Turning Everyday Activities into Play: Building Relationships and Fostering Connections for Adopted Children and Children in Foster Care

Chapter 1: Introduction

The purpose of this proposal is to outline the vision for a capstone project focused on program development for community members that work children in foster care. The aim of this project is to help community members gain the knowledge and skills that will aid in the development of children in foster care through the use of occupation-based programming.

Background

Foster care provides a temporary living situation for children whose biological parent(s) are unable to care for the basic needs of a child (American Occupational Therapy Association [AOTA], 2015). A child will be temporarily removed from the parents' care and placed in foster care until the child is able to return home safely or is permanently placed with a family member or adoptive family (AOTA, 2017). As of September 30, 2018, there were over 430,000 children in foster care with over 195,000 children waiting to be adopted (U.S. Department of Health and Human Services, 2019).

A child can enter the foster system at any age ranging from birth to 20 years. However, 19% of children entering foster care are less than one year of age (U.S. Department of Health and Human Services, 2018). A child can enter foster care for a number of reasons. The most common reasons are "neglect, physical or emotional abuse, parental substance abuse, and caretaker's inability to provide or cope" (Lickteig & Lickteig, 2019, p.1). The initial trauma a foster child experiences is from the initial abuse or neglect from their birth parent or parents (Lickteig & Lickteig, 2019). The separation from the birth family can also be traumatic for a

child. The results of childhood trauma often lead to significantly higher rates of behavioral problems and developmental disorders (Child Welfare Information Gateway, 2015).

Research has shown that abuse is often associated with low self-esteem, hostility, and aggression in individuals who have suffered maltreatment during their childhood (Liu et al., 2018). Depression and psychological distress are additional lasting effects of abuse (Liu et al., 2018). The consequences of abuse are long-lasting and are often carried by a child through adolescence and into adulthood. These consequences often result in insecure attachment and are extremely difficult to change after abuse as they often lead to a “negative attitude toward self and others” (Liu et al., 2018, p. 794). Although there is a considerable amount of research on the effects of childhood trauma and abuse, very little programming exists to help a child cope with the consequences of childhood trauma.

Current programs and trainings for foster parents and potential foster parents vary by state (Hebert & Kulkin, 2017). Many trainings only fulfill the minimum requirement to certify a family to take a child into their home (Herbert & Kulkin, 2017). The program discussed by Hebert and Kulkin (2017) was developed based on the expressed needs of foster parents. Herbert and Kulkin found that the top expressed needs of foster parents are how to manage challenging behaviors, how to help a child adjust to a foster home, and how to prevent foster care burnout as parents. The behavioral and emotional issues that a foster child experiences often results in added stress that is put on foster parents. Caregiver burnout and illness are very common issues that foster parents face while caring for a foster child (Miller, Green, & Lambros, 2019).

Occupational therapists can provide occupational therapy services to foster care children in a variety of settings such as at school, in the home, or in the community (Lynch et al., 2017). The role of occupational therapy within the foster care system is to promote participation in

meaningful occupations to help develop the skills necessary for “independence in activities of daily living, instrumental activities of daily living, play, leisure, and overall wellness satisfaction in independent living” (Lynch et al., 2017, p.2).

Being in the foster care system does not automatically qualify a child for occupational therapy services. Often, a child needs to have a disability such as a developmental or learning disability in order to receive occupational therapy services. In the school setting, occupational therapy services are determined through the use of the Individualized Education Program (IEP) (AOTA, 2016). If a child is unable to receive a “free, appropriate public education in the least restrictive environment”, an occupational therapist will collaborate with other IEP team members to determine which “services, supports, modifications, and accommodations” are necessary for the student (AOTA, 2016, p. 2).

Other barriers such as financial aspects can also prevent a foster child from receiving occupational therapy services. While foster parents do receive some financial assistance for taking in a foster child, the amount of money they receive varies greatly depending on the state and foster agency. Additionally, the stipend that foster parents receive is intended to offset the cost of everyday items such as food, housing, and clothing. According to the Child Welfare Information Gateway (n.d.), foster parents are also responsible for everyday financial obligations. These financial obligations may include child care or participation in recreational sports.

Insurance can also be a barrier for a foster child to receive occupational therapy services. All children in foster care qualify for Medicaid insurance through the federal and state governments (Child Welfare Information Gateway, n.d.). Occupational therapy is a covered service under Medicaid but is classified as optional rather than mandatory (AOTA, 2020).

Because it is optional, it depends on the state the child resides in to determine whether occupational therapy services will be covered by Medicaid. If Medicaid does not cover occupational therapy services, a foster parent may have to pay out of pocket for a child in foster care to receive occupational therapy services.

The effects of childhood trauma often result in “adverse outcomes including emotional, psychosocial, cognitive, and functional impairments” (Farias et al., 2019, p.228). These outcomes can negatively impact a child and can result in long-term impairments that affect a child not only at a young age but last through adolescence and into adulthood. The adverse outcomes of childhood trauma can negatively impact a child’s occupational performance in meaningful activities. These challenges that a foster child experiences often affects their relationships with others, their occupations, and their overall development.

Within the scope of occupational therapy, occupations are various life activities that an individual engages in (AOTA, 2014). For a child, the occupation of play is what helps a child grow and learn (AOTA, 2020). Occupational therapists utilize play in practice to support the growth and development of children. Occupational therapists have expertise in child development and understand the impact childhood illness has on growth and development (AOTA, 2014).

Statement of the Problem

The problem with current programming for children in foster care is that training is inconsistent for those individuals who are not foster parents. There are some programs for teachers and school personnel that focus on mental health and overall well-being for children (Bazyk, 2014). Programming available for community members that want to aid in the development of children in foster care is limited. Community members such as teachers and

school personnel, family members, respite providers, and recreational and daycare providers can all help support the development of a foster child.

This program development is needed not only because of the inconsistent training available for community members but also because the number of children in foster care is continuously growing. Community members should be trained and made aware of the effects of childhood trauma. Community members should also be trained to support the development of a foster child who has been exposed to childhood trauma.

Additionally, the current programming rarely incorporates the occupation of play and can be enhanced by utilizing an occupational therapy lens. Occupational therapists understand child development and how to utilize occupations to help a child grow and learn.

