#### Abstract

In a continuing study of novel anti-HIV agents with drug-like structures and properties, $301^{\prime}-\mathrm{O}-$, $1^{\prime}-S$-, $4^{\prime}-O$ - and $4^{\prime}$-substituted- $2^{\prime}, 3^{\prime}$-seco-3'-nor DCP and DCK analogues (8-37) were designed and synthesized. All newly synthesized seco-compounds were screened against HIV-1 ${ }_{\text {NLA-3 }}$ and a multiple reverse transcriptase (RT) inhibitor-resistant (RTMDR) strain in the TZM-bl cell line, using seco-DCK (7) and 2-ethyl-DCP (4) as controls. Several compounds (14, 18, 19, 22-24, and 32) exhibited potent anti-HIV activity with $\mathrm{EC}_{50}$ values ranging from 0.93 to $1.93 \mu \mathrm{M}$ and therapeutic index (TI) values ranging from 20 to $39.1^{\prime}-O$-Isopropoxy- $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor-DCP (12) showed the greatest potency among the newly synthesized compounds with $\mathrm{EC}_{50}$ values of 0.47 and $0.88 \mu \mathrm{M}$, and TI of 96 and 51 , respectively, against HIV-1 ${ }_{\text {NLA-3 }}$ and RTMDR strains. The seco-compounds exhibited better chemical stability in acidic conditions compared with DCP and DCK compounds. Overall, the results suggested that seco-DCP analogues with simplified structures may be more favorable for development as novel anti-HIV candidates.

## Keywords

2', 3'-Seco-3'-nor-DCPs; Anti-HIV activity; Structure-activity relationship (SAR)

## 1. Introduction

Acquired immunodeficiency syndrome (AIDS), one of the most devastating diseases currently affecting mankind, is caused by infection with the human immunodeficiency virus (HIV). Although there are over 30 clinically used drugs [1], the fast emergence of drug resistance and toxicity problems due to long-term use and drug-drug interactions have

[^0]limited their long-term drug effectiveness. Therefore, studies aimed at the discovery of new anti-viral agents with novel structures or targets are still needed.

In our prior research, $3^{\prime} R, 4^{\prime} R$-di- $O-(-)$-camphanoyl-(+)-cis-khellactone (DCK, 1) and 4-methyl-DCK (2) exhibited high potency against HIV-1 replication in H9 lymphocytes (Figure 1) [2, 3]. Subsequently, diverse DCK analogues were designed and synthesized by modifications of DCK, particularly different coumarin substituents, ring isomers, and bioisosteric replacements [4-10]. Most of the new compounds showed promising in vitro inhibitory activity in anti-HIV replication assays, and a preliminary structure-activity relationship (SAR) was established. However, the problems of poor water solubility, low bioavailability and reduced potency against multiple reverse transcriptase (RT) inhibitorresistant (RTMDR) strains have obstructed the further development of DCKs. Subsequently, 4 H -chromone-4-one ( $\mathrm{DCP}, 3$ ) derivatives, which are positional isomers of DCK , were designed and synthesized [11, 12]. Among them, 2-ethyl DCP (4), 5-methyl-2-ethyl DCP (5), and 2,5-dimethyl DCP (6) not only exhibited high activity against wild-type HIV isolates, but also retained potency against RTMDR-1 (Figure 1).

These favorable results led us to investigate whether the integrity of the tricyclic system (ring-A, -B and -C) was essential for the anti-HIV activity. While ring-A opened DCK analogues did not exhibit antiviral activity, ring-C opened DCK analogues (seco-DCKs) were active. In fact, compared with 2, seco-DCK analogue 7 showed better anti-HIV activity and increased sensitivity against RTMDR in anti-HIV replication assays using HIV- $1_{\text {IIIB }}$ in MT-2 cell lines, as well as HIV-1 ${ }_{\text {NL4-3 }}$ and RTMDR in MT-4 lymphocytes [13]. The secoDCKs have a simplified skeleton, fewer hydrogen-bond acceptors and lower $\log \mathrm{P}$ values, resulting in increased water solubility and better pharmacokinetic properties compared with DCKs. Our success with seco-DCKs prompted us to make corresponding modifications on DCP analogues in our search for new desirable anti-HIV inhibitors with better drug-like properties and inhibitory activity against RTMDR. Herein, we report the design, synthesis, biological evaluation and chemical stability of novel $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor DCP (8-31, 33-37) and DCK (32) analogues (Figures 2-4).

## 2. Design

Previous research suggested that a 4'-camphanoyl moiety is preferred for anti-HIV activity of DCK/DCP analogues. Therefore, in our current study, we first retained the 4'-camphanoyl ester substitution, while focusing on diverse substituents at the $1^{\prime}-O$ position of the new ringC opened seco-DCP products. Eight $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor-2-ethyl DCP analogues (8-15) with different aliphatic groups, such as methyl, ethyl, isopropyl, isobutyl, and 2- $\alpha$-bromoethyl, at the $1^{\prime}-O$ position were synthesized. Aromatic and heterocyclic moieties, which were not introduced at the $1^{\prime}-O$ position in our prior seco-DCK study, were also incorporated to examine the effects of $1^{\prime}-O$-aryl rings with electron-donating or -withdrawing groups and $1^{\prime}-$ $O$-heterocyclic substituents on the antiviral replication activity of new compounds (16-28). In addition, because an ether bond usually has better chemical stability than an ester bond, the $4^{\prime}$-camphanoyl ester $\left[-\mathrm{O}(\mathrm{C}=\mathrm{O})\right.$ - linkage] was replaced with a $4^{\prime}$-camphanol ether [-O$\mathrm{CH}_{2}$ - linkage] with the aim of slowing down possible metabolism at this position. Accordingly, three $4^{\prime}$-camphanol ethers of $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor-2-ethyl-DCPs (29-31) were generated. Prior research on bioisosteric replacement showed that some 1-thia and/or 1'-thia DCKs exhibited comparable or better activity against HIV replication compared with 1-oxa and/or 1'-oxa DCKs. Consequently, we synthesized 1'-thia-2', $3^{\prime}$-seco- $3^{\prime}$-nor-4-methyl-DCK (32) and $1^{\prime}$-thia- $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor-2-ethyl-DCP (33) to verify if seco-series showed a similar trend. Finally, we replaced the $4^{\prime}-O$-camphanoyl ester with piperidinyl oxalamide moieties, and synthesized four $4^{\prime}-\left(\mathrm{N}^{\prime}\right.$-substituted piperidin-1-yl)-2', $3^{\prime}$-seco- $3^{\prime}$-nor DCP analogues ( $\mathbf{3 4}$
37). All new compounds were evaluated in an antiviral replication assay against wild-type virus, and 15 compounds were also assayed against RTMDR virus.

