ПОТРОШУВАЧКА НА ЕНЕРГИЈА, ЕКОНОМСКИ РАЗВОЈ И ЦЕНИ: ДОКАЗ СО ВРЕМЕНСКИ СЕРИИ ЗА CESEE ЗЕМЈИТЕ

Во овој труд се проценува причинско-последична врска помеѓу потрошувачката на енергија и приход за Албанија, Босна и Херцеговина, Србија и Македонија (CESEE - Централна, Источна и Југоисточна Европа), со користење коинтеграциски и техники за моделирање на корекција на отстапувањата од еквилибриум. Резултатите укажуваат на тоа дека потрошувачката на енергија, приходите и цените се коинтегрирани од втор ред, освен за Албанија, каде што постои само еден коинтеграциски сооднос. Во механизмот на корекција на отстапувањето на долг рок резултатите покажуваат дека за одредени земји во коинтеграциската равенка само инфлацијата влегува значително статистички сигнификантно. На краток рок исто така, само инфлација се чини дека влијае врз потрошувачката на енергија, додека на потрошувачката на енергија се чини дека влијае на приходот на краток рок, но само во Албанија. Оваа студија го поддржува ставот дека односите на потрошувачката на енергија и приходите се неутрални. Ова значи дека во овие земји постои простор за мерки за зачувување на енергијата без сериозни последици за нивниот економски раст.

Клучни зборови : потрошувачка на енергија, доход и цени

Energy consumption, economic development and prices: Time series evidence in CESEE countries

Ass. MSc. Dushko Josheski, Marija Magdinceva-Sopova, Ph.D, Ass. Prof. Zlatko V. Sovreski, Ph.D

University Goce Delcev-Stip

Abstract

This paper estimates the causal relationships between energy consumption and income for Albania, Bosnia and Herzegovina, Serbia, and Macedonia (CESEE - Central, Eastern and Southeastern Europe countries), using cointegration and error-correction modelling techniques. The results indicate that energy consumption, income and prices are second order cointegrated, except for Albania where there exist only one cointegration relationship. In the error correction mechanism on the long run the results show that for the selected countries in the cointegration relationship only inflation does seem to enter significantly in the equation. On a short run also only inflation seems to affect energy consumption, while energy consumption seems to affect income on short run, but only in Albania. This study supports the view that energy and income are neutral. This means that in these countries there is scope for energy conservation measures without severe impact on their economic growth.

Keywords: energy consumption, income, prices

1. Introduction

In the previous two decades the association between energy consumption and economic growth, with either income or employment as proxy for the latter. Empirical findings had been conflicting and confusing. Seminal article was written by Kraft and Kraft (1978)¹. These two authors found out evidence on the causality running from GDP to energy consumption,

¹ Kraft, J., Kraft, A., (1978). *On the relationship between energy and GNP*. J. Energy Dev. 3, 401-403.

this finding was for United States data. Later, Akarca and Long (1979), were supportive of the Kraft and Kraft study, when they found evidence of the association between employment and energy consumption. But, Yu and Choi (1985)², and previously Yu and Hwang (1984)³, found no causal relationship between income and energy consumption. Reason, why there was such a inconsistency in the results was because earlier studies employed OLS, not taking into account different nature of times series, and previously was not known that in levels series are not stationary, Granger, Newbold(1974)⁴. Regressions with high value fo fit as measured by R² and low measure of Durbin-Watson statistic. Low Durbin statistics means autocorrelation, in her presence error are autocorelated.

2. Methodology and data

In this paper we are testing the association between income and energy consumption, also in the model inflation is present. The modeling strategy that was adopted, is based on widely used Granger methodology, Engle, Granger (1981)⁵. Though Johansen test⁶ was adopted later because it allows for more than one cointegrating relationship. But first we sue the simplest approach to test for a unit root and that is AR(1) model :

$$Y_t = \theta_0 + \phi Y_{t-1} + \varepsilon_t \quad (1)$$

On the previous expression residuals follow normal distribution, i.e. $\varepsilon \sim (0, \sigma_a^2)$. The null hypothesis that we are testing is:

$$\begin{aligned} H_0 : |\phi| = 1 &\Rightarrow Y_t \sim I(1) \\ H_1 : |\phi| < 1 &\Rightarrow Y_t \sim I(0) \end{aligned} \quad (2)$$

