 Instituto Espanol de Oceanografia  
 Cabo Estay, Vigo, Spain

## Subarea 3

Status of the Fisheries

During 1992 three Spanish fleets fished in NAFO Convention area: pair-trawlers, fishing mainly for cod and partially for Greenland halibut, small freezers, fishing traditionally for flatfish but fishing mainly for Greenland halibut in 1992, and large freezers, fishing for Greenland halibut in deep water of Divisions 3LM.

Pair-trawl fishery for cod

There were 18 pair-trawlers fishing in NAFO area during 1992. The fleet left the area in June when the cod quotas were already caught. One observer was on board a pair-trawler. Sampling intensity of cod catch was:

Division:	3L	3M	3N
Samples	9	28	
Fish measured	2612	5066	
Otoliths aged	304	451	
Catch (t)	3822	4216	1927

Cod length and age frequency in those months with sampling are presented in Tables 1 and 2. In these tables SAMPLED CATCH means the catches from which samples were taken; frequencies are referred to the sample size. SAMPLED WEIGHT means the weight of all samples taken from the catch to make length measurements. Samples were not weighed on board; their weights were calculated with a length-weight relationship. SAMPLES means the number of samples taken, and MEAN WEIGHT is the quotient between Sampled Catch and Total (frequency).

Mean weights at age in the catch were also calculated with the same length-weight relationship. Results are presented in Table 3. In Table 2 SOP means Sum Of Products and it is a later calculation of sampled catch using age frequencies and weight at age data (Table 3). Under the headline "%" the quotient between SOP and Sampling catch is presented and expressed in percent. This figure means the proportion of Sampling catch covered by the sampling process. When the value is less than 100 it means that the same portion of the length range was not covered by otolith sampling.

As in previous reports, length and age frequencies presented in this report came from the bulk of the catch, including discards.

During 1992 some pair-trawlers, those with freezing capacity, moved occasionally to deep waters to fish Greenland halibut. The geographic area belongs mainly to statistical Division 3M, but the fishery was carried out on the Grand Bank side of the Flemish Pass. We use in tables the denomination 3LM for that zone of deep waters.

#### Groundfish fishery of small freezers

Thirteen small freezers, those traditionally fishing for flatfish, were fishing in NAFO area during 1992. Most of them moved to deep waters during the first half of the year to fish Greenland halibut in the same area described for pair-trawlers. One observer was on board at this time. Greenland halibut and witch flounder length frequencies are presented in Tables 4 and 5, respectively. Length frequencies are referred to the catch figure under SAMPLED CATCH in the table. Sampled catch was divided by sex using length frequencies and a length-weight relationship, and mean weight by sex was calculated after that. Under the headline "%" the quotient between SOP by sex and catch sampled is presented and expressed in percent.

During the second half of the year all vessels were fishing for Greenland halibut and each vessel had an observer on board. American plaice, cod and Greenland halibut length frequencies in the catch are presented in Tables 6, 7 and 8, respectively.

#### Greenland halibut fishery of large freezers

Twenty three bottom trawlers fished on Greenland halibut in the zone described of Divisions 3LM. Fishing was conducted in 700-1,500 meters depth, and Greenland halibut comprised the bulk of the catch. One of each three vessels had an observer on board sampling the catch. The length distribution of the catch is presented in Tables 9, 10 and 11, for Divisions 3L, 3M and 3N, respectively.

#### Special Research Studies

During 1992 we co-operated in the EEC survey of Flemish Cap, carried out in July. The survey had a bottom trawl stratified random design and 117 valid tows were made up to a depth of 720 meters (400 f.). Results of the survey are presented in the report (SCR Doc. 93/ ) and it includes age compositions for cod, American plaice, redfish (the three species of *Sebastes* sp) and Greenland halibut stocks.
