AGRADECIMIENTOS

Al culminar una nueva etapa, llena de dificultades en el desarrollo del Diplomado De Profundización CISCO CCNP, es para mí un verdadero placer poder dedicar este espacio, al poder expresar mi más sincero agradecimiento al profesor Alejandro Pérez y al director de grado Gerardo Granados. Por su apoyo, orientación y confianza durante el trascurso de aprendizaje del Diplomado De Profundización CISCO CCNP.

Finalmente agradezco a mis compañeros de curso. A José Cándelo, Johana Parada, Cesar Correa y Orlando Linares. Por su comunicación contantes en cada una de las actividades y el apoyo incondicional.

GLOSARIO

CONFIGURACIÓN EBGP E IBGP: Es el que permite crear un dominio en el ruteo libre de loops en un sistema de autónomo. Es el protocolo de BGP utilizado para el transporte de mensajes para abrir y se encarga de la conexión de los parámetros.

NETLAB: Son las topologías de redes en datos, en particular las empresas que trabajan con redes de datos controlados remotamente con fines únicamente educativos.

PROTOCOLO HSRP: Es un protocolo de propiedad de Cisco, Es de capa tres encargado de proporcionar redundancia al Gateway. Se utiliza para cuando se produce una falla de red en un sistema multicast.

HOT STANDBY: Es un protocolo de Cisco que se encarga del despliegue de los routes en caso de que se produzca una falla de red. Lo que evita las inconsistencias de puntos de fallo únicos en el sistema.

REDUNDANCY PROTOCOL (VRRP): Este tipo de protocolo permite la comunicación de un propietario definido y puede estar diseñado con el fin de aumentar los enlaces de puerta dados a una misma máquina de subred.

PLANTILLAS SDM: Son las que permiten a los routes la configuración con el fin de sacar el mayor rendimiento de los routes de centro de red para poder maximizar los recursos del sistema mediante unicast.

RESUMEN

En este estudio de Diplomado CISCO CCNP, es un curso de profundización. Se examinó los aspectos más relevantes de enrutamiento y conmutación, donde se busca una manera de equipar a nuevos profesionales en el ámbito laboral y se puedan adquirir métodos de diseño de redes, para el enrutamiento de redes avanzadas, la implementación de diversos mecanismos en la actualización de enrutamiento en el tráfico de redes empresariales.

Se desarrolla el módulo CCNP ROUTE, donde se utiliza el método de tareas, con esta estrategia se promueve el aprendizaje de cada una de las competencias, las cuales cumple con un orden lógico, facilitando el aprendizaje de cada uno de los temas con los simuladores de Packet Tracer / GNS3 y el acceso a la plataforma de laboratorios remotos SMARTLAB.

Palabras Clave: CISCO, CCNP, Conmutación, Enrutamiento, Redes, Electrónica.

ABSTRACT

In this CISCO CCNP Diploma study, it is an in-depth course. The most relevant aspects of routing and switching are examined, where team management is sought for new professionals in the workplace and network design methods can be obtained, for routing advanced networks, the implementation of various mechanisms in updating routing in business network traffic.

The CCNP ROUTE module is developed, where the task method is used, with this strategy the learning of each of the competences is promoted, which complies with a logical order, facilitating the learning of each of the topics with the simulators of Packet Tracer / GNS3 and access to the SMARTLAB remote laboratory platform.

Keywords: CISCO, CCNP, Routing, Switching, Networking, Electronics.

INTRODUCCIÓN

Con el siguiente trabajo, se debe dar cumplimiento al desarrollo de los dos escenarios planteados en el Diplomado de profundización CNNP, con el fin de realizar un proceso de documentación y solución a cada una de las actividades propuestas con su respectiva configuración de los dispositivos.

Durante el desarrollo del escenario uno, se emplea el software GNS3, con el fin de crear una topología donde por medio de 4 Router se busca dar la configuración BGP y la codificación de los ID para los routers. Por medio del comando show ip route, se debe verificar la información utilizada en el enrutamiento. Se debe elaborar un paso a paso del escenario plantado.