Now one to simplify the computation:

$$\begin{aligned} Y_t - Y_{t-1} &= \theta_0 - \underbrace{(1-\phi)}_{\delta} Y_{t-1} + a_t \\ \Delta Y_t &= \theta_0 - \delta Y_{t-1} + a_t \end{aligned} \quad (3)$$

And, if $\delta=0$, system has a unit root.

$$\begin{aligned} H_0 : \delta &= 0 \\ H_1 : \delta &< 0 \end{aligned} \quad (4)$$

² Yu, E.S.H., Choi, J.Y., 1985. *The causal relationship between energy and GNP: an international comparison*. J. Energy Dev. 10, 249]272

³ Yu, E.S.H., Hwang, B.K., (1984). *The relationship between energy and GNP: further results*. Energy Econ. 6, 186-190

⁴ Granger, C., Newbold, P., (1974). *Spurious regressions in econometrics*. J. Econometrics 2, 111]120

⁵ Granger, Clive (1981). "*Some Properties of Time Series Data and Their Use in Econometric Model Specification*". *Journal of Econometrics* 16 (1): 121–130.

⁶ Johansen, Soren (1991). "*Estimation and Hypothesis Testing of Cointegration Vectors in Gaussian Vector Autoregressive Models*". *Econometrica* 59 (6): 1551–1580. JSTOR 2938278.

In the second part of the empirical chapter one can use Johansen procedure for testing of the cointegration rank between the variables. This approach is similar to augmented Dickey-Fuller test but it requires for VAR approach.

$$\begin{aligned}
 x_t &= A_1 x_{t-1} + \varepsilon_t \\
 \Delta x_t &= (A_1 - IDmatrix)x_{t-1} + \varepsilon_t \\
 \Delta x_t &= v x_{t-1} + \varepsilon_t \\
 \text{where } v &= A_1 - IDmatrix
 \end{aligned}
 \tag{5}$$

So in Johansen cointegrating relationship IDmatrix is identity matrix, A_1 is a $g \times g$ matrix, x_t and y_t are cointegrating vectors. The rank of v is the number of cointegrating relationships. After one determines the number of cointegrating relationships, one can use VECM model to capture the long run relationship between variables in the model. Vector Error Correction Models (VECM) are the basic VAR, with an error correction term incorporated into the model and as with bivariate cointegration, multivariate cointegration implies an appropriate VECM can be formed. We are estimating the error correction mechanism by using the lagged residuals u_{t-1} .

$$\Delta Y_t = \beta_0 + \beta_1 \Delta X_t - \beta_2 (Y_{t-1} - C - \beta X_{t-1})
 \tag{6}$$

Now the error correction mechanism is :

$$EC = (Y_{t-1} - C - \beta X_{t-1})
 \tag{7}$$

In the cointegrating regression

$$\begin{aligned}
 Y_t &= C + X_t + u_t \\
 u_t &= Y_t - C - X_t \implies u_{t-1} = Y_{t-1} - C - \beta X_{t-1}
 \end{aligned}
 \tag{8}$$

u_{t-1} in the last expression represents error correction mechanism. Data used in this paper are gathered from World Bank and World development indicators published by the World Bank. The precise definitions of the variables are as follows:

LogGDP-logarithm of GDP in current US dollars.

Logenergyuse-logarithm of Energy use (kg of oil equivalent per capita)

LogCPI-Logarithm of inflation, consumer prices annual percentage

Here we set the hypothesis that energy efficiency measures in the countries of the sample will not deteriorate growth.

3. Energy sectors and energy efficiency measures in selected CESEE economies

Energy efficiency represents the using of less quantities of energy for executing the same activity or function as such heating to a certain area, lighting, the production of other elements, cooling to a certain area, etc. Energy efficiency is not the same as the saving of energy. Energy efficiency is related to the efficient use of energy and the saving of energy the usual is related with waiver of certain executing or spending. Energy efficiency is an important element in energy policy in each national economy because a efficient use of energy is aimed at reducing the consumption for produce the same quantities a certain

