Multiple Positive solutions of Sturm-Liouville problems for second order singular and impulsive differential equations

Ying He¹

Abstract

In this paper, we study the existence of multiple positive solutions of nonlinear singular two-point boundary value problems for second-order impulsive differential equations. The proof is based on the theory of fixed point index in cones.

Mathematics Subject Classification: 34B15

Keywords: Multiple positive solutions; Singular two-point boundary value problem; Second-order impulsive differential equations; Fixed point index in cones.

1 Introduction

Impulsive differential equations play a very important role in modern applied mathematics due to their deep physical background and broad application. In this paper,we consider the existence of multiple positive solutions of two-point boundary value problems for nonlinear second-order singular and impulsive differential equations:

$$\begin{aligned} -Lu &= h(x)g(x,u), & x \in I', \\ -\Delta(pu')|_{x=x_k} &= I_k(u(x_k)), & k = 1, 2, \cdots, m, \\ \Delta(pu)|_{x=x_k} &= \overline{I}_k(u(x_k)), & k = 1, 2, \cdots, m, \\ R_1(u) &= \alpha u(0) - \beta u'(0) = 0, \\ R_2(u) &= \gamma u(1) + \delta u'(1) = 0, \end{aligned}$$
(1.1)

here Lu = (p(x)u')' + q(x)u is sturm-liouville operator, $I = [0,1], I' = I \setminus \{x_1, x_2, \cdots, x_m\}$ and $0 < x_1 < x_2 < \cdots < x_m < 1$ are given, $R^+ = [0, +\infty), g \in C(I \times R^+, R^+), I_k, \overline{I}_k \in C(R^+, R^+), \Delta(pu')|_{x=x_k} = p(x_k)u'(x_k^+) - p(x_k)u'(x_k^-), \Delta(pu)|_{x=x_k} = p(x_k)u(x_k^+) - p(x_k)u(x_k^-)u'(x_k^+), u(x_k^+)(u'(x_k^-), u(x_k^-)))$ denote the right limit (left limit) of u'(x) and u(x) at $x = x_k$ respectively, $h(x) \in C(I, R^+)$ and may be singular at x = 0 or x = 1.

Throughout this paper, we always suppose that $(S_1) \quad p(x) \in C^1([0,1], R), \ p(x) > 0, \ q(x) \in C([0,1], R), \ q(x) \le 0, \ \alpha, \beta, \gamma, \delta \ge 0, \ \rho = \beta \gamma + \alpha \gamma + \alpha \delta > 0.$

It is well known that there are abundant results about the existence of positive solutions of boundary value problems for second order impulsive differential equations. Some works can be found in [1,3,6-9] and references therein. They, mainly investigated the case p(x) = 1 and q(x) = 0. In this paper ,we will consider the case $p(x) \neq 1$, and $q(x) \neq 0$. Here we also mention that second order dynamic inclusions on time scales with impulses has been studied in [2]. We obtain the existence results of positive solutions, by means of the fixed point index theorem in cones under some conditions on g(x, u) concerning the first eigenvalue corresponding to the relevant linear operator.

To conclude the introduction, we introduce the following notation:

$$g_0 = \liminf_{u \to 0^+} \min_{x \in [a,b]} \frac{g(x,u)}{u}, \ I_0(k) = \liminf_{u \to 0^+} \frac{I_k(u)}{u}, \ \overline{I}_0(k) = \liminf_{u \to 0^+} \frac{\overline{I}_k(u)}{u}$$
$$g_\infty = \liminf_{u \to +\infty} \min_{x \in [a,b]} \frac{g(x,u)}{u}, \ I_\infty(k) = \liminf_{u \to +\infty} \frac{I_k(u)}{u}, \ \overline{I}_\infty(k) = \liminf_{u \to +\infty} \frac{\overline{I}_k(u)}{u};$$

Moreover, for the simplicity in the following discussion, we introduce the following hypotheses.

 (H_1) :

$$g_0 + \frac{\sigma \sum_{k=1}^m (I_0(k)\phi_1(x_k) + \overline{I}_0(k)\phi_1'(x_k))}{\int_a^b \phi_1(x)h(x)dx} > \lambda_1,$$
$$g_\infty + \frac{\sigma \sum_{k=1}^m (I_\infty(k)\phi_1(x_k) + \overline{I}_\infty(k)\phi_1'(x_k))}{\int_a^b \phi_1(x)h(x)dx} > \lambda_1.$$

here $\sigma = \min\{\frac{m(a)}{m(1)}, \frac{n(b)}{n(0)}\}$ (see section 2), and $\phi_1(x)$ is the eigenfunction related to the smallest eigenvalue λ_1 of the eigenvalue problem $-L\phi = \lambda\phi h$, $R_1(\phi) = R_2(\phi) = 0$.

