Outline

- ✓ **Cluster approach for SiC electronic and vibration properties modeling**
 - Motivation
 - Hierarchic computational approach
 - Local field model

- ✓ **TiO₂ electronic properties modeling using cluster approach**
 - Isolated TiO₂ clusters, N doped TiO₂, TiO₂ \dye

- ✓ **Electronic properties modeling of BiVO₄**

- ✓ **Summary/perspectives**

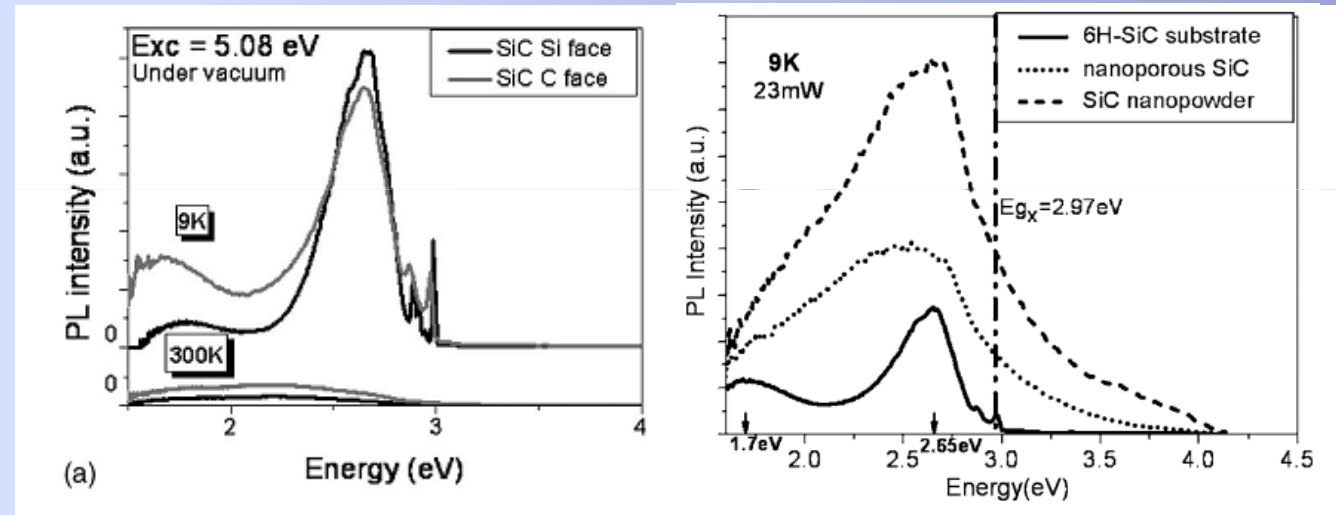

Scanning electron micrographs of MgB₂/SiC metamaterial

[N. Limberopoulos et al. *Appl. Phys. Lett.* 95, 023306 (2009)]

Silicon carbide is one of the most promising semiconductor materials for high power electronics as well as one of the best biocompatible materials due to its superior properties.

a) PL spectra taken on both sides of the crystalline 6H-SiC wafer at 9 and 300 K. b) Low temperature PL spectra of SiC wafer(C side), nanoporous SiC, and SiC nanopowder. [Botsoa et al. *J. Appl. Phys.*102, 083526 (2007)]

Silicon Carbide nanoparticles

Investigated SiC nanoparticles have different:

•Structure

3C – SiC
6H - SiC

•Size

10 – 50 nm

•C/Si ratio

C/Si
1.10 – 0.85

A high-resolution TEM image evidences the covering of the particle surface by carbon sheets

A. Kassiba, M. Makowska-Janusik, J. Boucle, J.F. Bardeau, A. Bulou, N. Herlin, M. Mayne, X. Arman, *Diamond and Related Materials* 11 (2002) 1243–1247