Purpose Statement

This project aims to develop a training program for community members to support the development of children in foster care through the use of play. In occupational therapy practice, the occupation of play can be used as a tool to foster a child's development. Children use play to learn about their surroundings and "develop physical coordination, emotional maturity, social skills to interact with other children, and self-confidence to try new experiences and explore new environments" (AOTA, 2012). For a child, being in the foster care system is a very challenging moment in their life. Play can help "bolster a youth's sense of self-efficacy and reduce stress, especially at challenging moments" (Shea & Siu, 2016, p. 276). The goal of this program is to first educate the community members on the needs of children in foster care due to the trauma these children experience at a young age. The project will also provide information and suggestions on how to support a child's developmental needs through structured play activities.

And lastly, the project will provide examples of specific play activities that can be used to support a child's development.

Rationale for Proposed Project

This project needs to be done in order to meet the developmental needs of this underserved population. Through this project, the aim is to create a program that will provide support and training for community members who are not familiar with the developmental needs of children in foster care. This program will be beneficial for a foster child's development while also providing additional support for foster parents. In the end, this project will enable a foster child to continue to grow and develop while adapting to the changes they are experiencing as they navigate through the foster care system.

The concept and importance of facilitating growth and development for a child is highlighted in Llorens' 1970 theory, *The Developmental Theory of Occupational Therapy*. According to Llorens, by facilitating growth, an occupational therapist will assist a child in achieving mastery of life tasks by considering the physical, neurophysiological, psychosocial, psychodynamic, and social-cultural aspects of the child throughout all stages of development (La Corte, 2008). Utilizing this framework, the child's growth will be facilitated by an adult through the participation in a variety of sensori-motor activities that build on underlying skills that are essential for child development (La Corte, 2008). Llorens believes that the experiences an individual has within the environment of the family promotes early growth and development (1970). As a child ages, influences from "extended family, community, social and civic groups assist in the growth process" (La Corte, 2008, p.206). When children experience trauma either physical or psychological in childhood, their growth and development is interrupted.

Occupational therapists can close these gaps that children may have in their growth and development using skilled application of activities (La Corte, 2008).

Another model that will be used in this program development process is Kielhofner's Model of Human Occupation (MOHO). MOHO is the most commonly used model both nationally and internationally that is occupation-focused (Lee et al., 2012). The use of MOHO is important in order to remain client-centered by incorporating motivational activities that allow an individual to relate to and prioritize a client's needs (Kielhofner, 2008). Research has shown that by utilizing MOHO in treatment planning and monitoring, the client's overall satisfaction with occupational therapy services is enhanced (Lee et al., 2012). Community members will be utilizing structured play activities in this program that are enjoyable and motivating for children in foster care. Community members will be provided with ideas and suggestions on how to tailor activities while considering the specific interests and needs of the child. Additionally, information will be gathered from the community members to find out what their goals are for this program in order to incorporate motivating factors for them as well. By utilizing MOHO in this program, relevant interventions will be incorporated while also setting goals that are client-centered to ensure the best overall outcome of the program.

Significance of the Proposed Project

Entering the foster care system and any time spent in foster care can be a difficult time in a child's life. Children in foster care experience a number of challenges and emotions due to their separation from their birth parents (Cox, 2013). Foster parents are encouraged to seek support from other parents through meetings and events hosted by organizations that provide support groups for kinship, foster, and adoptive parents. In the state of California, there are 79 organizations that provide these support services for foster parents (Child Welfare Information

Gateway, n.d.). In order to attend support group meetings and sessions, foster parents often seek out childcare services or are provided childcare services by the organization. Many of these childcare services provide a place for the child to play and interact with other children while being supervised by an adult. These services often provide toys and activities for children to participate in. However, the supervising adult typically does not have the training or knowledge to aid in the child's development.

This program will be directed at the community members who frequently work or interact with children in foster care either on a professional or personal level. By developing this program, foster care children will still have the opportunity to interact and play with peers but will do so in a way that incorporates occupation which will help develop essential life skills while also helping overall development. The knowledge gained through this program will allow any community member to create activities that will help a foster child's development.

Through this program, a consultative role will be provided for community members by providing guidance, advice, and suggestions to best support foster child development.

Consultation has become more prominent in the field of occupational therapy. Program consultation will be used in this program as this is commonly associated with new program development (Dudgeon & Greenberg, 1998). This program will not only help children in foster care but will also increase current programming that is available to community members.

Project Objectives

- I. Conduct a literature review to learn about gaps in current programming for children in foster care.
- II. To identify the developmental needs related to occupational participation of children in foster care due to the childhood trauma experienced at a young age.

- III. To identify common play activities that are used to aid in child development in occupational therapy.
- IV. To create play activities tailored specifically to aid in the development of a child in foster care.
- V. To create a program that educates and trains community members on the needs of children in foster care and how to structure play activities in a way that will support child development.
- VI. To measure the understanding of community members on this program directed at child development for children in foster care.
- VII. To measure the receptiveness of community members incorporating this training program into their childcare services.

Definition of Terms

For this capstone project, *community members* refer to any individual that interacts with children in foster care that is not a foster parent. Any child who is separated from his or her birth parents and placed in temporary custody of a foster parent or family member is a child in foster care. *Play* is a child's major occupation which can be classified as any "organized activity that provides enjoyment, entertainment, amusement, or diversion" (Parham & Fazio, 2008, p.448). *Structured play* refers to a physical activity that is planned and designed with a specific skill development goal in mind (Tortella et al., 2019). *Unstructured play* is referred to as free play or active play and is a form of physical activity that is freely chosen and that a child participates in an unstructured manner (Tortella et al., 2019).

Assumptions

This capstone project makes the assumption that children in foster care have disruptions in their development due to the childhood trauma experienced at a young age. It is also assumed that community members do not have the training or knowledge to support the development of children in foster care and that they want to enhance their training and knowledge to support the development of children in foster care . Lastly, although caregiver burnout and burden are frequently discussed with foster parents, it is assumed that foster care burden results in foster parents needing assistance from community members to support the development of a foster child.