 (H_2) : There is a p > 0 such that $0 \le u \le p$ and $0 \le x \le 1$ implies

 $q(x,u) < \eta p, I_k(u) < \eta_k p, \overline{I}_k(u) < \overline{\eta}_k p$

here
$$\eta$$
, η_k , $\bar{\eta}_k \ge 0$, $\eta + \sum_{k=1}^m (\eta_k + \bar{\eta}_k) > 0$, $\eta \int_0^1 G(y, y)h(y)dy + \sum_{k=1}^m G(x_k, x_k)(\eta_k + \bar{\eta}_k) < 1$ and $G(x, y)$ is the Green's function of boundary value problem $-Lu = 0$, $R_1(u) = R_2(u) = 0$ (see section 2).
 $(H_3): \quad 0 < \int_1^0 G(y, y)h(y)dy < +\infty$

2 Preliminary Notes

In this paper, we shall consider the following space $PC(I, R) = \{u \in C(I, R); u|_{(x_k, x_{k+1})} \in C(x_k, x_{k+1}), u(x_k^-) = u(x_k), \exists u(x_k^+), k = 1, 2, \cdots, m\} PC'(I, R) = \{u \in C(I, R); u'|_{(x_k, x_{k+1})} \in C(x_k, x_{k+1}), u'(x_k^-) = u'(x_k), \exists u'(x_k^+), k = 1, 2, \cdots, m\} \text{ with the norm } \|u\|_{PC} = \sup_{x \in [0,1]} |u(x)|, \|u\|_{PC'} = \max\{\|u\|_{PC}, \|u'\|_{PC}\}, \text{ Then } PC(I, R), PC'(I, R) \text{ are Banach spaces.}$

Definition 2.1. A function $u \in PC'(I, R) \cap C^2(I', R)$ is a solution of (1.1), if it satisfies the differential equation

$$Lu + h(x)g(x, u) = 0, \quad x \in I'$$

and the function u satisfies conditions $\Delta(pu')|_{x=x_k} = -I_k(u(x_k)), \Delta(pu)|_{x=x_k} = \overline{I}_k(u(x_k))$ and $R_1(u) = R_2(u) = 0.$

Let $Q = I \times I$ and $Q_1 = \{(x, y) \in Q | 0 \le x \le y \le 1\}$, $Q_2 = \{(x, y) \in Q | 0 \le y \le x \le 1\}$. Let G(x, y) is the Green's function of the boundary value problem

$$-Lu = 0, R_1(u) = R_2(u) = 0.$$

Following from [4], G(x, y) can be written by

$$G(x,y) := \begin{cases} \frac{m(x)n(y)}{\omega}, & (x,y) \in Q_1, \\ \frac{m(y)n(x)}{\omega}, & (x,y) \in Q_2. \end{cases}$$
(2.1)

Lemma 2.2. Suppose that (S_1) holds, then the Green's function G(x, y), defined by (2.1), possesses the following properties: (i): $m(x) \in C^2(I, R)$ is increasing and m(x) > 0, $x \in (0, 1]$. (ii): $n(x) \in C^2(I, R)$ is decreasing and n(x) > 0, $x \in [0, 1)$. (iii): $(Lm)(x) \equiv 0$, $m(0) = \beta$, $m'(0) = \alpha$. (iv): $(Ln)(x) \equiv 0$, $n(1) = \delta$, $n'(1) = -\gamma$. (v): ω is a positive constant. Moreover, $p(x)(m'(x)n(x) - m(x)n'(x)) \equiv \omega$. (vi): G(x, y) is continuous and symmetrical over Q. (vii): G(x, y) has continuously partial derivative over Q_1 , Q_2 . (viii): For each fixed $y \in I$, G(x, y) satisfies LG(x, y) = 0 for $x \neq y$, $x \in I$. Moreover, $R_1(G) = R_2(G) = 0$ for $y \in (0, 1)$. (viiii): G'_x has discontinuous point of the first kind at x = y and

$$G'_x(y+0,y) - G'_x(y-0,y) = -\frac{1}{p(y)}, \ y \in (0,1).$$

Following from Lemma2.2, it is easy to see that:

$$G(x,y) \le G(y,y) = \frac{m(y)n(y)}{\omega}, \ x,y \in [0,1]$$

$$G(x,y) \ge \sigma G(y,y), x \in [a,b], y \in [0,1],$$
(2.2)

where $a \in (0, t_1], b \in [t_m, 1), 0 < \sigma = \min\{\frac{m(a)}{m(1)}, \frac{n(b)}{n(0)}\} < 1$