Model of SiC nanograins

Cluster model

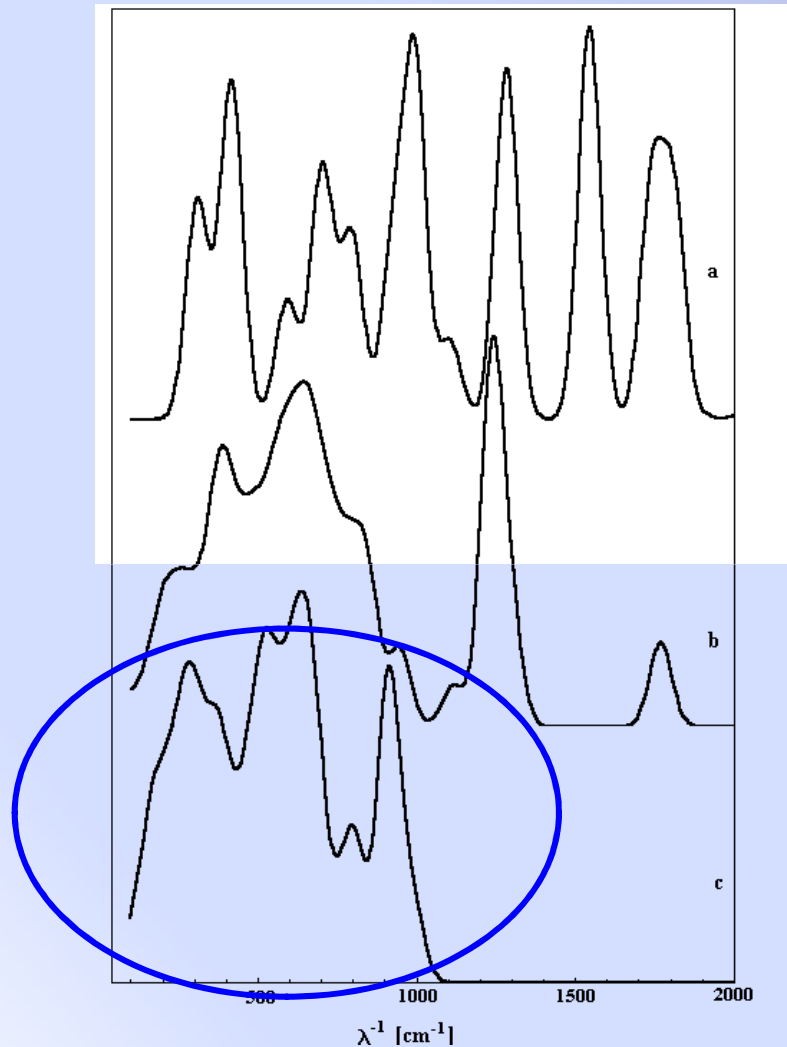

- ✓ Clusters possessing about 200 atoms
- ✓ Clusters covered with carbon

Simulated structures

- ✓ 3C-SiC and 6H-SiC ideal structures
- ✓ Partially reconstructed structure
- ✓ Amorphous structure of SiC

Test of cluster size

IR absorption spectra for 3C-SiC nanoclusters:
0.5 nm (a), 0.8 nm (b), 1.1 nm (c).

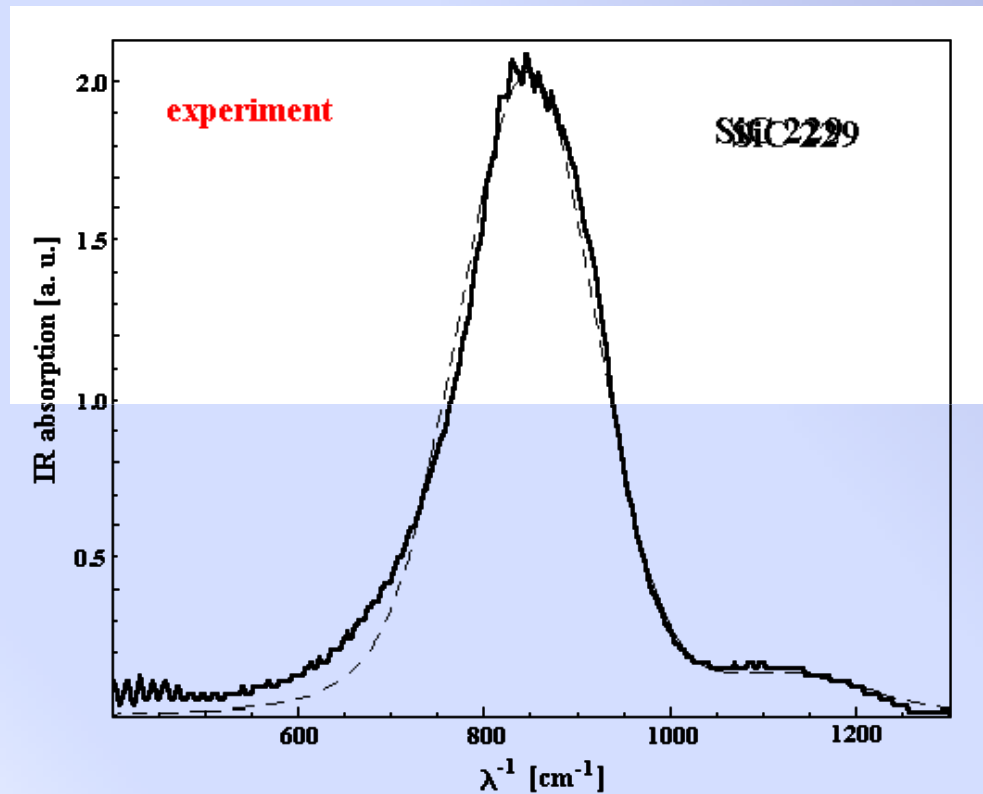

Phonon DOS for 3C-SiC nano-clusters :
0.5 nm (a), 0.8 nm (b), 1.1 nm (c).