products or service that the other side contributes to the reduction of financial expenses. Each country implements strategies for energy efficiency, but also leads to policy and implementation of directives for energy efficiency. Measures that are necessary for the implementation the policy on energy efficiency in the Republic of Serbia represent the adoption of the necessary legislation for the efficient use of energy, the implementation of a system for managing energy, introduction of subsidies and rebates for the implementation of projects for energy efficiency and increase in public awareness among the population of the importance and efficiency using of energy. The same is imposes itself as a necessity in the Republic of Macedonia, because statistical data show that the use of energy in the Republic of Macedonia has an impact on the environment as a result of the pollution of fuel, cutting in the forest, land degradation, health problems and low energy efficiency. The energy sector in the Republic of Macedonia depends of the import of oil. Every penny intended for the payment of the import of the energy is lost a penny to the national economy. According to the published statistical data, the highest consumer of the geothermal energy in 2010 is the agricultural sector which participates with 83.4 % in the consumption and other sectors participate with 16.6 % in the consumption and losses in the distribution of energy equalling 10.45%. Therefore the increase in energy efficiency and the achievement of sustainable development should be made through implementation of the system and projects in which priority will have total consumption, distribution and providing of energy. The energy sector in Bosnia and Herzegovina represents one of the most important part of the economy. Bosnia and Herzegovina has important hydropower potential that is used about 40 %, and oil and gas imported. The energy intensity of the economy is expected to be 2.5 times higher than the EU average as an indicator of the high potential for improving the energy efficiency. In Bosnia and Herzegovina in progress is a process of adaptation of the energy system to the international standards and best practices of the European Union. In Albania, the energy sector is also one of the most important sectors. Energy sources basically are based on hydro energy, which represents the primary source of energy and the demand for energy is characterized by a tendency to increase. Satisfying the energy needs of Albania is projected to be realized through the improvement of control an increase in the consumption, reducing the energy dependency and interventions for improve the energy efficiency.

4. Empirical section results

In this part first the results from the Dickey-Fuller test are being presented in Table 1.

Table 1 Results from the empirical testing Dickey –Fuller test

Country/variable	Levels	First difference
Albania		
LogGDP	-0.424	-4.425
Log energyuse	-1.580	-4.126
LogCPI	-2.910	-4.400
Bosnia and Herzegovina		
LogGDP	-2.288	-4.629
Log energyuse	0.989	-0.989
LogCPI	-1.557	-5.908
Macedonia		
LogGDP	-0.494	-4.035

Log energyuse	-3.227	-3.227
LogCPI	-3.004	-6.986
Serbia		
LogGDP	-1.522	-4.816
Log energyuse	-2.817	-2.817
LogCPI	-1.751	-5.084
Critical values		
10%	-3.750	-3.730
5%	-3.000	-2.999
1%	-2.630	-2.630

From the previous Table 1 one can see that all variables contain unit root when in levels, but when first differenced all are stationary. Now, since all variables are I(1), i.e. integrated of order one, one can check whether they are cointegrated. Cointegration tests are performed with all three variables in the model, logGDP, logcpi, and logenergy use. Johansen maximum likelihood test has been put in use here.

Table 3 Results from Johansen Maximum likelihood test

Country/null hypothesis	eingevalue	SBIC	HQIC
Albania			
r=0		2.258129	2.14727
r=1	0.73001	1.630374*	1.334749*
r=2	0.23371	1.773157	1.366673
Bosnia and Herzegovina			
r=0		8.711394	8.600535
r=1	0.62871	8.402257	8.106632
r=2	0.34679	8.385375*	7.978892*
SERBIA			
r=0		6.708554	6.597694
r=1	0.59	6.4749	6.179276
r=2	0.42	6.336627*	5.930143*
Macedonia			
r=0		2.72616	2.615301
r=1	0.46826	2.77619	2.480565
r=2	0.40176	2.671407*	2.264924*

Note: * denotes statistical significance of the criteria. In this paper as more reliable Hannan-Quinn and Schwarz Bayesian criterion had been used.

From the Johansen test for cointegration rank one can see that except for Albania, where there exist one cointegration equation for the variables of interest, in all other countries there exist two cointegration relationships. This means that for Bosnia, Macedonia and Serbia we will estimate two cointegration equations in the error correction mechanism. And in Albania only one equation.

5. VECM models

Next, we present the results from the Vector error correction mechanism. First for Albania there exist one cointegrating relationship.

Albania –One cointegrating equation

$$ec_t^{fgls} = \log energyuse - 0.0729 \log GDP + 0.3024 \log CPI - 5.063972 \quad (9)$$

(0.145) (0.000)

If one rearranges the last expression for logarithm of energy use can get :

$$\log energyuse = 5.063972 + 0.0729 \log GDP - 0.3024 \log CPI + ec_t^{fgls} \quad (10)$$

(0.145) (0.000)

From the above equation one can see that if inflation increases by 1% , energy consumption will fall by 0.3%, coefficient on GDP is positive but insignificant at long run.

