#### Abstract

**Context:** This protocol is as a supplementary document to our review paper that investigates security-related challenges and solutions that have occurred during the past decade (from January 2003 to December 2013).

**Objectives:** The objective of this systematic review is to identify security-related challenges, security goals and defenses in ubiquitous computing by answering to three main research questions. First, demographic data and trends will be given by analyzing where, when and by whom the research has been carried out. Second, we will identify security goals that occur in ubiquitous computing, along with attacks, vulnerabilities and threats that have motivated the research. Finally, we will examine the differences in addressing security in ubiquitous computing with those in traditional distributed systems.

**Method:** In order to provide an overview of security-related challenges, goals and solutions proposed in the literature, we will use a systematic literature review (SLR). This protocol describes the steps which are to be taken in order to identify papers relevant to the objective of our review. The first phase of the method includes *planning*, in which we define the scope of our review by identifying the main research questions, search procedure, as well as inclusion and exclusion criteria. Data extracted from the relevant papers are to be used in the second phase of the method, *data synthesis*, to answer our research questions. The review will end by *reporting* on the results.

**Results and conclusions:** The expected results of the review should provide an overview of attacks, vulnerabilities and threats that occur in ubiquitous computing and that have motivated the research in the last decade. Moreover, the review will indicate which security goals are gaining on their significance in the era of ubiquitous computing and provide a categorization of the security-related countermeasures, mechanisms and techniques found in the literature.

**Keywords:** systematic review; ubiquitous computing; mobile computing; wearable computing; security

#### 1 Background

Ubiquitous computing, as envisioned by Mark Weiser [Wei99], assumes disappearance of technologies into the everyday environment, making them invisible to a user. With the proliferation of mobile and wearable devices enhanced with sensing capabilities, users are able to seamlessly collect and receive information from their surroundings [DMWS09] [PM03] [YHGY06] [ZMN06b]. Such an opposing image to virtual reality introduces a number of unprecedented characteristics to the era of ubiquitous computing. For one, devices participating in a ubiquitous environment are heterogeneous with respect to their hardware capabilities and operating systems. On the one hand, such a nature of devices introduces a number of advantages while designing ubiquitous infrastructures. For example, smartphones and tablets enriched with a number of embedded sensors, such as microphones, GPS, accelerometer and gyroscope [WCMA13], are able sense the changes of the environment and respond accordingly. Such a capability to react to the context has been recognized as an important factor in designing dynamic and complex infrastructures [LSP<sup>+</sup>14] which support the mobility of users. Furthermore, the notion of context-awareness has brought changes to the research and development in the human-computer interaction [HCS05] where the emphasis has been put on designing such interfaces, which do not interrupt or distract users from their surroundings.

Although such a vision offers many advantages to the way users interact with their environment and use available services, designing ubiquitous computing systems and environments that are privacy-sensitive and ensure security of user data still remains a challenge [Oh08][PAN05][RL07]. Over the last decade, a large and growing body of literature has tackled different security-related challenges, such as ensuring the availability of applications and services [ASA08], dealing with the lack of a fixed pre-deployed infrastructure [AHH<sup>+</sup>10] [AMD<sup>+</sup>08b], designing security mechanisms for the resource-constrained devices [HCC<sup>+</sup>12] [HHNL07] and managing trust among the large number of nodes participating in a mobile ad-hoc network (MANET) [WF07], to name a few.

To the best of our knowledge, there is no systematic review which provides a comprehensive overview of the research in the area of security in ubiquitous computing. It is, therefore, our aim to identify which attacks, vulnerabilities and threats have motivated the researchers in the last decade. Moreover, we are interested in security goals, as well as security countermeasures presented in the literature. Additionally, we will examine whether the necessary algorithms and technologies are publicly available and identify the validation mechanisms used to assess the appropriateness of the proposed solutions.

In order to provide an overview of the aforementioned security-related challenges and solutions, we will use a systematic literature review (SLR) method proposed by [KC07], which consists of 3 phases: planning, conducting and reporting. This document provides guidelines for our SLR developed in the first phase of the review (planning). To ensure rigor in the review process, the following procedures have been defined and presented in this document in detail:

- 1. Design of the research questions (see Section 2),
- 2. Search strategy (see Section 3),
- 3. Definition of the inclusion and exclusion criteria (see Section 4.1),
- 4. Quality assessment (see Section 4.4),
- 5. Data extraction (see Section 4.5),
- 6. Data synthesis (see Section 5).

Report on the pilot procedures will also be provided in this document, as well as any revisions to the first version of the protocol.

### 2 Research questions

The review is motivated by three research questions:

#### **RQ1:** Demographic data and trends.

RQ2: Which security goals have been addressed in ubiquitous computing in the last decade (from January 2003 - December 2013)?

#### RQ3: Is there a difference in addressing security in distributed systems in comparison with ubiquitous computing?

As suggested in [ATF09b] [KC07] [RHTi13], we used the *population*, *intervention*, *comparison*, *outcomes* and *context* (PICOC) criteria to clarify the general goal of the review (see Table 1). The details of each PICOC criterion will form the basis for the construction of our search terms (see section 3). In order to reach the goal of our review, we included additional terms that are related to ubiquitous computing. These are pervasive computing, mobile computing and wearable computing. The choice of the additional terms can be justified through the definition of ubiquitous computing found in the literature which identifies wireless networks, mobile and wearable devices as an essential part of a ubiquitous computing environment [DMWS09] [PM03] [YHGY06] [ZMN06b]. Moreover, we introduced *wireless body area network* (WBAN)<sup>1</sup> to the list of terms because we wanted to ensure that papers on the topic of security in wearable computing (that are considered relevant for the purpose of our research) are found and included in our review.

| PICOC                    | Terms                                                                                                                                 |

Table 1: PICOC criteria and research questions.

#### 2.1 Details of the first research question

The main goal of the first research question (RQ1) is threefold:

- RQ1.1: provide an overview of where the research on security in ubiquitous computing has been carried out (*expected outcome*: list of countries),
- RQ1.2: examine when the research on security in ubiquitous computing has been carried out (*expected outcome*: number of articles per year),
- RQ1.3: identify by whom the research on security in ubiquitous computing has been carried out (*expected outcome*: names of the researchers).

Moreover, we will also look for the information on the paper citations and venue where the paper was published.

RQ1.4: identify the most cited papers based on the Google Scholar citation count (*expected outcome*: number of citations).

<sup>&</sup>lt;sup>1</sup>WBAN is the network of wearable computing devices and differs from traditional wired networks due to its specific characteristics, such as shared resources, node mobility and short transmission range [BR08].

We decided to use Google Scholar search engine to count the number of citations for each paper because it is able to search for scholarly literature across many disciplines and sources and, therefore, provide a more comprehensive citation count than individual databases.

- RQ1.5: identify journals where the papers on security in ubiquitous computing have been published (*expected outcome*: list of journals),
- RQ1.6: identify conferences where the papers on security in ubiquitous computing have been published (*expected outcome*: list of conference proceedings),

Data will be presented using the diagrams presented in Table 2.1. The list of countries (RQ1.1) will be presented using a bar diagram. Since we expect a lengthy list of countries, we will present only the first ten countries based on the number of times they have occurred in the papers. On the horizontal axis we will present the number of times (in percentages) a country occurred and on the horizontal axis the names of the countries. Since we expect to find at least one paper for each year in the interval [2003-2013], we will present the distribution of papers over years (RQ1.2) by a line diagram. The vertical axis will represent the number of papers published each year. On the horizontal axis we will plot the year interval. In case the distribution of numbers is not continuous, i.e. in case it happens that we could not identify any paper for one year within the interval, we will use a bar diagram. Author's names (RQ1.3) will be presented in a table format, which consists of two columns - author's name and number of papers identified. We will provide information for the first five authors based on the amount of papers identified in our SLR. Number of citations (RQ1.4) will be presented with a bar diagram, where the horizontal axis represents a paper and a vertical axis its corresponding number of citations. We will show the results for the first five papers based on the number of citations. The results of the questions RQ1.5 and RQ1.6 will be presented in a table, where the first column stands for a title of a journal/conference, and the second column for the number of papers identified, respectively. We will present the results for the first five journals/conference proceedings based on the number of papers found.

