Phonological divergences between adult's speech and children's in the Spanish of Lima (Peru) (Article)

[Las divergencias fonológicas entre el habla adulta y el de los niños en el español hablado en Lima (Perú)]

Abstract

This article compares the adult speech production of the Spanish spoken in Lima (Peru) to the speech of monolingual children from the same city, between the ages of two and a half and five. No of the subjects present any articulatory, auditory or mental disability. In particular, this article focuses on which phonological features show divergences when adult and child speech are compared. It also discusses the age until which those divergences remain in the speech of children. The main result is the identification that between the ages of two and a half and three and a half, a significant decrease of the divergences occurs. The results are of great importance for language therapists who work with preschoolers. In addition to corroborating that the phonological system is progressively acquired, this provides a point of reference that will help language therapists detect and give early treatment to children who may show minor phonological disorders or specific language impairments.