Bosnia and Herzegovina -2 cointegrating equations

$$ec_t^{fgls} = \log energyuse - 6.94e - 18 \log GDP + 0.0856 \log CPI - 7.463977 \quad (11)$$

(n.a) (0.000)

If one rearranges the last expression for logarithm of energy use can get :

$$\log energyuse = 6.94e - 18 \log GDP - 0.0856 \log CPI + ec_t^{fgls} + 7.463977 \quad (12)$$

(n.a) (0.000)

Second cointegrating equation for Bosnia and Herzegovina:

$$ec_t^{fgls} = \log GDP + 0.5497 \log CPI - 26.60594 \quad (13)$$

(0.073)

In the last equation energy use variable had been omitted.

$$\log GDP = 26.60594 - 0.5497 \log CPI + ec_t^{fgls} \quad (14)$$

(0.073)

In Bosnia there existed two cointegrating relationships, sign on inflation in relation to energy consumption is negative and significant, and the coefficient on GDP when in relation to log of energy use is insignificant, this is for the first equation. And, for the second equation, when logGDP is dependent variable, logCPI is negative and significant and energy consumption variable is omitted from the regression.

Macedonia -2 cointegrating equations

$$ec_t^{fgls} = \log energyuse - 1.39E - 17 \log GDP + 0.1231 \log CPI - 7.4279 \quad (15)$$

(n.a) (0.004)

If one rearranges the last expression for logarithm of energy use can get :

$$\log energyuse = 7.42799 + 1.39E - 17 \log GDP - 0.1231 \log CPI + ec_t^{fgls} \quad (16)$$

(n.a) (0.004)

Second cointegrating equation for Macedonia is:

$$ec_t^{fgls} = \log GDP + \underset{(n.a.)}{7.11e-15} \log energyuse + \underset{(0.004)}{1.637} \log CPI - 25.47 \quad (17)$$

In the last equation energy use variable had been omitted.

$$\log GDP = 25.47 - \underset{(n.a.)}{7.11e-15} \log energyuse - \underset{(0.004)}{1.637} \log CPI + ec_t^{fgls} \quad (18)$$

As for Macedonia there also existed two cointegrating equations. Log GDP is positively associated with the energy consumption but the coefficient is insignificant. Inflation in the two equations is negatively and statistically significantly associated with the energy consumption and GDP.

Serbia -2 cointegrating equations

$$ec_t^{fgls} = \log energyuse + \underset{(0.000)}{0.0349418} \log CPI - 7.88 \quad (19)$$

In the previous expression log of GDP is omitted, If one rearranges the last expression for logarithm of energy use can get :

$$\log energyuse = 7.88 - \underset{(0.000)}{0.0349418} \log CPI + ec_t^{fgls} \quad (20)$$

Second cointegrating equation for Macedonia is:

$$ec_t^{fgls} = \log GDP + \underset{(0.000)}{2.07} \log CPI - 29.30 \quad (21)$$

In the last equation energy use variable had been omitted.

$$\log GDP = 29.30 - \underset{(0.000)}{2.07} \log CPI + ec_t^{fgls} \quad (22)$$

As for Macedonia there also existed two cointegrating equations. Log GDP is omitted when energy consumption is dependent variable. Also energy consumption is omitted from the model when log GDP is dependent variable. Inflation in the two equations is negatively and statistically significantly associated with the energy consumption and GDP.

6. Conclusion

The purpose of this paper was to test the association and causality between income (GDP), energy consumption (use of oil kg/per capita), and prices represented through inflation. Maximum likelihood procedures were used one to analyses time series properties of the variables, and error correction models in order to see the long run relationship between the variables. From the results one can see that in Albania there exists one directional causality from prices to energy consumption. In Bosnia and Herzegovina there exist two one way relationships between inflation and energy consumption, and prices and income (i.e. GDP). In Macedonia. In Macedonia there exists two way association between energy consumption and GDP, but the statistical significance of that causality is unknown. Also, in Macedonia there exist two one way relationships between inflation and energy consumption, and prices and income (i.e. GDP). Price effects are very significant in the causality equations. Our results suggest that in some cases, energy consumption, income and price are endogenous and therefore single equation forecasts of one or the other could be misleading. This notion is the same as in the study of Adyaye (2000)⁷. This means that in these countries there is scope for energy conservation measures without severe impact on their economic growth.