#### 2.2 Details of the second research question

The second research question (RQ2) can be addressed in more depth. Therefore, six additional subquestions (see Table 2) are included to identify the security goals, motivation for the papers and proposed techniques, algorithms and methods used to solve security issues. We are also interested in the assessment of the proposed solutions, as well as limitations, recommendations and future work. Additionally, we will examine whether the algorithms and technologies used in the proposed solutions are publicly available, i.e. whether the results can be repeated and validated.

#### 2.3 Details of the third research question

The aim of the **third research question (RQ3)** is to analyze the differences in addressing security in traditional distributed computing with those in ubiquitous computing based on the results obtained from the second research question. More specifically, we will compare security-related mechanisms and techniques that occur in both computing paradigms in order to find out whether the proposed solutions are inherited from distributed computing or newly introduced to ubiquitous computing.

## 3 Search strategy

In this section we will provide details of the following procedures: definition of the search terms, construction of the search strings, list of the resources to be searched and inclusion and exclusion criteria.

| ID    | Expected outcome               |              | Visualization                                                                                                                                                            | Restrict to   |
|-------|--------------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
|       |                                | Туре         | Presentation                                                                                                                                                             |               |
| RQ1.1 | List of countries              | bar diagram  |                                                                                                                                                                          | 10 countries  |

| RQ1.6 | Number of conference<br>papers | table        | Conference name     Number of papers identified                                                                                                                          | 5 conferences |

| RQ                                                                                    | Motivation                                                                                                       |
|---------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| RQ 2: Which security goals have been ad-<br>dressed in terms of ubiquitous computing? | Identify security goals addressed in the papers.                                                                 |
|                                                                                       |                                                                                                                  |
| RQ 2.1: What is the motivation for the research?                                      | Identify factors which motivated the papers, such as vul-<br>nerabilities, threats and attacks.                  |
| RQ 2.2: Which solutions have been presented?                                          | Identify suggested techniques, algorithms and methods.                                                           |
| RQ 2.3: Are the algorithms and technologies pub-<br>licly available?                  | Investigate whether the papers can be repeated in order<br>to check the validity of results.                     |
| RQ 2.4: What kind of validation of the results has been performed?                    | Assess the appropriateness of the proposed solution.                                                             |
| RQ 2.5: Which future work has been proposed?                                          | Investigate future trends in development and implemen-<br>tation of security mechanisms in ubiquitous computing. |

Table 2: Refinement of the second research question.

#### 3.1 Definition of the search terms

Based on the definition of the research scope and the PICOC details, we chose the first keyterms for a pilot search in order to determine whether the relevant papers will be identified. In addition to the PICOC terms (pervasive, ubiquitous, wearable, mobile computing and security), we included security goals to increase the probability of finding relevant papers. In order to identify the list of security goals that we will refer to in this review, we examined the proposed categorizations by [SRM13], [Wol08], [TS06] and [PS09]. Although the aforementioned categorizations include the same list of the basic security goals (data confidentiality, authentication, integrity and availability), the main difference lies in identifying the list of additional goals. For example, [PS09] identifies goals specific to the wireless sensor networks (WSN), such as data freshness, self-organization of a network, time synchronization and secure localization. Furthermore, categorization by [Wol08] includes only one goal (audit) additionally to the list of the basic goals. Therefore, we will use the list of security goals by [SRM13], which includes 4 basic goals (confidentiality, integrity, authentication and availability), 5 composite goals (access control, non-repudiation, authenticity of data, privacy and accountability) and audit. Throughout our SLR we will not exclude the possibility of identifying additional security goals, i.e. in addition to the predefined list of security goals we will use a general term "security" to increase our chances of finding as many relevant papers as possible.

We conducted a **pilot search** with a smaller subset of the search terms *pervasive*, *ubiquitous*, *wearable*, *mobile computing*, *security*, *authentication*, *confidentiality*, *privacy* and the alternative term *protection*. The results have shown that this combination of keyterms produces a large number of papers that are irrelevant for our review. For example, the keyword *protection* found papers on the topic of a homeland security, which was not in the scope of our review. Moreover, not many papers related to security in wearable computing were found. Thus, we included an additional search term "wireless body area network (WBAN)" to increase the chance of finding relevant papers on the topic. The list of keyterms was iteratively refined until we got a satisfactory list of initial papers. The final list of keyterms is presented below (Table 3), and includes the security goals proposed by [SRM13].

| Keyterms  |                      | Alternative terms                                                                                                                              |
|-----------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>T1</b> | ubiquitous computing |                                                                                                                                                |
| T2        | security             | puting<br>confidentiality, authentication, access control, non-repudiation, audit, in-<br>tegrity, authenticity of data, availability, privacy |

Table 3: Search terms.

#### 3.2 Design of the search string

We constructed a search string using the identified keywords, their alternatives and related terms linked with Boolean AND and OR operators. Since our review will focus on identifying security goals in ubiquitous computing, the search string is built in the following way:  $(T1_1 \lor T1_2 \lor \ldots \lor T1_n) \land (T2_1 \lor T2_2 \lor \ldots \lor T2_n)$  where  $T1_1 \ldots n \in T1 \land T2_1 \ldots n \in T2$ .

Due to the large number of keywords and the specific limitations of search engines [FSGC13], the general search string is divided into three search strings, as presented in Table 4.

| <ul> <li>work") AND (security OR confidentiality OR "access control" OR authentication)</li> <li>(ubiquitous OR "pervasive computing" OR "mobile computing" OR wearable OR "body area network") AND (privacy OR integrity OR "authenticity of data" OR availability)</li> </ul> | String        | Form                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|---------------------------------------------------------------------------------------------------|
| <b>S2</b> (ubiquitous <i>OR</i> "pervasive computing" <i>OR</i> "mobile computing" <i>OR</i> wearable <i>OR</i> "body area network") <i>AND</i> (privacy <i>OR</i> integrity <i>OR</i> "authenticity of data" <i>OR</i> availability)                                           | <b>S</b> 1    | (ubiquitous OR "pervasive computing" OR "mobile computing" OR wearable OR "body area net-         |
| work") AND (privacy OR integrity OR "authenticity of data" OR availability)                                                                                                                                                                                                     |               | work") $AND$ (security $OR$ confidentiality $OR$ "access control" $OR$ authentication)            |
|                                                                                                                                                                                                                                                                                 | $\mathbf{S2}$ | (ubiquitous OR "pervasive computing" OR "mobile computing" OR wearable OR "body area net-         |
|                                                                                                                                                                                                                                                                                 |               | work") AND (privacy $OR$ integrity $OR$ "authenticity of data" $OR$ availability)                 |
|                                                                                                                                                                                                                                                                                 | $\mathbf{S3}$ | (ubiquitous $OR$ "pervasive computing" $OR$ "mobile computing" $OR$ wearable $OR$ "body area net- |
| work") $AND$ ("non-repudiation" $OR$ audit $OR$ accountability)                                                                                                                                                                                                                 |               |                                                                                                   |

Table 4: Search strings.

#### 3.3 Resources to be searched

In order to find relevant papers for our review, we will perform the search procedure automatically by using scientific databases' search engines and manually by scanning through the selected conferences, as shown in Figure 1.

Figure 1: Manual and automatic search

The following 5 scientific databases have been chosen for our review because they publish a substantial amount of peer-reviewed papers on the subject of computer science, including security and privacy:

- 1. Science Direct,
- 2. IEEEXplore,
- 3. ACM DL,
- 4. Wiley DL,
- 5. Springer library.

In addition to the automatic database search, we identified 5 conferences that will be searched manually. The choice of the conferences has been made according to the topics the conferences focus on and encompass the search terms defined in 3.1, as shown in Figure 2.

