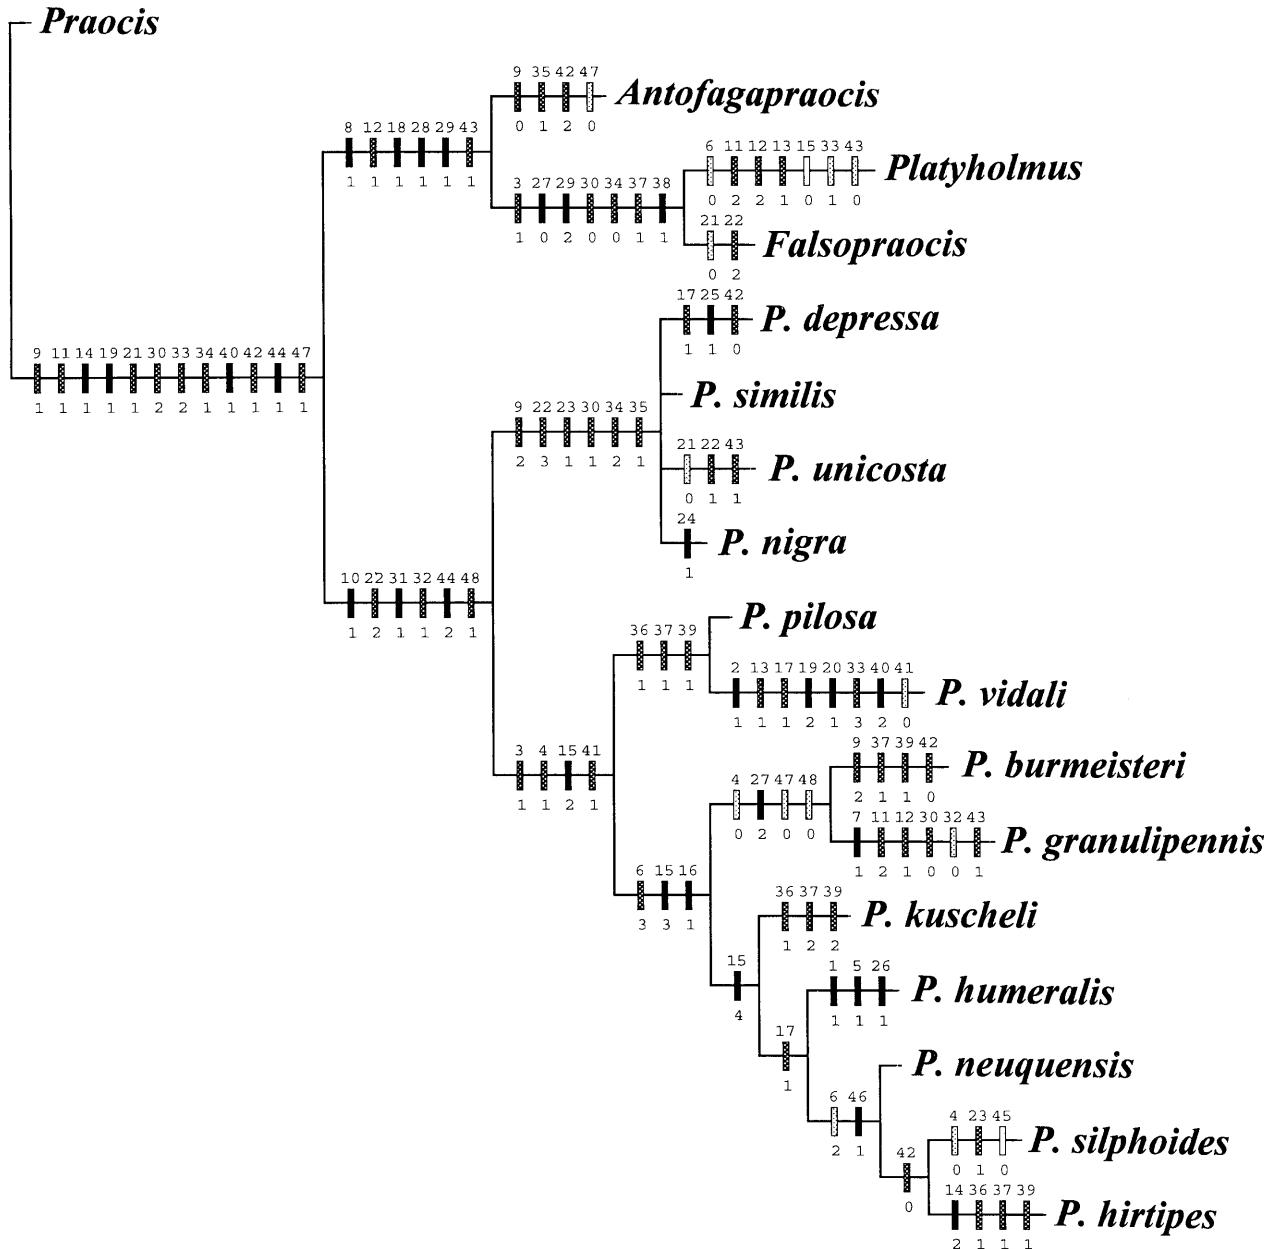

Fig. 42. Cladogram showing relationships of species of *Platesthes*. Black squares: non-homoplasious apomorphies; dotted squares: homoplasies.

Procedure. The data matrix (Appendix 2) was analyzed with NONA version 2.0 (Goloboff, 1993), applying the command sequence hold 1,000; hold 50; mult* 20, and max*. The consistency and retention indices (Farris, 1989) were calculated including and excluding autapomorphies (characters 1, 2, 5, 20, 25, and 26). Clados version 1.8.1 (Nixon, 1993) was employed to examine the character distribution and print the cladogram.

Results. The analysis of the data matrix (Appendix 2) produced one most parsimonious cladogram (Fig. 42) 109 steps long, with a consistency index (CI) of 0.65 and a retention index (RI) of 0.72. Excluding autapomorphies the consistency index (CI) is 0.63. The monophyly of *Platesthes* is established by three unambiguous synapomorphies (Fig. 42): antennae longer in the male (10.1),

epipleuron conspicuous in posterior 4/5 (31.1) and setae of lateral styles of tegmen on ventral surface, lateral margins and dorsal surface (44.2). The cladogram shows three other character states (22.2, 32.1 and 48.1) that support the monophyly of *Platesthes* (Fig. 42), from which 22.2 (elytra with two main carinae, internal longer than external) evolves to state 3 (elytra with two main