Limitations

Limitations of the capstone project include a sample size that is dependent on the voluntary involvement of foster parents and community members. The capstone experience will take place at an outpatient pediatric clinic which will likely result in having more voluntary involvement of foster parents than community members. Another limitation is that the program will occur during the Summer 2020 trimester which may limit the number of children in foster care receiving services at the pediatric clinic as some children may only receive school-based therapy services that are not provided during the summer months. Finally, participants will only be gathered from one outpatient pediatric clinic which may result in this program not being applicable to all children in foster care of different areas.

Delimitations

There are a few delimitations to this capstone project. First, as the capstone experience for this project will take place in one outpatient clinic in California, information gathered by foster parents and community members may not be applicable to other states or regions. Second,

due to the wide age range of children in foster care, play activities suggested will need to be altered to fit specific age ranges. Finally, community members may work with children in foster care in a variety of settings. The structured play activities discussed and taught to community members will change depending on the intended setting of use.

Chapter 2: Literature Review

The foster care population is continuously growing. Children in foster care experience trauma at a young age and the effects of trauma often last a lifetime. Trauma impacts a child's overall well-being and often makes everyday activities a challenge. The literature shows that childhood trauma often results in a child having problems with negative behaviors both at home and in school. Not only are negative behaviors a common issue, but the literature has also shown that trauma can often have negative effects on a foster child's overall development. While training is emerging and evolving for foster parents and teachers, there is still a lack of training available to community members. Community members can help support the development of a foster child with the proper education.

The Impacts of Foster Care

Children entering foster care often experience challenges with their social, academic, and mental health due to the trauma experienced at a young age (Miller et al., 2019). Research has shown that the effects of childhood trauma can greatly impact a child's life through adolescence and into adulthood. Childhood trauma has been linked to poor interpersonal relationships, poor coping strategies, and an increased likelihood to suffer from depression (Liu et al., 2018). Additionally, childhood trauma often results in a child having difficulty handling their emotions, sensations, and stress (AOTA, 2015). As a result, foster parents often report the need for additional support and training on problematic behaviors (Greeno et al., 2016).

These effects of childhood trauma can impact a child at home, school, and in the community. Literature has shown the difficulty children in foster care have in the school setting. It has been found that children in foster care frequently have difficulty concentrating in the classroom setting, getting along with others, and often have emotional instability, which often results in children having trouble with class and homework (Cox, 2013). In addition, some school personnel have reported that they are not fully prepared or supported to work with children in foster care (Cox, 2013). Some programming is already in place for school personnel to learn more about the needs of children in foster care in the school setting.

Current Programming

Theraplay is commonly used by parents of children in foster care to meet the adolescent's attachment needs through the Theraplay model (Robinson et al., 2009). Theraplay utilizes the occupation of play to help families learn how to form "secure well regulated relationships with their child" (Robinson et al., 2009, p. 292). Theraplay has been utilized in a variety of settings and has been successful in creating positive behavioral changes and relationships between families. The focus of Theraplay is on the relationship between a child and a caregiver and the child's individual developmental needs (Robinson et al., 2009).

The Trust Based Relational Intervention (TRBI) is a program that aims to correct a child's challenging behaviors with healthy behaviors (Howard et al., 2014). TRBI has the guiding principles of empowering, connection, and correcting to provide trauma-informed intervention for children (Howard et al., 2014). The TRBI also uses play to teach proactive strategies that help a child "self-regulate and use appropriate behaviors when challenging situations occur" (Howard et al., 2014, p. 50). Howard et al. (2014) utilized TRBI for families in post-adoption services and found that parents have the ability to be important change agents in

the lives of their children. Howard et al. (2014) found that the TRBI provides families with the knowledge on how to address and overcome challenges to prevent adoption disruption.

When looking at programming for foster parents, it varies depending on the state the parent is in. Some states only require as few as 4 hours of training while others require a minimum of 30 hours (Greeno et al., 2016). While all foster parents receive training, the literature shows that many foster parents feel that foster agencies do not provide enough training, support, or information related to the foster care system or their foster child specifically (Greeno et al., 2016). As mentioned earlier, negative behaviors are often problems that school personnel and foster parents observe.

In a study by Cox (2013), the Keeping Foster and Kinship Parents Trained and Supported intervention (KEEP) was implemented to look at child behavioral change and permanency and placement stability. The KEEP intervention consists of a group of 7-12 foster/kinship parents who meet weekly with trained group leaders (“What is KEEP?”, n.d.). Two group leaders tailor each weekly session to the group’s specific expressed needs (“What is KEEP?”, n.d.). Through KEEP, some skills that parents learn are how to reinforce preferred behaviors, build cooperation, and how to manage emotions (“What is KEEP?”, n.d.). When looking at the effectiveness of the KEEP intervention for foster and kin parents, parents “reported significantly fewer child behavior problems” at the termination of the KEEP intervention compared to at baseline (Price, Chamberlain, Landsverk, & Reid, 2009, p.237). KEEP was also found to be beneficial for increasing positive parenting skills such as increased use of positive reinforcement to help reduce problem behaviors (Price et al., 2009). Price et al. also found that children who participated in the KEEP intervention group were more likely to experience positive exits from foster care (2009). Positive exits refer to reunification with the birth family or adoption (Price et al., 2009).

Based on the literature, there appears to be a gap in current programming for community members who work with children in foster care. Community members can work with children in foster care in a variety of settings. They can be daycare providers, school staff, extended family members, etc. These individuals could benefit from the knowledge about the foster care system, childhood trauma, and the needs of a foster child. Although there are current programs that utilize the occupation of play, this program will differ as it will utilize the occupation of play to support the development of children in foster care.

Benefits of Play

Play has numerous benefits for a child as it can support and aid in development while also increasing a child's overall physical activity rate (Roach & Keats, 2018). Healthy weight, motor skill development, overall mental health and metabolic health are associated with participation in physical activity (Tortella et al., 2019). Play can also help a child mature emotionally and develop the confidence and skills necessary to interact with others and explore a new environment (AOTA, 2012). Some research states that unstructured play is insufficient for developing fundamental movement skills in a child (Roach & Keats, 2018). While an unstructured free play approach is often more enticing for children, both unstructured and structured play have their advantages (Roach & Keats, 2018).