M. Makowska-Janusik, A. Kassiba, J. Bouclé, J-F. Bardeau, S. Kodjikian, A. Désert,
J. Phys.: Condens. Matter, 33 (2005) 5101

IR absorption spectra for SiC nanoclusters

- *SiC amorphous structure*
- *β -SiC defected structure*

M. Makowska-Janusik, A. Kassiba, J. Bouclé, J-F. Bardeau, S. Kodjikian, A. Désert,
J. Phys.: Condens. Matter, 33 (2005) 5101

Characteristic of the host-guest silicone carbide based materials

- ✓ **In the investigated host-guest system the SiC nanoparticles are embedded into polymeric matrix (not grafted)**

Requirements:

- **The wt % of SiC nanoparticles should be appropriate in order to not agglomerate (3 – 6 wt %)**
- **Dissolution of small molecules in host material decreases its T_g . There should be chosen polymers with relatively high T_g and well transparent for light used in experiment**

Characteristic of the host-guest silicone carbide based materials

SiC where incorporated into polymeric matrix:

- ❖ PMMA
- ❖ PVK
- ❖ PC

TEM image of the composite PVK/SiC system. It shows the local dispersion of the nc-SiC in the polymer matrix.

J. Bouclé, A. Kassibaa, J. Emerya, I.V. Kityk, M. Makowska-Janusik, J. Sanetra, N. Herlin-Boime, M. Mayne, *Physics Letters A* 302 (2002) 196–202

Bulk system approach

Requirements:

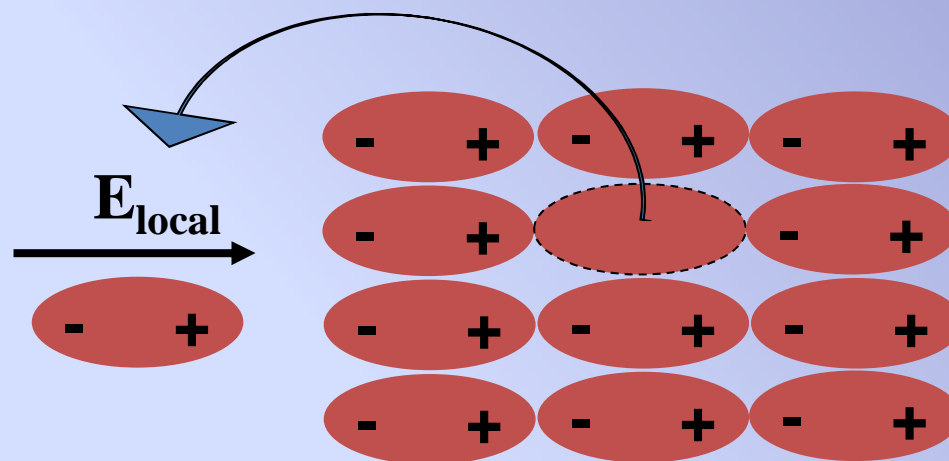

- SiC cluster should be separated one from the other (Drude nonpolar fluid model)
- Cluster should be big enough to model influence of polymer on structural properties of dopant
- The size of SiC cluster should allow the quantum – chemical calculations of optical

Local field

$$\mathbf{E}_{\text{loc}} = \mathbf{E}_{\text{ex}} + \mathbf{E}_{\text{el}} + \mathbf{E}_{\text{d}}$$

Calculated by removing molecule and evaluating field at the point of interest from neighbour charges and dipoles surrounding this point.