- 1. ACM International Joint Conference on Pervasive and Ubiquitous Computing (UbiComp),
- 2. IEEE Pervasive Computing and Communication conference (PerCom),
- 3. ACM Conference on Computer and Communications Security (CCS),

- 4. Annual ACM International Conference on Mobile Computing and Networking (MobiCom),
- 5. International Symposium on Wearable Computers (ISWC).

Figure 2: Conferences and search terms

#### 3.4 Refinement of the general search string

Due to the specific requirements of each search engine, we adapted our search procedure to each scientific database, as seen in Table 5.

| Scientific database | Search type     | Search in                    | Refinement                                                |
|---------------------|-----------------|------------------------------|-----------------------------------------------------------|
| Science Direct      | Expert search   | Title, abstract and keywords | Limit the search to journals and a time-frame [2003-2013] |
| Wiley DL            | Advanced search | Abstract                     | Limit the search to a time-frame [2003-2013]              |
| IEEEXplore          | Command search  | Abstract                     | Limit the search to a time-frame [2003-2013]              |
| ACM DL              | Advanced search | Abstract                     | Limit the search to a time-frame [2003-2013]              |
| Springer            | Advanced search | Title                        | Limit the search to a time-frame [2003-2013] and English  |

Table 5: Requirements of scientific databases.

Once the search procedure has been adapted for each database, we refined the general search string defined in 3.2 (see Table 6).

| Scientific Database   | First set of search strings                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Science Direct        | TITLE-ABSTR-KEY(ubiquitous OR "pervasive computing" OR "mobile computing"<br>OR wearable OR "body area network") and TITLE-ABSTR-KEY(security OR confi-<br>dentiality OR "access control" OR authentication)                                                                         |
| IEEEXplore            | ("Abstract":ubiquitous OR "Abstract":"pervasive computing" OR "Abstract":"mobile<br>computing" OR "Abstract":wearable OR "Abstract":"body area network") AND ("Ab-<br>stract":security OR "Abstract":confidentiality OR "Abstract":"access control" OR<br>"Abstract":authentication) |

Table 6: List of search strings.

The results for each database search and its corresponding search string are given in Appendix A.

#### 3.5 Evaluation of the search process

Before undertaking the review, search strings will be evaluated by their ability to detect the papers presented in Table 7. The list of papers was identified by using the general keyterms "security" and "ubiquitous computing" over the scientific databases prior to the definition of the search strings.

| DB             | Author                 | Title                                                                                                                                                            | Venue                                                                                                           | Year    | Page Nr.  | Reference             |

Table 7: The known subset of papers.

### 4 Paper selection

#### 4.1 Inclusion and exclusion criteria

In order to identify the papers that are in line with the objective of our review, we conducted a consensus meeting where the inclusion and exclusion criteria were defined. The initial list of criteria is presented below (Table 8 and Table 9 present exclusion and inclusion criteria, respectively).

| Criterion ID | Criterion                                                                                      |
|--------------|------------------------------------------------------------------------------------------------|
| E01          | Summaries of workshops and tutorials, title pages, editorials and extended abstracts as they   |
|              | do not provide sufficient information to the objective of our review.                          |
| E02          | Workshop articles as they report on a study in its early stage.                                |
| E03          | Posters, as they do not provide enough information for the purpose of our review.              |
| E04          | Books and PhD theses, as they are beyond the scope of this review.                             |
| E05          | Double entries. If an extended journal article is found, it will be chosen over the conference |
|              | article. If a more recent paper is found, it will be chosen over its preceding paper.          |
| E06          | Papers whose focus was not put on security goals in ubiquitous, mobile and wearable com-       |
|              | puting, i.e. papers that mentioned security in their abstracts as one of the issues.           |
| E07          | Opinion papers, discussion papers and survey papers that do not propose a solution.            |
| E08          | Any paper whose full text is not accessible.                                                   |
| E09          | Papers not written in English.                                                                 |
| E10          | Papers with a low quality assessment score (to be done after the quality assessment proce-     |
|              | dure, see Section 4.4).                                                                        |

Table 8: Exclusion criteria

| Criterion ID | Criterion                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| I01          | Full version of journal and conference articles that report on, discuss or investigate security issues in ubiquitous, mobile and wearable computing. |
| I02          | Papers that propose a solution to the identified security issue.                                                                                     |
| I03          | Papers written in English.                                                                                                                           |
| I04          | Papers published since 2003.                                                                                                                         |

We conducted a pilot selection procedure with the criteria defined above, which resulted in a large number of potentially relevant papers (n=4369). Both reviewers participated in the search procedure, one searched for the papers according to the defined set of criteria, while the other checked titles and abstracts against the inclusion criteria.

Due to the large number of papers identified in the initial search process, two additional criteria are introduced to keep the selection process manageable:

- 1. Papers published in the journals with a Scimago Journal Ranking (SJR) where h-index  $^2 \ge 35$  or SJR  $\ge 0.8$ .
- 2. Papers published in the conference proceedings with a rank A+ or A based on the CORE ranking (Computer Science Conference Rankings) <sup>3</sup>

The latter criterion was formerly used in literature review papers [WW02] where it was indicated that researchers should examine conference proceedings with a reputation for quality.

 $<sup>^{2}</sup>$  journal's number of papers that have received at least h citations over the whole period. For additional information refer to [sci]

<sup>&</sup>lt;sup>3</sup>For additional information refer to [Cor].

#### 4.2 Filtering of the papers

We will use the inclusion and exclusion criteria on the initial pool of papers in the following way (see Figure 3). While obtaining the papers for the initial pool, we will check whether they are written in English. This criterion can be incorporated within the automatic database search for some databases, such as Springer. For the results of the remaining databases, we will manually check the list of papers and exclude those written in any other language than English (exclusion criterion E09).

Once the initial papers have been identified, we will begin with the first filtering phase in which the double entries will be removed  $(\mathbf{P1})$  with the help of the Zotero reference manager (exclusion criterion E5). In order to ensure that there are only unique entries left, we will check the papers and manually remove any doubles remaining in the pool. Our second phase will be to look for the workshop articles, summaries of workshops and tutorials, title pages, editorials, posters and extended abstracts (**P2**). If such papers are found, we will exclude them from the pool (exclusion criteria E01-E04). Next we will look for the papers whose focus is not put on security in ubiquitous computing based on the information provided in the titles and abstracts (P3, exclusion criterion E06). Moreover, opinion and discussion papers will also be removed from the pool (exclusion criterion E07). The filtering procedure will continue by checking the journal and conference rankings  $(\mathbf{P4})$ , as described in section 4.1. Once the papers have been removed based on the rankings, our next step  $(\mathbf{P5})$  will be to combine the remaining ones with those found manually while scanning through the selected conference proceedings. Since we expect double entries to occur as a result of the phase P5, we will remove them before continuing with the filtering procedure  $(\mathbf{P6})$ . The next phase  $(\mathbf{P7})$  is to obtain the full version of each paper. If it is not available in a corresponding database, we will check the authors' personal websites and, if necessary, contact the authors. If we still cannot obtain the full version of a paper, we will exclude it from our review (exclusion criterion E08). The following two phases will be conducted in parallel - quality assessment and screening of the content of the papers (**P8a** and **P8b**).

Figure 3: Filtering of papers.

If a paper is given a low quality assessment score, we will exclude it from our review, as described in Section 4.4 (exclusion criterion E10). We expect to identify the papers that are out of the scope of the review while screening through their full version and exclude them from our review, as well. After the filtering procedure has been completed, we expect to have a pool of relevant papers that will go through the data extraction procedure.

Report on the details of the selection procedure is given in Appendix B.

#### 4.3 Tools to be used during the selection procedure

During the selection procedure, we will use a Zotero reference manager to automatically collect the general information about the papers, such as authors, publication venue, publication year and the corresponding source (titles of journals and conferences). In order to be able to track in which database each paper was found, we will organize the information into folders, as shown in Figure 4.

