

- Just 100 companies are responsible for 70% of the world's greenhouse gas emissions since 1988
- The Earth's temperature is likely to rise by 39° F by 2050
- Species will begin to go extinct and food will be scarce if we do not change our ways.

- Engineers must use their skills to implement green solutions to slow the effects of climate change.
- Green Engineering is the design, commercialization and use of processes and products that are feasible, economical, and reduce the generation of pollution at the source.
- Solutions include Ultra Diesel produced from biomass and even using recyclable and compostable materials.