M. Makowska-Janusik et al., *J. Phys. Chem. B* 2004, 108, 588-596; M. Makowska-Janusik et al., *Theor Chem Acc* (2005) 114: 153–158

Parameters of molecular dynamics simulations

Density of the simulated systems 1.20 g/cm^3

PMMA 90-mer - molecular wt. 9012.58 amu

PC 50-mer – molecular wt. 12716.21 amu

PVK 50-mer – molecular wt. 9664,45 amu

SiC - 216 atoms - mass 4330.48 amu

PMMA/SiC - 48.05 wt %

PC/SiC - 34.05 wt %

PVK/SiC - 44.81 wt %

MM - molecular mechanics method

Force field - all-atom consistent valence force field (CVFF)

Boundary condition – 3D Ewald summation

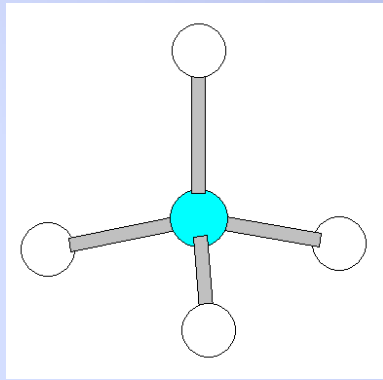

Cutoff – 1.30 nm

GROMACS:
The World's fastest Molecular
Dynamics - and it's GPL!