Figure 4: Zotero tree-like organization

Initially, the manager will consist of a root folder named "SLR" and two parent folders - one to store the information about the conference papers found manually (named "Conferences"), and the other to store the information about the papers found by an automatic search (named "DBs"). In each parent folder, the information will be further organized into subfolders that represent the specific source where the paper has been found. Therefore, the folder "Conferences" will include in total five subfolders (named "CCS", "ISWC", "Mobicom", "Percom" and "Ubicom"). Information collected in these subfolders will not be checked for the double entries, as they are mutually exclusive. However, the same is not valid for the information stored in the subfolders of the folder "DBs". This is the case for two reasons. First, some conference papers are indexed in both the ACM and the IEEEXplore database. Second, since our search procedure is based on three different search strings for each database, we expect to find a number of the same papers in each run. For this reason, after the automatic search has been completed, we will check for any double entries by using a separate folder called "doubles". This folder will initially hold all the entries found during the automatic search. We will go through the list of papers and gradually remove any double entries. The resulting list should hold only unique entries. This list will be used for the filtering procedure (as described in Section 4.2). A screenshot of the list of the papers prior to the removal of the double entries is presented in Figure 5.

It is important to note that both reviewers will participate in the selection process in order to minimize personal bias, as recommended in [GBBGG<sup>+</sup>13] [KB13] [RHTi13].

In addition to Zotero, we will use a Google Spreadsheet (see Table 10) shared between the

Encryption in mobile devices using sensors
 Analysis of WiMAX bandwidth allocation mechanism considering physical conditions
 A Context-aware Group Management Middleware to Support Resource Sharing in MANET Environments
 Bluetooth Security in Wearable Computing Applications
 Towards building a fault tolerant and conflict-free distributed file system for mobile clients
 A secure mobile healthcare system using trust-based multicast scheme (double entry)
 A secure mobile healthcare system using trust-based multicast scheme
 Towards building a conflict-free mobile distributed file system
 A trust-based security system for ubiquitous and pervasive computing environments
 Challenges in body area networks for healthcare: the MAC
 Enforcing role based access control model with multimedia signatures
 Building Pervasive Applications: Research Challenges and Envisioned Solutions (double entry)

#### Figure 5: Double entries

both reviewers to record search and selection details, such as a number of papers found for each search string, number of double entries identified for each database, number of workshops, number of papers left after the inclusion based the titles and abstracts, number of papers after checking the journal and conference rankings.

| String Nr. | Database       | Doubles | Workshops, table of contents, summaries | Title, abstract | Rank |
|------------|----------------|---------|-----------------------------------------|-----------------|------|
|            | ACM            |         |                                         |                 |      |
| S1         |                |         |                                         |                 |      |
| S2         |                |         |                                         |                 |      |
| S3         |                |         |                                         |                 |      |
|            | Springer       |         |                                         |                 |      |
| S1         |                |         |                                         |                 |      |
| S2         |                |         |                                         |                 |      |
| S3         |                |         |                                         |                 |      |
|            | Science Direct |         |                                         |                 |      |
| S1         |                |         |                                         |                 |      |
| S2         |                |         |                                         |                 |      |
| S3         |                |         |                                         |                 |      |
|            | IEEE           |         |                                         |                 |      |
| S1         |                |         |                                         |                 |      |
| S2         |                |         |                                         |                 |      |
| S3         |                |         |                                         |                 |      |
|            | Wiley          |         |                                         |                 |      |
| S1         |                |         |                                         |                 |      |
| S2         |                |         |                                         |                 |      |
| S3         |                |         |                                         |                 |      |

#### Table 10: Search form

Once the initial pool of relevant papers has been made, we will obtain their full versions (in a PDF format) and put them in a shared Google Drive folder. These papers will be used in the collaborative quality assessment procedure.

#### 4.4 Quality Assessment

After the relevant papers have been identified, we will prepare them for the quality assessment procedure by renaming each in the following way. Each paper will be given a prefix  $S[000]_{-}$  (*S* stands for *paper*) and a three-digit number starting from 000. For example, a paper with a title "A compensation scheme of fingerprint distortion using combined radial basis function model for ubiquitous services" is alphabetically first in our initial pool of relevant papers. After the renaming procedure, the PDF document will have the following title: "S001\_A compensation scheme of fingerprint distortion using combined radial basis function model for ubiquitous services". The renaming will be done automatically by using a script written in Perl (see Listing 1).

| Listing | 1: | Perl | scrip | 1 |
|---------|----|------|-------|---|
|         |    |      |       |   |

```
#!/usr/bin/perl -w
use File :: Find;
use File :: Basename;
use File::Spec;
use strict;
my \ $i='001';
find ({ 'wanted ' \Rightarrow \&renamefile }, '(source)');
sub renamefile {
    my file = ;
    return unless (-f $file);
    my $dirname = dirname($file);
    my $file_name = basename($file);
    my $new_file_name = $file_name;
    $new_file_name = 'S'.$i.'_'.$file_name;
    rename($file, File::Spec->catfile($dirname, $new_file_name))
                 or die $!;
           $i++;
```

```
}
```

Based on the suggestions by [ATF09b] [DD08] [GBBGG<sup>+</sup>13] [KB13] [SJV<sup>+</sup>12], we will use a quality assessment form that consists of 7 questions represented in a three-point scale with Yes (1), No (0) and To some extent (0.5) as the possible answers.

QA1: Is the paper based on research?

- 1.1 Yes, it is based on research (1).
- 1.2 To some extent (0.5).
- 1.3 No, it is a lessons learned based on expert opinion (0).

QA2: Is there a clear statement of the aim?

- 2.1 Yes, the aim is specific and mentioned explicitly (1).
- 2.2 To some extent (0.5).
- 2.3 No, there is no mention of the aim, or the aim is too general (0).

QA3: Is there an adequate description of the context in which the research was carried out?

3.1 Yes, the paper reports on the application domain for which the security mechanism is designed (1).

- 3.2 To some extent (0.5).
- 3.3 No, the application domain is unclear (0).
- QA4: Did the paper make a review of previous research of the topic?
  - 4.1 Yes, the paper provided a thorough review of the related work (1).
  - 4.2 To some extent (0.5).
  - 4.3 No, the paper did not provide a review of the related work (0).
- QA5: Is the methodology described adequately?
  - 5.1 Yes, the process of creating the research artifacts is clear and provides sufficient information on data collection and algorithms used (1).
  - 5.2 The paper provides a description of the research process, but lacks in detail (0.5).
  - 5.3 No, the paper does not report on the creation of research artifacts (0).

QA6: Is there a clear statement of the findings?

- 6.1 Yes, the paper provides an adequate description of the findings, as well as the corresponding evaluation (1).
- 6.2 The paper reports on the findings, but lacks in evaluation (0.5).
- 6.3 No, the paper does not clearly state its findings (0).

QA7: Did the paper discuss future work?

- 7.1 Yes, the paper discusses future work (1).
- 7.2 The paper briefly mentions future work (0.5).
- 7.3 No, the paper does not discuss future work (0).

The form is presented in Table 12.

| ID  | Question                                                                               | Score |
|-----|----------------------------------------------------------------------------------------|-------|
| QA1 | Is the paper based on research?                                                        |       |
| QA2 | Is there a clear statement of the aim?                                                 |       |
| QA3 | Is there an adequate description of the context in which the research was carried out? |       |
| QA4 | Did the paper make a review of previous research of the topic?                         |       |
| QA5 | Is the methodology described adequately?                                               |       |
| QA6 | Is there a clear statement of the findings?                                            |       |
| QA7 | Did the paper discuss future work?                                                     |       |

Table 11: Quality assessment scores.

The maximum value of the assessment for a paper is 7, indicating high quality, whereas 0 value means poor quality. The range is further divided into three categories:

- 1. High quality (final score  $\geq 6$ ),
- 2. Medium quality  $(4 \leq final \ score \leq 5.5)$ ,
- 3. Poor quality (final score  $\leq 3.5$ ).