Literature Review Conclusion

In summary, childhood trauma is the underlying cause of many challenges that a foster child experiences. Training programs have started to evolve for foster parents and teachers to help understand the needs of this population. However, this programming does not appear to have evolved for community members. Community members could benefit from additional

training to support the development of children in foster care through the use of the occupation of play.

Chapter 3: Project Description

This project focused on the occupation of play to support the development of children in foster care. Play is the number one occupation for children and is essential for a child's overall growth and development. Children in foster care experience a number of challenges due to the trauma and abuse experienced at a young age. These challenges can take a toll on parents of children in foster care which often results in increased rates of caregiver burden. This project aimed to educate community members on the developmental needs of children in foster care, the importance of play, how to utilize play to support child development, and how to utilize play to foster the connection between foster families.

This project took place at an outpatient pediatric clinic, Growing Healthy Children Therapy Services in Rescue, California. The Doctor of Occupational Therapy student (OTD) worked with children in foster care, adopted children, foster families, and families enrolled in the summer camp program. The aim of this portion of the project was to gain additional experience and knowledge on how to use play to support child development and how play is used in occupational therapy practice. Throughout the six-week summer camp program, the OTD student worked with level II occupational therapy students, occupational therapists, and occupational therapy assistants to develop play-based activities for summer camp for children ages four through fifteen. Through this activity, the OTD student was able to learn about proper grading of play activities, potential sensory triggers to activities, and how to support the social connection to meet the individualized needs of children in foster care and adopted children.

Additionally, in this part of the project, information was gathered through observation and participation in occupational therapy treatment sessions with children who were adopted or who are currently in foster care. Through the observation and participation in occupational therapy treatments, the OTD student was able to gain additional knowledge and experience on play-based activities, how to incorporate developmental skills into play-based activities, and how to use play to foster the connection between children and adults.

In order to learn about the challenges related to occupational performance that children face when exposed to childhood trauma, the OTD student attended webinars and online trainings relating to trauma-informed care and the effects of childhood trauma on children in foster care. Following these trainings, discussions with occupational therapists were used to help brainstorm strategies on how to use play to foster the relationship between therapist and child and parent and child. The information gathered helped guide the program development process.

Following the development of the play-based program for children in foster care and adopted children, a resource was created that can be used by community members who work with adopted children or children in foster care in their profession. This resource could also be used by foster and adoptive families in the home environment. A survey was developed and used to help identify qualitative themes and quantitative data to meet the program objectives six and seven which measure the understanding and receptiveness of community members on the program and the likelihood of implementing the program into their professional services. See Appendix A for a copy of the survey questions for community members. See Appendix B for a copy of the resource, *Turning Everyday Activities into Play – Home Guide*, which was presented to community members.

There was a total of four different stakeholders for this program. These groups are occupational therapists, parents of children in foster care or adopted children, community members who work with this population in their profession, and children in foster care or adoptive children. The roles of these participants were discussed in the paragraphs above. All four groups of participants play a key role in the program development and implementation process. While the goal is to create this program for community members, it can be an additional tool that occupational therapists can use in their profession. This program utilized everyday activities and provided participants with strategies on how to turn these activities into play. By doing this, this program can be used in the home environment by foster and adoptive families.

Program Planning Model

The logic model for this project has the inputs of evidence-based research on the importance of play for children in foster care, observation and research on play-based activities, and connections within the community for those who work with the foster care population. One of the outputs requires the creation of a resource on play and play-based activities. This resource will be intended for community members but can also be beneficial for foster families to educate on the importance of play and how to use play at home to support child development. Educating on the importance of play is another output of the logic model. The third output relies on community connections and developing relationships with the foster community to be able to implement the program.

There are short, medium, and long-term goals associated with the logic model for this program. The short-term goals are on increasing knowledge on play-based activities to support child development and increase knowledge on the importance of play. Creating a resource for community members will help achieve this short-term goal.

The medium-term goals of this project are community members feeling more competent in supporting the development of a child in foster care and increasing the number of community members who utilize play as a tool to support development. Together these goals help shape the long-term goals. These goals consist of the following: increase in foster placement stability and increase in the number of individuals who can support children in foster care in a variety of settings. See Appendix C for a visual of the logic model discussed above.

Process

The first portion of the capstone experience focused on expanding the literature review and preparing for the in-person capstone experience. Due to the COVID-19 pandemic, the first few months of the capstone experience (March-May) were spent at home as all California Residents were required to “shelter-in-place” until June. Shelter-in-place required all non-essential businesses to shut down. Some of these businesses included hair and nail salons, retail stores, business offices, and schools.

Due to COVID-19, there were many changes within the community that took place to help stop the spread of the virus. These changes were challenging for everyone but were especially difficult for children who did not completely understand what was going on in the world. Some of these changes that took place were that schools transitioned from an in-person format to an online “distance learning” format. Additionally, child care and day care providers were forced to temporarily close. Many employees who were not deemed essential were required to work from home and care for children in home. Many children lost out on social opportunities due to distance learning, sports seasons being canceled, after-school programs being shut down, and many summer activities being canceled.

At the beginning of June, essential businesses, such as the Growing Healthy Children Therapy Services were able to open again. At the start of the six week long summer camp program at Growing Healthy Children, many parents reported on the challenges they have been experiencing as a family due to COVID-19. Parents expressed how challenging it has been to shelter-in-place as a family and that summer camp was a great opportunity for children to get back into a routine and to provide children the opportunity to socialize and be around other children again.

After having these conversations with families, the decision was made to shift the focus of the capstone project to include families even more than originally planned. With children learning from home due to distance learning and childcare services being closed, families were spending a lot of time at home together. Families no longer had the physical support provided by teachers, school personnel, respite providers, day care providers, etc. that they did previously. Additionally, with many non-essential businesses being closed and the risk associated with going into public with large crowds, many families reduced the number of public outings that were not necessary.

Program Changes

The idea for the home guide was developed after considering the challenges families were experiencing due to COVID-19. It was important to include activities in the home guide that could be completed at home with minimal supplies or supplies available around the home. By doing so, families did not have to make unnecessary trips to gather supplies and equipment.

The home guide still focused on the occupation of play. However, the goal was to provide strategies on how to turn everyday household activities into play. It was also essential to

support child development and foster the connections and relationships of families. The home guide's goal was to be a resource that could be used by both families and community members.