carinae, external and internal of same length) in the clade *Platesthes depressa*, *P. similis*, *P. unicosta* and *P. nigra* and then evolves to state 1 (elytra with one main carina) in *P. unicosta*; the character state 32.1 (epipleuron texture similar to that of elytron) shows a reversal to plesiomorphic state 0 (epipleuron texture different from that of elytron), in *P. granulipennis*; and the character state 48.1 (apicodorsal lobe of coxite extending about 1/4 length of

coxite) shows a reversal to plesiomorphic state 0 (apico-dorsal lobe of coxite extending about $\frac{1}{2}$ length of coxite) in the clade *P. burmeisteri* and *P. granulipennis*.

Examination of the morphology of species from the remaining genera of Praocini not used as outgroups in this analysis, revealed that the character states epipleuron conspicuous in posterior 4/5 (31.1) and setae of lateral styles of tegmen on ventral surface, lateral margins and dorsal surface (44.2) are unique to *Platesthes*.

The species of *Platesthes* are grouped in two clades (Fig. 42), the first includes four species in an unresolved polity. The second clade includes the remaining nine species of *Platesthes*, in which the relationships are resolved and some of its subclades are supported by the character states punctures on the frons (6.2, 6.3) and pronotum (15.2, 15.3, and 15.4), which are unique within the Praocini.