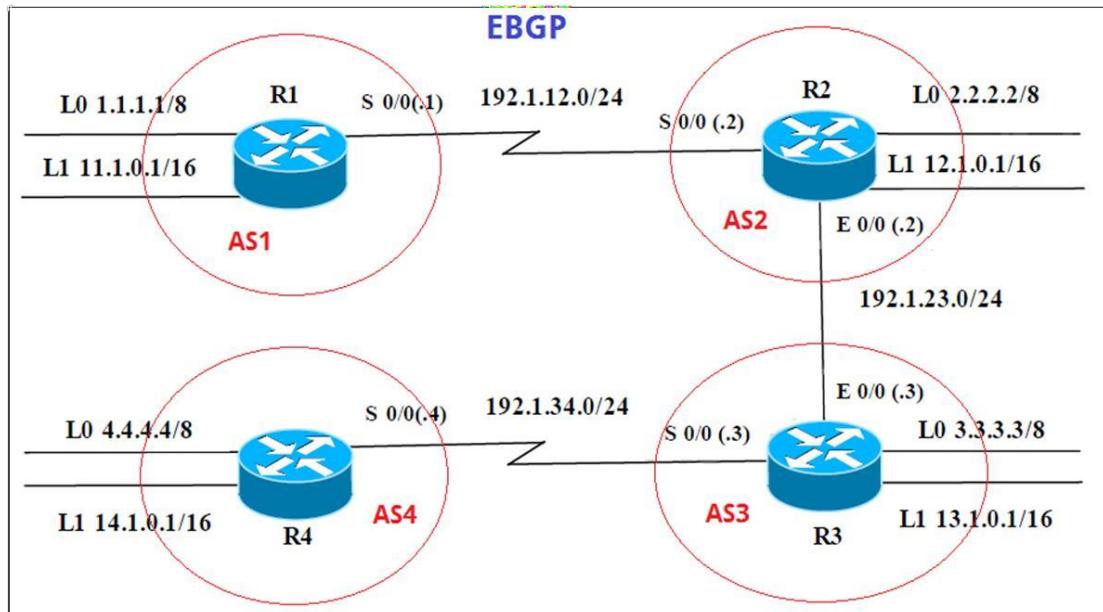

En el escenario dos, se emplea el software Packet Tracer, a partir de una topología donde se deben emplear switches y computadores de escritorio. Se debe crear un protocolo dinámico con la configuración del VTP y la actualización de las VLAN en los switch. En los PC se deben asociar los puertos VLAN y configurar las direcciones IP. Por medio de un ping entre los PC y los Switch se debe comprobar su conexión.

