## **ACKNOWLEDGEMENT**

IN THE NAME OF ALLAH, THE MOST GRACIOUS, THE MOST MERCIFUL

Firstly, we are really grateful to Allah S.W.T for giving us the strength and His blessings throughout our research work to complete the research successfully.

In preparation of our research, we had to take the guidance of a respected person, who deserves our deepest gratitude. We would like to express our gratitude to Prof. Madya Nur Azlina Binti. Abd. Aziz, supervisor of our final year project for giving us an excellent guideline in our research throughout numerous consultations. She has taught us all the methodology to carry out in this research and how to present the research works as clearly as possible. Apart from that, she also thought us a few core values that we should be practicing. It was really a great honor to work and study under her guidance. We all are extremely grateful for what she has offered us. We would also like to thank her for her empathy and great sense of humor.

We are extending our special thanks to our parents for their prayers, love and never-ending support and not to miss out their sacrifices for educating and preparing for our future.

Finally, our thanks go to all the people who have supported and helped us to complete the research work directly or indirectly.

## **ABSTRACT**

The purpose of this research is to evaluate efficiency of life insurance and Takaful companies in Malaysia by comparing the efficiency result based on integrating of Data Envelopment Analysis (DEA) with Analytic Hierarchy Process (AHP) and Data Envelopment Analysis (DEA) with Fuzzy Analytic Hierarchy Process (FAHP) during the period 2015-2017. The output-input data consist of 19 life insurance and Takaful companies in Malaysia were chosen as the sample of the study. This research develops the output orientation CCR model to measure the efficiency. This study utilizes two inputs and two outputs; commission expenses and management expenses as well as net premium and net investment income. The secondary data has been collected from each company's annual financial report respectively. This paper has compared the three models which are DEA, DEA/Fuzzy AHP and DEA/AHP. The result showed that DEA model produces many efficient units and many zero weights for three consecutive years. Then, by integrating Fuzzy AHP and AHP into DEA the number of efficient units has been reduced. Besides that, by using the DEA/Fuzzy AHP model the number of zero weights has been reduced. While by using DEA/AHP model, the number of zero weights has been eliminated. It shows that the discrimination power has been increased when expert judgement being considered.