DISCUSSION

The first clade of species of *Platesthes* includes *P. depressa*, *P. similis*, *P. unicosta* and *P. nigra* (Fig. 42), which occur from south of the Santa Cruz River to north of Tierra del Fuego island (Figs 40, 41) (with the exception of *P. unicosta*, which occurs northwest of the source of the Santa Cruz River). The remaining nine species of *Platesthes* in the second clade are distributed from north of the Santa Cruz River to Neuquén in Argentina and reach Region VII in Central Chile (Figs 40, 41) (with the exception of *P. granulipennis*, which occurs on both sides of the Santa Cruz River). The valley of the Santa Cruz River was covered by ice repeatedly, during the Pliocene and Pleistocene glaciations (Mercer, 1976), which could have acted as a vicariant event separating populations to the north and south of the valley. The Santa Cruz River is a biogeographic barrier as is shown by the distribution of other genera of Tenebrionidae, such as *Psectrascelis* Solier, 1836 (Peña, 1985) and *Patagonogenius* Flores, 1999 (Flores, 1999), which do not occur south of the Santa Cruz River.

The distribution of the species of the two clades of *Platesthes* coincides approximately with the boundaries of the three districts recognized by Morrone et al. (2002) for the Central Patagonia biogeographic province: the four species of the first clade (*Platesthes depressa*, *P. similis*, *P. unicosta* and *P. nigra*) inhabit the Fuegian district (Figs 40, 41), while the species of the second clade inhabit the Payunia district (*P. neuquensis*) and the Central district (the remaining species) (Figs 40, 41), reaching also to the Region VII in Central Chile (*P. vidali*).

From a biodiversity conservation perspective, the distribution of *Platesthes* in the Patagonian steppes is subject to threats from livestock grazing and mining, which lead to habitat destruction (Flores, 1998). The distribution of *Platesthes* in the Patagonian steppes includes 16 protected zones (Table 1), which represent less than 1% of the total area of distribution of the genus in this area. This percentage is low, because a biome is poorly represented when less than 3% of it is protected and adequately represented when it is more than 10% (Roig-Juñent & Claver,

1999). These protected zones fall in the area of distribution of 10 of the 12 species of *Platesthes*. There are no protected zones for species with small areas of distribution such as *P. humeralis* and *P. hirtipes*. On the Patagonian steppes, most of the reserves are isolated and remote (Flores & Roig Juñent, 2001), and are as biological islands within modified ecosystems (Halffter & Ezcurra, 1992).

TABLE 1. Protected zones in the areas of distribution of *Platesthes*. A – Argentina; C – Chile.

Fuegian district	Reserva Provincial Dicky (A) Reserva Provincial Cabo Virgenes (A) Reserva Provincial Laguna Azul (A) Reserva Municipal Laguna Nimez (A) Parque Nacional Los Glaciares (A) Parque Nacional Torres del Paine (C)
Central district	Reserva Provincial Península San Julián (A) Reserva Provincial Ría de Puerto Deseado (A) Monumento Natural Bosques Petrificados (A) Reserva Provincial Cabo dos Bahías (A) Reserva Provincial Punta Tombo (A) Reserva Faunística Península Valdés (A) Reserva Provincial Trevelín (A) Parque Nacional Los Alerces (A) Parque Nacional Nahuel Huapi (A)
Payunia district	Parque Nacional Laguna Blanca (A)
Southern	Reserva Nacional Radal (C)
Andean	Reserva Nacional Alto de Vilches (C)
Mountain range	Reserva Nacional Altos de Lircay (C) Parque Nacional Laguna del Laja (C)

The distribution of *Platesthes vidali* in Central Chile falls within the Southern Andean Mountain range entomofaunal region (Peña, 1966a). This area has been ranked by Flores & Vidal (2000) as the first for conservation priority of the areas of endemism of the tenebrionid genus *Callyntra* Solier, 1836 using the cladistic indices of Vane-Wright et al. (1991). These authors emphasized the necessity for creating more reserves in this area, which has only four protected areas (Table 1) and specimens of *P. vidali* have been collected in three of these.

