**Abstract:** In this paper is presented a very efficient method for constructing Hadamard matrices, using binary code products. We will construct such matrices using the scalar production of two vectors and the tensor production of Hadamard matrices. This method is based on the representation of the natural number as a binary code which takes only two values 0 or 1. Such a method of generating Hadamard matrices can be used in practice to generate different codes, in telecommunication systems, to correct blocked codes, but also in science as for example in Boolean algebra.

**Keywords:** Hadamad matrices, binary code, scalar product, tensorial

## product. 1 INTRADUCTION

Definition of Hadamard matrix:[8] A Hadamard matrix of order  $n$ , is  $n \times n$ , a square matrix with elements  $\pm 1$ 's and  $-1$ 's such that  $H \cdot H^T = nI$ , where  $I$  is the identity matrix of order  $n$ .

Definition 2. [3] The Hadamard matrix which has all the elements (components) in the first row and column 1 is called the normalized Hadamard matrix.

Examples of the normalized Hadamard matrix of order 2 and 4:

$$H_2 = \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}, H_4 = \begin{pmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & 1 & -1 \\ 1 & -1 & -1 & 1 \end{pmatrix}$$

If  $H_2 = (h_{ij})$  and  $H_4 = (h_{ijkl})$  are

vector over  $\mathbb{F}_2$ , then, scalar product defined:  $\langle u, v \rangle = (u_1 v_1 + u_2 v_2 + \dots + u_n v_n) \pmod 2$ .

$$\langle u, v \rangle = (u_1 v_1 + u_2 v_2 + \dots + u_n v_n) \pmod 2. [9]$$

The Kronecker product also called tensor product or the direct product of two matrices  $A$  and  $B$  is defined as follows:

$$A \otimes B = \begin{pmatrix} a_{11}B & a_{12}B & \dots & a_{1n}B \\ a_{21}B & a_{22}B & \dots & a_{2n}B \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1}B & a_{m2}B & \dots & a_{mn}B \end{pmatrix}$$

For example,

$$\begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \otimes \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{pmatrix} = \begin{pmatrix} a_{11}b_{11} & a_{11}b_{12} & a_{12}b_{11} & a_{12}b_{12} \\ a_{11}b_{21} & a_{11}b_{22} & a_{12}b_{21} & a_{12}b_{22} \\ a_{21}b_{11} & a_{21}b_{12} & a_{22}b_{11} & a_{22}b_{12} \\ a_{21}b_{21} & a_{21}b_{22} & a_{22}b_{21} & a_{22}b_{22} \end{pmatrix}$$

### 3 CONSTRUCTION OF THE BINARY CODES

For the construction of Hadamard matrices using binary codes, we will give a field, based on which we can define the elements of the Hadamard matrix.

Lemma 1.[5] Let  $u = (u_1, u_2, \dots, u_n)$

$j = k-k$ , when  $u_j = 0, u_j = 1$

$i = k-k$  and  $u_j = 0, u_j = 1$

then:

$$\sum_{i=1}^k (u_i - 1/2)$$

$$\begin{pmatrix} u_1 & u_2 & \dots & u_n \\ u_1 & u_2 & \dots & u_n \\ \vdots & \vdots & \ddots & \vdots \\ u_1 & u_2 & \dots & u_n \end{pmatrix}$$

when  $\begin{matrix} r \\ = \\ 0 \end{matrix}$ ,  $1 = -$

$$H_{kij} = \sum_{r=0}^k \binom{k}{r} H_{rrij}$$

is scalar production.

Proof: We will do the proof by mathematical induction, according to  $\diamond\diamond$ .

For  $\diamond\diamond = \diamond\diamond$  confirmation it is trivial:

$$H_2 = \begin{vmatrix} 1 & 1 \\ - & \end{vmatrix} = 1$$

Assume that the lemma is valid for  $\diamond\diamond\diamond$ ,  $ku \diamond\diamond = \diamond\diamond\diamond$  and prove that:

$$H_2 = \begin{vmatrix} H & H \\ - & \end{vmatrix} = \begin{vmatrix} H & H \\ - & \end{vmatrix}$$

The four possible cases for  $(\diamond\diamond, \diamond\diamond)$  are:  $(0,0), (0,1), (1,0), (1,1)$ .