Consider the linear Sturm-Liouvile problem

$$-(Lu)(x) = \lambda u(x)h(x), \quad R_1(u) = R_2(u) = 0.$$

By the Sturm-Liouvile theory of ordinary differential equations, we know that there exists an eigenfunction $\phi_1(x)$ with respect to the first eigenvalue $\lambda_1 > 0$ such that $\phi_1(x) > 0$ for $x \in (0, 1)$.

Let *E* be a Banach space and $K \subset E$ be a closed convex cone in *E*. For r > 0, let $K_r = \{u \in K : ||u|| < r\}$ and $\partial K_r = \{u \in K : ||u|| = r\}$. The following two Lemmas are needed in our argument.

Lemma 2.3. Let $\Phi : K \to K$ be a continuous and completely continuous mapping and $\Phi u \neq u$ for $u \in \partial K_r$. Thus the following conclusions hold: (i) If $||u|| \leq ||\Phi u||$ for $u \in \partial K_r$, then $i(\Phi, K_r, K) = 0$; (ii) If $||u|| \geq ||\Phi u||$ for $u \in \partial K_r$, then $i(\Phi, K_r, K) = 1$.

Lemma 2.4. Let $\Phi : K \to K$ be a continuous and completely continuous mapping. Suppose that the following two conditions are satisfied:

(i) $\inf_{u \in \partial K_r} ||\Phi u|| > 0;$ (ii) $\mu \Phi u \neq u$ for every $u \in \partial K_r$ and $\mu \ge 1$. Then, $i(\Phi, K_r, K) = 0$.

In applications below, we take E = C(I, R) and define

$$K = \{ u \in C(I, R) : u(x) \ge \sigma ||u||, x \in [a, b] \}.$$

One may readily verify that K is a cone in E.

Define an operator $\Phi: K \to K$ by

$$(\Phi u)(x) = \int_0^1 G(x, y)h(y)g(y, u(y))dy + \sum_{0 < x_k < x} G(x, x_k)(I_k(u(x_k)) + \overline{I}_k(u(x_k))), \ x \in I$$

It follows form (H_3) that ϕ is well defined.

Lemma 2.5. If (H_3) is satisfied, then $\Phi : K \to K$ is continuous and completely continuous, Moreover, $\Phi(K) \subset K$.

Proof By the property of continuous of g(x, u), $I_k(x)$, $\overline{I}_k(x)$, it is easy to see that $\Phi: K \to K$ is continuous and completely continuous. Thus we only need to show $\Phi(K) \subset K$. In fact, for $u \in K$, by using inequalities (2.2) and (H₃), we have that

$$\|\Phi u\| \le \int_0^1 G(y,y)h(y)g(y,u(y))dy + \sum_{0 < x_k < x} G(x_k,x_k)(I_k(u(x_k)) + \bar{I}_k(u(x_k))) < +\infty$$

On the other hand , for any $x \in [a, b]$, by (2.2) we obtain

$$\begin{aligned} (\Phi u)(x) &= \int_{0}^{1} G(x,y)h(y)g(y,u(y))dy + \sum_{0 < x_{k} < x} G(x,x_{k})(I_{k}(u(x_{k})) + \overline{I}_{k}(u(x_{k})))) \\ &\geq \int_{b}^{a} G(x,y)h(y)g(y,u(y))dy + \sum_{0 < x_{k} < x} G(x,x_{k})(I_{k}(u(x_{k})) + \overline{I}_{k}(u(x_{k})))) \\ &\geq \sigma \left(\int_{1}^{0} G(y,y)h(y)g(y,u(y))dy + \sum_{0 < x_{k} < x} G(x_{k},x_{k})(I_{k}(u(x_{k})) + \overline{I}_{k}(u(x_{k})))) \right) \\ &\geq \sigma \|\Phi u\| \end{aligned}$$

Thus, $\Phi(K) \subset K$.