Additionally, another change made was to include adopted children as stakeholders for this program. After working with adopted children in the clinic setting and during the summer camp experience, it was apparent that adopted children often face many of the challenges that children in foster care face. The concepts and activities discussed in this program applied to this population, making it appropriate to include them in the program moving forward.

Chapter 4: Results & Analysis

The home guide for *Turning Everyday Activities into Play* was created to provide a resource that is easily accessible and that can be used in the home or professional environment. The home guide provides strategies on how to make tasks easier or harder to allow for families to continuously provide the just right challenge for children as their needs and skills change and develop. This program also provides readers with the background knowledge of the needs of children in foster care and adoptive children by explaining the lasting implications of childhood trauma. Not only does this resource use play to work on a child’s developmental motor and

sensory skills, but it also provides strategies to work on communication skills that help foster connections and build relationships. Play can be tailored to best fit the needs of a child and the child's interests to be used as a motivating tool. Play provides children and families the opportunity to work on the skills necessary to establish a sense of trust, security, and comfort to build stronger bonds and relationships.

Data analysis was required as surveys and interviews were both a part of this project. An interview was created for foster and adoptive families with the intention of implementing *Turning Everyday Activities into Play* as a week-long virtual program. This interview consisted of mostly open-ended questions to provide the OTD student with additional information on the family as well as the family's goal(s) for the program. Unfortunately, there were no participants in either of the week-long virtual programs offered for foster and adoptive families. Moving forward with future implementation of this program, the interview questions will be used to find ways to tailor specific everyday activities to best meet the needs and goals of the family. See Appendix D for the interview questions created for foster and adoptive families.

A six-question survey was developed for the community member participants of this program. The survey consisted of a variety of questions, some being open-ended and some being multiple choice. The survey was sent along with the *Turning Everyday Day Activities into Play - Home Guide* to community members who work with foster and adoptive families in their profession. The survey and home guide were distributed to 40 participants and a total of 26 surveys were returned. The participants consisted of:

- Occupational Therapist (OT), Occupational Therapy Assistant (COTA), OT Student
- Speech-Language Pathologist, SLPA, SLP student
- Physical Therapist (PT), Physical Therapy Assistant, PT student
- Teacher
- Paraeducator
- Special Education Teacher

- Psychologist
- Inclusion Specialist
- Program Specialist
- Counselor
- Family Therapist
- Social Worker
- School Administrator
- Nurse
- Board Certified Behavior Analyst (BCBA), Applied Behavior Analyst (ABA)
- Daycare/child care provider
- Respite care provider

The three short answer questions required coding for qualitative themes and the three multiple choice questions required data collection and analysis to organize the quantitative data. The first question informed the OTD student in which role the community member worked with foster and adoptive children in the community. Many participants work with this population in multiple professional roles and marked more than one profession in the survey question. The breakdown of the participants can be seen in the Table 1. The top 3 professions of the community member participants were occupational therapists, school psychologists, and special education teachers. 11 of the 26 participants were occupational therapists, occupational therapy assistants, or occupational therapy students. Seven of the 26 were school psychologists. Five of the 26 participants were special education teachers. The other professional roles are listed in Table 1.

Table 1

Professional Roles of Community Member Participants

	No. of participants
Occupational Therapist (OT), Certified Occupational Therapy Assistant (COTA), Occupational Therapy Student	11
School Psychologist	7

Special Education Teacher	5
Speech Language Pathologist (SLP), Speech Language Pathologist Assistant (SLPA)	3
Daycare/Childcare Provider	3
Paraeducator	2
Counselor	2
Family Therapist	2
Board Certified Behavior Analyst (BCBA)	2
Teacher	1
Program Specialist	1
School Administrator	1
Non-Profit for Foster Youth	1
Total no. of participants	26

Overall, there was a good variety in the professions of the community members who were program participants. With 26 survey participants, there were 14 different professions represented. This demonstrates how many professionals work with and see foster and adoptive families in their profession that have the opportunity to impact the life of a child in foster care or adopted child. To expand this project, by including more community member participants, it will be an opportunity to include professions that were not represented in the initial program implementation. Other community members that would be beneficial to include in the future would be social workers, youth advocates, respite care providers, ABA therapists, other mental health specialists, and foster agency staff members.

The second survey question asked, what was something that you learned from this resource? The themes that were discovered were on the importance of play, how to connect and engage my students, the importance of understanding sensory triggers, and the needs of children in foster care. The qualitative themes that were discovered confirmed that the goals of this program were met. One of the main goals of this program was to inform participants on the needs of foster children while considering the effects of childhood trauma. Another goal of this

program was to use the power of play to support regulation and build stronger bonds and relationships.

Table 2

Survey Question 2 Themes: What was something that you learned from this resource?

Themes	Examples
Importance of Play	<p>“Play is an important activity for kids” (P4)</p> <p>“Play is accessible to everyone! Mundane chores and tasks can be made enjoyable for everyone, I love it!” (P14)</p> <p>Play can be used to enhance things that we do every day which is important for a child’s overall growth (P18)</p> <p>Can enhance carry-over skills (P19)</p>
How to Connect/Engage	<p>“connecting with students through probing questions in regards to food and exercise might be a great way to connect and engage my students” (P2)</p> <p>“I learned about various ways to increase social connections with kids and tips I can provide family members” (P5)</p> <p>“The "How to foster connection" section included on many topics is a great resource as often I don't think of parents or caregivers an how their relationship could be altered due to past circumstances in the child's life” (P12)</p>
Effects of Childhood Trauma	<p>Although an activity is seemingly fun, there can be potential sensory triggers for students who have experienced trauma (P1; P3; P22)</p> <p>Potential triggers can affect a child’s learning and development (P1)</p> <p>How self-regulation affects foster and adopted children. “I was able to connect some of the self-regulation activities to some of my students at work who have been exposed through childhood trauma” (P7)</p> <p>Sensory triggers may seem so small to me but they can be incredibly distracting for my students (P15)</p>

Children who are in foster care or who have been adopted can have a hard time letting others in due to their traumatic experiences. This resource teaches different ways to build that relationship (P26)

The third question asked, in your opinion, what was the most valuable information or topic that was presented in this resource? The themes that were discovered were the glossary to allow a better understanding of commonly used terms, how to tailor activities to best fit a child's needs, and how to use play to support development, connections, and relationships.