For  $(\diamond\diamond, \diamond\diamond) = (\diamond\diamond, \diamond\diamond) \diamond\diamond\diamond\diamond (\diamond\diamond, \diamond\diamond) \diamond\diamond\diamond\diamond (\diamond\diamond, \diamond\diamond)$  we have:

$$\binom{k}{i} \binom{k}{j} \binom{k}{i} \binom{k}{j} H_{i,j} H_{u,u} H_{i \dots i} \dots H_{j \dots j} H_{i \dots i} \dots H_{j \dots j} = \dots$$

For, by mathematical induction we get the equation:

$$- \sum_{k=0}^k$$

$$\sum_{i=0}^n \binom{n}{i} \binom{i}{j} = \sum_{i=j}^n \binom{n}{i} \binom{i}{j} \quad [1]$$

For  $(\diamond\diamond, \diamond\diamond) = (\diamond\diamond, \diamond\diamond)$  we have:

$$\binom{n}{i} \binom{i}{j} = \sum_{k=0}^i \binom{i}{k} \binom{k}{j} = \sum_{k=j}^i \binom{i}{k} \binom{k}{j}$$

Using the inductive assumption we will have:

$$\sum_{i=0}^n \binom{n}{i} \binom{i}{j} = \sum_{i=j}^n \binom{n}{i} \binom{i}{j}$$

$$\sum_{i=0}^n \binom{n}{i} \binom{i}{j} = \sum_{i=j}^n \binom{n}{i} \binom{i}{j} = \sum_{i=j}^n \binom{n}{i} \binom{i}{j}$$

The construction through lemma 1 is realized as follows:

We get all binary  $\diamond\diamond$ -sets  $u_1 u_2 \dots u_k$

, ..., . The order of the binary -s will be denoted by that taken

from the binary -s, adding 0 first as the component after and then 1, which are elements of

$[0,1] \pi_1 =$ . So if,  $[ ]^i$

$u_1 u_2 \dots u_k \pi =$ , ..., then:

$$\pi_i = [u_1 0, u_2 0, \dots, u_2 0, u_1 1, u_2 1, \dots, u_2 1], \forall i \in \{1, 2, \dots, k-1\}$$

$\pi_i$

For example,

$$\begin{aligned} \diamond\diamond\diamond\diamond &= [\diamond\diamond, \diamond\diamond], \diamond\diamond\diamond\diamond = [\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond], \diamond\diamond\diamond\diamond = \\ &[\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond, \\ &\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond] \end{aligned}$$

$$\begin{aligned} &\diamond\diamond\diamond\diamond = \\ &[\diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \\ &\diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \\ &\diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond, \\ &\diamond\diamond\diamond\diamond\diamond\diamond\diamond\diamond] \end{aligned}$$

Let  $k$   
 $n = 2$ , and let  $\diamond\diamond\diamond\diamond$ -sets under the proper binary ranking as follows:

$$[\ ]_{0121}, \dots, \pi_k = u u u u^{n-}. [5]$$

We will use this indexing to find the elements, and that is why we start the indexing of 0. For example for binary sets we will have:

with elements  $( )^{( )}$

Dec	Hex	Bin
0	0	0000
1	1	0001
2	2	0010
3	3	0011
4	4	0100
5	5	0101
6	6	0110
7	7	0111
8	8	1000

Matrix,

9	9	1001
10	A	1010
11	B	1011
12	C	1100
13	D	1101

14	E	1110
15	F	1111

$$H = (h_{ij})_{n \times n}$$

$$h_{ij} = (-1)^{w(u_i u_j)}$$

$$u_i = \{0, 1, \dots, 1\}$$

$$h = - \forall i, j \in n$$

is a H-matrix of order

$n = 2$ . As a concrete example we will examine  $k = 4$  meaning that we will construct the  $H_k$  matrix of order 16, then  $H_{16}$ . [5]

Since  $u_0 \leftrightarrow 0000$ , then it follows that  $(u_0, u_i) = (u_j, u_0) = 0, \forall i, j \in \{1, 2, \dots, n-1\}$  comes from  $h_{0i} = h_{j0} = +1$ .  $h_{ij}$  will also be  $+1$  or  $-1$  depending on the weight  $w(u_i)$  where  $u_i$  is an even or odd number (number of members 1).