DESARROLLO

ESCENARIO 1

1. Para este escenario se utilizó el software GNS3

Figura 1. Escenario 1

Información para configuración de los Routers

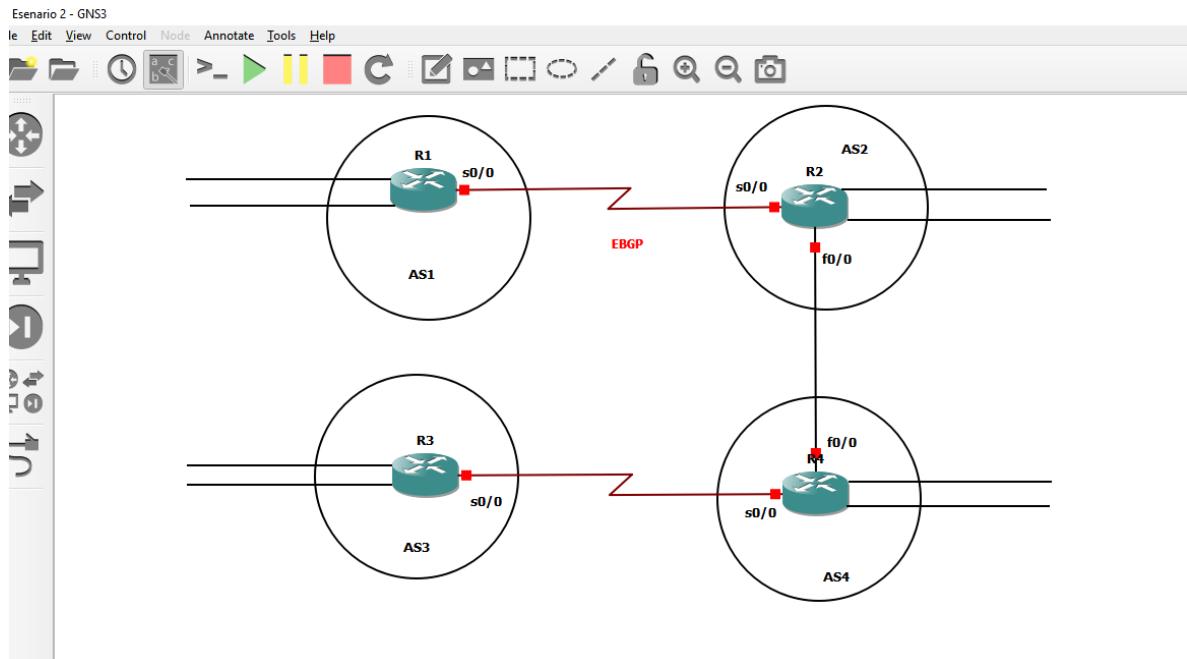

Interfaz	Dirección IP	Máscara
Loopback 0	1.1.1.1	255.0.0.0
Loopback 1	11.1.0.1	255.255.0.0

```

Figura 5. Comprobación del código R1

The screenshot shows two terminal windows side-by-side. The left window is titled 'R1' and displays the configuration of router R1. The right window is titled 'R2' and displays the configuration of router R2. Red arrows point from the top of each window towards the center, indicating the transition between the two routers. The R1 window shows commands for BGP configuration, including setting the router ID and network statements. The R2 window shows similar BGP configuration. Below the configurations, both windows display the output of the 'show ip route' command, which lists various network routes with their metrics and next-hop information.

```

1.3. Configure una relación de vecino BGP entre R3 y R4. R3 ya debería estar configurado en AS3 y R4 debería estar en AS4. Anuncie las direcciones de Loopback de R4 en BGP. Codifique el ID del router R4 como 66.66.66.66. Establezca las relaciones de vecino con base en las direcciones de Loopback 0. Cree rutas estáticas para alcanzar la Loopback 0 del otro router. No anuncie la Loopback 0 en BGP. Anuncie la red Loopback de R4 en BGP. Presente el paso a con los comandos utilizados y la salida del comando show ip route.