For each paper we will calculate the final quality assessment scores. This information will be used to identify the number of papers placed in each quality assessment category (poor, medium and high quality). Additionally, we will find the final scores for each question to identify the overall weaknesses of the papers used in our review. For example, as reported in a systematic

| Paper ID                 | Q1 | $\mathbf{Q2}$ | $\mathbf{Q3}$ | $\mathbf{Q4}$ | $\mathbf{Q5}$ | $\mathbf{Q6}$ | Q7   Final score per paper |
|--------------------------|----|---------------|---------------|---------------|---------------|---------------|----------------------------|
| S001                     |    |               |               |               |               |               |                            |
| S002                     |    |               |               |               |               |               |                            |
| S003                     |    |               |               |               |               |               |                            |
|                          |    |               |               |               |               |               |                            |
| Final score per question | 1  |               |               |               |               |               |                            |

Table 12: Quality assessment form

review paper [SLB14], future work scored low in the quality assessment procedure indicating that authors of the reviewed papers did not properly discuss future plans. The cumulative scores found for each quality assessment question will be presented in a form presented in Table 12.

Following the example of the other systematic reviews [MHGA13] [RHTi13], we will exclude the papers placed in the poor quality category and include those that have a substantial quality assessment score into the data extraction process.

In order to ensure that the selected papers will make a valuable contribution to the findings of the review, we considered the concepts of reporting, rigor, credibility and relevance (proposed in [DD08]) while designing our quality assessment questions.

- **Reporting:** questions QA1, QA2 and QA3 examine the quality of reporting on the rationale, aim and context of the research.
- **Rigor:** question QA5 is used to examine the rigor and validity of the research methodology.
- **Credibility:** question QA6 is designed to assess the validity and meaningfulness of a paper.
- **Relevance:** questions QA4 and QA7 are introduced to assess the relevance of a paper.

Both reviewers will be involved in the quality assessment procedure. The pool of the potentially relevant papers will be divided into two parts, each assessed by one author and checked by the other.

#### 4.4.1 Report on the pilot quality assessment

Based on the suggestion by [KB13], we performed a pilot quality assessment with a random sample of 10 papers to ensure that all researchers understand how to apply the quality assessment checklist. Each author has individually assessed the papers. After comparing the quality scores, a Cohen's Kappa coefficient was calculated (23% fair). In order to reduce the differences in the individual understanding of the procedure, additional refinements to the quality assessment form were made. In particular, more explanation was given to the checklist of the *research methodology* and the *context of the research*.

#### 4.5 Data extraction

In order to manage the data extraction procedure, we designed an online form using Google Forms, which will help us during the collaborative data extraction process and, later on, while aggregating and synthesizing the information for further analysis. The data extracted from the papers will be recorded in a Google Spreadsheet, which is automatically generated once an entry has been submitted to the form. As the data extraction procedure will be conducted in parallel with the quality assessment, reviewer A will check the data extracted by the reviewer B, and vice versa. We will discuss any potential disagreements and, if an agreement cannot be reached, we will ask for a third opinion.

#### 4.5.1 Details of the extraction form

It is possible to choose one of the nine question types:

- 1. Text includes a small one-line text box.
- 2. Paragraph text includes a multi-line text box, which is well suited for writing a longer paragraph of text
- 3. Multiple choice allows two types of answers: 1) predefined (as designed by the form owners), 2) custom answer (any additional answer a reviewer might come up with during the data extraction process). Though the name implies that this question is a multiple choice type of a question, we have found out that in practice a reviewer can choose only one option from the list. Therefore, this option stands for a single choice question type. While testing the questions types, we found out that it is not possible to allow a reviewer to enter an additional value to the ones already given in the list of options. The advanced settings additionally allow to shuffle option order. To avoid confusion, we decided not to use this option for any question in our data extraction form.
- 4. Checkbox as in the multiple choice question type, it allows two types of answers: 1) predefined answer, 2) custom answer. In our case, we provided a list of security goals, which included confidentiality, integrity, authentication, availability, access control, non-repudiation, authenticity of data, privacy, accountability, and audit. The list of these security goals can be found in [SRM13]. In case an additional security goal is identified in the papers, a reviewer is given an option to enter it by using a custom answer textbox. In this way we wanted to ensure that the important information for our SLR get recorded without restricting the reviewers by the predefined options.
- 5. Choose from list provides a drop-down list of options. For this type of a question it is impossible to have a custom answer textbox. We decided not to use this type of a question.
- 6. Scale includes a scale of values on which a reviewer can place a response. We choose not to use this type of a question.
- 7. Grid includes a grid of rows and columns where a reviewer has to click a single cell to place a response. This type is often used for Likert scale questions. We did not use this type of a question.
- 8. Date includes a calendar on which a reviewer has to click to enter a date in the format dd.mm.yyyy, where d stands for day, m for month and y for year. In addition, it is also possible to enter time in the format hh:mm, where h stands for hours and m for minutes. Although this question type might have been useful to check the time and date an entry has been submitted to our data extraction form by each reviewer, we decided not to use it because the timestamps were automatically recorded for each form entry in the first column in a Google Spreadsheet.
- 9. Time

It is possible to define every question as a "required question", meaning that a reviewer will be forced to answer the corresponding question before being able to proceed to the next question. We used this option only for one textbox, namely *Paper ID*.

Once a reviewer is done with extracting the data from the papers, he/she is prompted to press the submit button. The data is then automatically transferred to the Google Spreadsheet in a sheet called "Form Responses", where the number of columns corresponds to the number of questions in a form and number of rows correspond to the number of entries a reviewer has submitted. In our case, the number of rows will respond to the number of papers that were identified as relevant for our SLR.

#### 4.5.2 Description of the data extraction form

| Part  | $\mathbf{R}\mathbf{Q}$ | Data extracted                                                               | Question type                                                                                                                                                                                     |
|-------|------------------------|------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $1^4$ | RQ1                    | Name of the reviewer                                                         | Textbox                                                                                                                                                                                           |
|       |                        | Paper ID ( <b>*required</b> )                                                | Textbox                                                                                                                                                                                           |
|       |                        | Title of the paper                                                           | Textbox                                                                                                                                                                                           |
|       |                        | Authors                                                                      | Textbox                                                                                                                                                                                           |

The form consists of four parts, as presented in Table 13.

Table 13: Description of the data extraction form

 $<sup>^{4}</sup>$ We will not manually fill in the date when the information is extracted, as the timestamp is automatically assigned to each entry once the answers are submitted in the Google Forms.

<sup>&</sup>lt;sup>5</sup>Due to the specific characteristics of the technologies, devices and networks that we will come across in our review, we expect to identify additional security goals and put them into the *Other* category.

 $<sup>^{6}\</sup>mathrm{Validation}$  methods are defined in Table 14

#### 4.5.3 Description of the pages included in the form

The first page of the data extraction form (see Figure 6) consists of 11 data-entry fields, namely name of the reviewer, paper ID (required), title of the paper, author's name, country where the research has been carried out (country where the author worked at the moment when the paper written), publication venue, publication details for a journal (volume, number), conference acronym, page numbers (as they appear in the original publication venue), date of publication, number of cites (based on Google Scholar citation count).

Figure 6: Extraction form, page 1.

The second page of the data extraction form (see Figure 7) consists of three questions, out of which two are multi-line textboxes (one for the aim of the study and the other one for the motivation behind the researce) and one checkbox with the list of security goals, as proposed in [SRM13]. For the checkbox, the predefined possible answers are: confidentiality, integrity, authentication, availability, access control, non-repudiation, authenticity of data, privacy, accountability, and audit. The final check-box option is a blank single-line textbox in which a reviewer can write an additional security goal identified in the papers.

Figure 7: Extraction form, page 2.

The third page of the data extraction form (see Figure 8) consists of four questions - one multi-line textbox, two single-choice questions, and one checkbox. The reviewer is expected to provide a short description of the solution proposed and described in the paper in the multi-line textbox. We will also check whether the algorithms and technologies needed for the implementation of security mechanisms are publicly available by checking the information provided in the paper, as well as authors' personal websites. If the algorithms and technologies are available, we will mark it as Yes in our form. The second single-choice question refers to the validation of results. We will examine the papers to identify whether the authors of the paper have validated their solution. If they reported on the validation, we will mark it as Yes in our form. The last question on the third page of the form should be answered only if the previous question was answered with Yes. Although Google Forms provides some navigation control (it is possible to define the page to be opened based on the respondent's answer), it did not react to a reviewer's response the way we wanted to. For example, by choosing an option No for the question "Has the validation of the results been performed?", we could not forbid a reviewer to choose validation methods presented in the checkbox on the bottom of the page. Therefore, we agreed to manually skip the checkbox question in case the previous question was answered with No.