Lemma 2.6. If u is a fixed point of the operator Φ , then u is a solution of problem (1.1).

3 Main Results

Lemma 3.1. If (H_2) is satisfied, then $i(\Phi, K_p, K) = 1$.

Proof Let $u \in K$ with ||u|| = p. It follows from (H_2) that

$$\begin{aligned} \|\Phi u\| &\leq \int_0^1 G(y,y)h(y)g(y,u(y))dy + \sum_{k=1}^m G(x_k,x_k)(I_k(u(x_k)) + \overline{I}_k(u(x_k)))) \\ &\leq p[\eta \int_0^1 G(y,y)h(y)dy + \sum_{k=1}^m G(x_k,x_k)(\eta_k + \overline{\eta}_k)]$$

Thus

 $\|\Phi u\| < \|u\|, \quad \forall \ u \in \partial K_p.$

It is obvious that $\Phi u \neq u$ for $u \in \partial K_p$. Therefore, $i(\Phi, K_p, K) = 1$, here we use Lemma2.3.

Theorem 3.2. Assume that $(H_1) - (H_3)$ are satisfied. Then problem (1.1) has at least two positive solutions u_1 and u_2 with

$$0 < ||u_1|| < p < ||u_2||.$$

Proof According to Lemma 3.1, we have that

$$i(\Phi, K_p, K) = 1.$$
 (3.1)

Since (H_1) holds, then there exists $0 < \varepsilon < 1$ such that

$$(1-\varepsilon)[g_0 + \frac{\sigma \sum_{k=1}^m (I_0(k)\phi_1(x_k) + \overline{I}_0(k)\phi_1'(x_k))}{\int_a^b \phi_1(x)h(x)dx}] > \lambda_1,$$

$$(1-\varepsilon)[g_\infty + \frac{\sigma \sum_{k=1}^m (I_\infty(k)\phi_1(x_k) + \overline{I}_\infty(k)\phi_1'(x_k))}{\int_a^b \phi_1(x)h(x)dx}] > \lambda_1.$$
(3.2)

By the definitions of g_0 , I_0 , one can find $0 < r_0 < p$ such that

$$g(x, u) \ge g_0(1-\varepsilon)u, \ I_k(u) \ge I_0(k)(1-\varepsilon)u, \ \overline{I}_k(u) \ge \overline{I}_0(k)(1-\varepsilon)u \ \forall x \in [a, b], \ 0 < u < r_0.$$

Let $r \in (0, r_0)$, then for $u \in \partial K_r$, we have

$$u(x) \ge \sigma \|u\| = \sigma r > 0. \quad x \in [a, b]$$

Thus

$$\begin{split} (\Phi u)(\frac{1}{2}) &= \int_{0}^{1} G(\frac{1}{2}, y)h(y)g(y, u(y))dy + \sum_{0 < x_{k} < \frac{1}{2}} G(\frac{1}{2}, x_{k})(I_{k}(u(x_{k})) + \overline{I}_{k}(u(x_{k})))) \\ &\geq \int_{a}^{b} G(\frac{1}{2}, y)h(y)g(y, u(y))dy + \sum_{0 < x_{k} < \frac{1}{2}} G(\frac{1}{2}, x_{k})(I_{k}(u(x_{k})) + \overline{I}_{k}(u(x_{k})))) \\ &\geq g_{0}(1 - \varepsilon) \int_{a}^{b} G(\frac{1}{2}, y)h(y)u(y)dy + (1 - \varepsilon) \sum_{0 < x_{k} < \frac{1}{2}} G(\frac{1}{2}, x_{k})I_{0}(k)u(x_{k}) \\ &+ (1 - \varepsilon) \sum_{0 < x_{k} < \frac{1}{2}} G(\frac{1}{2}, x_{k})\overline{I}_{0}(k)u(x_{k}) \\ &\geq (1 - \varepsilon)\sigma r \left(g_{0} \int_{a}^{b} G(\frac{1}{2}, y)h(x)dy + \sum_{0 < x_{k} < \frac{1}{2}} G(\frac{1}{2}, x_{k})(I_{0}(k) + \overline{I}_{0}(k))\right) > 0 \end{split}$$

from which we see that $\inf_{u \in \partial K_r} ||\Phi u|| > 0$, namely, hypothesis (i) of Lemma 2.4 holds. Next we show that $\mu \Phi u \neq u$ for any $u \in \partial K_r$ and $\mu \geq 1$.