ESCENARIO 2

1. Para este escenario se utilizó el Packet Tracer

Figura 15. Escenario 2

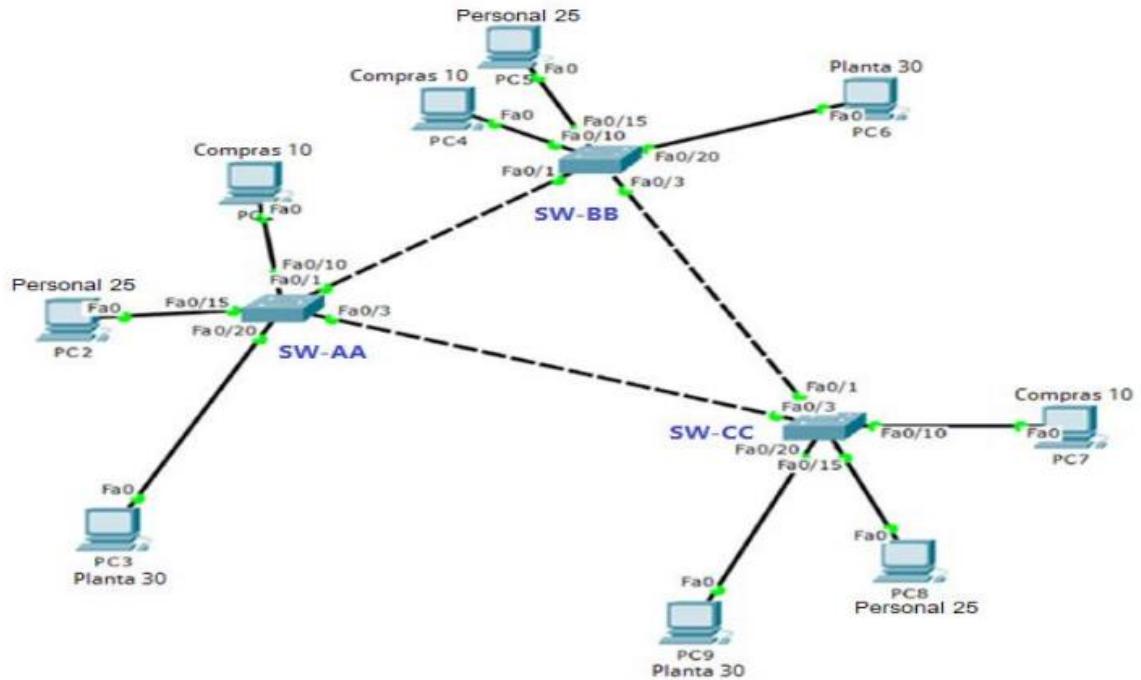

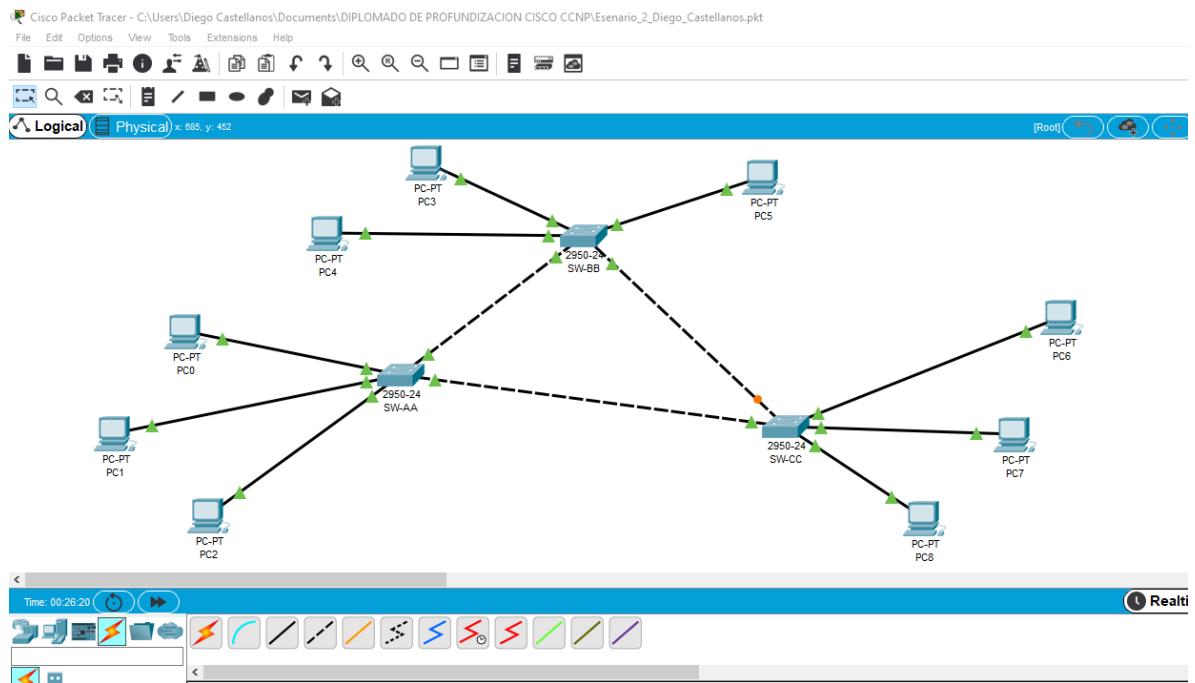

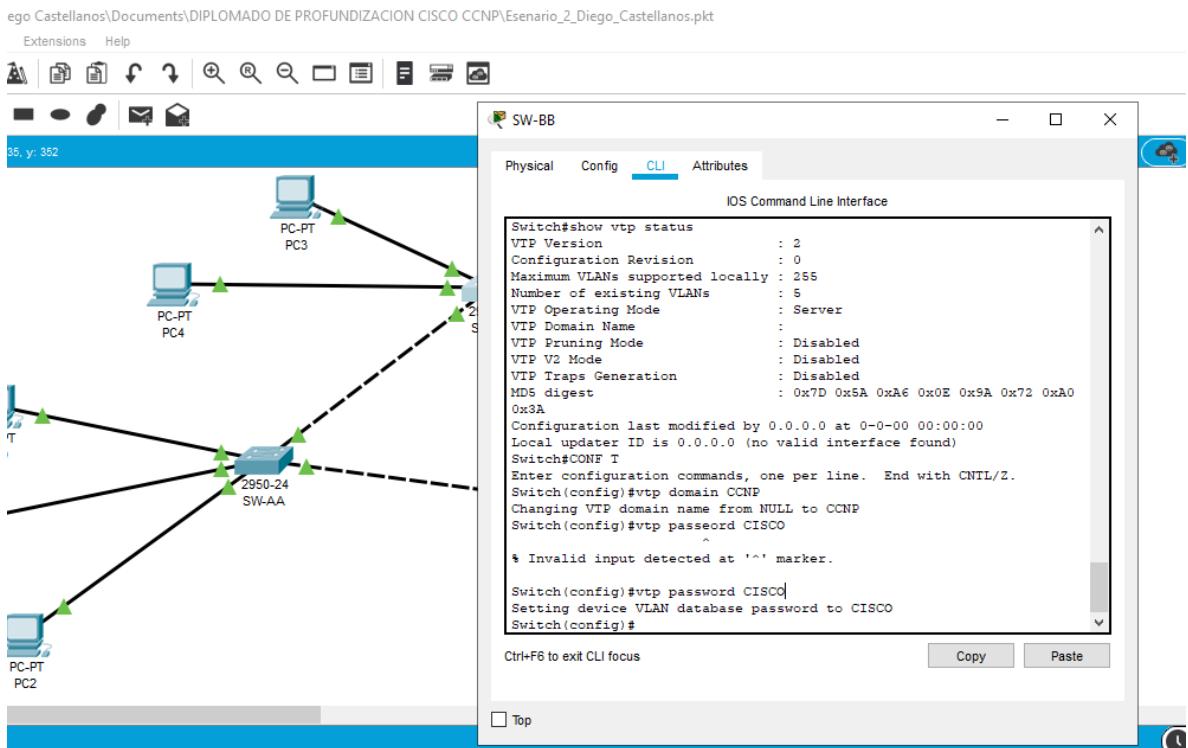

Figura 16. Simulación del escenario 2

Configurar VTP

2.1. Todos los switches se configurarán para usar VTP para las actualizaciones de VLAN. El switch SW-BB se configurará como el servidor. Los switches SW-AA y SW-CC se configurarán como clientes. Los switches estarán en el dominio VPT llamado CCNP y usando la contraseña cisco

Figura 17. Configuración switch SW-BB

El switch SW-BB se configuro como el servidor en el dominio VPT llamado CCNP y usando la contraseña CISCO, se configura la VLAN 10 y 20. Los puertos que van del 0/1-3 los convertimos en modo troncal.

Switch#

2.6. Verificar la conectividad Extremo a Extremo

- Ejecute un Ping desde cada PC a los demás. Explique por qué el ping tuvo o no tuvo éxito.

Figura 33. Ping

The screenshot shows a Windows Command Prompt window titled "PC4". The window has tabs at the top: Physical, Config, Desktop, Programming, and Attributes. The "Config" tab is selected. The main area is labeled "Command Prompt". The command entered is "ping 190.108.10.3". The output shows three successful pings to the specified IP address, each with 32 bytes and a TTL of 128. The round-trip times are listed as 24ms, <1ms, and 6ms. Below this, another ping command is entered: "ping 190.108.20.4", followed by "Invalid Command". Finally, "ping 190.108.20.10.1" is entered, also followed by "Invalid Command".

```
Ping statistics for 190.108.10.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 4ms, Average = 1ms

C:\>ping 190.108.10.3

Pinging 190.108.10.3 with 32 bytes of data:

Reply from 190.108.10.3: bytes=32 time=24ms TTL=128
Reply from 190.108.10.3: bytes=32 time<1ms TTL=128
Reply from 190.108.10.3: bytes=32 time<1ms TTL=128
Reply from 190.108.10.3: bytes=32 time<1ms TTL=128