Figure 8: Extraction form, page 3.

The final page of the data extraction form (see Figure 9) consists of four questions. The first one is a single-choice question, which refers to the limitations of the solution presented in the paper, with Yes and No as two possible answers. In order to provide an answer to this question, we will examine results, discussion, and conclusion sections of the papers. The second question is a multi-line textbox and refers to the description of the limitations, as stated by the authors of the paper. Again, we faced the same problem with restricting the reviewer to answer to the question once the previous question was answered with No. The third question is a single-choice question, which refers to the future work, with Yes and No as two possible answers. The final question in our data extraction form is a multi-line textbox, in which a short description of future work, as stated by the authors of the paper in the discussion and conclusion sections of the paper, is expected.

Once the data has been entered by a reviewer, the answers can be submitted by clicking on a button *Submit*, found at the very bottom of the form. As we linked the Google Forms with a Google Spreadsheet, the answers provided are automatically put into the corresponding cells in a Google Spreadsheet's sheet titled "Form Responses". An additional column, timestamp (date and time the answers have been submitted) is automatically created in the first column in the Spreadsheet.

Figure 9: Extraction form, page 4.

| Method              | Description                                                                                                                                                                                             | Example                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Experiment          | Manipulation of one or more inde-<br>pendent variables. In our review,<br>a simulation will be regarded as an<br>experiment.                                                                            | A simulation is conducted in [74] where the au-<br>thors provide the objective of the simulation, a<br>list of parameters, report on the simulation pro-<br>cess and discuss the results.           |
| Case paper          | One case or a small number of cases<br>are studied in detail with a holistic<br>focus, i.e. it aims to understand the<br>wholeness of the case.                                                         | In [33] the authors consider the case of a user mov-<br>ing through different localities and changes in the<br>context condition while using a ubiquitous service.                                  |
| Opinion survey      | Inquiry designed to collect the opin-<br>ion of a sample population.                                                                                                                                    | A report on the opinion survey is given in [90].<br>The survey was conducted on a number of users<br>to gain insight into whether a virtual password<br>scheme is applicable in a certain scenario. |
| Lessons learned     | After a solution had been imple-<br>mented, authors report on the ex-<br>perience in working with the solu-<br>tion.                                                                                    | paper [73] reports on a home respiratory therapy system.                                                                                                                                            |
| Example             | Authors provide a description of a scenario, actors and procedures in order to illustrate a certain process or behavior.                                                                                | Examples are provided in [146] in order to show<br>how an algorithm assigns privileges to categories<br>in an RBAC model.                                                                           |
| Formal verification | Proving the validity of algorithms<br>by using formal methods and math-<br>ematics. Formal proof and first-<br>order logic were put into this cat-<br>egory.                                            | A protocol is formally verified using BAN logic in<br>[195].                                                                                                                                        |
| Other               | Any other validation methods that<br>could not be categorized into the<br>above-mentioned categories, such<br>as a theoretical comparison with<br>existing solutions, usability test or<br>data mining. | paper [97] provides a comparison of a a group de-<br>vice pairing protocol with existing schemes.                                                                                                   |

The validation methods are defined as follows (see Table 14):

Table 14: Validation methods

### 5 Data synthesis

Before we start synthesizing and reporting on the findings, we will check if the data extraction procedure resulted in any missing information. If required, we will re-check the paper whose information might be missing. If the answer is not provided, we will mark the field in the data extraction form as "information unknown" or "general", depending on whether the information is entirely missing or the authors of a particular paper provided general information. We expect to come across papers that provide, for example, a general list of attacks while reporting on the motivation. Therefore, we will write "general" in the respective textbox.

During the data synthesis procedure, we will use separate tables to group the information extracted in the Google Spreadsheet. This step will be taken to help summarize the information needed to answer to our research questions.

#### 5.1 Synthesis of data for the RQ1

The first form used for the data synthesis will contain the information about the researchers who published papers on security in ubiquitous computing (see Table 15). We will provide a list of authors identified in our systematic literature review and count the number of papers published by each author. This information will identify the most active researchers in the area.

| Paper ID     | Author |
|--------------|--------|
| S001<br>S002 |        |
|              |        |

Table 15: Demographic data: active researchers

The second table (see Table 16) will present the demographic information. More precisely, we will look for the list of countries whose authors published the papers identified in our review. This information will give us an insight into where the research on security in ubiquitous computing is being carried out.

| Paper ID     | Country |
|--------------|---------|
| S001<br>S002 |         |
|              |         |

Table 16: Demographic data: country which contributed to the paper

In Table 17, we will present the number of papers published per year.

| Year | Number |
|------|--------|
| 2003 |        |
| 2004 |        |
| 2005 |        |
| 2006 |        |
| 2007 |        |
| 2008 |        |
| 2009 |        |
| 2010 |        |
| 2011 |        |
| 2012 |        |
| 2013 |        |

Table 17: Trends: Papers per year

The fourth table will present the most cited papers identified in our review (see Table 18).

| Paper ID     | Number of citations |
|--------------|---------------------|
| S001<br>S002 |                     |
|              |                     |

Table 18: Trends: citation count

Journals and conferences with the most published papers on security in ubiquitous computing will be identified by using the information given in Tables 19 and 20, respectively. Once identified, we will fill in the names of the journals in place of "JournalX" and conference abbreviations in place of "ConferenceX".

| No. of papers |
|---------------|
|               |
|               |
|               |

Table 19: Number of papers found in each journal

| Conference abbreviation    | No. of papers |
|----------------------------|---------------|
| ConferenceX<br>ConferenceX |               |
|                            |               |

Table 20: Number of papers found in each conference proceeding

#### 5.2 Synthesis of data for the RQ2

The second research question "Which security goals have been addressed in terms of ubiquitous computing?" was examined in more depth by including six additional research questions, as reported in Section 2. We designed a data synthesis form for each additional research question.

#### 5.2.1 Synthesis for the RQ 2.1: What is the motivation for the papers?

A list of threats, attacks and vulnerabilities that have motivated the papers will be recorded in Table 21. Instead of marking the cells with the uninformative "Yes" and "No", the table will contain a short description of each motivating factor found in a specific paper. For example, paper S004 (paper [135] in our list of references) reports on two vulnerabilities and one threat, as shown in Table 21. Since there were no attacks identified in the paper S004, the corresponding table cell is left blank.

| Motivation for the paper |                                                                                                                                 |                                                                                                      |        |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|--------|
| Paper ID                 | Vulnerability                                                                                                                   | Threat                                                                                               | Attack |
| S001                     |                                                                                                                                 |                                                                                                      |        |
| S002                     |                                                                                                                                 |                                                                                                      |        |
| S003                     |                                                                                                                                 |                                                                                                      |        |
| S004                     | device's resource constraints<br>(limited memory and processing<br>power), insecure and untrustworthy<br>nodes in a P2P network | presence of malicious and unreliable peers<br>may deteriorate the accuracy and system<br>performance |        |
|                          |                                                                                                                                 |                                                                                                      |        |

Table 21: Motivation for the paper

This information will be used to summarize and categorize the motivating factors found in the papers and to count the number of occurrences for each attack. The list of motivating factors with their corresponding source (paper) is given in the Appendix C.

#### 5.2.2 Synthesis for the RQ 2.2: Which solutions have been presented?

Table 22 will hold the information on the solutions proposed in the papers. If additional information is needed during reporting, we will refer to the corresponding paper to find any further explanations or information missing from our data synthesis table. Additionally to the table, we are planning to provide a narrative description of the findings.

| Paper ID | Short description of the solution |
|----------|-----------------------------------|
| S001     |                                   |
| S002     |                                   |
|          |                                   |
|          |                                   |

Table 22: Solutions.