If this is not true, then there exist $u_0 \in \partial K_r$ and $\mu_0 \ge 1$ such that $\mu_0 \Phi u_0 = u_0$. Note that $u_0(x)$ satisfies

$$\begin{cases}
Lu_0 + \mu_0 h(x)g(x, u_0(x)) = 0, & x \in I', \\
-\Delta(pu'_0)|_{x=x_k} = \mu_0 I_k(u_0(x_k)), & k = 1, 2, \cdots, m, \\
\Delta(pu_0)|_{x=x_k} = \mu_0 \overline{I}_k(u_0(x_k)), & k = 1, 2, \cdots, m, \\
\alpha u_0(0) - \beta u'_0(0) = 0, \\
\gamma u_0(1) + \delta u'_0(1) = 0.
\end{cases}$$
(3.3)

Multiply equation (3.3) by $\phi_1(x)$ and integrate from a to b, note that

$$\begin{split} & \int_{a}^{b} \phi_{1}(x)[(p(x)u_{0}'(x))' + q(x)u_{0}(x)]dx = \int_{a}^{x_{1}} \phi_{1}(x)[(p(x)u_{0}'(x))' + q(x)u_{0}(x)]dx \\ & + \sum_{k=1}^{m-1} \int_{x_{k}}^{x_{k+1}} \phi_{1}(x)[(p(x)u_{0}'(x))' + q(x)u_{0}(x)]dx \\ & + \int_{x_{m}}^{b} \phi_{1}(x)[(p(x)u_{0}'(x))' + q(x)u_{0}(x)]dx \\ & = \phi_{1}(x_{1})p(x_{1})u_{0}'(x_{1} - 0) - \int_{a}^{x_{1}} p(x)u_{0}'(x)\phi_{1}'(x)dx + \int_{a}^{x_{1}} q(x)u_{0}(x)\phi_{1}(x)dx \\ & + \sum_{k=1}^{m-1} [\phi_{1}(x_{k+1})p(x_{k+1})u_{0}'(x_{k+1} - 0) - \phi_{1}(x_{k})p(x_{k})u_{0}'(x_{k} + 0) \\ & - \int_{x_{k}}^{x_{k+1}} p(x)u_{0}'(x)\phi_{1}'(x)dx + \int_{x_{k}}^{x_{k+1}} q(x)u_{0}(x)\phi_{1}(x)dx \\ & - \phi_{1}(x_{m})p(x_{m})u_{0}'(x_{m} + 0) - \int_{x_{m}}^{b} p(x)u_{0}'(x)\phi_{1}'(x)dx + \int_{x_{m}}^{b} q(x)u_{0}(x)\phi_{1}(x)dx \\ & = -\sum_{k=1}^{m} \Delta(p(x_{k})u_{0}'(x_{k}))\phi_{1}(x_{k}) - \int_{a}^{b} p(x)\phi_{1}'(x)u_{0}'(x)dx + \int_{a}^{b} q(x)\phi_{1}(x)u_{0}(x)dx \end{split}$$

Also note that

$$\int_{a}^{b} p(x)\phi_{1}'(x)u_{0}'(x)dx = \int_{a}^{x_{1}} p(x)\phi_{1}'(x)du_{0}(x) + \sum_{k=1}^{m-1} \int_{x_{k}}^{x_{k+1}} p(x)\phi_{1}'(x)du_{0}(x)$$

$$+ \int_{x_{m}}^{b} p(x)\phi_{1}'(x)du_{0}(x)$$

$$= -\sum_{k=1}^{m} \Delta(p(x_{k})u_{0}(x_{k}))\phi_{1}'(x_{k}) - \int_{a}^{b} u_{0}(x)(p(x)\phi_{1}'(x))'dx$$

$$= -\sum_{k=1}^{m} \Delta(p((x_{k})u_{0}(x_{k}))\phi_{1}'(x_{k}) + \int_{a}^{b} u_{0}(x)q(x)\phi_{1}(x)dx + \lambda_{1} \int_{a}^{b} h(x)\phi_{1}(x)u_{0}(x)dx$$