## 3. Chemistry

Scheme 1 shows the synthesis of $1^{\prime}-O$-alkyl-2', $3^{\prime}$-seco- $3^{\prime}$-nor DCPs ( $\mathbf{8}-\mathbf{1 5}$ ). Commercially available 2,4-dihydroxy-3-methylacetophenone (38) was selectively protected as the 4methoxymethyl (MOM) ether (39), followed by condensation with ethyl propionate to afford 40, which was further reacted with concentrated hydrochloric acid in EtOH to provide bicyclic compound 41. Four 7-alkoxy ethers (42a-d) were synthesized by alkylation of $\mathbf{4 1}$ with corresponding bromides, and subsequent treatment with $N$-bromosuccinimide provided 8 -bromomethylmonobromides (43a-d) and 2- $\alpha$-bromoethyl-8-bromomethyldibromides $(\mathbf{4 4 e} \mathbf{- h})$. A mixture of the mono- and di-bromides was first heated at reflux in a solution of $\mathrm{NaOAc} / \mathrm{Ac}_{2} \mathrm{O}$ and then hydrolyzed with 2 N HCl in EtOH to produce 8-hydroxymethyl compounds (45a-d) and 2- $\alpha$-bromoethyl-8-hydroxymethyl compounds (46e-h), respectively. Subsequently, the desired esters $\mathbf{8}-\mathbf{1 5}$ were prepared by esterification of $\mathbf{4 5 a} \mathbf{a} \mathbf{d}$ and 46e-h with camphanoyl chloride in DMAP and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature.

The synthesis of $1^{\prime}-O$-aryl or -heterocyclic substituted $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor-2-ethyl-DCPs (1628) is depicted in Scheme 2. To avoid the reaction of the $7-\mathrm{OH}$ group of 41 with NBS, the MOM ether $\mathbf{4 7}$ was prepared and subsequently brominated with NBS to yield the 8bromomethyl compound 48, which was then treated as described above to afford 49. Thirteen 7-aromatic and -heterocyclic substituted ethers ( $\mathbf{5 0 a} \mathbf{- m}$ ) were prepared by alkylation of 49 with corresponding bromides in DMF in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ at room temperature. Compounds $\mathbf{5 0 a}-\mathbf{m}$ were then converted into the target compounds (16-28) by acylation with camphanoyl chloride.

As shown in Scheme 3, etherification of 7-alkyloxy-8-bromomethyl-2-ethyl-4H-chromen-4ones (43a-c) with camphanol in toluene in presence of NaH afforded the three respective $4^{\prime}$ camphanol ether $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor-2-ethyl-DCPs (29-31). Four 4'-( $\mathrm{N}^{\prime}$-substituted piperidin-1-yl)-2', $3^{\prime}$-seco-3'-nor DCP analogues (34-37) were obtained from the amidation of 43b with the corresponding $\mathrm{N}^{\prime}$-substituted piperidine in THF in presence of DMAP at room temperature.

The syntheses of $1^{\prime}$-thia-2', $3^{\prime}$-seco- $3^{\prime}$-nor-4-methyl-DCK (32) and $1^{\prime}$-thia-2', $3^{\prime}$-seco- $3^{\prime}$-nor-2-ethyl-DCP (33) are depicted in Schemes 4 and 5, respectively. For 33, the mono-acetylation of commercially available resorcinol ( $\mathbf{6 0}$ ) in an HOAc solution containing zinc chloride gave 61. 2-Ethyl-7-hydroxy-4H-chromen-4-one (64) was then obtained from 61 via three steps, $4-\mathrm{OH}$ protection with $\mathrm{MOMCl}(62)$, condensation with ethyl propionate (63), and ring-A closure. Compounds 52 (Scheme 4) and 65 (Scheme 5) were obtained by Duff formylation of 51 and 64, respectively, with hexamethylenamine in acetic acid solution. Because hydrogen bonding between the 7-hydroxy and 8-formyl groups could possibly interfere with the conversion of the 7-OH to 7-SH, the 8-formyl moiety in $\mathbf{5 2}$ and $\mathbf{6 5}$ was first protected as a cyclic acetal in intermediates 53 and $\mathbf{6 6}$ by reaction with ethylene glycol in the presence of $p$-toluenesulfonic acid in benzene under reflux-dehydration conditions. Subsequently, the 7 -hydroxy compounds ( $\mathbf{5 3}$ and 66) were converted to the 7 -mercapto compounds ( $\mathbf{5 6}$ and $\mathbf{6 9}$ ) in three steps, acylation with dimethylthiocarbamoyl chloride ( 54 and 67), Newman-Kwart rearrangement ( 55 and 68), and basic hydrolysis. The alkylation of 56 and 69 with isopropyl bromide yielded 57 and 70 . Finally, target compounds 32 and 33 were prepared from 57 and $\mathbf{7 0}$ by the following reaction sequence, deprotection of the 8acetal in 1 N HCl , reduction of $\mathbf{5 8}$ and $\mathbf{7 1}$ with $\mathrm{NaBH}_{4}$ in MeOH , and esterification of $\mathbf{6 0}$ and 72 with camphanoyl chloride.