Table 3

Survey Question 3 Themes: In your opinion, what was the most valuable information or topic that was presented in this resource?

Themes	Examples
How to use Play to Support Development, Connection, and Relationships	<p>The use of everyday activities is a way for families to connect in ways they might not have thought (P2; P24)</p> <p>“How play is such an important area in which parents and caregivers can help kids to grow and develop their skills” (P5)</p> <p>“I think the specific strategies you provided in each section on how to specifically foster and increase connection” (P11)</p> <p>“How to foster connection and increase social connection. These are so important to emphasize to parents/caregivers” (P17)</p>
How to Tailor Activities	<p>“I really liked the activity ideas to work on their skills. Especially the upgrades and downgrades” (P7)</p> <p>“The specific ways to grade the activities to make them harder or easier. This is something families have a hard time knowing how to do. This really allows an activity to be a positive experience for the child” (P9)</p> <p>Connecting the triggers and the strategies to incorporate solutions with play (P13; P26)</p> <p>Breaking things down to easy, medium, difficult, how to "upgrade" or "downgrade" (P18; P25)</p>

Commonly Used Terms	The glossary which allows parents to understand the terms as they relate to the activities (P4; P6) New terms to me such as: Bilateral integration, crossing midline, proprioception (P8; P23) The terms and definitions were helpful and made it easier to understand concepts in the program (P26)
---------------------	--

The fourth question asked, moving forward, how would you use this resource in your profession? The results can be seen in the Table 4. The majority of responses from community members state that this home guide can be used as a resource or home program. The second highest response was that community members would use this resource in their profession by applying the concepts discussed in the home program. Two participants selected the other option and explained that they can use this resource with children of different backgrounds and diagnoses.

Table 4

Survey Question 4: Moving forward, how would you use this resource in your profession? (Mark all that apply)

	No. of responses
Provide it as a resource or a home program for a child	21
Apply the concepts discussed in the resource to my profession	19
Use specific activities discussed in the resource	17
Other	2

The fifth question asked, who would you recommend this resource to? The results are shown in the Table 5. The top two responses were to recommend this resource to other professionals and to all families that a community member works with in their profession.

Table 5

Survey Question 5: Who would you recommend this resource to? (Mark all that apply)

	No. of responses
Other Professionals	22
All Families That I Work With	22
Foster or Adoptive Families	17
Other	2

The last question asked participants how the resource can be improved and what topics/information should have been discussed. As this was a short answer question, some of the discovered themes were: needing specific step-by-step instructions of activities or recipes, adding information on other routines – night time or community routines, and how to include siblings and foster the sibling relationship. The home guide and survey were distributed to community member participants in August 2020. Since then, the home guide has been modified based on the feedback received in question six. There have been slight modifications to some activities discussed and sections added on emotions and how to include siblings in play.

Table 6

Survey Question 6 Themes: How can this resource be improved or what topics/information should have been discussed?

Themes	Examples
Expanding the Resource	Add testimonials from families that have tried these activities and how it has helped them (P22) Family outings (P16; P19) Component on communication and talking to the child through each section (P17) Including a section on education. Parents may need more support with more homeschooling and virtual learning in today's world (P12)

Provide Step-by-Step Instructions	Provide strategies to work on specific skills such as fine motor, obstacle course breakdowns to provide movement (P12) Links or videos to provide instructions for games or activities mentioned (P3; P8; P9; P10)
Including Others	Opportunities to share personal emotions to normalize the experience (P20) Fostering the relationship with siblings and other foster kids (P5)

After reviewing and analyzing the data from the survey responses, it was apparent that this program can be used in a wide variety of professions that work with children in foster care and children who were adopted. From the survey responses it was interesting to see that the participants were finding ways to connect the concepts discussed in this program to other students and children that have not been in foster care or adopted. It is important to note that a child can experience childhood trauma without being in foster care or adopted. Through this data, it showed that this program can be expanded to include children of other backgrounds and children with other diagnoses as they too can benefit from the use of play to support development and to help strengthen relationships.

Chapter 5: Discussion and Conclusion

Discussion

The purpose of this capstone project was to create a program for community members, foster families, and adoptive families. The goal of this program is to use play to build stronger family bonds and relationships while also supporting the development of children in foster care and adopted children. By providing this program as a tool that can be used by families and community members, this can help bridge the gap and inconsistencies with current trainings and programming.

The development and implementation of *Turning Everyday Activities into Play* affirmed that play can be a powerful tool especially when working with foster and adoptive children. This program also showed that although an individual might work with foster and adoptive children in their profession, it is always important to consider the effects of childhood trauma and use a motivating tool such as play to support development and build connections. This project also showed that educating and providing community members with this resource is a great way to indirectly make a difference in the lives of foster and adoptive families.

Although it would have been informative to implement this program with foster and adoptive families directly, it provides a goal for envisioned next steps of this project. While also considering the feedback provided by community members, there are many ways to continue to expand and improve the program.

Turning Everyday Activities into Play is a program that can be used as a tool to help educate foster parents, adoptive parents, and community members who work with this population in their profession. Including community members in this program will help with the sustainability of this program as these individuals can continue to share this program and their knowledge gained from this program with other families and professionals.

Implications for OT

Although OTs working in pediatrics and school-based settings incorporate the occupation of play into treatment sessions daily, this program can be a useful tool for OTs who work with foster and adoptive families. This program can educate therapists on the effects of childhood trauma and what it may look like when working with children in foster care or who were adopted. OTs can use the activities or concepts discussed in this program to build rapport and

strengthen their connection with a child. This program can serve as another tool in the OT toolbox to support child development, connections, and relationships.

Additionally, there are a couple different ways that OTs can use this program. First, OTs can use this program as a way to include parents in treatment sessions. Therapists can go over specific concepts or activities discussed in this program to include parents in the session by showing how easy it is to make everyday activities therapeutic and playful. Therapists can also provide this resource to parents as a home program to work on developmental skills and communication skills at home to strengthen the family relationships. Although this program is directed at foster and adoptive children, the concepts and activities can be used with children of other diagnoses and abilities.