$$\int_{a}^{b} \phi_{1}(x)[(p(x)u_{0}'(x))' + q(x)u_{0}(x)]dx = -\sum_{k=1}^{m} \Delta(p(x_{k})u_{0}'(x_{k}))\phi_{1}(x_{k})$$
$$+ \sum_{k=1}^{m} \Delta(p(x_{k})u_{0}(x_{k}))\phi_{1}'(x_{k}) - \lambda_{1}\int_{a}^{b} h(x)\phi_{1}(x)u_{0}(x)dx$$
$$= \sum_{k=1}^{m} \mu_{0}(I_{k}(u_{0}(x_{k}))\phi_{1}(x_{k}) + \overline{I}_{k}(u_{0}(x_{k}))\phi_{1}'(x_{k})) - \lambda_{1}\int_{a}^{b} u_{0}(x)h(x)\phi_{1}(x)dx$$

So we obtain

$$\begin{split} \lambda_1 \int_a^b u_0(x) h(x) \phi_1(x) dx &= \sum_{k=1}^m \mu_0(I_k(u_0(x_k)) \phi_1(x_k) + \overline{I}_k(u_0(x_k)) \phi_1'(x_k)) \\ &+ \mu_0 \int_a^b \phi_1(x) h(x) g(x, u_0(x)) dx \\ \geq (1 - \varepsilon) \sum_{k=1}^m u_0(x_k) (I_0(k) \phi_1(x_k) + \overline{I}_0(k) \phi_1'(x_k)) \\ &+ (1 - \varepsilon) g_0 \int_a^b \phi_1(x) u_0(x) h(x) dx \end{split}$$

Since $u_0(x) \ge \sigma ||u_0|| = \sigma r$, we have $\int_a^b \phi_1(x)u_0(x)h(x)dx > 0$ and $\sum_{k=1}^m u_0(x_k)(I_0(k)\phi_1(x_k) + \overline{I}_0(k)\phi_1'(x_k)) > 0$. So from the above inequality we see that $\lambda_1 > (1 - \varepsilon)g_0$. Thus

$$\begin{aligned} [\lambda_1 - (1 - \varepsilon)g_0] \int_a^b u_0(x)h(x)\phi_1(x)dx &\geq (1 - \varepsilon)\sum_{k=1}^m (I_0(k)\phi_1(x_k) + \overline{I}_0(k)\phi_1'(x_k))u_0(x_k) \\ &\geq (1 - \varepsilon)\sigma r\sum_{k=1}^m (I_0(k)\phi_1(x_k) + \overline{I}_0(k)\phi_1'(x_k)). \end{aligned}$$

Since $\int_a^b u_0(x)h(x)\phi_1(x)dx \le r \int_a^b \phi_1(x)h(x)dx$, we have

$$[\lambda_1 - (1 - \varepsilon)g_0] \int_a^b h(x)\phi_1(x)dx \ge (1 - \varepsilon)\sigma \sum_{k=1}^m (I_0(k)\phi_1(x_k) + \overline{I}_0(k)\phi_1'(x_k)),$$

which contradicts (3.2) again. Hence Φ satisfies the hypotheses of Lemma 2.4 in K_r . Thus

$$i(\Phi, K_r, K) = 0.$$
 (3.4)

On the other hand, from (H_1) , there exists H > p such that for any $x \in [a, b], u \geq H$.

$$g(x,u) \ge g_{\infty}(1-\varepsilon)u, \ I_k(u) \ge I_{\infty}(k)(1-\varepsilon)u, \ \overline{I}_k(u) \ge \overline{I}_{\infty}(k)(1-\varepsilon)u, \ (3.5)$$

Let

$$C = \max_{0 \le u \le H} \max_{a \le x \le b} |g(x, u) - g_{\infty}(1 - \varepsilon)u| + \sum_{k=1}^{m} \max_{0 \le u \le H} |I_{k}(u) - I_{\infty}(k)(1 - \varepsilon)u| + \sum_{k=1}^{m} \max_{0 \le u \le H} |\overline{I}_{k}(u) - \overline{I}_{\infty}(k)(1 - \varepsilon)u|.$$
 It is clear that for any $x \in [a, b], u \ge 0$.
$$g(x, u) \ge g_{\infty}(1 - \varepsilon)u - C, \ I_{k}(u) \ge I_{\infty}(k)(1 - \varepsilon)u - C, \ \overline{I}_{k}(u) \ge \overline{I}_{\infty}(k)(1 - \varepsilon)u - C,$$
(3.6)