So,

$$h_{3,3} = h_{5,5} = h_{6,6} = h_{9,9} = h_{10,10} = h_{12,12} = h_{15,15} = +1,$$

whereas,

$$h_{1,1} = h_{2,2} = h_{4,4} = h_{7,7} = h_{8,8} = h_{11,11} = h_{13,13} = h_{14,14} = -1.$$

Other elements of the matrix are similarly assigned, such as:

$$h_{1,3} = +1, \text{ because } (u_1, u_3) = (0001, 0010) = (0000, 0000) = 0000 \cdot 0000 + 0000 \cdot 0001 + 0001 \cdot 0000 + 0001 \cdot 0001 = 0000 \text{ and } (-0001) \cdot 0001 = 0000.$$

$$h_{1,5} = -1, \text{ because } (u_1, u_5) = (0001, 0100) = (0000, 0000) = 0000 \cdot 0000 + 0000 \cdot 0001 + 0001 \cdot 0000 + 0001 \cdot 0001 = 0001$$

and  $(-0001) \cdot 0100 = 0001$ , etc. [1]

So the H-matrix constructed in this way will look like this:

Now for practical reasons, in the above matrix, we will substitute, 1-s with + and 0-s with -, from where we get the matrix:

A more complete explanation of the construction of Hadamard matrices with the binary code

method will be given below.

Step 1: [2] We obtain the Hadamard matrix of order N as follows:

$$\begin{matrix}
 & & & & h & h & h & h & & \dots \\
 & & & & \begin{matrix} | \\ | \\ | \\ | \\ | \\ | \\ | \\ | \\ | \\ | \end{matrix} & & & & & \dots \\
 & & & & & & & & & \begin{matrix} | \\ | \\ | \\ | \\ | \\ | \\ | \\ | \\ | \\ | \end{matrix} \\
 & & & & & & 00 & 01 & 02 & 0 & & m \\
 & & & & & & h & h & h & h & & \\
 & & & & & & 10 & 11 & 12 & 1 & & \dots \\
 \\
 H & & & & & & & & & & & \\
 \begin{matrix} N \\ m \end{matrix} & & & & \square & & & & & & & \\
 \dots & = & & & \dots & h & h & h & h & & & \\
 \dots & & & & & & & & & & & \dots \\
 & & & & & & & & & & & k & k & k & k & m & 0 & 1 & 2
 \end{matrix}$$

where  $h_{km}$  are the elements of the Hadamard matrix  $\forall k, m = 0, 1, 2, \dots, N-1$ . Its elements can be found as in the following steps.

Step 2: [1] For  $k, m \geq 0$  write the binary numbers  $k, m$  as follows:

$$\begin{aligned}
 & (k)_n = \sum_{i=0}^{n-1} b_{ni} 2^i \\
 & (m)_n = \sum_{i=0}^{n-1} m_{ni} 2^i
 \end{aligned}$$

where,

$$\{ b_{ni}, m_{ni} \} \in \{-1, 1\}$$

$$i \quad \min \quad \begin{matrix} 1,1, 0,1,2,\dots, 1 \\ \{ 1,1\}, 0,1,2,\dots, 1 \end{matrix}$$

where  $\log_2 N$ .

$$\sum_{i=1}^n \epsilon - \forall = -$$

Take, (1)

Step 3: [1]

$$h_{k,m}, \text{ where } \oplus \text{ represents summation according to module 2,}$$

$$= \sum_{i=1}^n \oplus ii$$

$$(i - e - 0 \oplus 0 = 0, 0 \oplus 1 = 1 \oplus 0 = 1 \text{ dhe } 1 \oplus 1 = 1)$$