Ping statistics for 190.108.10.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 24ms, Average = 6ms

C:\>ping 190.108.10.3

Pinging 190.108.10.3 with 32 bytes of data:

Reply from 190.108.10.3: bytes=32 time=1ms TTL=128
Reply from 190.108.10.3: bytes=32 time<1ms TTL=128
Reply from 190.108.10.3: bytes=32 time<1ms TTL=128
Reply from 190.108.10.3: bytes=32 time<1ms TTL=128

Ping statistics for 190.108.10.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>190.108.20.4
Invalid Command.

C:\>190.108.20.10.1
Invalid Command.

C:\>ping 190.108.20.10.1|
```

Se pueden hacer los pings sin ningún tipo de problema, pero en caso de tener unos pc en VLAN 10 y otros en la VLAN20, los intervalos se pueden comunicar en capa 3, pero si la VLAN20 tiene un PC y la VLAN15 Estos Equipos Pueden Estar Direccionados De Manera Diferente y si se realiza el ping desde otro puede llegar sin ningún problema por que usaría ACLs para poder comprobar su funcionamiento.

CONCLUSIONES

El tipo de configuración que se utilizó para cada uno de los escenarios o topologías se logró ejecutar con éxito en cada uno de los Routers, Switch y PC con cierto tipo de conexiones en serie, dando un paso a paso en cada uno de los escenarios plantados y se logró dar una simulación perfecta.

Se empleó en el escenario uno el software GNS3 y se establecieron una conexión entre los cuatro Routers, por medio de la configuración AS1, AS2, y AS3 donde anuncias las conexiones del Loopback en BGP. Con el comando show ip route, se verificó la información utilizada en los enrutamiento. Se elaboró un paso a paso del escenario plantado.

Se logró ejecutar el escenario dos con el uso del software Packet Tracer, se creó un protocolo de enrutamiento para los switches y computadores de escritorio. Se logra verificar la configuración VTP y la actualización de las VLAN en los switch, como y computadores de escritorio. Por medio de un ping entre los PC y los Switch se debe comprobó su conexión.