#### 5.2.3 Synthesis for the RQ 2.3: Are the algorithms and technologies publicly available?

We are also interested in the availability of the algorithms and technologies used to present a solution (see Table 23). In particular, we will examine the way algorithms and technologies are presented (for the purpose of this review we will call it "presentation types"), such as diagrams and programming code excerpts, and categorize them during our reporting process.

| Paper ID | Availability of algorithms (Y or N) | Presentation type |
|----------|-------------------------------------|-------------------|
| S001     |                                     |                   |
| S002     |                                     |                   |
|          |                                     |                   |

Table 23: Algorithms.

# 5.2.4 Synthesis for the RQ 2.4: Which security goals have been addressed in the papers?

Using the information recorded in the spreadsheet, we will count the number of occurrences for each security goal (see Table 24) and present them in a bar chart. We will pay special attention to the list of goals placed in the *Other* category by examining whether there are any additional security goals with a high frequency of appearance. If such are found, we will add an additional row in the Table 24.

The information about the number of security goals identified in the papers will be used in the reporting phase of the review where we will explain and interpret the obtained results.

| Security goals  | Number |
|-----------------|--------|
| Confidentiality |        |
| Integrity       |        |
| Authentication  |        |
| Availability    |        |
| Access control  |        |
| Non-repudiation |        |
| Authenticity    |        |
| Privacy         |        |
| Accountability  |        |
| Audit           |        |
| Other           |        |

Table 24: Security goals.

#### 5.2.5 Synthesis for the RQ 2.5: What kind of validation of the results been performed?

To assess the appropriateness of the proposed solutions, we will synthesize the information about the validation mechanisms as reported in the papers. First we will identify the number of papers that did not report on any validation mechanisms used (see Table 25). For the remaining, we will count the number of occurrences of each validation mechanism and record it in the Table 26. This information will be used to identify the mechanisms that researchers tend and prefer to use.

| Has the validation been performed? | Number |
|------------------------------------|--------|
| Yes<br>No                          |        |
| NO                                 |        |

Table 25: Performance of the validation mechanisms.

| Validation mechanism | Number |
|----------------------|--------|
| Experiment           |        |
| Case paper           |        |
| Opinion survey       |        |
| Lessons learned      |        |
| Example              |        |
| Formal verification  |        |
| Other                |        |

Table 26: Validation mechanisms.

#### 5.2.6 Synthesis for the RQ 2.6: Which future work has been proposed?

While summarizing the information about the future work, we will first use the data recorded in the Google spreadsheet to identify the number of papers that did not provide any plans for future work or research directions (see Table 27). The same data will be also available in our quality assessment form (0 points is given to the papers that do not report on the future work).

| Future work reported? | Number |
|-----------------------|--------|
| Yes<br>No             |        |
|                       |        |

Table 27: Report on the future work.

Table 28 presents a data synthesis form in which we will summarize the short descriptions of future work extracted from the papers. Since we expect to encounter similarities in the reported future plans, we plan to categorize them and show frequencies for each category. For example, information about the performed validation of results given in the Table 25 may indicate that researchers who did not report on any validation mechanisms in they paper, might plan it as their future work. Therefore, "validate" can be regarded as a potential category of the planned future work.

| Paper ID     | Short description of the future work |
|--------------|--------------------------------------|
| S001<br>S002 |                                      |
| •••          |                                      |

Table 28: Future work.

# 6 Potential conflict of interest

None known.

# 7 Review timetable

The SLR will be conducted within the following time-frame:

| Task                              | Date       | Task description                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Completion of the protocol        | 30/12/2013 | After the examples of the SLRs found in the literature <sup><i>a</i></sup> have been examined, identify and describe all the procedures and their details that are essential to conduct the SLR, such as definition of the research scope, search procedure, filtering of papers, quality assessment, data extraction and data synthesis. |
| Completion of the protocol review | 20/01/2014 | Conduct pilot procedures and report on their results. If necessary, refine the protocol.                                                                                                                                                                                                                                                  |
| Completion of search              | 10/02/2014 | Use the defined search strings to automatically search for<br>the papers in the scientific databases and manually in the<br>conference proceedings, as defined in the protocol.                                                                                                                                                           |
| Completion of paper selection     | 23/03/2014 | Perform the quality assessment procedure and filter the<br>initial pool of papers according to the defined inclusion<br>and exclusion criteria.                                                                                                                                                                                           |
| Completion of data extraction     | 20/05/2014 | Extract the information by using a predefined form, as defined in the protocol.                                                                                                                                                                                                                                                           |
| Completion of data synthesis      | 30/06/2014 | Synthesize the data extracted from the papers by using<br>the predefined forms.                                                                                                                                                                                                                                                           |
| Completion of reporting           | 31/07/2014 | Report on the results obtained from the review.                                                                                                                                                                                                                                                                                           |

<sup>a</sup>While defining review procedures we followed the examples from the following systematic reviews: [SLB14], [RHTi13], [DBCG14], [ATF09a], [BBH<sup>+</sup>08], [KB13], [KC07], [GBBGG<sup>+</sup>13] and [SJV<sup>+</sup>12].

# A Appendix: Results of the search and selection procedures

### A.1 Results of the automatic search

| Search string | Database       | Doubles | Workshops, table of con-<br>tents, summaries | Title, abstract | Rank |

### A.2 Results of the manual search

| Conference name                                                          | Abbreviation   | Results |
|--------------------------------------------------------------------------|----------------|---------|
| ACM International Joint Conference on Pervasive and Ubiquitous Computing | Ubicomp        | 24      |
| IEEE Pervasive Computing and Communication conference                    | PerCom         | 47      |
| ACM Conference on Computer and Communications Security                   | $\mathbf{CCS}$ | 34      |
| Annual ACM International Conference on Mobile Computing and Networking   | MobiCom        | 16      |
| International Symposium on Wearable Computers                            | ISWC           | 2       |

Table 31: Details of the manual search.

### **B** Report on the paper selection

Our initial pool included n=4369 papers. We followed the filtering procedure and its corresponding phases in order to identify those papers that are of good quality and that would provide information relevant for the purposes of our review. In phase P4 we reached a more manageable number of papers (n=199) and combined them with those found during the manual search process (n=320). The double entries were removed, which further reduced the number of papers to n=291. After taking all the steps to obtain the full versions, we had to exclude in total 7 from our review. Therefore, the total number of papers that were considered for the quality assessment and data extraction phase was 284. The filtering procedure continued during the screening of the papers. We read the full versions of the articles while performing quality assessment and data extraction in parallel. Those papers that were not in scope of our research or had a poor quality assessment score were not considered for the data extraction process. As shown in Figure 10, out of 284 papers 70 (24%) were out of the research scope. For 8 (2%) papers a matching journal article or a more recent paper was found. Quality assessment was done for the remaining 206 (74%) papers.

Figure 10: Filtering of papers.

# C Motivation

| Motivation                                                   | paper                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 32: List of vulnerabilities, attacks and threats.

# D List of journals

| Journal name                                                      | Publisher                                   | Coverage                |
|-------------------------------------------------------------------|---------------------------------------------|-------------------------|
| ACM Transactions on Information and System Security               | ACM                                         | 2003-2013               |
| ACM Transactions on Sensor Networks                               | ACM                                         | 2006-2013               |
| American Journal of Preventive Medicine                           | Elsevier                                    | 1985-2014               |
| Computers & Security                                              | Elsevier                                    | 1982-2014               |
| Computer Communications                                           | Elsevier                                    | 1978-2014               |
| Computer Networks                                                 | Elsevier                                    | 1977-1984,              |
|                                                                   |                                             | 1989-1990,              |
|                                                                   |                                             | 1996-2014               |
| Computer Standards and Interfaces                                 | Elsevier                                    | 1985-2014               |

## F List of conferences

Table 35: List of conferences in ascending alphabetical order based on abbreviations.