Cluster model

- ✓ Clusters possessing up to 200 atoms
- ✓ Clusters covered with carbon

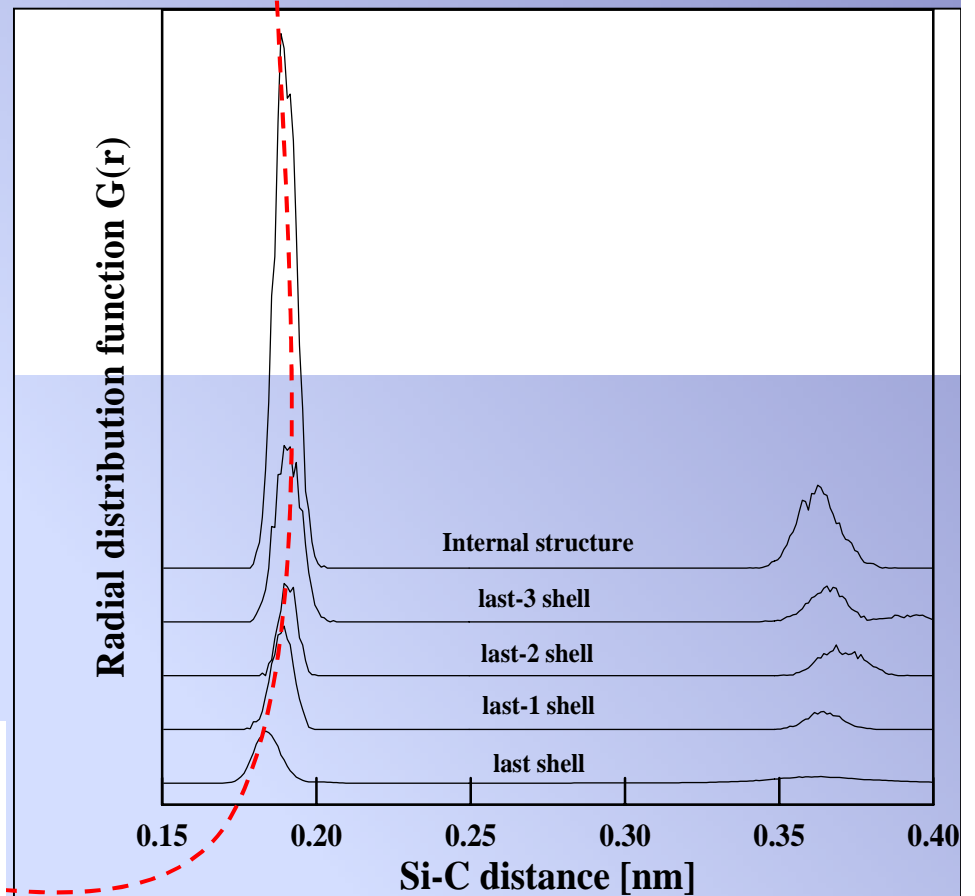

S-C distances

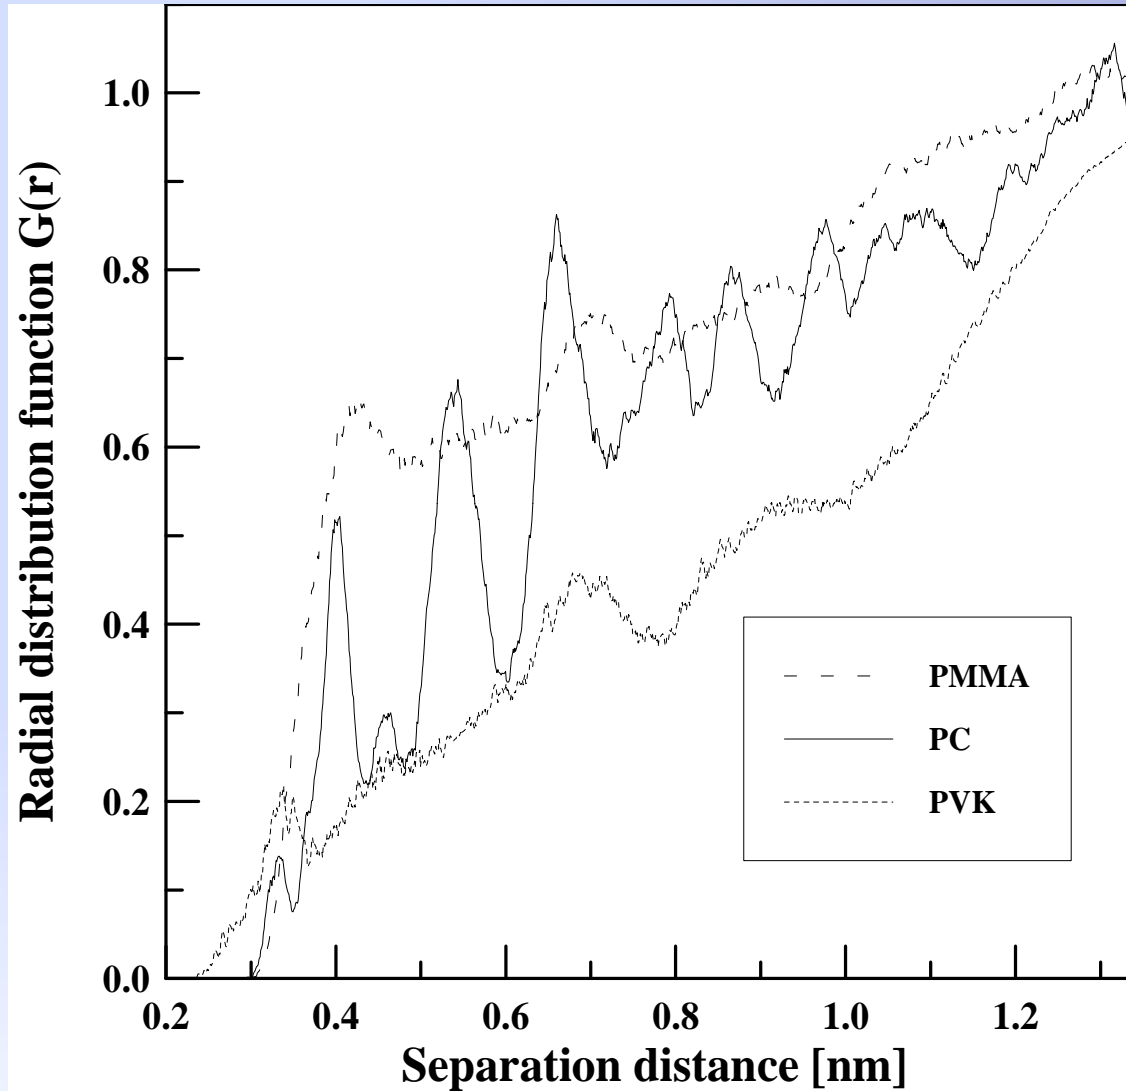

$$R_1 = 1.88 \text{ \AA}$$

$$R_2 = 3.61 \text{ \AA}$$

**Si-C distance it is
intrinsic cluster
property**

SiC – polymer distance

The shortest distance between
COM of SiC and polymer's groups

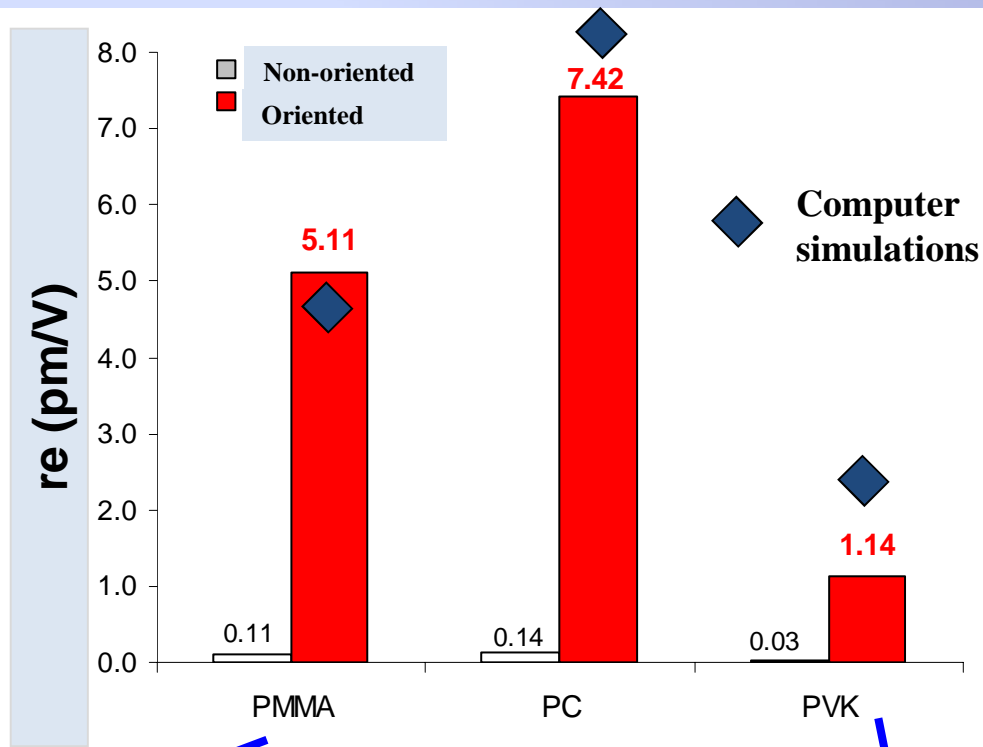

PMMA

PC

PVK

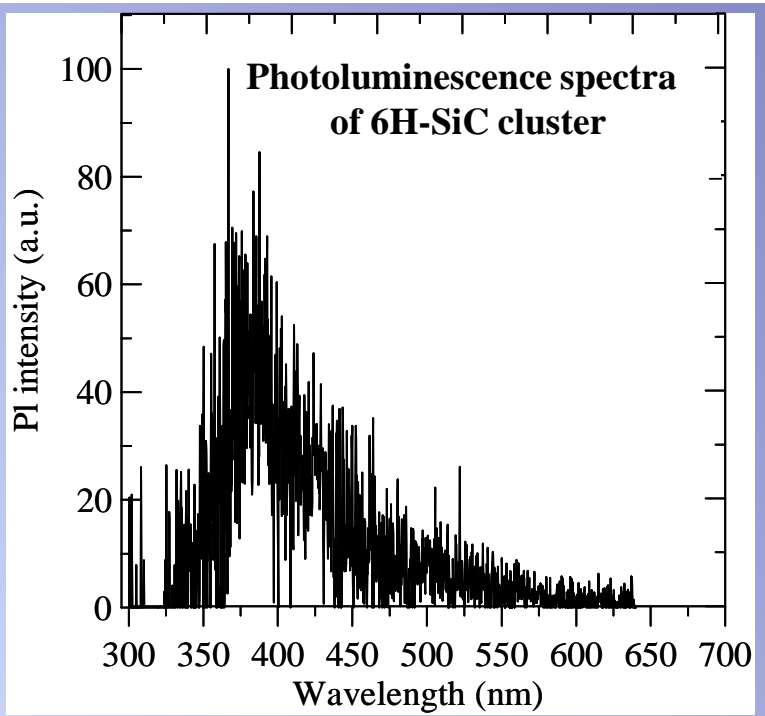

Electro-optical property of investigated systems

System parameters:
 1% SiC 218/1400°C, C/Si<1, d = 39 nm

ANATASE

TiO

RUTILE

TiO₂ and N-TiO₂ Nanoparticles Synthesis by Laser pyrolysis

B. Pignon et al. *Eur. J. Inorg. Chem.* (2008) 883

Liquid precursor - Titanium Isopropoxide (+ C₂H₄) (aerosol)

N-doping : addition of NH₃

Production rate - 20g/h (lab. scale)

+ soft annealing in air at 400°C (remove C)

TiO₂

$\langle d \rangle = 12.5 \pm 2.5$ nm

Anatase > 95 %

Wide band gap material ($E_g > 3\text{eV}$)

N-TiO₂

$\langle d \rangle = 7.5 \pm 1.8$ nm

Anatase > 95 %

N content = 0.5 at. %

- Cheap – abundant – non toxic
- Leads to best performance up to now
> 12% in 2011 with a liquid electrolyte

Doping procedures \Rightarrow photo-activity in the visible

A. Yella et al. *Science* 334 (2011) 629-634

Analysis of the computational method

For the analysis the anatase structure was chosen - It has the simplest and best known structure.