## 4. Results and discussion

All 30 newly synthesized seco-DCK and DCP analogues (8-37) were evaluated for in vitro suppression of HIV-1 ${ }_{\text {NL4-3 }}$ replication in a single cycle infection assay using the TZM-bl cell line with both 2-ethyl-DCP (4) and seco-DCK (7) as positive controls. Moreover, compounds 8-15, 29-31, and 34-37 were also screened for antiviral activity against HIV-1 RTMDR. The data are summarized in Tables 1 and 2.

As shown in Table 1, compounds 8 - $\mathbf{1 5}$ exhibited varying degrees of potency against wildtype $\mathrm{HIV}-1_{\mathrm{NL} 4-3}$. Based on the size of the alkyl group at the $1^{\prime}-O$ position, the rank order of antiviral activity was methyl < ethyl < isobutyl < isopropyl. 1'-O-Isopropyl substituted $\mathbf{1 2}$ showed the best antiviral activity against both HIV-1 ${ }_{\text {NL4-3 }}$ and RTMDR with $\mathrm{EC}_{50}$ values of 0.47 and $0.88 \mu \mathrm{M}$, and TI of 96 and 51 , respectively, which were generally comparable or better, particularly against RTMDR, than those of prior hits 7 ( $\mathrm{EC}_{50} 0.5$ and $1.89 \mu \mathrm{M}$; TI 34.54 and 9.13 , respectively) and $4\left(\mathrm{EC}_{50} 0.12\right.$ and $0.20 \mu \mathrm{M}$, TI 118.75 and 71.25 , respectively). Compounds $\mathbf{1 2}$ and $\mathbf{1 4}$ ( $1^{\prime}-O$-isobutyl-2',3'-seco-3'-nor-2-ethyl-DCP) had comparable anti-RTMDR potencies ( $\mathrm{EC}_{50} 0.88$ and $0.94 \mu \mathrm{M}$, respectively), which were two-fold better than that of $\mathbf{7}$. Compounds with a bromine on the 2-ethyl group $(\mathbf{9}, \mathbf{1 1}, \mathbf{1 3}$, and 15) exhibited much lower anti-HIV activity compared with the corresponding nonbrominated compounds $(\mathbf{8}, \mathbf{1 0}, 12$, and $\mathbf{1 4})$. This finding suggested that a 2 - $\alpha$-bromoethyl group was unfavorable. Overall, the results suggested that the size of an isopropyl group at the $1^{\prime}-O$ position was more suitable to fit within the binding pocket of wild-type virus, while both isopropyl and isobutyl may fit into the slightly changed binding pocket of the RTMDR strain, due to possible mutations near the interaction site.

The three novel 4'-camphanol ether seco-DCP analogues (29-31) exhibited better inhibition activity against drug-resistant RTMDR than wild-type HIV-1 ${ }_{\text {NL4-3 }}$. $1^{\prime}-O$-Isopropyl-4'camphanol ether 31 exhibited the best potency against RTMDR ( $\mathrm{EC}_{50} 1.49 \mu \mathrm{M}$, TI 31.45). However, the $4^{\prime}$-camphanol ether compounds $(\mathbf{2 9} \mathbf{- 3 1})$ were less potent than their corresponding $4^{\prime}$-camphanoyl ester analogues $(\mathbf{8}, \mathbf{1 0}, \mathbf{1 2}$, respectively). The four compounds (34-37) with a piperidinyl group rather than a camphanoyl ester or camphanol ether at the 4'-position showed decreased or completely abolished inhibitory activity against HIV, further confirming our prior finding that a 4'-camphanoyl group is very important for enhanced anti-HIV activity in the DCK/DCP series.

The anti-HIV-1 ${ }_{\text {NL4-3 }}$ results for $1^{\prime}-O$-aryl and -heterocyclic $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor-2-ethyl- DCPs (16-28) and $1^{\prime}$-thia compounds ( $\mathbf{3 2}$ and $\mathbf{3 3}$ ) are shown in Table 2. Among these analogues, 1'-O-3-methoxycarbonylbenzyl-2',3'-seco-3'-nor-2-ethyl-DCP (23) (EC ${ }_{50} 0.93 \mu \mathrm{M}$, TI 39.20) and the positive control (7) $\left(\mathrm{EC}_{50} 0.5 \mu \mathrm{M}\right.$, TI 34.54) exhibited comparable potency. 1'-O-Pyrid-3-yl-methyl, -pyrid-4-yl-methyl, 1'-O-3-cyanobenzyl, 1'-O-3-methoxybenzyl, and 1'-O-3-methylbenzyl analogues (18, 19, 21, 22, and 24, respectively) also showed moderate anti-HIV inhibitory activity with $\mathrm{EC}_{50}$ values ranging from 1.26 to $2.41 \mu \mathrm{M}$. The significantly reduced potency of $\mathbf{1 7}$, which contains a $1^{\prime}-O$-pyrid-2-yl-methyl substituent, compared with 18 and 19 suggested that a nitrogen atom at the 2-position of the aromatic ring is detrimental to the antiviral activity. Compounds $\mathbf{2 5}$ and 26 with $1^{\prime}-O-3,5-$ dimethoxybenzyl and 1'-O-3-trifluoromethoxybenzyl substituents exhibited very weak antiHIV activity, while compounds $16,20,27$, and 28 with $1^{\prime}-O-\gamma$-butyrolactone, $1^{\prime}-O-3-$ trifluoromethylbenzyl, 1'-O-2-bromo-5-methoxybenzyl, and 1'-O-2-nitro-4,5dimethoxybenzyl substituents lost all activity. These results indicated that the $1^{\prime}-O-$ substituents have a significant impact on the analogues' antiviral activity. The $1^{\prime}-O$ position in the seco-compounds, which corresponds to the $2^{\prime}$-postion of DCK and DCP analogues, should be interacting with the viral binding target, as consistent with our previous study in the DCK series. Finally, compound 32 (1'-thia-seco-DCK) showed moderate antiviral
activity ( $\mathrm{EC}_{50} 1.53 \mu \mathrm{M}$, TI 21.32), while 33 (1'-thia-seco-DCP) was more active ( $\mathrm{EC}_{50} 0.56$ $\mu \mathrm{M}$, TI 11.25). Comparing the sulfur compounds with their oxygen counterparts, $\mathbf{3 2}$ was less potent than 12 , while 33 was equipotent with 7 .