Choose $R > R_0 := \max\{\frac{H}{\sigma}, p\}$ and let $u \in \partial K_R$. Since $u(x) \ge \sigma ||u|| = \sigma R > H$ for $x \in [a, b]$, from (3.5) we see that

$$g(x, u(x)) \ge g_{\infty}(1 - \varepsilon)u(x) \ge \sigma g_{\infty}(1 - \varepsilon)R, \ \forall \ x \in [a, b].$$
$$I_{k}(u(x_{k}) \ge \sigma I_{\infty}(k)(1 - \varepsilon)R, \ \overline{I}_{k}(u(x_{k}) \ge \sigma \overline{I}_{\infty}(k)(1 - \varepsilon)R.$$

Essentially the same reasoning as above yields $\inf_{u \in \partial K_R} ||\Phi u|| > 0$. Next we show that if R is large enough, then $\mu \Phi u \neq u$ for any $u \in \partial K_R$ and $\mu \ge 1$. In fact, if there exist $u_0 \in \partial K_R$ and $\mu_0 \ge 1$ such that $\mu_0 \Phi u_0 = u_0$, then $u_0(x)$ satisfies equation (3.3).

Multiply equation (3.3) by $\phi_1(x)$ and integrate from a to b, using integration by parts in the left side to obtain

$$\begin{split} \lambda_1 \int_a^b u_0(x)h(x)\phi_1(x)dx &= \sum_{k=1}^m \mu_0(I_k(u_0(x_k))\phi_1(x_k) + \overline{I}_k(u_0(x_k))\phi_1'(x_k)) \\ &+ \mu_0 \int_a^b \phi_1(x)h(x)g(x,u_0(x))dx \\ &\geq (1-\varepsilon)\sum_{k=1}^m (I_\infty(k)\phi_1(x_k) + \overline{I}_\infty(k)\phi_1'(x_k))u_0(x_k) + (1-\varepsilon)g_\infty \int_a^b u_0(x)\phi_1(x)h(x)dx \\ &- C\left(\sum_{k=1}^m (\phi_1(x_k) + \phi_1'(x_k)) + \int_a^b \phi_1(x)h(x)dx\right). \end{split}$$

If $g_{\infty} \leq \lambda_1$, then we have

$$\begin{aligned} & [\lambda_1 - (1 - \varepsilon)g_{\infty}] \int_a^b u_0(x)h(x)\phi_1(x)dx + C\left(\sum_{k=1}^m (\phi_1(x_k) + \phi_1'(x_k)) + \int_a^b \phi_1(x)h(x)dx\right) \\ \geq & (1 - \varepsilon)\sum_{k=1}^m (I_{\infty}(k)\phi_1(x_k) + \overline{I}_{\infty}(k)\phi_1'(x_k))u_0(x_k). \end{aligned}$$

thus

$$\|u_0\|[\lambda_1 - (1 - \varepsilon)g_\infty] \int_a^b h(x)\phi_1(x)dx + C\left(\sum_{k=1}^m (\phi_1(x_k) + \phi_1'(x_k)) + \int_a^b \phi_1(x)h(x)dx\right) \\ \ge (1 - \varepsilon)\sigma\|u_0\|\sum_{k=1}^m (I_\infty(k)\phi_1(x_k) + \overline{I}_\infty(k)\phi_1'(x_k)).$$

and

$$\|u_0\| \leq \frac{C\left(\sum_{k=1}^{m} (\phi_1(x_k) + \phi_1'(x_k)) + \int_a^b \phi_1(x)h(x)dx\right)}{(1-\varepsilon)\sigma\sum_{k=1}^{m} (I_{\infty}(k)\phi_1(x_k) + \overline{I}_{\infty}(k)\phi_1'(x_k)) - [\lambda_1 - (1-\varepsilon)g_{\infty}]\int_a^b \phi_1(x)h(x)dx}$$

=: \overline{R} . (3.7*a*)

If $g_{\infty} > \lambda_1$, we can choose $\varepsilon > 0$ such that $(1 - \varepsilon)g_{\infty} > \lambda_1$, then we have

$$C\left(\sum_{k=1}^{m} (\phi_1(x_k) + \phi_1'(x_k)) + \int_a^b \phi_1(x)h(x)dx\right) \geq [(1-\varepsilon)g_\infty - \lambda_1]\int_a^b \phi_1(x)u_0(x)h(x)dx$$
$$\geq [(1-\varepsilon)g_\infty - \lambda_1]\sigma \|u_0\| \int_a^b \phi_1(x)h(x)dx$$