Example. We know that the Hadamard matrix of order 2

$$H_2 \text{ is: } \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}$$

The Hadamard matrix of the order  $N = 2$  is taken from the matrix:

$$\begin{bmatrix} 1 \\ 1 \end{bmatrix} = \begin{matrix} h & h \\ 1 & 1 \end{matrix} \quad H(1)$$

All elements of the Hadamard matrix of the order  $( )_{0,0,1,1,0,1,1} N = 2$ ,  $h, h, h, h$  can be found using the following binary codes:

First, we get  $k, m = 0, 1$  binary numbers:  $( ) ( )_2 0 = 0$  and  $( ) ( )_2 1 = 1$ . Then we apply the formula

$$h_{km}[1] = \sum_{i=0}^{n-1} (1) - 0$$

as follows:

$$\begin{aligned}
 &= \sum_{i=0}^0 \dots = ( ) ( ) ( ) ( ) ( ) \\
 h h & \quad \begin{matrix} k m k m \\ 0 0 0 * \end{matrix} \quad \begin{matrix} 1 1 1 1 1 \\ 0 0 0 0 \\ i i \end{matrix} \quad \begin{matrix} \oplus \\ 0 \end{matrix} \quad \begin{matrix} 0 0 \\ 0 0 \end{matrix} \\
 &= \sum_{i=0}^0 \dots = ( ) ( ) ( ) ( ) ( ) \\
 h h & \quad \begin{matrix} k m k m \\ 0 1 0 * \end{matrix} \quad \begin{matrix} 1 1 1 1 1 \\ 0 1 0 1 \\ i i \end{matrix} \quad \begin{matrix} \oplus \\ 0 \end{matrix} \quad \begin{matrix} 0 0 \\ 0 0 \end{matrix} \\
 &= \sum_{i=0}^0 \dots = ( ) ( ) ( ) ( ) ( ) \\
 h h & \quad \begin{matrix} k m k m \\ 1 0 0 * \end{matrix} \quad \begin{matrix} 1 1 1 1 1 \\ 1 0 1 0 \\ i i \end{matrix} \quad \begin{matrix} \oplus \\ 0 \end{matrix} \quad \begin{matrix} 0 0 \\ 0 0 \end{matrix} \\
 &= \sum_{i=0}^0 \dots = ( ) ( 1 ) ( 1 ) ( 1 ) ( 1 ) 1 \\
 h h & \quad \begin{matrix} k m k m \\ 1 1 1 * \end{matrix} \quad \begin{matrix} 1 1 1 \\ 1 1 1 \\ i i \end{matrix} \quad \begin{matrix} \oplus \\ 0 \end{matrix} \quad \begin{matrix} * \\ 0 0 \end{matrix}
 \end{aligned}$$

Substitute the above equations into equation (1) and obtain:

$$H_2 = \begin{bmatrix} 1 & 1 \\ - & \end{bmatrix}$$

$$= 1 \ 1$$

The Hadamard order  $N = 4$  matrix can be constructed using binary codes. The Hadamard matrix of the order  $N = 4$  is given in the form:

$$\begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & 1 & -1 \\ 1 & -1 & -1 & 1 \end{bmatrix} \quad \begin{matrix} 00 & 01 & 02 & 03 \\ h & h & h & h \end{matrix}$$

$H(2)$

$$\begin{matrix} 4 \\ = \\ 10 \ 11 \ 12 \ 13 \end{matrix} \quad \begin{matrix} h & h & h & h \\ h & h & h & h \end{matrix} \quad \begin{matrix} 20 & 21 & 22 & 23 \\ 30 & 31 & 32 & 33 \end{matrix}$$

$^2 N =$  matrix can be constructed as follows:

The Hadamard order 2 4

First we get binary codes  $k, m$ :

$$(\ )_2 0 = 0, 0^b, (\ )_2 1 = 0, 1^b, (\ )_2 2 = 1, 0^b, (\ )_2 3 = 1, 1^b$$

then, we assign the elements of the matrix  $H_4$ .