Chemically, the seco-DCK/DCP analogues have lower molecular weights and should have reduced spatial strain, because they contain only one rather than two adjacent, extremely bulky cis- $3^{\prime}, 4^{\prime}$-camphanoyl esters as found in the DCK and DCP series. Hypothetically, these changes could improve the chemical stability of the molecules and their drug-like properties. Consequently, the chemical stability of 4-Me-DCK (2), seco-DCK (7), 1'-thia-seco-DCK (32), 2-ethyl-DCP (4), and seco-DCP (12) were tested under acidic conditions with HPLC monitoring. The preliminary results are listed in Table 3. The results showed that, after 30 min , only $64 \%$ of compound $\mathbf{2}$ was detectable, while $77 \%$ of $\mathbf{7}$ and $96 \%$ of $\mathbf{3 2}$ were intact. Compound $\mathbf{1 2}$, which exhibited the greatest antiviral activity among the newly synthesized seco-DCK/DCP analogues, also showed the best chemical stability in this study $(100 \%$ intact after 30 min$)$. Overall, the seco-series of compounds showed good stability in acidic conditions, indicating that they should remain stable in the stomach via oral administration.

## 5. Conclusions

In conclusion, most of the new $2^{\prime}, 3^{\prime}$-seco-3'-nor-2-ethyl-DCP analogues showed potent to moderate anti-HIV activity, and compounds $\mathbf{1 2}$ and $\mathbf{1 4}$ also showed promising activity against RTMDR. In addition, the chemical stability of seco-DCKs and seco-DCPs was improved in comparison with DCK and DCP analogues. Preliminary SAR conclusions were as follows, a) integrity of the ring-C is not essential for DCK and DCP analogues, and aliphatic alkyl substituents at 1 '- $O$-position are better than aryl or heterocyclic groups, with isopropyl substitution being the most favorable for anti-HIV potency; b) converting the $4^{\prime}$ camphanoyl ester into a camphanol ether resulted in some potency decrease, but compounds remained more selective against RTMDR; c) 4'-camphanoyl is the most preferred moiety for anti-HIV activity of DCK and DCP analogues; and d) sulfur rather than oxygen at the 1'position led to similar or slightly reduced anti-HIV activity.

## 6. Experimental

Melting points were measured with a Fisher Johns melting apparatus without correction. The proton nuclear magnetic resonance ( ${ }^{1} \mathrm{H}$ NMR) spectra were measured on a Bruker-DPX 400 MHz spectrometer and 300 MHz Varian Gemini 2000 spectrometer using TMS as internal standard. The solvent used was $\mathrm{CDCl}_{3}$ unless indicated. Mass spectra were measured with HP5973N analytical mass spectrometers. High resolution mass spectra (HRMS) were measured on a Shimadzu LCMSIT-TOF with ESI interface. HPLC purity determinations were conducted using a Shimadzu LCMS-2010 with a Grace Alltima $2.1 \times 150 \mathrm{~mm}$ HP C18 $3 \mu \mathrm{M}$ column and Shimadzu SPD-M20A detector at 254 nm wavelength. HPLC purity analyses were determined by using two different solvent conditions. The first was $70 \%$ MeCN as solvent A and $30 \% \mathrm{H}_{2} \mathrm{O}$ as solvent B with $0.2 \mathrm{~mL} / \mathrm{min}$ flow rate; the second was $70 \% \mathrm{MeOH}$ as solvent A and $30 \% \mathrm{H}_{2} \mathrm{O}$ as solvent B with $0.1 \mathrm{~mL} / \mathrm{min}$ flow rate. The HPLC model was an isocratic system. All target compounds had purity greater than $95 \%$. Commercially available silica gel H was used for column chromatography. Thin-layer chromatography (TLC) was performed on PLC silica gel 60 F 254 plates.