CONCLUSIONS

A cladistic analysis of *Platesthes* reveals that this genus is a monophyletic group defined by three synapomorphies of external morphology and male genitalia. Other character states, such as the punctures on frons and pronotum are unique to *Platesthes* among the Praocini and support subclades of species. Phylogenetic analysis indicates that the species of *Platesthes* are arranged in two monophyletic groups, which allows the proposal of a biogeographic evolutionary scenario.

Preliminary observations on the status of conservation of *Platesthes* in its area of distribution indicates that species of this genus are inadequately protected. Further studies of the taxa inhabiting mainly the Patagonian steppes are required to identify additional areas in need of conservation.

ACKNOWLEDGEMENTS. I gratefully acknowledge curators for the loan of material; S. Roig Juñent, C.A. Triplehorn and two anonymous reviewers for suggestions for improving this paper; S. Roig Juñent for the use of NONA, K.C. Nixon for the use of Clados; O. Merkl for providing helpful information about the location of the types of Kulzer, P. Sackmann for sending information on the habitat of *Platesthes pilosa*, O. Villegas for taking the photographs and my wife Cláudia Vergara for help in preparation of artwork and help in the field trip to Santa Cruz province in 1998. This study was supported by a re-entry fellowship of the Consejo Nacional de Investigaciones Científicas y Técnicas (CONICET), Argentina, and a re-entry grant of the Antorchas Foundation, Argentina.

- APPENDIX 1. Characters and character states used in the cladistic analysis of *Platesthes* (0 – plesiomorphic; 1, 2, 3, 4 – apomorphic).
- Head**
1. Labrum, anterior margin: concave (0); “V”-shaped (1).
 2. Clypeus: straight (0); bent downward (1).
 3. Clypeal suture: clypeus and frons at same level (0); clypeus lower than frons (1).
 4. Clypeal suture: not covered by frons (0); covered by frons (1).
 5. Clypeus, punctures: round with a central seta (0); round with a seta on posterior margin (1).
 6. Frons, punctures: absent (0); round with a central seta (1); round with a seta on posterior margin (2); semicircular, with a seta on posterior margin (3).
 7. Frons, distance between punctures, if present: much greater than diameter of one puncture (0); less than diameter of one puncture (1).
8. Maxillary palps, last segment: axe-shaped (0); subcylindrical (1).
9. Groove between eye and frons: absent (0); present on entire dorsal margin of eye (1), present only on posterior half of dorsal margin of eye (2).
10. Antennal length: equal in both sexes (0); longer in the male (1).
11. Antennal length male: reaching the middle of lateral margin of pronotum (0); reaching 3/4 along lateral margin of pronotum (1); reaching posterior margin of pronotum (2).
12. Antennal length female: reaching the middle of lateral margin of pronotum (0); reaching 3/4 along lateral margin of pronotum (1); reaching posterior margin of pronotum (2).
13. Antennomere 10, width: wider than long (Fig. 18) (0); longer than wide (Fig. 19) (1).
14. Antennomere 11, width: not exceeding width of 9 th (0); equal to width of 9 th (Fig. 19) (1); exceeding width of 9 th (Fig. 18) (2).
- Thorax**
15. Pronotum, punctures: absent (0); round with a central seta (Fig. 32) (1); round with a seta on anterior margin (Fig. 33) (2); semicircular with a seta on anterior margin (Fig. 34) (3); triangular with a seta on anterior margin (Fig. 35) (4).
 16. Pronotum, distance between punctures, if present: much greater than diameter of one puncture (Figs 32, 33) (0); equal or less than diameter of one puncture (Figs 34, 35) (1).
 17. Lateral margin of pronotum: not raised (0); raised (1).
 18. Lateral margin of pronotum: remote from disc (0); contiguous with disc (1).
 19. Posterior angles of pronotum: acute (0); obtuse (Figs 20–24) (1); straight (Fig. 25) (2).
 20. Disc of pronotum: convex, higher than lateral margins (0); flat, at lower level than lateral margins (1).
 21. Prosternum, shape: flat (0); convex (1).
- Elytron**
22. Carinae: absent (0); one (1); two, internal longer than external (Figs 37–39) (2), two, external and internal of same length or external longer than internal (Fig. 36) (3).
 23. Carinae, if present: equidistant between suture and lateral margin (Figs 37–39) (0); more approximate to a lateral margin (Fig. 36) (1).
 24. Carinae, if present: reaching the end of elytron (0); reaching to half or 3/4 the length of the elytron (1).
 25. Elytron: arched (Figs 37–39) (0); flat (Fig. 36) (1).
 26. Elytral humeri: not raised (Figs 36–37, 39) (0); very expanded and raised (Fig. 38) (1).
 27. Elytral punctures: absent (0); round, with anterior margin not raised (1); round, with anterior margin raised appearing as protuberances (2).
 28. Lateral margin: glabrous (0); with setae (1).
 29. Lateral margin surface: smooth (0); punctate (1); with protuberances (2).
 30. Pseudopleuron surface: with protuberances (0); with sparse punctures (1); with abundant punctures (2).
 31. Epipleuron: conspicuous throughout (0); conspicuous in posterior 4/5 (1).
 32. Epipleuron, texture: different from that of elytron (0); similar to that of elytron (1).
 33. Epipleuron, anterior quarter: four times as wide as posterior half (0); three times as wide as posterior half (1); twice as wide as posterior half (2); 1.5 times as wide as posterior half (3).
 34. Epipleuron surface: with protuberances (0); punctate (1); smooth (2).
 35. Epipleuron surface: with setae (0); glabrous (1).
- Legs**

