RESUMEN

Realizar los presentes ejercicios conllevan a la utilización de herramientas tecnológicas adquiridas y aprendidas en el Diplomado CCNA1 y CCNA 2, en estos módulos, aprendimos que hay diferentes plataformas y softwares necesarios para configurar, conectar y diseñar redes. La evaluación denominada “Prueba de habilidades prácticas”, forma parte de las actividades evaluativas del Diplomado de Cisco, la cual busca identificar el grado de desarrollo de competencias y habilidades que fueron adquiridas a lo largo del diplomado y a través de la cual se pondrá a prueba los niveles de comprensión y solución de problemas relacionados con diversos aspectos de Networking.

ABSTRACT

Performing these exercises leads to the use of technological tools acquired and learned in the CCNA1 and CCNA 2 Diploma, in these modules, we learned that there are different platforms and softwars necessary to configure, connect and design networks. The evaluation called "Practical skills test" is part of the evaluation activities of the Cisco Diploma, which seeks to identify the degree of development of skills and abilities that were acquired throughout the diploma and through which it will be tested the levels of understanding and solution of problems related to various aspects of Networking.

INTRODUCCION

Esta “Prueba de habilidades prácticas”, es el paso final en las actividades del Diplomado de Profundización CCNA, lo que identifica el alcance de competencia y habilidades obtenidas por el estudiante en el desarrollo del diplomado de profundización. El desarrollo de la actividad pretende dar solución a ciertos parámetros establecidos para lograr comunicar tres hosts de Colombia, se implementa una serie de comandos y condiciones de operación que permiten la comunicación en internet de Bucaramanga, Tunja y Cundinamarca, poniendo en práctica los conceptos de VLANs, los servidores DHCP, topologías de red, información de OSPF entre otros.

OBJETIVOS

OBJETIVO GENERAL

Analizar los casos de estudio CCNA1 Y CCNA2 asignados implementando soluciones integradas LAN-WAN mediante la utilización de la herramienta de simulación Packet Tracer.

OBJETIVOS ESPECIFICOS

- Diseñar las topologías de los casos de estudio CCNA1 Y CCNA2 utilizando PKT.
- Conectar dispositivos y desarrollar un esquema de direccionamiento y prueba.
- Considerar la asignación de los parámetros básicos y la detección de vecinos directamente conectados.
- Determinar la cantidad de Host y subredes de una red.
- Identificar los protocolos de rutas estáticas, de enrutamiento dinámico y de enrutamiento IP.
- Diferenciar los protocolos de enrutamiento por vector distancia: RIP, IGRP, EIGRP.
- Comprender el direccionamiento de red y la máscara de direcciones.
- Determinar la cantidad de Host y Subredes de una red.

JUSTIFICACION

Con el desarrollo del siguiente trabajo, se identificarán cada uno de los dispositivos utilizados en una topología sencilla de red, enfatizando sus características principales y los pasos a seguir para la configuración de los mismos. Es importante conocer y entender la importancia de cada uno de ellos dentro de la red de comunicación; esto se hará posible con ayuda del programa de simulación de redes “Packet Tracer”, que servirá de guía para el desarrollo algunos ejercicios que aquí se plantean.

Desarrollo

Escenario 1

Una empresa posee sucursales distribuidas en las ciudades de Bogotá, Medellín y Cali en donde el estudiante será el administrador de la red, el cual deberá configurar e interconectar entre sí cada uno de los dispositivos que forman parte del escenario, acorde con los lineamientos establecidos para el direccionamiento IP, protocolos de enrutamiento y demás aspectos que forman parte de la topología de red.

Reply from 192.168.1.66: bytes=32 time=6ms TTL=126

Ping statistics for 192.168.1.66:

packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 2ms, Maximum = 18ms, Average = 8ms

CALI>ping 192.168.1.34

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 192.168.1.34, timeout is 2 seconds:
!!!!

Success rate is 100 percent (5/5), round-trip min/avg/max = 2/8/14 ms

MEDELLIN>ping 192.168.1.66

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 192.168.1.66, timeout is 2 seconds:
!!!!

Success rate is 100 percent (5/5), round-trip min/avg/max = 2/8/15 ms

Escenario 2

Una empresa tiene la conexión a internet en una red Ethernet, lo cual deben adaptarlo para facilitar que sus routers y las redes que incluyen puedan, por esa vía, conectarse a internet, pero empleando las direcciones de la red LAN original.

Conclusiones

- El diplomado me brindo conocimientos importantes en mi carrera venidera como ingeniero de Sistemas, aportando grandes expectativas a nivel laboral y personal para continuar capacitándome y dar apoyo en todo lo que se pueda a mi empresa.
- Se obtuvieron los logros que se querían obtener, el aprendizaje que se quería adquirir y termino gratamente satisfecho por la labor realizada.
- Se adquirieron los conocimientos esenciales para el manejo de redes, y el manejo del simulador Cisco PacketTracer, el cual es de vital importancia para la ejecución de los ejercicios.