### 6.1. Synthesis of 1 '-alkoxy-seco-DCPs (8-15)

6.1.1. 1-(2-Hydroxy-4-(methoxymethoxy)-3-methylphenyl)ethanone (39)-

Chloromethyl methyl ether ( $9.14 \mathrm{~mL}, 120 \mathrm{mmol}$ ) was added dropwise into a mixture of $\mathbf{3 8}$ $(10.0 \mathrm{~g}, 60.2 \mathrm{mmol})$ and potassium carbonate $(20.8 \mathrm{~g}, 150 \mathrm{mmol})$ in anhydrous acetone (60
mL ) in an ice-bath. The reaction mixture was then allowed to warm to room temperature and stirred for 1.5 h . The mixture was then filtered, and the filtrate was dissolved in brine and extracted with EtOAc ( 35 mL ). The organic layer was dried in vacuo to provide $39(13.9 \mathrm{~g})$ as brown oil: $91 \%$ yield. ${ }^{1} \mathrm{H}$ NMR $\delta: 2.14\left(3 \mathrm{H}, \mathrm{s}, 3-\mathrm{CH}_{3}\right), 2.56\left(3 \mathrm{H}, \mathrm{s}, 1-\mathrm{COCH}_{3}\right), 3.50(3 \mathrm{H}$, $\left.\mathrm{s}, 4-\mathrm{OCH}_{2} \mathrm{OCH}_{3}\right), 5.27\left(2 \mathrm{H}, \mathrm{s}, 4-\mathrm{OCH}_{2} \mathrm{OCH}_{3}\right), 6.65(1 \mathrm{H}, \mathrm{d}, J=8.7 \mathrm{~Hz}, 6-\mathrm{H}), 7.57(1 \mathrm{H}, \mathrm{d}, J$ $=8.7 \mathrm{~Hz}, 5-\mathrm{H}), 12.80(1 \mathrm{H}, \mathrm{s}, 2-\mathrm{OH})$. ESI-MS $m / z 209\left(\mathrm{M}^{+}-1\right)$.
6.1.2. 2-Ethyl-7-hydroxy-8-methyl-4H-chromen-4-one (41)—Sodium hydride (60\% in mineral oil, $9.52 \mathrm{~g} / 15.9 \mathrm{~g}, 397 \mathrm{mmol})$ was added slowly to a mixture of $\mathbf{3 9}(13.9 \mathrm{mg}, 66.1$ mmol ) and ethyl propionate ( $19.0 \mathrm{~mL}, 165 \mathrm{mmol}$ ) in absolute THF under nitrogen. Then, the mixture was warmed to reflux temperature for 2 h , cooled and neutralized to pH 8 with $37 \%$ $\mathrm{HCl}(25 \mathrm{~mL})$. Water ( 60 mL ) was added and the mixture was extracted with EtOAc $(4 \times 30$ mL ). The organic layer was collected and evaporated in vacuo to yield $\mathbf{4 0}$ as dark oil. This crude product and $37 \% \mathrm{HCl}(3 \mathrm{~mL})$ were dissolved in $\mathrm{EtOH}(60 \mathrm{~mL})$ and refluxed for 45 $\min$ to give 41, which was used in the next reaction without further purification. mp 223$224^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR (DMSO, $\delta$ ): $1.23\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.2 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 2.20\left(3 \mathrm{H}, \mathrm{s}, 8-\mathrm{CH}_{3}\right)$, $2.65\left(2 \mathrm{H}, \mathrm{q}, J=7.2 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 6.06(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 6.98(1 \mathrm{H}, \mathrm{d}, J=8.7 \mathrm{~Hz}, 6-\mathrm{H}), 7.68$ $(1 \mathrm{H}, \mathrm{d}, J=8.7 \mathrm{~Hz}, 5-\mathrm{H})$. ESI-MS $m / z 203\left(\mathrm{M}^{+}-1\right)$.
6.1.3. Synthesis of 2-ethyl-7-alkoxychromones (42a-d)-A mixture of 41 (1 equiv), $\mathrm{K}_{2} \mathrm{CO}_{3}$ (3 equiv), and halogenated compounds (2 equiv) in DMF ( 5 mL ) was stirred for 45 min at room temperature. After filtering the mixture and removing the solvent in vacuo, the residue was purified by column chromatography (eluent: hexane/EtOAc 95:5) to afford the desired compounds (42a-d) as white solids in $73-82 \%$ yields.
6.1.3.1. 2-Ethyl-7-methoxy-8-methyl-4H-chromen-4-one (42a): $75 \%$ yield, mp 104-106 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta: 1.32\left(3 \mathrm{H}, \mathrm{t}, J=7.5 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 2.30\left(3 \mathrm{H}, \mathrm{s}, 8-\mathrm{CH}_{3}\right), 2.68(2 \mathrm{H}, \mathrm{q}, J=$ $\left.7.5 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 3.95\left(3 \mathrm{H}, \mathrm{s}, 7-\mathrm{OCH}_{3}\right), 6.11(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 6.96(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}, 6-\mathrm{H})$, $8.10(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}, 5-\mathrm{H})$. ESI-MS $m / z 219\left(\mathrm{M}^{+}+1\right)$.
6.1.3.2. 7-Ethoxy-2-ethyl-8-methyl-4 $\boldsymbol{H}$-chromen-4-one (42b): $73 \%$ yield, mp $85-87$
${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta: 1.33\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.5 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.48\left(3 \mathrm{H}, \mathrm{t}, J=7.2 \mathrm{~Hz}, 7-\mathrm{OCH}_{2} \mathrm{CH}_{3}\right)$, $2.31\left(3 \mathrm{H}, \mathrm{s}, 8-\mathrm{CH}_{3}\right), 2.68\left(2 \mathrm{H}, \mathrm{q}, J=7.5 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 4.17(2 \mathrm{H}, \mathrm{q}, J=7.2 \mathrm{~Hz}, 7-$ $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 6.11(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 6.93(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}, 6-\mathrm{H}), 8.01(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}, 5-\mathrm{H})$. ### 6.3. Synthesis of 4'-camphanol-seco-DCPs (29-31)

A mixture of 43a-c ( 1 equiv), camphanol ( 1.2 equiv), and NaH ( 6 equiv) in toluene ( 6 mL ) was stirred for 4 h at room temperature and monitored by $\mathrm{TLC}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 20: 1\right)$. Icewater ( 10 mL ) was then added to stop the reaction. Following extraction with EtOAc (10
$\mathrm{mL} \times 3$ ), the organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removal of solvent in vacuo, the residue was purified by PTLC (eluent: $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 40: 1$ and 20:1) to give 29-31.

### 6.5. Synthesis of 1 '-thia -seco-DCK (32)

6.5.1. 7-Hydroxy-4-methyl-2-oxo-2H-chromene-8-carbaldehyde (52)—A reaction mixture of $51(20.0 \mathrm{~g}, 114 \mathrm{mmol})$ and hexamethylenetetramine $(40.0 \mathrm{~g}, 285 \mathrm{mmol})$ in HOAc $(150 \mathrm{~mL})$ was stirred for 5.5 h at $80-90^{\circ} \mathrm{C}$. Aq. $\mathrm{HCl}\left(300 \mathrm{~mL}\right.$, conc. $\mathrm{HCl} / \mathrm{H}_{2} \mathrm{O} 84: 100$, v/v) was then added, and the reaction mixture was stirred for 0.5 h at $70^{\circ} \mathrm{C}$. After cooling, the reaction mixture was poured into ice-water ( 1.5 L ) and extracted with EtOAc ( $500 \mathrm{~mL} \times 3$ ). The combined organic fraction was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and the solvent was removed in vacuo. The residue was recrystallized from EtOAc to provide 52 as a light yellow solid (2.4 $\mathrm{g}, 11 \%$ yield): $\mathrm{mp} 120-122^{\circ} \mathrm{C}$.

