Correspondence e-mail: jason.masuda@smu.ca

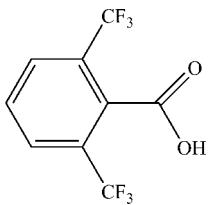

Received 24 March 2011; accepted 29 March 2011

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.048; wR factor = 0.151; data-to-parameter ratio = 10.8.

The asymmetric unit of a second polymorph of the title compound, $\text{C}_9\text{H}_4\text{F}_6\text{O}_2$, contains five independent molecules, which form hydrogen-bonded $\text{O}-\text{H}\cdots\text{O}$ dimers about inversion centers. The most significant structural difference between this structure and that of the first polymorph [Tobin & Masuda (2009). *Acta Cryst. E65*, o1217] is the hydrogen-bonded, dimeric orientation of the carboxylic acid functionalities.

Related literature

For the first polymorph of the title compound, see: Tobin & Masuda (2009). For details of the synthesis, see: Dmowski & Piasecka-Maciejewska (1998). For information on dimeric *versus* catemeric crystal growth in benzoic acids, see: Moorthy *et al.* (2002).

A new polymorph of 2,6-bis(trifluoromethyl)benzoic acid

N. A. Giffin, A. D. Hendsbee and J. D. Masuda

Comment

Recent studies on benzoic acids have indicated a potential for selective crystal polymorph engineering. It is suggested that catemeric or dimeric structures of benzoic acids can be influenced by concentration and the presence of solvent (Moorthy *et al.*, 2002). Crystallization from solvent free oil led to the formation of the hydrogen bound, dimeric form of the title compound.

The molecular structure of the title compound is presented in Fig. 1. The most significant structural difference between this structure and the literature polymorph (Tobin & Masuda, 2009) is the hydrogen bound, dimeric orientation of the carboxylic acid functionalities. The five molecules in the asymmetric unit are defined by O—H \cdots O hydrogen bonds ranging from 2.638 (4)–2.701 (4) Å and angles of 170–174° (Tab. 1 & Fig. 2).

Experimental

The title compound was prepared following the literature methods (Dmowski & Piasecka-Maciejewska, 1998). The compound was crystallized slowly from the resultant oil forming colorless, block-like crystals.

Refinement

The H atoms were placed in geometrically idealized positions with C—H and O—H distances = 0.95 and 0.98 Å, respectively, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}(\text{O})$.

Several short contact distances are found for F(2) & F(4) to F(17), F(8) to F(23), F(9) to F(20), F(10) to F(25), F(13) to F(21) and F(14) to F(27). The short contacts are believed to arise from disorder present in the crystal. Modeling this disorder yielded low occupancy which was detrimental to the integrity of the data set upon refinement. In order to obtain satisfactory thermal parameters the use of DELU restraints were applied to fluorine atoms F(4)>F(6) relative to the adjacent C(8) atom.

Figures

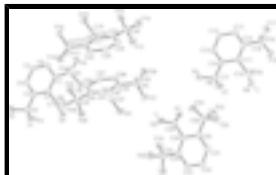

Fig. 1. The molecular structure of the title compound, with atom labels and 50% probability displacement ellipsoids for non-H atoms. Aromatic hydrogen atoms are removed for clarity.

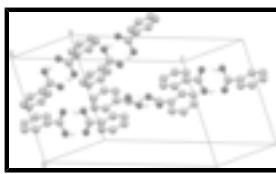

Fig. 2. The hydrogen bonding interactions between molecules of the title compound lying about inversion centers. Trifluoromethyl groups and aromatic H atoms are removed for clarity.

supplementary materials

2,6-Bis(trifluoromethyl)benzoic acid

Crystal data

C ₉ H ₄ F ₆ O ₂	Z = 10
M _r = 258.12	F(000) = 1280
Triclinic, PT	D _x = 1.773 Mg m ⁻³
Hall symbol: -P 1	Mo K α radiation, λ = 0.71073 Å
a = 10.312 (2) Å	Cell parameters from 4371 reflections
b = 11.243 (2) Å	θ = 2.2–27.4°
c = 21.283 (4) Å	μ = 0.20 mm ⁻¹
α = 79.565 (3)°	T = 100 K
β = 88.961 (3)°	Block, colourless
γ = 85.125 (3)°	0.14 × 0.11 × 0.11 mm
V = 2418.0 (9) Å ³	

Data collection

Bruker APEXII CCD diffractometer	8352 independent reflections
Radiation source: fine-focus sealed tube graphite	5092 reflections with $I > 2\sigma(I)$
φ and ω scans	$R_{\text{int}} = 0.046$
Absorption correction: multi-scan (SADABS; Bruker, 2010)	$\theta_{\text{max}} = 25.0^\circ$, $\theta_{\text{min}} = 1.9^\circ$
$T_{\text{min}} = 0.973$, $T_{\text{max}} = 0.980$	$h = -11 \rightarrow 12$
16341 measured reflections	$k = -13 \rightarrow 13$
	$l = -25 \rightarrow 25$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.048$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.151$	H-atom parameters constrained
$S = 0.85$	$w = 1/[\sigma^2(F_o^2) + (0.0887P)^2 + 1.2723P]$ where $P = (F_o^2 + 2F_c^2)/3$
8352 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
771 parameters	$\Delta\rho_{\text{max}} = 0.28 \text{ e \AA}^{-3}$
6 restraints	$\Delta\rho_{\text{min}} = -0.29 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