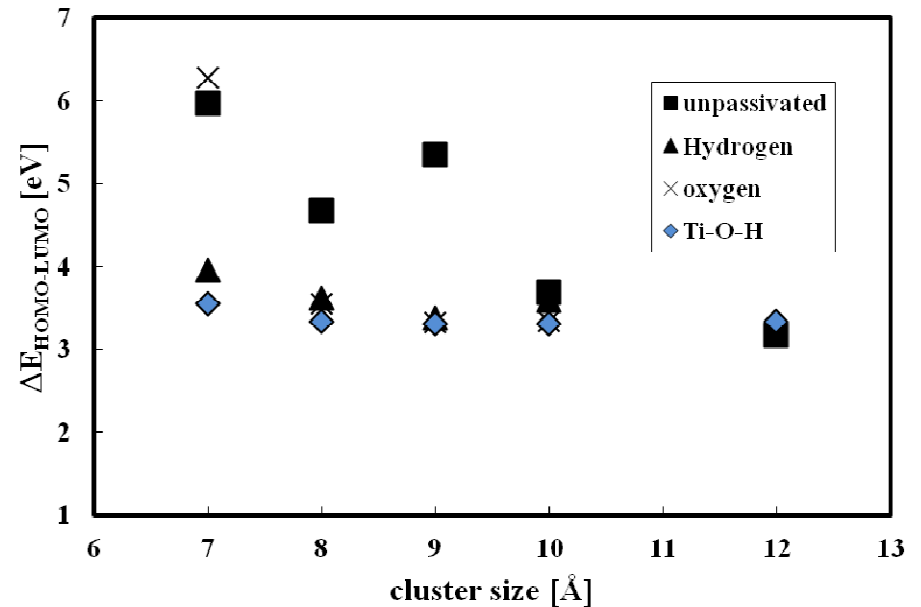

Total charge density redistribution

Semi-empirical PM7

The Ti atoms of rutil are octahedrally coordinated.

The strongly ionic character of the bonds results in localization of charge around the O^{2-} anions

- The passivation procedure is important for small clusters.
- For bigger clusters all passivation methods give the same results

RUTIL 3.06 eV experiment – bulk
 $\Delta E_{\text{HOMO-LUMO}}$ 3.17 eV PM7 method – cluster 1.2 nm

ANATASE 3.20 eV experiment – bulk
 $\Delta E_{\text{HOMO-LUMO}}$ 3.33 eV PM7 method – cluster 1.2 nm
 unpassivated

The HOMO-LUMO energy gap splitting of TiO₂ vs cluster size

DFT methodology with different XC potential

Cluster size [nm]	BLYP	B3LYP	LC-BLYP	CAMB3LYP	LC- BLYP $\mu=0.8$
	$\Delta E_{\text{HOMO-LUMO}}$ [eV]				
0.6	0.97	1.04	4.63	2.92	4.76
0.8	0.77	0.83	3.62	2.28	3.97
1.0	0.47	0.50	2.94	1.85	3.03
1.2	0.42	0.45	2.91	1.46	3.03

$$E_X = E_X^{sr} + E_X^{lr}$$

Electron energy DFT

x

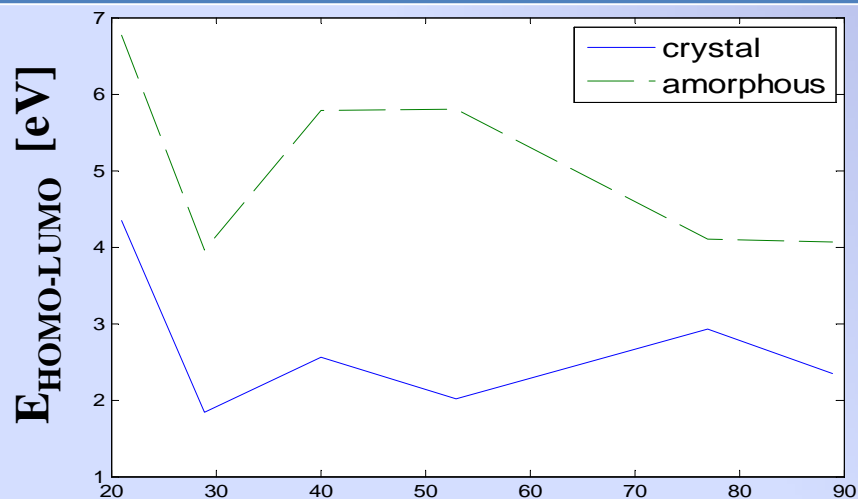

$$\frac{1}{r_{12}} = \frac{1 - \text{erf}(\mu r_{12})}{r_{12}} + \frac{\text{erf}(\mu r_{12})}{r_{12}}$$