### 6.5.2. 8-(1,3-Dioxolan-2-yl)-7-hydroxy-4-methyl-2H-chromene-2-one (53)—A

 mixture of $52(2.13 \mathrm{~g}, 10.4 \mathrm{mmol})$, ethane-1,2-diol ( 3.0 mL ) and $p$-toluenesulfonic acid (120 $\mathrm{mg})$ in toluene ( 25 mL ) was refluxed for 2 h with removal of water by a water separator. After removing solvent in vacuo, the residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and filtered. The filtrate was washed with saturated $\mathrm{NaHCO}_{3}$, and the organic layer was dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure to afford 53 as a yellow solid ( $1.96 \mathrm{~g}, 76 \%$ yield): mp 215-217 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta 2.39\left(3 \mathrm{H}, \mathrm{s}, 4-\mathrm{CH}_{3}\right), 4.11-4.61\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right.$ of $1,3-$ dioxolane), $6.12(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 6.39(1 \mathrm{H}, \mathrm{s}, 8-\mathrm{CH}-), 6.84(1 \mathrm{H}, \mathrm{d}, J=9.1 \mathrm{~Hz}, 6-\mathrm{H}), 7.50(1 \mathrm{H}$, d, $J=9.1 \mathrm{~Hz}, 5-\mathrm{H})$.
### 6.5.3. O-(8-(1,3-Dioxolan-2-yl)-4-methyl-2-oxo-2H-chromen-7-yl)-N,N-

 dimethylcarbamothioate (54)-Compound $53(1.50 \mathrm{~g}, 6.05 \mathrm{mmol})$ and $\mathrm{KOH}(2.0 \mathrm{~g}, 36$ $\mathrm{mmol})$ were dissolved in $\mathrm{MeOH}(30 \mathrm{~mL})$ and reacted with dimethylthiocarbamoyl chloride $(2.5 \mathrm{~g}, 20 \mathrm{mmol})$ for 3 h at rt . The mixture was poured into saturated $\mathrm{NH}_{4} \mathrm{Cl}(150 \mathrm{~mL})$ and filtered to afford crude product, which was purified by column chromatography (eluent: petroleum ether/EtOAc 4:1) to give 54 as a white solid ( $667 \mathrm{mg}, 33 \%$ yield): mp 190-192 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta 2.36\left(3 \mathrm{H}, \mathrm{s}, 4-\mathrm{CH}_{3}\right), 3.38,3.47\left(6 \mathrm{H}, \mathrm{s},-\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 4.05-4.40\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right.$ of 1,3-dioxolane), 6.27 ( $2 \mathrm{H}, \mathrm{s}, 3-\mathrm{H} \& 8-\mathrm{CH}-$ ), $7.02(1 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz}, 6-\mathrm{H}), 7.62(1 \mathrm{H}, \mathrm{d}, J$ $=8.6 \mathrm{~Hz}, 5-\mathrm{H})$. ESI-MS $m / z 336(\mathrm{M}+\mathrm{H})$.
### 6.5.4. S-(8-(1,3-Dioxolan-2-yl)-4-methyl-2-oxo-2H-chromen-7-yl)-N,N-

 dimethylcarbamothioate (55)-Compound $54(1.50 \mathrm{~g}, 5.70 \mathrm{mmol})$ was heated to 200 ${ }^{\circ} \mathrm{C}$ with stirring for 1 h . The crude product was purified by column chromatography (eluent: petroleum ether/EtOAc 4:1) to give 55 as light yellow crystals ( $235 \mathrm{mg}, 47 \%$ yield): mp $138-140{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta 2.42\left(3 \mathrm{H}, \mathrm{s}, 4-\mathrm{CH}_{3}\right), 3.08\left(6 \mathrm{H}, \mathrm{s},-\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 4.05-4.48(4 \mathrm{H}, \mathrm{m}$,$2 \times \mathrm{CH}_{2}$ of 1,3-dioxolane), $6.36(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 6.65(1 \mathrm{H}, \mathrm{s}, 8-\mathrm{CH}-), 7.46(1 \mathrm{H}, \mathrm{d}, J=8.29 \mathrm{~Hz}$, $6-\mathrm{H}), 7.59(1 \mathrm{H}, \mathrm{d}, J=8.29 \mathrm{~Hz}, 5-\mathrm{H})$. ESI-MS m/z $336(\mathrm{M}+\mathrm{H})$.

### 6.5.5. 7-(Isopropylthio)-4-methyl-2-oxo-2H-chromene-8-carbaldehyde (58)-

 Under nitrogen and in the dark, compound $\mathbf{5 5}(200 \mathrm{mg}, 0.6 \mathrm{mmol})$ was hydrolyzed in the presence of $\mathrm{KOH}(500 \mathrm{mg})$ in $\mathrm{MeOH}(20 \mathrm{~mL})$ for 2 h at reflux temperature. At completion, 2-bromopropane ( 2.0 mL ) was added, and the reaction continued for another 30 min . The reaction solution was then poured into cool $1 \mathrm{~N} \mathrm{HCl}(100 \mathrm{~mL})$ and filtered to give $\mathbf{5 8}$ as a light yellow solid ( $12 \mathrm{mg}, 8 \%$ yield): mp $159-162{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta 1.44(6 \mathrm{H}, \mathrm{d}, J=6.7 \mathrm{~Hz}, 7-$ $\left.\mathrm{SCH}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.45\left(3 \mathrm{H}, \mathrm{s}, 4-\mathrm{CH}_{3}\right), 3.62\left(1 \mathrm{H}, \mathrm{m}, J=6.7 \mathrm{~Hz}, 7-\mathrm{SCH}\left(\mathrm{CH}_{3}\right)_{2}\right), 6.15(1 \mathrm{H}, \mathrm{s}, 3-$ H), $7.30(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}, 6-\mathrm{H}), 7.67(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}, 5-\mathrm{H}), 10.84(1 \mathrm{H}, \mathrm{s}, 8-\mathrm{CHO})$. ESIMS $m / z 263(\mathrm{M}+\mathrm{H})$.
### 6.5.6. 4'-((-)-Camphanoyloxymethyl)-7-(isopropylthio)-4-methyl-2H-