## G Selected papers

- Nidal Aboudagga, Giacomo de Meulenaer, Mohamed Eltoweissy, and Jean-Jacques Quisquater. Imaps: Imbricated authentication protocol suite for mobile users and groups. In *IEEE 34th Conference on Local Computer Networks*, LCN '09, pages 30–36, Oct 2009.
- [2] Isaac Agudo, Ruben Rios, and Javier Lopez. A privacy-aware continuous authentication scheme for proximity-based access control. *Computers & Security*, 39:117–126, November 2013.
- [3] Sheikh I. Ahamed, Munirul M. Haque, Md. Endadul Hoque, Farzana Rahman, and Nilothpal Talukder. Design, analysis, and deployment of omnipresent Formal Trust Model (FTM) with trust bootstrapping for pervasive environments. *Journal of Systems and Software*, 83(2):253–270, February 2010.
- [4] Sheikh Iqbal Ahamed, Haifeng Li, Nilothpal Talukder, Mehrab Monjur, and Chowdhury Sharif Hasan. Design and implementation of S-MARKS: A secure middleware for pervasive computing applications. *Journal of Systems and Software*, 82(10):1657–1677, October 2009.
- [5] S.I. Ahamed, N. Talukder, and M. Haque. Privacy challenges in context-sensitive access control for pervasive computing environment. In *Fourth Annual International Conference* on *Mobile and Ubiquitous Systems: Networking Services*, MobiQuitous '07, pages 1–6, Aug 2007.
- [6] Zahra Ahmadian, Mahmoud Salmasizadeh, and Mohammad Reza Aref. Recursive Linear and Differential Cryptanalysis of Ultralightweight Authentication Protocols. *IEEE Transactions on Information Forensics and Security*, 8(7):1140–1151, July 2013.
- [7] M.D. Aime and Antonio Lioy. Incremental trust: building trust from past experience. In Sixth IEEE International Symposium on a World of Wireless Mobile and Multimedia Networks, WoWMoM '05, pages 603–608, June 2005.
- [8] Jalal Al-Muhtadi, Anand Ranganathan, Roy Campbell, and M.Dennis Mickunas. Cerberus: a context-aware security scheme for smart spaces. In *Proceedings of the First IEEE International Conference on Pervasive Computing and Communications*, PerCom '03, pages 489–496, March 2003.
- [9] Florina Almenarez, Andres Marin, Daniel Diaz, Alberto Cortes, Celeste Campo, and Carlos Garcia-Rubio. A trust-based middleware for providing security to ad-hoc peer-to-peer applications. In Proceedings of the 2008 Sixth Annual IEEE International Conference on Pervasive Computing and Communications, PerCom '08, pages 531–536, Washington, DC, USA, 2008. IEEE Computer Society.
- [10] Myrto Arapinis, Loretta Mancini, Eike Ritter, Mark Ryan, Nico Golde, Kevin Redon, and Ravishankar Borgaonkar. New privacy issues in mobile telephony: Fix and verification. In Proceedings of the 2012 ACM Conference on Computer and Communications Security, CCS '12, pages 205–216, New York, NY, USA, 2012. ACM.
- [11] Joan Arnedo-Moreno, Noemí Pérez-Gilabert, and Marc Domingo-Prieto. Anonymously accessing {JXTA} community services through split message forwarding. *Mathematical* and Computer Modelling, 58(5–6):1313 – 1327, 2013. The Measurement of Undesirable Outputs: Models Development and Empirical Analyses and Advances in mobile, ubiquitous and cognitive computing.

- [12] F. Bagci, H. Schick, J. Petzold, W. Trumler, and T. Ungerer. The reflective mobile agent paradigm implemented in a smart office environment. *Personal and Ubiquitous Computing*, 11(1):11–19, February 2006.
- [13] Şerif Bahtiyar and Mehmet Ufuk Çağlayan. Extracting trust information from security system of a service. Journal of Network and Computer Applications, 35(1):480–490, January 2012.
- [14] Daniel V. Bailey, Dan Boneh, Eu-Jin Goh, and Ari Juels. Covert channels in privacypreserving identification systems. In *Proceedings of the 14th ACM Conference on Computer* and Communications Security, CCS '07, pages 297–306, New York, NY, USA, 2007. ACM.
- [15] Marc Barisch. Design and evaluation of an architecture for ubiquitous user authentication based on identity management systems. In *IEEE 10th International Conference on Trust, Security and Privacy in Computing and Communications*, TrustCom '11, pages 863–872, Nov 2011.
- [16] Allan Beaufour and Philippe Bonnet. Personal servers as digital keys. In Proceedings of the Second IEEE Annual Conference on Pervasive Computing and Communications, PerCom '04, pages 319–328, March 2004.
- [17] A Boukerche and Yonglin Ren. A secure mobile healthcare system using trust-based multicast scheme. *IEEE Journal on Selected Areas in Communications*, 27(4):387–399, May 2009.
- [18] Azzedine Boukerche and Yonglin Ren. A trust-based security system for ubiquitous and pervasive computing environments. *Computer Communications*, 31(18):4343–4351, December 2008.
- [19] I Boutsis and V. Kalogeraki. Privacy preservation for participatory sensing data. In *IEEE International Conference on Pervasive Computing and Communications*, PerCom '13, pages 103–113, March 2013.
- [20] An Braeken, Antonio De La Piedro, and Karel Wouters. Secure event logging in sensor networks. In Svetla Petkova-Nikova, Andreas Pashalidis, and Günther Pernul, editors, *Public Key Infrastructures, Services and Applications*, volume 7163 of *Lecture Notes in Computer Science*, pages 194–208. Springer Berlin Heidelberg, 2012.
- [21] Mike Burmester, Tri Van Le, Breno De Medeiros, and Gene Tsudik. Universally composable rfid identification and authentication protocols. ACM Transactions on Information and System Security, 12(4):21:1–21:33, April 2009.
- [22] Laurent Bussard and Rrefik Molva. One-time capabilities for authorizations without trust. In Proceedings of the Second IEEE Annual Conference on Pervasive Computing and Communications, PerCom '04, pages 351–355, March 2004.
- [23] Jin Wook Byun, Dong Hoon Lee, and Jong In Lim. Ec2c-paka: An efficient client-toclient password-authenticated key agreement. *Information Sciences*, 177(19):3995–4013, October 2007.
- [24] V. Cahill, E. Gray, J. M Seigneur, C.D. Jensen, Yong Chen, B. Shand, N. Dimmock, A Twigg, J. Bacon, C. English, W. Wagealla, S. Terzis, P. Nixon, G. Di Marzo Serugendo, C. Bryce, M. Carbone, K. Krukow, and M. Nielson. Using trust for secure collaboration in uncertain environments. *IEEE Pervasive Computing*, 2(3):52–61, July 2003.

- [25] Pierluigi Casale, Oriol Pujol, and Petia Radeva. Personalization and user verification in wearable systems using biometric walking patterns. *Personal and Ubiquitous Computing*, 16(5):563–580, July 2011.
- [26] Qi Chai, Guang Gong, and Daniel W. Engels. How to develop clairaudience active eavesdropping in passive rfid systems. In *IEEE International Symposium on a World of Wireless, Mobile and Multimedia Networks*, WoWMoM '12, pages 1–6, June 2012.
- [27] Chia-Hsin Owen Chen, Chung-Wei Chen, Cynthia Kuo, Yan-Hao Lai, Jonathan M. Mc-Cune, Ahren Studer, Adrian Perrig, Bo-Yin Yang, and Tzong-Chen Wu. Gangs: Gather, authenticate 'n group securely. In *Proceedings of the 14th ACM International Conference* on Mobile Computing and Networking, MobiCom '08, pages 92–103, New York, NY, USA, 2008. ACM.
- [28] Chunhua Chen, ChrisJ. Mitchell, and Shaohua Tang. Ubiquitous one-time password service using the generic authentication architecture. *Mobile Networks and Applications*, 18(5):738–747, 2013.
- [29] Bo-Chao Cheng, Huan Chen, Yi-Jean Li, and Ryh-Yuh Tseng. A packet marking with fair probability distribution function for minimizing the convergence time in wireless sensor networks. *Computer Communications*, 31(18):4352–4359, December 2008.