This program utilizes everyday activities that are done in the home such as cooking, playing, and household chores. The goal of using these activities that take place around the home, was to ensure that this program was appropriate for all families. By providing strategies on how to foster the connection, how to increase social connection, and how to modify the activity to increase or decrease the challenge, families are able to apply those strategies to their own routines at home.

Lastly, it is important to remember that as an occupational therapist, specifically a pediatric occupational therapist, play is used constantly to support child development and is incorporated into tasks to help work towards a child's established goals. Other factors such as social interactions, functional communication, and a child's relationship with peers and family are all areas that occupational therapists focus on each day in practice. Through this program, it showed how beneficial it is to empower other professionals to utilize occupations and make seemingly simple activities enjoyable and therapeutic to best serve the child and family.

Conclusion

While many occupational therapists are trained on providing trauma-informed care and use play as a tool to help children work through the effects of trauma, other professionals may not have the knowledge or training to do so. By using an occupational therapy lens, this program was able to educate and empower community members on how to do the things that OTs do every day in practice. By empowering others to utilize the power of play while also considering the effects of trauma, OTs, community members, and parents can work together to mitigate the effects of childhood trauma for children and foster care and adopted children.

LETTER TO READERS

Dear Readers:

My name is Marissa Siu, and I created the program *Turning Everyday Activities into Play* as a resource for foster families, adoptive families, and those individuals who work with this population in the community. This program was created as a part of my capstone project to fulfill my occupational therapy degree requirements. When creating this program, my goal was to create a resource that can be used at home while incorporating household items and activities. The purpose of this program is to foster the family connection by engaging in fun and enjoyable activities while also allowing all family members to be involved. I hope you enjoy this resource and can utilize it at home or in your profession!

ABOUT THE PROGRAM

This program is designed for foster families, adoptive families, and individuals who work with this population in the community. Many foster and adopted children experience some form of childhood trauma. Childhood trauma has been linked to poor interpersonal relationships, poor coping strategies, and an increased likelihood to suffer from mental health problems (Liu et al., 2018). Additionally, research has shown that childhood trauma can result in children having difficulty handling their emotions, sensations, and stress (American Occupational Therapy Association, 2015). Children who are placed in foster care need additional support to gain a sense of trust, security, and comfort to allow them to be successful in their new environment (Malek, 2011).

In this program, we will be fostering the connection through everyday activities. We will be using the power of play to support regulation and build stronger bonds and relationships by turning everyday activities into play. The everyday activities discussed in this program are cooking, exercise, household chores/gardening, play, and self-care.

While this program was designed with children ages 4-15 in mind, the concepts discussed can be used for children outside of this age range and with other diagnoses.

Each activity discussed will provide the following information:

- Activity ideas (easy, medium, hard)
- Skills being targeted
- How to make the activity easier or harder (downgrade or upgrade)
- How to increase the social connection
- How to foster the connection

TERMS

- Bilateral Integration:** The use of both sides of the body.
- Crossing Midline:** Crossing over from one side of the body to the other.
- Downgrade:** Strategies to make an activity easier.
- Fine Motor:** Skill requiring the use of the smaller hand muscles — using a pencil, pulling a zipper, buttoning a shirt (Kid Sense, 2020).
- Foster the Connection:** Ways to strengthen the bond and relationship between adult and child.
- Gross Motor:** Physical skills that require whole body movements involving the large muscles of the body (Kid Sense, 2020).
- Heavy Work:** Activities that provide a push or pull against the body.
- Insignificant Stimuli:** When referring to self-regulation, insignificant stimuli can be sensory input that is not required to complete the task at hand (i.e. the noise of a classmate talking is the insignificant stimuli that needs to be filtered out in order to focus on the teacher presenting).
- Play:** Activities in which children engage.
- Proprioception:** Involving the muscles and joints of the body. Sense of self and movement (Middletown Centre for Autism, 2020).
- Self Care:** Activities oriented toward taking care of one's own body (i.e. bathing, toileting, dressing, personal hygiene and grooming).
- Self-Regulation:** A child's ability to control their feelings, emotions, and behaviors while taking in other internal or external input.
- Sensory Trigger:** Sensory input that is overwhelming for a child.
- Social Connection:** Ways to strengthen communication skills or initiate conversations between adult and child.
- Tactile Input:** Sense of touch, providing different textures and sensations to the receptors of the body and skin (Middletown Centre for Autism, 2020).
- Upgrade:** Strategies to make an activity more challenging.
- Visual Input:** Visual information and input provided by light, color, movements, and the environment (Middletown Centre for Autism, 2020).
- Vestibular Input:** The vestibular system is the movement system. Activities provide speed, direction of movement, and pull of gravity (Middletown Centre for Autism, 2020).

INCLUDING SIBLINGS

Not only is the parent and child relationship important, but the sibling relationship is just as important. When completing activities, encourage all children to participate. When possible, try to provide challenges to your children and see if they can work together and problem solve together. Below are a few activity ideas of ways to include siblings in play!

Activity Ideas

- **Create an obstacle course**
 - Working together, siblings can create an obstacle course. Children can work together to brainstorm ideas for the obstacle course and put the course together. Children can take turns selecting and placing components for the obstacle course.
 - For example: Child 1 chooses to start the obstacle course with 10 jumps on the couch cushion. Child 2 chooses the second step of the obstacle course, army crawl under the table. Child 1 chooses step three which is to throw a ball into a laundry basket. Child 2 chooses step four which is to hop on one foot to the kitchen. Continue the sequence until the obstacle course has reached the desired length.
- **Put on a performance**
 - Siblings can take turns creating a dance routine, singing show, acrobat show, etc. and performing for an audience (including parents and siblings). Children can take turns performing and then watching other siblings perform.
 - Siblings can also take turns teaching each other the routine and then performing for an audience together.
- **Complete challenges together**
 - Activities that require teamwork are a great idea to encourage siblings to work together and problem solve together.
 - Scavenger hunts
 - Hot Lava - get from one side of the room to the other without touching the ground
 - Build a tall tower only using marshmallows and toothpicks
 - Use household supplies to build a protective structure for an egg. Go outside and drop the egg from a higher place to see if your structure protected the egg.