 chromen-2-one (32)—A mixture of $\mathbf{5 8}(9 \mathrm{mg}, 0.034 \mathrm{mmol})$ and $\mathrm{NaBH}_{4}(3 \mathrm{mg})$ in MeOH $(2 \mathrm{~mL})$ was stirred for 1 h at room temperature, then acidified to $\mathrm{pH} 3-4$ with 1 N HCl and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL} \times 3)$. The organic layer was dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and most of the solvent was removed under reduced pressure to give crude 59. Then, $\mathbf{3 2}$ was synthesized following the same synthetic procedure as for $\mathbf{1 6} \sim 28$, but starting from $\mathbf{5 9}$. $52 \%$ yield, White solid: $\mathrm{mp} 146-147^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta \times 3$ ), $1.34(6 \mathrm{H}, \mathrm{d}, J=6.71 .00,1.05,1.09$ $\left(9 \mathrm{H}, \mathrm{s}\right.$, camphanoyl- $\left.\mathrm{CH}_{3} \mathrm{~Hz}, 7-\mathrm{SCH}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.67-2.46\left(4 \mathrm{H}, \mathrm{m}\right.$, camphanoyl- $\left.\mathrm{CH}_{2} \times 2\right)$, 2.47 $\left(3 \mathrm{H}, \mathrm{s}, 4-\mathrm{CH}_{3}\right), 3.57\left(1 \mathrm{H}, \mathrm{m}, J=6.7 \mathrm{~Hz}, 7-\mathrm{SCH}\left(\mathrm{CH}_{3}\right)_{2}\right), 5.65\left(2 \mathrm{H}, \mathrm{s}, 4^{\prime}-\mathrm{CH}_{2} \mathrm{O}-\right), 6.27(1 \mathrm{H}$, $\mathrm{s}, 3-\mathrm{H}), 7.36(1 \mathrm{H}, \mathrm{d}, J=8.4 \mathrm{~Hz}, 6-\mathrm{H}), 7.57(1 \mathrm{H}, \mathrm{d}, J=8.4 \mathrm{~Hz}, 5-\mathrm{H})$. ESI-MS m/z $445(\mathrm{M}$ $+\mathrm{H})$.
### 6.6. Synthesis of 1'-thia-seco-DCP (33)

6.6.1. 2-Ethyl-7-hydroxy-4H-chromen-4-one (64)—The procedure was the same as that used for the preparation of $\mathbf{4 1} .52 \%$ yield, white crystals (starting from 10 g of $\mathbf{6 0}$ ): mp $188-189^{\circ} \mathrm{C}$.
6.6.2. 2-Ethyl-7-hydroxy-4-oxo-4H-chromen-8-carbaldehyde (65)—The procedure was the same as that used for the preparation of $\mathbf{5 2 . 4 4 \%}$ yield, white crystals (starting from 650 mg of $\mathbf{6 4})$ : $\mathrm{mp} 179-181^{\circ} \mathrm{C}$.

### 6.6.3. O-(8-(1,3-Dioxolan-2-yl)-2-ethyl-4-oxo-4H-chromen-7-yl)-N,N-

 dimethylcarbamothioate (67)-Compound 66 was prepared by the same procedure as used for the preparation of $\mathbf{5 2}$. However, due to its instability, $\mathbf{6 6}$ was not purified, but was reacted directly with dimethylthiocarbamoyl chloride $(1.0 \mathrm{~g}, 8.09 \mathrm{mmol})$ to give compound 67 following the same method used for the synthesis of $\mathbf{5 4 . 3 1 \%}$ yield, white solid (starting from 600 mg of 66): $\mathrm{mp} 132-134{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta 1.31\left(3 \mathrm{H}, \mathrm{t}, J=7.43 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 2.66$ $\left(2 \mathrm{H}, \mathrm{q}, J=7.43 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 3.43\left(6 \mathrm{H}, \mathrm{s},-\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 4.08,4.24\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right.$ of $1,3-$ dioxolane), $6.19(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 6.35(1 \mathrm{H}, \mathrm{s}, 8-\mathrm{CH}-), 7.06(2 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz}, 6-\mathrm{H}), 8.22(2 \mathrm{H}$, d, $J=8.6 \mathrm{~Hz}, 5-\mathrm{H})$. ESI-MS $m / z 350(\mathrm{M}+\mathrm{H})$
### 6.6.4. S-(8-(1,3-Dioxolan-2-yl)-2-ethyl-4-oxo-4H-chromen-7-yl)-N,N-