36. Ventral surface of trochanters: with uniform pubescence (0); with brush-like pubescence (1).

37. Ventral femoral surface: with uniform pubescence (0); densely setose throughout (1); densely setose on proximal half (2).

38. Setae on ventral femoral surface: arising in punctures (0); arising in protuberances (1).

39. Ventral tibial surface: with uniform pubescence (0); densely setose throughout (1); densely setose on distal half (2).

40. Protibiae, width of distal margin: exceeding 1/3 protibial length, but not exceeding half protibial length (0); equal to 1/4 protibial length (1); equal to 1/5 protibial length (2).

41. Setae on ventral surface of tarsi: sparse (0); abundant (1).

Male genitalia

42. Lateral styles of tegmen: ventrally concave (Fig. 14) (0); ventrally bisinuate (Fig. 12) (1); ventrally triangular (2).

43. Lateral styles of tegmen: not overlapping dorsally median lobe (Fig. 13) (0); projecting dorsally over median lobe (Fig. 11) (1).

44. Setae of lateral styles of tegmen: on ventral surface and lateral margins (0); only on lateral margins (1); on ventral surface, lateral margins and dorsal surface (Figs 11–14) (2).

45. Lateral styles of tegmen: widest at distal third (Fig. 14) (0); widest at base (Fig. 12) (1).

46. Base of basal lamina of tegmen: concave (Fig. 12) (0); straight (Fig. 14) (1).

Female genitalia

47. Paraprocts: with setae (0); glabrous (1).

48. Proctiger, extent of apicodorsal lobe: extending about 1/2 length of coxite (0); extending about 1/4 length of coxite (1).

Received August 28, 2003; revised January 12, 2004; accepted April 5, 2004

APPENDIX 2. Data matrix of species of *Platesthes* (plus the outgroups *Praocis*, *Antofagapraocis*, *Platyholmus* and *Falsopraocis*). 0–4 = character states (0 = plesiomorphic; 1, 2, 3, 4 = apomorphic); a (polymorphy) = 0/1; – = inapplicable.