HOMO-LUMO energy gap splitting calculated for unpassivated (TiO₂)_n anatase cluster with diameter equal to 1.0 nm using LC-BLYP functional vs range separation parameter μ

DFT functional	$\mu=0.1$	$\mu=0.33$	$\mu=0.5$	$\mu \geq 0.8$
	$\Delta \text{HOMO-LUMO}$ [eV]			
LC-BLYP	2.88	2.94	2.99	3.03

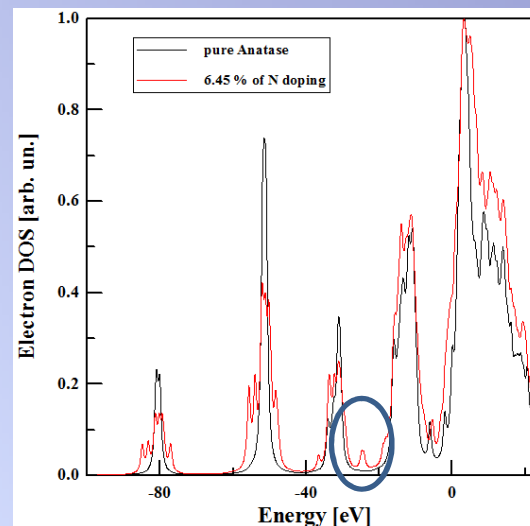

$E_{\text{HOMO-LUMO}}$ energy gap splitting vs $(\text{TiO}_2)_n$ size

	n	
	Crystal	Amorphous
n	HOMO-LUMO	
21	4.343	6.769
29	2.545	5.784
40	1.839	3.951
53	2.004	5.792
77	2.924	4.099
89	2.339	3.058

Computer simulation of N-TiO₂ clusters

Nitrogen doping – cluster with size 1 nm Anatase structure
HOMO-LUMO 3.06 eV
Anatase (6.45 % of N)
HOMO-LUMO 2.4 eV

The acceptor character of nitrogen

HOMO

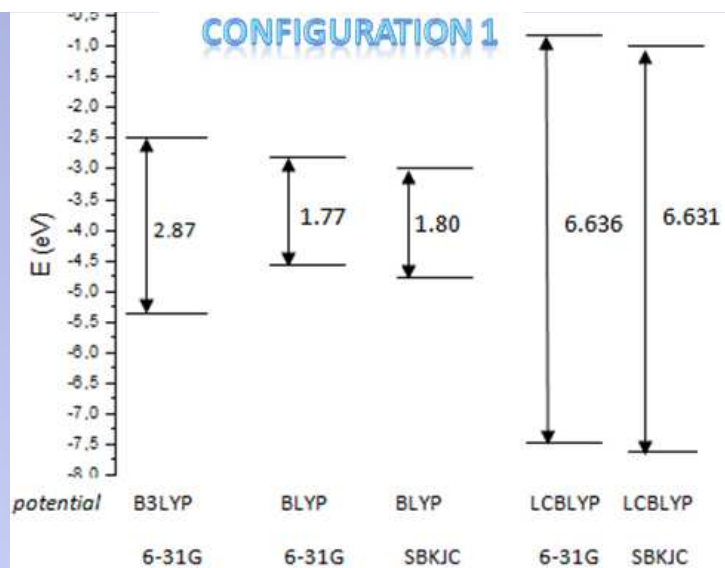

LUMO

The evidential influence of Nitrogen atomic orbitals on HOMO is seen for the Oxygen vacancy containing clusters

Electronic properties of TiO₂/D102 composite

D102

HOMO (red) and LUMO (blue) orbitals redistribution for D102 dye molecule calculated by LC-BLYP functional approximation.

Computer simulations of the Bi_2O_3 and the BiVO_4 electronic properties

BiVO_4 starting from $n=20$ has 2.93 eV
Experimental value 2.40 - 2.50 eV

Bi_2O_3 starting from $n=50$ has 2.01 eV
Experimental value 2.58 - 2.85 eV

Conclusions

- **Electronic properties of isolated nanoparticles may be calculated using the cluster approach applying the discrete local field approximation**
- **Covalently bounded atoms like SiC or BiVO₄ nanoparticles may be calculated using *semi*-empirical or DFT theory.**
- **TiO₂ is the ionic crystal and the LC methodology should be used for the suitable calculations.**
- **The surface passivation and the surface reconstruction is important for the SiC calculations and should be important for all covalently bounded nanostructures .**
- **The TiO₂ as the big nanoparticles may be computer without any defined surface properties.**