 dimethylcarbamothioate (68)-The procedure was the same as that used for the preparation of $\mathbf{5 5} .34 \%$ yield, light yellow solid (starting from 450 mg of $\mathbf{6 7}$ ): mp 132-135 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta 1.32\left(3 \mathrm{H}, \mathrm{t}, J=7.4 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 2.66\left(2 \mathrm{H}, \mathrm{q}, J=7.4 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, $3.13\left(6 \mathrm{H}, \mathrm{s},-\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 4.08,4.27\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right.$ of 1,3 -dioxolane), $6.21(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 6.59$ $(1 \mathrm{H}, \mathrm{s}, 8-\mathrm{CH}-), 7.52(1 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz}, 6-\mathrm{H}), 8.20(2 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz}, 5-\mathrm{H})$. ESI-MS $m / z$ $350(\mathrm{M}+\mathrm{H})$.6.6.5. 2-Ethyl-7-(isopropylthio)-4-0xo-4H-chromene-8-carbaldehyde (71)—The procedure was the same as that used for the preparation of $\mathbf{5 8} .52 \%$ yield, light yellow solid (starting from 70 mg of $\mathbf{6 8}$ ): mp $152-154{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta 1.32(3 \mathrm{H}, \mathrm{t}, J=7.3 \mathrm{~Hz}, 2-$ $\left.\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.45\left(6 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.7 \mathrm{~Hz}, 7-\mathrm{SCH}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.72\left(2 \mathrm{H}, \mathrm{q}, J=7.3 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, $3.67\left(1 \mathrm{H}, \mathrm{m}, J=6.7 \mathrm{~Hz}, 7-\mathrm{SCH}\left(\mathrm{CH}_{3}\right)_{2}\right), 6.23(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{CH}), 7.40(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}, 6-\mathrm{H})$, $8.24(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}, 5-\mathrm{H}), 10.81(1 \mathrm{H}, \mathrm{s}, 8-\mathrm{CHO})$. ESI-MS $m / z 277(\mathrm{M}+\mathrm{H})$.
6.6.6. 4'-((-)-Camphanoyloxymethyl)-7-(isopropylthio)-2-ethyl-4H-chromene-2one (33)—The procedure was the same as that used for the preparation of $\mathbf{3 2} .48 \%$ yield, white solid (starting from 27 mg of 71 ): $\mathrm{mp} 92-94^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\delta 0.95,1.05,1.00,1.09(9 \mathrm{H}$, s, camphanoyl-CH3 $\times 3$ ), $1.31\left(3 \mathrm{H}, \mathrm{t}, J=7.3 \mathrm{~Hz}, 2-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.35(6 \mathrm{H}, \mathrm{d}, J=6.7 \mathrm{~Hz}, 7-$ $\left.\mathrm{SCH}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.89-2.40\left(4 \mathrm{H}, \mathrm{m}\right.$, camphanoyl- $\left.\mathrm{CH}_{2} \times 2\right), 2.67(2 \mathrm{H}, \mathrm{q}, J=7.3 \mathrm{~Hz}, 2-$ $\left.\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 3.62\left(1 \mathrm{H}, \mathrm{m}, \mathrm{J}=6.7 \mathrm{~Hz}, 7-\mathrm{SCH}\left(\mathrm{CH}_{3}\right)_{2}\right), 5.66\left(2 \mathrm{H}, \mathrm{s}, 4^{\prime}-\mathrm{CH}_{2} \mathrm{O}-\right), 6.18(1 \mathrm{H}, \mathrm{s}, 3-$ H), $7.42(1 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz}, 6-\mathrm{H}), 8.14(1 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz}, 5-\mathrm{H})$. ESI-MS $m / z 459(\mathrm{M}+\mathrm{H})$.

### 6.7. HIV-1 infectivity assay

Anti-HIV-1 activity was measured as reductions in Luc reporter gene expression after a single round of virus infection of TZM-bl cells. HIV-1 at 200 TCID $_{50}$ and various dilutions of test samples (eight dilutions, fourfold stepwise) were mixed in a total volume of $100 \mu \mathrm{~L}$ growth medium in 96-well black solid plates (Corning-Costar). After 48-h incubation, culture medium was removed from each well and $100 \mu \mathrm{~L}$ of Bright Glo luciferase reagent was added to each culture well. The luciferase activity in the assay wells was measured using a Victor 2 luminometer. The $50 \%$ inhibitory dose ( $\mathrm{EC}_{50}$ ) was defined as the sample concentration that caused a 50\% reduction in Relative Luminescence Units (RLU) compared to virus control wells after subtraction of background RLU.

### 6.8. Cytotoxicity assay

Compounds were tested for cytotoxicity against TZM-bl cells. The cells at $1 \times 10^{5}$ cells $/ \mathrm{mL}$ were added to each well in a 96 -well plate in the presence of various concentrations of the tested compounds for an indicated period parallel to the antiviral assays. Cell viability was determined by using a Promega cytotoxicity assay kit, CellTiter-Glo® Luminescent Cell Viability Assay, following the manufacturer's instruction. The drug concentration that resulted in a $50 \%$ decrease in viable cells was defined as the $\mathrm{IC}_{50}$ of the compound.

### 6.9. Chemical stability analysis

Each tested compound ( 1 mg ) was dissolved in $\mathrm{MeOH}(0.5 \mathrm{~mL})$ in centrifuge tubes. After adding $1 \% \mathrm{HCl}(0.2 \mathrm{~mL})$ into the tubes, each mixture was shaken at room temperature. The amount of compound in acidic solution was measured by HPLC (Column: Hypersil ODS2 $5 \mu \mathrm{~m}, 4.6 \mathrm{~mm}$ G 250 mm ; a mobile phase of $30 \%$ water and $70 \% \mathrm{MeOH}$ ) at 1 min and 30 min.

## Research Highlights

- Thirty $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor DCP and DCK analogs (8-37) were designed and synthesized.
- Several seco-compounds showed potent anti-HIV activity against HIV-1 ${ }_{\text {NL4-3 }}$ and RTMDR strains.
- $1^{\prime}$-O-Isopropoxy-2',3'-seco-3'-nor-DCP (12) showed the greatest potency among $1^{\prime}-O$-Isopropoxy- $2^{\prime}, 3^{\prime}$-seco- $3^{\prime}$-nor-D
the newly synthesized compounds.
- The seco-analogues exhibited better chemical stability in acidic conditions than

The seco-analogues exh
DCP/DCK compounds.

- Seco-DCP analogues may be favorable for development as novel anti-HIV candidates.