Thus

$$\|u_0\| \le \frac{C\left(\sum_{k=1}^{m} (\phi_1(x_k) + \phi_1'(x_k)) + \int_a^b \phi_1(x)h(x)dx\right)}{[(1-\varepsilon)g_{\infty} - \lambda_1]\sigma \int_a^b \phi_1(x)h(x)dx} =: \bar{R}.$$
 (3.7_b)

Let $R > \max\{p, \overline{R}\}$, then for any $u \in \partial K_R$ and $\mu \ge 1$, we have $\mu \Phi u \neq u$. Hence hypothesis (ii) of Lemma 2.4 is satisfied and

$$i(\Phi, K_R, K) = 0.$$
 (3.8)

In view of (3.1), (3.4) and (3.8), we obtain

$$i(\Phi, K_R \setminus \overline{K}_p, K) = -1, \ i(\Phi, K_p \setminus \overline{K}_r, K) = 1.$$

Then Φ has fixed points u_1 and u_2 in $K_p \setminus \overline{K}_r$ and $K_R \setminus \overline{K}_p$, respectively, which means $u_1(x)$ and $u_2(x)$ are positive solution of the problem (1.1) and $0 < ||u_1|| < p < ||u_2||$. **Corollary 3.3.** The conclusion of Theorem 3.2 is valid if (H_1) is replaced by

(H₁^{*})
$$g_0 = \infty \text{ or } \sum_{k=1}^m I_0(k)\phi_1(x_k) = \infty \text{ or } \sum_{k=1}^m \overline{I}_0(k)\phi_1'(x_k) = \infty;$$

and

$$g_{\infty} = \infty$$
 or $\sum_{k=1}^{m} I_{\infty}(k)\phi_1(x_k) = \infty$ or $\sum_{k=1}^{m} \overline{I}_{\infty}(k)\phi'_1(x_k) = \infty$.

Example 3.4.

$$\begin{cases}
Lu + \frac{1}{2}(u^{\frac{1}{3}} + u^{3}) = 0, & x \in I', \\
-\Delta(pu')|_{x=x_{k}} = c_{k}u(x_{k}), & c_{k} \ge 0, \\
\Delta(pu)|_{x=x_{k}} = d_{k}u(x_{k}), & d_{k} \ge 0, \\
R_{1}(u) = \alpha u(0) - \beta u'(0) = 0, \\
R_{2}(u) = \gamma u(1) + \delta u'(1) = 0,
\end{cases}$$
(3.9)

here Lu = (p(x)u')' + q(x)u. Assume that (S_1) is satisfied. Then problem (3.9) has at least two positive solutions u_1 and u_2 with

$$0 < ||u_1|| < 1 < ||u_2||$$

provided

$$1 < \frac{1}{d} \left(1 - \sum_{k=1}^{m} G(x_k, x_k) (c_k + d_k) \right), \quad d = \int_0^1 G(y, y) dy.$$
(3.10)

Proof To see this we will apply Theorem 3.2 (or Corollary 3.3). By (3.10), $\eta > 0$ is chosen such that

$$1 < \eta < \frac{1}{d} (1 - \sum_{k=1}^{m} G(x_k, x_k)(c_k + d_k)).$$

 Set

$$g(x,u) = \frac{1}{2}(u^{\frac{1}{3}} + u^{3}).$$

Note

$$g_0 = \infty, \qquad g_\infty = \infty,$$

so (H_1) (or (H_1^*)) holds.

Let $\eta_k = c_k, \bar{\eta}_k = d_k$, then $\eta, \eta_k, \bar{\eta}_k$ satisfy

$$\eta \int_0^1 G(y,y)dy + \sum_{k=1}^m G(x_k,x_k)(\eta_k + \overline{\eta}_k) < 1.$$

Let p = 1, then for $0 \le u \le p$, we have

$$g(x,u) = \frac{1}{2}(u^{\frac{1}{3}} + u^3) \le \frac{1}{2} + \frac{1}{2} < \eta p = \eta,$$

and

$$I_k(u) = c_k u = \eta_k u \le \eta_k p, \quad \overline{I}_k(u) = d_k u = \overline{\eta}_k u \le \overline{\eta}_k p$$

thus (H_2) holds. The result now follows from Theorem 3.2 (or Corollary3.3).