EMOTIONS

Research has shown that children who have experienced childhood trauma often experience challenges when it comes to handling their emotions (AOTA, 2015). It is important to validate the emotions of a child and encourage them to share their feelings with you. You can start by sharing your feelings with your child and then invite them to share their feelings with you. Children may not always be open to or willing to sharing their emotions or feelings, but getting the dialogue started is a great first step. There are tools that can be used to help a child understand and identify their emotions. Below are a few resources that can be used but there may be other programs and strategies that can also be used.

THE ZONES OF REGULATION

The Zones of Regulation is a resource that is used in school and therapy settings. With this resource, emotions are classified under colored zones - blue, green, yellow, red. This tool can help a child identify their emotions and impulses. As a child becomes more familiar and comfortable with this program, they can start to identify and communicate their colored zone with other teachers, parents, therapists, etc. <https://www.zonesofregulation.com/index.html>

REGULATED AND READY

Regulated and Ready is a program that supports a child's social-emotional development. With Regulated and Ready, a child will work on self-awareness and identify if they are feeling stuck in the mud, on track, or off the road. This resource also provides strategies on how to use sensory tools and input to support self-regulation. <https://www.ghcot.com/regulated-and-ready/>

SUPERFLEX

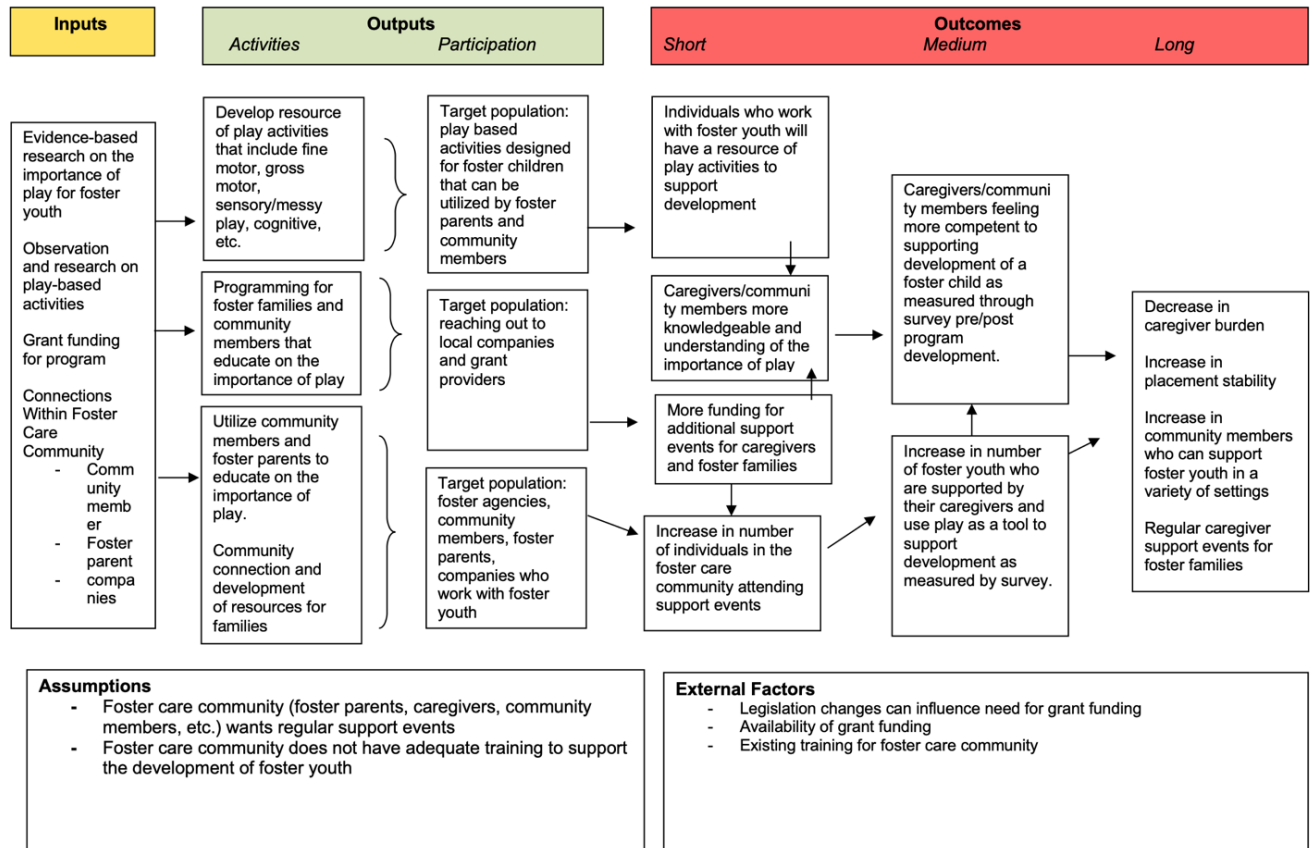

Superflex is a curriculum that is used to promote self-regulation, social thinking, and related social skills. This program is better suited for older children (third to fifth graders) but does have resources that can cater to younger children (K-2). This resource is more complex and teaches children about their behaviors and feelings and how those may impact others around them. <https://www.socialthinking.com/Articles?name=superflex-team-unthinkables-five-step-power-plan>

Appendix C – Logic Model

Program: Play Based Program for Children in Foster Care - Logic Model

Appendix D – Sample Interview Questions for Adoptive and Foster Families

Question
How long have you been a foster parent/adoptive parent/worked with children in foster care?
Tell me about your family - How many children do you have? How old are your children? Were all of your children adopted or fostered?
Can you describe the training you received to certify your family to foster a child?
<p>Were there any topics that were brought up during your training that you felt you needed more information or training on?</p> <ul style="list-style-type: none"> • Childhood trauma? • How trauma affects child development? • How to use play to support development? • How to support the emotional needs of a child?
What are some things that trigger your child?
What are some interests/likes your child has?
What are some needs of your child? (visual schedule, clear expectations, movement breaks, etc.)
Has your child received OT services either clinic based or in the school?
What are you hoping to get from this program? Do you have any goals for this program?
What do you think has been most helpful for you to connect with your child?
What are some areas that you would like to improve in your connection/relationship?