To determine the elements of matrix  $H_4$  we use the formula:

$$h_{km} = \sum_{i=0}^{n-1} (-1)^{k \oplus i} (-1)^{m \oplus i}$$

We have:

$$= \sum_{i=0}^1 (-1)^{k \oplus i} (-1)^{m \oplus i}$$

$h \ h$

$$\begin{matrix} k \ m \\ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \end{matrix} \oplus \oplus \oplus \oplus \oplus \oplus \oplus \oplus$$

$$1 \ 1 \ 1 \ 1 \ 1 \ 1 \ 1 \ 1$$

$$\begin{matrix} 0 \ 0 \ 0 \ 0 \ 0 \ 0 \\ i \ i \end{matrix} \oplus \oplus \oplus \oplus \oplus \oplus \oplus \oplus$$

$$= \sum_{i=0}^1 (-1)^{k \oplus i} (-1)^{m \oplus i}$$

$h \ h$

$$\begin{matrix} k \ m \\ 0 \ 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 0 \end{matrix} \oplus \oplus \oplus \oplus \oplus \oplus \oplus \oplus$$

$$1 \ 1 \ 1 \ 1 \ 1 \ 1 \ 1 \ 1$$

$$\begin{matrix} 0 \ 1 \ 0 \ 0 \ 0 \ 1 \\ i \ i \end{matrix} \oplus \oplus \oplus \oplus \oplus \oplus \oplus \oplus$$

\begin{array}{c}
km \\
1110101* \oplus * \oplus \\
111111 \\
32\ 1,1,1,0 \quad \begin{array}{c} ii \\ i \\ = \end{array} \quad \oplus \\
0
\end{array}
\end{array}$$

$$= = - \sum = - - - - = ( ) ( ) ( ) ( )$$

$$h h \quad \oplus \oplus$$

We replace the obtained elements in the matrix (2) and we have:

$$H_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & 1 & -1 \\ 1 & -1 & -1 & 1 \end{bmatrix}$$

<sup>3</sup>N = is taken from the matrix:

Example1. [8] The Hadamard matrix of order 2 8

$$H_8 = \begin{bmatrix} h & h & h & h & h & h & h & h \\ h & h & h & h & -h & -h & -h & -h \\ h & h & -h & -h & h & h & -h & -h \\ h & h & -h & -h & -h & -h & h & h \\ h & -h & h & -h & h & -h & h & -h \\ h & -h & h & -h & -h & h & -h & h \\ h & -h & -h & h & h & -h & -h & h \\ h & -h & -h & h & -h & -h & h & -h \end{bmatrix}$$

<sup>3</sup>N = order

Acting as in the matrix of order 4, we find all the elements of the matrix 2 8 and have:

$$H_8 = \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & -1 & -1 & 1 & 1 & -1 & -1 \\ 1 & -1 & 1 & -1 & 1 & -1 & 1 & -1 \\ 1 & -1 & -1 & 1 & 1 & -1 & -1 & 1 \\ 1 & 1 & 1 & 1 & -1 & -1 & -1 & -1 \\ 1 & 1 & -1 & -1 & -1 & -1 & 1 & 1 \\ 1 & -1 & 1 & -1 & -1 & 1 & -1 & 1 \\ 1 & -1 & -1 & 1 & -1 & 1 & 1 & -1 \end{bmatrix}$$

$H_8$

$$\begin{array}{rcccc}
 = & & & & \text{-----} \\
 & & & & 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1 \\
 & & \text{-----} & & \\
 & & & & 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1 \\
 & & & & \text{-----} \\
 & & & & 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1 \\
 & & \text{-----} & & \\
 & & & & 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1 \\
 3\ \text{Conclusions} & & & & 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1 \\
 & & 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1 & \text{-----} & \\
 \text{-----} & 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1 & & & 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1
 \end{array}$$

- Constructing Hadamard matrices using binary codes is easy, using the appropriate equation for assigning matrix elements.
- Binary code construction is quite simple and fast using the vector scalar product. · For practical reasons the elements of the Hadamard matrix  $\{+ 1, -1\}$  are denoted by +, respectively -.
- The Hadamard matrix that has the first row and column 1's, respectively +, is the Hadamard normalized matrix.
